  - The balsa is to be tested according to the requirements of [Ch 14, 3.8 Structural core materials 3.8.1](#).
  - The test methods for balsa are given in [Table 14. 3. 4: Tests on end-grain balsa](#).

**Table 14. 3. 4: Tests on end-grain balsa**

| Test                   | Standard  |
|------------------------|---|
| Density                | ISO 845   |
| Tensile properties     | ASTM C297/C297M                                   |
|                        | Test speed = $\frac{\text{Thickness}}{10}$ mm/min |
| Compressive properties | ISO 844   |
|                        | Test speed = $\frac{\text{Thickness}}{10}$ mm/min |
| Shear properties       | ISO 1922  |
|                        | Test speed = 1 mm/min                             |

3. 8. 4 The following requirements apply to rigid foams:
- The data requirements of [Ch 14, 2.7 Core materials 2.7.1](#) are to be provided in accordance with a suitable National or International Standard.
  - The foam is to be tested according to the requirements of [Ch 14, 3.8 Structural core materials 3.8.1](#).
  - The test methods for rigid foams are to be in accordance with [Table 14. 3. 4: Tests on end-grain balsa](#).
3. 8. 5 The following requirements apply to synthetic felt type materials:
- The data requirements of [Ch 14, 2.10 Synthetic felt type materials with or without microspheres 2.10.1](#) are to be provided according to suitable National or International Standards.
  - The material is to be tested according to the requirements of [Ch 14, 3.8 Structural core materials 3.8.1](#), with the following modifications:
    - The core of the laminate test sandwich panel is to be prepared with a fibre content as recommended by the manufacturer.
    - The felt fibre/resin ratio is to be stated.
    - The required test thicknesses of the cores are to be changed from 30 mm and 15 mm to 12 mm and 6 mm respectively.
  - The prepared laminate of the base material is to be of minimum thickness 3.5 mm with a minimum of three layers.
  - The specified tests on the laminate (See [Ch 14, 2.10 Synthetic felt type materials with or without microspheres 2.10.3](#)) are to be conducted according to the requirements of [Table 14. 3. 3: Tests on laminate specimens](#).

## 3. 9 Machinery chocking compounds

3. 9. 1 Test samples of the cured chock resin are to be prepared under ambient conditions and then post-cured at the exotherm temperature as determined in [Ch 14, 2.11 Machinery chocking compounds \(resin chocks\) 2.11.3](#).

3. 9. 2 The specified properties are to be determined as required by [Table 14. 3. 5: Tests for machinery chocking components](#).

**Table 14. 3. 5: Tests for machinery chocking components**

| Test                                 | Standard               |
|--------------------------------------|------------------------|
| Izod Impact Resistance               | ISO 180 Unnotched      |
|                                      |                        |
| Barcol hardness                      | ASTM D2583 or BS EN 59 |
|                                      |                        |
| Compressive strength                 | ISO 604                |
|                                      | Test speed = 1 mm/min  |
|                                      |                        |
| Water absorption                     | ISO 62 Method 1        |
|                                      | 25 mm x 20 mm cylinder |
|                                      | (to constant weight)   |
|                                      |                        |
| Oil absorption (light machine)       | ISO 175                |
|                                      | 25 mm x 20 mm cylinder |
|                                      | (to constant weight)   |
|                                      |                        |
| Temperature of deflection under load | ISO 75-2 Method A      |

3. 9. 3 The percentage linear shrinkage of cured material is to be measured.
3. 9. 4 Creep is to be measured according to the following method:
- A 25 mm x 20 mm diameter parallel faced cylinder is to be pre-loaded against a steel base at 2.5 N/mm<sup>2</sup> or 3.5 N/mm<sup>2</sup>, or at the specified higher loading condition, at ambient temperature for 16 hours.
  - The temperature is to be increased at the rate of 8°C per hour until the service temperature (60°C or 80°C) is reached.
  - During this time, the creep of the cylinder is to be measured at 15 minute intervals.
  - The temperature and loading are to be maintained for a minimum of 100 days measuring the creep at intervals of 24 hours.
  - A plot of creep in mm (linear scale) against time (log scale), together with full experimental details, is to be provided for review by ACS.

### 3. 10 Rudder and pintle bearings

3. 10. 1 All mechanical properties as required by [Ch 14, 2.12, Rudder and pintle bearings](#) are to be measured according to suitable National or International Standards.
3. 10. 2 Frictional properties are to be determined according to a method agreed with ACS.

### **3. 11 Sterntube bearings**

3. 11. 1 The requirements for sterntube bearings are as defined in [Ch 14, 2.13 Sterntube bearings](#).

**CHAPTER 14 Plastics Materials and other Non-Metallic Materials****SECTION 4 Plastic pipes and fittings****4. 1 Scope**

- 4. 1. 1 This Section gives the general requirements for plastic pipes and fittings, with or without reinforcement, intended for use in the services listed in the relevant Rules dealing with design and construction. Hoses and mechanical couplings are not covered by these requirements.
- 4. 1. 2 Pipes and fittings intended for application in Class I, Class II and Class III systems for which there are Rule requirements, are to be manufactured in accordance with the requirements of [Ch 14, 1 General requirements](#) and this Section.
- 4. 1. 3 As an alternative to [Ch 14, 4.1 Scope 4.1.2](#), plastic pipes and fittings which comply with National or proprietary specifications may be accepted, provided that the specifications give reasonable equivalence to the requirements of this Section or, alternatively, are approved for a specific application. The survey and certification are however to be carried out in accordance with the requirements of this Section.

**4. 2 Design requirements**

- 4. 2. 1 The requirements for design approval are detailed in the relevant Rules.
- 4. 2. 2 The design submission is to include a materials list with confirmation that the materials listed have properties and characteristics conforming with those values used in the design submission. As a minimum, the details given should include the following:
  - a. Resin.
  - b. Accelerator (type and concentration).
  - c. Catalyst or curing agent (type and concentration).
  - d. Reinforcement.
  - e. Cure/post-cure conditions.
  - f. Resin/reinforcement ratio.
  - g. Wind angle (or lay-up sequence) and orientation.
  - h. Dimensions and tolerances.This submission is to include similar details for the fittings together with a description of the method of attachment of the fittings to the pipes.
- 4. 2. 3 Any alteration of the component materials or manufacturing operations from those used in the design submission will necessitate a completely new submission.
- 4. 2. 4 If the piping manufacturer anticipates the possible use of alternative materials, these should be listed in the design submission. Proof that the modified product will meet the specified requirements will be needed prior to its use.

### 4. 3 Manufacture

- 4. 3. 1 Plastic pipes and fittings intended for use in Class I, Class II and Class III systems are to be manufactured at facilities approved by ACS, using materials approved by ACS.
- 4. 3. 2 A Manufacturing Specification is to be submitted. This is to contain details of the following:
  - a. All constituent materials.
  - b. Manufacturing procedures such as lay-up sequence or wind angle, the ratios of curing agent to resin and reinforcement to resin, the laminate thickness, the mandrel dwell time (initial cure) and the cure and post-cure conditions.
  - c. Quality control procedures including details and frequency of tests on the incoming materials, tests made during production and on the finished piping.
  - d. Acceptance standards and tolerances, including all dimensions.
  - e. Procedures for cosmetic repair.
  - f. System for traceability of the finished piping to the batches of raw materials.
  - g. Method of bonding pipes and fittings.
- 4. 3. 3 Details of all raw materials are to be submitted for approval and are to be in accordance with the Manufacturing Specification and the design submission.
- 4. 3. 4 All batches of raw materials are to be provided with unique identifications by their manufacturers.
- 4. 3. 5 No batch of material is to be used later than its date of expiry.
- 4. 3. 6 The piping manufacturer is to ensure that all batches of materials are used sequentially.
- 4. 3. 7 The piping manufacturer is to maintain records of the amounts of resin and reinforcement used, in order to ensure that the proportions remain within the limits set in the Manufacturing Specification.
- 4. 3. 8 Records are to be kept of the wind angle and/or the orientation of the reinforcement.
- 4. 3. 9 The piping manufacturer is to ensure that each item of piping is traceable to the batch or batches of material used in its manufacture. The unique identifications referred to in [Ch 14, 4.3 Manufacture 4.3.4](#) are to be included on all documents.
- 4. 3. 10 The curing oven is to be suitable for the intended purpose and all pyrometric equipment is to be calibrated at least annually and adequate records maintained.
- 4. 3. 11 The temperature of the pipe or fitting is to be controlled and recorded by the attachment of suitably placed thermocouples.

### 4. 4 Quality assurance

- 4. 4. 1 The piping manufacturer is to have a quality assurance system approved to ISO 9001 or equivalent. This system should ensure that the pipes and fittings are produced with uniform and consistent mechanical and physical properties in accordance with acceptable standards.

### 4. 5 Dimensional tolerances

- 4. 5. 1 Dimensions and tolerances are to conform to the Manufacturing Specification.
- 4. 5. 2 The wall thicknesses of the pipes are to be measured at intervals around the circumference and along the length in accordance with an appropriate National Standard. The thicknesses are to accord with the Manufacturing Specification.
- 4. 5. 3 The responsibility for maintaining the required tolerances and making the necessary measurements rests with the manufacturer. Occasional checking by the Surveyor does not absolve the manufacturer from this responsibility.

## 4. 6 Composition

- 4. 6. 1 The composition of the pipes and fittings is to be in accordance with the Manufacturing Specification.
- 4. 6. 2 Where alternative materials are used (See [Ch 14, 4.2 Design requirements 4.2.4](#)), the manufacturer is to demonstrate to the Surveyor's satisfaction, and prior to their introduction, their suitability with respect to the performance of the piping. Otherwise, full testing as specified in [Ch 14, 4.7, Testing](#) will be required.

## 4. 7 Testing

- 4. 7. 1 For thermoplastic pipes, the polymer manufacturer is to make the following measurements on samples taken from each batch:
  - a. Melting point.
  - b. Melt flow index.
  - c. Density.
  - d. Filler/pigment content, where applicable.
  - e. Tensile stress at yield and break.
  - f. Tensile strain at yield and break.
- 4. 7. 2 The values obtained are to be certified by the polymer manufacturer.
- 4. 7. 3 For reinforced thermoset pipes, the resin manufacturer is to determine, on samples taken from each batch, at least the following:
  - a. All resins:
    - i. Viscosity.
    - ii. Gel time.
    - iii. Filler content, where applicable.
  - b. Polyester resins:
    - i. Type (orthophthalic, isophthalic, etc.).
    - ii. Volatiles content.
    - iii. Acid value.
  - c. Epoxide resins:
    - i. Free epoxide content.
  - d. Phenolic resins:
    - i. Free phenol content.
    - ii. Free formaldehyde content.
- 4. 7. 4 The values obtained are to comply with the requirements of the Manufacturing Specification.
- 4. 7. 5 Where the resin manufacturer mixes batches, both the original batches and the mixed batch are to be tested in accordance with [Ch 14, 4.7 Testing 4.7.1](#) to [Ch 14, 4.7 Testing 4.7.3](#) as appropriate. The mixed batch is then to be given a unique batch number.
- 4. 7. 6 The polymer or resin manufacturer is to demonstrate that each batch of polymer or resin satisfies the requirement for temperature of deflection under load and this is not to be less than 80°C.
- 4. 7. 7 These measurements should be repeated on each batch by the piping manufacturer. Where this is not done, ACS may require that the tests be made on a random basis by an independent laboratory.
- 4. 7. 8 The piping manufacturer is to confirm, by means of tests on at least one batch in twenty, that the temperature of deflection under load exceeds the specified minimum under manufacturing conditions.
- 4. 7. 9 Where reinforcements are used, at least the following are to be recorded, where applicable:
  - a. Tex of yarn(s) or roving(s).

- b. Ends per 100 mm in all reinforcement orientations.
  - c. Weight per square metre.
  - d. Binder/size content.
  - e. Stitch type and count.
  - f. Type of fibre used.
  - g. Surface treatment and/or finish.
4. 7. 10 All items in [Ch 14, 4.7 Testing 4.7.9](#) are to comply with the Manufacturing Specification.
4. 7. 11 The piping manufacturer is to maintain accurate records of resin and glass usage and is to calculate the resin/glass ratio on an ongoing basis.
4. 7. 12 During manufacture of the piping, apart from the requirements of [Ch 14, 4.7 Testing 4.7.5](#), [Ch 14, 4.7 Testing 4.7.6](#) and [Ch 14, 4.7 Testing 4.7.8](#), tests are to be carried out on the constituents and final product in accordance with [Table 14. 4. 1: Testing during manufacture of pipes](#).

**Table 14. 4. 1: Testing during manufacture of pipes**

| Component/ operation  | Characteristic                  | Rate of testing                 |
|---|---------------------------------|---------------------------------|
| Resin/curing  | Gel time                        | Two per shift                   |
| agent/catalyst  | Rate of consumption             | Continuous                      |
| Reinforcement   | Quality                         | Continuous                      |
|   | Wind angle                      | Continuous                      |
|   | Rate of consumption             | Continuous                      |
| Resin/reinforcement   | Ratio                           | Continuous                      |
| Pipe  | Post-cure:                      |                                 |
|   | temperature of the pipe in oven | Continuous                      |
|   | Cure level                      | At least eight per length       |
|   | Dimensions                      | Each length                     |
|   | Hydraulic pressure test         | Each length                     |
|   | Electrical resistance           | Each length ( <i>See Note</i> ) |
|   | Hydraulic bursting test         | At Surveyor's discretion        |
|   | Axial strength                  | At Surveyor's discretion        |
| <b>Note</b> Measurements of electrical resistance are only required on piping where the operating conditions given in <a href="#">Pt 5, Ch 12, 5.2 Design and performance criteria 5.2.4</a> of the <i>Rules and Regulations for the Classification of Ships</i> apply. |                                 |                                 |

4. 7. 13 The standards of acceptance are those listed in the Manufacturing Specification approved by ACS.
4. 7. 14 At the Surveyor's discretion, sections of pipe are to be subjected to hydraulic bursting tests and/or measurements of axial strength.
4. 7. 15 If the batch of resin or polymer, or the curing agent, or their ratio is changed during manufacture of a batch of pipes, at least two additional measurements of the gel time are to be carried out during each shift.

## 4. 8 Visual examination

- 4. 8. 1 All pipes and fittings are to be visually examined and are to be free from surface defects and blemishes.
- 4. 8. 2 The pipes are to be reasonably straight and the cut ends are to be square to the axis of the pipe.

## 4. 9 Hydraulic test

- 4. 9. 1 Each length of pipe is to be tested at a hydrostatic pressure not less than 1.5 times the rated pressure of the pipe.
- 4. 9. 2 The test pressure is to be maintained for sufficient time to permit proof and inspection. Unless otherwise agreed, the manufacturer's certificate of satisfactory hydraulic test, endorsed by the Surveyor, will be accepted.

## 4. 10 Repair procedure

- 4. 10. 1 Repairs are not allowed, with the exception of minor cosmetic blemishes as detailed in [Ch 14, 1.10 Rectification of defective material 1.10.1](#).
- 4. 10. 2 A repair procedure for these minor blemishes is to be included in the Manufacturing Specification.

## 4. 11 Identification

- 4. 11. 1 All piping is to be identified in such a manner that traceability to all the component materials used in its manufacture is ensured. The Surveyor is to be given full facilities for so tracing the material when required.
- 4. 11. 2 Pipes and fittings are to be permanently marked by the manufacturer by moulding, hot stamping or by any other suitable method, such as printing, in accordance with [Ch 14, 1.11, Identification of products and base materials](#). The markings are to include:
  - a. Identification number, See [Ch 14, 4.11 Identification 4.11.1](#).
  - b. ACS or Asia Classification Society, and the abbreviated name of ACS 's.
  - c. Manufacturer's name or trademark.
  - d. Pressure rating.
  - e. Design standard.
  - f. Material system with which the piping is made.
  - g. Maximum service temperature.

## 4. 12 Certification

- 4. 12. 1 The manufacturer is to provide the Surveyor with copies of the test certificates or shipping statements for all material which has been accepted.
- 4. 12. 2 Each test certificate is to contain the following particulars:
  - a. Purchaser's name and order number.
  - b. If known, the contract number for which the piping is intended.
  - c. Address to which piping is despatched.
  - d. Type and specification of material.
  - e. Description and dimensions.
  - f. Identification number, See [Ch 14, 4.11 Identification 4.11.1](#).
  - g. Test results.

CHAPTER **14** **Plastics Materials and other Non-Metallic Materials**

SECTION **5** **Control of material quality for composite construction**

**5. 1 Scope**

- 5. 1. 1 This Section gives the general requirements for control of material quality when used in the construction of composite craft.
- 5. 1. 2 For composite craft built under the Rules, the survey of materials is to be conducted in accordance with the requirements of [Ch 14, 1 General requirements](#) to [Ch 14, 3 Testing procedures](#) and this Section.

**5. 2 Design submission**

- 5. 2. 1 The requirements for design submission are detailed in the appropriate Part of the Rules which includes full information on composite materials.

**5. 3 Construction**

- 5. 3. 1 All constructions are to be carried out using materials approved or accepted by ACS.
- 5. 3. 2 All materials are to be in accordance with the approved construction documentation.
- 5. 3. 3 All batches of materials are to be provided with unique identifications by their manufacturers. Components are to be similarly identified.
- 5. 3. 4 No batch of material is to be used later than its date of expiry.
- 5. 3. 5 The Builder is to ensure that all batches of materials are used systematically and sequentially.
- 5. 3. 6 The Builder is to maintain, on a continuous basis, records of the amounts of resin and reinforcement used, in order to ensure that the proportions remain within the limits set in the construction documentation.
- 5. 3. 7 Records are to be kept of the sequence and orientation of the reinforcements.
- 5. 3. 8 The Builder is to ensure that each section of the construction is traceable to the batch or batches of material used. The unique identifications required under [Ch 14, 1.11 Identification of products and base materials 1.11.1](#) are to be included on all relevant quality control documentation.
- 5. 3. 9 Any curing system used is to be demonstrated as suitable for the intended purpose and all pyrometric equipment is to be calibrated at least annually and adequate records maintained.
- 5. 3. 10 The post-curing temperature is to be controlled and recorded by the attachment of suitably placed thermocouples.

## 5. 4 Quality assurance

5. 4. 1 Where the Builder has a quality assurance system, this is to include the requirements of this Section.

## 5. 5 Dimensional tolerances

5. 5. 1 Dimensions and tolerances are to conform to the approved construction documentation.
5. 5. 2 The thicknesses of the laminates are, in general, to be measured at not less than ten points, evenly distributed across the surface. In the case of large sections, at least ten evenly distributed measurements are to be taken in bands across the width at maximum spacing of two metres along the length.
5. 5. 3 The responsibility for maintaining the required tolerances and making the necessary measurements rests with the Builder. Monitoring and random checking by the Surveyor does not absolve the Builder from this responsibility.
5. 5. 4 Where ultrasonic thickness gauges are used, these are to be calibrated against an identical laminate (of measured thickness) to that on which the thickness measurement is to be carried out. If suitable pieces are not available from the construction, then a small sample of identical lay-up is to be prepared.

## 5. 6 Material composition

5. 6. 1 The materials, prefabricated sections or components used are to be in accordance with the approved construction documentation.
5. 6. 2 Where alternative materials are used, these are to be of approved or accepted types and the manufacturer is to demonstrate to the Surveyor's satisfaction, prior to their introduction, their suitability with respect to performance, otherwise full testing as appropriate will be required.

## 5. 7 Material testing

5. 7. 1 Where so required, the material manufacturer is to provide the purchaser with certificates of conformity for each batch of material supplied, indicating the relevant values specified in [Ch 14, 5.7 Material testing 5.7.4](#) to [Ch 14, 5.7 Material testing 5.7.8](#). These values are to comply with those specified by the approved construction documentation.
5. 7. 2 Where the Builders do not conduct verification testing of the information indicated in [Ch 14, 5.7 Material testing 5.7.4](#) to [Ch 14, 5.7 Material testing 5.7.8](#), they are to ensure that copies of all certificates of conformity (which must indicate the actual tested values) are obtained for all batches of materials received, and maintain accurate records. The Surveyor may at any time select a sample of a material for testing by an independent, where applicable, source and should such tests result in the material failing to meet the specification, then that batch will be rejected.
5. 7. 3 The following tests are to be carried out, where applicable, on receipt of any material:
- The consignment is to be divided into its respective batches and each batch is to be labelled accordingly.
  - Each batch is to be visually examined for conformity with the batch number, visual quality and date of expiry.
  - Each batch is to be separately labelled and stored separately.
  - Each unit, within the batch, is to be labelled with the batch number.
  - Records are to be maintained of the above and these are to be cross-referenced with the certificate of conformity for the material and/or the Builder's own test results.

5. 7. 4 For thermosetting resins, reinforced or otherwise, the resin manufacturer is to have determined, on samples taken from each batch, at least the following:
- All resins:
    - Viscosity.
    - Gel time.
    - Filler content, where applicable.
  - Polyester and vinylester resins:
    - Type (orthophthalic, isophthalic, etc.).
    - Volatiles content.
    - Acid value.
  - Epoxide resins:
    - Free epoxide content.
  - Phenolic resins:
    - Free phenol content.
    - Free formaldehyde content.
5. 7. 5 For thermoplastics, the polymer manufacturer is to have made the following measurements on samples taken from each batch:
- Melting point.
  - Melt flow index.
  - Density.
  - Filler/pigment content, where applicable.
  - Tensile stress at yield and break.
  - Tensile strain at yield and break.
5. 7. 6 Where the resin or polymer manufacturer mixes batches, both the original batches and the mixed batch are to be tested in accordance with [Ch 14, 5.7 Material testing 5.7.4](#) or [Ch 14, 5.7 Material testing 5.7.5](#) as appropriate. The mixed batch is then to be given a unique batch number.
5. 7. 7 For reinforcements, the material manufacturer is to have recorded, where applicable, the following for each batch of material:
- Tex of yarn(s) or roving(s).
  - Ends per 100 mm in all reinforcement orientations.
  - Weight per square metre.
  - Binder/size content.
  - Stitch type and count.
  - Type of fibre used.
  - Surface treatment and/or finish.
5. 7. 8 For core materials, the following properties are to be recorded by the manufacturer for each batch:
- Type of material.
  - Density.
  - Description (block, scrim mounted, grooved).
  - Thickness and tolerance.
  - Sheet/block dimensions.
  - Surface treatment.
- Together with the following mechanical properties:
- In the case of rigid foams:
- Compressive strength (stress at maximum load) and modulus of elasticity.
  - Core shear strength.
- In the case of end-grain balsa:
- Tensile strength (stress at maximum load).
  - Compressive strength (stress at maximum load) and modulus of elasticity.

5. 7. 9 During construction, tests are to be carried out on the constituents and final product in accordance with [Table 14. 5. 1: Tests during construction](#).
5. 7. 10 The standards of acceptance for testing are those listed in the material manufacturer's specification, approved construction documentation or agreed quality control procedures as applicable.
5. 7. 11 Laminate fibre content is to be determined at the request of the Surveyor, in particular where the thickness measured does not correlate with the specified fibre content, by weight. This will, in general, result in additional reinforcement being required.
5. 7. 12 If the batch of resin or polymer, or the curing agent, or their ratio is changed, at least two additional measurements of the gel time are to be carried out during each shift.

**Table 14. 5. 1: Tests during construction**

| Component/operation         | Characteristic   | Rate of testing  |
|-----------------------------|--|--|
| Resin/curing agent/catalyst | Gel time   | Two per shift  |
|                             | Rate of consumption  | Continuous   |
| Reinforcement               | Quality  | Continuous   |
|                             | Orientation  | Continuous   |
|                             | Rate of consumption  | Continuous   |
| Resin/reinforcement         | Ratio  | Continuous   |
| Construction                | Temperature during cure/post cure                              | Continuous   |
|                             | Dimensions   | Continuous against approved construction documentation   |
|                             | Cure level (Barcol) against resin manufacturer's specification | At least one per square metre  |
|                             | Laminate thickness   | Continuous against material usage and approved construction documentation<br>(See also <a href="#">Ch 14, 5.5 Dimensional tolerances 5.5.2</a> ) |
|                             | Laminate fibre content   | At the Surveyor's request<br>(See <a href="#">Ch 14, 5.7 Material testing 5.7.11</a> )   |

## 5. 8 Visual examination

5. 8. 1 All constructional mouldings and any components are to be visually examined and are to be free from surface defects and blemishes.

## 5. 9 Repair procedure

5. 9. 1 Repairs of minor cosmetic blemishes are permitted providing that these are brought to the attention of the Surveyor.
5. 9. 2 A repair procedure for these minor blemishes is to be included in the agreed quality control procedures.

5. 9. 3 Structural repairs are subject to individual consideration and full written details must be approved by the plan approval office prior to introduction.

## 5. 10 Material identification

5. 10. 1 Records of the construction are to be kept in such a manner that traceability of all the component materials used is ensured. The Surveyor is to be given full facilities for tracing the material's origin when required.
5. 10. 2 Small representative samples of each batch of material are to be retained, these being suitably labelled to ensure traceability.
5. 10. 3 When so requested by the Surveyor, the Builder is to provide copies of all test data and/or manufacturers' certificates of conformity appertaining to any material used.

## 5. 11 Minimum tested requirements for material approval

5. 11. 1 This Section provides the minimum property values required of a material for approval or acceptance by ACS and are applicable to materials cured under ambient conditions.
5. 11. 2 **Gel coat resins.** When the cast resin is tested according to the requirements of [Ch 14, 2.3, Thermosetting resins](#), [Table 14. 5. 2: Gel coat resins, minimum property values](#) gives the minimum values for the respective properties.

**Table 14. 5. 2: Gel coat resins, minimum property values**

| Properties                                 | Minimum value            |
|--|--------------------------|
| Tensile strength (stress at maximum load)  | 40 N/mm <sup>2</sup>     |
| Tensile stress at break                    | 40 N/mm <sup>2</sup>     |
| Tensile strain at maximum load             | 2.5%                     |
| Modulus of elasticity in tension           | As measured              |
| Flexural strength (stress at maximum load) | 80 N/mm <sup>2</sup>     |
| Modulus of elasticity in flexure           | As measured              |
| Barcol hardness                            | As measured at full cure |
| Water absorption                           | 70 mg (max)              |

5. 11. 3 **Laminating resins.** When tested according to the requirements of [Ch 14, 2.3, Thermosetting resins](#) and [Ch 14, 2.4, Reinforcements](#), [Table 14. 5. 3: Laminating resins, minimum property values](#) and [Table 14. 5. 4: Laminating resins, minimum values for properties for CSM laminate at 0.3 glass fraction by weight](#) give the minimum properties for the cast resin and chopped strand mat laminate respectively.

**Table 14. 5. 3: Laminating resins, minimum property values**

| Properties                                | Minimum value        |
|---|----------------------|
| Tensile strength (stress at maximum load) | 40 N/mm <sup>2</sup> |
| Tensile stress at break                   | 40 N/mm <sup>2</sup> |
| Tensile strain at maximum load            | 2.0%                 |

|   |                          |
|---|--------------------------|
| Modulus of elasticity in tension  | As measured              |
| Barcol hardness   | As measured at full cure |
| Temperature of deflection under load  | 55°C                     |
| <b>Note</b> These minimum value are for the recommended glass content by weight of 0.3. |                          |

**Table 14. 5. 4: Laminating resins, minimum values for properties for CSM laminate at 0.3 glass fraction by weight**

| Properties  | Minimum value          |
|---|------------------------|
| Tensile strength (stress at maximum load)   | 90 N/mm <sup>2</sup>   |
| Secant modulus at 0.25% and 0.5% strain respectively                              | 6.9 kN/mm <sup>2</sup> |
| Compressive strength (stress at maximum load)                                     | 125 N/mm <sup>2</sup>  |
| Compressive modulus   | 6.4 kN/mm <sup>2</sup> |
| Flexural strength (stress at maximum load)  | 160 N/mm <sup>2</sup>  |
| Modulus of elasticity in flexure  | 5.7 kN/mm <sup>2</sup> |
| Apparent interlaminar shear strength ( <i>See Note</i> )                          | 18 N/mm <sup>2</sup>   |
| Fibre content   | As measured (0.3)      |
| Water absorption  | 70 mg (max)            |
| <b>Note</b> Applicable only to the special test for environmental control resins. |                        |

5. 11. 4 When tested to the requirements of [Ch 14, 2.4, Reinforcements](#) for reinforcements, [Table 14. 5. 5: Laminates, minimum property requirements](#) gives the minimum properties for laminates.

**Table 14. 5. 5: Laminates, minimum property requirements**

| Material type                 | Property   | Value                       |
|-------------------------------|--|-----------------------------|
| Chopped strand mat            | Tensile strength (stress at maximum load) (N/mm <sup>2</sup> ) | $200G_C + 30$               |
|                               | Modulus of elasticity in tension (kN/mm <sup>2</sup> )         | $15G_C + 2.4$               |
| Bi-directional reinforcement  | Tensile strength (stress at maximum load) (N/mm <sup>2</sup> ) | $400G_C - 10$               |
|                               | Modulus of elasticity in tension (kN/mm <sup>2</sup> )         | $30G_C - 0.5$               |
| Uni-directional reinforcement | Tensile strength (stress at maximum load) (N/mm <sup>2</sup> ) | $1800G_C^2 - 1400G_C + 510$ |
|                               | Modulus of elasticity in tension (kN/mm <sup>2</sup> )         | $130G_C^2 - 114G_C + 39$    |

|   |  |                               |
|---|--|-------------------------------|
| Chopped strand mat  | Flexural (stress at maximum load) (N/mm <sup>2</sup> )             | $502G_C^2 + 114.6$            |
|   | Modulus of elasticity in flexure (kN/mm <sup>2</sup> )             | $33.4G_A^2 + 2.7$             |
| All   | Flexural strength (stress at maximum load) (N/mm <sup>2</sup> )    | $502G_C^2 + 106.8$            |
|   | Modulus of elasticity in flexure (kN/mm <sup>2</sup> )             | $33.4G_C^2 + 2.2$             |
|   | Compressive strength (stress at maximum load) (N/mm <sup>2</sup> ) | $150G_C + 72$                 |
|   | Compressive modulus (kN/mm <sup>2</sup> )                          | $40G_C - 6$                   |
|   | Interlaminar shear strength (N/mm <sup>2</sup> )                   | $22 - 13.5G_C (\text{min}15)$ |
|   | Water absorption (mg)  | 70 (maximum)                  |
|   | Glass content (% by weight)  | As measured                   |
| <p><b>Note 1.</b> After water immersion, the values shall be a minimum of 75% of the above.</p> <p><b>Note 2.</b> Where materials have reinforcement in more than two directions, the requirement will be subject to individual consideration dependent on the construction.</p> <p><b>Note 3.</b> <math>G_C</math> = glass fraction by weight.</p> |  |                               |

5. 11. 5 Alternatively, materials may be approved by use of the actual tested values whereby the approval value shall equal the mean of the tested values minus twice the standard deviation of a minimum of five tested values.

## 5. 12 Closed cell foams for core construction based on PVC or polyurethane

5. 12. 1 [Table 14. 5. 6: Minimum characteristics and mechanical properties of rigid expanded foams at 20°C](#) gives minimum values for closed cell forms for core construction based on PVC or polyurethane.

**Table 14. 5. 6: Minimum characteristics and mechanical properties of rigid expanded foams at 20°C**

| Material          | Apparent density kg/m <sup>3</sup> | Strength (stress at maximum load) (N/mm <sup>2</sup> ) |             |       | Modulus of elasticity (N/mm <sup>2</sup> ) |       |
|-------------------|------------------------------------|--|-------------|-------|--|-------|
|                   |                                    | Tensile  | Compressive | Shear | Compressive                                | Shear |
| Polyurethane      | 96                                 | 0.85   | 0.60        | 0.50  | 17.20                                      | 8.50  |
| Polyvinylchloride | 60                                 |  |             |       |  |       |

5. 12. 2 Other types of foam will be subjected to individual consideration. A minimum core shear strength of 0.5 N/mm<sup>2</sup> is to be achieved.

## 5. 13 End-grain balsa

5. 13. 1 [Table 14. 5. 7: Minimum characteristics and mechanical properties of end-grain balsa](#) gives the minimum property requirement for end-grain balsa.

**Table 14. 5. 7: Minimum characteristics and mechanical properties of end-grain balsa**

| Apparent density (kg/m³) | Strength (stress at maximum load) (N/mm²) |                        |                   |                        |       | Compressive modulus of elasticity (N/mm²) |                        | Shear modulus of elasticity (N/mm²) |
|--------------------------|---|------------------------|-------------------|------------------------|-------|---|------------------------|-------------------------------------|
|                          | Compressive                               |                        | Tensile           |                        | Shear |   |                        |                                     |
|                          | Direction of stress                       |                        |                   |                        |       | Direction of stress                       |                        |                                     |
|                          | Parallel to grain                         | Perpendicular to grain | Parallel to grain | Perpendicular to grain |       | Parallel to grain                         | Perpendicular to grain |                                     |
| 96                       | 5.0                                       | 0.35                   | 9.00              | 0.44                   | 1.10  | 2300                                      | 35.2                   | 105                                 |
| 144                      | 10.6                                      | 0.57                   | 14.6              | 0.70                   | 1.64  | 3900                                      | 67.8                   | 129                                 |
| 176                      | 12.8                                      | 0.68                   | 20.5              | 0.80                   | 2.00  | 5300                                      | 89.6                   | 145                                 |

## 5. 14 Synthetic chocking compounds

5. 14. 1 After 1000 hours the chocking resin must be stabilised and maximum creep is to be less than or equal to 0.2 per cent.
5. 14. 2 Compliance with [Ch 14, 5.14 Synthetic chocking compounds 5.14.1](#) is to be demonstrated at the time of chocking compound approval for a specified cure/post cure schedule. The Izod, barcol, compression, and water and oil absorption are additionally to be determined for the creep tested cure/post cure schedule.
5. 14. 3 Confirmation of creep, barcol and compression will be required for cure/post cure conditions which differ from those shown on the product approval certificate.

## 5. 15 Other materials

5. 15. 1 All other materials will be subject to special consideration.

## CHAPTER **15 Corrosion Prevention**

### LIST OF TABLES

---

|   |     |
|---|-----|
| Table 15. 4. 1: Typical corrosion protection requirements for the hull steelwork..... | 827 |
|---|-----|

CHAPTER **15 Corrosion Prevention**

SECTION **1 General Requirements**

**1.1 Scope**

- 1.1.1 This Chapter specifies the requirements for the corrosion protection of ships and other marine structures. In general, suitable protective systems may include coatings, corrosion resistant materials, cathodic protection, corrosion allowances or other approved methods, either individually or in combination. Corrosion protection systems should be selected with consideration for the design life of the structure, and the in-service inspection and maintenance regimes.
- 1.1.2 The materials and processes described in this Chapter are to be considered in accordance with the requirements of the relevant design and construction Rules, as well as the *ACSPlus Guidelines Anti-Corrosion System Notation*. Where applicable, the requirements of current statutory legislation must be satisfied.

PART

# 2

CHAPTER **15 Corrosion Prevention**

SECTION **2 Coatings**

## **2. 1 General**

- 2. 1. 1 The following plans and information regarding corrosion protection by the use of coatings are to be agreed between the shipyard and owner prior to construction, and, where required by subsequent sections, submitted to Class for review:
  - a. A copy of the Asia Classification Society approval certificate for pre-fabrication primer (shop-primer).
  - b. Details of the coating system. This is to include the paint specification with regard to:
    - i. The identity and generic type of the coating, and confirmation by the manufacturer of its suitability for the intended environment;
    - ii. The methods used to prepare the surface before the coating is applied, and the standards to be achieved, with reference to shipyard standards, or National or International Standards;
    - iii. The method of application of the coating in each area; and
    - iv. The number of coats to be applied, with the nominal total dry film thickness.
  - c. Details of the areas to be coated.
- 2. 1. 2 Paints or other coatings are to be confirmed as being suitable for their intended purpose in the locations where they are to be used. In areas not covered by the Regulations identified in the following Sections, this shall be demonstrated by the submission of the paint manufacturer's technical data sheet, together with appropriate in-service experience.
- 2. 1. 3 Coatings used in cargo oil tanks, cargo tank deck areas, pump rooms, cofferdams or any other area where flammable vapours may accumulate shall be coated using suitable coating systems. If the selected coatings for these spaces contain aluminium, it shall be present at less than 10 per cent by weight in the dry film.
- 2. 1. 4 Coatings utilised in areas such as accommodation or defined escape routes are required to comply with the appropriate Sections of the following SOLAS Regulations:
  - a. Areas defined as requiring low flame spread coatings shall be treated in accordance with SOLAS II-2, Regulation 5.
  - b. Areas defined as requiring low smoke and toxicity emission coatings shall be treated in accordance with SOLAS II-2, *Regulation 6*.
- 2. 1. 5 Coating manufacturers shall comply with the requirements of [Ch 1, 2.1 Approval and survey requirements – General 2.1.5](#) regarding control of the manufacturing process.
- 2. 1. 6 The top coat of coating systems used in spaces subject to scheduled inspection should be light in colour to assist the Surveyor.

## 2. 2 Surface preparation

- 2. 2. 1 Coatings are to be applied in accordance with the manufacturer's recommendations, to surfaces prepared in accordance with the agreed coating application specification.
- 2. 2. 2 The surface treatment prior to coating application should be performed in accordance with the manufacturer's recommendations, unless a mandatory minimum standard has been established for specified areas, such as in Sections [Ch 15, 2.4., Seawater ballast tank coatings](#) and [Ch 15, 2.5 Cargo oil tank coatings](#) below.
- 2. 2. 3 Dust and surface contamination, such as oil or salt deposits, is to be removed, as far as is practicable, from the surface prior to the application of any paint. The cleanliness of the surface should be measured using appropriate shipyard, National or International standard methods, with the following properties assessed:
  - a. Residual salt levels.
  - b. Oil contamination.
  - c. Dust or other particulates.
- 2. 2. 4 Appropriate methods shall be used to remove, as far as practicable, surface contamination detected when assessing the surfaces. Selection of these methods shall consider the location of the surface to be cleaned, any applicable standards and any local environmental legislation.

## 2. 3 Pre-fabrication primers (Shop primers)

- 2. 3. 1 Where a pre-fabrication primer is used to coat steel after surface preparation and prior to fabrication, the composition of the coating is to be such that it will have no significant deleterious effect on subsequent welding work, and it is to be compatible with the coatings subsequently applied over it.
- 2. 3. 2 For Asia Classification Society classed vessels and structures the pre-fabrication primer shall be of an approved type. A list of pre-fabrication primers currently approved by ACS is available on Asia Classification Society website.
- 2. 3. 3 The full approval procedure is detailed in MQPS Book P, Procedure 19-5.

## 2. 4 Seawater ballast tank coatings

- 2. 4. 1 For ships that are required to comply with IMO Resolution MSC.215(82) - *Performance Standard for Protective Coatings for Dedicated Seawater Ballast Tanks in all Types of Ships and Double-Side Skin Spaces of Bulk Carriers - (Adopted on 8 December 2006)*, all dedicated seawater ballast tanks for all ship types and double-side skin spaces of bulk carriers are to have approved coating systems applied in accordance with the *ACSPlus Guidelines Anti-Corrosion Systems Notation*.
- 2. 4. 2 The procedure for coating system type approval is detailed in MQPS Book P, Procedure 19-3. A list of PSPC-compliant seawater ballast tank coating systems currently type approved by ACS is available on Asia Classification Society website.
- 2. 4. 3 The compliance of the vessel with the PSPC requirements is demonstrated by the formal acceptance of the Coating Technical File (CTF) and the issue of the vessel's SOLAS certificate. A copy of the accepted CTF shall be retained on the vessel. The appropriate Class notations will be assigned in accordance with the *ACSPlus Guidelines Anti-Corrosion System Notation*.
- 2. 4. 4 The CTF shall record all of the mandatory information required by the PSPC, including the paint schedule, primary surface preparation, pre-fabrication priming, secondary surface preparation, assessment of the surface condition, coating application, repairs and evidence of the resolution of any non-compliances. This data is to be recorded by a designated, appropriately qualified coatings inspector assigned by the ship builder.

- 2. 4. 5 Maintenance of PSPC-compliant coatings in accordance with the CTF is mandatory.
- 2. 4. 6 For ships that are not required to comply with IMO *Resolution MSC.215(82) - Performance Standard for Protective Coatings for Dedicated Seawater Ballast Tanks in all Types of Ships and Double-Side Skin Spaces of Bulk Carriers - (Adopted on 8 December 2006)*, all seawater ballast spaces having boundaries formed by the hull envelope are to have a corrosion protection coating applied, *See ACSPlus Guidelines Protective Coatings in Water Ballast Tanks (PCWBT)*.
- 2. 4. 7 Where requested, a Descriptive Note **PCWBT** will be entered in column six of the *Register Book* to indicate that all seawater ballast spaces having boundaries formed by the hull envelope have a corrosion protection coating applied, and that the coating remains efficient and is maintained in good condition. If the coatings have broken down, particularly at more critical areas, and no effort is being made to maintain the coatings, then this note will be placed in parentheses, i.e. **(PCWBT)**. In either case, the date of the last survey will be placed in parentheses after the note.
- 2. 4. 8 The following tanks shall not be considered to be dedicated seawater ballast tanks and shall therefore be exempted from the application and requirements of the Performance Standard for Protective Coatings for dedicated seawater ballast tanks in all types of ships and double-side skin spaces of bulk carriers (*Resolution MSC.215(82) - Performance Standard for Protective Coatings for Dedicated Seawater Ballast Tanks in all Types of Ships and Double-Side Skin Spaces of Bulk Carriers - (Adopted on 8 December 2006)*), provided the coatings applied in the tanks described in [Ch 15, 2.4 Seawater ballast tank coatings 2.4.8.b](#) and [Ch 15, 2.4 Seawater ballast tank coatings 2.4.8.c](#) below are confirmed by the coating manufacturer to be resistant to the media stored in these tanks and provided such coatings are applied and maintained according to the coating manufacturer's procedures.
  - a. Ballast tank identified as 'Spaces included in Net Tonnage' in the 1969 ITC Certificate;
  - b. Seawater ballast tanks in passenger vessels also designated for the carriage of grey water or black water;
  - c. Seawater ballast tanks in livestock carriers also designated for the carriage of the livestock dung.

## 2. 5 Cargo oil tank coatings

- 2. 5. 1 For ships that are required to comply with IMO *Resolution MSC.288(87) – Performance Standard for Protective Coatings for Cargo Oil Tanks of Crude Oil Tankers – (Adopted on 14 May 2010)*, all cargo oil tanks are to have type approved coating systems applied in accordance with *ACSPlus Guidelines Anti-Corrosion System Notation*. Owners may request to receive the optional notation **ACSPlus ACS(C)**.
- 2. 5. 2 The procedure for coating system type approval is detailed in MQPS Book P, Procedure 19-4. A list of PSPC-COT compliant cargo oil tank coating systems currently type approved by ACS is available on Asia Classification Society website.
- 2. 5. 3 Sections [Ch 15, 2.4 Seawater ballast tank coatings 2.4.4](#), [Ch 15, 2.4 Seawater ballast tank coatings 2.4.5](#) and [Ch 15, 2.4 Seawater ballast tank coatings 2.4.6](#) above apply.
- 2. 5. 4 Where the vessel's Owner has not requested to receive the **ACSPlus ACS(C)** notation, compliance with the PSPC-COT Regulation is demonstrated by the formal acceptance of the Coating Technical File and the issue of the vessel's Oil Tanker Safety Certificate.

## 2. 6 Void space coatings

- 2. 6. 1 Ships within the scope of IMO *Resolution MSC.244(83) - Adoption of Performance Standard for Protective Coatings for Void Spaces on Bulk Carriers and Oil Tankers - (Adopted on 5 October 2007)* may, if requested by the Owner, receive an optional notation in accordance with the *ACSPlus Guidelines Anti-Corrosion System Notation*.

2. 6. 2 Void spaces on ships should, if possible, be coated in accordance with IMO *Resolution MSC.244(83) - Adoption of Performance Standard for Protective Coatings for Void Spaces on Bulk Carriers and Oil Tankers - (Adopted on 5 October 2007)*, which is not mandatory. Where an alternative to these guidelines is used the coating system selected shall be suitable for the service environment, and applied in accordance with the manufacturer's instructions.

## **2. 7 Bulk carrier cargo hold coatings**

2. 7. 1 The cargo hold spaces of bulk carriers shall be protected by a suitable corrosion protection coating. The coating system selected shall be suitable for the intended cargoes and applied in accordance with the manufacturer's instructions.
2. 7. 2 All internal and external surfaces of hatch coamings and hatch covers, and all internal surfaces of the cargo holds, excluding the flat tank top areas and the hopper tank sloping plating more than approximately 300 mm below the side shell frame and brackets, shall be coated.

## **2. 8 Other internal tanks**

2. 8. 1 Other internal tanks not covered by the above shall include those listed in [Ch 15, 2.4, Seawater ballast tank coatings 2.4.8](#) and shall include those intended for the storage of, for example: black water; grey water; potable or made water, permanent ballast tanks, fuel tanks, etc.
2. 8. 2 Internal tanks and other compartments may require corrosion protection where the intended contents may cause or promote corrosion. Acceptable protective measures may include suitable coatings, cathodic protection or corrosion inhibitors, either individually, or in combination.
2. 8. 3 Selection of any coating system for such spaces shall be confirmed by the coating manufacturer to be resistant to the media stored in these tanks and shall be applied and maintained according to the coating manufacturer's procedures.
2. 8. 4 Some internal spaces are subject to Flag State or other local regulations regarding the coatings and other corrosion prevention systems that may be used. The selected coating system shall be fully compliant with all relevant legislation and be capable of protecting the tank from corrosion in applications where the use of sacrificial anodes is prohibited, such as in potable water tanks.

## **2. 9 Coatings for external hulls**

2. 9. 1 External hulls are to be protected from corrosion by the use of appropriate anti-corrosive measures, which may include the application of suitable coating systems to all external surfaces.
2. 9. 2 Coatings used for corrosion prevention of exterior hulls should be confirmed as suitable for this application by the manufacturer, whose recommendations regarding surface preparation and coating application should be followed. Compatibility of the coating with other anti-corrosive measures should be confirmed by the coating manufacturer.
2. 9. 3 High resistance paints (HRP) shall be used on the underwater hull of vessels applying for or in possession of the in-water survey notation **\*IWS**. High resistance paints shall be of a hard, convertible type, such as an epoxy, polyurethane or equivalent, and shall be applied in accordance with the manufacturer's recommendations.
2. 9. 4 Vessels applying for the **\*IWS** notation must submit the details of the coatings selected for review, including the manufacturer's technical data sheets, the number of coats and the total dry film thicknesses applied.
2. 9. 5 Coatings which have been certified by ACS as being either PSPC-compliant seawater ballast tank coatings or recognised Corrosion Control Coatings (CCC) are automatically acceptable as high-resistance paints. Any such certification should be submitted when requesting the in-water survey Notation as above.

2. 9. 6 The procedure of ACS recognition for Corrosion Control Coatings is detailed in MQPS Book P, Procedure 19-7. A list of corrosion control coatings currently recognised by ACS is available on Asia Classification Society website.

## **2. 10 Anti-fouling coatings**

2. 10. 1 Coatings used on the hulls of ACS classed vessels shall be recognised by ACS as complying with the IMO Convention on the Control of Harmful Anti-fouling Systems on Ships.
2. 10. 2 Compliance of a coating shall be demonstrated prior to use by the issue of a certificate of recognition, or alternatively by the sampling of the coating during or immediately after application. Coating samples shall be tested for their organotin content and confirmed as being compliant before the vessel is issued with its AFS convention certificate.
2. 10. 3 The procedure for achieving ACS recognition is detailed in MQPS Book P, Procedure 19-6. A list of anti-fouling coatings currently recognised by ACS is available on Asia Classification Society website.

## **2. 11 Cargo tanks of product carriers or mixed-use tankers**

2. 11. 1 The cargo tanks of tankers engaged in the carriage of refined products or mixed product/crude oil usage should be protected from corrosion by the application of corrosion resistant alloys, or alternatively by the application of suitable coatings or other corrosion prevention systems.
2. 11. 2 Any coating used in such environments should be of a type recommended by the manufacturer for that use, and applied according to their recommendations. Proof of compatibility of the coating with the intended cargoes shall be provided by the coating manufacturer.

## **2. 12 Coating maintenance and repairs**

2. 12. 1 The regular inspection, maintenance and, where necessary, repair of coatings are essential to preserve their anti-corrosive performance during the life of the vessel.
2. 12. 2 Where deterioration in the quality of a coating is identified, it should be addressed immediately, and preferably restored to the original condition.

## **2. 13 Ice coatings**

2. 13. 1 A combination of laboratory tests and in-service inspections by ACS Surveyors of vessels that have been operated in ice conditions for at least two winters is required for full recognition.
2. 13. 2 Laboratory tests shall include assessments of the coating's resistance to abrasion, impact resistance, strength of adhesion to the substrate and flexibility, in addition to conventional corrosion resistance tests.
2. 13. 3 A list of ice coatings currently recognised by ACS is available on Asia Classification Society website.

CHAPTER **15 Corrosion Prevention**SECTION **3 Corrosion Resistant Steels****3. 1 Performance standard and definition**

- 3. 1. 1 IMO Resolution MSC.289(87) – *Performance Standard for Alternative Means of Corrosion Protection for Cargo Oil Tanks of Crude Oil Tankers – (Adopted on 14 May 2010)* defines minimum standards for the means of corrosion protection by the use of approved corrosion resistant steel in cargo oil tanks during the construction of crude oil tankers.
- 3. 1. 2 Corrosion resistant steel is steel whose corrosion resistance performance in the bottom or top of the internal cargo oil tank is tested and approved to satisfy the requirements in the IMO Performance Standard in addition to other relevant requirements for ship steel, structure strength and construction.

**3. 2 Corrosion resistant steel approval**

- 3. 2. 1 The compliance of the corrosion resistant steel with the IMO Performance Standard shall be confirmed on the steel manufacturer's Approval certificate. The full approval procedure for corrosion resistant steel manufacturers and for the steel products involved is contained in MQPS Book C, Procedure 3-3.
- 3. 2. 2 The compliance of the vessel with IMO Performance Standard is indicated by the acceptance of the Technical File (TF) by the Flag State or their Recognised Organisation (RO), the issue of the vessel's SOLAS certificate and, if requested, the assignment of the appropriate notations by the Class Society. The TF must be kept on board and maintained throughout the life of the vessel.
- 3. 2. 3 The TF shall record all of the data required by IMO Performance Standard, including a copy of the Works Approval Certificate, technical data (approved welding methods, welding consumables and repair procedures) and records of the application, including the applied actual space and area of each compartment and the applied product and its thickness.

**3. 3 Certification**

- 3. 3. 1 For certification requirements, See [Ch 3, 1.3 Corrosion resistant steels for cargo oil tanks of crude oil tankers 1.3.8.](#)

## PART

# 2

## CHAPTER 15 Corrosion Prevention

### SECTION 4 Cathodic Protection (CP)

#### 4. 1 General principles

4. 1. 1 Where the design requires application of cathodic protection systems, either by impressed current or sacrificial means, this Section gives guidance on satisfying this requirement.
4. 1. 2 The type of cathodic protection of the structure required is to be considered in terms of the following zones:
  - a. Submerged zone. That part of the hull below the maximum design operating draught.
  - b. Splash zone. That part of the hull above the submerged zone and subject to wet and dry conditions.
  - c. Atmospheric zone. That part of the hull above the splash zone.Cathodic protection inside tanks is considered separately (See Section [Ch 15, 4.8 Cathodic protection in tanks](#)).
4. 1. 3 The cathodic protection system for the submerged areas should be capable of polarising the steelwork to a sufficient level in order to minimise corrosion. This may be achieved using an impressed current system, sacrificial anodes or a combination of both.
4. 1. 4 All parts of the submerged structure should be electrically continuous, and where considered necessary, appropriate bonding devices and straps should be fitted across such items as propeller shafts, thrusters, stabilisers and rudders, pipe work, etc. Where bonding straps are not fitted then a supplementary cathodic protection system should be considered. The influence of any connecting structures, such as docking structures, on the efficiency of the cathodic protection system should be evaluated.
4. 1. 5 The cathodic protection system is to be capable of polarising the steel structure to potentials measured with respect to a silver/silver chloride/seawater (Ag/AgCl) reference electrode to within the range -0.80 to -1.20 volts for open seawater conditions. An average potential range from -0.90 to -0.95 volts vs. Ag/AgCl may be considered ideal. The electrode potential for steels which have surfaces operating above 25°C should be 1 mV (0.001 V) more negative for each degree above 25°C.
4. 1. 6 Potentials more negative than -1.20 volts vs. Ag/AgCl must be avoided in order to minimise any damage to the coating system.
4. 1. 7 In applications where high strength steels (tensile strengths in excess of 700 N/mm<sup>2</sup>) are used in the submerged zone, potentials should be limited to -0.95 volts vs. Ag/AgCl in order to reduce the possibility of hydrogen embrittlement.
4. 1. 8 High strength fastening materials should be avoided due to the possible effects of hydrogen absorption. If the use of high strength fasteners is unavoidable, then the hardness of such bolting materials should be limited to a maximum of 300 HV.
4. 1. 9 When selecting protection systems the following items are normally considered:

- a. A surface area breakdown for all areas to be protected, including appendages.
- b. The assumed resistivity of the seawater.
- c. All current densities used for design purposes.
- d. The type and location of any reference electrodes and their methods of attachment.
- e. Full details of any coatings used and the areas to which they are to be applied.
- f. Details of the shaft grounding.
- g. The electrical bonding.

## 4. 2 CP systems for the submerged zones of ships

4. 2. 1 Where the design specifies cathodic protection, the typical requirements of the hull and hull appendages and openings are given in [Table 15. 4. 1: Typical corrosion protection requirements for the hull steelwork](#).

**Table 15. 4. 1: Typical corrosion protection requirements for the hull steelwork**

| Corrosion protection required and area |                                     |   |
|--|-------------------------------------|---|
| Zone                                   | Structural steelwork                | Method of protection required                                 |
| Submerged zone                         | Main hull                           | Coatings, or coatings in combination with cathodic protection |
| Splash zone                            | Main hull                           | Coatings  |
| Atmospheric zone                       | All structure above the splash zone | Coatings only   |

## 4. 3 Impressed Current Cathodic Protection (ICCP)

4. 3. 1 When designing an ICCP system, the following items are to be considered in addition to those identified in [Ch 15, 4.1 General principles 4.1.9](#):
  - a. The anode composition and, where applicable, the thickness of the plated surface together with consumption and life data.
  - b. Anode resistance, limiting potential and current output.
  - c. System maximum operating voltage.
  - d. Details of the anode and reference electrode cofferdam construction, including the specification of the steel used and welding details, and the standards and specifications which are applicable.
  - e. Size, shape and composition of the dielectric shields.
  - f. Diagram of the wiring system used for the impressed current and monitoring systems including details of cable sizes, junction boxes, joints (if any), type of insulation and normal working current in circuits, as well as the capacity, type and make of the protected devices.
  - g. Details of glands and size of steel conduits (if applicable).
  - h. The locations of the anodes and reference electrodes.
  - i. The coating manufacturer should confirm that the hull coating is compatible with an impressed current cathodic protection system.
4. 3. 2 All impressed current anodes and reference electrodes should be capable of being replaced easily by divers.
4. 3. 3 Impressed current anode materials are to consist of lead/silver alloy or platinum over such substrates as titanium, niobium, tantalum or mixed metal oxide coated titanium.

- 4. 3. 4 The design and installation of electrical equipment and cables are to be in accordance with the requirements of the relevant Rules.
- 4. 3. 5 All equipment is to be suitable for its intended location
- 4. 3. 6 The arrangements for glands, where cables pass through shell boundaries, are to include a small cofferdam.
- 4. 3. 7 Cables which pass through ballast tanks are to be enclosed in a steel tube of at least 10 mm thickness.
- 4. 3. 8 Cables to anodes are not to pass through tanks intended for the storage of low flash point products, including but not limited to, oils.
- 4. 3. 9 Cables which pass through the cofferdams of storage tanks which may contain low flash point products are to be enclosed in a steel tube of at least 10 mm thickness.
- 4. 3. 10 Cable and insulating material shall be resistant to chlorides, hydrocarbons and any other chemicals with which they may come into contact.
- 4. 3. 11 The electrical connection between the anode cable and the anode body is to be watertight, and mechanically and electrically sound.
- 4. 3. 12 Where electrical power is derived from a rectified a.c. source, adequate protection is to be provided to trip the supply in the event of:
  - a. A fault between the input or high voltage windings of the transformer (i.e. main voltage) and the d.c. output of the associated rectifier; or
  - b. The ripple on the rectified d.c. exceeding 5 per cent.
- 4. 3. 13 Suitable dielectric shields are to be fitted in order to avoid negative potentials of -1.70 volts (vs. Ag/AgCl) and below.
- 4. 3. 14 Where protection is primarily by an impressed current cathodic protection system, sufficient sacrificial anodes are to be fitted that are capable of polarising the critical regions of the structure from the time of initial immersion until full commissioning of the impressed current system.

#### **4. 4 ICCP systems for aluminium hulls**

- 4. 4. 1 The use of ICCP for the corrosion protection of aluminium has a significantly higher risk of failure than ICCP used for the protection of steel vessels. However, applications for its use in fast craft such as fast ferries, sailing yachts and water jet tunnels must be considered because traditional zinc sacrificial anode cathodic protection is unsuitable for aluminium structures.
- 4. 4. 2 The accepted potential limits for the corrosion protection of aluminium hulls in clean, undiluted and aerated sea water using ICCP are as follows:
  - a. Positive limit: -0.90V(vs. Ag/AgCl)
  - b. Negative limit: -1.15V(vs. Ag/AgCl)
- 4. 4. 3 In addition to the information required for design as given in [Ch 15, 4.1 General principles 4.1.9](#) and [Ch 15, 4.3 Impressed Current Cathodic Protection \(ICCP\) 4.3.1](#), the ICCP system as applied to aluminium hulls has the following additional considerations:
  - a. The corrosion protection potential range must be strictly controlled and alarmed with the overprotection limit setting not to be exceeded.
  - b. The ICCP is to operate within the following potential limits:  
Under-protection limit: -0.85 V (vs. Ag/AgCl)  
Overprotection limit: -1.15 V (vs. Ag/AgCl)
  - c. The monitoring and control reference electrodes are to be positioned to register the maximum and minimum limits on the hull. In practice this usually means that a reference electrode should be placed near the propellers and on the periphery of the anode dielectric shield.

- d. The anode dielectric shield is to be fabricated from plastic unless an alternative coating system can be proven to maintain adhesion and dielectric properties for at least the duration of the dry dock maintenance period under the maximum operating anode voltage.
  - e. The power/control and monitoring unit shall have a dielectric shield breakdown detection system capable of detecting water ingress behind the shield and current leakage through the shield. The unit should be able to detect and shut down current output automatically as well as registering an alarm. Each dielectric shield shall have an in-built sensor to detect water leakage behind the shield and current leakage through the shield.
  - f. The bare marine grade aluminium (series 5000) has very low corrosion rates in open seawater and will require a current density of less than 1 mA/m<sup>2</sup> to fully protect it. Therefore the most suitable location of the anodes will differ from that of a steel hulled vessel. Any requirement for current density of coated aluminium can be ignored provided that the full current demand requirement for the metal underwater appendages has been taken into account.
  - g. The anodes shall be located near the appendages where the current demand is at its greatest.
4. 4. 4 Special additional consideration needs to be undertaken to prevent bi-metallic corrosion at areas vulnerable to such attack, e.g. water-lubricated sterntubes and the underwater hull penetrations such as water cooling suctions (intakes), overboard discharges and exhaust discharges. Such considerations include:
- a. For hull penetrations, the sea valves are to be electrically isolated from hull and pipework, and the penetration depth (depth from the hull) should be less than four times the internal diameter of the penetration.
  - b. For sterntubes, the wetted areas of the sterntube should be lined with a plastic tube or other sufficiently insulating material, and the shaft should have an effective passive shaft grounding system.

## 4. 5 Sacrificial anodes

- 4. 5. 1 Sacrificial anodes intended for installation on Classed structures are to be manufactured in accordance with the requirements of this Section.
- 4. 5. 2 For offshore structures, plans showing anode nominal dimensions, tolerances and installation details are to be submitted for approval prior to manufacture.
- 4. 5. 3 For ships, anode design and details are to be agreed between the shipyard and owners.
- 4. 5. 4 When calculating the number and location of sacrificial anodes, the following items are normally considered in addition to those identified in [Ch 15, 4.1 General principles 4.1.9](#):
  - a. The design life of the system in years.
  - b. Anode type, material and minimum design capacity of anode material, in Ah/kg.
  - c. The dimensions of anodes, including details of the inserts and their locations.
  - d. The nett and gross weight of the anodes, in kilograms.
  - e. The means of attachment.
  - f. The location of the anodes.
  - g. Calculation of anodic resistance (in ohms) in the as-installed condition and when consumed to their design utilisation factor.
  - h. Closed circuit potential of the anode material, in volts.
  - i. Computer modelling or supporting calculations.
  - j. The anode design utilisation factor.
- 4. 5. 5 The anode materials are to be approved alloys of zinc or aluminium with a closed circuit potential of at least -1.00 volt (vs. Ag/AgCl). Magnesium-based anodes may be used for short-term temporary protection of materials which are not susceptible to hydrogen embrittlement.

- 4. 5. 6 The anode material is to be cast around a steel insert so designed as to retain the anode material even when it is consumed to its design utilisation factor. The steel inserts are to have sufficient strength to withstand all external forces that they may encounter such as wave, wind, and ice loadings in the vessel or structure's normal operating conditions.
- 4. 5. 7 The anodes are to be sufficiently rigid to avoid vibration in the anode support. The steel inserts are to be of weldable, fully killed structural steel bar, section or pipe with a carbon equivalent not greater than 0.45 per cent determined using the following formula:
  - a. Carbon equivalent  $C_{eq} = C + Mn/6 + (Cr + Mo + V)/5 + (Ni + Cu)/15$

#### **4. 6 Hybrid or combined impressed current and sacrificial anode cathodic protection system**

- 4. 6. 1 The definition of the hybrid system is that it is an impressed current cathodic protection system, supplemented by sacrificial anodes.
- 4. 6. 2 If sacrificial anodes are installed on the submerged parts of a vessel or structure where impressed current is the primary cathodic protection system, then the cathodic protection should be treated as a single hybrid system and the Rules stated below are applied. The exception to this would be if the hull of a vessel is purposely electrically isolated from any of the appendages. In this case the hull and its appendages can be independently protected with either system, provided that sufficient measures are taken to prevent interference and stray current damage.
- 4. 6. 3 The design of the hybrid system should be integrated, with the impressed current and sacrificial anodes positioned so that the sacrificial anodes do not interfere with the performance of the impressed current cathodic protection system. The distances of the sacrificial anodes from the ICCP reference electrodes should not be less than three metres.
- 4. 6. 4 Where the hybrid system is installed on a vessel, the impressed current portion of the hybrid system should be designed in accordance with Section 4.3. The number, size and location of the sacrificial anodes should be sufficient to protect the aft section of the ship, without the impressed current, for a design life of one year.
- 4. 6. 5 For applications where there is a risk of anode passivation or poor performance, only zinc sacrificial anodes should be used.

#### **4. 7 Fixed potential monitoring systems**

- 4. 7. 1 Offshore structures with a sacrificial anode cathodic protection system should be monitored regularly to confirm the least negative potential from the system.
- 4. 7. 2 For ships over 300 m, a permanent monitoring system is to be installed on the bow of the hull protected by an all-aft impressed current cathodic protection system. Consideration is to be given to the use of sacrificial anodes in way of known high potential zones.
- 4. 7. 3 For offshore structures, details of the monitoring system should be submitted for review.

#### **4. 8 Cathodic protection in tanks**

- 4. 8. 1 Impressed current cathodic protection systems are not to be fitted in any tank.
- 4. 8. 2 Particular attention is to be given to the locations of anodes in tanks which can contain explosive or other inflammable vapour, both in relation to the structural arrangements and openings of the tanks.
- 4. 8. 3 Aluminium and aluminium alloy anodes are permitted in tanks which may contain explosive or flammable vapour, or in tanks adjacent to tanks which may contain explosive or flammable vapour, but only at locations where the potential energy of the anode does not exceed 275 J. The

weight of the anode is to be taken as the weight at the time of fitting, including any inserts and fitting devices. The height of the anode is, in general, to be measured from the bottom of the tank to the centre of the anode. Where the anode is located on a horizontal surface (such as bulkhead stringer) not less than 1 m wide, provided with an upstanding flange or face plate projecting not less than 75 mm above the horizontal surface, the height of the anode can be measured above that surface.

- 4. 8. 4 Aluminium anodes are not to be located under tank hatches or other openings unless protected by adjacent structure.
- 4. 8. 5 Magnesium or magnesium alloy anodes are not permitted in tanks which can contain explosive or flammable vapour, or in tanks adjacent to which can contain explosive or flammable vapour. Where permitted for other tanks, adequate venting must be provided.
- 4. 8. 6 Anodes fitted internally should preferably be attached to stiffeners, or aligned in way of stiffeners on plane bulkhead plating. Where they are welded to asymmetrical stiffeners, they are to be connected to the web with the welding at least 25 mm away from the edge of the web.
- 4. 8. 7 In the case of stiffeners or girders with symmetrical face plates, the connection may be made to the web or to the centreline of the mild steel face plate but well clear of the free edges. Where higher tensile steel face plates are fitted, the anodes are to be attached to the webs.
- 4. 8. 8 Anodes are not to be attached directly to the shell plating of main hulls, columns or primary bracings.
- 4. 8. 9 For guidance on the design of sacrificial anode systems in tanks, See [Ch 15, 4.5, Sacrificial anodes](#).

## **4. 9 Surveys of electrical potential**

- 4. 9. 1 Surveys of electrical potential in way of the submerged areas of the external hull or structure should be carried out at regular intervals.
- 4. 9. 2 Should the results of any potential survey measured with respect to a Ag/AgCl reference cell indicate values more positive than -0.8 volts for aerobic conditions or -0.9 volts for anaerobic conditions then remedial action should be carried out at the earliest opportunity.

## **4. 10 Replacing and retrofitting of sacrificial anodes**

- 4. 10. 1 Replacement and retrofitting of sacrificial anodes would preferably be carried out during dry docking. Alternatively, these operations could be carried out whilst afloat, if suitable arrangements can be made.
- 4. 10. 2 Where it is proposed to fit additional anodes, design approval is required in accordance with [Ch 15, 4.5 Sacrificial anodes 4.5.2](#) or [Ch 15, 4.5 Sacrificial anodes 4.5.3](#).
- 4. 10. 3 Where it is necessary to weld anodes to the structure only approved welding procedures and consumables are to be used.
- 4. 10. 4 The welding procedure is to be qualified under fully representative conditions in accordance with the requirements of [Ch 12 Welding Qualifications](#).

## Ship Structures

### CONTENTS

|                  |   |            |

| SECTION 6        | Hull shear strength .....  | 940         |
| SECTION 7        | Hull buckling strength .....                                       | 946         |
| SECTION 8        | Loading guidance information .....                                 | 952         |
| <b>CHAPTER 5</b> | <b>Fore End Structure.....</b>                                     | <b>956</b>  |
| SECTION 1        | General .....  | 960         |
| SECTION 2        | Deck structure .....   | 973         |
| SECTION 3        | Shell envelope plating .....                                       | 980         |
| SECTION 4        | Shell envelope framing .....                                       | 984         |
| SECTION 5        | Single and double bottom structure .....                           | 995         |
| SECTION 6        | Fore peak structure .....  | 1000        |
| SECTION 7        | Forward deep tank structure.....                                   | 1004        |
| <b>CHAPTER 6</b> | <b>Aft End Structure.....</b>                                      | <b>1007</b> |
| SECTION 1        | General .....  | 1011        |
| SECTION 2        | Deck structure .....   | 1013        |
| SECTION 3        | Shell envelope plating .....                                       | 1018        |
| SECTION 4        | Shell envelope framing .....                                       | 1021        |
| SECTION 5        | Single and double bottom structure .....                           | 1029        |
| SECTION 6        | After peak structure .....   | 1031        |
| SECTION 7        | Sternframes and appendages .....                                   | 1033        |
| <b>CHAPTER 7</b> | <b>Machinery Spaces .....</b>                                      | <b>1049</b> |
| SECTION 1        | General .....  | 1052        |
| SECTION 2        | Deck structure .....   | 1054        |
| SECTION 3        | Side shell structure .....   | 1055        |
| SECTION 4        | Double and single bottom structure .....                           | 1057        |
| SECTION 5        | Machinery casings and fuel oil bunkers .....                       | 1060        |
| SECTION 6        | Engine seatings.....   | 1062        |
| <b>CHAPTER 8</b> | <b>Superstructures, Deckhouses and Bulwarks .....</b>              | <b>1065</b> |
| SECTION 1        | General .....  | 1068        |
| SECTION 2        | Scantlings of erections other than forecastles .....               | 1072        |
| SECTION 3        | Aluminium erections .....  | 1076        |
| SECTION 4        | Forecastles .....  | 1077        |
| SECTION 5        | Bulwarks, guard rails and other means for the protection of crew.. | 1078        |
| <b>CHAPTER 9</b> | <b>Special Features.....</b>                                       | <b>1087</b> |
| SECTION 1        | General .....  | 1092        |

|                   |  |             |
|-------------------|--|-------------|
| SECTION 2         | Timber deck cargoes.....   | 1093        |
| SECTION 3         | Decks loaded by wheeled vehicles.....  | 1099        |
| SECTION 4         | Movable decks .....  | 1105        |
| SECTION 5         | Helicopter landing areas.....  | 1108        |
| SECTION 6         | Lifting appliances and support arrangements .....  | 1113        |
| SECTION 7         | Bottom strengthening for loading and unloading aground.....                                      | 1117        |
| SECTION 8         | Strengthening for regular discharge by heavy grabs .....   | 1119        |
| SECTION 9         | Strengthening for machinery on deck .....  | 1121        |
| <b>CHAPTER 10</b> | <b>Welding and Structural Details.....</b>   | <b>1126</b> |
| SECTION 1         | General .....  | 1130        |
| SECTION 2         | Welding .....  | 1131        |
| SECTION 3         | Secondary member end connections .....   | 1146        |
| SECTION 4         | Construction details for primary members .....   | 1150        |
| SECTION 5         | Structural details .....   | 1154        |
| SECTION 6         | Access arrangements for oil tankers and bulk carriers .....                                      | 1167        |
| <b>CHAPTER 11</b> | <b>Closing Arrangements for Shell, Deck and Bulkheads .....</b>                                  | <b>1168</b> |
| SECTION 1         | General .....  | 1173        |
| SECTION 2         | Steel hatch covers.....  | 1176        |
| SECTION 3         | Hatch beams and wood covers .....  | 1204        |
| SECTION 4         | Hatch cover securing arrangements and tarpaulins.....  | 1205        |
| SECTION 5         | Hatch coamings .....   | 1211        |
| SECTION 6         | Miscellaneous openings .....   | 1218        |
| SECTION 7         | Tanker access arrangements and closing appliances .....  | 1229        |
| SECTION 8         | Side and stern doors and other shell openings.....   | 1232        |
| SECTION 9         | Watertight doors in bulkheads below the freeboard deck .....                                     | 1239        |
| SECTION 10        | External openings and openings in watertight bulkheads and internal<br>decks in cargo ships..... | 1241        |
| <b>CHAPTER 12</b> | <b>Ventilators, Air Pipes and Discharges .....</b>   | <b>1242</b> |
| SECTION 1         | General .....  | 1245        |
| SECTION 2         | Ventilators .....  | 1246        |
| SECTION 3         | Air and sounding pipes.....  | 1249        |
| SECTION 4         | Scuppers and sanitary discharges.....  | 1251        |
| SECTION 5         | Air pipes, ventilator pipes and their securing devices located on the<br>exposed fore deck.....  | 1255        |
| <b>CHAPTER 13</b> | <b>Ship Control Systems .....</b>  | <b>1260</b> |
| SECTION 1         | General .....  | 1266        |

|                   |   |             |
|-------------------|---|-------------|
| SECTION 2         | Rudders .....   | 1267        |
| SECTION 3         | Fixed and steering nozzles.....   | 1292        |
| SECTION 4         | Steering gear and allied systems .....  | 1298        |
| SECTION 5         | Bow and stern thrust unit structure .....   | 1299        |
| SECTION 6         | Stabiliser structure .....  | 1300        |
| SECTION 7         | Equipment.....  | 1301        |
| SECTION 8         | Anchor windlass design and testing .....  | 1318        |
| SECTION 9         | Structural requirements associated with towing and mooring .....                            | 1329        |
| SECTION 10        | Anchoring equipment in deep and unsheltered water .....                                     | 1337        |
| SECTION 11        | Mooring of ships at single point moorings.....  | 1341        |
| SECTION 12        | Emergency towing arrangements.....  | 1345        |
| <b>CHAPTER 14</b> | <b>Cargo Securing Arrangements.....</b>   | <b>1347</b> |
| SECTION 1         | General .....   | 1353        |
| SECTION 2         | Fixed cargo securing fittings, materials and testing .....                                  | 1367        |
| SECTION 3         | Loose container securing fittings, materials and testing.....                               | 1370        |
| SECTION 4         | Ship structure.....   | 1374        |

| SECTION 4  | Fatigue design assessment.....                          | 1432 |
| SECTION 5  | Whipping design assessment.....                         | 1433 |
| SECTION 6  | Ship Event Analysis .....                               | 1434 |
| SECTION 7  | Enhanced scantlings .....                               | 1435 |
| SECTION 8  | Corrosion protection of internal tanks and spaces ..... | 1436 |
| SECTION 9  | Ship Emergency Response Service .....                   | 1438 |
| SECTION 10 | Assessment of Ballast Water Management Plans .....      | 1439 |
| SECTION 11 | Inventory of Hazardous Materials .....                  | 1440 |
| SECTION 12 | Safe return to port and orderly evacuation.....         | 1441 |

PART

**3**

CHAPTER **1 General**

**CONTENTS**

|                  |  |            |
|------------------|--|------------|
| <b>SECTION 1</b> | <b>Rule application .....</b>                                      | <b>841</b> |
| 1. 1             | General .....  | 841        |
| 1. 2             | Exceptions .....   | 841        |
| 1. 3             | Loading .....  | 841        |
| 1. 4             | Advisory services .....  | 841        |
| 1. 5             | Intact stability .....   | 841        |
| <b>SECTION 2</b> | <b>Direct calculations .....</b>                                   | <b>842</b> |
| 2. 1             | General .....  | 842        |
| 2. 2             | Submission of direct calculations .....                            | 842        |
| <b>SECTION 3</b> | <b>Equivalents .....</b>   | <b>843</b> |
| 3. 1             | Alternative arrangements and scantlings .....                      | 843        |
| <b>SECTION 4</b> | <b>National and International Regulations .....</b>                | <b>844</b> |
| 4. 1             | International Conventions .....                                    | 844        |

## PART

**3**CHAPTER **1 General**SECTION **1 Rule application****1.1 General**

- 1.1.1 The Rules apply in general to single hull ships of normal form, proportions and speed. Relevant parameters to define what is regarded as normal are given by limitations specified at the beginning of individual ship type Chapters. Although the Rules are, in general, for steel ships of all welded construction, other materials for use in hull construction will be considered.

**1.2 Exceptions**

- 1.2.1 Ships of unusual form, proportions or speed, intended for the carriage of special cargoes, or for special or restricted service, not covered by [Pt 3 Ship Structures \(General\)](#) and [Pt 4 Ship Structures \(Ship Types\)](#), will receive individual consideration based on the general standards of the Rules.
- 1.2.2 The requirements of [Pt 3, Ch 1, 7.1, Calculation of Equipment Number](#) are not applicable to Double Hull Oil Tankers or Bulk Carriers with a CSR notation (See [Pt 1, Ch 2, 2.3 Class notations \(hull\)](#)).

**1.3 Loading**

- 1.3.1 The Rules are framed on the understanding that ships will be properly loaded and handled; they do not, unless it is stated or implied in the class notation, provide for special distributions or concentrations of loading other than those included in the approved Loading Manual. The Committee may require additional strengthening to be fitted in any ship which, in their opinion, would otherwise be subjected to severe stresses due to particular features of the design, or where it is desired to make provision for exceptional load or ballast conditions.

**1.4 Advisory services**

- 1.4.1 The Rules do not cover certain technical characteristics, such as stability, trim, vibration, docking arrangements, etc. The Committee cannot assume responsibility for these matters but is willing to advise upon them on request.

**1.5 Intact stability**

- 1.5.1 New ships to which the Load Lines Conventions are applicable will be assigned Class only after it has been demonstrated that the level of intact stability is adequate, See [Pt 1, Ch 2, 1.1 General 1.1.9](#).

## PART

# 3

## CHAPTER 1 General

## SECTION 2 Direct calculations

### 2.1 General

- 2.1.1 Direct calculations may be specifically required by the Rules or may be required for ships having novel design features, as defined in [Pt 3, Ch 1, 1.2 Exceptions](#) or may be submitted in support of alternative arrangements and scantlings. Asia Classification Society (hereinafter referred to as 'ACS') may, when requested, undertake calculations on behalf of designers and make recommendations in regard to suitability of any required model tests.
- 2.1.2 Where model testing is undertaken to complement direct calculations the following details would normally be required to be submitted:
  - Schedule of tests;
  - details of test equipment;
  - input data;
  - analysis; and
  - calibration procedure together with tabulated and plotted output.

### 2.2 Submission of direct calculations

- 2.2.1 ACS's direct calculation procedures and facilities are summarised in the document entitled *Overview. ACSPlus Guidelines*.
- 2.2.2 In cases where direct calculations have been carried out using *ACSPlus Guidelines*, the following supporting information should be submitted as applicable:
  - a. Reference to the *ACSPlus Guidelines* and technical program used.
  - b. A description of the structural modelling.
  - c. A summary of analysis parameters including properties and boundary conditions.
  - d. Details of the loading conditions and the means of applying loads.
  - e. A comprehensive summary of calculation results. Sample calculations should be submitted where appropriate.
- 2.2.3 In general, submission of large volumes of input and output data associated with such programs as finite element analysis will not be necessary.
- 2.2.4 The responsibility for error free specification and input of program data and the subsequent correct transposal of output rests with the Builder.

## PART

**3**CHAPTER **1 General**SECTION **3 Equivalents****3. 1 Alternative arrangements and scantlings**

3. 1. 1 In addition to cases where direct calculations are specifically required by the Rules, ACS will consider alternative arrangements and scantlings which have been derived by direct calculations in lieu of specific Rule requirements. All direct calculations are to be submitted for examination.
3. 1. 2 Where calculation procedures other than those available within—*ACSP* are employed, supporting documentation is to be submitted for appraisal and this is to include details of the following:
  - calculation methods, assumptions and references;
  - loading;
  - structural modelling;
  - direct criteria and their derivation, e.g. permissible stresses, factors of safety against plate panel instability, etc.
3. 1. 3 ACS will be ready to consider use of Builders' programs for direct calculations in the following cases:
  - a. Where it can be established that the program has previously been satisfactorily used to perform a direct calculation similar to that now submitted.
  - b. Where sufficient information and evidence of satisfactory performance is submitted to substantiate the validity of the computation performed by the program.

CHAPTER **1** **General**

SECTION **4** **National and International Regulations**

**4. 1 International Conventions**

- 4. 1. 1 The Committee, when authorised, will act on behalf of Governments and, if requested, ACS will certify compliance in respect of National and International statutory safety and other requirements for passenger and cargo ships.
- 4. 1. 2 In satisfying the Load Line Conventions, the general structural strength of the ship is required to be sufficient for the draught corresponding to the freeboards to be assigned. Ships built and maintained in accordance with ACS's Rules and Regulations possess adequate strength to satisfy the Load Line Conventions. However, some National Authorities may, in addition, require to be supplied with calculations of bending moments and shear forces for certain conditions of loading.

**4. 2 International Association of Classification Societies (IACS)**

- 4. 2. 1 Where applicable, the Rules take into account unified requirements and interpretations established by IACS.

**4. 3 International Maritime Organization (IMO)**

- 4. 3. 1 Attention is drawn to the fact that Codes of Practice issued by IMO contain requirements which are outside classification as defined in these Rules and Regulations.

CHAPTER **1 General**

SECTION **5 Information required**

**5.1 General**

- 5.1.1 The categories and lists of information required are given in [Pt 3, Ch 1, 5.2, Plans and supporting calculations](#).
- 5.1.2 Plans are generally to be submitted in triplicate, but one copy only is necessary for supporting documents and calculations.
- 5.1.3 Plans are to contain all necessary information to fully define the structure, including construction details, equipment and systems as appropriate.
- 5.1.4 Additional requirements for individual ship types are given in subsequent Chapters.

**5.2 Plans and supporting calculations**

- 5.2.1 Plans covering the following items are to be submitted:
  - Midship sections showing longitudinal and transverse material.
  - Profile and decks.
  - Shell expansion.
  - Oiltight and watertight bulkheads.
  - Propeller brackets.
  - Double bottom construction.
  - Pillars and girders.
  - Aft end construction.
  - Engine room construction.
  - Engine and thrust seatings.
  - Fore end construction.
  - Hatch coamings.
  - Hatch cover construction.
  - Deckhouses and superstructures.
  - Sternframe.
  - Rudder, stock and tiller.

- Equipment.
  - Loading Manuals, preliminary and final.
  - Ice strengthening.
  - Welding.
  - Hull penetration plans.
  - Support structure for masts, derrick posts or cranes.
  - Bilge keels showing material grades, welded connections and detail design.
  - Supporting structure of deck fittings used for towing and mooring.
5. 2. 2 The following supporting documents are to be submitted:
- General arrangement.
  - Capacity plan.
  - Lines plan or equivalent.
  - Dry-docking plan.
  - Freeboard plan or equivalent showing freeboards and items relative to the conditions of assignment.
  - Towing and mooring arrangements plan as defined in [Pt 3, Ch 1, 5.3 Plans to be supplied to the ship 5.3.1.n.](#)
  - When the ship is required to comply with statutory damage stability criteria: Watertight Integrity plan or equivalent showing watertight boundaries and associated design head necessary to satisfy damage stability criteria.
5. 2. 3 The following supporting calculations are to be submitted:
- Calculation of Equipment Number.
  - Calculation of hull girder still water bending moment and shear force as applicable.
  - Calculation of midship section modulus.
  - Calculations for structural items in the aft end, midship and fore end regions of the ship.
  - Preliminary freeboard calculation.
5. 2. 4 Where an \*IWS (In-Water Survey) notation is to be assigned (See [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.11](#)), plans and information covering the following items are to be submitted:
- Details showing how rudder pintle and bush clearances are to be measured and how the security of the pintles in their sockets is to be verified with the vessel afloat.
  - Details showing how for water lubricated bearings, sternbush clearances are to be measured with the vessel afloat.
  - Details of high resistance paint, for information only.
5. 2. 5 Where it is intended to exchange ballast water at sea resulting in the partial filling of the ballast spaces, the scantlings and structural arrangements of the tank boundaries are to be capable of withstanding the loads imposed by the movement of the ballast water in those spaces. The magnitude of the predicated loadings, together with the scantling calculations, may require to be submitted.

5. 2. 6 Ships that are required to comply with SOLAS Regulation 3-6 in chapter II-1 for ‘Access to and within spaces in the cargo area of oil tankers and bulk carriers’ are to supply information showing attachment of the access arrangements to the ship structure. This is to include necessary strength calculations, local detail and any reinforcements.
5. 2. 7 Ships that are required to comply with the *Performance Standards for Protective Coatings of SOLAS Regulation 3-2 - Protective coatings of dedicated seawater ballast tanks in all types of ships and double-side skin spaces of bulk carriers* are to submit information on the coating specification agreed by the shipyard, the ship owner and the manufacturer, including the coating system selection, surface preparation and coating application and inspection procedure. Corrosion prevention arrangements and coating system specifications are to comply with [Ch 15 Corrosion Prevention of the Part 2](#) .

### 5. 3 Plans to be supplied to the ship

5. 3. 1 A Ship Construction File is to be provided on board of the ship containing information to facilitate inspection/survey, repair and maintenance. As a minimum it is to include the following documentation and plans:
  - a. Copies of approved as-built plans, including the main scantling plans are to be placed on board the ship. These plans are to indicate, as applicable, the disposition and grades (other than Grade A) of hull structural steel, the extent and location of higher tensile steel together with details of specification and mechanical properties, location of butts and seams, cross-section details and locations of all partial and full penetration welds, areas identified for close attention and rudders, wastage allowances and any recommendations for welding, working and treatment of these steels.
  - b. Similar information is to be provided on board when aluminium alloy or other materials are used in the hull construction.
  - c. Copies of certificates of forgings and castings welded into the hull.
  - d. Details of equipment forming part of the watertight and weather tight integrity of the ship.
  - e. The approved tank testing plan including details of the test requirements.
  - f. Docking plan and details of all penetrations normally examined at dry-docking.
  - g. Ship structure access manual, as applicable.
  - h. A copy of the final Loading Manual, when approved, and details of the loadings applicable to approved decks, hatch covers and inner bottom.
  - i. Operations and maintenance manuals required for classification (e.g. hatch cover and coamings, shell doors and container securing arrangements).
  - j. Details of any corrosion prevention systems applied or fitted.
  - k. For ships that are required to comply with IMO *Performance Standard for Protective Coatings*, a copy of the Coating Technical File (CTF), See [Ch 15 Corrosion Prevention of the Part 2](#).
  - l. Where an \*IWS (In-water Survey) notation is to be assigned, approved plans and information covering the items detailed in [Pt 3, Ch 1, 5.2 Plans and supporting calculations 5.2.4](#) .
  - m. Where the *ACSPlus* notation CM is to be assigned, the approved Construction Monitoring Plan (CMP), as detailed in the *ACSPlus Construction Monitoring Guidelines*.
  - n. The towing and mooring arrangements plan in accordance with [Pt 3, Ch 13, 9.4 Towing and mooring arrangements plan](#) is to be provided for the guidance of the Master.  
The information contained in the towing and mooring arrangement plan is also to be incorporated into the pilot card in order to provide the pilot with the necessary information on harbour/escorting operations.
  - o. Details of the principal dimensions, the freeboard marks and draft marks.

## **5. 4 Fire protection, detection and extinction**

5. 4. 1 For information and plans required, See [Pt 6, Ch 4 Fire Protection, Detection and Extinction Requirements](#).

**6. 1 Principal particulars**

- 6. 1. 1 Rule length,  $L$ , is the distance, in metres, on the waterline at draught  $T$ , from the forward side of the stem to the after side of the rudder post or to the centre of the rudder stock if there is no rudder post.  $L$  is to be not less than 96 per cent, and need not be greater than 97 per cent, of the extreme length on the waterline. For ships without rudders, the Rule length is to be taken as 97 per cent of the extreme length on the waterline. In ships with unusual stem or stern arrangements the Rule length,  $L$ , will be specially considered.
- 6. 1. 2 Amidships is to be taken as the middle of the Rule length,  $L$ , measuring from the forward side of the stem.
- 6. 1. 3 Breadth,  $B$ , is the greatest moulded breadth, in metres.
- 6. 1. 4 Depth,  $D$ , is measured, in metres, at the middle of the length,  $L$ , from top of keel to top of the deck beam at side on the uppermost continuous deck, or as defined in appropriate Chapters. When a rounded gunwale is arranged, the depth  $D$  is to be measured to the continuation of the moulded deck line.
- 6. 1. 5 Draught,  $T$ , is the summer draught, in metres, measured from top of keel, or a greater value if such a value has been specified as 'scantling draught'. Both of the draughts are to be indicated on the midship plan, irrespective of whether or not they are of the same value.
- 6. 1. 6 The block coefficient,  $C_b$ , is the moulded block coefficient at draught,  $T$ , based on Rule length,  $L$ , and moulded breadth,  $B$ , as follows:

$$C_b = \frac{\text{moulded displacement (m}^3\text{) at draught } T}{LBT}$$

- 6. 1. 7 Length between perpendiculars,  $L_{pp}$ , is the distance, in metres, on the waterline at draught  $T$ , from the fore side of the stem to the after side of the rudder post, or to the centre of the rudder stock if there is no rudder post. In ships with unusual stern arrangements the length,  $L_{pp}$ , will be specially considered. The forward perpendicular, F.P., is the perpendicular at the intersection of the waterline with the fore side of the stem. The after perpendicular, A.P., is the perpendicular at the intersection of the waterline with the after side of the rudder post. For ships without a rudder post, the A.P. is the perpendicular at the intersection of the waterline with the centreline of the rudder stock.
- 6. 1. 8 Load line length,  $L_L$ , is to be taken as 96 per cent of the total length on a waterline at 85 per cent of the least moulded depth measured from the top of the keel, or as the length from the fore side of the stem to the axis of the rudder stock on that waterline, if that is greater. In ships designed with a rake of keel, the waterline on which this length is measured is to be parallel to the designed waterline. The length  $L_L$  is to be measured in metres.

6. 1. 9 Load line block coefficient,  $C_{bL}$ , is defined as:

$$C_{bL} = \frac{\nabla}{L_L B T_L}$$

where

$\nabla$  = volume of the moulded displacement, in  $m^3$ , excluding appendages, taken at draught  $T_L$

$T_L$  = moulded draught, in metres, measured to the waterline at 85 per cent of the least moulded depth.

6. 1. 10 Maximum service speed,  $V$ , means the maximum ahead service speed, in knots, which the ship is designed to maintain, at the summer load waterline at maximum propeller RPM and corresponding MCR.

6. 1. 11 Bow reference height,  $H_b$ , is defined as:

For ships less than 250 m in length:

$$H_b = 0.056 L_L \left( 1 - \frac{L_L}{500} \right) \left( \frac{1.36}{C_{bL} + 0.68} \right) m$$

For ships 250 m or greater in length:

$$H_h = 7 \left( \frac{1.36}{C_{bL} + 0.68} \right) m$$

Where

$L_L$  = is defined in [Pt 3, Ch 1, 6.1 Principal particulars 6.1.8](#)

$C_{bL}$  = is defined in [Pt 3, Ch 1, 6.1 Principal particulars 6.1.9](#) ADD, but is not to be taken less than 0.68

## 6. 2 Freeboard deck

6. 2. 1 The freeboard deck is normally the uppermost complete deck exposed to weather and sea, which has permanent means of closing all openings in the weather part, and below which all openings in the sides of the ship are fitted with permanent means of watertight closing.

6. 2. 2 For the purposes of the Load Lines Conventions, as applicable, where the assigned summer freeboard is increased such that the resulting draught is not more than that corresponding to a minimum summer freeboard for the same ship, but with an assumed freeboard deck located a distance below the actual freeboard deck at least equal to the standard superstructure height, the related items for the conditions of assignment to the actual freeboard deck may be as required for a superstructure deck.

## 6. 3 Bulkhead deck

6. 3. 1 For a passenger ship the bulkhead deck is generally to be taken as the deck to which the main bulkheads and side shell are carried watertight.

6. 3. 2 For a cargo ship the bulkhead deck is generally to be taken as the freeboard deck.

## 6. 4 Weathertight

6. 4. 1 A closing appliance is considered weathertight if it is designed to prevent the passage of water into the ship in any sea conditions.
6. 4. 2 Generally, all openings in the freeboard deck and in enclosed superstructures are to be provided with weathertight closing appliances.

## 6. 5 Watertight

6. 5. 1 A closing appliance is considered watertight if it is designed to prevent the passage of water in either direction under a head of water for which the surrounding structure is designed.
6. 5. 2 Generally, all openings below the freeboard deck in the outer shell/envelope (and in main bulkheads) are to be fitted with permanent means of watertight closing.

## 6. 6 Position 1 and Position 2

6. 6. 1 For the purpose of Load Line conditions of assignment, there are two basic positions of hatchways, doorways and ventilators defined as follows (See also [Figure 1. 6. 1: Position 1 and Position 2](#)):

Position 1:

- Exposed decks located abaft the forward 0.25 of the load line length,  $L_L$ , and less than one standard superstructure height above the freeboard deck.
- Exposed decks situated within the forward 0.25 of the load line length,  $L_L$ , and located less than two standard heights of superstructure above the freeboard deck.

Position 2:

- Exposed decks situated abaft the forward 0.25 of the load line length,  $L_L$ , and located at least one standard height of superstructure, but less than two standard heights of superstructure, above the freeboard deck.
- Exposed decks situated within the forward 0.25 of the load line length,  $L_L$ , and located at least two standard heights of superstructure, but less than three standard heights of superstructure, above the freeboard deck.

**Figure 1. 6. 1: Position 1 and Position 2**

## 6. 7 Passenger ship

6. 7. 1 A passenger ship is a ship which carries more than 12 passengers.

## 6. 8 Reference system

6. 8. 1 For hull reference purposes, the ship is divided into 21 equally spaced stations where Station 0 is the after perpendicular, Station 20 is the forward perpendicular, and Station 10 is mid- $L_{pp}$ .

## 6. 9 Co-ordinate system

6. 9. 1 Unless otherwise stated, the co-ordinate system is as shown in [Figure 1. 6. 2: Co-ordinate system](#), that is, a right-hand co-ordinate system with the X axis positive forward, the Y axis positive to port and the Z axis positive upwards. Angular motions are considered positive in a clockwise direction about the X, Y or Z axes.

**Figure 1. 6. 2: Co-ordinate system**

**7.1 Calculation of Equipment Number**

- 7.1.1 The equipment of anchors and chain cables specified in [Pt 3, Ch 13, 7 Equipment](#) is based on an 'Equipment Number' which is to be calculated as follows:

$$\text{Equipment Number} = \Delta^{2/3} + 2BH + \frac{A}{10}$$

Where

|          |   |   |
|----------|---|---|
| $A$      | = | area, in m <sup>2</sup> , in profile view of the hull, within the Rule length of the vessel, and of superstructures and houses above the summer load waterline, which are within the Rule length of the vessel, and also having a breadth greater than $\frac{B}{4}$  |
|          | = | <i>See also</i> <a href="#">Pt 3, Ch 1, 7.1 Calculation of Equipment Number 7.1.3</a> and <a href="#">Pt 3, Ch 1, 7.1 Calculation of Equipment Number 7.1.4</a>   |
| $B$      | = | greatest moulded breadth, in metres   |
| $H$      | = | freeboard amidships, in metres, from the summer load waterline to the upper deck, plus the sum of the heights at the centreline, in metres, of each tier of houses having a breadth greater than $\frac{B}{4}$<br><i>See also</i> <a href="#">Pt 3, Ch 1, 7.1 Calculation of Equipment Number 7.1.2</a> , <a href="#">Pt 3, Ch 1, 7.1 Calculation of Equipment Number 7.1.3</a> and <a href="#">Pt 3, Ch 1, 7.1 Calculation of Equipment Number 7.1.4</a> |
| $\Delta$ | = | moulded displacement, in tonnes, to the summer load waterline.  |

- 7.1.2 In the calculation of  $H$ , sheer and trim are to be ignored. Where there is a local discontinuity in the upper deck,  $H$  is to be measured from a notional deckline.
- 7.1.3 If a house having a breadth greater than  $\frac{B}{4}$  is above a house with a breadth of  $\frac{B}{4}$  or less, then the wide house is to be included, but the narrow house ignored.
- 7.1.4 Screens and bulwarks more than 1.5 m in height are to be regarded as parts of houses when determining  $H$  and  $A$ . Where a screen or bulwark is of varying height, the portion to be included is to be that length the height of which exceeds 1.5 m. The height of the hatch coamings and that of any deck cargo, such as containers, may be disregarded when determining  $H$  and  $A$ .
- 7.1.5 The Equipment Number for tugs is to be calculated as follows:

$$\text{Equipment Number} = \Delta \frac{2}{3} + 2 \left( Bf + \sum bh \right) + \frac{A}{10}$$

Where

$\Delta$ ,  $B$  and  $A$  = are defined in [Pt 3, Ch 1, 7.1 Calculation of Equipment Number 7.1.1](#)

$b$  = breadth, in metres, of the widest superstructure or deckhouse on each tier having a breadth greater than  $\frac{B}{4}$

$f$  = freeboard amidships, in metres, from the summer load waterline

$h$  = the height, in metres, of each tier of superstructure or deckhouse at side having a breadth of  $\frac{B}{4}$  or greater. In the calculation of  $h$ , sheer and trim are to be ignored.

7. 1. 6 In the case of dredgers having normal ship shape underwater hull, bucket ladders and gallows are not to be included in the Equipment Number calculations. If the dredger has an unusual underwater hull design or has a limited service area, the anchoring equipment needs to be specially considered.
7. 1. 7 The Equipment Number formulae for anchoring equipment as given in this Section are based on an assumed maximum current speed of 2.5 m/s, maximum wind speed of 25 m/s and a minimum scope of chain cable of 6, the scope being the ratio between length of chain paid out and water depth. For ships with a Rule length,  $L$ , greater than 135 m, the required anchoring equipment is also considered adequate for a maximum current speed of 1.54 m/s, a maximum wind speed of 11 m/s and waves with maximum significant height of 2 m.

## PART

# 3

## CHAPTER 1 General

## SECTION 8 Inspection and workmanship

### 8.1 Inspection

- 8.1.1 Adequate facilities are to be provided to enable the Surveyor to carry out a satisfactory inspection of all components during each stage of prefabrication and construction.

### 8.2 Workmanship

- 8.2.1 All workmanship is to be of good quality and in accordance with good shipbuilding practice. Any defect is to be rectified to the satisfaction of the Surveyor before the material is covered with paint, cement or other composition. The materials and welding are to be in accordance with the requirements of the Part 2 . The assembly sequence and welding sequence are to be agreed prior to construction and are to be to the satisfaction of the Surveyor. Plates which have been subjected to excessive heating while being worked are to be satisfactorily heat treated before being erected in the hull.
- 8.2.2 **Wood sheathing on decks.** Where plated decks are sheathed with wood, the sheathing is to be efficiently attached to the deck, caulked and sealed, to the satisfaction of the Surveyor.
- 8.2.3 **Rudder and sternframe.** The final boring out of the propeller boss and sternframe skeg or solepiece, and the fit-up and alignment of the rudder, pintles and axles, are to be carried out after completing the major part of the welding of the after part of the ship. The contacts between the conical surfaces of pintles, rudder stocks and rudder axles are to be checked before the final mounting.

### 8.3 Trial trip and operational tests

- 8.3.1 The items listed in [Table 1. 8. 1: Trial trip and operational tests](#) are to be tested on completion of the installation or at sea trials.

**Table 1. 8. 1: Trial trip and operational tests**

| Item                     | Requirement  |
|--------------------------|--|
| Sliding watertight doors | To be operated under working conditions  |
| Windlass                 | An anchoring test is to be carried out in the presence of the Surveyor<br>The test should demonstrate that the windlass with brakes, etc. functions satisfactorily, and that the power to raise anchor can be developed and satisfies the Rule requirements<br>For Rule requirements, See <a href="#">Pt 3, Ch 13, 7 Equipment</a> . |

|   |   |
|---|---|
| Steering gear, main and auxiliary                     | To be tested under working conditions, to the satisfaction of the Surveyors, to demonstrate that the Rule requirements are met<br>For Rule requirements, See <a href="#">Pt 5, Ch 19 Steering Systems</a> . |
| Bilge suction in holds, and hand pumps in peak spaces | To be tested under working conditions to the satisfaction of the Surveyors.   |

PART

**3**

CHAPTER **1 General**

SECTION **9 Procedures for testing tanks and tight boundaries**

**9.1 General**

- 9.1.1 The test procedures detailed in this Section are to be used to confirm the watertightness of tanks and watertight boundaries, the structural adequacy of tanks and weathertightness of structures.

**9.2 Application**

- 9.2.1 The testing requirements for gravity tanks, defined as tanks subject to a vapour pressure not greater than 70 kN/m<sup>2</sup>, and other boundaries required to be watertight or weathertight, are to be tested in accordance with this Section. Tests are to be carried out in the presence of a Surveyor at a stage sufficiently close to completion such that the strength and tightness are not subsequently impaired and prior to any sealing and cement work being applied over joints *See also* [Pt 3, Ch 1, 9.8, Application of coating](#).
- 9.2.2 Testing procedures for watertight compartments for SOLAS Ships (including CSR BC & OT) are to be carried out in accordance with [Pt 3, Ch 1, 9.4, Structural test procedures for SOLAS ships](#), unless:
- a. the shipyard provides documentary evidence of the Shipowner's agreement to a request to the responsible Flag Administration for an exemption from the application of SOLAS, Ch. II.1, Part B-2, *Regulation 11 - Initial testing of watertight bulkheads, etc.* or for an equivalency agreeing that the content of [Pt 3, Ch 1, 9.5, Structural test procedures for non-SOLAS ships and SOLAS exempt/equivalent ships](#) is equivalent to *Regulation 11 - Initial testing of watertight bulkheads, etc.* and;
  - b. the above-mentioned exemption/equivalency has been granted by the responsible Flag Administration.
- 9.2.3 Where the requirements of [Pt 3, Ch 1, 9.2 Application 9.2.2.a](#) and [Pt 3, Ch 1, 9.2 Application 9.2.2.b](#) have been met, then the testing procedures for watertight compartments for SOLAS Ships (including CSR BC & OT) are to be carried out in accordance with [Pt 3, Ch 1, 9.5, Structural test procedures for non-SOLAS ships and SOLAS exempt/equivalent ships](#)
- 9.2.4 Testing procedures for watertight compartments for non-SOLAS Ships are to be carried out in accordance with [Pt 3, Ch 1, 9.5, Structural test procedures for non-SOLAS ships and SOLAS exempt/equivalent ships](#).
- 9.2.5 The testing of cargo containment systems of liquefied gas carriers are to be in accordance with the requirements of the *Rules and Regulations for the Classification of Ships for the Carriage of Liquefied Gases in Bulk*.
- 9.2.6 The testing of structures not listed in this Section are to be specially considered.

**Table 1. 9. 1: Testing requirements**

| Item to be tested                                      | Testing procedure   | Testing requirement  |
|--|---------------------|--|
| Double bottom tanks, <i>See</i> Note 1                 | Leak and structural | The greater of:<br>head of water up to the top of the overflow<br>head of water 2.4 m above top of tank, <i>See</i> Note 2<br>head of water up to bulkhead deck  |
| Combined double bottom and hopper side tanks           | Leak and structural | The greater of:<br>head of water up to the top of the overflow<br>head of water representing the maximum pressure experienced in service   |
| Double bottom voids, <i>See</i> Note 3                 | Leak                |  |
| Double side tanks                                      | Leak and structural |  |
| Combined double bottom, lower hopper and topside tanks | Leak and structural | The greater of:<br>head of water up to the top of the overflow<br>head of water 2.4 m above top of tank, <i>See</i> Note 2<br>head of water up to bulkhead deck  |
| Topside tanks  | Leak and structural |  |
| Double side voids                                      | Leak                |  |
| Deep tanks (other than those listed elsewhere)         | Leak and structural | The greater of:<br>head of water up to the top of the overflow<br>head of water 2.4 m above top of tank, <i>See</i> Note 2   |
| Cargo oil tanks, and fuel oil bunkers                  | Leak and structural | The greater of:<br>head of water up to the top of the overflow<br>head of water 2.4 m above top of tank, <i>See</i> Note 2<br>head of water up to top of tank, <i>See</i> Note 2, plus setting of fitted pressure-relief valve |
| Scupper and discharge pipes in way of tanks            | Leak and structural |  |
| Ballast hold of bulk carriers                          | Leak and structural | Head of water up to the top of cargo hatch coaming, <i>See</i> Note 9  |
| Holds used for in-port ballasting                      | Leak and structural | Head of water representing the maximum loading that will occur in-port as indicated in the Loading Manual.   |

|   |                     |  |
|---|---------------------|--|
| Peak tanks, <i>See</i> Note 4   | Leak and structural | The greater of:<br>head of water up to the top of the overflow<br>head of water 2.4 m above top of tank, <i>See</i> Note 2 |
| Fore peak spaces with equipment   | Leak                |  |
| Fore peak voids   | Leak                |  |
| Aft peak spaces with equipment  | Leak                |  |
| Aft peak voids, <i>See</i> Note 4   | Leak                |  |
| Cofferdams  | Leak                |  |
| Watertight bulkheads  | Leak                | <i>See</i> Note 5  |
| Superstructure end bulkhead   | Leak                |  |
| Watertight doors below freeboard or bulkhead deck, and watertight hatches   | Leak                | <i>See</i> Notes 6 and 12  |
| Double plate rudder blades  | Leak                |  |
| Shaft tunnel clear of deep tanks  | Leak                | <i>See</i> Note 5  |
| Shell doors when fitted in place  | Leak                | <i>See</i> Notes 5 and 7   |
| Weathertight doors, hatch covers and closing appliances   | Leak                | <i>See</i> Note 5  |
| Steel hatch covers fitted to the cargo oil tanks and cargo holds of ships used for the alternate carriage of oil cargo and dry bulk cargo | Leak                | <i>See</i> Note 5  |
| Chain locker  | Leak and structural | Head of water up to top of chain pipe  |
| Independent edible liquid tanks   | Leak and structural | The greater of:<br>head of water up to the top of the overflow<br>head of water 0.9 m above top of tank, <i>See</i> Note 2 |
| L.O. Sump tanks and other similar tanks/spaces under main engines   | Leak                | <i>See</i> Notes 5 and 11  |
| Ballast ducts   | Leak and structural | The greater of:<br>ballast pump maximum pressure<br>setting of pressure-relief valve                                       |

|  |                     |   |
|--|---------------------|---|
| Chemical tanker cargo tanks  | Leak and structural | The greater of:<br>head of water 2.4 m above top of tank, <i>See</i> Notes 2 and 8<br>head of water up to top of tank, <i>See</i> Notes 2 and 8, plus setting of fitted pressure-relief valve |
| Independent tanks, <i>See</i> Note 13  | Leak and structural | The greater of:<br>head of water up to the top of the overflow<br>head of water 2.4 m above top of tank, <i>See</i> Note 2  |
| <p><b>Note 1.</b> Including tanks arranged in accordance with the provisions of SOLAS <i>Regulation 9 - Double bottoms in passenger ships and cargo ships other than tankers</i>.</p> <p><b>Note 2.</b> Top of tank is the deck forming the top of the tank, excluding any hatchways. In holds for liquid cargo or ballast with large hatch openings, the top of tank is to be taken to the top of the hatch.</p> <p><b>Note 3.</b> Including dry compartments and duct keels arranged in accordance with the provisions of SOLAS Chapter II-1 <i>Regulation 9 - Double bottoms in passenger ships and cargo ships other than tankers</i> and <i>Regulation 11 - Initial testing of watertight bulkheads, etc.</i>, as well as voids used for the protection of fuel oil tanks and pump rooms arranged in accordance with the provisions of MARPOL Annex I, <i>Reg. 12A</i> and <i>Reg. 22</i>.</p> <p><b>Note 4.</b> Testing of the aft peak is to be carried out after the sterntube has been fitted.</p> <p><b>Note 5.</b> A hose test will be considered, <i>See</i> <a href="#">Pt 3, Ch 1, 9.6 Leak test procedures 9.6.2</a> and <a href="#">Pt 3, Ch 1, 9.7 Definitions and details of tests 9.7.3</a>.</p> <p><b>Note 6.</b> Watertight doors and hatches not confirmed watertight by a prototype test are to be subject to a hydrostatic test, <i>See</i> SOLAS Chapter II-1 <i>Regulation 16 - Construction and initial tests of watertight closures</i></p> <p><b>Note 7.</b> For shell doors providing watertight closure, watertightness is to be demonstrated through prototype testing before installation. The testing procedure is to be agreed with ACS prior to testing.</p> <p><b>Note 8.</b> Where a cargo tank is designed for the carriage of cargoes with a specific gravity greater than 1.0, an appropriate additional head is to be considered.</p> <p><b>Note 9.</b> Where air vents are fitted below the top of the coaming, adequate blanking off of these vents may be required prior to the commencement of the test.</p> <p><b>Note 10.</b> Other testing methods listed in <a href="#">Pt 3, Ch 1, 9.7 Definitions and details of tests 9.7.7</a> and <a href="#">Pt 3, Ch 1, 9.7 Definitions and details of tests 9.7.8</a> may be considered, subject to adequacy of such testing methods being verified, <i>See</i> SOLAS Chapter II-1 <i>Regulation 11 - Initial testing of watertight bulkheads, etc.</i></p> <p><b>Note 11.</b> Where L.O. sump tanks and other similar spaces under main engines intended to hold liquid form part of the watertight subdivision of the ship, they are to be tested in accordance with the requirements for deep tanks (other than those listed elsewhere).</p> <p><b>Note 12.</b> All watertight doors and hatches are to be hose tested after installation. Hose testing is to be carried out from each side of a door or hatch unless, for a specific application, flooding is anticipated from only one side. Where a hose test is not practicable because of possible damage to machinery, electrical equipment insulation or outfitting items, it may be replaced by an ultrasonic leak test or an equivalent test.</p> <p><b>Note 13.</b> Independent tanks not confirmed watertight by a prototype test are to be subject to a hydrostatic test. A leak test is to be carried out after installation on board.</p> |                     |   |

## 9. 3 Test types

9. 3. 1 The types of test specified in this Section are:

- a. **Structural test:** which is to be conducted to verify the tightness and structural adequacy of the construction of tanks. This may be a hydrostatic test or, where the situation warrants, a hydropneumatic test.
- b. **Leak test:** which is to be used to verify the tightness of a boundary. Unless a specific test is indicated, this may be a hydrostatic, hydropneumatic test, air or other medium test.

## 9. 4 Structural test procedures for SOLAS ships

9. 4. 1 Tanks which are intended to hold liquids, and which form part of the watertight subdivision of the ship, shall be tested for tightness and structural strength as indicated in [Table 1. 9. 1: Testing requirements](#).
9. 4. 2 Watertight subdivision means the transverse and longitudinal subdivisions of the ship required to satisfy the subdivision requirements of *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations*.
9. 4. 3 Where a structural test is specified in [Table 1. 9. 1: Testing requirements](#), unless specified otherwise, a hydrostatic test is to be carried out in accordance with [Pt 3, Ch 1, 9.7 Definitions and details of tests 9.7.1](#). Where practical limitations prevent a hydrostatic test being carried out, a hydropneumatic test in accordance with [Pt 3, Ch 1, 9.7 Definitions and details of tests 9.7.2](#) is to be conducted. All external boundaries of the tested space are to be examined for structural distortion, bulging, buckling, or other related damage and/or leaks.
9. 4. 4 A hydrostatic test or hydropneumatic test may be carried out afloat to confirm the structural adequacy of tanks, provided that a leak test is carried out and the results are confirmed as satisfactory before the vessel is afloat.
9. 4. 5 Consideration is to be given to the selection of tanks to be structurally tested. Selected tanks are to be chosen so that all representative structural members are tested for the expected tension and compression. Tank boundaries are to be tested from at least one side.
9. 4. 6 For watertight boundaries of spaces other than tanks, excluding ballast holds, chain lockers and cargo holds which are intended to be used for in-port ballasting, structural testing may be exempted completely, provided that the watertightness in all boundaries of exempted spaces are verified by leak tests and thorough inspection. The testing of ballast holds, chain lockers and cargo holds which are intended to be used for in-port ballasting, are to comply with the requirements of [Pt 3, Ch 1, 9.4 Structural test procedures for SOLAS ships 9.4.3](#) to [Pt 3, Ch 1, 9.4 Structural test procedures for SOLAS ships 9.4.5](#).
9. 4. 7 Tanks which do not form part of the watertight subdivision of the ship, need not be structurally tested providing that the watertightness of all boundaries of these spaces is verified by leak tests and thorough inspection.

## 9. 5 Structural test procedures for non-SOLAS ships and SOLAS exempt/equivalent ships

9. 5. 1 Testing procedures are to be carried out in accordance with the requirements of [Pt 3, Ch 1, 9.4, Structural test procedures for SOLAS ships](#) in association with the alternative test procedures given in [Pt 3, Ch 1, 9.5 Structural test procedures for non-SOLAS ships and SOLAS exempt/equivalent ships 9.5.2](#) to [Pt 3, Ch 1, 9.5 Structural test procedures for non-SOLAS ships and SOLAS exempt/equivalent ships 9.5.5](#).
9. 5. 2 For tanks of the same structural design, configuration and the same general workmanship, as determined by the attending Surveyor, a structural test need only be carried out on one tank, provided that all subsequent tanks are tested for leaks by an air test. The relaxation to accept leak testing using an air test instead of a structural test does not apply to cargo space boundaries

adjacent to other compartments in tankers and combination carriers or to the boundaries of tanks for segregated cargoes or pollutant cargoes in other types of ship.

9. 5. 3 Where the structural adequacy of a tank has been verified by structural testing on a previous vessel in a series, tanks of structural similarity on subsequent vessels within that series (which are built at the same shipyard) need not be structurally tested, provided that the watertightness of all exempt tanks is verified by leak tests and thorough inspection. However, structural testing is to be carried out for at least one tank of each type of tank on every vessel in the series. The relaxation to accept leak testing and thorough inspections instead of a structural test on subsequent vessels in a series does not apply to cargo space boundaries adjacent to other compartments in tankers and combination carriers or to the boundaries of tanks for segregated cargoes or pollutant cargoes in other types of ship.
9. 5. 4 For sister ships built two or more years after the delivery of the last ship of the series, the application of the provisions of [Pt 3, Ch 1, 9.5 Structural test procedures for non-SOLAS ships and SOLAS exempt/equivalent ships 9.5.3](#) will be specially considered provided that the general practices, equipment and workmanship of the shipyard have been maintained continuously, and an NDT programme is implemented for the tanks not subject to structural tests.
9. 5. 5 Tanks exempted from structural testing in [Pt 3, Ch 1, 9.5 Structural test procedures for non-SOLAS ships and SOLAS exempt/equivalent ships 9.5.2](#) and [Pt 3, Ch 1, 9.5 Structural test procedures for non-SOLAS ships and SOLAS exempt/equivalent ships 9.5.3](#) will require structural testing if found necessary after the structural testing of the first tank.

## 9. 6 Leak test procedures

9. 6. 1 Where a leak test is specified in [Table 1. 9. 1: Testing requirements](#), unless specified otherwise, a tank air test, compressed air fillet weld test, or vacuum box test is to be carried out in accordance with the applicable requirements of [Pt 3, Ch 1, 9.7 Definitions and details of tests 9.7.4](#) to [Pt 3, Ch 1, 9.7 Definitions and details of tests 9.7.6](#). A hydrostatic or hydropneumatic test conducted in accordance with the applicable requirements of [Pt 3, Ch 1, 9.7 Definitions and details of tests 9.7.1](#) and [Pt 3, Ch 1, 9.7 Definitions and details of tests 9.7.2](#) will be accepted as a leak test on the condition that safe access to all joints being examined is provided, *See* [Pt 3, Ch 1, 9.9 Safe access to joints 9.9.1](#). Where a hydrostatic or hydropneumatic test is applied as a leak test, the external boundaries are to be free of any liquid residue prior to the commencement of the test.
9. 6. 2 A hose test will be accepted as means of verifying the tightness of joints only in specific locations, identified in [Table 1. 9. 1: Testing requirements](#).
9. 6. 3 Air tests of joints may be conducted at any stage during construction provided that all work that might affect the tightness of the joint is completed before the test is carried out.
9. 6. 4 Where acceptable to the attending Surveyor, provided that careful visual inspections show a continuous uniform weld profile shape, free from repairs, and the results of selected NDE testing show no significant defects, the leak testing of automatic butt welds and semi-automatic (flux core arc welding) butt welds may be omitted.

## 9. 7 Definitions and details of tests

9. 7. 1 **Hydrostatic test** is a test conducted by filling a space with a liquid to a specified head. Unless another liquid is approved, the hydrostatic test is to consist of filling a space with either fresh or sea-water, whichever is appropriate for the space being tested, to the level specified in [Table 1. 9. 1: Testing requirements](#). For tanks intended to carry cargoes of a higher density than the test liquid, the head of the liquid is to be specially considered.
9. 7. 2 **Hydropneumatic test** is a combination of a hydrostatic test and a tank air test, consisting of partially filling a tank with water and conducting a tank air test on the unfilled portion of the tank. A hydropneumatic test, where approved, is to be such that the test condition in conjunction with

the approved liquid level and air pressure will simulate the actual loading as far as practicable. The requirements for tank air testing shown in [Pt 3, Ch 1, 9.7 Definitions and details of tests 9.7.4](#) are to be adhered to.

9. 7. 3 **Hose test** is a test used to verify the tightness of joints with a jet of water. The jet of water is to be directed perpendicular to the joint. It is to be carried out with the pressure in the hose nozzle maintained at not less than 0.2 MPa during the test. The hose nozzle is to have a minimum inside diameter of 12 mm and is to be situated no further than 1.5 m from the joint. Where a hose test is not practical because of possible damage to machinery, electrical equipment insulation or outfitting items, it may be replaced by a careful visual examination of welded connections, supported by an ultrasonic or penetration leak test, or an equivalent, *See SOLAS Regulation 11 - Initial testing of watertight bulkheads, etc.*
9. 7. 4 **Tank air test** is to be used to verify the tightness of a compartment by means of an air pressure differential and leak indicator solution. An efficient indicating solution (e.g. soapy water) is to be applied to the weld or penetration being tested and is to be examined whilst an air pressure differential of not less than 0.015 MPa is applied by pumping air into the compartment. Arrangements are to be made to ensure that any increase in air pressure does not exceed 0.03 MPa. A U-tube with a height sufficient to hold a head of water corresponding to the required test pressure is to be used for verification and to avoid overpressure. The cross-sectional area of the U-tube is not to be less than that of the pipe supplying air to the tank. Alternatively, two calibrated pressure gauges may be considered acceptable. All boundary welds, including pipe connections in the compartment are to be examined twice. The first is to be examined immediately upon applying the leak indication solution; the second approximately five minutes afterwards.
9. 7. 5 **Compressed air fillet weld test.** This test consists of compressed air being injected into one end of a fillet welded joint and the pressure verified at the other end of the joint by a pressure gauge. Pressure gauges are to be arranged so that an air pressure of at least 0.015 MPa above atmospheric pressure can be verified at each end of all passages within the portion being tested. A leak indicator solution is to be applied and the weld line examined for leaks. A compressed air test may be carried out for partial penetration welds where the root face is greater than 6 mm.
9. 7. 6 **Vacuum box test** is a test used to verify the tightness of joints by means of a localised air pressure differential and leak indicator solution. The test is to be conducted with the use of a box with air connections, gauges and an inspection window that is to be placed over the joint being tested with a leak indicator solution applied. The air within the box is to be removed by an ejector to create a vacuum i.e. a pressure differential of 0.02 to 0.026 MPa inside the box.
9. 7. 7 **Ultrasonic test** may be used where a hose test is not practical to verify the tightness of a boundary, *See [Pt 3, Ch 1, 9.7 Definitions and details of tests 9.7.3](#)*. An arrangement of ultrasonic echo transmitters is to be placed inside a compartment and a receiver outside. The receiver is to be used to detect any leaks in the compartment.
9. 7. 8 **Penetration test** may be used where a hose test is not practical to assess butt welds, *See [Pt 3, Ch 1, 9.7 Definitions and details of tests 9.7.3](#)*, by applying a low surface tension liquid to one side of a compartment boundary. When no liquid is detected on the opposite side of the boundary after expiration of a defined period of time, the verification of tightness of the compartment's boundary may be assumed. A developer solution may be applied on the other side of the weld to aid leak detection.
9. 7. 9 Other methods of testing may be considered and are to be agreed by ACS prior to commencement of testing.

## 9. 8 Application of coating

9. 8. 1 A final coating may be applied over automatic butt welds before the completion of a leak test, provided that careful visual inspections show continuous uniform weld profile shape, free from repairs, and the results of selected NDE testing show no significant defects. For all other joints,

the final coating is to be applied after the completion of a leak test. The Surveyor reserves the right to require a leak test prior to the application of the final coating over automatic erection butt welds.

9. 8. 2 Any temporary coating which may conceal defects or leaks is to be applied at a time as specified for the final coating, *See* [Pt 3, Ch 1, 9.8 Application of coating 9.8.1](#). This requirement does not apply to shop primer.

## **9. 9 Safe access to joints**

9. 9. 1 For leak tests, safe access to all joints under examination is to be provided.

## CHAPTER 2 Materials

### SECTION 1 Materials of construction

#### 1.1 General

- 1.1.1 The Rules relate in general to the construction of steel ships, although consideration will be given to the use of other materials.
- 1.1.2 The materials used in the construction of the ship are to be manufactured and tested in accordance with the requirements of the [Part 2 \(hereinafter referred to as Rules for Materials\)](#). Materials for which provision is not made therein may be accepted, provided that they comply with an approved specification and such tests as may be considered necessary.
- 1.1.3 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation (See [Pt 1, Ch 2, 2.3 Class notations \(hull\)](#)) with the exception of [Pt 3, Ch 2, 1.2 Steel 1.2.6](#) and [Pt 3, Ch 2, 3.2 Prefabrication primers](#) which are to be complied with.

#### 1.2 Steel

- 1.2.1 Steel having a specified minimum yield stress of 235 N/mm<sup>2</sup> is regarded as mild steel. Steel having a higher specified minimum yield stress is regarded as higher tensile steel.
- 1.2.2 For the determination of the hull girder section modulus, where higher tensile steel is used, a higher tensile steel factor,  $k_L$ , is given in [Table 2. 1. 1: Values of  \$k\_L\$](#) .

**Table 2. 1. 1: Values of  $k_L$**

| Specified minimum yield stress in N/mm <sup>2</sup> | $k_L$                  |
|---|------------------------|
| 235   | 1.0                    |
| 265   | 0.92                   |
| 315   | 0.78                   |
| 355   | 0.72                   |
| 390   | 0.68 (0.66 See Note 3) |
| 460 See Note 4                                      | 0.62 See Note 4        |

**Note 1.** Intermediate values by linear interpolation.

**Note 2.** For the purpose of calculating hull moment of inertia as specified in [Pt 3, Ch 4, 5.8 Hull moment of inertia 5.8.1](#),  $k_L = 1.0$ .

**Note 3.** A  $k_L$  factor of 0.66 may be applied to all ship types provided that a fatigue assessment is carried out as required by [Pt 3, Ch 2, 1.2 Steel 1.2.4](#).

**Note 4.** Grade only applies to thickness above 50 mm for upper deck, hatch coamings, shear strake, uppermost strake of longitudinal bulkhead and other longitudinal strength members in way of the above structures of container ships. The requirements specified in [Ch 3, 3 Higher strength steels for ship and other structural applications](#) of the [Part 2 Rules for Materials](#) apply, *See Pt 3, Ch 2, 1.2 Steel 1.2.4* and [Pt 3, Ch 2, 1.2 Steel 1.2.5](#).

1. 2. 3 The local scantling requirements of higher tensile steel plating, longitudinals, stiffeners and girders may be based on a  $k$  factor determined as follows:

$$k = \frac{235}{\sigma_o}$$

or 0.66, whichever is the greater,

Where

$\sigma_o$  = specific minimum yield stress in N/mm<sup>2</sup>

1. 2. 4 For the application of the requirements of [Pt 3, Ch 2, 1.2 Steel 1.2.2](#) and [Pt 3, Ch 2, 1.2 Steel 1.2.3](#), special consideration will be given to steel where  $\sigma_o > 355$  N/mm<sup>2</sup>. Where such steel grades are used in areas which are subject to fatigue loading, the structural details are to be verified using fatigue design assessment methods.
1. 2. 5 For container ships only a  $k_L$  factor of 0.62 may be applied to steel with a specified minimum yield stress of 460 N/mm<sup>2</sup> for structural members that contribute to the ship's longitudinal strength, provided that:
- the member's plate or web thickness is greater than 50 mm, *See also* [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates](#);
  - the requirements of [Pt 3, Ch 2, 1.2 Steel 1.2.4](#) are satisfied; and
  - a spectral fatigue assessment is carried out in accordance with *ACSPlus Fatigue Design Assessment (FDA level 3) Guidelines*, to demonstrate that key structural details sensitive to the hull girder loads have satisfactory fatigue performance. The assessment should normally include the following:
    - Hatch corners in way of cross-deck strips;
    - Hatch corners at the forward region;
    - Hatch corners forward and aft of the engine room and the accommodation blocks;
    - Connection of hatch coaming to supporting structure; and
    - Other critical locations subject to dynamic hull girder bending and torsional effects.
  - In addition, the *ACSPlus Construction Monitoring (CM) Guidelines* is to be applied to the fatigue critical locations described above.

1. 2. 6 Where steel castings or forgings are used for sternframes, rudder frames, rudder stocks, propeller shaft brackets and other major structural items, they are to comply with [Ch 4 Steel Castings](#) or [Ch 5 Steel Forgings](#) of the [Part 2 Rules for Materials](#), as appropriate.

### 1. 3 Aluminium

1. 3. 1 The use of aluminium alloy is permitted for superstructures, deckhouses, hatch covers, helicopter platforms, or other local components on board ships.
1. 3. 2 Aluminium is not to be used for the crowns or casings of Category A machinery spaces, See [Pt 5, Ch 1, 4.9 Category A machinery spaces 4.9.1](#).
1. 3. 3 Except where otherwise stated, equivalent scantlings are to be derived as follows:

- a. Plating thickness;

$$t_a = t_s \sqrt{k_a c}$$

- b. Section modulus of stiffeners;

$$Z_a = Z_s k_a c$$

Where

$c$  = 0.95 for high corrosion resistant alloy

$$k_a = \frac{245}{\sigma_a}$$

$t_a$  = thickness of aluminium plating

$t_s$  = thickness of mild steel plating

$Z_s$  = section modulus of mild steel stiffener

$\sigma_a$  = 0.2 per cent proof stress or 70 per cent of the ultimate strength of the material, whichever is the lesser.

1. 3. 4 In general, for welded structure, the maximum value of  $\sigma_a$  to be used in the scantlings derivation is that of the aluminium in the welded condition. However, consideration will be given to using unwelded values depending upon the weld line location, other heat affected zones, in relation to the maximum applied stress on the member (e.g. extruded sections).
1. 3. 5 A comparison of the mechanical properties for selected welded and unwelded alloys is given in [Ch 13, 8.3 Fabrication and welding 8.3.2](#) of the [Part 2 Rules for Materials](#).
1. 3. 6 Where strain hardened grades (designated Hxxx) are used, adequate protection by coating is to be provided to avoid the risk of stress corrosion cracking.

## PART

# 3

## CHAPTER 2 Materials

### SECTION 2 Fracture control

2. 1. 1 The resistance to fracture is controlled, in part, by the notch toughness of the steel used in the structure. Steels with different levels of notch toughness are specified in the [Part 2](#). The grade of steel to be used is, in general, related to the thickness of the material and the stress pattern associated with its location.
2. 1. 2 In order to distinguish between the material grade requirements for different hull members at varying locations along the ship, material classes are assigned as shown in [Table 2. 2. 1: Material classes and grades](#). For each class, depending on thickness, the material grade requirements are not to be lower than those given in .
2. 1. 3 Where tee or cruciform connections employ full penetration welds, and the plate material is subject to significant strains in a direction perpendicular to the rolled surfaces, it is recommended that consideration be given to the use of special plate material with specified through thickness properties, as detailed in [Ch 3, 8 Plates with specified through thickness properties](#) of the [Part 2 Rules for Materials](#).
2. 1. 4 Design for normal worldwide service assumes the navigation to areas of minus 10°C, where the design air temperature is to be taken as the lowest mean daily average air temperature in the area of operation:

Where

|         |   |   |
|---------|---|---|
| Mean    | = | statistical mean over a minimum of 20 years |
| Average | = | average during one day and one night        |
| Lowest  | = | lowest during the year                      |
| MDHT    | = | Mean Daily High Temperature                 |
| MDAT    | = | Mean Daily Average Temperature              |
| MDLT    | = | Mean Daily Low Temperature                  |

[Figure 2. 2. 1: Design air temperature](#) shows the definition graphically.

The material grade of exposed structure of ships intended to operate in external air temperatures below minus 10°C is to be in accordance with [Pt 3, Ch 2, 2.3 Structures exposed to low temperatures](#).

**Figure 2. 2. 1: Design air temperature**

2. 1. 5 For container ships only, measures for the prevention of brittle fracture of thick plates are to be taken in accordance with the requirements of [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates](#).

## 2. 2 Refrigerated spaces

2. 2. 1 Where the minimum design temperature of the steel falls below 0°C in refrigerated spaces, in addition to the requirements of [Pt 3, Ch 2, 2.1 Grades of steel 2.1.2](#), the grade of steel for the following items is to comply, in general, with the requirements of [Table 2. 2. 3: Grades of steel for refrigerated spaces with a minimum design temperatures below 0°C](#):
- Deck plating.
  - Webs of deck girders.
  - Longitudinal bulkhead strakes attached to deck.
  - Shelf plates and their face bars supporting hatch covers.
2. 2. 2 Unless a temperature gradient calculation is carried out to assess the design temperature in the items defined in [Pt 3, Ch 2, 2.2 Refrigerated spaces 2.2.1](#), the temperature to which the steel deck may be subjected is to be assessed as shown in [Table 2. 2. 4: Assessment of deck temperature](#).

**Table 2. 2. 1: Material classes and grades**

| Structural member category  | Material class/Minimum grade          |
|---|---------------------------------------|
| SECONDARY   |                                       |
| A1. Longitudinal bulkhead strakes, other than belonging to the Primary category                   | Class I within 0.4 <i>L</i> amidships |
| A2. Deck plating exposed to weather, other than that belonging to the Primary or Special category |                                       |
| A3. Side plating  |                                       |
| Grade A/AH outside 0.4 <i>L</i> amidships   |                                       |
| PRIMARY   |                                       |

|   |   |
|---|---|
| B1. Bottom plating, including keel plate  |   |
| B2. Strength deck plating, excluding that belonging to the Special category   |   |
| B3. Continuous longitudinal plating of strength members above strength deck, excluding hatch coamings   | Class II within 0.4L amidships  |
| B4. Uppermost strake in longitudinal bulkhead   | Grade A/AH outside 0.4L amidships   |
| B5. Vertical strake (hatch side girder) and uppermost sloped strake in top wing tank  |   |
| SPECIAL   |   |
| C1. Sheerstrake (or rounded gunwale) and stringer plate at strength deck, <i>See Note 1</i>   | Class III within 0.4L amidships   |
| C2. Deck strake at longitudinal bulkhead excluding deck plating in way of inner skin bulkhead of double hull ships, <i>See Note 1</i>   | Class II outside 0.4L amidships<br>Class I outside 0.6L amidships   |
| C3. Strength deck plating at outboard corners of cargo hatch openings (and plating intersections of the longitudinal underdeck girders and the cross-deck strips) in container carriers and other ships with similar hatch opening configurations | Class III within 0.4L amidships<br><br>Class II outside 0.4L amidships<br>Class I outside 0.6L amidships<br>Minimum Class III within cargo region |
| C4. Strength deck plating at corners of cargo hatch openings in bulk carriers ( <i>See Pt 3, Ch 2, 1.1 General 1.1.3</i> ), ore carriers, combination carriers and other ships with similar hatch opening configurations                          | Class III within 0.6L amidships   |
| C5. Trunk deck and inner deck plating at corners of openings for liquid and gas domes in membrane type liquefied gas carriers   | Class II within rest of cargo region  |
| C6. Bilge strake in ships with double bottom over the full breadth and length less than 150 m   | Class II within 0.6L amidships<br>Class I outside 0.6L amidships  |
| C7. Bilge strake in other ships, <i>See Note 1</i>  | Class III within 0.4L amidships<br>Class II outside 0.4L amidships<br>Class I outside 0.6L amidships  |
| C8. Longitudinal hatch coamings of length greater than 0.15L including coaming top plate and flange   | Class III within 0.4L amidships<br><br>Class II outside 0.4L amidships  |

|  |  |   |
|--|--|---|
| C9.  | End brackets and deck house transition of longitudinal cargo hatch coamings  | Class I outside 0.6L amidships Not to be less than Grade D/DH |
| ADDITIONAL REQUIREMENTS FOR SINGLE STRENGTH DECK SHIPS OF LENGTH GREATER THAN 150 m. |  |   |
| D1.  | Longitudinal plating of strength deck where contributing to the longitudinal strength  | Grade B/AH within 0.4L amidships                              |
| D2.  | Continuous longitudinal plating of strength members above strength deck  |   |
| D3   | Continuous longitudinal trunk deck plating of membrane type liquefied gas carriers   | Class II within 0.4L amidships                                |
| D4   | Single side strakes for ships without inner continuous longitudinal bulkhead(s) between bottom and strength deck   | Grade B/AH within cargo region                                |
| ADDITIONAL REQUIREMENTS FOR SHIPS OF LENGTH GREATER THAN 250 m.                      |  |   |
| E1.  | Sheerstrake (or rounded gunwale) and stringer plate at strength deck, <i>See</i> Note 2  | Grade E/EH within 0.4L amidships                              |
| E2.  | Bilge strake, <i>See</i> Note 2  | Grade D/DH within 0.6L amidships                              |
| SINGLE SKIN BULK CARRIERS SUBJECTED TO SOLAS REGULATION XII/6.5                      |  |   |
| F1.  | Lower bracket of ordinary side frame, <i>See</i> Notes 6 and 7   | Grade D/DH  |
| F2.  | Side shell strakes included totally or partially between the two points located to 0.125l above and below the intersection of side shell and bilge hopper sloping plate or inner bottom plate, <i>See</i> Note 7 | Grade D/DH  |

- Note 1.** Single strakes required to be of Class III and within  $0.4L$  amidships are to have breadths not less than  $800 + 5L$  mm, but need not be greater than 1800 mm, unless limited by the geometry of the ship's design.
- Note 2.** Single strakes required to be of Grade E/EH and within  $0.4L$  amidships are to have breadths not less than  $800 + 5L$  mm, but need not be greater than 1800 mm, unless limited by the geometry of the ship's design.
- Note 3.** For strength members not mentioned, Grade A/AH may be generally used.
- Note 4.** Steel grade is to correspond to the as-fitted thickness.
- Note 5.** Plating materials for sternframes supporting the rudder and propeller boss, rudders, rudder horns and shaft brackets are, in general, not to be of lower grades than corresponding to Class II. For rudder and rudder body plates subjected to stress concentrations (e.g. in way of lower support of semi-spade rudders or at upper part of spade rudders) Class III is to be applied.
- Note 6.** The term 'lower bracket' means webs of lower brackets and webs of the lower part of side frames up to the point of  $0.125l$  above the intersection of side shell and bilge hopper sloping plate or inner bottom plate.
- Note 7.** The span of the side frame,  $l$ , is defined as the distance between the supporting structures.
- Note 8.** Corner inserts in way of complex openings such as for lifts and side doors which may impinge on the deck plating or stringer plate are to be of Grade D/DH for  $t \leq 20$  mm and Grade E/EH for  $t > 20$  mm.
- Note 9.** The material class used for reinforcement and the quality of material (i.e. whether mild or higher tensile steel) used for welded attachments, such as waterway bars and bilge keels, is to be similar to that of the hull envelope plating in way. Where attachments are made to rounded gunwale plates, special consideration will be given to the required grade of steel, taking account of the intended structural arrangements and attachment details.
- Note 10.** The material class for deck plating, sheer strake and upper strake of longitudinal bulkhead within  $0.4L$  amidships is also to be applied at structural breaks of the superstructure, irrespective of position.
- Note 11.** Engine seat top plates outside  $0.6L$  amidships may be Grade A/AH. Steel grade requirement for top plates within  $0.6L$  amidships will be specially considered.

**Table 2. 2. 2: Steel grades**

| Thickness, $t$ , in mm   | Material class |            |            |            |            |            |
|--|----------------|------------|------------|------------|------------|------------|
|  | I              |            | II         |            | III        |            |
|  | Mild steel     | H.T. steel | Mild steel | H.T. steel | Mild steel | H.T. steel |
| $t \leq 15$  | A              | AH         | A          | AH         | A          | AH         |
| $15 < t \leq 20$   | A              | AH         | A          | AH         | B          | AH         |
| $20 < t \leq 25$   | A              | AH         | B          | AH         | D          | DH         |
| $25 < t \leq 30$   | A              | AH         | D          | DH         | D          | DH         |
| $30 < t \leq 35$   | B              | AH         | D          | DH         | E          | EH         |
| $35 < t \leq 40$   | B              | AH         | D          | DH         | E          | EH         |
| $t > 40$   | D              | DH         | E          | EH         | E          | EH         |
| <b>Note</b> See Notes under <a href="#">Table 2. 2. 1: Material classes and grades</a> |                |            |            |            |            |            |

**Table 2. 2. 3: Grades of steel for refrigerated spaces with a minimum design temperatures below 0°C**

| Minimum design temperature, in °C | Thickness, in mm   | Grades of steel  |
|-----------------------------------|--------------------|--|
| <0 to –10                         | $t \leq 12.5$      | B/AH   |
|                                   | 12.5 $t \leq 25.5$ | D/DH   |
|                                   | $t > 25.5$         | E/EH   |
| <–10 to –25                       | $t \leq 12.5$      | D/DH   |
|                                   | $t > 12.5$         | E/EH   |
| <– 25 to –40                      | $t \leq 12.5$      | E/EH   |
|                                   | $t > 12.5$         | FH/LT–FH,<br>See also <a href="#">Ch 3, 6 Carbon–manganese and nickel alloy steels for low temperature service</a> of the <a href="#">Part 2 Rules for Materials</a> |

**Table 2. 2. 4: Assessment of deck temperature**

| Arrangement   | Deck temperature   |
|---|--|
| (1) Deck not covered with insulation in the refrigerated space  | Temperature of the refrigerated space                                    |
| (2) Deck covered with insulation in the refrigerated space and not insulated on the other side                                  | Temperature of the space on the uninsulated side                         |
| (3) Deck covered with insulation on both sides  |  |
| (a) Temperature difference not greater than 11°C  | Mean of the temperatures of the spaces above and below the deck          |
| (b) Temperature difference greater than 11°C but not greater than 33°C  | Mean of the temperatures of the spaces above and below the deck less 3°C |
| (c) Temperature difference greater than 33°C  | Deck temperature will be specially assessed                              |
| <b>Note</b> Where one of the internal spaces concerned is not refrigerated, the temperature of the space is to be taken as 5°C. |  |

## 2. 3 Structures exposed to low temperatures

2. 3. 1 For ships intended to operate in areas with low air temperatures (below –10°C), e.g. regular service during winter seasons to Arctic or Antarctic waters, the material grade requirements of structures above the lowest ballast water line exposed to air are not to be of lower grades than those given in [Table 2. 2. 5: Material classes and grades for structures exposed to low air temperatures](#), [Table 2. 2. 6: Materials for Class I for low air temperatures](#), [Table 2. 2. 7: Materials for Class II for low air temperatures](#) and [Table 2. 2. 8: Materials for Class III for low air temperatures](#).

2. 3. 2 Where the material class in [Table 2. 2. 1: Material classes and grades](#) is higher than in [Table 2. 2. 5: Material classes and grades for structures exposed to low air temperatures](#), the higher material class is to be applied.

## 2. 4 Carriage of cold cargoes

2. 4. 1 For ships other than liquefied gas carriers, which are intended to be loaded with liquid cargo having a temperature below  $-10^{\circ}\text{C}$ , e.g. loading from cold onshore storage tanks during winter conditions, the grade of steel for the cargo tank boundary plating is to comply with the requirements of [Table 2. 2. 6: Materials for Class I for low air temperatures](#) where the design air temperature is to be taken as the design minimum cargo temperature in  $^{\circ}\text{C}$ . The design minimum cargo temperature is to be specified in the Loading Manual, See [Pt 3, Ch 4, 8.2, Loading Manual 8.2.4](#).

**Table 2. 2. 5: Material classes and grades for structures exposed to low air temperatures**

| Structural member category  | Material class         |                         |
|---|------------------------|-------------------------|
|   | Within 0.4 L amidships | Outside 0.4 L amidships |
| SECONDARY   | I                      | I                       |
| <ul style="list-style-type: none"> <li>Deck plating exposed to weather, in general</li> <li>Side plating above CWL, <i>See Note 5</i></li> <li>Transverse bulkheads above CWL, <i>See Notes 5 and 6</i></li> </ul>  |                        |                         |
| PRIMARY   | II                     | I                       |
| <ul style="list-style-type: none"> <li>Strength deck plating</li> <li>Continuous longitudinal members above strength deck, excluding longitudinal hatch coamings</li> <li>Longitudinal bulkhead above CWL, <i>See Notes 5 and 6</i></li> <li>Top wing tank bulkhead above CWL, <i>See Notes 5 and 6</i></li> </ul>  |                        |                         |
| SPECIAL   | III                    | II                      |
| <ul style="list-style-type: none"> <li>Sheerstrake at strength deck, <i>See Note 1</i></li> <li>Stringer plate in strength deck, <i>See Note 1</i></li> <li>Deck strake at longitudinal bulkhead, <i>See Note 2</i></li> <li>Continuous longitudinal hatch coamings, <i>See Note 3</i></li> </ul>   |                        |                         |
| <p><b>Note 1.</b> Not to be less than Grade E/EH within 0.4L amidships in ships with length exceeding 250 m.</p> <p><b>Note 2.</b> In ships with breadth exceeding 70 m at least three deck strakes are to be Class III.</p> <p><b>Note 3.</b> Not to be less than Grade D/DH.</p> <p><b>Note 4.</b> Within 0.4L amidships, single strakes which are required to be of Class III or of Grade E/EH or FH are to have breadths not less than <math>800 + 5L</math>, but need not be taken greater than 1800 mm.</p> <p><b>Note 5.</b> The Cold Waterline (CWL) is to be taken as 0.3 m below the minimum design Ballast Waterline (BWL).</p> <p><b>Note 6.</b> Applicable to plating attached to hull envelope plating exposed to cold air. At least one strake is to be considered in the same way as exposed plating and the strake width is to be at least 600 mm. If thermal stress calculations are performed, then the extent of plate requiring consideration is to be adjusted accordingly.</p> |                        |                         |

## PART

**3**CHAPTER **2 Materials**SECTION **3 Corrosion protection****3.1 General**

- 3.1.1 Where bimetallic connections are made, measures are to be incorporated to mitigate galvanic corrosion.

**3.2 Prefabrication primers**

- 3.2.1 Prefabrication primers are to be approved in accordance with [Ch 15 Corrosion Prevention of the Part 2 Rules for Materials](#).
- 3.2.2 Aluminium coatings intended for oil tankers and chemical tankers used in way of the cargo oil tanks, cargo tank deck areas, pumprooms, cofferdams or any other area where oil vapour may accumulate are to be coated using systems containing less than 10 per cent aluminium by weight in the dry film.

**3.3 Internal cathodic protection**

- 3.3.1 The requirements for cathodic protection of internal tanks in [Ch 15 Corrosion Prevention of the Part 2 Rules for Materials](#) are to be complied with. When a cathodic protection system is to be fitted in tanks for the carriage of liquid cargo with flash point not exceeding 60°C, a plan showing details of the locations and attachment of anodes is to be submitted. The arrangements will be considered for safety against fire and explosion aspects only. Impressed current cathodic protection systems are not permitted in any tank.
- 3.3.2 Particular attention is to be given to the locations of anodes in relation to the structural arrangements and openings of the tank.
- 3.3.3 Anodes are to be of approved design and sufficiently rigid to avoid resonance in the anode support. Steel cores are to be fitted, and these are to be so designed as to retain the anode even when the latter is wasted.
- 3.3.4 Anodes are to be attached to the structure in such a way that they remain secure both initially and during service. The following methods of attachment would be acceptable:
- Steel core connected to the structure by continuous welding of adequate section.
  - Steel core bolted to separate supports, provided that a minimum of two bolts with lock nuts is used at each support. The separate supports are to be connected to the structure by continuous welding of adequate section.
  - Approved means of mechanical clamping.
- 3.3.5 Anodes are to be attached to stiffeners, or may be aligned in way of stiffeners on plane bulkhead plating, but they are not to be attached to the shell. The two ends are not to be attached to separate members which are capable of relative movement.

3. 3. 6 Where cores or supports are welded to the main structure, they are to be kept clear of the toes of brackets and similar stress raisers. Where they are welded to asymmetrical stiffeners, they are to be connected to the web with the welding kept at least 25 mm away from the edge of the web. In the case of stiffeners or girders with symmetrical face plates, the connection may be made to the web or to the centreline of the face plate but well clear of the free edges. However, it is recommended that anodes are not fitted to face plates of higher tensile steel longitudinals.

### 3. 4 Aluminium and magnesium anodes

3. 4. 1 Aluminium and aluminium alloy anodes are permitted in tanks which can contain explosive or flammable vapour, or in tanks adjacent to tanks which can contain explosive or flammable vapour, but only at locations where the potential energy of the anode does not exceed 275 J. The weight of the anode is to be taken as the weight at the time of fitting, including any inserts and fitting devices. The height of the anode is, in general, to be measured from the bottom of the tank to the centre of the anode. Where the anode is located on a horizontal surface (such as a bulkhead stringer) not less than 1 m wide, provided with an upstanding flange or face plate projecting not less than 75 mm above the horizontal surface, the height of the anode can be measured above that surface.
3. 4. 2 Aluminium anodes are not to be located under tank hatches or Butterworth openings unless protected by adjacent structure.
3. 4. 3 Magnesium or magnesium alloy anodes are not permitted in tanks which can contain explosive or flammable vapour, or in tanks adjacent to tanks which can contain explosive or flammable vapour. Where permitted for other tanks, adequate venting must be provided.

### 3. 5 External hull protection

3. 5. 1 Suitable protection of the underwater portion of the hull is to be provided.
3. 5. 2 Where a cathodic protection system is fitted, plans showing the proposed layout of anodes and hull penetrations are to be submitted in accordance with [Ch 15 Corrosion Prevention of the Part 2 Rules for Materials](#).
3. 5. 3 All equipment is to be suitable for its intended location.
3. 5. 4 The arrangements for glands, where cables pass through the shell, are to include a small cofferdam.
3. 5. 5 Cables which pass through ballast tanks are to be enclosed in a steel tube of at least 10 mm thickness.
3. 5. 6 Cables to anodes are not to pass through tanks intended for the storage of low flash point products; including, but not limited to, oils.
3. 5. 7 Cables which pass through cofferdams of storage tanks which may contain low flash point products are to be enclosed in a steel tube of at least 10 mm thickness. *See also* [Pt 6, Ch 2, 14 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts](#).
3. 5. 8 Where an \*IWS (In-water Survey) notation is to be assigned, *See* [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.11](#), protection of the underwater portion of the hull is to be provided by means of a suitable high resistance paint applied in accordance with the manufacturer's requirements. Details of the high resistance paint are to be submitted for information in accordance with [Ch 15 Corrosion Prevention of the Part 2 Rules for Materials](#).

### 3. 6 Application of coatings and alternative means of protection

3. 6. 1 For ships that are required to comply with IMO Resolution MSC.215(82) - *Performance Standard for Protective Coatings for Dedicated Seawater Ballast Tanks in all Types of Ships and Double-*

*Side Skin Spaces of Bulk Carriers - (Adopted on 8 December 2006)*, all dedicated sea-water ballast tanks of all types of ships and double-side skin spaces of bulk carriers are to comply with all of the requirements of the Resolution, See *ACSPlus Guidelines Anti-Corrosion Systems Notation* and [Ch 15 Corrosion Prevention of the Part 2 Rules for Materials](#).

3. 6. 2 For ships that are required to comply with IMO Resolution MSC.288(87) – *Performance Standard for Protective Coatings for Cargo Oil Tanks of Crude Oil Tankers – (Adopted on 14 May 2010)* , all cargo oil tanks are to comply with all of the requirements of the Resolution, See *ACSPlus Guidelines Anti-Corrosion System Notation* and [Ch 15 Corrosion Prevention of the Part 2 Rules for Materials](#).
3. 6. 3 For ships that are required to comply with the IMO Resolution MSC.289(87) – *Performance Standard for Alternative Means of Corrosion Protection for Cargo Oil Tanks of Crude Oil Tankers – (Adopted on 14 May 2010)* , by application of corrosion resistant steel, See [Ch 3, 1.3, Corrosion resistant steels for cargo oil tanks of crude oil tankers of the Part 2 Rules for Materials](#), all cargo oil tanks are to comply with all of the requirements of the Resolution, See *ACSPlus Guidelines Anti-Corrosion System Notation* and [Ch 15 Corrosion Prevention of the Part 2 Rules for Materials](#).
3. 6. 4 For ships that are required to comply with IMO Resolution MSC.244(83) - *Adoption of Performance Standard for Protective Coatings for Void Spaces on Bulk Carriers and Oil Tankers - (Adopted on 5 October 2007)*, all void spaces are to comply with all of the requirements of the Resolution, See *ACSPlus Guidelines Anti-Corrosion System Notation* and [Ch 15 Corrosion Prevention of the Part 2 Rules for Materials](#).
3. 6. 5 For ships that are not required to comply with the IMO Resolution MSC.215(82) - *Performance Standard for Protective Coatings for Dedicated Seawater Ballast Tanks in all Types of Ships and Double-Side Skin Spaces of Bulk Carriers - (Adopted on 8 December 2006)*, all sea-water ballast spaces having boundaries formed by the hull envelope are to have an efficient protective coating, epoxy or equivalent, applied in accordance with the manufacturer's recommendations, See *ACSPlus Guidelines Protective Coatings in Water Ballast Tanks (PCWBT)* and [Ch 15 Corrosion Prevention of the Part 2 Rules for Materials](#).
3. 6. 6 The following tanks are not considered to be dedicated sea-water ballast tanks and are therefore exempted from the application and requirement of the IMO PSPC:
  - a. ballast tanks identified as 'Spaces included in Net Tonnage' in the 1969 ITC Certificate;
  - b. sea-water ballast tanks in passenger vessels also designated for the carriage of grey water or black water; or
  - c. sea-water ballast tanks in livestock carriers also designated for the carriage of the livestock dung.

Alternative provisions are to be made for the protection of these tanks.

PART

# 3

CHAPTER **2 Materials**

SECTION **4 Corrosion protection**

## **4. 1 General**

- 4. 1. 1 Where plated decks are sheathed with wood or an approved composition, reductions in plate thickness may be allowed.
- 4. 1. 2 The steel deck is to be coated with a suitable material in order to prevent corrosive action, and the sheathing or composition is to be effectively secured to the deck.
- 4. 1. 3 Primary deck coverings within accommodation spaces, control stations or service spaces are to be of a type which will not readily ignite or give rise to smoke or toxic or explosive hazards at elevated temperatures in accordance with the requirements of the *International Code for the Application of Fire Test Procedure*

## CHAPTER 3 Structural Design

## PART

**3**CHAPTER **3** **Structural Design**SECTION **1** **General****1. 1 Application**

1. 1. 1 This Chapter illustrates the general principles to be adopted in applying the Rule structural requirements given in [Pt 3 Ship Structures \(General\)](#) and [Pt 4 Ship Structures \(Ship Types\)](#). In particular, consideration has been given to the layout of the Rules as regards the different regions of the ship, principles for taper of hull scantlings, definition of span point, derivation of section moduli and basic design loading for deck structures. Principles for subdivision are also covered.
1. 1. 2 Where additional requirements relating to particular ship types apply, these are, in general, dealt with under the relevant ship type Chapter in [Pt 4 Ship Structures \(Ship Types\)](#).
1. 1. 3 The requirements in this chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a CSR notation (See [Pt 1, Ch 2, 2.3 Class notations \(hull\)](#)) with the exception of [Pt 3, Ch 3, 4.7, Separation and protection of tanks](#) which is to be complied with.

CHAPTER 3 **Structural Design**SECTION 2 **Rule structural concepts****2. 1 Definition of requirements**

2. 1. 1 In [Figure 3. 2. 1: Rule Scantlings - Schematic layout of requirements](#) the breakdown of the ship into regions is shown. Within each region, the applicable Parts and Chapters of the Rules are indicated.

**2. 2 Definition of fore end region**

2. 2. 1 The fore end region structure is considered to include structure forward of the midship  $0.4L$  region.

**2. 3 Definition of aft end region**

2. 3. 1 The aft end region structure is considered to include all structure aft of the midship  $0.4L$  region.

**2. 4 Symbols**

2. 4. 1 The symbols used in this Section are defined as follows:  
 $F_D, F_B$  = local scantling reduction factor as defined in [Pt 3, Ch 4, 5.7, Local reduction factors](#)  
 $k_L, k$  = higher tensile steel factor, See [Pt 3, Ch 2, 1.2, Steel](#)  
 $z_D, z_B$  = vertical distance, in metres, from the hull transverse neutral axis to the moulded deck line at side and to the top of keel respectively  
 $z_{ht}$  = vertical extent of higher tensile steel.

**2. 5 Taper requirements for hull envelope**

2. 5. 1 The thickness of the shell envelope and strength deck plating, and the modulus and sectional area of strength deck longitudinals are to taper gradually from the midship region to the fore and aft ends. For the requirements, See [Table 3. 2. 1: Taper requirements for hull envelope](#).
2. 5. 2 Outside the line of openings where higher tensile steel is used amidships and mild steel at the ends, the equivalent mild steel midship thickness for plating, equivalent mild steel midship deck longitudinal area and equivalent mild steel midship total deck area, for taper purposes are to be determined as follows:
- Equivalent mild steel value
 
$$= \frac{\text{H.T.steel value}}{k_L}$$
  - If the higher tensile steel plating is based on minimum thickness requirements, then:

Equivalent mild steel midship plating thickness determined from [Pt 4, Ch 1 General Cargo Ships](#) and [Pt 4, Ch 9 Double Hull Oil Tankers](#).

2. 5. 3 The transition from higher tensile steel to mild steel is to be as shown in [Figure 3. 2. 2: Transition of steel grades](#) for the forward region. The transition in the aft region is to be similar to the forward region.
2. 5. 4 Where the higher tensile steel longitudinals extend beyond the point of transition from higher tensile to mild steel plating, the modulus of the composite section is not to be taken less than the required mild steel value at the deck plate flange, and  $k$  times the mild steel value at the higher tensile flange.

## 2. 6 Vertical extent of higher tensile steel

2. 6. 1 Higher tensile steel may be used for both deck and bottom structures or deck structure only. Where fitted, it is to be used for the whole of the longitudinal continuous material for the following vertical distances:

- a. from the line of deck at side

$$Z_{ht} = \left(1 - \frac{k_L}{F_D}\right) Z_D$$

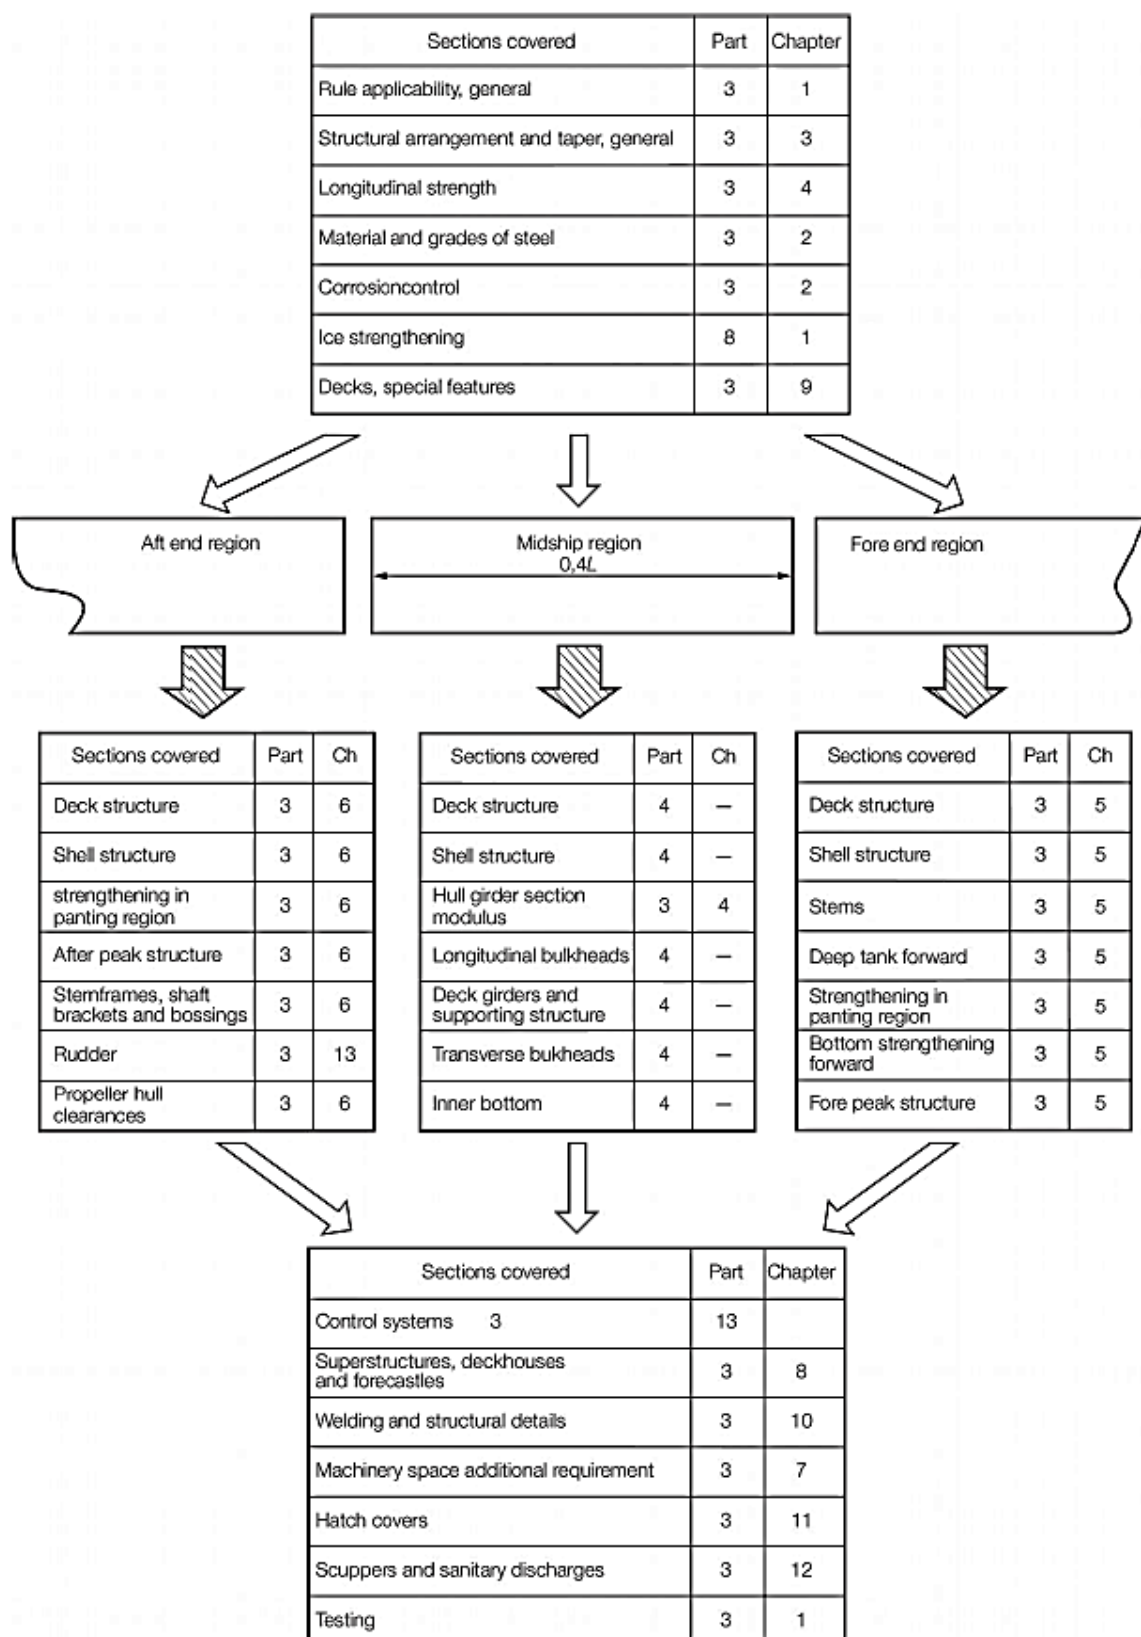

- b. from the top of keel

$$Z_{ht} = \left(1 - \frac{k_L}{F_B}\right) Z_B$$

In the above formulae,  $F_D$  and  $F_B$  are to be taken not less than  $k_L$ .

Figure 3. 2. 1: Rule Scantlings - Schematic layout of requirements

**Table 3. 2. 1: Taper requirements for hull envelope**

| Item   | Location           | Requirement  |
|--|--------------------|--|
| Plating  |                    |  |
| (1) Shell envelope plating,<br>See Notes 1 and 2 | Fore and aft ends  | The thickness, in mm, is to be the greater of the following:<br>$(a) t_t = [(t_c - t_{e1})(1 - \frac{d}{0.225L}) + t_{e1}] \text{ (See Note 3)}$ $(b) t_t = (6.5 + 0.033L)f_2\sqrt{\frac{ks_1}{s_0}}$  |
| (2) Strength deck plating,<br>See Notes 1 and 2  | Fore and aft ends  | The thickness, in mm, is to be the greater of the following:<br>$(a) t_t = [(t_c - t_{e2})(1 - \frac{d}{0.225L}) + t_{e2}] \text{ (See Note 3)}$ $(b) t_t = (5.5 + 0.02L)\sqrt{\frac{ks_1}{s_b}}$  |
| Longitudinals outside 0.4L amidships             |                    |  |
| (3) Strength deck,<br>See Notes 1 and 2          | Fore and aft ends  | MODULUS The section modulus in association with deck plating, in cm <sup>3</sup> , is to be the greater of the following:<br>$(a) Z_t = [(Z_c - Z_e)(1 - \frac{d}{0.225L}) + Z_e] \text{ (See Note 3)}$<br>$(b) \text{ As determined by Table 5. 2. 3: Strength/weather deck longitudinals forward, Table 6. 2. 3: Strength/weather deck longitudinals aft, and Pt 4, Ch 9 Double Hull Oil Tankers, as appropriate}$ |
|  |                    | SECTIONAL AREA<br>The deck longitudinals may be gradually tapered outside the 0.4L midships region in association with the deck plating on the basis of area.<br><br>The sectional area of one longitudinal without plating, in cm <sup>2</sup> , is to be not less than the following:<br>$A_t = [(A_c - A_e)(1 - \frac{d}{0.225L}) + A_e] \text{ (See Note 3)}$  |
| Strength deck area                               |                    |  |
| (4) Deck area taper,<br>See Notes 1 and 2        | Fore and aft decks | The total area of longitudinals and deck plating outside line of openings at midship region should have a linear taper from 0.2L from midships to 0.075L from F.P. or A.P. such that the area at 0.075L and 0.15L from the F.P. or A.P. is not less than 30 and 50 per cent respectively of the total midships area, See Note 3.   |
| Symbols  |                    |  |

$L, k, s, T$  as defined in [Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1](#)

$d$  = distance, in m, from  $0.2L$  forward or aft of amidships to the mid-length of the building block, strake, or longitudinal under consideration

$s_b$  = standard frame spacing, in mm, as given in [Table 5. 2. 1: Strength/weather deck plating forward \(excluding forecastle deck\)](#) and [Table 5. 3. 1: Shell plating forward](#) in Chapter 5, and [Table 6. 2. 1: Strength/weather deck plating aft \(excluding poop deck\)](#) and [Table 6. 3. 1: Shell plating aft](#) in Chapter 6, as appropriate

$s_1$  =  $s$ , but is to be taken not less than  $s_b$

$t_c$  = actual thickness of deck or shell plating within the  $0.4L$  midships region

$t_{e1}$  = basic shell end thickness for taper and is  $(6.5 + 0.033L) f_2 \sqrt{k}$  at  $0.075L$  from the A.P. or F.P.

$t_{e2}$  = basic strength deck end thickness for taper and is  $(5.5 + 0.02L) \sqrt{k}$  at  $0.075L$  from the A.P. or F.P.

$t_t$  = taper thickness for strength deck and shell plating

$Z_c$  = section modulus of deck longitudinal in association with deck plating, in  $\text{cm}^3$ , within the  $0.4L$  midships region

$Z_e$  = section modulus of deck longitudinal in association with deck plating, in  $\text{cm}^3$ , at  $0.075L$  from the ends

$Z_t$  = taper section modulus of deck longitudinal in association with deck plating, in  $\text{cm}^3$

$A_c$  = cross-sectional area of one longitudinal without attached plating, in  $\text{cm}^2$ , within the  $0.4L$  midships region

$A_e$  = cross-sectional area of one longitudinal without attached plating, in  $\text{cm}^2$ , at  $0.075L$  from the ends

$A_t$  = taper cross-sectional area of one longitudinal without attached plating, in  $\text{cm}^2$

$f_2$  = factor to be taken as:

$$f_2 = \left(\frac{15}{L/T}\right)^{0.2} \text{ but need not be taken greater than 1. } L/T \text{ is not to be taken greater than 25.}$$

**Note 1.** For thickness of strength deck and shell plating in way of cargo tanks of double hull oil tankers, single hull oil tankers or ore carriers, See also [Pt 4, Ch 9 Double Hull Oil Tankers](#), [Pt 4, Ch 10 Single Hull Oil Tankers](#), or [Pt 4, Ch 11 Ore Carriers](#) as appropriate.

**Note 2.** The taper requirement does not apply to container ships or open type ships, See [Pt 3, Ch 4, 2.3 Open type ships](#), where the requirements of [Pt 4, Ch 8, 3.2 Longitudinal strength](#) are applicable, nor to fast cargo ships where the requirements of [Pt 4, Ch 1, 3 Longitudinal strength](#) are applicable. See also [Pt 3, Ch 4, 5 Hull bending strength](#) for hull section modulus requirement away from the midship area.

**Note 3.** The formulae for the taper values are based on the assumption that the quality of steel is the same at amidships and ends. Where higher tensile steel is used in the midship region and mild steel at the ends, the taper values should be calculated for both qualities of steel in way of the transition from higher tensile to mild steel, and applied as determined by [Pt 3, Ch 3, 2.5 Taper requirements for hull envelope 2.5.2](#) and [Pt 3, Ch 3, 2.5 Taper requirements for hull envelope 2.5.3](#).

**Figure 3. 2. 2: Transition of steel grades**

## 2. 7 Grouped stiffeners

2. 7. 1 Where stiffeners are arranged in groups of the same scantling, the section modulus requirement of each group is to be based on the greater of the following:
- the mean value of the section modulus required for individual stiffeners within the group,
  - 90 per cent of the maximum section modulus required for individual stiffeners within the group.

## 2. 8 Rounding policy for plate thickness

2. 8. 1 Where plating thicknesses as determined by the Rules are required to be rounded, then this should be carried out to the nearest half millimetre, with thicknesses 0.75 mm and 0.25 mm being rounded up.

For example,

- for  $10.75 \leq t < 11.25$  mm, the Rule required thickness is 11.0 mm;
- for  $11.25 \leq t < 11.75$  mm, the Rule required thickness is 11.5 mm.

CHAPTER 3 **Structural Design**SECTION 3 **Structural idealisation****3.1 General**

- 3.1.1 For derivation of scantlings of stiffeners, beams, girders, etc. the formulae in the Rules are normally based on elastic or plastic theory using simple beam models supported at one or more points and with varying degrees of fixity at the ends, associated with an appropriate concentrated or distributed load.
- 3.1.2 Apart from local requirement for web thickness or flange thicknesses, the stiffener, beam or girder strength is defined by a section modulus and moment of inertia requirement.

**3.2 Geometric properties of section**

- 3.2.1 The symbols used in this sub-Section are defined as follows:
- $b$  = the actual width, in metres, of the load-bearing plating, i.e. one-half of the sum of spacings between parallel adjacent members or equivalent supports
- $f$  =  $0.3\left(\frac{l}{b}\right)^{2/3}$  but is not to exceed 1.0. Values of this factor are given in [Table 3.3.1: Load bearing plating factor](#)
- $l$  = the overall length, in metres, of the primary support member, See [Figure 3.3.3: Span points](#)
- $t_p$  = the thickness, in mm, of the attached plating. Where this varies, the mean thickness over the appropriate span is to be used.

**Table 3.3.1: Load bearing plating factor**

| $\frac{l}{b}$   | $f$  | $\frac{l}{b}$ | $f$  |
|---|------|---------------|------|
| 0.5   | 0.19 | 3.5           | 0.69 |
| 1.0   | 0.30 | 4.0           | 0.76 |
| 1.5   | 0.39 | 4.5           | 0.82 |
| 2.0   | 0.48 | 5.0           | 0.88 |
| 2.5   | 0.55 | 5.5           | 0.94 |
| 3.0   | 0.62 | 6 and above   | 1.00 |
| <b>Note</b> Intermediate values to be obtained by linear interpolation. |      |               |      |

- 3.2.2 The effective geometric properties of rolled or built sections may be calculated directly from the dimensions of the section and associated effective area of attached plating. Where the web of the

section is not normal to the attached plating, and the angle exceeds  $20^\circ$ , the properties of the section are to be determined about an axis parallel to the attached plating.

3. 2. 3 The geometric properties of rolled or built stiffener sections and of swedges are to be calculated in association with effective area of attached load bearing plating of thickness  $t_p$  mm and of width 600 mm or  $40t_p$  mm, whichever is the greater. In no case, however, is the width of plating to be taken as greater than either the spacing of the stiffeners or the width of the flat plating between swedges, whichever is appropriate. The thickness,  $t_p$ , is the actual thickness of the attached plating. Where this varies, the mean thickness over the appropriate span is to be used.
3. 2. 4 The effective section modulus of a corrugation over a spacing  $p$  is to be calculated from the dimensions and, for symmetrical corrugations, may be taken as:

$$Z = \frac{d_w}{6000} (3bt_p + ct_w) \text{ cm}^3$$

where  $d_w$ ,  $b$ ,  $t_p$ ,  $c$  and  $t_w$  are measured, in mm, and are as shown in [Figure 3. 3. 1: Corrugation dimensions](#). The value of  $b$  is to be taken not greater than:

$50t_p\sqrt{k}$  for welded corrugations

$60t_p\sqrt{k}$  for cold formed corrugations

The value of  $\theta$  is to be not less than  $40^\circ$ . The moment of inertia is to be calculated from:

$$I = \frac{Z}{10} \left( \frac{d_w}{2} \right) \text{ cm}^4$$

**Figure 3. 3. 1: Corrugation dimensions**

3. 2. 5 The section modulus of a double plate bulkhead over a spacing  $b$  may be calculated as:

$$Z = \frac{d_w}{6000} (6fbt_p + d_w t_w) \text{ cm}^3$$

Where  $d_w$ ,  $b$ ,  $t_p$  and  $t_w$  are measured, in mm, and are as shown in [Figure 3. 3. 2: Double plate bulkhead dimensions](#).

**Figure 3. 3. 2: Double plate bulkhead dimensions**

3. 2. 6 The effective section modulus of a built section may be taken as:

$$Z = \frac{ad_w}{10} + \frac{t_w d_w^2}{6000} \left(1 + \frac{200(A - a)}{200A + t_w d_w}\right) \text{cm}^3$$

where

- |       |   |   |
|-------|---|---|
| $a$   | = | the area of the face plate of the member, in $\text{cm}^2$  |
| $d_w$ | = | the depth, in mm, of the web between the inside of the face plate and the attached plating. Where the member is at right angles to a line of corrugations, the minimum depth is to be taken   |
| $t_w$ | = | the thickness of the web of the section, in mm  |
| $A$   | = | the area, in $\text{cm}^2$ , of the attached plating, See <a href="#">Pt 3, Ch 3, 3.2 Geometric properties of section 3.2.7</a> . If the calculated value of $A$ is less than the face area $a$ , then $A$ is to be taken as equal to $a$ . |

3. 2. 7 The geometric properties of primary support members (i.e. girders, transverses, webs, stringers, etc.) are to be calculated in association with an effective area of attached load bearing plating,  $A$ , determined as follows:

- For a member attached to plane plating:  
 $A = 10ft_p \text{ cm}^2$
- For a member attached to corrugated plating and parallel to the corrugations:  
 $A = 10bt_p \text{ cm}^2$
- See [Figure 3. 3. 1: Corrugation dimensions](#)
- For a member attached to corrugated plating and at right angles to the corrugations:  
 $A$  is to be taken as equivalent to the area of the face plate of the member.

### 3. 3 Determination of span point

3. 3. 1 The effective length,  $l_e$ , of a stiffening member is generally less than the overall length,  $l$ , by an amount which depends on the design of the end connections. The span points, between which the value of  $l_e$  is measured, are to be determined as follows:

- For rolled or built secondary stiffening members:  
The span point is to be taken at the point where the depth of the end bracket, measured from the face of the secondary stiffening member is equal to the depth of the member. Where there is no end bracket, the span point is to be measured between primary member webs. For double skin construction, the span may be reduced by the depth of primary member web stiffener, See [Figure 3. 3. 3: Span points](#).
- For primary support members:

The span point is to be taken at a point distant from the end of the member,  
*Where*

$$b_e = b_b \left(1 - \frac{d_w}{d_b}\right)$$

See also [Figure 3. 3. 3: Span points](#).

- 3. 3. 2 Where the end connections of longitudinals are designed with brackets to achieve compliance with the *ACSPlus FDA Guidelines*, no reduction in span is permitted for such brackets unless the fatigue life is subsequently re-assessed and shown to be adequate for the resulting reduced scantlings.
- 3. 3. 3 Where the stiffener member is inclined to a vertical or horizontal axis and the inclination exceeds 10°, the span is to be measured along the member.
- 3. 3. 4 It is assumed that the ends of stiffening members are substantially fixed against rotation and displacement. If the arrangement of supporting structure is such that this condition is not achieved, consideration will be given to the effective span to be used for the stiffener.

### 3. 4 Calculation of hull section modulus

- 3. 4. 1 All continuous longitudinal structural material is to be included in the calculation of the inertia of the hull midship section, and the lever  $z$  is, except where otherwise specified for particular ship types, to be measured vertically from the neutral axis to the top of keel and to the moulded strength deck line at the side. The strength deck is to be taken as follows:
  - a. Where there is a complete upper deck and no effective superstructure, the strength deck is the upper deck.
  - b. Where the upper deck is stepped, as in the case of a raised quarterdeck or a long forecastle, or there is an effective superstructure on the upper deck, the strength deck is stepped

**Figure 3. 3. 3: Span points**

3. 4. 2 transition zone, See [Figure 3. 3. 4: Midship strength deck stepping](#) and [Figure 3. 3. 5: Local strength deck stepping](#), is to be assumed at the ends of effective superstructures and at the end of stepped decks, where the longitudinal material cannot be included in the calculation of the hull section modulus. The length of the zone is to be taken as four times the deck height. Local insert plates are to be fitted in the side shell as appropriate with a thickness at least 25 per cent greater than the adjacent plating. They are to extend a minimum of one primary frame spacing forward and aft, but are to be not less than 1500 mm each way from the end of the transition zone. For vessels with complex arrangements or geometries, shadow plan areas are to be submitted.
3. 4. 3 A superstructure deck or stepped deck can only be considered as the strength deck and included in the calculation of hull midship section modulus if it extends at least the complete  $0.4L$  amidships and transversely to the side shell with transition zones being located aft and forward (as appropriate) outside of this length.
3. 4. 4 A superstructure deck or stepped deck can only be considered effective and used in local section modulus calculations if it extends at least  $0.15L$  and transversely to the side shell with the transition zones being located aft and forward outside of this length.

**Figure 3. 3. 4: Midship strength deck stepping**

**Figure 3. 3. 5: Local strength deck stepping**

3. 4. 5 Openings having a length in the fore and aft directions exceeding 2.5 m or  $0.1B$  m or a breadth exceeding 1.2 m or  $0.04B$  m, whichever is the lesser, are always to be deducted from the sectional areas used in the section modulus calculation.
3. 4. 6 Smaller openings (including manholes, lightening holes, single scallops in way of seams, etc.) need not be deducted provided they are isolated and the sum of their breadths or shadow area breadths (See [Pt 3, Ch 3, 3.4 Calculation of hull section modulus 3.4.9](#)), in one transverse section does not reduce the section modulus at deck or bottom by more than 3 per cent.
3. 4. 7 Where  $B_1$  equals the breadth of the ship at the section considered and  $\Sigma b_1$  equals the sum of breadths of deductible openings, the expression  $0.06 (B_1 - \Sigma b_1)$  may be used for deck openings in lieu of the 3 per cent limitation of reduction of section modulus in [Pt 3, Ch 3, 3.4 Calculation of hull section modulus 3.4.6](#).
3. 4. 8 Where a large number of openings are proposed in any transverse space, special consideration will be required.
3. 4. 9 When calculating deduction-free openings, the openings are assumed to have longitudinal extensions as shown by the shaded areas in [Figure 3. 3. 6: Deduction free openings shadow areas](#). The shadow area is obtained by drawing two tangent lines to an opening angle of  $30^\circ$ . The section to be considered should be perpendicular to the centreline of the ship and should result in the maximum deduction in each transverse space.

3. 4. 10 Isolated openings in longitudinals or longitudinal girders need not be deducted if their depth does not exceed 25 per cent of the web depth with a maximum depth for scallops of 75 mm.
3. 4. 11 Openings are considered isolated if they are spaced not less than 1 m apart.
3. 4. 12 For compensation that may be required for openings, *See* individual ship Chapters.
3. 4. 13 Where trunk decks or continuous hatch coamings are effectively supported by longitudinal bulkheads or deep girders, they are to be included in the longitudinal sectional area when calculating the hull section modulus. The lever  $z_t$  is to be taken as:

$$z_t = z_c(0.9 + 0.2 \frac{y}{B}) \text{ m but not less than } z$$

$y$  = horizontal distance from top of continuous strength member to the centreline of the ship, in metres

$Z$  = vertical distance from the neutral axis to the moulded deck line at side, in metres

$z_c$  = vertical distance from the neutral axis to the top of the continuous strength member, in metres

$z_c$  and  $y$  are to be measured to the point giving the largest value of  $z_t$ .

3. 4. 14 Where continuous hatch coamings are effectively supported (except inboard coamings of multi-hatch arrangements, *See* [Pt 3, Ch 3, 3.4 Calculation of hull section modulus 3.4.16](#)), 100 per cent of their sectional area may be included in the calculation of the hull section modulus.

**Figure 3. 3. 6: Deduction free openings shadow areas**

- 3. 4. 15 Where a continuous longitudinal underdeck girder, or girders, are arranged to support the inboard hatch coamings, 50 per cent of their sectional area may be included. If the girder is fitted in conjunction with a longitudinal centreline bulkhead, 100 per cent of the sectional area may be included. In cases where the girders are enclosed box sections, or where the girders are effectively tied to the bottom structure, the area to be included will be specially considered.
- 3. 4. 16 The percentage of the sectional area to be included for inboard continuous hatch side coamings should be the same percentage as that of the longitudinal girder under.
- 3. 4. 17 Where continuous deck longitudinals or deck girders are arranged above the strength deck, the sectional area may be included in the calculation of the hull section modulus. The lever is to be taken to a position corresponding to the depth of the longitudinal member above the moulded deckline at side amidships.

## CHAPTER 3 Structural Design

## SECTION 4 Bulkhead requirements

### 4. 1 Number and disposition of bulkheads

4. 1. 1 All ships are to have a collision bulkhead, an after peak bulkhead, generally enclosing the sterntubes in a watertight compartment, and a watertight bulkhead at each end of the machinery space. Additional watertight bulkheads are to be fitted so that the total number of bulkheads is at least in accordance with [Table 3. 4. 1: Total number of bulkheads](#).

**Table 3. 4. 1: Total number of bulkheads**

| Length, <i>L</i> , in metres  | Total number of bulkheads     |                                |
|---|-------------------------------|--------------------------------|
|   | Machinery amidships           | Machinery aft, <i>See Note</i> |
| ≤65   | 4                             | 3                              |
| >65    ≤85  | 4                             | 4                              |
| >85    ≤90  | 5                             | 5                              |
| >90    ≤105   | 5                             | 5                              |
| >105   ≤115   | 6                             | 5                              |
| >115   ≤125   | 6                             | 6                              |
| >125   ≤145   | 7                             | 6                              |
| >145   ≤165   | 8                             | 7                              |
| >165   ≤190   | 9                             | 8                              |
| >190  | To be considered individually |                                |
| <b>Note</b> With after peak bulkhead forming after boundary of machinery space. |                               |                                |

4. 1. 2 The bulkheads in the holds should be spaced at reasonably uniform intervals. Where non-uniform spacing is unavoidable and the length of a hold is unusually great, the transverse strength of the ship is to be maintained by fitting web frames, increased framing, etc. and details are to be submitted.
4. 1. 3 Proposals to dispense with one or more of these bulkheads will be considered, subject to suitable structural compensation, if they interfere with the requirements of a special trade.
4. 1. 4 Where applicable, the number and disposition of bulkheads are to be arranged to suit the requirements for subdivision, floodability and damage stability, and are to be in accordance with the requirements of the National Authority in the country in which the ship is registered.

## 4. 2 Collision bulkhead

4. 2. 1 A collision bulkhead shall be fitted which shall be watertight up to the bulkhead deck. This bulkhead shall be located at a distance from the forward side of the stem, on the waterline on which  $L_L$  is measured, of not less than  $0.05L_L$  or 10 m, whichever is the less, and, except as may be permitted by the Administration, not more than  $0.08L_L$  or  $0.05L_L+3\text{m}$ , whichever is the greater.
4. 2. 2 Where any part of the ship below the waterline extends forward of the forward side of the stem, on the waterline on which  $L_L$  is measured, e.g. a bulbous bow, the distances stipulated in [Pt 3, Ch 3, 4.2 Collision bulkhead 4.2.1](#) are to be measured from a point either:
  - a. at the mid-length of such extension;
  - b. at a distance  $0.015L_L$  forward of the forward side of the stem, on the waterline on which  $L_L$  is measured; or
  - c. at a distance 3 m forward of the forward side of the stem, on the waterline on which  $L_L$  is measured, whichever is the least.
4. 2. 3 No doors, manholes, access openings, ventilation ducts or any other openings shall be fitted in the collision bulkhead below the bulkhead deck.

## 4. 3 After peak bulkhead

4. 3. 1 All ships are to have an after peak bulkhead generally enclosing the sterntube and rudder trunk in a watertight compartment. In twin screw ships where the bossing ends forward of the after peak bulkhead, the sterntubes are to be enclosed in suitable watertight spaces inside or aft of the shaft tunnels. The sterntubes are to be enclosed in watertight spaces of moderate volume. In passenger ships, the stern gland is to be situated in a watertight shaft tunnel or other watertight space separate from the sterntube compartment and of such volume that, if flooded by leakage through the stern gland, the bulkhead deck will not be submerged.

## 4. 4 Height of bulkheads

4. 4. 1 The collision bulkhead is normally to extend to the uppermost continuous deck or, in the case of ships with combined bridge and forecastle or a long superstructure which includes a forecastle, to the superstructure deck. However, if a ship is fitted with more than one complete superstructure deck, the collision bulkhead may be terminated at the deck next above the freeboard deck. Where the collision bulkhead extends above the freeboard deck, the extension need only be to weathertight standards.
4. 4. 2 The after peak bulkhead may terminate at the first deck above the load waterline, provided that this deck is made watertight to the stern or to a watertight transom floor. In passenger ships, the after peak bulkhead is to extend watertight to the bulkhead deck. However, it may be stepped below the bulkhead deck provided the degree of safety of the ship as regards watertight subdivision is not thereby diminished.
4. 4. 3 The remaining watertight bulkheads are to extend to the freeboard deck. In passenger ships of restricted draught and all ships of unusual design, the height of the bulkheads will be specially considered.

## 4. 5 Watertight recesses, flats and loading ramps

4. 5. 1 Watertight recesses in bulkheads are generally to be so framed and stiffened as to provide strength and stiffness equivalent to the requirements for watertight bulkheads.
4. 5. 2 In collision bulkheads, any recesses or steps in the bulkhead are to fall within the limits of bulkhead positions given in [Pt 3, Ch 3, 4.2 Collision bulkhead 4.2.1](#). Where the bulkhead is extended above the freeboard deck or bulkhead deck, the extension need only be to weathertight

standards. If a step occurs at that deck, the deck need also only be to weathertight standards in way of the step, unless the step forms the crown of a tank, *See* [Pt 4, Ch 1, 4 Deck structure](#).

4. 5. 3 Where bow doors are fitted and a sloping loading ramp forms part of the extension of the collision bulkhead above the bulkhead deck the ramp shall be weathertight over its complete length. In cargo ships the part of the ramp which is more than 2.3 m above the bulkhead deck may extend forward of the limit specified in [Pt 3, Ch 3, 4.2 Collision bulkhead 4.2.1](#) or [Pt 3, Ch 3, 4.2 Collision bulkhead 4.2.2](#). Ramps not meeting the above requirements shall be disregarded as an extension of the collision bulkhead.
4. 5. 4 The number of openings in the extension of the collision bulkhead above the freeboard deck shall be restricted to the minimum compatible with the design and normal operation of the ship. All such openings shall be capable of being closed weathertight.

## 4. 6 Longitudinal subdivision

4. 6. 1 When timber load lines are to be assigned, double bottom tanks within the midship half-length are to have adequate longitudinal subdivision.

## 4. 7 Separation and protection of tanks

4. 7. 1 Where the cross contamination of liquids stored in adjacent tanks is hazardous to machinery, these tanks are to be separated by cofferdams. Hazardous pairings of liquid consumables include but are not limited to the following:
  - a. Fuel oil and lubricating oil;
  - b. Fuel oil and technical water (e.g. feedwater);
  - c. Lubricating oil and technical water;
  - d. Fuel oil and urea.
4. 7. 2 Tanks carrying liquids for the purposes of fire fighting (e.g. foam concentrate) are to be separated by cofferdams from adjacent tanks containing liquid fuels.
4. 7. 3 Tanks carrying fresh water for human consumption (potable water) are to be separated by cofferdams from adjacent tanks containing liquid substances harmful to human health. Fresh water for other purposes and water ballast are not considered harmful.
4. 7. 4 Where a cofferdam as specified in [Pt 3, Ch 3, 4.7 Separation and protection of tanks 4.7.1](#) is impracticable, special consideration may be given, subject to the arrangements complying with the following:
  - a. The thickness of common boundary plates is increased by 1 mm;
  - b. Common boundaries have full penetration welds.
4. 7. 5 Where a corner to corner situation occurs, tanks are not considered to be adjacent.
4. 7. 6 Where fitted, cofferdams are to be suitably ventilated, provided with a suitable drainage arrangement, *See* [Pt 5, Ch 13, 3.4 Tanks and cofferdams](#), and be of sufficient size to allow proper inspection, maintenance and safe evacuation.
4. 7. 7 If fuel oil tanks are necessarily located within or adjacent to the machinery spaces, their arrangement is to be such as to avoid direct exposure of the bottom from rising heat resulting from a machinery or hazardous space fire, *See also SOLAS - International Convention for the Safety of Life at Sea Chapter II-2 - Construction - Fire protection, fire detection and fire extinction Part B - Prevention of fire and explosion* 4.2.2.3.2.
4. 7. 8 For vessels which do not comply with the accidental fuel oil outflow performance standard given in MARPOL Annex 1, *Regulation 12A-11*, fuel oil tanks are to be bounded by double bottom and double side tanks or void spaces such that the distance between the fuel oil tank boundary and the shell plating is not less than that given in [Table 3. 4. 2: Fuel oil tank boundary requirements](#) and

[Figure 3. 4. 1: Fuel oil tank boundary lines](#). For double hull oil tankers where the requirements of [Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.17](#) conflict with this requirement [Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.17](#) is to take precedent. Alternatively the accidental oil outflow performance standard specified in MARPOL Annex 1 *Regulation 12A* may be complied with.

**Table 3. 4. 2: Fuel oil tank boundary requirements**

| Fuel oil tank capacity ( $C$ ),<br>$m^3$  | Minimum double side width ( $d_s$ )<br>metres  | Minimum double bottom depth ( $d_b$ )<br>metres   |
|---|--|---|
| $C \geq 5000$   | $d_s = 0.5 + \frac{C}{20000}$<br>or<br>whichever is the lesser,<br>but not less than 1.0       | $d_b = \frac{B}{20}$<br>or<br>$d_b = 2.0$<br>whichever is the lesser,<br>but not less than 0.76 |
| $600 \leq C < 5000$   | $d_s = 0.4 + \frac{2.4C}{20000}$<br>or<br>$d_s = 1.0$<br>whichever is the greater,<br>See Note | $d_b = \frac{B}{20}$<br>or<br>$d_s = 2.0$<br>whichever is the lesser,<br>but not less than 0.76 |
| $C < 600$   | $d_s = 0$  | $d_s = 0$   |
| <b>Symbols</b><br><br>$C$ the ship's total volume of fuel oil, including that of small fuel oil tanks, in $m^3$ , at 98 per cent tank filling<br>$d_b$ = the distance, in metres, between the bottom of the fuel oil tank and the moulded line of the bottom shell plating. In the turn of bilge area and at locations without a clearly defined turn of bilge, the fuel oil tank boundary line shall run parallel to the line of the midship flat bottom as shown in <a href="#">Figure 3. 4. 2: Definition of <math>d_b</math></a><br>$d_s$ = the distance, in metres, between the side of the fuel oil tank and the moulded line of the side shell plating, See <a href="#">Figure 3. 4. 1: Fuel oil tank boundary lines</a><br><br><b>Note 1.</b> However, for individual tanks with an fuel oil capacity of less than $500 m^3$ , the minimum distance is 0.76 m.<br><br><b>Note 2.</b> Fuel oil tanks with a maximum individual capacity not greater than $30 m^3$ need not comply with the requirements of this Table, provided the aggregate capacity of such excluded tanks is not greater than $600 m^3$ .<br><br><b>Note 3.</b> Suction wells in fuel oil tanks may protrude into the double bottom below the boundary line defined by the distance $d_b$ , provided that such wells are as small as practicable and the distance between the well bottom and the bottom shell plating is not less than $0.5d_b$ . |  |   |

**Figure 3. 4. 1: Fuel oil tank boundary lines**

**Figure 3. 4. 2: Definition of  $d_b$**

4. 7. 9 No individual fuel oil tank is to have a capacity greater than 2.500 m<sup>3</sup>.

## 4. 8 Watertight tunnels and passageways

- 4. 8. 1 Where a machinery space is situated with a compartment or compartments between it and the after peak bulkhead, the shafting is to be enclosed in a watertight tunnel large enough to permit proper examination and repair of shafting. A sliding watertight door, capable of being operated locally from both sides, is to be provided at the forward end of the tunnel. Consideration may, however, be given to the omission of the watertight door, subject to satisfactory compliance with any relevant statutory requirements. Where two or more shafts are fitted, the tunnels shall be connected by an interconnecting passage. There shall be only one door between the machinery space and the tunnel spaces where two shafts are fitted and only two doors where there are more than two shafts.
- 4. 8. 2 Pipe tunnels are to have dimensions adequate for reasonable access.
- 4. 8. 3 Where fore and aft underdeck passageways are arranged at the ship's side, the after access thereto is to be by a watertight trunk led to the upper deck. Alternative arrangements to prevent the engine room being flooded, in the event of a collision or if the passageway doors are left open, will be considered.

## 4. 9 Means of escape

- 4. 9. 1 For the requirements for means of escape, See SOLAS 1974 as amended *Regulation 13 - Means of escape*.

## **4. 10 Oil tankers**

4. 10. 1 For subdivision requirements within the cargo tank region for oil tankers, See [Pt 4, Ch 9, 1 General](#).

## CHAPTER 3 Structural Design

### SECTION 5 Design loading

5.1.1 This Section contains the design heads/pressures to be used in the derivation of scantlings for decks, tank tops and transverse bulkheads. These are given in [Table 3. 5. 1: Design heads and permissible cargo loadings](#).

**Table 3. 5. 1: Design heads and permissible cargo loadings**

| Structural item and position                                  | Component               | Standard stowage rate $C$ , in $\text{m}^3/\text{tonne}$ | Design loading $p$ , in $\text{kN/m}^2$ | Equivalent design head $h_i$ in metres | Permissible cargo loading in $\text{kN/m}^2$ | Equivalent permissible head, in metres |
|---|-------------------------|--|---|--|--|--|
| <b>Design heads and permissible cargo loadings (SI units)</b> |                         |  |   |  |  |  |
| Weather deck (general cargo)                                  |                         |  |   | $h_1$                                  |  |  |
| (a) Loading for minimum scantlings                            |                         |  |   |  |  |  |

## 5. 2 Symbols

5. 2. 1 The symbols used in this Section are defined as follows:

$L, L_{pp}, C_b, B, D$  and  $T$  as defined in [Pt 3, Ch 1, 6.1, Principal particulars](#)

$h_i$  = appropriate design head, in metres

$l_e$  = span of stiffener

$p$  = design loading, in kN/m<sup>2</sup>

$p_a$  = applied loading, in kN/m<sup>2</sup>

$C$  = stowage rate, in m<sup>3</sup>/tonne

$= \frac{h_i}{p}$  generally  
= volume of the hold, in m<sup>3</sup> excluding the volume contained within the depth of the cargo hatchway, divided by the weight of cargo, in tonnes, stowed in the hold, for inner bottom

$E$  = correction factor for height of platform  
 $= \frac{0.0914+0.003L}{D-T} - 0.15$ , but not less than zero nor more than 0.147

$H$  = height from tank top to deck at side, in metres

$H_c$  = 'tween deck height measured vertically on the centreline of the ship from 'tween deck to underside of hatch cover stiffeners on deck above, in metres

$H_{id}$  = cargo head in 'tween deck, in metres, as defined in [Figure 3. 5. 1: Heads for 'tween decks](#).

Figure 3. 5. 1: Heads for 'tween decks

Figure 3. 5. 2: Heads for watertight and deep tank bulkheads

(a) Heads for watertight and deep tank bulkheads in intact condition

(b) Heads for watertight bulkheads in damaged condition

5. 2. 2 The following symbols and definitions apply in particular to the design pressures for partially filled tanks:

$L_{pp}$  and  $C_b$  as defined in [Pt 3, Ch 1, 6.1, Principal particulars](#)

$b$  = height of internal primary bottom members, in metres

$F$  = fill height, in metres

$F_r$  = effective filling ratio

$$\frac{\pi}{L_s} (F - b \sqrt{\frac{n}{n+1}})$$

$GM$  = transverse metacentric height, in metres, including free surface correction, for the loading condition under consideration

$H_t$  = tank depth, in metres, measured from the bottom of the tank to the underside of the deck at side. In the case of holds, the depth is measured from the inner bottom to the underside of the deck at hatch side, except in double skin ships with hatch coaming in line with the inner skin, in which case, the depth is measured to the top of the hatch coaming

$N$  = number of internal primary bottom members

$L_s$  = the effective horizontal free surface length, in metres, in the direction of angular motion (i.e. tank breadth for roll, tank length for pitch)

$S_{nr}$  = ship's natural rolling period

$$= \frac{2.35_r}{\sqrt{GM}} \text{ seconds}$$

= for ships for which either  $r$  or  $GM$  varies significantly between loading conditions (for example, bulk carriers and tankers, *See* [Pt 3, Ch 3, 1.1 Application 1.1.3](#)),  $S_{nr}$  should be evaluated for each representative loading condition considered

$r$  = radius of gyration of roll, in metres, and may be taken as  $0.34B$

$S_{np}$  = ship's natural pitching period

$$= 3.5 \sqrt{TC_b} \text{ seconds}$$

= for ships for which either  $T$  or  $C_b$  varies significantly between loading conditions (for example, bulk carriers and tankers, *See* [Pt 3, Ch 3, 1.1 Application 1.1.3](#)),  $S_{np}$  should be evaluated for each representative loading condition considered

$T_{np}$  = fluid natural period of pitch

$$= \sqrt{\frac{4\pi L_s}{g \cdot \tanh(F_r)}} \text{ seconds}$$

$T_{nr}$  = fluid natural period of roll

$$\sqrt{\frac{4\pi L_s}{g \cdot \tanh(F_r)}} \text{ seconds}$$

$\theta_{\max}$  = maximum 'lifetime' pitch angle, in degrees

$$= (32.7 - 8.2C_b)e^{-0.001L_{pp}}(4.9 + 0.5C_b)$$

$$\varphi_{\max} = \text{maximum 'lifetime' roll angle, in degrees}$$

$$= (14.8 + 3.7 \frac{L_{pp}}{B})e^{-0.0023L_{pp}}$$

### 5.3 Stowage rate and design loads

- 5.3.1 Unless it is specifically requested otherwise, the following standard stowage rates are to be used:
- 1.39 m<sup>3</sup>/tonne for weather or general cargo loading on deck and inner bottom.
  - 0.975 m<sup>3</sup>/tonne for liquid cargo of density of 1.025 tonne/m<sup>3</sup> or less on watertight and tank divisions. For liquid of density greater than 1.025 tonne/m<sup>3</sup> the corresponding stowage rates are to be adopted.
- 5.3.2 Proposals to use a stowage rate greater than 1.39 m<sup>3</sup>/tonne for permanent structure will require special consideration, and will normally be accepted only in the case of special purpose designs such as fruit carriers, etc.
- 5.3.3 The design head and permissible cargo loading are shown in [Table 3.5.1: Design heads and permissible cargo loadings](#).

### 5.4 Design pressure for partially filled tanks

- 5.4.1 When partial filling of tanks or holds is contemplated for sea-going conditions, the risk of significant loads due to sloshing induced by any of the ship motions is to be considered. An initial assessment is to be made to determine whether or not a higher level of sloshing investigation is required, using the following procedure which corresponds to the Level 1 investigation outlined in the *SDA Procedure for Sloshing loads and scantling assessment*, on tanks partially filled with liquids.
- 5.4.2 In general, significant dynamic magnifications of the sloshing pressures are considered unlikely for the following cases:
- For internally stiffened tanks:
    - Where two (or more) deck girders (in the case of rolling) or deck transverses (in the case of pitching) are located not more than 25 per cent of the tank breadth or length respectively from the adjacent tank boundary, and the fill level is greater than the tank depth minus the height of the deck girders or transverses;
    - Where the deck girders or transverses, at any location, are less than 10 per cent of the tank depth, and the fill level is greater than the tank depth minus the height of the deck girders or transverses;
    - Where the fill level is less than the height of any bottom girders or transverses.
  - For smooth tanks:  
where the fill level is less than 10 per cent or more than 97 per cent of the tank depth.
- 5.4.3 Significant dynamic magnification of the fluid motions, and hence the sloshing pressure, can occur if either of the following conditions exist:
- The natural rolling period,  $T_{nr}$ , of the fluid and the ship's natural rolling period,  $S_{nr}$ , are within five seconds of each other.
  - The natural pitching period,  $T_{np}$ , of the fluid is greater than a value of three seconds below the ship natural pitching period,  $S_{np}$ .
- These values define the limits of the critical fill range for each tank.
- 5.4.4 The critical fill range,  $F_{crit}$ , is to be determined using the following formula:

$$F_{\text{crit}} = \left(\frac{100}{H_t}\right) \left[\left(\frac{L_s}{2\pi}\right) \ln \left(\frac{1+\eta}{1-\eta}\right) + b \sqrt{\frac{n}{n+1}}\right] \%$$

where

$\ln$  = natural logarithm to base e

$\eta$  =  $\frac{4\pi L_s}{[(S_{nr}-5)^2 g]}$  for fill level at  $S_{nr}-5$  seconds upper bound roll critical fill level

or  $\eta$  =  $\frac{4\pi L_s}{[(S_{nr}+5)^2 g]}$  for fill level at  $S_{nr}+5$  seconds lower bound roll critical fill level

or  $\eta$  =  $\frac{4\pi L_s}{[(S_{np}-3)^2 g]}$  for fill level at  $S_{np}-3$  seconds upper bound pitch critical fill level

or  $\eta$  =  $\frac{4\pi L_s}{[(S_{np})^2 g]}$  for fill level at  $S_{np}$  seconds

The lower bound pitch critical fill level is 0.1 per cent fill. The value of  $F_{\text{crit}}$  is limited to the range 0 to 100 per cent, *See also* [Pt 3, Ch 3, 5.4 Design pressure for partially filled tanks 5.4.6](#).

5. 4. 5 The natural periods of the ship for a given motion type are to be determined for the service loading conditions agreed between the Shipbuilder and ACS. From this aspect, the storm-ballast and the segregated ballast conditions and the condition with all tanks partially filled could be the most critical.

5. 4. 6 When a ship is to be approved for Unrestricted Filling Levels - Unspecified Loading Conditions, many arbitrary ship loading conditions are possible. In order to cover the complete range of loading conditions, the fully loaded and ballast conditions are to be considered. These two conditions give an upper and lower limit for the possible range of natural periods of the ship as shown in [Figure 3. 5. 3: Natural periods diagrams](#). Both the roll and pitch motion modes are to be examined.

Because of the unrestricted filling level requirement, the critical sloshing ranges extend from  $[S_{nrBallast}-5]$  to  $[S_{nrLoaded}+5]$  seconds in roll and from  $[S_{npBallast}-3]$  to  $[S_{npLoaded}]$  in pitch. Also, because of unrestricted filling levels, the ship natural period range extends from  $[S_{nBallast}]$  to  $[S_{nLoaded}]$  for both pitch and roll.

For sloshing in the roll motion mode shown in [Figure 3. 5. 3: Natural periods diagrams](#), the critical fill range extends from  $F_1$  to  $F_4$ . All fill levels between  $F_1$  and  $F_4$  are to be investigated:

- For fill levels between  $F_1$  and  $F_2$ ,  $S_{nrBallast}$  is to be used.
- For fill levels between  $F_3$  and  $F_4$ ,  $S_{nrLoaded}$  is to be used.
- For fill levels between  $F_2$  and  $F_3$ ,  $S_{nr}$  is to be equal to  $T_{nr}$ .

Similarly, for sloshing in the pitch motion mode shown in [Figure 3. 5. 3: Natural periods diagrams](#), the critical fill range extends from  $F_1$  to  $F_4$ . All fill levels between  $F_1$  and  $F_4$  are to be investigated.

- For fill levels between  $F_1$  and  $F_2$ ,  $S_{npBallast}$  is to be used.
- For fill levels between  $F_2$  and  $F_3$ ,  $S_{np}$  is to be equal to  $T_{np}$ .
- For fill levels between  $F_3$  and  $F_4$ ,  $S_{np}$  loaded is to be used.

**Figure 3. 5. 3: Natural periods diagrams**

5. 4. 7 When a ship is to be approved for Restricted Filling Levels - Unspecified Loading Conditions, many arbitrary ship loading conditions are possible within the restrictions imposed. In order to cover the complete range of loading conditions, the fully loaded and ballast conditions are to be considered. These two conditions give an upper and lower limit for the possible range of ship natural period. It is recognised that there might be ship natural period bands which will not be applicable as a result of the limitations on the fill levels. However, it is recommended that the Unrestricted Filling Levels - Unspecified Loading Conditions procedure outlined in [Pt 3, Ch 3, 5.4 Design pressure for partially filled tanks 5.4.6](#) be applied.
5. 4. 8 When a ship is to be approved for Unrestricted Filling Levels - Specified Loading Conditions, each specified loading condition is to be examined for the complete fill ranges to determine the critical sloshing fill range for each tank in both roll and pitch motion modes.
5. 4. 9 When a ship is to be approved for Restricted Filling Levels - Specified Loading Conditions, each specified loading condition is to be examined for the restricted fill ranges to determine the critical sloshing fill range for each tank in both roll and pitch motion modes.

- 5. 4. 10 here the assessment indicates that all the intended fill levels are outside the critical fill ranges and, therefore, significant sloshing will not occur, no further evaluation is required with regard to sloshing pressure. In such cases, the scantlings of the tank boundaries are to be determined in accordance with the relevant Rule requirements.
- 5. 4. 11 Where the separation of periods defined in [Pt 3, Ch 3, 5.4 Design pressure for partially filled tanks 5.4.3](#) is not met, other levels of assessment will be required as given in the *SDA Procedures for sloshing loads and scantling assessment*, on tanks partially filled with liquids.
- 5. 4. 12 The structural capability of the tank boundaries to withstand the dynamic sloshing pressures is to be examined. The magnitude of the predicted loads, together with the scantling calculations may be required to be submitted.

CHAPTER **3**    **Structural Design**

SECTION **6**    **Minimum bow heights, reserve buoyancy and extent of forecastle**

**6. 1    Minimum bow heights**

- 6. 1. 1    Ships are to comply with the Load Lines conventions, so far as these are applicable.
- 6. 1. 2    Bulk carriers, ore carriers and combination carriers are also to comply with the requirements of [Pt 4, Ch 7, 14 Forecastles](#).

**6. 2    Extent of forecastle**

- 6. 2. 1    Forecastles are to extend from the stem to a point at least  $0.07L_L$  abaft the forward end of  $L_L$  (as defined in [Pt 3, Ch 1, 6.1, Principal particulars](#)). If the minimum bow height is obtained by increasing the sheer of the upper deck, the sheer is to extend for at least  $0.15L_L$  abaft the forward end of  $L_L$ .
- 6. 2. 2    Bulk carriers, ore carriers and combination carriers are also to comply with the requirements of [Pt 4, Ch 7, 14 Forecastles](#).
- 6. 2. 3    Forecastles are to be enclosed; that is with enclosing bulkheads of efficient construction and access openings complying with [Pt 3, Ch 11 Closing Arrangements for Shell, Deck and Bulkheads](#) and all other openings in sides or ends fitted with efficient weathertight means of closing.

CHAPTER **4** **Longitudinal Strength**

SECTION **1** **Definitions**

## **1. 1 List of symbols**

1. 1. 1 The following symbols definitions are applicable to this Chapter, unless otherwise stated:  
 $L$ ,  $B$ ,  $D$ ,  $C_b$  and  $V =$  are as defined in [Pt 3, Ch 1, 6.1, Principal particulars](#)  
 $k_L$ ,  $k$  = higher tensile steel factor, See [Pt 3, Ch 2, 1.2, Steel](#)

CHAPTER **4** **Longitudinal Strength**SECTION **2** **General****2. 1 Longitudinal strength calculations**

- 2. 1. 1 Longitudinal strength calculations are to be carried out for all ships where  $L$  is greater than 65 m, covering the range of load and ballast conditions proposed, in order to determine the required hull girder strength. The calculations of still water shear forces and bending moments are to cover both departure and arrival conditions and any special mid-voyage conditions caused by changes in ballast distribution.
- 2. 1. 2 For ships where  $L$  is equal to or less than 65 m, longitudinal strength calculations may be required, dependent upon proposed loading.
- 2. 1. 3 Specific information regarding required loading conditions is given in the individual ship type Chapters.

**2. 2 Erections contributing to hull strength**

- 2. 2. 1 In general, where a long superstructure or deckhouse of length greater than  $0.15L$  is fitted, extending within the  $0.5L$  amidships, the requirements for longitudinal strength in the hull and erection will be considered in each case.

**2. 3 Open type ships**

- 2. 3. 1 For ships other than container ships which have large deck openings and where the structural configuration is such that warping stresses in excess of  $14.7 \text{ N/mm}^2$  are likely to occur, local increases in section modulus, based normally on the combined stress diagram undertaken for container ships, may be required. For calculations for container ships, See [Pt 4, Ch 8, 3 Longitudinal strength](#).
- 2. 3. 2 For ships with large deck openings such as containerships, sections at or near to the aft and forward quarter length positions are to be checked. For such ships with cargo holds aft of the superstructure, deckhouse or engine room, strength checks of sections in way of the aft end of the aft-most holds, and the aft end of the deckhouse or engine room are to be performed.

**2. 4 Ships with large flare**

- 2. 4. 1 In ships of length between 120 and 170 m and maximum service speed greater than 17.5 knots, in association with a bow shape factor of more than 0.15, the Rule hull midship section modulus and the distribution of longitudinal material in the forward half-length will be specially considered, See [Pt 4, Ch 1, 3 Longitudinal strength](#).

## **2. 5 Direct calculation procedures**

- 2. 5. 1 In direct calculation procedures capable of deriving the wave induced loads on the ship, and hence the required modulus, account is to be taken of the ship's actual form and weight distribution.
- 2. 5. 2 Asia Classification Society (hereinafter referred to as 'ACS') direct calculation method involves derivation of response to regular waves by appropriate sea keeping software, short-term response to irregular waves using the sea spectrum concept, and long-term response predictions using statistical distributions of sea states. Other direct calculation methods submitted for approval should normally contain these three elements and produce similar and consistent results when compared with ACS's methods.

## **2. 6 Approved calculation systems**

- 2. 6. 1 Where the assumptions, method and procedures of a longitudinal strength calculation system have received general approval from ACS, calculations using the system for a particular ship may be submitted.

CHAPTER **4** **Longitudinal Strength**SECTION **3** **Application****3. 1** **Symbols**

3. 1. 1 The symbols used in this Section are defined as follows:

- $b$  = breadth, in metres, of the hatch opening. Where there are multiple openings abreast, these are regarded as a single opening, and  $b$  is to be the sum of the individual breadths of these openings
- $l_H$  = length of the hatch opening, in metres
- $l_{BH}$  = distance, in metres, between centres of the deck strip at each end of the hatch opening. Where there is no further opening beyond the one under consideration, the point to which  $l_{BH}$  is measured will be considered, *See also* [Figure 4. 3. 1: Deck opening size](#)
- $B_1$  = extreme breadth of deck including hatch opening, measured at the mid-length of the opening, in metres.

**Figure 4. 3. 1: Deck opening size**

## 3. 2 General

3. 2. 1 The requirements of this Chapter apply to sea-going steel ships, of normal form, proportions and speed, unless direct calculation procedures are adopted, in which case the assumptions made and the calculations performed are to be submitted for approval.
3. 2. 2 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a CSR notation. See [Pt 1, Ch 2, 2.3 Class notations \(hull\)](#).

## 3. 3 Exceptions

3. 3. 1 Individual consideration based on direct calculation procedures will generally be required for ships having one or more of the following characteristics:
  - Length  $L$  greater than 400 m.
  - Speed  $V$  greater than that defined in [Table 4. 3. 1: Ship speed criteria](#) for the associated block coefficient.
  - Unusual type or design.
  - Unusual hull weight distribution.
  - $\frac{L}{B} \leq 5$ . or  $\frac{B}{D} \geq 2.5$
  - Large deck openings, or where warping stresses in excess of 14.7 N/mm<sup>2</sup> are likely to occur.
  - Openings for side loading in way of both sheerstrake and stringer.

- $C_b < 0.6$
- Carriage of heated cargo, See [Pt 4, Ch 9, 12 Cargo temperatures](#).

**Table 4. 3. 1: Ship speed criteria**

| Ship length $L, m$  | $C_b$    | Speed, knots |
|---|----------|--------------|
| $\leq 200$  | $> 0.80$ | 17           |
|   | $= 0.70$ | 19.5         |
|   | $< 0.60$ | 22           |
| $> 200$   | $> 0.80$ | 18           |
|   | $= 0.70$ | 21.5         |
|   | $< 0.60$ | 25           |
| <b>Note</b> Intermediate values of speed to be obtained by linear interpolation for $C_b$ |          |              |

3. 3. 2 A ship is regarded as having large deck openings if both the following conditions apply to any one opening:

$$\frac{b}{B_1} > 0.6$$

$$\frac{l_H}{l_{BH}} > 0.7$$

See also [Figure 4. 3. 1: Deck opening size](#).

PART

# 3

CHAPTER **4 Longitudinal Strength**

SECTION **4 Information required**

## **4. 1 List of requirements**

- 4. 1. 1 In order that an assessment of the longitudinal strength requirements can be made, the following information is to be submitted, in ACS's standard format where appropriate.
  - a. General arrangement and capacity plan or list, showing details of the volume and position of centre of gravity of all tanks and compartments.
  - b. Bonjean data, in the form of tables or curves, for at least 21 equally spaced stations along the hull. A lines plan and/or tables of offsets may also be required.
  - c. Details of the calculated lightweight and its distribution.
  - d. Loading Manual.
  - e. Details of the weights and centres of gravity of all deadweight items for each of the main loading conditions for individual ship types specified in [Pt 4 Ship Structures \(Ship Types\)](#). It is recommended that this information be submitted in the form of a preliminary Loading Manual, and that it includes the calculated still water bending moments and shear forces.
- 4. 1. 2 For final Loading Manual, See [Pt 3, Ch 4, 8 Loading guidance information](#).

**5. 1 Symbols**

5. 1. 1 The symbols used in this Section are defined as follows:

|                      |   |  |
|----------------------|---|--|
| $f_1$                | = | ship service factor  |
| $f_2$                | = | wave bending moment factor   |
| $F_B$                | = | local scantling reduction factor for hull members below the neutral axis, <i>See</i> <a href="#">Pt 3, Ch 4, 5.7, Local reduction factors</a>  |
| $F_D$                | = | local scantling reduction factor for hull members above the neutral axis, <i>See</i> <a href="#">Pt 3, Ch 4, 5.7, Local reduction factors</a>  |
| $I_{min}$            | = | minimum moment of inertia, of the hull midship section about the transverse neutral axis, in m <sup>4</sup>  |
| $M_s$                | = | design still water bending moment, sagging (negative) and hogging (positive), in kN m, to be taken negative or positive according to the convention given in <a href="#">Pt 3, Ch 4, 5.3 Design still water bending moments 5.3.2</a>        |
| $\bar{M}_s$          | = | maximum permissible still water bending moment, sagging (negative) and hogging (positive), in kN m, <i>See</i> <a href="#">Pt 3, Ch 4, 5.4, Minimum hull section modulus</a>   |
| $M_w$                | = | design hull vertical wave bending moment, sagging (negative) and hogging (positive), in kN m, to be taken negative or positive according to the convention given in <a href="#">Pt 3, Ch 4, 5.3 Design still water bending moments 5.3.2</a> |
| $Z_c$                | = | actual hull section modulus, in m <sup>3</sup> , at continuous strength member above strength deck, calculated with the lever specified in <a href="#">Pt 3, Ch 3, 3.4, Calculation of hull section modulus</a>                              |
| $Z_D, Z_B$           | = | actual hull section moduli, in m <sup>3</sup> , at strength deck and keel respectively, <i>See</i> <a href="#">Pt 3, Ch 3, 3.4, Calculation of hull section modulus</a>  |
| $Z_{min}$            | = | minimum hull midship section modulus about the transverse neutral axis, in m <sup>3</sup>  |
| $\sigma$             | = | permissible combined stress (still water plus wave), in N/mm <sup>2</sup> , <i>See</i> <a href="#">Pt 3, Ch 4, 5.5, Permissible still water bending moments</a>  |
| $\sigma_D, \sigma_B$ | = | maximum hull vertical bending stress at strength deck and keel respectively, in N/mm <sup>2</sup>  |

$z$  = vertical distance from the hull transverse neutral axis to the position considered, in metres

$z_M$  = vertical distance, in metres, from the hull transverse neutral axis to the minimum limit of higher tensile steel, as defined in [Pt 3, Ch 3, 2.6 Vertical extent of higher tensile steel](#), above or below the neutral axis as appropriate.

## 5.2 Design vertical wave bending moments

- 5.2.1 The appropriate hogging or sagging design hull vertical wave bending moment at amidships is given by the following:

$$M_w = f_1 f_2 M_{wo}$$

where

$C_b$  = is to be taken not less than 0.60

$C_1$  = is given in [Table 4. 5. 1: Wave bending moment factor](#)

$C_2$  = 1, (also defined in [Pt 3, Ch 4, 5.2 Design vertical wave bending moments 5.2.2](#) at other positions along the length  $L$ )

$f_1$  = ship service factor. To be specially considered depending upon the service restriction and in any event should be not less than 0.5. For unrestricted sea-going service  $f_1 = 1.0$

$f_2$  = -1.1 for sagging (negative) moment

Where

$f_2$  =  $\frac{1.9C_b}{(C_b + 0.7)}$  for hogging (positive) moment

$M_{wo}$  =  $0.1C_1C_2L^2B(C_b + 0.7)$  kN m

=  $(0.0102C_1C_2L^2B(C_b + 0.7))$  tonne – f m

Consideration will be given to direct calculations of long-term vertical wave bending moments, See [Pt 3, Ch 4, 2.6 Approved calculation systems](#).

**Table 4. 5. 1: Wave bending moment factor**

| Length $L$ , in metres | Factor $C_1$                          |
|------------------------|---------------------------------------|
| <90                    | $0.0412L + 4.0$                       |
| 90 to 300              | $10.75 - (\frac{300 - L}{100})^{1.5}$ |
| $> 300 \leq 350$       | 10.75                                 |
| $> 350 \leq 500$       | $10.75 - (\frac{L - 350}{150})^{1.5}$ |

- 5.2.2 The longitudinal distribution factor,  $C_2$ , of wave bending moment is to be taken as follows:
- 0 at the aft end of  $L$
  - 1.0 between  $0.4L$  and  $0.65L$  from aft

- 0 at the forward end of  $L$

Intermediate values are to be determined by linear interpolation.

5. 2. 3 For operation in sheltered water or short voyages, a higher permissible still water bending moment can be assigned based on a reduced vertical wave bending moment given by:
- For operating in sheltered water:
    - $M_w = 0.5f_2M_{w0}$
  - For short voyages:
    - $M_w = 0.8f_2M_{w0}$
- These expressions can only be used in the expression for permissible still water bending moment, See [Pt 3, Ch 4, 5.4, Minimum hull section modulus](#), and the relevant loading conditions are to be included in the Loading Manual, See [Pt 3, Ch 4, 8.1 General](#).
5. 2. 4 Short voyages' are defined as voyages of limited duration in reasonable weather. 'Reasonable weather' and 'sheltered water' are defined in [Pt 1, Ch 2, 2 Character of classification and class notations](#).

### 5. 3 Design still water bending moments

5. 3. 1 The design still water bending moment,  $M_s$ , hogging and sagging is the maximum moment calculated from the loading conditions, given in [Pt 3, Ch 4, 5.3 Design still water bending moments 5.3.3](#), and is to satisfy the following relationship:

$$|M_s| \leq |\overline{M}_s|$$

5. 3. 2 Still water bending moments are to be calculated along the ship length. For these calculations, downward loads are to be taken as positive values and are to be integrated in the forward direction from the aft end of  $L$ . Hogging bending moments are positive.
5. 3. 3 In general, the following loading conditions, based on amount of bunkers, fresh water and stores at departure and arrival, are to be considered.
- General cargo ships, container ships, passenger ships, roll on-roll off ships and refrigerated cargo carriers:
    - Homogeneous loading conditions, at maximum draught.
    - Ballast conditions.
    - Special loading conditions, e.g. container or light load conditions at less than the maximum draught, heavy cargo, empty holds or non-homogeneous cargo conditions, deck cargo conditions, etc. where applicable.
  - Bulk carriers (See [Pt 3, Ch 4, 3.2 General 3.2.2](#)), ore carriers and combination carriers
    - For ships of length,  $L$ , less than 150 m:
 

Alternate hold loading conditions at maximum draught, where applicable.

Homogeneous loading conditions at maximum draught.

Ballast conditions, including intermediate conditions associated with ballast exchange at sea.

Special conditions, e.g. deck cargo conditions.

For combination carriers, the conditions as specified in (c) for oil tankers are also to be considered.
    - For ships of length,  $L$ , 150 m or above:
 

Alternate light and heavy cargo loading conditions at maximum draught, where applicable.

Homogeneous light and heavy cargo loading conditions at maximum draught.

Ballast conditions. Where vessels are designed with a ballast hold adjacent to topside wing, hopper and double bottom tanks, the structure design is to be such that the ballast hold can be filled with all adjacent tanks empty;

Short voyage conditions where the ship is loaded to maximum draught with reduced bunkers, where applicable.

Multiple port loading/unloading conditions, where applicable.

Deck cargo conditions, where applicable.

Typical loading and discharging sequences from commencement to end of cargo operation, for homogeneous, alternate and part load conditions, where applicable.

Typical sequences for exchange of ballast at sea, where applicable.

For combination carriers, the conditions as specified in (c) for oil tankers are also to be considered.

For bulk carriers, the conditions as specified in [Pt 3, Ch 4, 5.4, Minimum hull section modulus](#) for the relevant notation are also to be considered.

- c. Oil tankers (*See* [Pt 3, Ch 4, 3.2 General 3.2.2](#)):
  - i. Homogeneous loading conditions (excluding dry and clean ballast tanks) and ballast or part loaded conditions.
  - ii. Any specified non-uniform distribution of loading.
  - iii. Mid-voyage conditions relating to tank cleaning or other operations where these differ significantly from the ballast conditions.
- d. Chemical tankers:
  - i. Conditions as specified for oil tankers.
  - ii. Conditions for high density or segregated cargo.
- e. Liquefied gas carriers:
  - i. Homogeneous loading conditions for all approved cargoes.
  - ii. Ballast conditions.
  - iii. Cargo conditions where one or more tanks are empty or partially filled or where more than one type of cargo having significantly different densities is carried.
- f. All ships:
  - i. Any other loading condition likely to result in high bending moments and/or shear forces (including docking conditions, as appropriate).

- 5.3.4 Where the amount and disposition of consumables at any intermediate stage of the voyage are considered more severe, calculations for such intermediate conditions are to be submitted in addition to those for departure and arrival conditions. Also where any ballasting and/or de-ballasting is intended during voyage, calculations of the intermediate condition just before and just after ballasting and/or de-ballasting any tank are to be submitted and, where approved, included in the loading manual for guidance.

- 5.3.5 Ballast loading conditions involving partially filled peak and/or other ballast tanks at departure, arrival or during intermediate conditions are not permitted as design conditions unless the design stress limits are satisfied for all filling levels between empty and full, and for bulk carriers the requirements of [Pt 4, Ch 7, 3 Longitudinal strength](#), as applicable, are to be complied with for all filling levels between empty and full, it will be acceptable if, in each condition at departure, arrival and where required by [Pt 3, Ch 4, 5.3 Design still water bending moments 5.3.3](#), any intermediate condition, the tanks intended to be partially filled are assumed to be:
  - empty
  - full
  - partially filled at intended level.

Where multiple tanks are intended to be partially filled, all combinations of empty, full or partially filled at intended level for those tanks are to be investigated. However, for conventional ore carriers with large wing water ballast tanks in cargo area, where empty or full ballast water filling levels of one or maximum two pairs of these tanks lead to the ship's trim exceeding one of the following conditions, it is sufficient to demonstrate compliance with maximum, minimum and

intended partial filling levels of these one or maximum two pairs of ballast tanks such that the ship's condition does not exceed any of these trim limits. Filling levels of all other wing ballast tanks are to be considered between empty and full. The trim conditions mentioned above are:

- trim by stern of 3 per cent of the ship's length, or
- trim by bow of 1.5 per cent of ship's length, or
- any trim that cannot maintain propeller immersion ( $I/D$ ) not less than 25 per cent, where;

$I$  = the distance from propeller centreline to the waterline, See [Figure 4. 5. 1: Propeller immersion](#)

$D$  = propeller diameter, See [Figure 4. 5. 1: Propeller immersion](#)

The maximum and minimum filling levels of the above mentioned pairs of side ballast tanks are to be indicated in the loading manual.

5. 3. 6 When considering cargo loading conditions, the requirements of [Pt 3, Ch 4, 5.3 Design still water bending moments 5.3.5](#) apply to peak tanks only.

**Figure 4. 5. 1: Propeller immersion**

5. 3. 7 When considering ballast water exchange using the sequential method, the requirements of [Pt 3, Ch 4, 5.3 Design still water bending moments 5.3.5](#) and [Pt 3, Ch 4, 5.3 Design still water bending moments 5.3.6](#) do not apply. However, bending moment and shear force calculations for each de-ballasting or ballasting stage in the ballast water exchange sequence are to be included in the loading manual or ballast water management plan of any vessel that intends to employ the sequential ballast water exchange method.

## 5. 4 Minimum hull section modulus

5. 4. 1 The hull midship section modulus about the transverse neutral axis, at the deck or the keel, is to be not less than:

$$Z_{\min} = f_1 k_L C_1 L^2 B (C_b + 0.7) \times 10^{-6} \text{m}^3$$

=and  $f_1$  is to be taken not less than 0.5.

5. 4. 2 For materials to be included in the calculation of actual hull section properties, See [Pt 3, Ch 3, 3 Structural idealisation](#).
5. 4. 3 The midship section modulus for ships with a service restriction notation is to be not less than half the minimum value required for unrestricted service.

5. 4. 4 Scantlings of all continuous longitudinal members of the hull girder based on the minimum section modulus requirements given in [Pt 3, Ch 4, 5.4 Minimum hull section modulus 5.4.1](#) are to be maintained within 0.4L amidships. However, in special cases, based on consideration of type of ship, hull form and loading conditions, the scantlings may be gradually reduced towards the ends of the 0.4L part, bearing in mind the desire not to inhibit the vessel's loading flexibility.
5. 4. 5 Outside 0.4L amidships, as a minimum, hull girder bending strength checks are to be carried out at the following locations:
- In way of the forward end of the engine room.
  - In way of the forward end of the foremost cargo hold.
  - At any locations where there are significant changes in hull cross-section.
  - At any locations where there are changes in the framing system.

## 5. 5 Permissible still water bending moments

5. 5. 1 The permissible still water bending moments sagging and hogging are to be taken as the lesser of the following:

$$a. \quad |\overline{M}_s| = F_D \sigma Z_D \times 10^3 - |M_w| \text{ kN m}$$

$$b. \quad |\overline{M}_s| F_B \sigma Z_B \times 10^3 - |M_w| \text{ kN m}$$

where

$\sigma$  = the permissible combined stress in N/mm<sup>2</sup> is given in [Pt 3, Ch 4, 5.6, Permissible hull vertical bending stresses](#) and  $F_D$  and  $F_B$  are defined in [Pt 3, Ch 4, 5.7 Local reduction factors 5.7.2](#).  $M_w$  is the design wave bending moment, sagging or hogging as appropriate, in accordance with [Pt 3, Ch 4, 5.2, Design vertical wave bending moments](#).

## 5. 6 Permissible hull vertical bending stresses

5. 6. 1 The permissible combined (still water plus wave) stress for hull vertical bending,  $\sigma$ , is given by:
- within 0.4L amidships

$$\sigma = \frac{175}{k_L} \text{ N/mm}^2$$

- for continuous longitudinal structural members outside 0.4L amidships

$$\sigma = (75 + 543 \frac{d}{L} - 699 (\frac{d}{L})^2) \frac{1}{k_L} \text{ N/mm}^2$$

where  $d$  is the distance, in metres, from the F.P. (for the fore end region) or from the A.P. (for the aft end region), as appropriate, to the location under consideration.

Special consideration will be given to increasing the permissible stress outside 0.4L amidships to

$$\frac{175}{k_L} \text{ N/mm}^2$$

provided that sufficient buckling checks are carried out.

- The requirements for ships of special or unusual design and for the carriage of special cargoes will be individually considered.

## 5.7 Local reduction factors

- 5.7.1 The maximum hull vertical bending stresses at deck,  $\sigma_D$ , and keel,  $\sigma_B$ , are given by the following, using the appropriate combination of bending moments to give sagging and hogging stresses:

$$\sigma_D = \frac{|\bar{M}_s + M_w|}{Z_D} \times 10^{-3} \text{ N/mm}^2$$

$$\sigma_B = \frac{|\bar{M}_s + M_w|}{Z_B} \times 10^{-3} \text{ N/mm}^2$$

Where the ship is always in the hogging condition, the sagging bending moment is to be specially considered.

- 5.7.2 Where the maximum hull vertical bending stress at deck or keel is less than the permissible combined stress,  $\sigma$ , reductions in local scantlings within  $0.4L$  amidships may be permitted. The reduction factors applicable in [Pt 4 Ship Structures \(Ship Types\)](#) are defined as follows:
- a. For hull members above the neutral axis

$$F_D = \frac{\sigma_D}{\sigma}$$

- b. For hull members below the neutral axis

$$F_B = \frac{\sigma_B}{\sigma}$$

In general, the values of  $\sigma_D$  and  $\sigma_B$  to be used are the greater of the sagging or hogging stresses, and  $F_D$  and  $F_B$  are not to be taken less than 0.67 for plating and 0.75 for longitudinal stiffeners.

- 5.7.3 Where higher tensile steel is used in the hull structure, the values of  $F_D$  and  $F_B$  for the mild steel part are to be taken as not less than  $\frac{Z}{Z_M}$

## 5.8 Hull moment of inertia

- 5.8.1 The hull midship section moment of inertia about the transverse neutral axis is to be not less than the following using the maximum total bending moment, sagging or hogging:

$$I_{min} = \frac{3L(|\bar{M}_s + M_w|)}{k_L \sigma} \times 10^{-5} \text{ m}^4$$

where values of  $\sigma$  are given in [Pt 3, Ch 4, 5.6 Permissible hull vertical bending stresses 5.6.1](#).

In addition for vessels with  $L \geq 90$  m the hull midship section moment of inertia is not to be less than the following:

$$I_{min} = 3C_1 L^3 B (C_b + 0.7) \times 10^{-8} \text{ m}^4$$

where  $C_1$  is given in [Pt 3, Ch 4, 5.2 Design vertical wave bending moments 5.2.1](#).

## 5.9 Continuous strength members above strength deck

- 5.9.1 Where trunk decks or continuous hatch coamings are effectively supported or deck longitudinals or girders are fitted above the strength deck, the modulus  $Z_c$  is to be not less than  $Z_{min}$ . The scantling reduction factor,  $F_D$ , referred to strength deck at side, is applicable and, in addition to the requirement given in [Pt 3, Ch 4, 5.5 Permissible still water bending moments 5.5.1](#), the permissible still water bending moments, sagging and hogging, are not to exceed:

$$|\bar{M}_s| = \sigma Z_c \times 10^3 - |M_w| \text{ kNm}$$

where

$M_w$  = is the design wave bending moment sagging or hogging, as appropriate, in accordance with [Pt 3, Ch 4, 5.2, Design vertical wave bending moments](#).

## CHAPTER 4 Longitudinal Strength

## SECTION 6 Hull shear strength

## 6.1 Symbols

- 6.1.1 The symbols used in this Section are defined as follows:

$q_v$  = unit shear flow per mm along the cross-section under consideration, in N/mm, See [Pt 3, Ch 4, 6.2 General 6.2.2](#) and [Pt 3, Ch 4, 6.2 General 6.2.3](#)

$Q_s$  = design hull still water shear force, in kN, to be taken as negative or positive according to the convention given in [Pt 3, Ch 4, 6.4 Design still water shear force 6.4.2](#)

$\overline{Q}_s$  = permissible hull still water shear force, in kN, See [Pt 3, Ch 4, 6.5, Permissible still water shear force](#)

$Q_w$  = design hull wave shear force, in kN, to be taken as negative or positive according to the convention given in [Pt 3, Ch 4, 6.4 Design still water shear force 6.4.2](#)

$\tau$  = permissible combined shear stress (still water plus wave), in N/mm<sup>2</sup>, See [Pt 3, Ch 4, 6.6 Permissible shear stress](#)

$\tau_A$  = design shear stress, in N/mm<sup>2</sup>, as given in [Pt 3, Ch 4, 6.7 Design shear stress 6.7.1](#)

## 6.2 General

- 6.2.1 For ships with length  $L$  greater than 65 m, the shear forces on the hull structure are to be investigated.
- 6.2.2 Shear flow calculation procedures are generally to be in accordance with *ACSPlus Guidelines Additional calculation procedures for longitudinal strength*.
- 6.2.3 Where shear flow calculation procedures, other than those available within *ACSPlus* are employed, the requirements of [Pt 3, Ch 1, 3 Equivalents](#) are to be complied with.
- 6.2.4 For passenger ships, the assessment of permissible still water shear forces is to take into consideration the effectiveness of the continuous superstructures and the sizes and arrangements of window and door openings.
- 6.2.5 Where longitudinal bulkheads are perforated by cut-outs, the assessment of permissible still water shear forces is to take into consideration the loss of material.
- 6.2.6 For ships where the side shell, side casings, superstructure or longitudinal bulkheads contain large openings or large numbers of windows or openings, consideration is to be given to assessing the permissible still water shear forces using direct calculation techniques.

## 6.3 Design wave shear force

- 6.3.1 The design wave shear force,  $Q_w$ , at any position along the ship is given by:

$$Q_w = K_1 K_2 Q_{w0} \text{ kN}$$

where

$$Q_{wo} = 0.3C_1LB(C_b + 0.7)$$

$C_1$  is given in [Table 4. 5. 1: Wave bending moment factor](#) and is to be taken not less than 0.6 .

$K_1$  is to be taken as follows, *See also* [Figure 4. 6. 1: Shear force factor  \$K\_1\$](#) :

- a. Positive shear force

$$\begin{aligned} K_1 &= 0 \text{ at aft end of } L \\ &= \frac{1.589C_b}{(C_b + 0.7)} \text{ between } 0.2L \text{ and } 0.3L \text{ from aft} \\ &= 0.7 \text{ between } 0.4L \text{ and } 0.6L \text{ from aft} \\ &= 1.0 \text{ between } 0.7L \text{ and } 0.85L \text{ from aft} \\ &= 0 \text{ at forward end of } L \end{aligned}$$

- b. Negative shear force

$$\begin{aligned} K_1 &= 0 \text{ at aft end of } L \\ &= -0.92 \text{ between } 0.2L \text{ and } 0.3L \text{ from aft} \\ &= -0.7 \text{ between } 0.4L \text{ and } 0.6L \text{ from aft} \\ &= \frac{1.727C_b}{(C_b + 0.7)} \text{ between } 0.7L \text{ and } 0.85L \text{ from aft} \\ &= 0 \text{ at forward end of } L \end{aligned}$$

- c. Intermediate values to be determined by linear interpolation.

$$\begin{aligned} K_2 &= 1.0 \text{ for unrestricted sea-going service conditions} \\ &= 0.8 \text{ for short voyages} \\ &= 0.5 \text{ for operation in sheltered water.} \end{aligned}$$

## 6. 4 Design still water shear force

6. 4. 1 The design still water shear force,  $Q_s$ , at each transverse section along the hull is to be taken as the maximum positive and negative value found from the longitudinal strength calculations for each of the loading conditions given in [Pt 3, Ch 4, 5.3 Design still water bending moments 5.3.3](#) and is to satisfy the following relationship:

$$|Q_s| \leq |\bar{Q}_s|$$

6. 4. 2 Still water shear forces are to be calculated at each section along the ship length. For these calculations, downward loads are to be taken as positive values and are to be integrated in a forward direction from the aft end of  $L$ . The shear force is positive when the algebraic sum of all vertical forces aft of the section is positive.

Figure 4. 6. 1: Shear force factor  $K_1$

6. 4. 3 For hull configurations where there are no longitudinal bulkheads (not including the inner hull) and where loading conditions feature either:

- cargo loading with specified or alternative cargo holds (or cargo tanks) empty; or
- ballasting of cargo hold(s);

the actual shear forces obtained from the longitudinal strength calculations are to be corrected for the effect of local forces at the transverse bulkheads. The calculation of these local forces is to be submitted for approval or, alternatively, the proportion of the double bottom load carried by the transverse bulkhead can be arrived at by using the following bulkhead factor  $F$ :

$$F = \frac{1}{1 + 1.5\alpha^{1.65}}$$

where

$$\alpha = \frac{S_H}{I_F}$$

$I_F$  = span of floors measured to the intersection of the hopper or ship's side, and inner bottom, in metres

$S_H$  span of floors measured to the intersection of the hopper or ship's side, and inner bottom, in metres

6. 4. 4 If the hull shear forces in kN at transverse bulkheads A and B are calculated to be  $Q_A$  and  $Q_B$  respectively (with appropriate algebraic signs), the excess load or buoyancy over hold AB is given by  $Q_B - Q_A$  and the load transmitted to each bulkhead is:

$$0.5F(Q_B - Q_A)\text{kN}$$

where  $F$  is the bulkhead factor as given in [Pt 3, Ch 4, 6.4 Design still water shear force 6.4.3](#). See [Figure 4. 6. 2: Shear force correction](#).

**Figure 4. 6. 2: Shear force correction**

6. 4. 5 The corrected shear forces,  $Q'_A$  and  $Q'_B$ , at bulkheads A and B with respect to hold AB are then obtained from:

$$Q'_A = Q_A + 0.5F(Q_B - Q_A)\text{kN}$$

$$Q'_B = Q_B + 0.5F(Q_B - Q_A)\text{kN}$$

## 6. 5 Permissible still water shear force

6. 5. 1 Still water shear forces are to be determined for all vertical structural elements which contribute to the shear strength capability of the ship. The permissible hull still water shear force is given by the minimum value obtained from:

$$|\bar{Q}_s| = \tau m \frac{t \times 10^{-3}}{q_v} - |Q_w|\text{kN}$$

where

$m$  = the plate thickness of the structural member at the vertical level and section under consideration, in mm

$m$  is given in [Pt 3, Ch 4, 6.5 Permissible still water shear force 6.5.2](#)

$q_v$  is the shear flow in the structural member at the vertical level and section under consideration, calculated in accordance with the *ACSPlus Guidelines Additional calculation procedures*.

6. 5. 2 To account for the effects of non-uniform loading in the transverse direction,  $m$  is to be taken as follows:

$m$  = 0.9 for loading conditions where the cargo region between two consecutive bulkheads, See [Figure 4. 6. 3: Examples of uneven transverse loading](#), within  $0.2L_T$ , is unevenly loaded in the transverse direction. Where there are two longitudinal bulkheads, the symmetric loading condition where the centre region has a different filling height to the port and starboard regions is considered to be uneven loading in the transverse direction.

$m$  = 1.0 otherwise

where

$L_T$  is the cargo hold length, in metres

**Figure 4. 6. 3: Examples of uneven transverse loading**

- 6. 5. 3 For hull configurations where loading conditions are such that hull girder torsion is induced, direct calculations are to be undertaken if considered necessary.
- 6. 5. 4 The calculation of shear forces immediately beyond the ends of the longitudinal bulkheads will be considered in relation to the arrangement of structure in these regions.

## 6. 6 Permissible shear stress

- 6. 6. 1 The permissible combined shear stress (still water plus wave) is to be taken as:

$$\tau = \frac{110}{k_L} \text{ N/mm}^2$$

- 6. 6. 2 Where a plate is tapered, the permissible combined shear stress is not to be exceeded at any point in way of the taper, See [Pt 3, Ch 4, 6.7 Design shear stress 6.7.1](#).

## 6. 7 Design shear stress

- 6. 7. 1 The design shear stress for use in *Pt 3, Ch 4, 7.4 Design stress* is to be taken as:

$$\tau_A = \frac{|Q_s| + |Q_w|}{mtl q_v} \times 10^3 \text{ N/mm}^2$$

where

$t$  and  $q_v$  are given in [Pt 3, Ch 4, 6.5 Permissible still water shear force 6.5.1](#).

$m$  is given in [Pt 3, Ch 4, 6.5 Permissible still water shear force 6.5.2](#).

Figure 4. 6. 4: Tapered plates

## CHAPTER 4 Longitudinal Strength

## SECTION 7 Hull buckling strength

## 7.1 Application

- 7.1.1 These requirements apply to plate panels and longitudinals subjected to hull girder compression and shear stresses based on design values for still water and wave bending moments and shear forces.
- 7.1.2 The hull buckling strength requirements are applicable within  $0.4L$  amidships to ships of 90 m or greater in length.
- 7.1.3 Hull buckling strength for ships less than 90 m in length will be specially considered.
- 7.1.4 Hull buckling strength outside  $0.4L$  amidships of members contributing to the longitudinal strength and subjected to compressive and shear stresses is to be checked, in particular in regions where changes in the framing system or significant changes in the hull cross-section occur.

## 7.2 Symbols

- 7.2.1 The symbols used in this Section are defined as follows:

|                |   |   |
|----------------|---|---|
| $d_t$          | = | standard deduction for corrosion, See <a href="#">Table 4. 7. 1: Standard deduction for corrosion, dt</a>   |
| $s$            | = | spacing of secondary stiffeners, in mm. In the case of symmetrical corrugations, $s$ is to be taken as $b$ or $c$ in <a href="#">Figure 3. 3. 1: Corrugation dimensions</a> in Ch 3, whichever is the greater |
| $t$            | = | as built thickness of plating, stiffener flange and web used in <a href="#">Table 4. 7. 1: Standard deduction for corrosion, dt</a> in calculating standard deduction $d_t$ , in mm                           |
| $t_p$          | = | as built thickness of plating less standard deduction $d_t$ , in mm, (i.e. $t_p = t - d_t$ )  |
| $E$            | = | modulus of elasticity, in N/mm <sup>2</sup>   |
|                | = | 206000 N/mm <sup>2</sup> for steel  |
| $S$            |   | spacing of primary members, in metres   |
| $\sigma_o$     | = | specified minimum yield stress, in N/mm <sup>2</sup>  |
| $\sigma_A$     | = | design longitudinal compressive stress in N/mm <sup>2</sup>   |
| $\sigma_{CRB}$ | = | critical buckling stress in compression, in N/mm <sup>2</sup> corrected for yielding effects  |
| $\sigma_E$     | = | elastic critical buckling stress in compression, in N/mm <sup>2</sup>   |

$\tau_A$  = design shear stress in N/mm<sup>2</sup>

$\tau_{CRB}$  = critical buckling stress in shear, N/mm<sup>2</sup> corrected for yielding effects

$\tau_E$  = elastic critical buckling stress in shear, in N/mm<sup>2</sup>

$$\tau_0 = \frac{\sigma_0}{\sqrt{3}}$$

### 7.3 Elastic critical buckling stress

- 7.3.1 The elastic critical buckling stress of plating is to be determined from [Table 4.7.2: Elastic critical buckling strength of plating](#).
- 7.3.2 The elastic critical buckling stress of longitudinals is to be determined from [Pt 3, Ch 4, 7.5 Scantling criteria 7.5.3](#).

### 7.4 Design stress

- 7.4.1 Design longitudinal compressive stress,  $\sigma_A$ , is to be determined in accordance with [Pt 3, Ch 4, 5 Hull bending strength](#):

$$\text{minimum } \sigma_A = \frac{30}{k_L} N/\text{mm}^2$$

for structural members above the neutral axis,

$$\sigma_A = \sigma_D \frac{z}{z_D}$$

for structural members below the neutral axis,

$$\sigma_A = \sigma_B \frac{z}{z_B}$$

$\sigma_D$  based on sagging moment and  $\sigma_B$  based on hogging moment are determined in [Pt 3, Ch 4, 5.8 Hull moment of inertia 5.8.1](#).

where

$z$  = vertical distance from the hull transverse neutral axis to the position considered, excluding deck camber, in metres

$z_D$ ,  $z_B$  = vertical distances from the hull transverse neutral axis to the deck and keel respectively, in metres

For initial design purposes, the hull transverse neutral axis may be taken at a distance  $\frac{D}{2}$  above keel, where  $D$  is the depth of the ship, in metres, as defined in [Pt 3, Ch 1, 6 Definitions](#).

**Table 4.7.1: Standard deduction for corrosion,  $d_t$**

| Structure                                  | $d_t$ mm | $d_t$ range mm<br>min.-max. |
|--|----------|-----------------------------|
| (a) Compartments carrying dry bulk cargoes | 0.05t    | 0.5-1                       |

|  |  |       |       |
|--|--|-------|-------|
| (b) One side exposure to water ballast and/or liquid cargo.  | Vertical surfaces and surfaces sloped at an angle greater than 25° to the horizontal line. |       |       |
| (c) One side exposure to water ballast and/or liquid cargo.  | Horizontal surfaces and surfaces sloped at an angle less than 25° to the horizontal line.  | 0.10t | 2 - 3 |
| (d) Two side exposure to water ballast and/or liquid cargo.  | Vertical surfaces and surfaces sloped at an angle greater than 25° to the horizontal line. |       |       |
| (e) Two side exposure to water ballast and/or liquid cargo.  | Horizontal surfaces and surfaces sloped at an angle less than 25° to the horizontal line.  | 0.15t | 2 - 4 |
| <p><b>Note 1.</b> The standard deduction <math>d_1</math> is to be taken as appropriate and within the range given above.</p> <p><b>Note 2.</b> For direct calculation purposes, standard deductions will be specially considered.</p> |  |       |       |

**Table 4. 7. 2: Elastic critical buckling strength of plating**

| Mode   | Elastic critical buckling stress, N/mm <sup>2</sup>  |
|--|--|
| (a) Compression of plating with longitudinal stiffeners (parallel to compressive stress), <i>See Note</i>  | $\sigma_E = 3.6E\left(\frac{t_p}{s}\right)^2$  |
| (b) Compression of plating with transverse stiffeners (perpendicular to compressive stress), <i>See Note</i>   | $\sigma_E = 0.9c \left[ 1 + \left( \frac{s}{1000S} \right)^2 \right]^2 E \left( \frac{t_p}{s} \right)^2$ <p>where</p> <p><math>c = 1.3</math> when plating stiffened by floors or deep girders</p> <p><math>= 1.21</math> when stiffeners are built up profiles or rolled angles</p> <p><math>= 1.10</math> when stiffeners are bulb plates</p> <p><math>= 1.05</math> when stiffeners are flat bars</p> |
| (c) Shear, <i>See Note</i>   | $\tau_E = 3.6[1.335 + \left(\frac{s}{1000S}\right)^2]E\left(\frac{t_p}{s}\right)^2$  |
| <p><b>Note</b> Where the elastic critical buckling stress, as evaluated from (a), (b) or (c), exceeds 50 per cent of specified minimum yield stress of the material, the corrected critical buckling stresses in compression (<math>\sigma_{CRB}</math>) and shear (<math>\tau_{CRB}</math>) are given by:</p> |  |
| $\begin{aligned} \sigma_{CRB} &= \sigma_E & \text{when } \sigma_E &\leq \frac{\sigma_o}{2} \\ &= \sigma_o \left( 1 - \frac{\sigma_o}{4\sigma_E} \right) & \text{when } \sigma_E &> \frac{\sigma_o}{2} \end{aligned}$ <p style="text-align: right;">N/mm<sup>2</sup></p>  |  |
| $\begin{aligned} \tau_{CRB} &= \tau_E & \text{when } \tau_E &\leq \frac{\tau_o}{2} \\ &= \tau_o \left( 1 - \frac{\tau_o}{4\tau_E} \right) & \text{when } \tau_E &> \frac{\tau_o}{2} \end{aligned}$ <p style="text-align: right;">N/mm<sup>2</sup></p>  |  |

7. 4. 2 Design shear stress,  $\tau_A$ , is to be determined in accordance with [Pt 3, Ch 4, 6 Hull shear strength](#).  
For initial design purposes,  $\tau_A$  may be taken as:

$$\tau_A = \frac{110}{k_L} N/\text{mm}^2$$

## 7.5 Scantling criteria

- 7.5.1 The corrected critical buckling stress in compression,  $\sigma_{CRB}$ , of plate panels and longitudinals, as derived from [Table 4.7.2: Elastic critical buckling strength of plating](#) and [Pt 3, Ch 4, 7.5 Scantling criteria 7.5.3](#), is to satisfy the following:

$$\sigma_{CRB} \geq \beta \sigma_A$$

where

- |         |   |   |
|---------|---|---|
| $\beta$ | = | 1 for plating and for web plating of longitudinals (local buckling) |
| $\beta$ | = | 1.1 for longitudinals   |

- 7.5.2 The corrected critical buckling stress in shear,  $\tau_{CRB}$ , of plate panels, as derived from [Table 4.7.2: Elastic critical buckling strength of plating](#), is to satisfy the following:

$$\tau_{CRB} \geq \tau_A$$

**Figure 4.7.1: Dimensions of longitudinals**

3563/01

**Table 4. 7. 3: Elastic critical buckling strength of longitudinals**

| Mode   | Elastic critical buckling stress, N/mm <sup>2</sup>                                   |
|--|---|
| (a) Column buckling (perpendicular to plane of plating) without rotation of cross section, <i>See</i> Note 1   | $\sigma_E = 0.001E \frac{I_a}{A_t S^2}$   |
| (b) Torsional buckling, <i>See</i> Note 1  | $\sigma_E = \frac{0.001EI_w}{I_p S^2} (m^2 + \frac{K}{m^2}) + 0.385E \frac{I_t}{I_p}$ |
| (c) Web buckling, <i>See</i> Notes 1 and 3 (flat bars are excluded)  | $\sigma_E = 3.8E (\frac{t_w}{d_w})^2$   |
| Symbols and Parameters   |   |
| <p> <math>d_w</math> = web depth, in mm<br/> <math>t_w</math> = as built web thickness less standard deduction <math>d_t</math> as specified in <a href="#">Table 4. 7. 1: Standard deduction for corrosion</a>, <math>dt</math>, in mm, (i.e. <math>t_w = t - dt</math>). For webs in which the thickness varies, a mean thickness is to be used<br/> <math>b_f</math> = flange width, in mm<br/> <math>t_f</math> = as built flange thickness less standard deduction <math>d_t</math> as specified in <a href="#">Table 4. 7. 1: Standard deduction for corrosion</a>, <math>dt</math>, in mm, (i.e. <math>t_f = t - dt</math>). For bulb plates, the mean thickness of the bulb may be used, <i>See</i> <a href="#">Figure 4. 7. 1: Dimensions of longitudinals</a><br/> <math>A_t</math> = cross-sectional area, in cm<sup>2</sup>, of longitudinal, including attached plating, taking account of standard deductions, <i>See</i> Note 4<br/> <math>I_a</math> = moment of inertia, in cm<sup>4</sup>, of longitudinal, including attached plating, taking account of standard deductions, <i>See</i> Note 4<br/> <math>I_t</math> = St.Venant's moment of inertia, in cm<sup>4</sup>, of longitudinal (without attached plating)<br/> = <math>\frac{d_w t_w^3}{3} 10^{-4}</math> for flat bars<br/> = <math>\frac{1}{3} [d_w t_w^3 + b_f t_f^3 (1 - 0.63 \frac{t_f}{b_f})] 10^{-4}</math> for built up profiles, rolled angles and bulb plates<br/> <math>I_p</math> = polar moment of inertia, in cm<sup>4</sup>, of profile about connection of stiffener to plating<br/> = <math>\frac{d_w^3 t_w}{3} 10^{-4}</math> for flat bars<br/> = <math>(\frac{d_w^3 t_w}{3} + d_w^2 b_f t_f) 10^{-4}</math> for built up profiles, rolled angles and bulb plates<br/> <math>I_w</math> = sectorial moment of inertia, in cm<sup>6</sup>, of profile about connection of stiffener to plating<br/> = <math>\frac{d_w^3 t_w^3}{36} 10^{-6}</math> for flat bars<br/> = <math>\frac{t_f b_f^3 d_w^2}{12} 10^{-6}</math> for 'Tee' profiles<br/> = <math>\frac{b_f^3 d_w^2}{12(b_f + d_w)^2} [t_f(b_f^2 + 2b_f d_w + 4d_w^2) + 3t_w b_f d_w] 10^{-6}</math> for 'L' profiles, rolled angles and bulb plates<br/> <math>K</math> = <math>\frac{1.03CS^4}{EI_w} 10^4</math><br/> <math>m</math> is determined as follows: </p> |   |

| 1  | $0 < K \leq 4$  |
| 2  | $4 < K \leq 36$   |

|   |  |
|---|--|
| 3   | $36 < K \leq 144$                      |
| 4   | $144 < K \leq 400$                     |
| 5   | $400 < K \leq 900$                     |
| 6   | $900 < K \leq 1764$                    |
| $m$   | $(m - 1)^2 m^2 < K \leq m^2 (m + 1)^2$ |
| <p><b>C</b> = spring stiffness exerted by supporting plate panel</p> $= \frac{k_p E t_p^3}{3s \left( 1 + \frac{1.33 k_p d_w t_p^3}{s t_w^3} \right)}$ <p><b>kp</b> 1 - <math>\eta p</math>, and is not to be taken less than zero. For built up profiles, rolled angles and bulb plates, <math>k_p</math> need not be taken less than 0.1</p> <p><math>n_p</math> <math>\frac{\sigma_A}{\sigma_{E_p}}</math> where <math>\sigma_{EP}</math>=elastic critical buckling stress (<math>\sigma_E</math>) of supporting plate derived from <a href="#">Table 4. 7. 2: Elastic critical buckling strength of plating</a></p> <p>All other symbols as defined in <a href="#">Pt 3, Ch 4, 7.2 Symbols 7.2.1</a> .</p>   |  |
| <p><b>Note 1.</b> Where the elastic critical buckling stress, as evaluated from (a), (b) or (c), exceeds 50 per cent of specified minimum yield stress of the material, the corrected critical buckling stress in compression (<math>\sigma_{CRB}</math>) is given by:</p> $\sigma_{CRB} = \sigma_o \left( 1 - \frac{\sigma_o}{4\sigma_E} \right) \text{N/mm}^2$ <p><b>Note 2.</b> <a href="#">Figure 4. 7. 1: Dimensions of longitudinals.</a></p> <p><b>Note 3.</b> For flanges on angles and T-sections of longitudinals, the following requirement is to be satisfied: <math>\frac{b_f}{t} \leq 15</math> for angles, <math>\frac{b_f}{t} \leq 30</math> for 'Tee' profiles,</p> <ul style="list-style-type: none"> <li>• <b>where</b></li> </ul> <p><math>t</math> = as built flange thicknesses, in mm</p> <p><b>Note 4.</b> The area of attached plating is to be calculated using actual spacing of secondary stiffeners.</p> |  |

CHAPTER **4** **Longitudinal Strength**SECTION **8** **Loading guidance information****8. 1 General**

- 8. 1. 1 Sufficient information is to be supplied to the Master of every ship to enable him to arrange loading and ballasting in such a way as to avoid the creation of unacceptable stresses in the ship's structure.
- 8. 1. 2 This information is to be provided by means of a Loading Manual and in addition, where required, by means of an approved loading instrument.

**8. 2 Loading Manual**

- 8. 2. 1 A Loading Manual is to be supplied to all ships where longitudinal strength calculations have been required, *See [Pt 3, Ch 4, 2 General](#)*. The Manual is to be submitted for approval in respect of strength aspects. Where both Loading Manual and loading instrument are supplied, the Loading Manual must nevertheless be approved from the strength aspect. In this case, the Manual is to be endorsed to the effect that any departures from these conditions in service are to be arranged on the basis of the loading instrument and the allowable local loadings shown in the Manual, *See [Pt 3, Ch 4, 8.2, Loading Manual 8.2.4](#)*.
- 8. 2. 2 The Manual is to be based on the final data of the ship and is to include well-defined lightweight distribution and buoyancy data.
- 8. 2. 3 Details of the loading conditions given in [Pt 3, Ch 4, 5.3 Design still water bending moments 5.3.3](#) are to be included in the Manual as applicable.
- 8. 2. 4 The Manual is also to contain the following:
  - a. Values of actual and permissible still water bending moments and shear forces and, where applicable, limitations due to torsional loads.
  - b. The allowable local loadings for the structure such as the hatch covers, decks and double bottoms. If the ship is not approved to carry load on the deck or hatch covers, this is to be clearly stated.
  - c. Details of cargo carriage constraints imposed by the use of an accepted coating in association with a system of corrosion control, *See [Pt 3, Ch 2, 3.6 Application of coatings and alternative means of protection](#)*.
  - d. A note saying:  
'Scantlings approved for minimum draught forward of ...m with ballast tanks No... filled. In heavy weather conditions the forward draught should not be less than this value. If, in the opinion of the Master, sea conditions are likely to cause regular slamming, then other appropriate measures such as change in speed, heading or an increase in draught forward may also need to be taken.'
  - e. The maximum unladen weight, in tonnes, of grab that is considered suitable for the approved thickness of the hold inner bottom for bulk carriers and ore or oil carriers that are regularly

discharged by grabs. This maximum unladen weight may differ for adjacent holds, *See* [Pt 3, Ch 9, 8.2 Inner bottom plating](#) and [Pt 4, Ch 7, 8.1 General](#). This weight does not preclude the use of heavier grabs, but is intended as an indication to the Builders, Owners and operators of the increased risk of local damage and the possibility of accelerated diminution of the plating thickness if grabs heavier than this are used regularly to discharge cargo.

- f. The design minimum cargo temperature in °C for ships other than liquefied gas carriers which are intended to be loaded with liquid cargo having a temperature below –10°C, *See* [Pt 3, Ch 2, 2.4 Carriage of cold cargoes 2.4.1](#).
8. 2. 5 In addition to the requirements of [Pt 3, Ch 4, 8.2, Loading Manual 8.2.4](#), the Manual is to contain the following information for bulk carriers (*See* [Pt 3, Ch 4, 3.2 General 3.2.2](#)), ore carriers and combination carriers of length, *L*, 150 m or above:
- a. The cargo hold(s) or combination of cargo holds that may be empty at maximum draught. If no cargo hold is permitted to be empty at maximum draught, this is to be clearly stated in the Manual.
  - b. Maximum allowable and minimum required mass of cargo and double bottom ballast for each hold as a function of the draught at mid-hold position.
  - c. Maximum allowable and minimum required mass of cargo and double bottom ballast for any two adjacent holds as a function of the mean draught in way of these holds. The mean draught may be calculated by averaging the draught at the two mid-hold positions.
  - d. Maximum allowable inner bottom loading together with specification of the nature of the cargo, for cargoes other than bulk cargoes.
  - e. The maximum rate of ballast exchange, together with advice that a load plan is to be agreed with the terminal on the basis of achievable rates of exchange.
- For bulk carriers for which it is required to undertake longitudinal strength calculations in the flooded condition, *See* [Pt 4, Ch 7, 3.1 General 3.1.2](#), the Manual is also to contain envelope results and permissible limits of still water bending moments and shear forces for hold flooded conditions, *See* [Pt 4, Ch 7, 3.4 Flooded conditions](#).
8. 2. 6 Where applicable, the Manual is also to contain the procedure for ballast exchange and sediment removal at sea.
8. 2. 7 Where alteration to structure, lightweight, cargo distribution or draught is proposed, revised information is to be submitted for approval.

### 8. 3 Loading instrument

8. 3. 1 In addition to a Loading Manual, an approved type loading instrument is to be provided for all ships where *L* is greater than 65 m and which are approved for non-uniform distribution of loading. The following ships are exempt from this requirement:
  - a. Ships with very limited possibilities for variations in the distribution of cargo and ballast.
  - b. Ships with a regular or fixed trading pattern.
  - c. Ships exempt by individual Chapters in [Pt 4 Ship Structures \(Ship Types\)](#).
8. 3. 2 The loading instrument is to be capable of calculating shear forces and bending moments, in any load or ballast condition at specified readout points and is to indicate the permissible values. On container ships and other ships with large deck openings, (*See* [Pt 3, Ch 4, 3.3 Exceptions 3.3.2](#)) cargo torque is also to be calculated.
8. 3. 3 For bulk carriers, ore carriers and combination carriers of length, *L*, 150 m or above, the loading instrument is to be additionally capable of verifying that the following are within permissible limits:
  - a. the mass of cargo and double bottom ballast in way of each hold as a function of the draught at the mid-hold position.

- b. the mass of cargo and double bottom ballast for any two adjacent holds as a function of the mean draught in way of these holds. The mean draught may be calculated by averaging the draught at the two mid-hold positions.

For bulk carriers for which it is required to undertake longitudinal strength calculations in the flooded condition, See [Pt 4, Ch 7, 1.2 Application 1.2.2](#), the loading instrument is also to be capable of verifying that the still water bending moments and shear forces in hold flooded conditions (See [Pt 4, Ch 7, 3.4 Flooded conditions](#)) are within permissible limits.

- 8. 3. 4 If the approved loading manual utilises bulkhead correction factors for shear force distribution, then the loading instrument must also have the capability to account for the bulkhead correction factors.
- 8. 3. 5 The instrument is to be certified in accordance with ACS's document entitled *Approval of Longitudinal Strength and Stability Calculations Programs*.
- 8. 3. 6 The instrument readout points are usually selected at the position of the transverse bulkheads or other obvious boundaries. As many readout points as considered necessary by ACS are to be included, e.g. between bulkheads.
- 8. 3. 7 A notice is to be displayed on the loading instrument stating:
  - a. 'Scantlings approved for minimum draught forward of ...m with ballast tanks No... filled. In heavy weather conditions, the forward draught should not be less than this value. If, in the opinion of the Master, sea conditions are likely to cause regular slamming, then other appropriate measures such as change in speed, heading or an increase in draught forward may also need to be taken.'
- 8. 3. 8 Where alteration to structure, lightweight or cargo distribution is proposed, the loading instrument is to be modified accordingly and details submitted for approval.
- 8. 3. 9 The operation of the loading instrument is to be verified by the Surveyors upon installation and at Annual and Periodical Surveys as required in [Pt 1, Ch 3 Periodical Survey Regulations](#). An Operation Manual for the instrument is to be verified as being available on board.
- 8. 3. 10 Where an onboard computer system having a strength computation capability is provided as an Owner's option, it is recommended that the system be certified in accordance with ACS's document entitled *Approval of Longitudinal Strength and Stability Calculations Programs*. For systems having a stability computation capability and installed on a new ship, See also [Pt 1, Ch 2, 1.1 General 1.1.11](#). For systems having a stability computation capability and installed on an existing ship, it is recommended that the system be certified in accordance with ACS's document entitled *Approval of Longitudinal Strength and Stability Calculation Programs*.

## 8. 4 Onboard lashing program

- 8. 4. 1 An onboard lashing program to calculate forces acting on the container stowage arrangement may be provided, See [Pt 3, Ch 14 Cargo Securing Arrangements](#). This may be an extension to the loading instrument covered under [Pt 3, Ch 4, 8.3 Loading instrument](#). If the software to carry out lashing calculations is installed and maintained in accordance with the Rules, the ship will be eligible to be assigned the special features notation **BoxMax**, with one or more of the supplementary letters V and W. The notation **BoxMax(V,W)** may be supplemented with the letter L if the conditions for this notation are satisfied. **BoxMax** may be supplemented with the letter M if the conditions for this notation are satisfied.
- 8. 4. 2 For description of the **BoxMax** notation and its V, W, L and M features, See [Pt 3, Ch 14, 1.2 Classification notations and descriptive notes](#).
- 8. 4. 3 To qualify for the notation **BoxMax** the following requirements must be satisfied:
  - a. The onboard lashing program is to be certified in accordance with ACS's *Approval of Strength and Stability Calculation Programs*.

- b. Where alteration to the container stowage arrangements is proposed, the onboard lashing program is to be modified accordingly and details submitted for approval.
    - c. The operation of the onboard lashing program is to be verified by the Surveyors upon installation and at Annual and Periodical Surveys as required in [Pt 1, Ch 3 Periodical Survey Regulations](#). An Operation Manual for the onboard lashing program is to be verified as being available on board.
  - 8. 4. 4 To qualify for the aspects of the notation, i.e. **V**, **W**, **L** and **M**, the Surveyor is to verify upon installation and at Annual and Periodical Surveys as required in [Pt 1, Ch 3 Periodical Survey Regulations](#) that the individual features of the notation are implemented in the onboard lashing program. The Surveyor is also to verify that an Operation Manual for these aspects of the onboard lashing program is available on board.

**CHAPTER 5 Fore End Structure****SECTION 1 General****1.1 Application**

- 1.1.1 This Chapter applies to all types of ship covered by [Pt 4 Ship Structures \(Ship Types\)](#) except where specifically stated otherwise.
- 1.1.2 The requirements given are those specific to fore ends and relate to structure situated in the region forward of  $0.3L$  from the forward perpendicular.
- 1.1.3 Requirements for cargo space structure within this region not dealt with in this Chapter are to be as detailed in the relevant Chapter of [Pt 4 Ship Structures \(Ship Types\)](#) for the particular ship type.
- 1.1.4 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a CSR notation. See [Pt 1, Ch 2, 2.3 Class notations \(hull\)](#).

**1.2 Structural configuration**

- 1.2.1 The Rules provide for both longitudinal and transverse framing systems.
- 1.2.2 In the case of container ships and open type ships, additional requirements may apply as detailed in [Pt 4, Ch 8 Container Ships](#).
- 1.2.3 In the case of fast cargo ships, the additional requirements given in [Pt 4, Ch 1, 3 Longitudinal strength](#) are to be complied with where applicable.
- 1.2.4 The requirements regarding minimum bow height given in [Pt 3, Ch 3, 6 Minimum bow heights, reserve buoyancy and extent of forecastle](#) are to be complied with where applicable.

**1.3 Structural continuity**

- 1.3.1 Suitable scarfing arrangements are to be made to ensure continuity of strength and the avoidance of abrupt structural changes.
- 1.3.2 Where longitudinal framing terminates and is replaced by a transverse system, adequate arrangements are to be made to avoid an abrupt changeover. Where a forecastle is fitted extending aft of  $0.15L$  from the F.P., longitudinal framing at the upper deck and topsides is generally to be continued forward of the end bulkhead of this superstructure. In bulk carriers and oil tankers (See [Pt 3, Ch 5, 1.1 Application 1.1.4](#)) the longitudinal framing at the upper deck is to be maintained over the cargo space region and continued over the fore peak region.
- 1.3.3 In container or similar ships having continuous side tanks or double skin construction in way of the cargo spaces, the longitudinal bulkheads are to be continued as far forward as is practicable and are to be suitably tapered at their ends. Where, due to the ship's form, such bulkheads are stepped, suitable scarfing is to be arranged.

1. 3. 4 In bulk carriers (See [Pt 3, Ch 5, 1.1 Application 1.1.4](#)) the topside tank and double bottom hopper tank structures are to be maintained over the cargo space region, and suitable taper brackets are to be arranged in line with the end of these tank structures in the fore peak region. In addition, in way of the cargo space forward bulkhead, a girder or intercostal bulb plate stiffeners (fitted between and connected to the bulkhead vertical stiffeners), are to be arranged on the forward side in line with the sloped bulkheads of the topside and hopper tanks clear of the taper brackets.

## 1. 4 Symbols and definitions

1. 4. 1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:  
 $L, B, D, T, C_b$  and  $V$  = as defined in [Pt 3, Ch 1, 6.1, Principal particulars](#)  
 $k_L, k$  = higher tensile steel factor, See [Pt 3, Ch 2, 1.2, Steel](#)
- $l$  overall length of stiffening member, in metres, See [Pt 3, Ch 3, 3.3 Determination of span point](#)
- $l_e$  effective length of stiffening member, in metres, See [Pt 3, Ch 3, 3.3 Determination of span point](#)
- $s$  spacing of secondary stiffeners, in mm
- $t$  thickness of plating, in mm
- $I$  inertia of stiffening member, in  $\text{cm}^4$ , See [Pt 3, Ch 3, 3.2, Geometric properties of section](#)
- $S$  spacing, or mean spacing, of primary members, in metres
- $Z$  section modulus of stiffening member, in  $\text{cm}^3$ , See [Pt 3, Ch 3, 3.2, Geometric properties of section](#)
- $\rho$  relative density (specific gravity) of liquid carried in a tank and is to be taken not less than 1.025.
1. 4. 2 For the purpose of this Chapter the forward perpendicular, F.P., is defined as the forward limit of the Rule length  $L$ .

## 1. 5 Strengthening of bottom forward

1. 5. 1 The bottom forward of a sea-going ship is to be additionally strengthened, except where the ship is so designed that a minimum draught forward,  $T_{FB}$ , of  $0.045L$  can be achieved for any ballast or part loaded condition. This draught is to be indicated on the shell expansion plan, the plan showing the internal strengthening, the Loading Manual and loading instrument, where fitted, See [Pt 3, Ch 4, 8 Loading guidance information](#).
1. 5. 2 The requirements for the additional strengthening apply to ships where  $L$  is greater than 65 m. Where a ship is classed for service in protected waters or extended protected waters, compliance with the requirements of this Section may be modified or waived altogether.
1. 5. 3 The additional strengthening is to extend forward of  $0.3L$  from the F.P. over the flat of bottom and adjacent plating with attached stiffeners up to a height of  $0.002L$  above the base line or 300 mm whichever is the lesser.
1. 5. 4 The scantling requirements outside the areas defined in [Pt 3, Ch 5, 1.5 Strengthening of bottom forward 1.5.3](#) are to be suitably tapered to maintain adequate continuity of strength in both longitudinal and transverse directions.

1. 5. 5 The requirements for the additional strengthening within the region defined in [Pt 3, Ch 5, 1.5 Strengthening of bottom forward 1.5.3](#) are given in [Table 5. 1. 1: Additional strengthening of bottom forward](#), or may be obtained by direct calculation. Where  $T_{FB}$  is less than  $0.01L$ , the additional strengthening is to be specially considered.
1. 5. 6 Bottom longitudinals are to pass through and be supported by the webs of primary members. The vertical web stiffeners are to be connected to the bottom longitudinals. The cross-sectional area of the connections is to comply with the requirements given in [Table 5. 1. 1: Additional strengthening of bottom forward](#).
1. 5. 7 The scantlings required by this Section must in no case be less than those required by the remaining Sections in [Pt 3, Ch 5 Fore End Structure](#).
1. 5. 8 For minimum draught forward,  $T_{FB}$  between  $0.01L$  and  $0.045L$ , the equivalent slamming pressure expressed as a head of water,  $h_s$ , is to be obtained from [Figure 5. 1. 1: Pressure heads](#), where  $h_{max}$  is calculated from the following expressions:

$$65 < L \leq 169m, h_{max} = 10\sqrt{L}Fm$$

$$169 < L \leq 180 m, h_{max} = 130Fm$$

$$L > 180m, h_{max} = 130 F e^{-0.0125(L-180)0.705}m$$

where

$$F = 5.95 - 10.5 \left( \frac{T_{FB}}{L} \right)^{0.2}$$

= and

$$e = \text{base of natural logarithms, } 2.7183$$

- The application of the maximum pressure for forward of  $0.3L$  from the F.P. is as indicated in [Figure 5. 1. 1: Pressure heads](#). For  $C_b$  between 0.70 and 0.80 its position may be obtained by linear interpolation.
- Where the bottom plating forms the boundary of a double bottom tank, deep tank or double skin tank which is full in all ballast conditions, then for such conditions the head,  $h_s$ , may be reduced by 1.25 times the head, in metres, of ballast water to top of tank.
- For bulk carriers (See [Pt 3, Ch 5, 1.1 Application 1.1.4](#)) the reduction to the head,  $h_s$ , is not to exceed the head, in metres, of ballast water to the top of the hopper tank or 1.25 times the depth, in metres, of the double bottom tank, whichever is the greater.
- For ballast and part loaded conditions where the draught forward is less than  $0.045L$  and the reduction to the head,  $h_s$ , has been applied, the ballast tanks are to be filled and a note added to the loading booklet to this effect, See [Pt 3, Ch 4, 8.2 Loading Manual 8.2.4.d](#).

Figure 5. 1. 1: Pressure heads

## 1. 6 Strengthening against bow flare slamming

1. 6. 1 The requirements of this Section apply to all ships except those defined in [Pt 4, Ch 2 Ferries, Roll On-Roll Off Ships and Passenger Ships](#) and [Pt 4, Ch 8 Container Ships](#).
1. 6. 2 The side structure in the area forward of  $0.075L$  from the F.P. and above the summer load waterline is to be strengthened against bow flare impact pressure. The strengthening is to extend vertically to the uppermost deck level, including the forecastle deck, if fitted, but need not exceed the level of  $T + 1.65H_b$  above the base line, where  $H_b$  is the minimum bow height, in metres, as derived in [Pt 3, Ch 1, 6.1 Principal particulars 6.1.11](#).
1. 6. 3 The flare angle,  $\alpha$ , is the angle between the vertical axis and the tangent of the outer shell measured normal to the shell in a vertical plane, at the point under consideration. The entry angle,  $\beta$ , is the angle between the longitudinal axis and the waterplane tangent measured on the outer shell, at the point under consideration. The flare angle may normally be derived in accordance with [Figure 5. 1. 2: Flare angle determination](#).

Table 5. 1. 1: Additional strengthening of bottom forward

| Item   | Requirements              |
|--|---------------------------|
| (1) Longitudinally framed bottom shell plating (including keel), See Notes 1 and 2 | $t = 0.003sf\sqrt{h_s k}$ |

|   |   |   |
|---|---|---|
| (2) Bottom longitudinals - other than flat bars | $\frac{d_w}{t_w} \leq 55\sqrt{k}$ $\frac{d_w t_w}{100} \geq 0.00033 k h_s s c \left( S - \frac{s}{2000} \right) \text{ cm}^2$ $Z \geq 6.8 \times 10^{-6} h_s s k \left[ (17.5 l_s)^2 - (0.01 s)^2 + d_w c \left( S - \frac{s}{2000} \right) \right] \text{ cm}^3$ $\frac{(A_1 \bar{r} + \alpha)}{p} \times 10^{-1} \geq 1$ $A_w \geq 0.84 A_1$  |   |
| (3) Bottom longitudinals - flat bars            | Will be specially considered  |   |
|   | Transverse framing  | Longitudinal framing  |
| (4) Primary structure in way of single bottoms  | <p>(a) Centre girder:</p> <p>Scantlings as required by item (1) in <a href="#">Table 5. 1. 1: Additional strengthening of bottom forward</a>, except that in determining Z in way of a deep tank forward of 0.2L from the F.P. the value of <math>h_s</math> is to be increased by the following percentages:</p> <p>where <math>T_{FB} \leq 0.03L_2</math>, 30 per cent</p> <p>where <math>T_{FB} \geq 0.04L_2</math>, 0 per cent</p> <p>The increase in <math>h_s</math> for intermediate values of <math>T_{FB}</math> to be obtained by interpolation</p> <p>(b) Floors:</p> <p>Scantlings as required by item (2) in <a href="#">Table 5. 1. 1: Additional strengthening of bottom forward</a>, except that in way of dry cargo spaces the minimum face area is to be increased by the following percentages:</p> <p>where <math>T_{FB} \leq 0.03L_2</math>, 50 per cent</p> <p>where <math>T_{FB} \geq 0.04L_2</math>, 0 per cent</p> | <p>(a) Ships having one or more longitudinal bulkheads:</p> <p>(i) Centre girder</p> <p>Scantlings as required by item (4) in <a href="#">Table 5. 1. 1: Additional strengthening of bottom forward</a> and (iii)</p> <p>(ii) Bottom transverses</p> <p>Maximum spacing</p> <p>As for midships region</p> <p>Scantlings as required by <a href="#">Pt 4, Ch 9, 9 Primary members supporting longitudinal framing</a> or <a href="#">Pt 4, Ch 10, 2 Primary members supporting longitudinal framing</a></p> <p>(iii) For horizontally stiffened longitudinal bulkheads and girders the depth to thickness ratio of the panel attached to the bottom shell plate is not to exceed <math>55\sqrt{k}</math></p> <p>(iv) Where <math>T_{FB} &lt; 0.025L_2</math> the scantlings and arrangements will receive individual consideration</p> |

|  |   |   |
|--|---|---|
|  | <p>The increase of minimum face area for intermediate values of <math>T_{FB}</math> is to be obtained by interpolation</p> <p>(c) Side girders:</p> <p>Arrangement and scantlings as required by <a href="#">Pt 3, Ch 5, 5.2 Single bottoms – Transverse framing 5.2.2</a> and <a href="#">Pt 3, Ch 5, 5.2 Single bottoms – Transverse framing 5.2.3</a>, with the addition of intermediate half-height girders or equivalent fore and aft stiffening</p> | (b) Other ship arrangements will receive individual consideration   |
| (5) Primary structure in way of double bottoms, See Note 3                         | <p>(a) Plate floors:</p> <p>Maximum spacing, every frame</p> <p>Scantlings as required by <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a></p> <p>(b) Centre and side girders:</p> <p>Maximum spacing, <math>0.003S_F</math> m</p> <p>(c) Intermediate half-height girders to be arranged midway between side girders:</p> <p>Scantlings as required for non watertight side girders by <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a></p>    | <p>(a) Plate floors:</p> <p>Maximum spacing:</p> <p><math>0.002S_F</math> m for <math>T_{FB} &lt; 0.04L_2</math></p> <p><math>0.003S_F</math> m for <math>T_{FB} \geq 0.04L_2</math></p> <p>but not to exceed that required by item (2) in <a href="#">Table 5. 5. 2: Double bottom construction forward</a></p> <p>Scantlings as required by <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a></p> <p>(b) Centre and side girders:</p> <p>Maximum spacing:</p> <p><math>0.003S_L</math> m for <math>T_{FB} &lt; 0.04L_2</math></p> <p><math>0.004S_L</math> m for <math>T_{FB} &gt; 0.04L_2</math></p> <p>but not to exceed that required by item (4) in <a href="#">Table 5. 5. 2: Double bottom construction forward</a>.</p> <p>Scantlings as required by <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a></p> |
| (6) Primary structure in way of double bottoms supported by longitudinal bulkheads | –   | The scantlings and arrangements will receive individual consideration on the basis of direct calculations using, if necessary, a suitably defined two-dimensional grillage model, See <a href="#">Pt 3, Ch 1, 3 Equivalents</a>   |
| Symbols  |   |   |

$L, T, s, k$  as defined in [Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1](#)

$$c = 1.0 \text{ for } S \leq 2.5 \text{ m}$$

$$= (0.87 + 0.16S) c_1 \text{ for } S > 2.5 \text{ m}$$

$$c_1 = 1.0 \text{ for } S \leq 1.0 \text{ m}$$

$$= (1.14 - 0.14S) \text{ for } 1.0 \text{ m} < S \leq 4.0 \text{ m}$$

$$= \frac{2.32}{S} \text{ for } S > 4.0 \text{ m}$$

$d_w$  = web depth, in mm, which for bulb flats may be taken as 0.9 times the section height

$$f = \left( 1.1 - \frac{s}{2500S} \right)$$

= but not greater than 1.0

$h_s$  = equivalent slamming pressure, in metres obtained from [Pt 3, Ch 5, 1.5 Strengthening of bottom forward 1.5.8](#)

$l_s$  =  $l_e$ , in metres, as defined in [Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1](#) where in way of a double bottom

=  $S$ , in metres, where in way of a single bottom

$S$  = spacing of primary members, in metres

$$\rho = 9.81 h_s s c_1 \left[ S - \frac{s}{2000} \right] \times 10^{-3} \text{ kN}$$

$s_F$  = spacing of transverse frames, in mm, for longitudinally framed side and bottom construction  $s_F$  may be taken as  $s_L$

$s_L$  = spacing of bottom longitudinals, in mm

$t_w$  = web thickness, in mm

$A_f$  = cross-sectional area of primary member web stiffener, in  $\text{cm}^2$

$A_{fc}$  = effective area of primary member web stiffener in way of butted end connection to the longitudinal, in  $\text{cm}^2$

$A_L$  = area of weld of lapped connection, in  $\text{cm}^2$ , calculated as total length of weld, in  $\text{cm} \times$  throat thickness, in  $\text{cm}$

$A_w$  = area of weld of lug and web connection to the longitudinal, in  $\text{cm}^2$ , calculated as total length of weld in  $\text{cm} \times$  throat thickness, in  $\text{cm}$

$A_1$  = effective total cross-sectional area of the lug and web connection to the longitudinal, in  $\text{cm}^2$

$L_2$  =  $L$  but need not be taken greater than 215 m

$T_{FB}$  = draught, in metres, at the F.P., as defined in [Pt 3, Ch 5, 1.5 Strengthening of bottom forward 1.5.1](#)

$a$  =  $A_f \bar{\sigma}$  for the web stiffeners

=  $A_{fc} \bar{\sigma}$  for a butted connection to the longitudinals

=  $A_L \bar{\tau}$  for a lapped connection

$\bar{\sigma}$  = permissible direct stress, in  $\text{N/mm}^2$ , given in [Table 5. 1. 2: Permissible stresses](#)

$\bar{\tau}$  = permissible shear stress, in  $\text{N/mm}^2$ , given in [Table 5. 1. 2: Permissible stresses](#)

**Note 1.** If intermediate stiffening is fitted the thickness of the bottom shell plating may be 80 per cent of that required by (1) but is to be not less than the normal taper thickness.

**Note 2.** For transverse framing the bottom shell plating is to be specially considered.

**Note 3.** Particular care is to be taken to limit the size and number of openings in way of the ends of floors or girders or to fit suitable reinforcement where such openings are essential.

**Note 4.** The welding requirements of [Pt 3, Ch 10 Welding and Structural Details](#), and in cargo oil tanks of tankers, the requirements of [Pt 4, Ch 9, 10.14 Arrangements at intersections of continuous secondary and primary members](#) or [Pt 4, Ch 10, 7.14 Arrangements at intersections of continuous secondary and primary members](#), are also to be complied with.

1. 6. 4 The equivalent bow flare slamming head,  $h_s$ , is to be taken as:

$$h_s = 0.8(0.2 + 1.5 \tan \alpha) \left( 0.51V \sin \beta \cos \alpha + \frac{\pi}{\sqrt{L}} \delta \right)^2 m$$

where

|          |   |   |
|----------|---|---|
| $V$      | = | as defined in <a href="#">Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1</a>                           |
| $\alpha$ | = | flare angle, in degrees, at the point under consideration   |
| $\beta$  | = | entry angle, in degrees, at the point under consideration   |
| $\delta$ | = | $\left( \frac{\pi}{30} L e^{-0.0033L} - 0.5d \right)$ and is not to be taken less than zero           |
| $e$      | = | base of natural logarithms 2.7183   |
| $d$      | = | vertical distance, in metres, between the waterline at draught $T$ and the point under consideration. |

1. 6. 5 The thickness of the side shell is to be not less than:

$$t = 3.2s_c \sqrt{kh_s C_R} \times 10^{-2} \text{ mm}$$

where

|       |   |   |
|-------|---|---|
| $s_c$ | = | spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in <a href="#">Figure 5. 1. 3: Chord spacing and mean chord spacing for secondary members</a> |
| $h_s$ | = | bow flare slamming head, in metres, as defined in <a href="#">Pt 3, Ch 5, 1.6 Strengthening against bow flare slamming 1.6.3</a>  |
| $C_R$ | = | panel ratio factor  |
|       | = | $\left( \frac{l}{s_c} \right)^{0.41}$ but is not to be taken less than 0.06 or greater than 0.1   |
| $l$   | = | overall panel length, in metres, measured along a chord between the primary members.  |

1. 6. 6 The scantlings of secondary stiffeners are not to be less than:

a. Section modulus of secondary stiffeners

$$Z = 3.6s_{CM} k h_s l_e^2 \times 10^{-3} \text{ cm}^3$$

b. Web area of secondary stiffeners

$$A = 3.7s_{CM} k h_s (l_e - s_{CM}/2000) \times 10^{-4} \text{ cm}^2$$

Where

- $s_{CM}$  = mean spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in [Figure 5. 1. 3: Chord spacing and mean chord spacing for secondary members](#)
- $h_S$  = bow flare slamming head, in metres, as defined in [Pt 3, Ch 5, 1.6 Strengthening against bow flare slamming 1.6.3](#)
- = Other symbols are as defined in [Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1](#).

**Table 5. 1. 2: Permissible stresses**

| Item  |                             | Direct stress, $\bar{\sigma}$<br>in N/mm <sup>2</sup> See Note                                       | Shear stress, $\bar{\tau}$<br>in N/mm <sup>2</sup> |
|---|-----------------------------|--|--|
| Primary member web stiffener on area $A_f$  | (a) Flat bars<br>See Note   | $\frac{10.3}{k} \left[ 33 - \frac{d}{t\sqrt{k}} \right]$   | —  |
|   | (b) Bulb plates<br>See Note | $\frac{8.6}{k} \left[ 40 - \frac{d}{\left( \frac{100A_f}{d} - \frac{t}{6} \right) \sqrt{k}} \right]$ | —  |
|   | (c) Inverted angles         | $\frac{220}{k}$  | —  |
| Primary member web stiffener on area $A_{fe}$   |                             | $\frac{245}{k}$  | —  |
| Primary member web stiffener lapped to secondary member on area $A_L$   |                             | —  | $\frac{167}{k}$                                    |
| Lug or web connection on area $A_1$   | Single                      | —  | $\frac{124}{k}$                                    |
|   | Double                      | —  | $\frac{141}{k}$                                    |
| Symbols   |                             |  |  |
| $A_f, A_L, A_1$ as defined in <a href="#">Table 5. 1. 1: Additional strengthening of bottom forward</a><br>$d$ =stiffener depth, in mm<br>$k$ =as defined in <a href="#">Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1</a><br>$t$ =stiffener web thickness, in mm |                             |  |  |
| <b>Note</b> $\bar{\sigma}$ to be taken not greater than $\frac{220}{k}$   |                             |  |  |

1. 6. 7 The scantlings of primary members are not to be less than:

- a. Section modulus of primary members

$$Z = 2S_{CM}kh_sl_e^2\text{cm}^3$$

- b. Web area of primary members

$$A = 0.2S_{CM}kh_sl_e\text{cm}^2$$

where

- |          |   |   |
|----------|---|---|
| $S_{CM}$ | = | mean spacing of primary members, in metres, measured along a chord between parallel adjacent members or equivalent supports, as shown in <a href="#">Figure 5. 1. 4: Mean chord spacing for primary members</a> |
| $h_s$    | = | bow flare slamming head, in metres, as defined in <a href="#">Pt 3, Ch 5, 1.6 Strengthening against bow flare slamming 1.6.4</a>  |
|          | = | Other symbols are as defined in <a href="#">Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1.</a>  |

1. 6. 8 For primary members with cut-outs for the passage of secondary stiffeners, and which may have web stiffeners connected to the secondary stiffener, buckling checks are to be carried out to ensure that the primary member web plating and web stiffener will not buckle under the design load. The buckling procedure to be followed is given in [Table 5. 1. 3: Buckling procedure for primary member web plating and web stiffener](#). Where the web stiffener is fitted with a bracket, the buckling capability of the web stiffener in way of the cut-out is to take account of the bracket. Where no web stiffener is fitted, the buckling capability of the primary member web plating is to be checked for the total load transmitted to the connection.
1. 6. 9 The structural scantlings required in areas strengthened against bow flare slamming are to be tapered from 0.075L aft of fore perpendicular to meet the normal requirements at 0.15L aft of the fore perpendicular.
1. 6. 10 Where the stiffener web is not perpendicular to the plating, tripping brackets may need to be fitted in order to obtain adequate lateral stability.
1. 6. 11 For stiffeners and primary structure, where the angle between the stiffener web and the plating is less than 70°, the effective section modulus and shear area are to take account of the non-perpendicularity.
1. 6. 12 The side structure scantlings required by this Section must in no case be taken less than those required by the remaining Sections of [Pt 3, Ch 5 Fore End Structure](#).

**Figure 5. 1. 2: Flare angle determination**

## PART

**3**CHAPTER **5 Fore End Structure**SECTION **2 Deck structure****2. 1 General**

- 2. 1. 1 Where the upper deck is longitudinally framed outside the line of openings in the midship region, this system of framing is to be carried as far forward as possible. In the case of oil tankers (*See Pt 3, Ch 5, 1.1 Application 1.1.4*) longitudinal framing is to extend to at least the forward end of the cargo tank section.

**2. 2 Deck plating**

- 2. 2. 1 The thickness of strength/weather deck plating is to comply with the requirements of [Table 5. 2. 1: Strength/weather deck plating forward \(excluding forecastle deck\)](#).
- 2. 2. 2 The thickness of lower deck plating is to comply with the requirements of [Table 5. 2. 2: Lower deck plating forward](#).
- 2. 2. 3 The taper thickness of the strength deck stringer plate is to be increased by 20 per cent at the end of a forecastle or bridge where the end bulkhead is situated aft of  $0.25L$  from the F.P. No increase is required where the end bulkhead lies forward of  $0.2L$  from the F.P. The increase at intermediate positions is to be determined by interpolation.
- 2. 2. 4 The deck plating thickness and supporting structure are to be suitably reinforced in way of the anchor windlass and other deck machinery, and in way of cranes, masts or derrick posts.
- 2. 2. 5 Where long, wide hatchways are arranged at lower decks, it may be necessary to increase the deck plating thickness to ensure effective support for side framing.

**2. 3 Deck stiffening**

- 2. 3. 1 The scantlings of strength/weather deck longitudinals are to comply with the requirements of [Table 5. 2. 3: Strength/weather deck longitudinals forward](#).
- 2. 3. 2 The scantlings of cargo and accommodation deck longitudinals are to comply with the requirements given in [Table 1. 4. 4: Cargo and accommodation deck longitudinals](#) in [Pt 4, Ch 1 General Cargo Ships](#).
- 2. 3. 3 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and, so far as practicable, direct continuity of longitudinal strength.
- 2. 3. 4 The scantlings of weather deck beams are to comply with the requirements of [Table 5. 2. 4: Weather deck beams forward](#).
- 2. 3. 5 The scantlings of lower deck beams are to comply with the requirements of [Table 1. 4. 5: Strength/weather, cargo and accommodation deck beams](#) in [Pt 4, Ch 1 General Cargo Ships](#).

**Table 5. 2. 1: Strength/weather deck plating forward (excluding forecastle deck)**

| Symbols   | Location   | Thickness, in mm   |
|---|--|--|
| <p><math>L, D, T, s, S, k, \rho</math> as defined in <a href="#">Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1</a></p> <p><math>C = \left( \frac{D + 2.3 - T}{\text{height of deck above load waterline at F.P.}} \right)</math></p> <p>but is to be taken not greater than 1.0 nor less than 0.9</p>   | (1) Forward of 0.075L from the F.P.                        | $t = (6.5 + 0.02L)C \sqrt{\frac{k s_1}{s_b}}$  |

| whichever is the lesser   | (3) Aft of 0.2L from the F.P.                              | The taper thickness (See Notes 1, 2 and 3) or as (2) (c) whichever is the greater  |
| (b) between 0.05L and 0.2L from the F.P.:   | (4) Inside forecastle extending aft of 0.15L from the F.P. | As for a lower deck (See Note 4)   |
| <p><math>s_b = \left( 470 + \frac{L}{0.6} \right)</math> mm or 700 mm,</p> <p>whichever is the lesser</p> <p><math>f = 1.1 - \frac{S}{2500S}</math> but to taken not greater than 1.0</p> <p><math>h_4</math> = tank head, in metres, as defined in Ch 3.5</p>  | (5) In way of crown of a tank                              | $t = 0.004sf \sqrt{\frac{\rho k h_4}{1.025}} + 3.5$ <p>or as in (1) to (4) as applicable, whichever is the greater but not less than: 7.5 mm where <math>L \geq 90</math> m, or 6.5 mm where <math>L &lt; 90</math> m</p>  |
| <p><b>Note 1.</b> The taper thickness is to be determined from <a href="#">Table 3. 2. 1: Taper requirements for hull envelope</a>.</p> <p><b>Note 2.</b> For taper area requirements, See <a href="#">Table 3. 2. 1: Taper requirements for hull envelope</a>.</p> <p><b>Note 3.</b> For thickness of upper deck plating in way of the cargo and fore peak tanks of oil tankers or ore carriers, See also <a href="#">Pt 4, Ch 9 Double Hull Oil Tankers</a>, <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> or <a href="#">Pt 4, Ch 11 Ore Carriers</a>, as applicable.</p> <p><b>Note 4.</b> The exposed deck taper thickness is to extend into a forecastle or bridge for at least one-third of the breadth of the ship from the superstructure end bulkhead.</p> <p><b>Note 5.</b> The taper requirements from <a href="#">Table 3. 2. 1: Taper requirements for hull envelope</a> in <a href="#">Pt 3, Ch 3 Structural Design</a> do not apply to container ships or open ship types, See <a href="#">Pt 3, Ch 4, 2.3 Open type ships</a>, where the requirements of <a href="#">Pt 4, Ch 8, 3.2 Longitudinal strength</a> are applicable, nor to fast cargo ships where the requirements of <a href="#">Pt 4, Ch 1, 3 Longitudinal strength</a> are applicable. See also <a href="#">Pt 3, Ch 4, 5 Hull bending strength</a> for hull section modulus requirement away from the midship area.</p> |  |  |

**Table 5. 2. 2: Lower deck plating forward**

| Symbols  | Location  | Thickness, in mm  |
|--|---|---|
| <p><math>L, s, S, k, \rho</math> as defined in <a href="#">Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1</a></p> <p><math>b</math> = breadth of increased plating, in mm</p> <p><math>f = 1.1 - \frac{s}{2500S}</math> but is to be taken not greater than 1.0</p> <p><math>h_4</math>=tank head, in metres, as defined in <a href="#">Pt 3, Ch 3, 5 Design loading</a></p> <p><math>K_2</math> = 2.5 mm at bottom tank, or<br/>= 3.5 mm at crown of tank</p> <p><math>s_1 = s</math>, but is to be taken not less than <math>\left(470 + \frac{L_1}{0.6}\right) mm</math></p> <p><math>A_f</math> = girder face area, in <math>cm^2</math></p> <p><math>L_1 = L</math>, but need not be taken greater than 190 m</p> <p><b>Note 1.</b> Where the deck loading exceeds 43.2 kN/m<sup>2</sup>, the thickness of plating will be specially considered. This is equivalent to a 'tween deck height of 6.1 m in association with the standard stowage rate 1.39 m<sup>3</sup>/tonne.</p> <p><b>Note 2.</b> For minimum thickness of deck plating in oil tankers, See <a href="#">Pt 4, Ch 9, 10.2 Compartment minimum thickness</a>.</p> | (1) Forward of 0.075L from the F.P.                       | $t = 0.01s_1\sqrt{k}$<br>but not less than 6.5 mm   |
|  | (2) Aft of 0.075L from the F.P., inside line of openings  | $t = 0.01s_1\sqrt{k}$<br>but not less than 6.5 mm   |
|  | (3) Aft of 0.075L from the F.P., outside line of openings | As determined by a taper line from the midship thickness to the end thickness given by (1)  |
|  | (4) In way of crown or bottom of tank                     | $t = 0.004fs\sqrt{\frac{\rho kh_4}{1.025}} + K_2$<br>or as in (1), (2) or (3) as applicable, whichever is the greater but not less than:<br>= 7.5 mm where $L \geq 90$ m, or<br>= 6.5 mm where $L < 90$ m |
|  | (5) Plating forming the upper flange of underdeck girders | Clear of cargo hatches $t = \sqrt{\frac{A_f}{1.8k}}$<br><br>In way of hatch side girders $t = 1.1\sqrt{\frac{A_f}{1.8k}}$<br><br>Minimum breadth $b = 760$ mm   |

2. 3. 6 End connections of beams are to be in accordance with the requirements of [Pt 3, Ch 10, 3 Secondary member end connections](#).

## 2. 4 Deck supporting structure

2. 4. 1 The arrangements and scantlings of supporting structure are generally to be in accordance with the requirements given in [Pt 4, Ch 1, 4 Deck structure](#) using the heads given in [Pt 3, Ch 3, 5 Design loading](#) for the particular region concerned, except as required by [Pt 3, Ch 5, 2.4 Deck supporting structure 2.4.2](#) to [Pt 3, Ch 5, 2.4 Deck supporting structure 2.4.4](#).
2. 4. 2 The spacings of girders and transverses are generally not to exceed the values given in [Table 5. 2. 5: Spacing of girders and transverses under strength/weather decks forward](#).
2. 4. 3 Primary structure in the topside tanks of bulk carriers is to comply with the requirements of [Pt 4, Ch 7, 7 Topside tank structure](#).
2. 4. 4 Primary structure in the cargo tanks of oil tankers and ore carriers is to be determined from [Pt 4, Ch 9 Double Hull Oil Tankers](#), [Pt 4, Ch 10 Single Hull Oil Tankers](#) or [Pt 4, Ch 11 Ore Carriers](#), as applicable.

## 2. 5 Deck openings

2. 5. 1 In dry cargo ships the requirements for deck openings given in [Pt 4, Ch 1, 4 Deck structure](#) are generally applicable throughout the forward region, except that forward of  $0.25L$  from the F.P.:
- The radii or dimensions of the corners of main cargo hatchway openings on the strength deck are to be in accordance with the requirements of [Pt 4, Ch 1, 4.5 Deck openings](#). The thickness of the insert plates, where required, is not to be less than 20 per cent greater than the adjacent deck thickness outside the line of openings, with a minimum increase of 3 mm.
  - Insert plates will be required at lower decks in way of any rapid change in hull form to compensate for loss of deck cross-sectional area. Otherwise, insert plates will not normally be required.
  - Compensation and edge reinforcement for openings outside the line of main hatchways will be considered, bearing in mind their position, the deck arrangements and the type of ship concerned.
2. 5. 2 For deck openings in way of the cargo tanks in oil tankers and ore carriers, *See also* [Pt 4, Ch 9 Double Hull Oil Tankers](#), [Pt 4, Ch 10 Single Hull Oil Tankers](#) or [Pt 4, Ch 11 Ore Carriers](#), as applicable. For main cargo hatchway openings on bulk carriers and container ships, *See also* [Pt 4, Ch 7 Bulk Carriers](#) and [Pt 4, Ch 8 Container Ships](#), as applicable.

**Table 5. 2. 3: Strength/weather deck longitudinals forward**

| Location  | Modulus, $\text{cm}^3$  | Inertia, $\text{cm}^4$    |
|---|---|---------------------------|
| (1) Forward of $0.075L$ from the F.P.   | The greater of the following:<br>(a) $Z = sk(635h_1 + 0.0078(l_e L_1)^2) \times 10^{-4}$<br>(b) $Z = 0.0127skh_1 l_e^2$                               | —                         |
| (2) At $0.075L$ from the F.P., for end modulus for taper  | The greater of the following:<br>(a) $Z_e = sk(485h_0 + 0.0062(l_{e1} L_1)^2) \times 10^{-4}$<br>(b) $Z_e = 0.009skh_0 l_{e1}^2$                      | —                         |
| (3) Aft of $0.075L$ from the F.P., outside line of openings                                       | As given by (4) or as determined from <a href="#">Table 3. 2. 1: Taper requirements for hull envelope</a> whichever is the greater, <i>See</i> Note 1 | —                         |
| (4) At $0.075L$ and between $0.075L$ and $0.12L$ from the F.P.                                    | The greater of the following:<br>(a) $Z = sk(570h_1 + 0.0072(l_e L_1)^2) \times 10^{-4}$<br>(b) $Z = 0.0127skh_1 l_e^2$                               | —                         |

| (2) Between the collision bulkhead and 0.075L from the F.P.   | 3.7 m | 2.5 m where $L \leq 100$ m<br>3.5 m where $L \geq 300$ m<br>Intermediate values by interpolation |
| (3) In way of a deep tank, forward of 0.2L from the F.P.  | —     | 3.0 m where $L \leq 100$ m<br>4.2 m where $L \geq 300$ m<br>Intermediate values by interpolation |
| (4) Elsewhere in way of dry cargo spaces or deep tanks, See Note 1  | —     | 3.8 m where $L \leq 100$ m<br>(3.2 + 0.006L) m where $L > 100$ m                                 |
| <p><b>Note 1.</b> For the maximum spacing of transverses in the cargo tanks of oil tankers or ore carriers, See <a href="#">Pt 4, Ch 9, 9 Primary members supporting longitudinal framing</a>.</p> <p><b>Note 2.</b> For the maximum spacing of transverses in dredgers, See <a href="#">Pt 4, Ch 12, 5 Shell envelope framing</a>.</p> |       |  |

**CHAPTER 5 Fore End Structure****SECTION 3 Shell envelope plating****3.1 General**

- 3.1.1 Where the shell is longitudinally framed in the midship region, this system of framing is to be carried as far forward as practicable. In the case of oil tankers (See [Pt 3, Ch 5, 1.1 Application 1.1.4](#)), longitudinal framing is to extend at least to the forward end of the cargo tanks.

**3.2 Keel**

- 3.2.1 The scantlings of bar keels at the fore end are to be the same as in the midship region as required by [Pt 4, Ch 1, 5 Shell envelope plating](#).
- 3.2.2 The thickness and width of plate keels in the forward region are to be the same as required in the midship region for the particular type of ship concerned, See [Pt 4 Ship Structures \(Ship Types\)](#).

**3.3 Stem**

- 3.3.1 Bar stems may be either steel castings or steel forgings complying with the requirements of [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#) of the Rules for Materials for rolled steel flat bars or [Ch 5 Steel Forgings](#) of the Rules for Materials for solid round bars. The scantlings of bar stems are to comply with [Table 3. 5. 1: Design heads and permissible cargo loadings](#).
- 3.3.2 The scantlings of plate stems are to be determined from [Table 3. 5. 1: Design heads and permissible cargo loadings](#). Plate stems are to be supported by horizontal diaphragms positioned in line with the side stringers or perforated flats with intermediate breasthook diaphragms. Diaphragms are to be spaced not more than 1.5 m apart, measured along the stem. Where the stem plate radius is large, a centreline stiffener or web will be required.

**3.4 Bottom shell and bilge**

- 3.4.1 The thickness of bottom shell and bilge plating in the forward region for ships not requiring additional strengthening of bottom is to comply with [Table 5. 3. 1: Shell plating forward](#).
- 3.4.2 For thickness of bottom shell and keel when additional bottom strengthening is required, See [Pt 3, Ch 5, 1.5, Strengthening of bottom forward](#).
- 3.4.3 Where longitudinals are omitted in way of radiused bilge plating amidships, the plating thickness forward will be considered in relation to the support derived from the hull form and internal stiffening arrangements.

### 3.5 Side shell and sheerstrake

- 3.5.1 The thickness of side shell and sheerstrake plating in the forward region is to be not less than the values given in [Table 5.3.1: Shell plating forward](#), but may be required to be increased locally on account of high shear forces, in accordance with [Pt 3, Ch 4, 6.5, Permissible still water shear force](#).
- 3.5.2 For transversely framed side shells where panting stringers are omitted, See [Pt 3, Ch 5, 4.4, Panting stringers in way of transverse framing](#), the side shell plating in the region concerned is to be increased in thickness by the percentages given below:
- 15 per cent, where  $L \leq 150$  m
  - 5 per cent, where  $L \geq 215$  m
- For intermediate values of  $L$ , the percentage increase is to be obtained by interpolation.
- 3.5.3 The side shell plating of increased thickness required by [Pt 3, Ch 5, 3.5 Side shell and sheerstrake 3.5.2](#) is to be continued forward past the fore peak or collision bulkhead. In addition, horizontal brackets in line with the fore peak stringers are to be fitted at the aft side of the bulkhead where practicable. The brackets are to be the same thickness as the side shell and are to extend from the bulkhead to the adjacent shell frame and be connected thereto. Transversely the toes of the brackets are to extend past the outboard stiffener of the bulkhead to clear any cut out in the bulkhead stringer.
- 3.5.4 The sheerstrake taper thickness is to be increased by 20 per cent at the ends of a bridge superstructure extending out to the ship's side irrespective of position. Similar strengthening is to be fitted in way of the end of a forecastle if this occurs at a position aft of  $0.25L$  from the F.P. No increase is required if the forecastle end bulkhead lies forward of  $0.2L$  from the F.P. The increase at intermediate positions of end bulkhead is to be obtained by interpolation.
- 3.5.5 The shell plating may be required to be increased in thickness locally in way of hawse pipes, See [Pt 3, Ch 13, 8.12 Structural requirements associated with anchoring](#).
- 3.5.6 The shell plating is to be increased in thickness locally in way of a bulbous bow, See [Pt 3, Ch 5, 6.5 Bulbous bow 6.5.6](#).

### 3.6 Shell openings

- 3.6.1 In general, compensation will not be required for holes in the sheerstrake which are clear of the gunwale, or for any deck openings situated outside the line of main hatchways and whose depth does not exceed 20 per cent of the depth of the sheerstrake or 380 mm, whichever is the lesser. Openings are not to be cut in a rounded gunwale. Cargo door openings are to have well rounded corners, and the proposed compensation for the door openings will be individually considered.
- 3.6.2 Sea inlet and other openings are to have well rounded corners. The thickness of sea inlet box plating is generally to be the same as the adjacent shell. It is however, to be not less than 12.5 mm, and need not exceed 25 mm.

**Table 5.3.1: Shell plating forward**

| Location  | Thickness, in mm | Notes ( <i>Part only shown</i> )  |
|---|------------------|---|
| (1) Bottom shell and bilge, See also <a href="#">Pt 3, Ch 5, 1.5, Strengthening of bottom forward</a> and Note 5: |                  | <b>Note 1.</b> For ships where $L \leq 70$ m this thickness may be reduced by 1 mm, but it is to be not less than 6 mm. |

|  |  |  |
|--|--|--|
| (a) Forward of 0.075L from the F.P.  | $t = (6.5 + 0.033L)f_2 \sqrt{\frac{ks_1}{s_b}}$<br>(See Note 1)  | <b>Note 2.</b> The taper thickness is to be determined from <a href="#">Table 3. 2. 1: Taper requirements for hull envelope</a>  |
| (b) Between 0.075L and 0.25L from the F.P., See Note 7   | As (1)(a) or the taper thickness, whichever is the greater   | <b>Note 3.</b> For thickness of shell plating in way of the cargo and fore peak tanks of oil tankers or ore carriers, See also <a href="#">Pt 4, Ch 9 Double Hull Oil Tankers</a> , <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> or <a href="#">Pt 4, Ch 11 Ore Carriers</a> , as appropriate.  |
| (c) Aft of 0.25L from the F.P., See Note 7   | The taper thickness, (See Note 2)  | <b>Note 4.</b> In offshore supply ships the thickness of side shell is to be not less than 9 mm.   |
| (2) Side shell, See Notes 4 and 5:   |  | <b>Note 5.</b> For trawlers and fishing vessels See <a href="#">Pt 4, Ch 6, 5 Shell envelope plating</a> .   |
| (a) Forward of 0.075L from the F.P.  | $t = (6.5 + 0.033L)f_2 \sqrt{\frac{ks_1}{s_b}}$<br>(See Note 1)  | <b>Note 6.</b> For fast cargo ships, See <a href="#">Pt 4, Ch 1, 3 Longitudinal strength</a> .   |
| (b) Between 0.075L and 0.2L from the F.P., See also <a href="#">Pt 3, Ch 5, 3.5 Side shell and sheerstrake 3.5.2</a> | As (2)(a) or the taper thickness, whichever is the greater   | <b>Note 7.</b> For oil tankers the thickness is also to be in accordance with <a href="#">Pt 4, Ch 9, 4.3 Deck plating 4.3.3</a> .   |
| (c) Aft of 0.2L from the F.P.  | The taper thickness, (See Note 2)  | <b>Note 8.</b> The taper requirements from <a href="#">Table 3. 2. 1: Taper requirements for hull envelope</a> in <a href="#">Pt 3, Ch 3 Structural Design</a> do not apply to container ships or open ship types, See <a href="#">Pt 3, Ch 4, 2.3 Open type ships</a> , where the requirements of <a href="#">Pt 4, Ch 8, 3.2 Longitudinal strength</a> are applicable, nor to fast cargo ships where the requirements of <a href="#">Pt 4, Ch 1, 3 Longitudinal strength</a> |
| (3) Sheerstrake, See Notes 4 and 5:  |  |  |
| (a) Forward of 0.075L from the F.P.:   |  |  |
| where $\frac{T}{D} > 0.7$  | As (2)(a) for side shell   |  |
| where $\frac{T}{D} \leq 0.7$   | As (4) for a forecandle  |  |
| (b) Between 0.075L and 0.2L from the F.P., See Note 7  | As (3)(a) or as determined from <a href="#">Table 3. 2. 1: Taper requirements for hull envelope</a> in Chapter 3 |  |

| (c) Aft of 0.2L from the F.P., See Note 7   | The taper thickness, (See Note 2)  | are applicable. See also <a href="#">Pt 3, Ch 4, 5 Hull bending strength</a> for hull section modulus requirement away from the midship area. |        |                    |                  |                                |  |  |                                      |  |  |                                      |                                      |                           |

## PART

# 3

## CHAPTER 5 Fore End Structure

### SECTION 4 Shell envelope framing

#### 4.1 General

- 4.1.1 Requirements are given in this Section for both longitudinal and transverse framing systems. Where longitudinal framing is adopted in the midship region it is to be carried as far forward as practicable. In the case of oil tankers (See [Pt 3, Ch 5, 1.1 Application 1.1.4](#)), longitudinal framing is to be continued at least to the fore end of the cargo tanks.
- 4.1.2 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and, so far as practicable, direct continuity of longitudinal strength, See also [Pt 3, Ch 10, 3 Secondary member end connections](#). Where  $L$  exceeds 215 m, the bottom longitudinals are to be continuous in way of both watertight and non-watertight floors, but alternative arrangements will be considered. Higher tensile steel longitudinals within 10 per cent of the ship's depth at the bottom and deck are to be continuous irrespective of the ship length.
- 4.1.3 Stiffeners and brackets on side transverses, where fitted on one side and connected to higher tensile steel longitudinals between the base line and  $0.8D$  above the base line, are to have their heels well radiused to reduce stress concentrations. Where a symmetrical arrangement is fitted, i.e. bracket or stiffening on both sides, and it is connected to higher tensile steel longitudinals, the toes of the stiffeners or brackets are to be well radiused. Alternative arrangements will be considered if supported by appropriate direct calculations.
- 4.1.4 Where higher tensile steel side longitudinals pass through transverse bulkheads in the cargo area, well radiused brackets of the same material are to be fitted on both the fore and aft side of the connection between the upper turn of bilge and  $0.8D$  above the base line. Particular attention is to be given to ensuring the alignment of these brackets. Alternative arrangements will be considered if supported by appropriate direct calculations.
- 4.1.5 For ships intended to load or unload while aground, See [Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground](#).

#### 4.2 Shell longitudinals

- 4.2.1 The scantlings of bottom and side shell longitudinals in the forward region are to comply with the requirements given in [Pt 3, Ch 5, 4.2 Shell longitudinals 4.2.1](#). For the scantlings of bottom shell longitudinals where additional bottom strengthening is required, See [Pt 3, Ch 5, 1.5, Strengthening of bottom forward](#).

**Table 5. 4. 1: Shell framing (longitudinal) forward**

| Location                             | Modulus, in $\text{cm}^3$           |
|--------------------------------------|-------------------------------------|
| (1) Side longitudinals in forecastle | $Z = 0.0075skl_e^2(0.6 + 0.167D_1)$ |

|   |   |
|---|---|
| (2) Side longitudinals in way of dry spaces including double skin construction: |   |
| (a) Forward of the collision bulkhead   | $Z = 0.007skh_{Tl}l_e^2F_s$ but not to be less than as required by (1)  |
| (b) Between the collision bulkhead and 0.2L from the F.P.                       | As (a) above or as required in the midship region for the particular type of ship concerned, whichever is the greater. However, not to be taken less than as required by (1).   |
| (c) Aft of 0.2L from the F.P.   | As required in the midship region for the particular type of ship concerned.  |
| (3) Side longitudinals in way of double skin tanks or deep tanks                | The greater of the following:<br>Z as from (2)<br>As required by <a href="#">Pt 4, Ch 1, 9 Bulkheads</a> for deep tanks.  |
| (4) Bottom and bilge longitudinals  | The greater of the following:<br>As required in the midship region for the particular type of ship concerned.<br>As required by <a href="#">Pt 3, Ch 5, 1.5, Strengthening of bottom forward</a> , strengthening of bottom forward, where applicable. |
| Symbols   |   |

$L, D, T, s, k$ , as defined in [Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1](#)

$l_e =$  as defined in [Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1](#), but is to be taken not less than 1.5m

$L_1 = L$  but need not be taken greater than 190 m

$F_s$  is a fatigue factor to be taken as follows:

(a) For built sections and rolled angle bars:

$F_s = \frac{1.1}{k} \left[ 1 - \frac{2b_{f1}}{b_f} (1 - k) \right]$  at  $0.6D_1$  above the base line  
 $= 1.0$  at  $D_1$  and above, and  $F_{sb}$  at the base line intermediate values by linear interpolation

$F_{sb}$  is a fatigue factor for bottom longitudinals

$= 0.5(1 + F_s \text{ at } 0.6D_1)$

(b) For flat bars and bulb plates  $\frac{b_{f1}}{b_f}$  may be taken as 0.5

where

$b_{f1} =$  the minimum distance, in mm, from the edge of the face plate of the side longitudinal under consideration to the centre of the web plate, *See* Fig. 9.5.1 in Pt 4, Ch 9

$b_f =$  the width of the face plate, in mm, of the side longitudinal under consideration, *See* Fig. 9.5.1 in Pt 4, Ch 9

$T_1 = T$  but not to be taken less than  $0.65D_1$

$D_1 = T + H_b$  metres, where  $H_b$  is the minimum bow height, in metres, obtained from [Pt 3, Ch 1, 6.1 Principal particulars 6.1.11](#)

$h_{T1} = f_w C_w \left( 1 - \frac{h_6}{D_1 - T_1} \right) F_\lambda$ , in metres, for longitudinals above the waterline at draught  $T_1$  where

$f_w \left( 1 - \frac{h_6}{D_1 - T_1} \right)$  is not to be taken less than 0.7

$= \left[ h_6 + f_w C_w \left( 1 - \frac{h_6}{2T_1} \right) \right] F_\lambda$ , in metres, for longitudinals below the waterline at draught  $T_1$

where

$f_w = 1.0$  at  $0.2L$  from the F.P. and  $1.71$  at, and forward of,  $0.15L$  from the F.P. Intermediate positions by interpolation

$h_6 =$  vertical distance, in metres, from the waterline at draught  $T_1$ , to the longitudinal under consideration

$F_\lambda = 1.0$  for  $L \leq 200$  m

$= [1.0 + 0.0023(L - 200)]$  for  $L > 200$  m

$C_w =$  a wave head, in metres  $= 7.71 \times 10^{-2} L e^{-0.0044 L}$

where

$e =$  base of natural logarithms 2.7183

**Note** Where struts are fitted midway between transverses in double skin construction, the modulus of the side longitudinals may be reduced by 50% per cent from that obtained for locations (2) and (3) as applicable.

4. 2. 2 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and so far as practicable, direct continuity of longitudinal strength, *See also* [Pt 3, Ch 10, 3 Secondary member end connections](#).

### 4. 3 Shell framing

4. 3. 1 The scantlings of side frames in the forward region are to comply with the requirements given in [Pt 3, Ch 5, 4.4 Panting stringers in way of transverse framing 4.4.3](#).

4. 3. 2 The scantlings of main frames are normally to be based on Rule standard brackets at top and bottom, whilst the scantlings of 'tween deck frames are normally to be based on a Rule standard bracket at the top only.
4. 3. 3 End connections of transverse main and 'tween deck frames are to be in accordance with [Pt 3, Ch 10, 3 Secondary member end connections](#). For bulk carriers the end connections of main frames in cargo holds are to be in accordance with [Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.5](#) to [Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.12](#). Where brackets are omitted at the foot of main frames in cargo spaces, small easing brackets are to be fitted forward of 0.15L from the F.P.

#### 4. 4 Panting stringers in way of transverse framing

4. 4. 1 In lower hold or deep tank spaces panting stringers are generally to be fitted in line with each stringer or flat in the fore peak space and extending back to 0.15L from the F.P. These stringers may be omitted if the shell plating is increased in thickness as required by [Pt 3, Ch 5, 3.5 Side shell and sheerstrake 3.5.2](#). Where the span of the main frames exceeds 9 m, panting stringers are to be fitted irrespective of whether the shell plating is increased in thickness or not. These stringers are to be arranged in line with alternate stringers or flats in the fore peak and are to extend back to 0.2L from the F.P.
4. 4. 2 In 'tween deck spaces in the region forward of 0.15L from the F.P., where the unsupported length of frame exceeds 2.6 m in a lower 'tween deck or 3.0 m in an upper 'tween deck, intermediate panting stringers are generally to be fitted. These stringers may be omitted if the shell plating is increased in thickness as required by [Pt 3, Ch 5, 3.5 Side shell and sheerstrake 3.5.2](#).
4. 4. 3 The scantlings of panting stringers are to be determined from [Pt 3, Ch 5, 4.4 Panting stringers in way of transverse framing 4.4.3](#).

**Table 5. 4. 2: Shell framing (transverse) forward**

| Location   | Modulus, in cm <sup>3</sup>   | Inertia, in cm <sup>4</sup> |
|--|---|-----------------------------|
| (1)Frames in fore peak spaces and lower 'tween decks over, <i>See</i> Note 1   | $Z = 9.1skD_1 \times 10^{-3}$   | $I = \frac{3.5}{k} S_1 Z$   |
| (2) Frames in upper 'tween decks and forecastles forward of the collision bulkhead, <i>See</i> Notes 1, 2 and 8                              | The greater of the following:<br>$Z = Cskh_{T1}H^2 \times 10^{-3}$<br>$Z = 9.1skD_1 \times 10^{-3}$                     | $I = \frac{3.5}{k} HZ$      |
| (3) Main and 'tween deck frames (including forecastle) between the collision bulkhead and 0.15L from the F.P., <i>See</i> Notes 1 to 4 and 8 | The greater of the following:<br>$Z = Cskh_{T1}H^2 \times 10^{-3}$<br>$Z=9.1skD_1 \times 10^{-3}$                       | $I = \frac{3.5}{k} HZ$      |
| (4)Main and 'tween deck frames between 0.15L and 0.2L from the F.P. in dry cargo spaces, <i>See</i> Notes 1 to 4 and 8                       | The greater of the following:<br>$Z = Cskh_{T1}H^2 \times 10^{-3}$<br>$Z = 9.1skD_1 \times 10^{-3}$                     | $I = \frac{3.2}{k} HZ$      |
| (5) Panting stringers, <i>See</i> Note 5   | Web depth, $d_w$ , same depth as frames Web thickness, $t = 6 + 0.025L_2$ mm<br>Face area, $A = kS_2(H + 1)\text{cm}^2$ |                             |
| (6) Main and 'tween deck frames elsewhere, <i>See</i> Notes 1 to 4   | As required in the midship region for the particular type of ship concerned   |                             |
| Symbols  |   |                             |
| $L, D, T, s, k$ as defined in <a href="#">Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1</a>  |   |                             |

|                    |   |
|--------------------|---|
| $L_2$              | = $L$ , but need not be taken greater than 215 m  |
| $D_1$              | = $T + H_b$ , in metres, where $H_b$ is defined in <a href="#">Pt 3, Ch 1, 6.1 Principal particulars 6.1.11</a>   |
| $D_1$              | = $T + H_b$ , in metres, where $H_b$ is defined in <a href="#">Pt 3, Ch 1, 6.1 Principal particulars 6.1.11</a>   |
| $D_2$              | = $D_1$ , but is to be taken not greater than 16 m, nor less than 6.0 m   |
| $H$                | = $H_{MF}$ or $H_{TF}$ as applicable, <i>See Note 7</i>   |
| $H_{MF}$           | = vertical framing depth, in metres, of main frames as shown in Fig. 5.4.1 but is to be taken not less than 3.5 m, <i>See Note 6</i>  |
| $H_{TF}$           | = vertical framing depth, in metres, of 'tween deck frames as shown in Fig. 5.4.1 but is to be taken not less than 2.5 m  |
| $K_1$              | = 2.3 for peak tanks<br>= 1.87 for 'tween decks over peak tanks   |
| $S_1$              | = vertical spacing of peak stringers or height of lower 'tween deck above the peak, in metres, as applicable  |
| $S_2$              | = vertical spacing of panting stringers, in metres  |
| $C$                | = end connection factor<br>= 3.4 where two Rule standard brackets fitted<br>= 3.4 (1.8 – 0.8( $l_a/l$ )) where one Rule standard bracket and one reduced bracket is fitted<br>= 3.4 (2.15 – 1.15( $l_{\text{amean}}/l$ )) where two reduced brackets are fitted<br>= 6.1 where one Rule standard bracket is fitted<br>= 6.1 (1.2 – 0.2( $l_a/l$ )) where one reduced bracket is fitted.<br>= 7.3 where no brackets are fitted<br>= The requirements for frames where brackets larger than Rule standard are fitted will be specially considered |
| $l$                | = length, in mm, as derived from <a href="#">Pt 3, Ch 10, 3.4 Scantlings of end brackets 3.4.1</a>  |
| $l_a$              | = equivalent arm length, in mm, as derived from <a href="#">Pt 3, Ch 10, 3.4 Scantlings of end brackets 3.4.1</a>   |
| $l_{\text{amean}}$ | = mean equivalent arm length, in mm, for both brackets  |
| $T_1$              | = $T$ but not to be taken less than 0.65 $D_1$  |
| $h_{T1}$           | = head, in metres, at mid-length of $H$<br>= $f_w C_w \left(1 - \frac{h_6}{D_1 - T_1}\right) F_\lambda$ in metres for frames where the mid-length of frame is above the waterline, at draught $T_1$<br>where $f_w \left(1 - \frac{h_6}{D_1 - T_1}\right)$ is not to be taken less than 0.7<br><br>= $\left[h_6 + f_w C_w \left(1 - \frac{h_6}{2T_1}\right)\right] F_\lambda$ in metres for frames where the mid-length of frame is below the waterline at draught $T_1$   |

where

|             |  |
|-------------|--|
| $f_w$       | = 1.0 at 0.2L from F.P. and 1.71 at, and forward of, 0.15L from F.P. Intermediate positions by interpolation |
| $h_6$       | = vertical distance, in metres, from the waterline at draught $T_1$ to the mid-length of $H$                 |
| $F_\lambda$ | = 1.0 for $L \leq 200$ m<br>= $[1.0 + 0.0023 (L - 200)]$ for $L > 200$ m                                     |

$$C_w = \text{a wave head, in metres}$$

$$= 7.71 \times 10^{-2} L e^{-0.0044 L}$$

where

$$e = \text{base of natural logarithms } 2.7183$$

**Note 1.** For framing in the fore end of fishing vessels, See [Pt 4, Ch 6, 6 Shell envelope framing](#)

**Note 2.** In offshore supply ships the moduli of main and 'tween deck frames are to be 25 per cent greater than given in (2), (3) and (4).

**Note 3.** In way of the cargo tanks of oil tankers or ore carriers, the scantlings of frames are also to comply with the requirements for frames in the midship region of such ships, See [Pt 4, Ch 9 Double Hull Oil Tankers](#), [Pt 4, Ch 10 Single Hull Oil Tankers](#) or [Pt 4, Ch 11 Ore Carriers](#), as applicable.

**Note 4.** In bulk carriers the scantlings of frames are also to comply with the requirements of [Pt 4, Ch 7, 6 Shell envelope framing](#) in which the requirements of Table 7.6.1 location (1) are to be multiplied by the following factor: Between 0.15L and 0.2L from the F.P.,  $C_1 = (0.018D_2 + 0.82)$ , but not to be taken less than 1.0. Between collision bulkhead and 0.15L from the F.P.  $C_1 = (0.021D_2 + 0.96)$ .

**Note 5.** Panting stringers are not required in tugs less than 46 m in length, See [Pt 4, Ch 3, 4 Panting and strengthening of bottom forward](#).

**Note 6.** Where the frames are supported by fully effective horizontal stringers, these may be considered as decks for the purpose of determining  $H_{MF}$ .

**Note 7.** Where frames are inclined at more than 15° to the vertical,  $H_{MF}$  or  $H_{TF}$  is to be measured along a chord between span points of the frame.

**Note 8.** Except for main frames the modulus for these members need not exceed that derived from (1) using  $H_{TF}$  in place of  $S_1$ .

## 4. 5 Primary structure at sides

4. 5. 1 For the arrangement of primary structure in peak tanks and deep tanks forward, See also [Pt 3, Ch 5, 6 Fore peak structure](#) and [Pt 3, Ch 5, 7 Forward deep tank structure](#).

4. 5. 2 The spacing of side transverses and web frames is generally not to exceed the values given in [Table 5. 4. 3: Spacing of side transverses and web frames forward](#).

**Table 5. 4. 3: Spacing of side transverses and web frames forward**

| Location   | Maximum spacing  |  |
|--|--|--|
|  | Web frames in association with transverse framing system | Side transverses in association with longitudinal framing system                                     |
| (1) Forward of the collision bulkhead                                | 5 frame spaces   | 2.5 m where $L \leq 100\text{m}$<br>3.5 m where $L \geq 300$<br>Intermediate values by interpolation |
| (2) In way of a forward deep tank adjacent to the collision bulkhead | 5 frame spaces   | 3.0 m where $L \leq 100\text{m}$<br>4.2 m where $L \geq 300\text{m}$                                 |

|  |            |  |
|--|------------|--|
|  |            | Intermediate values by interpolation   |
| (3) Elsewhere in way of dry cargo spaces or deep tanks   | See Note 1 | 3.8 m where $L \leq 100\text{m}$<br>$(0.006L + 3.2)$ m where $L > 100\text{m}$ |
| (4) In way of the cargo tanks of oil tankers, chemical tankers or ore or oil carriers  | —          | 3.6 m where $L \leq 180$ m<br>0.02L where $L > 180$ m                          |
| <p><b>Note 1.</b> In 'tween decks above deep tanks situated adjacent to the collision bulkhead, web frames are to be fitted in line with those in the tanks.</p> <p><b>Note 2.</b> For the maximum spacing of transverses in dredgers, See <a href="#">Pt 4, Ch 12, 5 Shell envelope framing</a></p> |            |  |

4. 5. 3 The scantlings of side transverses supporting longitudinal framing and stringers and webs supporting transverse framing in the forward region are to be determined from [Table 5. 4. 4: Primary structure forward](#).

**Table 5. 4. 4: Primary structure forward**

| Item and location  | Modulus, in cm <sup>3</sup>   | Inertia, in cm <sup>4</sup> |
|--|---|-----------------------------|
| Longitudinal framing system  |   |                             |
| (1) Side transverses in dry spaces forward of 0.2 <i>L</i> from the F.P., <i>See</i> Note 5:                 |   | —                           |
| Holds 'tween decks   | $Z = 10kSh_{T1}l_e^2$<br>$Z = C_2kSTH_{TF}\sqrt{D}$   |                             |
| (2) Side transverses in peak and deep tanks forward of 0.2 <i>L</i> from the F.P., <i>See</i> Notes 1 and 4: |   | $I=\frac{2.5}{k}l_eZ$       |
| where no struts fitted<br>where struts fitted  | $Z = 14.1\rho kSh_4l_e^2\gamma$<br>or as (1) above, whichever is the greater<br>As in <a href="#">Pt 4, Ch 9, 9 Primary members supporting longitudinal framing</a> |                             |
| (3) Side transverses in dry spaces and deep tanks aft of 0.2 <i>L</i> from the F.P.                          | As in <a href="#">Pt 4, Ch 1, 6 Shell envelope framing</a> , <i>See</i> Notes 1 and 2   |                             |
| Transverse framing system  |   |                             |

|   |   |   |  |
|---|---|---|--|
| (4)   | Side stringers supported by webs in dry spaces forward of 0.2 <i>L</i> from the F.P., <i>See</i> Note 3 or as (4) above, whichever is the greater | $Z = 7.75kSh_{T1}l_e^2$   | —  |
| (5)   | Side stringers supported by webs in peak or deep tanks forward of 0.2 <i>L</i> from the F.P., <i>See</i> Notes 1 and 3                            | $Z = 11.7\rho kSh_4l_e^2$<br>or as (4) above, whichever is the greater  | $I=\frac{2.5}{k}l_eZ$                      |
| (6)   | Web frames supporting side stringers forward of 0.2 <i>L</i> from the F.P., <i>See</i> Notes 1, 2 and 3   | <p><i>Z</i> to be determined from the calculations based on the following assumptions:</p> <p>Fixed ends</p> <p>Point loadings from stringers</p> <p>Head <math>\gamma h_4</math> or <math>\gamma h_{T1}</math> as applicable</p> <p>Bending stress</p> $\frac{93.2}{k}N/mm^2$ <p>Shear stress</p> $\frac{83.4}{k}N/mm^2$ | <p>In deep tanks</p> $I=\frac{2.5}{k}l_eZ$ |
| (7)   | Web frames in 'tween decks, not supporting side stringers, forward of 0.2 <i>L</i> from the F.P.  | $Z = C_3kSTH_{TF}\sqrt{D}$  | —  |
| (8)   | Side stringers and web frames in dry spaces and deep tanks aft of 0.2 <i>L</i> from the F.P.  | As in <a href="#">Pt 4, Ch 1, 6 Shell envelope framing</a> , <i>See</i> Notes 1 and 2   |  |
| Symbols   |   |   |  |
| <i>D, T, S, l<sub>e</sub>, k, ρ</i> as defined in <a href="#">Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1</a> |   |   |  |

$B_f$  = bow fullness factor determined from Fig 5.4.3 to be taken as 1.0 for framing members located at and abaft  $0.2L$  from the forward perpendicular

$h_4$  = tank head, in metres, as defined in [Pt 3, Ch 3, 5 Design loading](#)

$h_{T1}$  = head, in metres, at mid-length of span

=  $f_w C_w \left(1 - \frac{h_6}{D_1 - T_1}\right) F_\lambda$ , in metres, where the mid-length of span is above the waterline at draught  $T_1$

Where  $f_w \left(1 - \frac{h_6}{D_1 - T_1}\right)$  is not to be taken less than 0.7

=  $\left[h_6 + f_w C_w \left(1 - \frac{h_6}{2T_1}\right)\right] F_\lambda$ , in metres, where the mid-length of span is below the waterline at draught  $T_1$

where

$f_w$  = 1.0 at  $0.2L$  from F.P. and 1.71 at, and forward of,  $0.15L$  from F.P. Intermediate positions by interpolation

$h_6$  = vertical distance, in metres, from the waterline at draught  $T_1$  to the mid-length of span

$F_\lambda$  = 1.0 for  $L \leq 200$  m

=  $[1.0 + 0.0023 (L - 200)]$  for  $L > 200$  m

$C_w$  = a wave head, in metres

=  $7.71 \times 10^{-2} L e^{-0.0044L}$

where

$e$  = base of natural logarithms 2.7183

$D_1$  =  $T + H_b$ , in metres, where  $H_b$  is defined in [Pt 3, Ch 1, 6.1 Principal particulars 6.1.11](#)

$T_1$  =  $T$  but not to be taken less than  $0.65D_1$

$C_2$ ,  $C_3$  = factors obtained from [Figure 5.4.2: Framing factors for primary members](#)

$H_{TF}$  = vertical height of 'tween decks, in metres, as shown in [Pt 3, Ch 5, 4.5 Primary structure at sides 4.5.4](#)

$\gamma$  is to be measured at the mid-span of the member as follows:

$\gamma_1$  = 1.0 at base line

$\gamma_2$  = bow fullness factor ( $B_f$ ) at  $0.6D$  above base

$\gamma_3$  =  $\left(\frac{B_f - 1}{2}\right) + 1.0$  at depth  $D$  above base

Intermediate values are to be determined by interpolation.

Minimum value = 1.0

**Note 1.** In way of the cargo tanks, fore peak tanks and dry spaces of oil tankers or ore carriers the scantlings of primary structure are to comply with the requirements of [Pt 4, Ch 9 Double Hull Oil Tankers](#), [Pt 4, Ch 10 Single Hull Oil Tankers](#) or [Pt 4, Ch 11 Ore Carriers](#), as appropriate.

**Note 2.** For bulk carriers See [Pt 4, Ch 7, 6.2, Transverse stiffening](#).

**Note 3.** For stringers and webs in fore peaks or deep tanks, See also [Pt 3, Ch 5, 6.3, Side structure – Transverse framing](#) and [Pt 3, Ch 5, 7.3, Side structure – Transverse framing](#).

**Figure 5. 4. 3: Illustration of bow fullness factor determination**

Conditions for  $\phi$

1.  $\phi$  to be deduced at  $0,025L$  aft of fore perpendicular
2. Aft of fore peak tank  $\phi$  to be deduced at section being considered
3. For ships with a bulbous bow the angle  $\phi$  is to be measured from the narrowest point of the bow between  $0,6D$  from base and upper deck

Bow fullness factor  
 $B_f = 2,45 \cos \phi \tan \theta$   
 but not to be taken less than 1,0

## CHAPTER 5 Fore End Structure

## SECTION 5 Single and double bottom structure

## 5.1 General

- 5.1.1 For dry cargo ships exceeding 120 m in length and for all ships which have the notation 'strengthened for heavy cargoes', longitudinal framing is, in general, to be adopted (*See also Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers and Pt 4, Ch 10 Single Hull Oil Tankers*).
- 5.1.2 For ships requiring additional strengthening of bottom forward the requirements given in 1.5 are also to be complied with, as applicable.
- 5.1.3 For ships having the notation 'strengthened for heavy cargoes' the requirements of [Pt 4, Ch 7, 8 Double bottom structure](#) are also to be complied with, as applicable.
- 5.1.4 For ships intended to load or unload while aground, *See Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground*.
- 5.1.5 Provision is to be made for the free passage of water and/or air from all parts of single or double bottoms to bilge or tank suction, account being taken of the pumping rates required.
- 5.1.6 For passenger ships, *See Pt 4, Ch 2, 6 Double bottom*.

## 5.2 Single bottoms – Transverse framing

- 5.2.1 In fore peak spaces, for ships of full form the floors are to be supported by a centreline girder or a centreline wash bulkhead. In other cases the centreline girder is to be carried as far forward as practicable. The arrangement and scantlings of the floors and centreline girder are to be sufficient to give adequate stiffness to the structure, but are to be not less than required by [Table 5.5.1: Single bottom construction forward](#). The floor panels and the upper edges of the floors and centreline girder are to be suitably stiffened.

Table 5.5.1: Single bottom construction forward

| Item   | Parameter | Requirement   |
|--|-----------|---|
| Transverse framing system  |           |   |
| (1) Centre girder:   |           | The greater of the following:   |
| (a) In fore peak tank, or deep tank, forward of 0.2L from the F.P. | Modulus   | $Z = 8.5kSh_5le^2 \text{ cm}^3$ , or<br>$Z = 9.75\rho kSh_4le^2 \text{ cm}^3$ |
|  | Inertia   | $I = \frac{2.5}{k} l_e Z \text{ cm}^4$  |

|   |   |  |
|---|---|--|
| (b) In dry spaces   | Web thickness   | $t = t_w$ as in <a href="#">Pt 3, Ch 10, 4.4 Geometric properties and proportions</a><br><br>Forward of $0.075L$ from the F.P.,<br>$t = (\sqrt{Lk} + 0.5)$ mm or 6 mm, whichever is the greater. |
|   | Web thickness   | Between $0.075L$ and $0.3L$ from the F.P. the thickness may taper from the midship thickness to the end thickness above  |
|   | Web depth and face area   | As in <a href="#">Pt 4, Ch 1, 7 Single bottom structure</a>  |
| (2) Floors:<br><br>(a) In fore peak tank, or deep tank, forward of $0.2L$ from the F.P. | Maximum spacing<br><br>Web depth (at centreline)<br><br>Web thickness<br><br>Minimum face plate area in deep tank | Every frame<br>$df = (83D + 150)\text{mm}$ or 1400 mm, whichever is the lesser<br><br>$t = (6.0 + 0.025L_2) \sqrt{\frac{S_2}{800}} \text{ mm}$<br><br>$A_f = 0.85k\text{Bcm}^2$                  |
| (b) In dry cargo spaces   | Maximum spacing<br><br>Scantlings   | Every frame<br><br>As in <a href="#">Pt 4, Ch 1, 7.2 Girders and floors</a>  |
| (3) Intercostal side girders:<br><br>(a) In deep tank, forward of $0.2L$ from the F.P.  | Maximum spacing<br><br>Web depth<br><br>Web thickness<br><br>Minimum face plate area                              | $0.003s_F \text{ m}$<br><br>As floors<br><br>$t = t_w$ as in <a href="#">Pt 3, Ch 10, 4.4 Geometric properties and proportions</a><br><br>Suitable stiffener                                     |
| (b) In dry cargo spaces   | Maximum spacing<br><br>Scantlings   | $0.003s_F \text{ m}$<br><br>As in <a href="#">Pt 4, Ch 1, 7 Single bottom structure</a>  |
| Longitudinal framing system   |   |  |
| (4) Centre girder:<br><br>(a) In deep tanks forward of $0.2L$ from the F.P.             | Scantlings  | As in <a href="#">Pt 4, Ch 9, 9 Primary members supporting longitudinal framing</a>  |
| (b) In dry spaces   | Scantlings  | To be specially considered   |
| (5) Bottom transverses:   |   |  |

|   |                 |  |
|---|-----------------|--|
| (a)<br>In deep tanks forward of 0.2L from the F.P.,<br>See Note 4   | Maximum spacing | 3.0 m for $L \leq 100$ m<br>4.2 m for $L \geq 300$ m<br>Spacing at intermediate lengths by interpolation |
|   | Scantlings      | As in <a href="#">Pt 4, Ch 9, 9 Primary members supporting longitudinal framing</a>                      |
| (b) In dry spaces   | Scantlings      | To be specially considered   |
| (6) Intercostal side girders  | Scantlings      | To be specially considered   |
| Symbols   |                 |  |
| $L, B, D, S, l_e, k, \rho$ as defined in <a href="#">Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1</a>  |                 |  |
| $h_4$ = tank head, in metres, as defined in <a href="#">Pt 3, Ch 3, 5 Design loading</a>  |                 |  |
| $h_5$ = distance, in metres, from mid-point of span to the following positions:<br>forward of 0.15L from the F.P., 3 m above the deck height obtained from <a href="#">Pt 3, Ch 1, 6.1 Principal particulars 6.1.11</a><br>at 0.2L from the F.P. the upper deck at side<br>between 0.15L and 0.2L from the F.P., by interpolation between (a) and (b)   |                 |  |
| $s_F$ = transverse frame spacing, in mm   |                 |  |
| $s_2$ = spacing of stiffener, in mm, but to be taken not less than 800 mm   |                 |  |
| $L_2$ = $L$ but need not be taken greater than 215 m  |                 |  |
| <p><b>Note 1.</b> For single bottom construction in way of the cargo tanks of oil tankers, See <a href="#">Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers</a> and <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a></p> <p><b>Note 2.</b> For minimum thickness of structure within cargo tanks and fore peak tanks in oil tankers, See <a href="#">Pt 4, Ch 9, 10.2 Compartment minimum thickness</a> and <a href="#">Pt 4, Ch 10, 7.2 Compartment minimum thickness</a>.</p> <p><b>Note 3.</b> For single bottom construction in dredgers, See <a href="#">Pt 4, Ch 12, 6 Bottom structure</a>.</p> <p><b>Note 4.</b> For ships having one or more longitudinal bulkheads the maximum spacing may be increased but is not to exceed that for the midship region.</p> |                 |  |

5. 2. 2 In deep tanks forward of 0.2L from the F.P. floors are to be supported by a primary centreline girder or centreline bulkhead together with intercostal side girders. In the case of an oil tanker (See [Pt 3, Ch 5, 1.1 Application 1.1.4](#)) or similar ship having longitudinal bulkheads port and starboard, these may be extended to the fore end of the deep tank in lieu of a centreline bulkhead. The arrangement and scantlings of centreline girder, floors and side girders are to be determined from [Table 5. 5. 1: Single bottom construction forward](#), but in way of web frames the depth of the floor and size of the face bar are to be not less than those of the web frame. In general, floors are not to be flanged.
5. 2. 3 In way of dry cargo spaces forward, the arrangement and scantlings of transversely framed single bottoms are to be generally as required in the midship region as given in [Pt 4, Ch 1, 7 Single bottom structure](#), except as required by [Table 5. 5. 1: Single bottom construction forward](#). The girders forward are to scarf into the normal girder arrangement in the midship region. In ships having considerable rise of floor towards the fore end, the depth of the floors may be required to be increased or the top edge sloped upwards towards the outboard end. In general, floors are not to be flanged.

## 5.3 Single bottoms – Longitudinal framing

- 5.3.1 In deep tanks forward of  $0.2L$  from the F.P., bottom transverses are to be supported by a primary centreline girder or a centreline bulkhead. In addition, an intercostal side girder is generally to be fitted port and starboard. In the case of an oil tanker (See [Pt 3, Ch 5, 1.1 Application 1.1.4](#)) or similar ship having longitudinal bulkheads port and starboard, these may be extended to the fore end of the deep tank in lieu of a primary centreline support and intercostal girders. The spacing of bottom transverses and scantlings of the centreline girder, bottom transverses and side girders are to be as required by [Table 5.5.1: Single bottom construction forward](#).
- 5.3.2 The requirements for longitudinally framed single bottoms in way of dry cargo spaces will be specially considered.

## 5.4 Double bottoms

- 5.4.1 The minimum depth of centre girder forward is generally to be the same as that required in the midship region by [Pt 4 Ship Structures \(Ship Types\)](#) for the particular type of ship concerned, but in ships with considerable rise of floor, a greater depth may be required at the fore end to provide adequate access throughout the double bottom tank.
- 5.4.2 Where the height of the double bottom varies, this variation is generally to be made gradual by sloping the inner bottom over an adequate longitudinal extent. Knuckles in the plating are to be arranged close to plate floors. Otherwise, suitable scarfing arrangements are to be made.
- 5.4.3 The arrangement and scantlings of girders, floors and inner bottom plating and the section modulus of inner bottom stiffening are to be determined from [Table 5.5.2: Double bottom construction forward](#). In other respects the structural arrangements are to be as detailed in [Pt 4 Ship Structures \(Ship Types\)](#) for the particular type of ship concerned.
- 5.4.4 For double bottom construction in way of the cargo tanks of oil tankers or ore carriers, See also [Pt 4, Ch 9 Double Hull Oil Tankers](#), [Pt 4, Ch 10 Single Hull Oil Tankers](#) or [Pt 4, Ch 11 Ore Carriers](#), as appropriate.

**Table 5.5.2: Double bottom construction forward**

| Item and parameter                                      | Requirements  |   |
|---|---|---|
|   | Transverse framing  | Longitudinal framing  |
| (1) Centre girder:                                      |   |   |
| (a) Thickness forward of $0.075L$ from the F.P.         | $t = (0.008d_{DB} + 2)\sqrt{k} \text{ mm}$  |   |
| (b) Thickness between $0.075L$ and $0.3L$ from the F.P. | As determined by a taper line from the midship thickness given in <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a> to the end thickness as for (1) (a) |   |
| (2) Plate floors:                                       |   |   |
| (a) Maximum spacing forward of $0.2L$ from the F.P.     | $0.002s_F \text{ m}$  | 2.5 m   |
| (b) Maximum spacing aft of $0.2L$ from the F.P.         | As for midship region   | As for midship region (See Note 5)                          |
| (c) Scantlings  | As in <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a>   | As in <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a> |

|  |  |   |
|--|--|---|
| (3) Watertight floors and bracket floors   | As in <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a>  | As in <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a> |
| (4) Side girders, <i>See</i> Note 1:   |  |   |
| (a) Maximum spacing forward of 0.2 <i>L</i> from the F.P.  | 0.003 <i>s<sub>F</sub></i> m   | 0.004 <i>s<sub>L</sub></i> or 3.7 m whichever is the lesser |
| (b) Maximum spacing aft of 0.2 <i>L</i> from the F.P.  | As for midship region  | As for midship region, <i>See</i> Note 5                    |
| (c) Scantlings   | As in <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a>  | As in <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a> |
| (5) Inner bottom plating, <i>See</i> Note 2:   |  |   |
| (a) Thickness at or forward of 0.075 <i>L</i> from the F.P.  | $t = (0.00127(s + 660)\sqrt[4]{k^2LT})$ mm or 6.5 mm, whichever is the greater, <i>See</i> Notes 3, 4 and 5  |   |
| (b) Thickness between 0.075 <i>L</i> and 0.3 <i>L</i> from the F.P.  | As determined by a taper line from the midship thickness given in <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a> to the end thickness as for (5) (a), but not less than 6.5 mm, <i>See</i> Notes 3, 4 and 5 |   |
| (c) In way of deep tanks or holds used for the carriage of water ballast or where the double bottom tank is common with a wing ballast tank.   | $t = \left(0.004sf\sqrt{\frac{\rho kh_4}{1.025}} + 2.5\right)$ mm or 6.5 mm, whichever is the greater  |   |
| (6) Inner bottom longitudinals   | As in <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a> , <i>See</i> Notes 2 and 5   |   |
| Symbols  |  |   |
| <i>L, T, S, s, k, ρ</i> = as defined in <a href="#">Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1</a>  |  |   |
| <i>d<sub>DB</sub></i> = minimum depth of centre girder as required by <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a>  |  |   |
| <i>f</i> = $1.1 - \frac{s}{2500S}$ but to be taken not greater than 1.0  |  |   |
| <i>h<sub>4</sub></i> = tank head, in metres, as defined in <a href="#">Pt 3, Ch 3, 5 Design loading</a>  |  |   |
| <i>s<sub>F</sub></i> = transverse frame spacing, in mm   |  |   |
| <i>s<sub>L</sub></i> = spacing of bottom longitudinals, in mm  |  |   |
| <b>Note 1.</b> The girders forward of 0.2 <i>L</i> are to be suitably scarfed into the midship girder arrangement.   |  |   |
| <b>Note 2.</b> For double bottom construction in way of the cargo tanks of oil tankers or ore carriers, <i>See also</i> <a href="#">Pt 4, Ch 9 Double Hull Oil Tankers</a> , <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> or <a href="#">Pt 4, Ch 11 Ore Carriers</a> , as appropriate. |  |   |
| <b>Note 3.</b> In way of hatches the tank top taper thickness is to be increased by 2 mm if no ceiling is fitted, but is to be taken not less than 7.5 mm.   |  |   |
| <b>Note 4.</b> Where cargo is to be regularly discharged by grabs the tank top taper thickness is to be increased by 5.0 mm if no ceiling is fitted, or by 3.0 mm where ceiling is fitted.   |  |   |
| <b>Note 5.</b> For ships having the notation 'strengthened for heavy cargoes', the requirements of <a href="#">Pt 4, Ch 7, 8 Double bottom structure</a> are also to be complied with.   |  |   |

PART

# 3

CHAPTER **5 Fore End Structure**

SECTION **6 Fore peak structure**

## **6. 1 General**

- 6. 1. 1 The requirements given in this Section apply to the arrangement of primary structure supporting the peak side framing and bulbous bow, the arrangement and scantlings of wash bulkheads and perforated flats, and the scantlings of collision bulkheads.
- 6. 1. 2 In ships of very full form it is recommended that transverse framing and side transverses supporting longitudinal framing, together with attached floors and beams, be inclined at an angle to the centreline of ship so that the frames or transverses lie as near normal to the shell plating as possible.

## **6. 2 Bottom structure**

- 6. 2. 1 The bottom of the peak space is generally to be transversely framed with arrangements and scantlings as detailed in [Pt 3, Ch 5, 5.2 Single bottoms – Transverse framing 5.2.1](#). Longitudinally framed bottom structure will be specially considered.

## **6. 3 Side structure – Transverse framing**

- 6. 3. 1 Above the floors, transverse side framing is to be supported by one of the following arrangements:
  - a. Side stringers spaced about 2.0 m apart and supported by struts fitted at alternate frames. The struts are to be bracketed to the frames and where the span is long, supported at the centreline by a complete or partial wash bulkhead or equally effective structure. Intermediate frames are to be bracketed to the stringer plates.
  - b. Side stringers spaced about 2.0 m apart and supported by web frames. The upper ends of the web frames are to be supported under the tank top by suitable deep beams or buttresses which should generally form a ring structure.
  - c. Perforated flats spaced not more than 2.5 m apart. The area of perforations in each flat is to be not less than 10 per cent of the total area of the flat. The plating is to be suitably framed in way of openings.
  - d. A combination of the above arrangements.
- 6. 3. 2 Where the depth of the peak space exceeds 10 m, a perforated flat is to be arranged at about mid-depth.
- 6. 3. 3 Where the length of the space exceeds 10 m and the side framing is supported as required by [Pt 3, Ch 5, 6.3., Side structure – Transverse framing 6.3.1](#) or [Pt 3, Ch 5, 6.3 Side structure – Transverse framing 6.3.1.c](#), additional transverse strengthening in the form of transverse wash bulkheads or web frames is to be provided.

6. 3. 4 The scantlings of side stringers supported by struts, and also of the struts and their brackets, are to be determined from [Table 5. 6. 1: Fore peak structure](#).

**Table 5. 6. 1: Fore peak structure**

| Item  | Parameter            | Requirement  |
|---|----------------------|--|
| (1) Unflanged stringers supported by panting beams at alternate frames                            | Web thickness        | $t = (6.0 + 0.025L_2) \sqrt{\frac{S_1}{600}} \text{ mm}$   |
|   | Web depth            | $d_w = (400 + 3.3L) \frac{S_1}{2.0} \text{ mm}$  |
| (2) Struts  | Cross-sectional area | $A = (2.5B_1 - 0.04L_2) \text{ k cm}^2$  |
|   | Least inertia        | $I = S_1 S_2 h_5 l_e^2 \text{ cm}^4$   |
| (3) Brackets supporting stringers and beams   | Thickness            | $t = (6.0 + 0.025L_2) \sqrt{\frac{S_1}{600}} \text{ mm}$   |
|   | Arm length           | $l_e = \frac{150A}{t} \text{ mm in way of struts}$<br>$l_e = 0.5d_w \text{ mm at intermediate frames}$ |
| (4) Perforated flats and wash bulkheads (excluding lowest strake of plating) See Notes 1, 2 and 3 | Plating thickness    | $t = (6.0 + 0.015L) \sqrt{\frac{S_2}{800}} \text{ mm}$   |
|   | Stiffener modulus    | $Z = \frac{0.0057skh_6 l_e^2}{b} \text{ cm}^3$   |
| (5) Diaphragms in bulbous bows and lowest strake of wash bulkhead                                 | Plating thickness    | $t = (6.0 + 0.025L_2) \sqrt{\frac{S_2}{800}} \text{ mm}$   |
| Symbols   |                      |  |

|           |  |
|-----------|--|
| $L, B, =$ | as defined in <a href="#">Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1</a>  |
| $S, s, k$ |  |
| $b$       | = 1.4 for rolled or built sections<br>= 1.6 for flat bars  |
| $h_5$     | = vertical distance, in metres, from the stringer to a position 3 m above the deck height obtained from <a href="#">Pt 3, Ch 1, 6.1 Principal particulars 6.1.11</a>   |
| $b$       | = 1.4 for rolled or built sections<br>= 1.6 for flat bars  |
| $h_5$     | = vertical distance, in metres, from the stringer to a position 3 m above the deck height obtained from <a href="#">Pt 3, Ch 1, 6.1 Principal particulars 6.1.11</a>   |
| $h_6$     | = vertical distance, in metres, from mid-depth of tank to top of tank  |
| $l_e$     | = effective length of stiffening member, in metres, See <a href="#">Table 1. 9. 1: Watertight and deep tank bulkhead scantlings</a> and <a href="#">Table 1. 9. 3: Bulkhead end constraint factors</a> in Pt 4, Ch 1 |
| $s_1$     | = spacing of peak frames, in mm, but to be taken not less than 600 mm  |
| $s_2$     | = spacing of stiffeners, in mm, but to be taken not less than 800 mm   |
| $B_1$     | = $B$ , but need not be taken greater than 32 m  |
| $L_2$     | = $L$ , but need not be taken greater than 215 m   |
| $S_1$     | = vertical spacing or mean spacing of stringers, in metres   |
| $S_2$     | = horizontal spacing of struts, in metres  |

**Note 1.** For oil tankers, See also [Pt 4, Ch 9, 10.7 Application of stiffening requirements](#)

**Note 2.** For horizontal flats supporting vertical webs in the fore peak tank, the thickness of the flat in way of the web is to comply with [Table 9. 7. 1: Transverse oiltight bulkhead scantlings](#).

**Note 3.** For minimum thickness within fore peak tanks of oil tankers, See also [Pt 4, Ch 9, 10.2 Compartment minimum thickness](#).

- 6. 3. 5 The scantlings of side stringers supported by web frames, and also of the web frames, are to be determined from [Pt 3, Ch 5, 4.5, Primary structure at sides](#).
- 6. 3. 6 The scantlings of perforated flats are to be determined from [Table 5. 6. 1: Fore peak structure](#).

## 6. 4 Side structure – Longitudinal framing

- 6. 4. 1 The spacing and scantlings of side transverses supporting longitudinal framing are to be as required by [Pt 3, Ch 5, 4.5, Primary structure at sides](#).
- 6. 4. 2 Where the depth of a tank exceeds 10 m, side transverses are generally to be supported by one or more perforated flats or an arrangement of struts.
- 6. 4. 3 Suitable transverses or deep beams are to be arranged at the top of the tank and at perforated flats to provide end rigidity to the side transverses.

## 6. 5 Bulbous bow

- 6. 5. 1 Where a bulbous bow is fitted, the structural arrangements are to be such that the bulb is adequately supported and integrated into the fore peak structure.
- 6. 5. 2 At the fore end of the bulb the structure is generally to be supported by horizontal diaphragm plates spaced about 1.0 m apart in conjunction with a deep centreline web.

- 6. 5. 3 In general, vertical transverse diaphragm plates are to be arranged in way of the transition from the peak framing to the bulb framing.
- 6. 5. 4 In way of a wide bulb, additional strengthening in the form of a centreline wash bulkhead is generally to be fitted.
- 6. 5. 5 In way of a long bulb, additional strengthening in the form of transverse wash bulkheads or substantial web frames spaced about five frame spaces apart are generally to be fitted.
- 6. 5. 6 The shell plating is to be increased in thickness at the fore end of the bulb and in other areas likely to be damaged by the anchors and chain cables. The increased plate thickness is to be the same as that required for plated stems by [Pt 3, Ch 5, 3.3 Stem 3.3.2](#).

## 6. 6 Wash bulkhead

- 6. 6. 1 Where a fore peak space is used as a tank and the breadth of the tank at its widest point exceeds  $0.5B$ , a complete or partial centreline wash bulkhead is to be fitted.
- 6. 6. 2 Wash bulkheads are to have an area of perforations not less than five per cent nor more than 10 per cent of the area of the bulkhead. The plating is to be suitably stiffened in way of openings.
- 6. 6. 3 The scantlings of wash bulkheads are to be determined from [Table 5. 6. 1: Fore peak structure](#). Stiffeners are to be bracketed at top and bottom.

## 6. 7 Collision bulkhead

- 6. 7. 1 The position and height of the collision bulkhead are to be in accordance with the requirements of [Pt 3, Ch 3, 4 Bulkhead requirements](#).
- 6. 7. 2 The scantlings are to comply with the requirements of [Pt 4, Ch 1, 9 Bulkheads](#) except that the thickness of plating and modulus of stiffeners are to be not less than 12 per cent greater and 25 per cent greater, respectively, than would be required for a dry space. If the collision bulkhead forms the boundary of a cargo tank or cofferdam in an oil tanker or ore carrier the minimum thickness requirements of [Pt 4, Ch 9, 10 Construction details and minimum thickness](#) are also to be complied with.
- 6. 7. 3 Doors, manholes, permanent access openings or ventilation ducts are not to be cut in the collision bulkhead below the freeboard deck, *See also* [Pt 5, Ch 13, 3 Drainage of compartments, other than machinery spaces](#). The number of openings in collision bulkheads above the freeboard deck is to be kept to a minimum compatible with the design and proper working of the ship. All such openings are to be fitted with means of closing to weathertight standards.

PART

# 3

CHAPTER **5 Fore End Structure**

SECTION **7 Forward deep tank structure**

## **7.1 General**

- 7.1.1 The requirements given in this Section apply to the arrangement of primary structure supporting the side framing, the arrangement and scantlings of wash bulkheads and perforated flats, and the scantlings of boundary bulkheads in way of deep tanks situated forward of  $0.2L$  from the F.P.
- 7.1.2 For deep tanks situated aft of this position, *See [Pt 4, Ch 1, 9 Bulkheads](#)*.

## **7.2 Bottom structure**

- 7.2.1 The bottom structure is to comply with the requirements given in [Pt 3, Ch 5, 5.2 Single bottoms – Transverse framing 5.2.2](#), [Pt 3, Ch 5, 5.3 Single bottoms – Longitudinal framing 5.3.1](#) and [Pt 3, Ch 5, 5.4 Double bottoms](#), as applicable.

## **7.3 Side structure – Transverse framing**

- 7.3.1 Above the floors, transverse framing is to be supported by one of the following arrangements:
  - a. Side stringers spaced not more than 5 m apart and supported by web frames. The upper ends of the web frames are to be supported under the tank top by suitable deep beams or buttresses which should generally form a ring system.
  - b. Side stringers spaced not more than 5 m apart and spanning from bulkhead to bulkhead. The ends of these stringers are to be connected to horizontal stringers on the transverse bulkheads to form a ring system.
  - c. In the case of narrow tanks, perforated flats spaced not more than 5 m apart. The area of perforations is to be not less than 10 per cent of the area of the flat, and the plating is to be suitably stiffened in way of openings.
- 7.3.2 Where the side framing is supported as required by [Pt 3, Ch 5, 7.3., Side structure – Transverse framing 7.3.1](#) and the depth of the tank exceeds 16 m, the web frames are to be supported by one of the following:
  - a. One or more side stringers spanning from bulkhead to bulkhead.
  - b. One or more perforated flats having deep beams or transverses in way of the web frames.
  - c. One or more cross ties.
- 7.3.3 Where the side framing is supported as required by [Pt 3, Ch 5, 7.3 Side structure – Transverse framing 7.3.1.c](#) and the length of the tank exceeds 14 m, additional transverse strengthening in the form of transverse wash bulkheads or web frames is to be provided.
- 7.3.4 The scantlings of stringers and web frames as required by [Pt 3, Ch 5, 7.3., Side structure – Transverse framing 7.3.1](#) are to be determined from [Pt 3, Ch 5, 4.5, Primary structure at sides](#).

- 7.3.5 The scantlings of side stringers supporting framing as required by [Pt 3, Ch 5, 7.3 Side structure – Transverse framing 7.3.1.b](#) are to be determined from Item (5) in [Table 5. 4. 4: Primary structure forward](#).
- 7.3.6 The scantlings of side stringers supporting web frames as required by [Pt 3, Ch 5, 7.3, Side structure – Transverse framing 7.3.2](#) are to be determined from Item (6) in [Table 5. 4. 4: Primary structure forward](#).
- 7.3.7 The scantlings of perforated flats as required by [Pt 3, Ch 5, 7.3 Side structure – Transverse framing 7.3.1.c](#) or [Pt 3, Ch 5, 7.3 Side structure – Transverse framing 7.3.2.b](#) are to be determined from [Table 5. 6. 1: Fore peak structure](#).
- 7.3.8 The scantlings of cross ties are to be determined as for cross ties in the cargo tanks of oil tankers, *See* [Pt 4, Ch 9, 9 Primary members supporting longitudinal framing](#) . Where the span between the side shell and longitudinal bulkhead exceeds  $0.3B$ , additional fore and aft or vertical support for the struts may be required.

## 7.4 Side structure – Longitudinal framing

- 7.4.1 The spacing and scantlings of side transverses supporting longitudinal framing are to be as required by [Pt 3, Ch 5, 4.5, Primary structure at sides](#).
- 7.4.2 Where the depth of the tank exceeds 16 m, the side transverses are to be supported as required by [Pt 3, Ch 5, 7.3, Side structure – Transverse framing 7.3.2](#).

## 7.5 Wash bulkheads

- 7.5.1 Where the breadth of the tank at its widest point exceeds  $0.5B$ , a centreline wash bulkhead is generally to be fitted. If the maximum breadth of tank exceeds  $0.7B$ , it is recommended that the centreline bulkhead be made intact. In the case of an oil tanker or similar ship having longitudinal bulkheads port and starboard, these may be extended to the fore end of the deep tank in lieu of a centreline bulkhead.
- 7.5.2 Wash bulkheads are to have an area of perforations not less than 5 per cent nor more than 10 per cent of the area of the bulkhead. The plating is to be suitably stiffened in way of openings.
- 7.5.3 The scantlings of wash bulkheads are generally to be as required by [Table 5. 6. 1: Fore peak structure](#), but *See also* [Pt 3, Ch 5, 7.5 Wash bulkheads 7.5.4](#) to [Pt 3, Ch 5, 7.5 Wash bulkheads 7.5.6](#). Stiffeners are to be bracketed at top and bottom.
- 7.5.4 The thickness of longitudinal bulkheads may be required to be increased to ensure compliance with the shear strength requirements of [Pt 3, Ch 4, 6 Hull shear strength](#). In the case of a centreline or perforated wing bulkhead, the proportion of the total shear force absorbed by the bulkhead will be specially considered.
- 7.5.5 The thickness of plating of wash bulkheads may also be required to be increased to take account of shear buckling.
- 7.5.6 Where longitudinal wash bulkheads support bottom transverses, the lower section of the bulkhead is to be kept free of non-essential openings for a depth equal to 1.75 times the depth of the transverses, and the plating thickness may be required to be increased to meet local buckling requirements.

## 7.6 Transverse boundary bulkheads

- 7.6.1 The transverse bulkheads forming the forward and after boundaries of the tank are generally to comply with the requirements of [Pt 4, Ch 1, 9 Bulkheads](#), except that when the after bulkhead forms the boundary of a cargo tank or cofferdam in an oil tanker or ore carrier, the minimum

**CHAPTER 6 Aft End Structure****SECTION 1 General****1.1 Application**

- 1.1.1 This Chapter applies to all types of ship covered by [Pt 4 Ship Structures \(Ship Types\)](#), except where specifically stated otherwise.
- 1.1.2 The requirements given are those specific to aft ends and relate to structure situated in the region aft of  $0.3L$  from the after perpendicular.
- 1.1.3 Requirements for cargo space structure within this region not dealt with in this Chapter are to be as detailed in the relevant Chapter of [Pt 4 Ship Structures \(Ship Types\)](#) for the particular ship type.
- 1.1.4 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a CSR notation. See [Pt 1, Ch 2, 2.3 Class notations \(hull\)](#).

**1.2 Structural configuration**

- 1.2.1 The Rules provide for both longitudinal and transverse framing systems.
- 1.2.2 In the case of container ships and open type ships additional requirements may apply as detailed in [Pt 4, Ch 8 Container Ships](#).

**1.3 Structural continuity**

- 1.3.1 Suitable scarfing arrangements are to be made to ensure continuity of strength and the avoidance of abrupt structural changes.
- 1.3.2 Where longitudinal framing terminates and is replaced by a transverse system, adequate arrangements are to be made to avoid an abrupt changeover. Where a poop is fitted extending forward of  $0.15L$  from the A.P., longitudinal framing at the upper deck and topsides is generally to be continued aft of the forward bulkhead of this superstructure. In bulk carriers and oil tankers (See [Pt 3, Ch 6, 1.1 Application 1.1.4](#)) the longitudinal framing at the upper deck is to be maintained over the cargo space region and continued over the aft end region.
- 1.3.3 In oil tankers (See [Pt 3, Ch 6, 1.1 Application 1.1.4](#)) with machinery aft, continuity of the longitudinal bulkheads is to be maintained as far as is practicable into the machinery space, and suitable taper brackets are to be fitted at their ends.
- 1.3.4 In bulk carriers (See [Pt 3, Ch 6, 1.1 Application 1.1.4](#)) with machinery aft, continuity of the topside tank and double bottom hopper tank structure is to be maintained over the cargo space region and as far as is practicable continued into the machinery space, and suitable taper brackets are to be arranged at their ends. Also a vertical taper bracket in line with the vertical strake of the topside tank is to be fitted at the forward side of the aft bulkhead of the cargo space region. Where the topside tank and double bottom hopper tank structures terminate at the cargo space aft bulkhead, the vertical strake of the topside tank is to be arranged with an integral taper bracket and continued

through the bulkhead into the machinery space for a distance of  $0.2B$ , and the ends of the hopper and topside structures are to be arranged with suitable taper brackets. In addition, in way of the cargo space aft bulkhead, a girder or intercostal bulb plate stiffeners (fitted between and connected to the bulkhead vertical stiffeners), are to be arranged on the aft side in line with the sloped bulkheads of the topside and hopper tanks clear of the taper brackets.

1. 3. 5 In container or similar ships having continuous side tanks or double skin construction in way of the cargo spaces, the longitudinal bulkheads are to be continued as far aft as is practicable and are to be suitably tapered at their ends. Where, due to the ship's form, such bulkheads are stepped, suitable scarfing is to be arranged.

## 1. 4 Symbols and definitions

1. 4. 1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

|              |   |   |
|--------------|---|---|
| $L, B, D, T$ | = | $L, B, D, T$ = as defined in <a href="#">Pt 3, Ch 1, 6.1, Principal particulars</a>   |
| $k_L, k$     | = | higher tensile steel factor as defined in <a href="#">Pt 3, Ch 2, 1.2, Steel</a>  |
| $l$          | = | overall length of stiffening member, in metres, See <a href="#">Pt 3, Ch 3, 3.3 Determination of span point</a>               |
| $l_e$        | = | effective length of stiffening member, in metres, See <a href="#">Pt 3, Ch 3, 3.3 Determination of span point</a>             |
| $s$          | = | spacing of secondary stiffeners, in mm  |
| $t$          | = | thickness of plating, in mm   |
| $S$          | = | spacing, or mean spacing, of primary members, in metres   |
| $Z$          | = | section modulus of stiffening member, in $\text{cm}^3$ , See <a href="#">Pt 3, Ch 3, 3.2, Geometric properties of section</a> |
| $P$          | = | relative density (specific gravity) of liquid carried in a tank and is to be taken not less than 1.025                        |
| $I$          | = | inertia of stiffening member, in $\text{cm}^4$ , See <a href="#">Pt 3, Ch 3, 3.2, Geometric properties of section</a> .       |

1. 4. 2 For the purpose of this Chapter, the after perpendicular, A.P., is defined as the after limit of the Rule length  $L$ .

CHAPTER **6 Aft End Structure**SECTION **2 Deck structure****2.1 General**

- 2.1.1 Where the upper deck is longitudinally framed outside the line of openings in the midship region, this system of framing is to be carried as far aft as possible. *See also* [Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers](#).

**2.2 Deck plating**

- 2.2.1 The thickness of strength/weather deck plating is to comply with the requirements of [Table 6. 2. 1: Strength/weather deck plating aft \(excluding poop deck\)](#).
- 2.2.2 The thickness of lower deck plating is to comply with the requirements of [Table 6. 2. 2: Lower deck plating aft](#).
- 2.2.3 The taper thickness of the strength deck stringer plate is to be increased by 20 per cent at the ends of a poop or bridge where the end bulkhead is situated forward of  $0.25L$  from the A.P. No increase is required where the end bulkhead lies aft of  $0.2L$  from the A.P. The increase at intermediate positions is to be determined by interpolation.
- 2.2.4 The deck plating thickness and supporting structure are to be suitably reinforced in way of deck machinery, and in way of cranes, masts or derrick posts.
- 2.2.5 Where long, wide hatchways are arranged at lower decks it may be necessary to increase the deck plating thickness to ensure effective support for side framing.

**2.3 Deck stiffening**

- 2.3.1 The scantlings of strength/weather deck longitudinals are to comply with the requirements of [Table 6. 2. 3: Strength/weather deck longitudinals aft](#).
- 2.3.2 The scantlings of cargo and accommodation deck longitudinals are to comply with the requirements given in [Table 1. 4. 4: Cargo and accommodation deck longitudinals](#).
- 2.3.3 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and so far as practicable, direct continuity of longitudinal strength.
- 2.3.4 The scantlings of weather deck beams are to comply with the midship requirements for the particular ship type.
- 2.3.5 The scantlings of lower deck beams are to comply with the requirements of [Table 1. 4. 5: Strength/weather, cargo and accommodation deck beams](#) in [Pt 4, Ch 1 General Cargo Ships](#).
- 2.3.6 End connections of beams are to be in accordance with the requirements of [Pt 3, Ch 10, 3 Secondary member end connections](#).

**Table 6. 2. 1: Strength/weather deck plating aft (excluding poop deck)**

| Symbols  | Location                                   | Thickness, in mm  |

| <p><b>Note 1.</b> For taper area requirements, See <a href="#">Table 3. 2. 1: Taper requirements for hull envelope</a> in Chapter 3.</p> <p><b>Note 2.</b> Where weather decks are intended to carry deck cargo and the loading is in excess of 8.5 kN/m<sup>2</sup> the scantlings of longitudinals are also to comply with the requirements for location (1) in <a href="#">Table 1. 4. 4: Cargo and accommodation deck longitudinals</a> using the equivalent design head, for specified cargo loadings, for weather decks given in <a href="#">Table 3. 5. 1: Design heads and permissible cargo loadings</a>.</p> <p><b>Note 3.</b> For the scantlings of deck longitudinals aft in way of the cargo tanks of oil tankers (See <a href="#">Pt 3, Ch 6, 1.1 Application 1.1.4</a>) or ore carriers, See also <a href="#">Pt 4, Ch 9 Double Hull Oil Tankers</a>, <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> or <a href="#">Pt 4, Ch 11 Ore Carriers</a> as applicable.</p> <p><b>Note 4.</b> The thickness of flat bar longitudinals, situated outside the line of openings is to be not less than the following:</p> <p><b>Note (a)</b> <math>t = \frac{d_w}{18\sqrt{k_L}} \text{ mm mm}</math><br/> where longitudinal continuous through bulkhead</p> <p><b>Note (b)</b> <math>t = \frac{d_w}{15\sqrt{k_L}} \text{ mm mm}</math><br/> where longitudinal cut at bulkhead</p> <p><b>Note 5.</b> The web depth of longitudinal, <math>d_w</math>, to be not less than 60 mm.</p> <p><b>Note 6.</b> The taper requirements from <a href="#">Table 3. 2. 1: Taper requirements for hull envelope</a> in <a href="#">Pt 3, Ch 3 Structural Design</a> do not apply to container ships or open ship types, See <a href="#">Pt 3, Ch 4, 2.3 Open type ships</a>, where the requirements of <a href="#">Pt 4, Ch 8, 3.2 Longitudinal strength</a> are applicable, nor to fast cargo ships where the requirements of <a href="#">Pt 4, Ch 1, 3 Longitudinal strength</a> are applicable. See also <a href="#">Pt 3, Ch 4, 5 Hull bending strength</a> for hull section modulus requirement away from the midship area.</p> |  |                           |

## 2. 4 Deck supporting structure

2. 4. 1 The arrangements and scantlings of supporting structure are generally to be in accordance with the requirements given in [Pt 4, Ch 1, 4 Deck structure](#) except as required by [Pt 3, Ch 6, 2.4 Deck supporting structure 2.4.2](#) to [Pt 3, Ch 6, 2.4 Deck supporting structure 2.4.4](#).
2. 4. 2 At upper and lower decks above the after peak, deep beams are generally to be fitted in way of web frames. Deck girders are generally to be spaced not more than 3.0 m apart.

- 2. 4. 3 Primary structure in the topside tanks of bulk carriers is to comply with the requirements of [Pt 4, Ch 7, 7 Topside tank structure](#).
- 2. 4. 4 Primary structure in the cargo tanks of oil tankers, or ore carriers, is to be determined from [Pt 4, Ch 9 Double Hull Oil Tankers](#), [Pt 4, Ch 10 Single Hull Oil Tankers](#) or [Pt 4, Ch 11 Ore Carriers](#), as applicable.

## 2. 5 Deck openings

- 2. 5. 1 In dry cargo ships, the requirements for deck openings given in [Pt 4, Ch 1, 4 Deck structure](#) are generally applicable throughout the aft region except that aft of 0.25L from the A.P.:
  - a. The radii or dimensions of the corners of main cargo hatchway openings of the strength deck are to be in accordance with the requirements of [Pt 4, Ch 1, 4.5 Deck openings](#). The thickness of the insert plates, where required, is not to be less than 20 per cent greater than the adjacent deck thickness outside the line of openings, with a minimum increase of 3 mm.
  - b. Insert plates will be required at lower decks in way of any rapid change in hull form to compensate for loss of deck cross-sectional area. Otherwise, insert plates will not normally be required.
  - c. Compensation and edge reinforcement for openings outside the line of main hatchways will be considered, bearing in mind their position, the deck arrangements and the type of ship concerned.
- 2. 5. 2 For deck openings in way of cargo tanks in oil tankers and ore carriers, *See also* [Pt 4, Ch 9 Double Hull Oil Tankers](#), [Pt 4, Ch 10 Single Hull Oil Tankers](#) or [Pt 4, Ch 11 Ore Carriers](#), as applicable. For main cargo hatchway openings on bulk carriers and container ships, *See also* [Pt 4, Ch 7 Bulk Carriers](#) and [Pt 4, Ch 8 Container Ships](#), as applicable.

**CHAPTER 6 Aft End Structure****SECTION 3 Shell envelope plating****3.1 General**

- 3.1.1 Where the shell is longitudinally framed in the midship region, this system of framing is to be carried as far aft as practicable.

**3.2 Keel**

- 3.2.1 The scantlings of bar keels at the aft end are to be the same as in the midship region as required by [Pt 4, Ch 1, 5 Shell envelope plating](#).
- 3.2.2 The thickness and width of plate keels in the aft region are to be the same as required in the midship region for the particular type of ship concerned, *See* [Pt 4 Ship Structures \(Ship Types\)](#).

**3.3 Bottom shell and bilge**

- 3.3.1 The thickness of bottom shell and bilge plating in the aft region is to comply with the requirements of [Table 6.3.1: Shell plating aft](#).
- 3.3.2 Where the bottom is transversely framed and there are large flat areas of shell plating, the buckling stability of the plating will be specially considered, and increased plate thickness or additional stiffening may be required, *See also* [Pt 3, Ch 6, 5.2 Single bottoms – Transverse framing 5.2.3](#).
- 3.3.3 Where longitudinals are omitted in way of radiused bilge plating amidships, the plating thickness aft will be considered in relation to the support derived from the hull form and internal stiffening arrangements.

**3.4 Side shell and sheerstrake**

- 3.4.1 The thickness of side shell and sheerstrake plating in the aft region is to be not less than the values given in [Table 6.3.1: Shell plating aft](#), but may be required to be increased locally on account of high shear forces, in accordance with [Pt 3, Ch 4, 6.5, Permissible still water shear force](#).
- 3.4.2 Increased shell plate thickness may be required where the panting stringers required by [Pt 3, Ch 6, 4.4 Panting stringers in way of transverse framing 4.4.1](#) are omitted. The extent and amount of the increase will be specially considered.
- 3.4.3 The thickness of shell plating is to be increased locally in way of the sternframe, propeller brackets or rudder horn. The increased plate thickness is to be not less than 50 per cent greater than the basic shell end thickness.
- 3.4.4 The sheerstrake thickness is to be increased by 20 per cent at the ends of a bridge superstructure extending out to the ship's side, irrespective of position. Similar strengthening is to be fitted in way of the end of a poop if this occurs at a position forward of  $0.25L$  from the A.P. No increase is

required if the poop end bulkhead lies aft of  $0.2L$  from the A.P. The increase at intermediate positions of end bulkhead is to be obtained by interpolation.

### 3. 5 Shell openings

3. 5. 1 In general, compensation will not be required for holes in the sheerstrake which are clear of the gunwale, or for any deck openings situated outside the line of main hatchways and whose depth does not exceed 20 per cent of the depth of the sheerstrake or 380 mm, whichever is the lesser. Openings are not to be cut in a rounded gunwale. Cargo door openings are to have well rounded corners, and the proposed compensation for the door openings will be individually considered.

**Table 6. 3. 1: Shell plating aft**

| Location  | Thickness, in mm   | NOTES  |
|---|--|--|
| <p>(1) Bottom shell and bilge, <i>See</i> Notes 4 and 5:</p> <p>(a) Aft of <math>0.075L</math> from the A.P.</p> <p>(b) Between <math>0.075L</math> and <math>0.15L</math> from the A.P., <i>See</i> Note 6</p> <p>(c) Forward of <math>0.15L</math> from the A.P., <i>See</i> Note 6</p>                                 | $t = (6.5 + 0.033L)f_2\sqrt{\frac{ks_1}{s_b}}$ <p>(<i>See</i> Note 1)</p> <p>As (1)(a) or the taper thickness, whichever is the greater, <i>See</i> Note 2</p> <p>The taper thickness, <i>See</i> Note 2</p> | <p><b>Note 1.</b> For ships where <math>L \leq 70</math> m this thickness may be reduced by 1 mm, but it is to be not less than 6 mm.</p> <p><b>Note 2.</b> The taper thickness is to be determined from <a href="#">Table 3. 2. 1: Taper requirements for hull envelope</a>, <i>See</i> Note 7.</p> <p><b>Note 3.</b> For thickness of shell plating in way of the cargo tanks of oil tankers or ore carriers, <i>See also</i> <a href="#">Pt 4, Ch 9 Double Hull Oil Tankers</a>, <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> or <a href="#">Pt 4, Ch 11 Ore Carriers</a>, as applicable.</p> <p><b>Note 4.</b> In offshore supply ships the thickness of side shell is to be not less than 9 mm.</p> <p><b>Note 5.</b> For trawlers and fishing vessels <i>See</i> <a href="#">Pt 4, Ch 6, 5 Shell envelope plating</a>.</p> <p><b>Note 6.</b> For oil tankers the thickness is also to be in accordance with <a href="#">Pt 4, Ch 9, 4.3 Deck plating 4.3.3</a></p> <p><b>Note 7.</b> The taper requirements from <a href="#">Table 3. 2. 1: Taper requirements for hull envelope</a> in <a href="#">Pt 3, Ch 3 Structural Design</a> do not apply to container ships or open ship types, <i>See</i> <a href="#">Pt 3, Ch 4, 2.3 Open type ships</a>, where the requirements of <a href="#">Pt 4, Ch 8, 3.2 Longitudinal strength</a> are applicable, nor to fast cargo ships where the requirements of <a href="#">Pt 4, Ch 1, 3 Longitudinal strength</a> are applicable. <i>See also</i> <a href="#">Pt 3, Ch 4, 5 Hull bending strength</a> for hull section modulus requirement away from the midship area.</p> |

| Symbols   |   |   |
| $L, B, D, T, s, k$ as defined in <a href="#">Pt 3, Ch 6, 1.4 Symbols and definitions 1.4.1</a>                            |   |   |
| $f_2$ = factor to be taken as: نیست این مطالب درون  |   |   |
| $f_2 = \left(\frac{15}{L/T}\right)^{0.2}$ but need not be taken greater than 1. $L/T$ is not to be taken greater than 25. |   |   |
| $s_1$ = $s$ but to be taken as not less than $s_b$  |   |   |
| $s_b$ = standard frame spacing, in mm, as follows:  |   |   |
| Region  | Bottom shell $s_b$                              | Side shell $s_b$  |
| Aft of 0.05L from the A.P.  | $\left(470 + \frac{L}{0.6}\right)$ or 600*      | $\left(470 + \frac{L}{0.6}\right)$ or 600* below the deck next above the load waterline |
|   | or $\left(470 + \frac{L}{0.6}\right)$ or 700*   | above the deck next above the load waterline  |
| Between 0.05L and 0.15L from the A.P.   | $\left(510 + \frac{L}{0.6}\right)$ or 850*      | $\left(510 + \frac{L}{0.6}\right)$ or 850*  |
| *whichever is the lesser  |   |   |

3. 5. 2 Sea inlet and other openings are to have well rounded corners and so far as possible, should be kept clear of the bilge radius. The thickness of sea inlet box plating is generally to be the same as the adjacent shell. It is not, however, to be less than 12.5 mm, and need not exceed 25 mm.

## CHAPTER 6 Aft End Structure

## SECTION 4 Shell envelope framing

## 4.1 General

- 4.1.1 Requirements are given in this Section for both longitudinal and transverse framing systems. Where longitudinal framing is adopted in the midship region, it is to be carried as far aft as practicable.
- 4.1.2 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and, so far as practicable, direct continuity of longitudinal strength, *See also* [Pt 3, Ch 10, 3 Secondary member end connections](#). Where  $L$  exceeds 215 m, the bottom longitudinals are to be continuous in way of both watertight and non-watertight floors, but alternative arrangements will be considered. Higher tensile steel longitudinals within 10 per cent of the ship's depth at the bottom and deck are to be continuous irrespective of the ship length.
- 4.1.3 Stiffeners and brackets on side transverses, where fitted on one side and connected to higher tensile steel longitudinals between the base line and  $0.8D$  above the base line, are to have their heels well radiused to reduce stress concentrations. Where a symmetrical arrangement is fitted, i.e. bracket or stiffening on both sides, and it is connected to higher tensile steel longitudinals, the toes of the stiffeners or brackets are to be well radiused. Alternative arrangements will be considered if supported by appropriate direct calculations.
- 4.1.4 Where higher tensile steel side longitudinals pass through transverse bulkheads in the cargo area, well radiused brackets of the same material are to be fitted on both the fore and aft side of the connection between the upper turn of bilge and  $0.8D$  above the base line. Particular attention is to be given to ensuring the alignment of these brackets. Alternative arrangements will be considered if supported by appropriate direct calculations.
- 4.1.5 For ships intended to load or unload while aground, *See* [Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground](#).

## 4.2 Shell longitudinals

- 4.2.1 The scantlings of bottom and side shell longitudinals in the aft region are to comply with the requirements given in [Table 6. 4. 1: Shell framing \(longitudinal\) aft](#).

## 4.3 Shell framing

- 4.3.1 The scantlings of side frames in the aft region are to comply with the requirements given in [Table 6. 4. 2: Shell framing \(transverse\) aft](#).

Table 6. 4. 1: Shell framing (longitudinal) aft

| Location | Modulus, in $\text{cm}^3$ |
|----------|---------------------------|
|----------|---------------------------|

|   |   |
|---|---|
| (1) Side longitudinals in poop  | $Z = 0.0065skle^2(0.6 + 0.167D_2)$  |
| (2) Side longitudinals in way of dry spaces including double skin construction:   |   |
| (a) Aft of the after peak bulkhead  | $Z = 0.0085skh_{TL}l_e^2F_s$ but not to be less than as required by (1)   |
| (b) Between the after peak bulkhead and 0.2L from the A.P.  | $Z = 0.007skh_{TL}l_e^2F_s$<br><br>or as required in the midship region for the particular type of ship concerned, whichever is the greater |
| (c) Forward of 0.2L from the A.P.   | As required in the midship region for the particular type of ship concerned   |

| $D_1=D$ but need not exceed $T+H_b$ , in metres, where $H_b$ is the minimum bow height, in metres, obtained from <a href="#">Pt 3, Ch 1, 6.1 Principal particulars 6.1.11</a>   |
| $D_2=D_1$ but is to be taken not greater than 16 m nor less than 6 m  |
| $H=H_{MF}$ or $H_{TF}$ as applicable, See Note 3  |
| $H_{MF}$ =vertical framing depth, in metres, of main frames as shown in <a href="#">Figure 6.4.1: Framing depths</a> but is not to be taken less than 3.5 m, See Note 5   |
| $H_{TF}$ =vertical framing depth, in metres, of 'tween deck frames as shown in <a href="#">Figure 6.4.1: Framing depths</a> , but is not to be taken less than 2.5 m  |
| $S_1$ =vertical spacing of peak stringers or height of lower 'tween deck above the peak, in metres, as applicable   |
| $S_2$ =vertical spacing of panting stringers, in metres   |
| $C$ =end connection factor<br>$=3.4$ where two Rule standard brackets fitted<br>$=3.4 (1.8 - 0.8 (l_a / l))$ where one Rule standard bracket and one reduced bracket fitted<br>$=3.4 (2.15 - 1.15 (l_{\text{amean}} / l))$ where two reduced brackets fitted<br>$=6.1$ where one Rule standard bracket fitted<br>$=6.1 (1.2 - 0.2 (l_a / l))$ where one reduced bracket fitted<br>$=7.3$ where no brackets fitted   |
| The requirements for frames where brackets larger than Rule standard are fitted will be specially considered  |
| $l$ =length, in mm, as derived from <a href="#">Pt 3, Ch 10, 3.4 Scantlings of end brackets 3.4.1</a>   |
| $l_a$ =equivalent arm length, in mm, as derived from <a href="#">Pt 3, Ch 10, 3.4 Scantlings of end brackets 3.4.1</a>  |
| $l_{\text{amean}}$ =mean equivalent arm length, in mm, for both brackets  |
| $T_1=T$ but not to be taken less than $0.65D_1$   |
| $h_{T1}$ =head, in metres, at mid-length of $H$<br>$=f_w C_w \left(1 - \frac{h_6}{D_1 - T_1}\right) F_\lambda$ , in metres for frames where the mid-length of frame is above the waterline, at draught $T_1$<br>$f_w \left(1 - \frac{h_6}{D_1 - T_1}\right)$ is not to be taken less than 0.7<br>$=\left[h_6 + f_w C_w \left(1 - \frac{h_6}{2T_1}\right)\right] F_\lambda$ , in metres for frames where the mid-length of frame is below the waterline at draught $T_1$ |
| <b>where</b><br>$f_w=1.0$ at $0.2L$ from A.P. and 1.32 at and aft of aft peak bulkhead Intermediate positions by interpolation.   |
| $h_6$ = vertical distance in metres from the waterline at draught $T_1$ to the mid-length of $H$  |
| $F_\lambda = 1.0$ for $L \leq 200$ m<br>$=[1.0 + 0.0023(L - 200)]$ for $L > 200$ m  |
| $C_w$ = a wave head in metres<br>$= 7.71 \times 10^{-2} L e^{-0.0044L}$   |

where  $e$ =base of natural logarithm 2.7183

**Note 1.** In fishing vessels the modulus of main and 'tween deck frames need not be greater than 80% of that given in (2).

**Note 2.** In offshore supply ships the moduli of main and 'tween deck frames are to be 25 % greater than those given in (2), (3) and (4).

**Note 3.** Where frames are inclined at more than  $15^\circ$  to the vertical,  $H_{MF}$  or  $H_{TF}$  is to be measured along a chord between span points of the frame.

**Note 4.** Panting stringers are not required in tugs less than 46 m in length, See [Pt 4, Ch 3, 4 Panting and strengthening of bottom forward](#).

**Note 5.** Where the frames are supported by fully effective horizontal stringers, these may be considered as decks for the purpose of determining  $H_{MF}$ .

**Note 6.** Except for main frames the modulus for these members need not exceed that derived from (1) using  $H_{TF}$  in place of  $S_1$ .

4. 3. 2 The scantlings of main frames are normally to be based on Rule standard brackets at top and bottom, whilst the scantlings of 'tween deck frames are normally to be based on a Rule standard bracket at the top only.
4. 3. 3 End connections of transverse main and 'tween deck frames are to be in accordance with [Pt 3, Ch 10, 3 Secondary member end connections](#). For bulk carriers (See [Pt 3, Ch 6, 1.1 Application 1.1.4](#)), the end connections of main frames in cargo holds are to be in accordance with [Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.5](#) to [Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.12](#).

#### 4. 4 Panting stringers in way of transverse framing

4. 4. 1 In deep 'tween decks above the after peak space, panting stringers having scantlings as given in [Table 6. 4. 2: Shell framing \(transverse\) aft](#) or increased shell plate thickness may be required, See also [Pt 3, Ch 6, 3.4 Side shell and sheerstrake 3.4.2](#).

Figure 6. 4. 1: Framing depths

**Figure 6. 4. 2: Framing factors**

## 4. 5 Primary structure at sides

4. 5. 1 Where the 'tween decks above an after peak space are transversely framed, web frames are to be fitted. Their spacing is generally not to exceed the values given in [Table 6. 4. 3: Spacing of side transverses and web frames aft](#), and their scantlings are to be determined from [Table 6. 4. 4: Primary structure aft](#).
4. 5. 2 Where longitudinal framing is arranged, the spacing of transverses is generally not to exceed the values given in [Table 6. 4. 3: Spacing of side transverses and web frames aft](#), and their scantlings are to be determined from [Table 6. 4. 4: Primary structure aft](#).
4. 5. 3 Where the shape of the after sections is such that there are large sloped flat areas, particularly in the vicinity of the propellers, additional primary supports for the secondary stiffening may be required. Their extent and scantlings will be specially considered.
4. 5. 4 The web thickness, stiffening arrangements and connections of primary supporting members are to be in accordance with the requirements of [Pt 3, Ch 10, 4 Construction details for primary members](#).

**Table 6. 4. 3: Spacing of side transverses and web frames aft**

| Location                           | Maximum spacing  |  |
|------------------------------------|--|--|
|                                    | Web frames in association with transverse framing system | Side transverses in association with longitudinal framing system                                 |
| (1) Aft of the after peak bulkhead | 4 frame spaces   | 2.5 m where $L \leq 100$ m<br>3.5 m where $L \geq 300$ m<br>Intermediate values by interpolation |

|  |   |   |
|--|---|---|
| (2) Elsewhere in way of dry cargo spaces or deep tanks, <i>See Note</i>  | — | 3.8 m where $L \leq 100$ m<br>( $0.006L+3.2$ ) m<br>where $L > 100$ m |
| (3) In way of cargo tanks of oil tankers, chemical tankers or ore or oil carriers  | — | 3.6 m where $L \leq 180$ m<br>$0.02L$ where $L > 180$ m               |
| <b>Note</b> For the maximum spacing of transverses in dredgers, <i>See</i> <a href="#">Pt 4, Ch 12, 5 Shell envelope framing</a> . |   |   |

CHAPTER **6 Aft End Structure**SECTION **5 Single and double bottom structure****5.1 General**

- 5.1.1 For dry cargo ships exceeding 120 m in length, and for all ships which are strengthened for heavy cargoes, longitudinal framing is, in general, to be adopted, *See also* [Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers](#).
- 5.1.2 For ships having the notation 'strengthened for heavy cargoes', the requirements of [Pt 4, Ch 7, 8 Double bottom structure](#) are also to be complied with, as applicable.
- 5.1.3 For ships intended to load or unload while aground, *See* [Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground](#).
- 5.1.4 Provision is to be made for the free passage of water and/or air from all parts of single or double bottoms to the bilge or tank suction, account being taken of the pumping rates required.
- 5.1.5 For passenger ships, *See* [Pt 4, Ch 2, 6 Double bottom](#).

**5.2 Single bottoms – Transverse framing**

- 5.2.1 In after peak spaces, floors are to be arranged at every frame. For details and scantlings, *See* [Pt 3, Ch 6, 6.1 Bottom structure](#).
- 5.2.2 In way of dry cargo spaces aft, the arrangement and scantlings of transversely framed single bottoms are to be generally as required in the midship region, as given in [Pt 4, Ch 1, 7 Single bottom structure](#), except that the thickness of the centreline girder may be tapered from the midship thickness at  $0.3L$  from the A.P. to  $t = (\sqrt{Lk} + 0.5)$  mm or 6 mm, whichever is the greater, at  $0.075L$  from the A.P. In ships having considerable rise of floor towards the aft end, the depth of the floors may be required to be increased.
- 5.2.3 Where the shape of the after sections is such that there are large flat areas of shell plating, additional stiffening and/or increased shell plate thickness may be required, *See* [Pt 3, Ch 6, 3.3 Bottom shell and bilge](#). The extent of this stiffening will be specially considered.

**5.3 Single bottoms – Longitudinal framing**

- 5.3.1 The scantlings and arrangement of longitudinally framed single bottoms in way of dry cargo spaces will be specially considered.

**5.4 Double bottoms**

- 5.4.1 The minimum depth of centre girder aft is generally to be the same as that required in the midship region by [Pt 4 Ship Structures \(Ship Types\)](#) for the particular type of ship concerned, but in ships

with considerable rise of floor a greater depth may be required at the aft end to provide adequate access throughout the double bottom tank.

- 5. 4. 2 Where the height of the double bottom varies, this variation is generally to be made gradual by sloping the inner bottom over an adequate longitudinal extent. Knuckles in the plating are to be arranged close to plate floors. Otherwise, suitable scarfing arrangements are to be made.
- 5. 4. 3 For dry cargo ships, the arrangement and scantlings of girders, floors, inner bottom plating and inner bottom stiffening in the aft end region are to be determined from [Pt 4, Ch 1, 8 Double bottom structure](#).
- 5. 4. 4 For double bottom construction in way of the cargo tanks of oil tankers or ore carriers, *See also* [Pt 4, Ch 9 Double Hull Oil Tankers](#), [Pt 4, Ch 10 Single Hull Oil Tankers](#) or [Pt 4, Ch 11 Ore Carriers](#), as appropriate.

PART

3

CHAPTER 6 Aft End Structure

SECTION 6 After peak structure

6. 1 Bottom structure

6. 1. 1 Floors are to be arranged at every frame space and are to be carried to a suitable height, and at least to above the sterntube, where fitted. They are to have a thickness as determined from [Table 6. 6. 1: After peak structure](#) and are to be adequately stiffened. In way of a propeller post, rudder post or rudder horn, the floors are generally to be carried to the top of the space and are to be increased in thickness. The extent and amount of the increase will be specially considered, account being taken of the arrangements proposed.

6. 2 Side structure – Transverse framing

6. 2. 1 Above the floors, transverse side framing is to be supported by one of the following arrangements:
- a. Side stringers spaced not more than 2.5 m apart and supported by web frames. The upper ends of the web frames are to be supported under the tank top by suitable deep beams to form a ring structure.
  - b. Perforated flats spaced not more than 2.5 m apart. The area of perforations in each flat is to be not less than 10 per cent of the total area of the flat.
  - c. A combination of the above arrangements.
6. 2. 2 The scantlings of side stringers supported by web frames, and also of the web frames are to be determined from [Pt 3, Ch 6, 4.5 Primary structure at sides](#).
6. 2. 3 The scantlings of perforated flats are to be determined from [Table 6. 6. 1: After peak structure](#). Stiffeners are to be fitted at every frame.

6. 3 Side structure – Longitudinal framing

6. 3. 1 The spacing and scantlings of side transverses supporting longitudinal framing are to be as required by [Pt 3, Ch 6, 4.5 Primary structure at sides](#).
6. 3. 2 Suitable transverses or deep beams are to be arranged at the top of the tank to provide end rigidity to the side transverses.

Table 6. 6. 1: After peak structure

| Item       | Parameter | Requirement  |
|------------|-----------|--|
| (1) Floors | Thickness | $t = (7.5 + 0.025L_2) \sqrt{\frac{S_2}{800}} \text{ mm}$ |

|   |                           |  |
|---|---------------------------|--|
| (2) Perforated flats and wash bulkheads   | Thickness <i>See</i> Note | $t = (7.5 + 0.015L) \sqrt{\frac{s_2}{800}} \text{ mm}$ |
|   | Stiffener modulus         | $Z = \frac{0.0057 s k h_6 l_e^2}{b} \text{ cm}^2$      |
| Symbols   |                           |  |
| $=L, s, l_e, k$ as defined in <a href="#">Pt 3, Ch 6, 1.4 Symbols and definitions 1.4.1</a>   |                           |  |
| $b=1.4$ for rolled or built sections<br>$=1.6$ for flat bars  |                           |  |
| $h_6$ =vertical distance from middle of effective length of stiffener to top of tank, in metres   |                           |  |
| $s_2$ =spacing of stiffeners, in mm, but is to be taken not less than 800 mm  |                           |  |
| $L_2=L$ but need not be taken greater than 215 m  |                           |  |
| <b>Note</b> The thickness for perforated flats and wash bulkheads may be reduced by 1 mm for ships of 40 m and under with no reduction for ships of 90 m and above. Reduction for intermediate lengths to be by linear interpolation. |                           |  |

## 6. 4 Wash bulkheads

6. 4. 1 A centreline wash bulkhead is to be arranged in the upper part of the after peak space and counter or cruiser stern. Where the overhang is very large, or the breadth of the space at the widest point exceeds 20 m, additional wash bulkheads may be required port and starboard.
6. 4. 2 Wash bulkheads are to have an area of perforations not less than 5 per cent nor more than 10 per cent of the area of the bulkhead. The plating is to be suitably stiffened in way of openings, and the arrangement of openings is to be such as to maintain adequate shear rigidity.
6. 4. 3 The scantlings of wash bulkheads are to be determined from [Table 6. 6. 1: After peak structure](#), and stiffeners are to be fitted at every frame and bracketed top and bottom. The plating thickness may be required to be increased locally in way of the upper part of the sternframe or the rudder horn.

## 6. 5 After peak bulkhead

6. 5. 1 The position and height of the after peak bulkhead are to be in accordance with the requirements of [Pt 3, Ch 3, 4 Bulkhead requirements](#).
6. 5. 2 The scantlings of the after peak bulkhead and of the flat forming the top of the peak space are to be determined from [Pt 4, Ch 1, 9 Bulkheads](#), but the plating thickness is to be increased locally in way of the sterntube gland.

## CHAPTER 6 Aft End Structure

## SECTION 7 Sternframes and appendages

## 7.1 General

- 7.1.1 Sternframes, rudder horns, boss end brackets and shaft brackets may be constructed of cast or forged steel, or may be fabricated from plate.
- 7.1.2 In castings, sudden changes of section or possible constrictions to the flow of metal during casting are to be avoided. All fillets are to have adequate radii, which should, in general, be not less than 50 to 75 mm, depending on the size of the casting.
- 7.1.3 Cast sternframes, rudder horns, shaft brackets and solepieces are to be manufactured from special grade material. Cast bossings can be manufactured from normal grade material, *See Ch 4, 2 Castings for ship and other structural applications* of the Rules for Materials.
- 7.1.4 Sternframes, rudder horns, shaft brackets, etc. are to be effectively integrated into the ship's structure, and their design is to be such as to facilitate this.

## 7.2 Sternframes

- 7.2.1 The scantlings of sternframes are to be determined from [Table 6. 7. 1: Sternframes](#). In the case of very large ships, the scantlings and arrangements may be required to be verified by direct calculations.

Table 6. 7. 1: Sternframes

| tem   | Parameter | Requirement  |  |   |
|---|-----------|--|--|---|
| (1) Propeller posts<br><i>See</i> Notes 1 and 2 |           | Cast steel, <i>See</i> <a href="#">Figure 6. 7. 5: Propeller posts</a> | Forged steel, <i>See</i> <a href="#">Figure 6. 7. 5: Propeller posts</a> | Fabricated mild steel, <i>See</i> <a href="#">Figure 6. 7. 5: Propeller posts</a> |

|  | $\delta_A$  | -  | $(25T + 76) \text{ mm}$<br>but need not exceed $0.9\delta_{PL2} \text{ mm}$                         | -  |
|  | $\delta_b$  | -  | $6.25T + 19) \text{ mm}$<br>or $0.225\delta_{PL2} \text{ mm}$<br>whichever is the greater           | -  |
|  | $\delta_{PL1}, \delta_{PL2}$<br>bearing pressure and pintle clearance | -  | As for rudder pintles (See <a href="#">Table 13. 2. 12: Pintle requirements</a> in Chapter 13)      | -  |
| Symbols  |   |  |   |  |
| $L, T$ as defined in <a href="#">Pt 3, Ch 6, 1.4 Symbols and definitions 1.4.1</a>                           |   |  |   |  |
| $b$ =length of the rudder post or axle, in m, as defined in <a href="#">Figure 6. 7. 10: Solepieces</a>      |   |  |   |  |
| $K_2$ =rudder profile coefficient, as given by <a href="#">Table 13. 2. 2: Rudder profiles</a> in Chapter 13 |   |  |   |  |

$n$ =number of bolts in palm coupling

$r_b$ =mean distance of bolt centres from centre of palm, in mm

$t_b$ =finished thickness of boss, in mm

$A$ =cross-sectional area of forged steel propeller post, in cm<sup>2</sup>

$A_R$ = rudder area, in m<sup>2</sup>

$k_R$ =rudder coefficient, as given by [Table 6. 7. 7: Rudder coefficient kR](#)

$V_0$ =maximum service speed, in knots, with the ship in the loaded condition

$Z_T$ =section modulus against transverse bending, in cm<sup>3</sup>

$\delta_b$ =diameter of coupling bolts, in mm

$\delta_{TS}$ =diameter of tail shaft, in mm

**Note 1.** Where scantlings and proportions of the propeller post differ from those shown in Item (1), the section modulus about the longitudinal axis of the proposed section normal to the post is to be equivalent to that with Rule scantlings.  $t$  is to be not less than  $8\sqrt{T}$  (minimum of 19 mm for cast steel sternframes) or as required by [Pt 3, Ch 6, 3.4 Side shell and sheerstrake 3.4.2](#), whichever is the greater.

**Note 2.** On sternframes without solepieces, the modulus of the post below the propeller boss, about the longitudinal axis may be gradually reduced to not less than 85% of that required by Note 1, subject to the same thickness limitations.

**Note 3.** In fabricated sternframes the connection of the propeller post to the boss is to be by full penetration welds.

**Note 4.** If more than six bolts are fitted, the arrangements are to provide equivalent strength.

7. 2. 2 Fabricated and cast propeller posts and rudder posts of twin screw ships are to be strengthened at intervals by webs. In way of the upper part of the sternframe arch, these webs are to line up with the floors.
7. 2. 3 Rudder posts and propeller posts are to be connected to floors of increased thickness, See [Pt 3, Ch 6, 6.1 Bottom structure](#).

**Table 6. 7. 2: Permissible stresses for sole pieces**

| Mode  | Permissible stress       |
|---|--------------------------|
| (1) Equivalent stress   | $115/K_0 \text{ N/mm}^2$ |
| Symbols   |                          |
| $\sigma_e$ =equivalent stress<br>$= \sqrt{\sigma_b^2 + 3\tau_T^2} \text{ N/mm}^2$ |                          |
| $\sigma_b$ =bending stress<br>$= \frac{M_B}{Z_T}$                                 |                          |
| $\tau_T$ =shear stress<br>$= \frac{B_1}{A_s}$                                     |                          |

|  |
|--|
| $M_B$ =bending moment, in Nm, at the section considered<br>$=B_1x$                   |
| $B_1$ =supporting force, in N, in pintle bearing<br>$=0.5P_L$                        |
| $P_L$ =rudder force, in N, as calculated in Ch 13.2                                  |
| $x$ =distance, in metres, from centre of rudder stock to section under consideration |
| $Z_T$ =See <a href="#">Table 6. 7. 1: Sternframes</a> (4)                            |
| $A_s$ =sectional area, in mm <sup>2</sup> , of solepiece                             |

### 7. 3 Sole pieces

Figure 6. 7. 1: Solepiece

7. 3. 1 The scantlings of sole pieces are to be not less than those required by [Table 6. 7. 3: Sole pieces scantlings](#):

Table 6. 7. 3: Sole pieces scantlings

|   |                                       |
|---|---------------------------------------|
| Item, See <a href="#">Figure 6. 7. 10: Solepieces</a> | Minimum requirements                  |
| Section modulus about the vertical (z)-axis, $Z_z$    | $Z_z = \frac{M_b k}{80} \text{ cm}^3$ |
| Section modulus about the transverse (y)-axis, $Z_y$  | $Z_y = 0.5Z_z \text{ cm}^3$           |
| Section area, $A_s$                                   | $A_s = \frac{B_1 k}{48} \text{ mm}^3$ |
| Symbols   |                                       |

|  |
|--|
| $M_b$ = bending moment, in Nm, at the section considered<br>$=B_1x$<br>$x$ =distance, in m, from centre of rudder stock to section under consideration<br>$k$ =as defined in <a href="#">Table 13. 2. 1: Rudder material factor, k</a><br>$B_1$ = supporting force in the pintle bearing, in N<br>$= 0.5 CR$<br>$C_R$ = as defined in <a href="#">Pt 3, Ch 13, 2 Rudders</a>   |
| <p><b>Note 1.</b> For dredging and reclamation craft classed 'A1 protected waters service', the scantlings of an 'open' type solepiece are to be such that:</p> <ol style="list-style-type: none"> <li><math>Z_z = 0.625Z_z</math></li> <li>The cross-sectional area is not less than 18 cm<sup>2</sup></li> <li>The depth is not less than two-thirds of the width at any point.</li> </ol> <p><b>Note 2.</b> In fabricated solepieces, transverse webs are to be fitted spaced not more than 760 mm apart. Where the breadth of the solepiece exceeds 900 mm, a centreline vertical web is also to be fitted.</p> <p><b>Note 3.</b> Solepieces supporting fixed or movable nozzles will be specially considered, See <a href="#">Pt 3, Ch 13, 3 Fixed and steering nozzles</a></p> |

7. 3. 2 The solepiece is to be dimensioned such that the stresses do not exceed the permissible stresses given in [Table 6. 7. 4: Permissible stresses for solepieces](#).

**Table 6. 7. 4: Permissible stresses for solepieces**

| Mode  | Permissible stress                |
|---|-----------------------------------|
| (1) Equivalent stress   | $\frac{115}{k}$ N/mm <sup>2</sup> |
| Symbols   |                                   |
| $\sigma_e$ =equivalent stress<br>$=\sqrt{\sigma_b^2 + 3\tau_1^2}$ N/mm <sup>2</sup><br>$\sigma_b$ =bending stress<br>$=\frac{M_b}{Z_z}$ N/mm <sup>2</sup><br>$\tau_1$ =shear stress<br>$=\frac{B_1}{A_s}$ N/mm <sup>2</sup><br>$k$ =as defined in <a href="#">Table 13. 2. 1: Rudder material factor, k</a> |                                   |

## 7.4 Rudder horns

Figure 6. 7. 2: Rudder horn

- 7. 4. 1 Rudder horns are to be effectively integrated into the main hull structure.
- 7. 4. 2 The rudder horn side plating should be carried through the ship's bottom shell plating and aligned with primary members. Brackets or stringers are to be fitted on the inside of the rudder horn to align with the ship's adjoining bottom shell plating, See [Figure 6. 7. 3: Rudder horn integration](#).
- 7. 4. 3 A number of transverse webs of the rudder horn should be carried through the ship's bottom shell up to the inner bottom or bottom deck. These rudder horn transverse webs should be fitted in line with strengthened plate floors.
- 7. 4. 4 Where practicable the rudder horn should be connected to the ship's centreline bulkhead.
- 7. 4. 5 Scallops in way of the connection between the rudder horn transverse webs and the ship's adjoining bottom shell plating are to be avoided.
- 7. 4. 6 The weld at the connection between the rudder horn plating and the ship's bottom shell is to be full penetration. The welding radius is to be as large as practicable and may be obtained by grinding.
- 7. 4. 7 When the connection between the rudder horn and the hull structure is designed as a curved transition into the hull plating, special consideration is to be given to the effectiveness of the rudder horn plate bending and to the stresses in the transverse web plates.
- 7. 4. 8 The ship's bottom shell plating is to be increased in thickness in way of the rudder horn. Where the horn plating is radiused into the shell plating, the radius at the shell connection is to be not less than:

$$r = (150 + 0.8L)\text{mm}$$

**Figure 6. 7. 3: Rudder horn integration**

7. 4. 9 The bending moments and shear forces are to be determined by direct calculations.
7. 4. 10 The scantlings of the rudder horn are to be not less than those required by [Table 6. 7. 5: Rudder horn scantlings](#):

**Table 6. 7. 5: Rudder horn scantlings**

|  |                                       |

## 7.5 Rudder trunks

- 7.5.1 Rudder trunks extending above or below the stern frame are to be constructed of steel of a weldable quality with a carbon content not exceeding 0.23 per cent on ladle analysis or a carbon equivalent (CEQ) not exceeding 0.41 per cent.
- 7.5.2 Plating materials for rudder trunks are in general not to be of lower grades than those corresponding to Class II as defined in [Table 2. 2. 2: Steel grades](#).
- 7.5.3 The weld at the connection between the rudder trunk and the shell or the bottom of the skeg is to be full penetration.
- 7.5.4 The fillet shoulder radius,  $r$ , of webs connected to the rudder trunk See [Figure 6. 7. 4: Rudder trunk fillet shoulder radii](#), are to be as large as practicable and are in no case to be less than:

$$r = 60 \text{ mm when } \sigma_b \geq \frac{40}{k} \text{ N/mm}^2$$

$$r = \text{the greater of } 0.1d_c, \text{ and } 30 \text{ mm when } \sigma_b < \frac{40}{k} \text{ N/mm}^2$$

Where

$$d_c = \text{rudder stock diameter as defined in [Table 13. 2. 4: Rudder stock diameter](#)}$$

$$\sigma_b = \text{bending stress in the rudder trunk, in N/mm}^2$$

$$k = \text{as defined in [Table 13. 2. 1: Rudder material factor, k](#)}$$

The radius may be obtained by grinding. If disk grinding is carried out, score marks are to be avoided in the direction of the weld. The radius is to be checked with a template for accuracy. At least four profiles are to be checked. A report is to be submitted to the Surveyor.

7. 5. 5 Rudder trunks comprising of materials other than steel will be specially considered.

**Figure 6. 7. 4: Rudder trunk fillet shoulder radii**

7. 5. 6 Where the rudder stock is arranged in such a way that it will impose forces on the rudder trunk, the scantlings of the trunk are to be as follows:

- a. the equivalent stress due to bending and shear is not exceed  $0.35\sigma$ ,
- b. the bending stress of fabricated rudder trunks is to be less than  $\frac{80}{k}$  N/mm<sup>2</sup>

Where

$\sigma_b$  = bending stress in the rudder trunk, in N/mm<sup>2</sup>

$k$  = as defined in [Table 13. 2. 1: Rudder material factor, k](#) but is not to be taken less than 0.7

$\sigma$  = minimum specified yield stress, in N/mm<sup>2</sup>.

For calculation of bending stress, the span to be considered is the distance between the mid-height of the lower rudder stock bearing and the point where the trunk is clamped into the shell or the bottom of the skeg.

## 7. 6 Shaft bossing

7. 6. 1 Where the propeller shafting is enclosed in bossings extending back to the bearings supporting the propellers, the aft end of the bossings and the bearings are to be supported by substantially constructed boss end castings or fabrications. These are to be designed to transmit the loading from the shafting efficiently into the ship's internal structure.

7. 6. 2 The length of the shaft bracket boss,  $l_b$ , is to be sufficient to support the length of the required bearing. In general,  $l_b$  is not to be less than  $4d_t$ , where  $d_t$  is the Rule diameter of the screwshaft, in mm, See [Pt 5, Ch 6, 3 Design](#). Proposals for a reduction in the required length of the shaft bracket boss will be considered in conjunction with details of the bearing material, allowable bearing operating pressure and installation arrangements. However, in no case is  $l_b$  to be less than the greater of:

- a.  $2d_t$ ; or
- b. that recommended by the bearing manufacturer; or

- c. that required to accommodate the aftermost bearing and to allow the proper connection of the shaft bracket .

7. 6. 3 Where the shaft and the shaft bracket boss are of the same material, the thickness of the shaft bracket boss is not to be less than  $d/4$ . Where the shaft and the shaft bracket boss are of dissimilar materials, the thickness of the boss,  $t_b$ , is to be not less than:

$$t_b = 0.75d_t(f_1^{1/3} - 0.667)\text{mm}$$

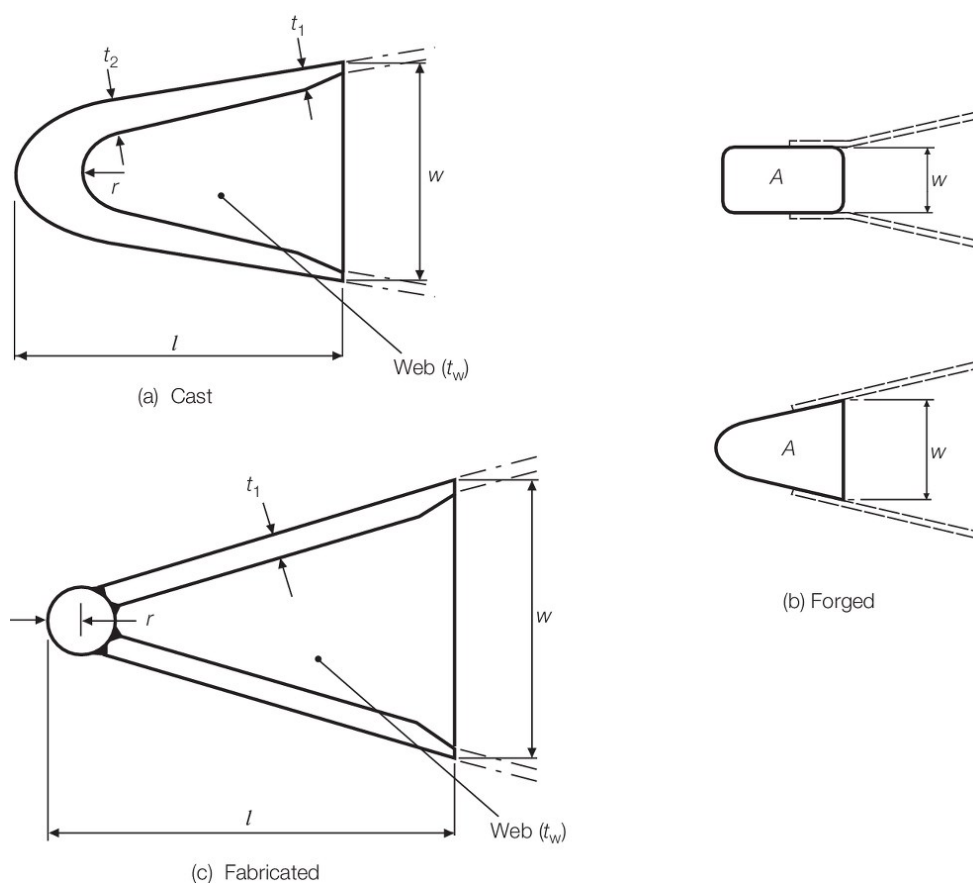

**Note** In no case is  $t_b$  to be taken as less than 12 mm

Where

|       |   |   |
|-------|---|---|
| $d_t$ | = | Rule diameter of the screwshaft in way of boss, in the appropriate screwshaft material, in mm, See <a href="#">Pt 5, Ch 6, 3 Design</a> : |
| $f_1$ | = | $s_s/s_b$ but not less than 0.825   |
| $s_s$ | = | ultimate tensile strength of the shaft material, in N/mm <sup>2</sup> .   |
| $s_b$ | = | ultimate tensile strength of the boss material, in N/mm <sup>2</sup> .  |

7. 6. 4 Cast steel supports are to be suitably radiused where they enter the main hull to line up with the boss plating radius. Where the hull sections are narrow, the two arms are generally to be connected to each other within the ship. The arms are to be strengthened at intervals by webs.
7. 6. 5 Fabricated supports are to be carefully designed to avoid or reduce the effect of hard spots. Continuity of the arms into the ship is to be maintained, and they are to be attached to substantial floor plates or other structure. The connection of the arms to the bearing boss is to be by full penetration welding.
7. 6. 6 The scantlings of supports will be specially considered. In the case of certain high powered ships, direct calculations may be required.
7. 6. 7 The boss plating is generally to be radiused into the shell plating and supported at the aft end by diaphragms at every frame. These diaphragms are to be suitably stiffened and connected to floors or a suitable arrangement of main and deep web frames. At the forward end, the main frames may be shaped to fit the bossing, but deep webs are generally to be fitted not more than four frame spaces apart.
7. 6. 8 The region where the shafting enters the ship, and the bearing in way, are to be adequately supported by floors or deep webs.

**Figure 6. 7. 5: Propeller posts**

**Figure 6. 7. 6: Propeller boss**

## 7. 7 Shaft brackets

7. 7. 1 The scantlings of the arms of shaft brackets, generally based on a breadth to thickness ratio of about five, are to be determined in accordance with [Pt 3, Ch 6, 7.8 Double arm shaft brackets \('A' - brackets\) 7.8.2.](#)

7. 7. 2 Where the propeller shafting is exposed to the sea for some distance clear of the main hull, it is generally to be supported adjacent to the propeller by independent brackets having two arms. In very small ships, the use of single arm brackets will be specially considered.
7. 7. 3 Fabricated brackets are to be designed to avoid or reduce the effect of hard spots and ensure a satisfactory connection to the hull structure. The connection of the arms to the bearing boss is to be by full penetration welding.
7. 7. 4 Where bracket arms are carried through the shell plating, they are to be attached to floors or girders of increased thickness. The shell plating is to be increased in thickness and connected to the arms by full penetration welding.
7. 7. 5 In the case of certain high powered ships, direct calculations may be required and scantlings of shaft brackets will be specially considered.
7. 7. 6 The region where the shafting enters the ship, and the bearing in way, is to be adequately supported by floors or deep webs.

**Figure 6. 7. 7: Rudder axle**

**Figure 6. 7. 8: Rudder post for twin screw ships**

## 7. 8 Double arm shaft brackets ('A' – brackets)

7. 8. 1 The angle between the arms for double arm shaft brackets is generally to be not less than 50°. Proposals for the angle between the arms to be less than 50° will be specially considered with supporting calculations to be submitted by the designers.
7. 8. 2 The arms of double arm shaft brackets are to have a section modulus,  $Z_{xx}$ , of not less than that determined from the formula:

$$Z_{xx} = 0.45n^3 \text{ cm}^3$$

Where

$n$  = the minimum thickness, in cm, of a hydrofoil section obtained from:

$$n = d_{up} \sqrt{\left(\frac{f}{2000}\right) \left(1 + \sqrt{\left(1 + \left(\frac{0.0112}{f}\right) \left(\frac{a_d}{d_{up}}\right)^2}\right)}\right)} \text{ cm}$$

$a_d$  = the length of the longer strut, in mm, See [Figure 6. 7. 9: Double arm shaft bracket](#)

$d_{up}$  = the Rule diameter for an unprotected screwshaft, in mm, or by the applicable Ice Class Rules, See [Pt 8, Ch 2, 7.8 Screwshafts](#), obtained from:.

$$d_{up} = 128 \sqrt[3]{P/R}$$

$P$  = shaft power, in kW as defined in [Pt 5, Ch 1, 3.3 Power ratings](#)

$R$  = revolutions per minute, as defined in [Pt 5, Ch 1, 3.3 Power ratings](#)

$$f = 400/\sigma_u$$

$\sigma_u$  = ultimate tensile strength of arm material, in N/mm<sup>2</sup>.

**Figure 6. 7. 9: Double arm shaft bracket**

## 7. 9 Propeller hull clearances

7. 9. 1 Recommended minimum clearances between the propeller and the sternframe, rudder or hull are given in [Table 6. 7. 8: Recommended propeller/hull clearances](#). These are the minimum distances considered desirable in order to expect reasonable levels of propeller excited vibration. Attention is drawn to the importance of the local hull form characteristics, shaft power, water flow characteristics into the propeller disc and cavitation when considering the recommended clearances.

## CHAPTER 7 Machinery Spaces

## SECTION 1 General

## 1.1 Application

- 1.1.1 This Chapter applies to all ship types detailed in [Pt 4 Ship Structures \(Ship Types\)](#). Only requirements particular to machinery spaces, including protected machinery casings and engine seatings, are given. For other scantlings and arrangement requirements, *See* the relevant Chapter in [Pt 4 Ship Structures \(Ship Types\)](#) for the particular ship type concerned.
- 1.1.2 Requirements are given for machinery spaces situated as follows:
  - a. In the midship region.
  - b. In the aft end region but with a cargo compartment between it and the after peak bulkhead.
  - c. In the aft end region where the after peak bulkhead forms the aft end of the machinery space.
- 1.1.3 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a CSR notation. *See* [Pt 1, Ch 2, 2.3 Class notations \(hull\)](#).

## 1.2 Structural configuration

- 1.2.1 Requirements are given for ships constructed using either a transverse framing system or a longitudinal framing system, or a combination of the two.
- 1.2.2 For midship machinery spaces, where the shell and decks (outside line of openings) are longitudinally framed in way of adjacent cargo spaces, this system of framing is also to be adopted in the machinery space.
- 1.2.3 For machinery spaces situated aft, where the longitudinal framing terminates and is replaced by transverse framing, a suitable scarfing arrangement of the longitudinal framing is to be arranged, *See also* [Pt 3, Ch 6, 1 General](#).
- 1.2.4 The maximum spacing,  $S_{\max}$ , of transverses in longitudinally framed machinery spaces is not to exceed the following:
  - a. where  $L \leq 100$  m,  $S_{\max} = 3.8$  m
  - b. where  $L > 100$  m,  $S_{\max} = (0.006L + 3.2)$  mIn addition, the spacing in way of a machinery space situated adjacent to the after peak is not to exceed five transverse frame spaces.

## 1.3 Structural continuity

- 1.3.1 Suitable scarfing arrangements are to be made to ensure continuity of strength and the avoidance of abrupt discontinuities where structure which contributes to the main longitudinal strength of the ship is omitted in way of a machinery space.
- 1.3.2 In cargo ships, suitable taper brackets are, in general, to be arranged in way of deck ends.

- 1. 3. 3 In oil tankers and bulk carriers with machinery aft (*See [Pt 3, Ch 6, 1.1 Application 1.1.3](#)*), continuity of the longitudinal bulkheads and topside tank structure is to be maintained as far as possible into the machinery space with suitable taper brackets at the end.
- 1. 3. 4 In container or similar ships having side tanks or double skin construction in way of the cargo spaces, the longitudinal bulkheads are generally to be carried through the machinery space where this is situated amidships or separated from the after peak by a cargo compartment. Where the machinery space is situated adjacent to the after peak, the longitudinal bulkheads are to be continued as far aft as possible and suitably tapered at their ends.

## 1. 4 Symbols and definitions

- 1. 4. 1 For symbols not defined in this Chapter, *See [Pt 4, Ch 1 General Cargo Ships](#)*. *L*, *B*, *D* and *T* are defined in [Pt 3, Ch 1, 6.1, Principal particulars](#). Other symbols are defined in the appropriate Sections.

PART

# 3

CHAPTER **7 Machinery Spaces**

SECTION **2 Deck structure**

## **2. 1 Strength deck – Plating**

- 2. 1. 1 The corners of machinery space openings are to be of suitable shape and design to minimise stress concentrations.
- 2. 1. 2 In the case of oil tankers (See [Pt 3, Ch 6, 1.1 Application 1.1.3](#)), or other ships having small deck openings amidships and machinery aft, where the width of machinery openings exceeds  $\frac{B}{2}$  and the opening extends forward beyond a point  $\frac{B}{3}$  aft of the poop front, the thickness of deck plating may be required to be increased locally.

## **2. 2 Strength deck – Primary structure**

- 2. 2. 1 Where a transverse framing system is adopted, deck beams are to be supported by a suitable arrangement of longitudinal girders in association with pillars or pillar bulkheads. Deep beams are to be arranged in way of the ends of engine casings and also in line with web frames where fitted.
- 2. 2. 2 Where a longitudinal framing system is adopted, deck longitudinals are to be supported by transverses in association with pillars or pillar bulkheads. For the maximum spacing of transverses, See [Pt 3, Ch 7, 1.2 Structural configuration 1.2.4](#). Deck transverses are to be in line with side transverses or web frames.
- 2. 2. 3 Machinery casings are to be supported by a suitable arrangement of deep beams or transverses and longitudinal girders in association with pillars or pillar bulkheads. In way of particularly large machinery casing openings, cross ties may be required, and these are to be arranged in line with deep beams or transverses.

## **2. 3 Lower decks**

- 2. 3. 1 The scantlings of lower decks or flats are generally to be as detailed in [Pt 3, Ch 5, 2 Deck structure](#), [Pt 3, Ch 6, 2 Deck structure](#) or [Pt 4, Ch 1, 4 Deck structure](#), as appropriate. However, in way of concentrated loads such as those from boiler bearers or heavy auxiliary machinery, etc. the scantlings of deck structure will be specially considered, taking account of the actual loading.
- 2. 3. 2 In way of machinery openings, etc. particularly towards the aft end, decks or flats are to have sufficient strength where they are intended as effective supports for side framing, webs or transverses. Web frames and side transverses are to be supported by deep beams or deck transverses.

**CHAPTER 7 Machinery Spaces****SECTION 3 Side shell structure****3.1 Secondary stiffening**

- 3.1.1 Transverse frames are generally to have scantlings determined as required by [Pt 4, Ch 1, 6 Shell envelope framing](#) for cargo spaces, except that where, in a machinery space situated in the midship region, it is desired to omit web frames as permitted by [Pt 3, Ch 7, 3.2 Primary structure - Transverse framing 3.2.3](#), the section modulus of the ordinary main or 'tween deck frames is to be increased by 50 per cent, up to the level of the lowest deck above the load waterline. Where fully effective stringers supported by web frames are fitted, the stringers may be considered as decks for the purpose of calculating the modulus of the frames.
- 3.1.2 Longitudinal framing is generally to have scantlings determined as required by [Pt 4, Ch 1, 6 Shell envelope framing](#) for machinery spaces in the midship region, and by [Table 6.4.1: Shell framing \(longitudinal\) aft](#) Location 2(b) in Chapter 6 for machinery spaces clear of and aft of the midship region.

**3.2 Primary structure - Transverse framing**

- 3.2.1 Where the space is situated in the aft end region, web frames are to be fitted, spaced in general not more than five frame spaces apart, extending from the tank top to the upper deck and having scantlings as required by [Table 7.3.1: Primary structure in machinery spaces](#). However, consideration will be given to a spacing of web frames at not more than seven transverse frame spaces apart, in association with substantially increased ordinary frames to satisfy the overall modulus and inertia requirements. The web frames are to be connected at top and bottom to members of adequate stiffness and supported at lower decks by deep beams. If the span of ordinary frames below the lowest deck or flat exceeds 6.5 m, one or more fully effective side stringers are to be fitted to support the frames. These are to have scantlings as required by [Table 7.3.1: Primary structure in machinery spaces](#). Stringers are to be efficiently bracketed to bulkheads, and their connection to the web frames is to be such as to provide adequate continuity of face material.
- 3.2.2 As an alternative to the fully effective stringers required by [Pt 3, Ch 7, 3.2 Primary structure - Transverse framing 3.2.1](#), an arrangement of light stringers spaced about 2.5 m apart may be accepted. These stringers are to have scantlings not less than those required in the panting region forward, See [Pt 3, Ch 5, 4.4 Panting stringers in way of transverse framing](#).
- 3.2.3 Where the machinery space is situated in the midship region, it is recommended that web frames be fitted in the engine-room, spaced not more than five frame spaces apart and extending from the tank top to the level of the lowest deck above the load waterline. The scantlings of these webs are to be such that the combined section modulus of the web frame and the main or 'tween deck frames is 50 per cent greater than that required for normal transverse framing. These webs may be omitted if the section modulus of the transverse frames is increased as required by [Pt 3, Ch 7, 3.1 Secondary stiffening 3.1.1](#).

3. 2. 4 If an effective side stringer supporting the side frames is fitted, then its scantlings and those of the supporting web frames are to be determined from [Table 7. 3. 1: Primary structure in machinery spaces](#).

### 3. 3 Primary structure - Longitudinal framing

3. 3. 1 Where the machinery space is longitudinally framed, side transverses are to be fitted having scantlings as required by [Table 7. 3. 1: Primary structure in machinery spaces](#). For the maximum spacing of transverses, See [Pt 3, Ch 7, 1.2 Structural configuration 1.2.4](#). Transverses are to be connected at top and bottom to members of adequate stiffness and supported at lower decks by transverses or deep beams.

**Table 7. 3. 1: Primary structure in machinery spaces**

## CHAPTER 7 Machinery Spaces

## SECTION 4 Double and single bottom structure

## 4.1 Double bottom structure

- 4.1.1 The minimum depth of the centre girder and its thickness are to be at least the same as required in way of cargo space amidships, *See* [Pt 4, Ch 1, 8 Double bottom structure](#). A greater depth is recommended in way of large engine-rooms when the variation in draught between light and load conditions is considerable. For passenger ships, *See* [Pt 4, Ch 2, 6 Double bottom](#).
- 4.1.2 In machinery spaces situated adjacent to the after peak, the double bottom is to be transversely framed. Elsewhere transverse or longitudinal framing may be adopted, but *See also* [Pt 4, Ch 1, 8 Double bottom structure](#).
- 4.1.3 Where the double bottom is transversely framed, plate floors are to be fitted at every frame in the engine-room. In way of boilers, plate floors are to be fitted under the boiler bearers, and elsewhere as required by [Pt 4, Ch 1, 8 Double bottom structure](#).
- 4.1.4 Where the double bottom is longitudinally framed, plate floors are to be fitted at every frame under the main engines and thrust bearing. Outboard of the engine seating, floors may be fitted at alternate frames, *See* [Figure 7.4.1: Engine-room with longitudinal framing](#).

Figure 7.4.1: Engine-room with longitudinal framing

\*Maximum spacing = 1,5 x normal spacing of longitudinals

- 4.1.5 The scantlings of floors clear of the main engine seatings, are generally to be as required in way of cargo spaces, *See* [Pt 4, Ch 1, 8 Double bottom structure](#). In way of engine seatings, the floors are to be increased in thickness, *See* [Pt 3, Ch 7, 6.2 Seats for engines 6.2.1](#).

4. 1. 6 Sufficient fore and aft girders are to be arranged in way of the main machinery to effectively distribute its weight and to ensure adequate rigidity of the structure. In midship machinery spaces these girders are to extend for the full length of the space and are to be carried aft to support the foremost shaft tunnel bearing. This extension beyond the after bulkhead of the engine-room is to be for at least three transverse frame spaces, aft of which the girders are to scarf into the structure. Forward of the engine-room bulkhead, the girders are to be tapered off over three frame spaces and effectively scarfed into the structure. In machinery spaces situated at the aft end the girders are to be carried as far aft as practicable and the ends effectively supported by web frames or transverses. For recommended scantlings of engine girders, See [Pt 3, Ch 7, 6.2 Seats for engines 6.2.1](#).
4. 1. 7 Outboard of the engines, side girders are to be arranged, where practicable, to line up with the side girders in adjacent cargo spaces. These are to have scantlings as required by [Pt 4, Ch 1, 8 Double bottom structure](#).
4. 1. 8 Where the double bottom is longitudinally framed and transverse floors are fitted in way of the engine seatings as required by [Pt 3, Ch 7, 4.1 Double bottom structure 4.1.4](#), no additional longitudinal stiffening is required in way of the engines other than the main engine girders, provided that the spacing of girders does not exceed 1.5 times the normal spacing of longitudinals. Where this spacing of girders is exceeded, shell longitudinals are to be fitted. These are to scarf into the longitudinal framing clear of the machinery spaces. The scantlings of the longitudinals are to be determined as required by [Pt 4, Ch 1, 6 Shell envelope framing](#) using a minimum span of 1.3 m, See [Figure 7. 4. 1: Engine-room with longitudinal framing](#).
4. 1. 9 The thickness,  $t$ , of inner bottom plating in engine-rooms, clear of the engine seatings, is to be not less than:

$$t = 0.0015\sqrt[4]{LTK^2}(s + 660)\text{mm}$$

and not less than 7.0 mm (symbols as defined in [Table 7. 3. 1: Primary structure in machinery spaces](#)). This thickness will be required to be increased in way of engine seatings integral with the tank top, See [Pt 3, Ch 7, 6.2 Seats for engines 6.2.1](#).

4. 1. 10 Where the height of inner bottom in the machinery spaces differs from that in adjacent spaces, continuity of longitudinal material is to be maintained by sloping the inner bottom over an adequate longitudinal extent. The knuckles in the plating are to be arranged close to plate floors.

## 4. 2 Single bottom structure

4. 2. 1 In way of machinery spaces situated amidships the minimum depth of floors is to be at least 10 per cent greater than that required elsewhere in general cargo ships, See [Pt 4, Ch 1, 7 Single bottom structure](#). If the top of the floors is recessed in way of the engines, the depth of the floors in way of the recess should generally be not less than that required by [Pt 4, Ch 1, 7 Single bottom structure](#), but this will be specially considered in each case in relation to the arrangements proposed.
4. 2. 2 In way of machinery spaces situated aft, or where there is considerable rise of floor, the depth of the floors will be specially considered.
4. 2. 3 Clear of the engine seatings the thickness and face plate area of the floor webs are to be 1.0 mm and 10 per cent greater, respectively, than the requirements for general cargo ships as given in [Pt 4, Ch 1, 7 Single bottom structure](#). The floors are not to be flanged.
4. 2. 4 Sufficient fore and aft girders are to be arranged in way of machinery to effectively distribute its weight and ensure adequate rigidity of the structure. In midship machinery spaces these girders are to extend for the full length of the space and are to be carried aft to support the foremost shaft tunnel bearing and forward to scarf into the structure. In machinery spaces situated at the aft end, the girders are to be carried as far aft as practicable and the ends effectively supported by web frames or transverses. For scantlings of engine girders, See [Pt 3, Ch 7, 6.2 Seats for engines 6.2.1](#).

4. 2. 5 Outboard of the engines, side girders are to be arranged having scantlings as required by [Pt 4, Ch 1, 7 Single bottom structure](#) and these are to be scarfed into the side girders in adjacent spaces.

## CHAPTER 7 Machinery Spaces

## SECTION 5 Machinery casings and fuel oil bunkers

## 5.1 Machinery casings

- 5.1.1 The scantlings and arrangements of exposed casings protecting machinery openings are to be in accordance with [Pt 3, Ch 8, 2 Scantlings of erections other than forecastles](#).
- 5.1.2 The minimum scantlings of protected casings are to be in accordance with [Table 7. 5. 1: Protected machinery casings](#).

Table 7. 5. 1: Protected machinery casings

| Item   | Minimum scantlings                 |
|--|------------------------------------|
| Plating:   |                                    |
| In way of cargo hold spaces  | $t = 6.5\sqrt{k}$ mm               |
| In way of accommodation spaces   | $t = 5.0\sqrt{k}$ mm               |
| Stiffeners   | $Z = 0.008l_e s k$ cm <sup>3</sup> |
| Symbols  |                                    |
| $k$ = higher tensile steel factor, See <a href="#">Pt 3, Ch 2, 1.2, Steel</a>  |                                    |
| $l_e$ = effective length of stiffening member, in metres, See <a href="#">Pt 3, Ch 3, 3.3 Determination of span point</a>            |                                    |
| $s$ = spacing of stiffeners, in mm   |                                    |
| $t$ = thickness, in mm   |                                    |
| $Z$ = section modulus of stiffening member, in cm <sup>3</sup> , See <a href="#">Pt 3, Ch 3, 3.2 Geometric properties of section</a> |                                    |
| <b>Note</b> In no case is the depth of the stiffener to be less than 60 mm.  |                                    |

- 5.1.3 Where casing stiffeners carry loads from deck transverses, girders, etc. or where they are in line with pillars below, they are to be suitably increased, See also [Pt 4, Ch 1, 4 Deck structure](#).
- 5.1.4 Where casing sides act as girders supporting decks over, care is to be taken that access openings do not seriously weaken the structure. Openings are to be effectively framed and reinforced if found necessary. Particular attention is to be paid to stiffening where the casing supports the funnel or exhaust uptakes.

## **5. 2 Fuel oil bunkers**

5. 2. 1 Fuel oil bunkers situated within the machinery space are generally to comply with the requirements given in [Pt 4, Ch 1 General Cargo Ships](#) or [Pt 3, Ch 9 Special Features](#), as appropriate.

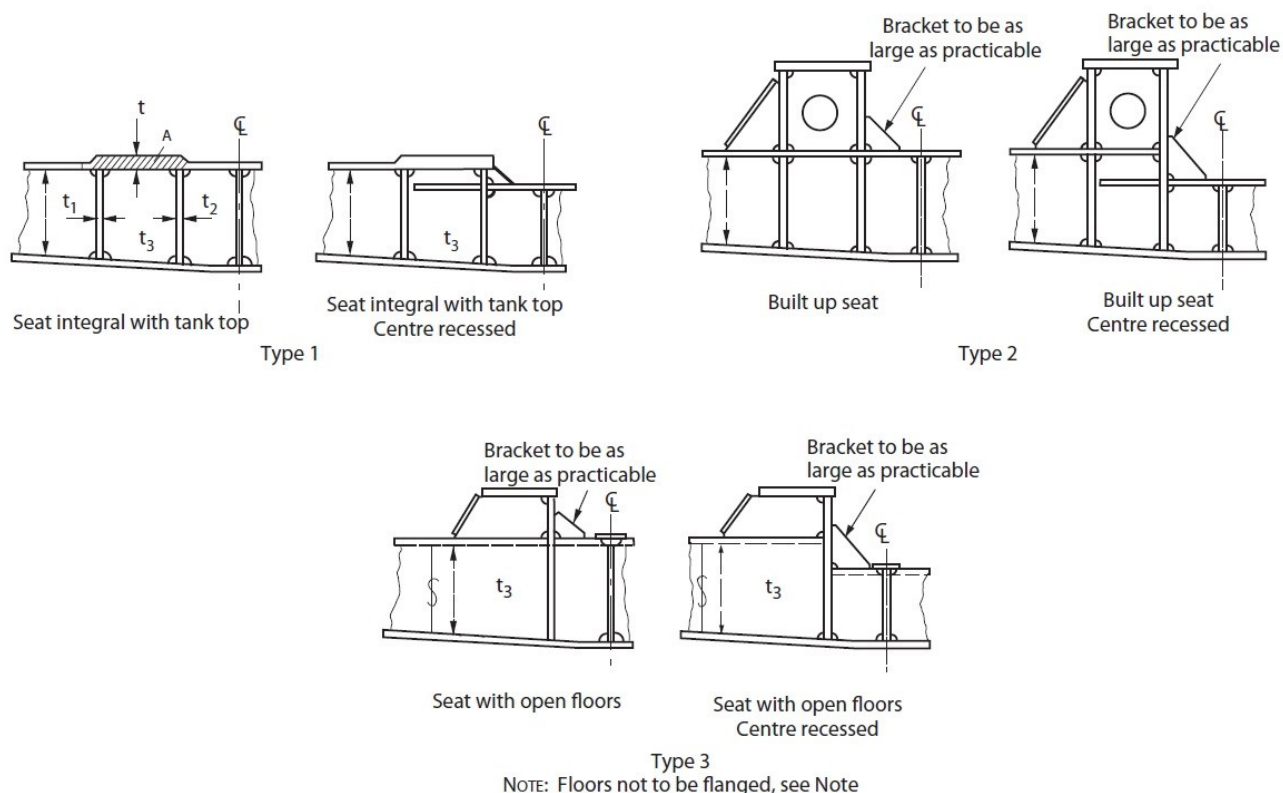

CHAPTER **7 Machinery Spaces**SECTION **6 Engine seatings****6.1 General**

- 6.1.1 Main engines and thrust bearings are to be effectively secured to the hull structure by seatings of adequate scantlings to resist the various gravitational, thrust, torque, dynamic and vibratory forces which may be imposed on them.
- 6.1.2 For initial guidance, recommended scantlings for engine seatings are given in [Pt 3, Ch 7, 6.2 Seats for engines 6.2.1](#).
- 6.1.3 In the case of higher power engines or turbine installations the seatings should generally be integral with the double bottom structure. The tank top plating in way of the engine foundation plate or the turbine gear case and the thrust bearing should be substantially increased in thickness, See [Figure 7.6.1: Engine seatings](#), Type 1.
- 6.1.4 If the main machinery is supported on seatings of Type 2 as shown in [Figure 7.6.1: Engine seatings](#), these are to be so designed that they distribute the forces from the engine as uniformly as possible into the supporting structure. Longitudinal members supporting the seating are to be arranged in line with girders in the double bottom, and adequate transverse stiffening is to be arranged in line with floors, See [Figure 7.6.1: Engine seatings](#), Type 2.
- 6.1.5 In ships having open floors in the machinery space the seatings are generally to be arranged above the level of the top of floors and securely bracketed to them, See [Figure 7.6.1: Engine seatings](#), Type 3.

**6.2 Seats for engines**

- 6.2.1 In determining the scantlings of seats for engines, consideration is to be given to the general rigidity of the engine itself and to its design characteristics in regard to out of balance forces. As a general guide to designers, recommended scantlings are given in [Table 7.6.1: Seats for engines - Recommended scantlings](#).

**Figure 7. 6. 1: Engine seatings**

Note See [Pt 3, Ch 7, 4.2 Single bottom structure 4.2.3](#)

**Table 7. 6. 1: Seats for engines - Recommended scantlings**

| Symbols   | Item   | Scantlings of one seat  |
|---|--|---|
| $L$ as defined in <a href="#">Pt 3, Ch 1, 6.1, Principal particulars</a><br>$f$ =engine factor $=\frac{P}{Rl}$<br>$t$ =minimum thickness of top plate, in mm  | Top plate  | $A = (120 + 44.2f + 4.07f^2)\text{cm}^2$  |
| $t_1, t_2$ =main engine girder thicknesses, in mm<br>$t_3$ =floor plate thickness under seating, in mm, See also <a href="#">Figure 7. 6. 1: Engine seatings</a><br>$A$ =area of top plate for one side of seat, in $\text{cm}^2$ |  | Minimum thickness:<br>(a) Where two girders fitted<br>$t = (19 + 3.4f) \text{ mm}$<br>(b) Where one girder fitted<br>$t = (25 + 3.4f) \text{ mm}$ |
|   | Girders (both inside and above double bottom where fitted) | Number:   |

|   |  |   |
|---|--|---|
| <p>where</p> <p><math>l</math>=effective length of engine foundation plate, in metres, required for bolting the engine to the seating.</p> <p>=The thrust and gearcase seating is to be considered as a separate item</p> <p><math>P</math>=power of one engine at maximum service speed, in kW (bhp)</p> |  | <p>Generally two but a single girder can be accepted where all the following apply:</p> <p>(a) <math>f &lt; 1.84</math></p> <p>(b) <math>P &lt; 5900 \text{ kW}</math></p> <p>(c) <math>L &lt; 100 \text{ m}</math></p> |
| <p><math>R</math>=rev/min of engine at maximum service speed</p>  |  | <p>Total thickness:</p> <p>(a) Where two girders are fitted<br/> <math>t_1 + t_2 = (28 + 4.08f) \text{ mm}</math></p> <p>(b) Where one girder is fitted<br/> <math>t_1 = (15 + 4.08f) \text{ mm}</math></p>             |
|   | Floors (between girders or under seat where a single girder is fitted) | <p>Thickness:</p> <p><math>t_3 = (10 + 1.5f) \text{ mm}</math></p>  |

### 6. 3 Seats for turbines

6. 3. 1 Seats are to be so designed as to provide effective support for the turbines and ensure their proper alignment with the gearing, and (where applicable) allow for thermal expansion of the casings. In general, the seats are not to be arranged in way of breaks or recesses in the double bottom.

### 6. 4 Seats for boilers

6. 4. 1 Boiler bearers are to be of substantial construction and efficiently supported by transverse and horizontal brackets. These should generally be arranged in line with plate floors and girders in a double bottom or with suitable deep beams or transverses and girders at boiler flats. Suitable allowance is to be made in the design of the supporting structure for the variation in loading due to thermal expansion effects, *See also* [Pt 5, Ch 14, 2 Fuel oil - General requirements](#).

### 6. 5 Seats for auxiliary machinery

6. 5. 1 Auxiliary machinery is to be secured on seatings, of adequate scantlings, so arranged as to distribute the loadings evenly into the supporting structure.

## CHAPTER 8 Superstructures, Deckhouses and Bulwarks

## SECTION 1 General

## 1.1 Application

- 1.1.1 This Chapter applies to all types of ships detailed in [Pt 4 Ship Structures \(Ship Types\)](#), except for deckhouses situated on forecastles of offshore supply ships, which are dealt with separately in [Pt 4, Ch 4 Offshore Support Vessels](#).
- 1.1.2 The scantlings of exposed bulkheads and decks of superstructures and deckhouses are generally to comply with the following requirements, but increased scantlings may be required where the structure is subjected to loading additional to Rule. Where there is no access from inside the house to below the freeboard deck, or where a bulkhead is in a particularly sheltered location, the scantlings may be specially considered.
- 1.1.3 The term 'erection' is used in this Section to include both superstructures and deckhouses.
- 1.1.4 For requirements relating to companionways, doors, accesses and skylights, See [Pt 3, Ch 11 Closing Arrangements for Shell, Deck and Bulkheads](#).
- 1.1.5 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a CSR notation. See [Pt 1, Ch 2, 2.3 Class notations \(hull\)](#).

## 1.2 Symbols

- 1.2.1 The following symbols and definitions are applicable to this Chapter, unless otherwise stated:

|                     |   |  |
|---------------------|---|--|
| $L, B, T$ and $C_b$ | = | as defined in <a href="#">Pt 3, Ch 1, 6.1, Principal particulars</a>   |
| $b$                 | = | breadth of deckhouse, at the positions under consideration, in metres  |
| $k$                 | = | higher tensile steel factor, See <a href="#">Pt 3, Ch 2, 1.2, Steel</a>  |
| $l_e$               | = | effective length, in metres, of the stiffening member, deck beam or longitudinal measured between span points, See <a href="#">Pt 3, Ch 3, 3.3 Determination of span point</a> |
| $l_s$               | = | span, in metres, of stiffeners, and is to be taken as the 'tween deck or house height but in no case as less than 2.0 m  |
| $s$                 | = | spacing of stiffeners, beams or longitudinals, in mm   |
| $s_b$               | = | standard spacing, in mm, of stiffeners, beams or longitudinals, and is to be taken as:   |

|           |   |  |
|-----------|---|--|
|           |   | (a) for 0.05L from the ends:   |
| $s_b$     | = | 610 mm or that required by (b), whichever is the lesser  |
|           | = | (b) elsewhere:   |
| $s_b$     | = | $470 + 1.67L_2$ mm   |
|           | = | but forward of 0.2L from the forward perpendicular $s_b$ is not to exceed 700 mm   |
| $B_1$     | = | actual breadth of ship, at the section under consideration, measured at the weather deck, in metres  |
| $D$       | = | moulded depth of ship, in metres, to the uppermost continuous deck or the deck next above a height of 1.6T from the base line amidships, whichever is the lesser   |
| $L_2$     | = | length of ship, in metres, but is not to be taken greater than 250 m or less than 50 m   |
| $L_3$     | = | length of ship, in metres, but is not to be taken greater than 300 m   |
| $X$       | = | distance, in metres, between the after perpendicular and the bulkhead under consideration. When determining the scantlings of deckhouse sides, the deckhouse is to be subdivided into parts of approximately equal length not exceeding 0.15L each, and X is to be measured to the mid-length of each part |
| $\alpha$  | = | a coefficient given in <a href="#">Table 8. 1. 1: Values of <math>\alpha</math></a>  |
| $\beta$   | = | $1.0 + \left( \frac{\left( \frac{X}{L} - 0.45 \right)^2}{(C_b + 0.2)} \right) f$ or $\frac{X}{L} \leq 0.45$  |
|           | = | $1.0 + 1.5 \left( \frac{\left( \frac{X}{L} - 0.45 \right)^2}{(C_b + 0.2)} \right) f$ or $\frac{X}{L} > 0.45$   |
|           | = | $C_b$ is to be taken as not less than 0.6 nor greater than 0.8. Where the aft end of an erection is forward of amidships, the value of $C_b$ used in determining $\beta$ for the aft end bulkhead need be taken as not less than 0.8   |
| $\gamma$  | = | vertical distance, in metres, from the summer load waterline to the mid-point of span of the bulkhead stiffener, or the mid-point of the plate panel, as appropriate   |
| $\delta$  | = | 1.0 for exposed machinery casings and houses protecting openings to pump-rooms   |
|           | = | $\left( 0.3 + 0.7 \frac{b}{B_1} \right)$ elsewhere, but in no case to be taken less than 0.475   |
| $\lambda$ | = | a coefficient given in <a href="#">Table 8. 1. 2: Values of <math>\lambda</math></a>   |

### 1.3 Definition of tiers

- 1.3.1 The lowest, or first tier, is normally that which is directly situated on the deck to which  $D$  is measured. The second tier is the next tier above the lowest tier and so on.

**Table 8. 1. 1: Values of  $\alpha$**

| Position                                       | $\alpha$                           |
|--|------------------------------------|
| Lowest tier - unprotected front                | $2.0 + 0.0083L_3$                  |
| Second tier - unprotected front                | $1.0 + 0.0083L_3$                  |
| Third tier and above - unprotected front       | $0.5 + 0.0067L_3$                  |
| All tiers - protected fronts                   |                                    |
| All tiers - sides                              |                                    |
| All tiers - aft end where aft of amidships     | $0.7 + 0.001L_3 - 0.8 \frac{x}{L}$ |
| All tiers - aft end where forward of amidships | $0.5 + 0.001L_3 - 0.4 \frac{x}{L}$ |

**Table 8. 1. 2: Values of  $\lambda$**

| Length $L$ | $\lambda$ | Expression for $\lambda$  |
|------------|-----------|---|
| metres     |           |   |
| 20         | 0.89      | $L \leq 150 \text{ m}$ $\lambda = \left(\frac{L}{10} e^{-\frac{L}{300}}\right) - \left(1 - \left(\frac{L}{150}\right)^2\right)$ |
| 30         | 1.76      |   |
| 40         | 2.57      |   |
| 50         | 3.34      |   |
| 60         | 4.07      |   |
| 70         | 4.76      |   |
| 80         | 5.41      |   |
| 90         | 6.03      |   |
| 110        | 7.16      |   |
| 130        | 8.18      |   |
| 150        | 9.10      |   |
| 150        | 9.10      | $150 \text{ m} \leq L \leq 300 \text{ m}$ $\lambda = \frac{L}{10} e^{-\frac{L}{300}}$   |
| 170        | 9.65      |   |
| 190        | 10.08     |   |
| 210        | 10.43     |   |
| 230        | 10.69     |   |
| 250        | 10.86     |   |
| 270        | 10.98     |   |

|               |       |   |
|---------------|-------|---|
| 290           | 11.03 |   |
| 300           | 11.03 |   |
| 300 and above | 11.03 | $L \geq 300 \text{ m}$<br>$\lambda = 11.03$ |

1. 3. 2 Where the freeboard corresponding to the required summer moulded draught for the ship can be obtained by considering the ship to have a virtual moulded depth at least one standard superstructure height less than the Rule depth,  $D$ , measured to the uppermost continuous deck, proposals to treat the first tier erection as a second tier, and so on, will be specially considered. The standard height of superstructure is the height defined in the *International Convention on Load Lines, 1966*.

## 1. 4 Design pressure head

1. 4. 1 The design pressure head,  $h$ , to be used in the determination of erection scantlings is to be taken as:

$$h = \alpha\delta(\beta\lambda - \gamma) \text{ m}$$

1. 4. 2 In no case is the design pressure head to be taken as less than the following:
- Lowest tier of unprotected fronts:  
minimum  $h = 2.5 + 0.01L_2 \text{ m}$
  - All other locations:  
minimum  $h = 1.25 + 0.005L_2 \text{ m}$ .

CHAPTER 8 **Superstructures, Deckhouses and Bulwarks**SECTION 2 **Scantlings of erections other than forecastles****2.1 Thickness of bulkhead and side plating**

- 2.1.1 The thickness,  $t$ , of plating of the fronts, sides and aft ends of all erections, other than the sides of superstructures where these are an extension of the side shell, is to be not less than:

$$t = 0.003s\sqrt{kh} \text{ mm}$$

but in no case is the thickness to be less than:

- a. for the lowest tier:

$$t = (5.0 + 0.01L_3)\sqrt{k} \text{ mm}$$

- b. for the upper tiers:

$$t = (4.0 + 0.01L_3)\sqrt{k} \text{ mm but not less than 5.0 mm}$$

- 2.1.2 The thickness of sides of poops and bridges is to be as required by [Pt 3, Ch 6, 3 Shell envelope plating](#) or [Pt 4, Ch 1, 5 Shell envelope plating](#), as appropriate.

**2.2 Stiffeners and their connections**

- 2.2.1 The modulus of stiffeners,  $Z$ , on front, side and end bulkheads of all erections, other than sides of superstructures, is to be not less than:

$$Z = 0.0035hsl_s^2k \text{ cm}^3$$

- 2.2.2 The section modulus of side frames of poops and bridges is to comply with the requirements of [Pt 3, Ch 6, 4 Shell envelope framing](#) or [Pt 4, Ch 1, 6 Shell envelope framing](#), as appropriate.
- 2.2.3 The end connections of stiffeners are to be as given in [Table 8.2.1: Stiffener end connections](#).

**2.3 Deck plating**

- 2.3.1 The requirements of [Pt 3, Ch 8, 2.3, Deck plating](#) need not apply to effective superstructure decks of passenger ships and ferries where direct calculations have been carried out in accordance with the SDA procedure relevant to the ship type.
- 2.3.2 The thickness of erection deck plating is to be not less than that required by [Table 8.2.2: Thickness of deck plating](#).
- 2.3.3 When decks are fitted with approved sheathing, the thicknesses derived from [Table 8.2.2: Thickness of deck plating](#) may be reduced by 10 per cent for a 50 mm sheathing thickness, or 5 per cent for 25.5 mm, with intermediate values in proportion. The steel deck is to be coated with a suitable material in order to prevent corrosive action, and the sheathing or composition is to be effectively secured to the deck, *See also* [Pt 6, Ch 4 Fire Protection, Detection and Extinction Requirements](#). Inside deckhouses the thickness may be reduced by a further 10 per cent.

**Table 8. 2. 1: Stiffener end connections**

| Position  | Attachment at top and bottom  |
|---|---|
| 1. Front stiffeners of lower tiers and of upper tiers when $L$ is 160 m or greater  | See <a href="#">Pt 3, Ch 10 Welding and Structural Details</a>  |
| 2. Front stiffeners of upper tiers when $L$ is less than 160 m  | May be unattached   |
| 3. Side stiffeners of lower tiers where two or more tiers are fitted  | Bracketed, unless stiffener modulus is increased by 20 per cent and ends are welded to the deck all round |
| 4. Side stiffeners if only one tier is fitted, and aft end stiffeners of after deckhouses on deck to which $D$ is measured  | See <a href="#">Pt 3, Ch 10 Welding and Structural Details</a>  |
| 5. Side stiffeners of upper tiers when $L$ is 160 m or greater  | See <a href="#">Pt 3, Ch 10 Welding and Structural Details</a>  |
| 6. Side stiffeners of upper tiers when $L$ is less than 160 m   | May be unattached   |
| 7. Aft end stiffeners except as covered by item 4   | May be unattached   |
| 8. Exposed machinery and pump-room casings - Front stiffeners on amidship casings and all stiffeners on aft end casings which are situated on the deck to which $D$ is measured | Bracketed   |
| 9. All other stiffeners on exposed machinery and pump-room casings  | 6.5 cm <sup>2</sup> of weld   |

**Table 8. 2. 2: Thickness of deck plating**

|                             | Thickness of deck plating, in mm                               |                             |
|-----------------------------|--|-----------------------------|
| Position                    | $L \leq 100$ m   | $L > 100$ m                 |
| Top of first tier erection  | $(5.5 + 0.02L) \sqrt{\frac{ks}{s_b}}$                          | $7.5 \sqrt{\frac{ks}{s_b}}$ |
| Top of second tier erection | $(5.0 + 0.02L) \sqrt{\frac{ks}{s_b}}$                          | $7.0 \sqrt{\frac{ks}{s_b}}$ |
| Top of third tier and above | $(4.5 + 0.02L) \sqrt{\frac{ks}{s_b}}$ but not less than 5.0 mm | $6.5 \sqrt{\frac{ks}{s_b}}$ |

## 2. 4 Deck longitudinals and beams

2. 4. 1 The requirements of [Pt 3, Ch 8, 2.4, Deck longitudinals and beams](#) need not apply to effective superstructure decks of passenger ships and ferries where direct calculations have been carried out in accordance with the SDA procedure relevant to the ship type.
2. 4. 2 The section modulus of superstructure deck longitudinals and beams is to be in accordance with the requirements for location (2) in [Table 1. 4. 4: Cargo and accommodation deck longitudinals](#)

and location (3) in [Pt 4, Ch 1 General Cargo Ships](#), using design heads not less than those specified in Table 3.5.1 in Chapter 3 for superstructure decks.

2. 4. 3 Transverse deck beams in deckhouses and deck longitudinals other than as in [Pt 3, Ch 8, 2.7 Erections contributing to hull strength](#) are to have a section modulus,  $Z$ , not less than:

$$Z = 0.0048 h_2 s l e^2 k \text{ cm}^3, \text{ but in no case less than:}$$

$$Z = 0.025 s m^3$$

and the value of  $h_2$ , the load head, is to be taken as not less than:

|                               |        |
|-------------------------------|--------|
| on first tier decks           | 0.9 m  |
| on second tier decks          | 0.6 m  |
| on third tier decks and above | 0.45 m |

## 2. 5 Deck girders and transverses

2. 5. 1 The section modulus of deck girders and transverses is to be in accordance with the requirements for location (1) in [Table 1. 4. 6: Deck girders, transverses and hatch beams](#) in [Pt 4, Ch 1 General Cargo Ships](#), using design heads not less than those specified in [Table 3. 5. 1: Design heads and permissible cargo loadings](#) for superstructure decks.

## 2. 6 Strengthening at ends and sides of erections

2. 6. 1 Web frames or partial bulkheads are to be fitted within poops and bridges that have large deckhouses or other erections above.
2. 6. 2 Web frames or equivalent strengthening are also to be arranged to support the sides and ends of large deckhouses.
2. 6. 3 These web frames should be spaced about 9 m apart and are to be arranged, where practicable, in line with watertight bulkheads below. Webs are also to be arranged in way of large openings, boats, davits and other points of high loading.
2. 6. 4 Arrangements are to be made to minimise the effect of discontinuities in erections. All openings cut in the sides are to be substantially framed and have well rounded corners. Continuous coamings or girders are to be fitted below and above doors and similar openings. House tops are to be strengthened in way of davits. Special care is to be taken to minimise the size and number of openings in the side bulkheads in the region of the ends of erections within  $0.5L$  amidships. Account is to be taken of the high vertical shear loading which can occur in these areas.
2. 6. 5 Adequate support under the ends of erections is to be provided in the form of webs, pillars, diaphragms or bulkheads in conjunction with reinforced deck beams. At the corners of houses and in way of supporting structures, attention is to be given to the connection to the deck, and inserts or equivalent arrangements are generally to be fitted especially for erections that are effective in resisting vertical hull girder bending as defined in [Pt 3, Ch 3, 4.2 Collision bulkhead](#).
2. 6. 6 The side plating of bridges having a length of  $0.15L$  or greater is to be increased in thickness by 25 per cent at the ends of the structure, and is to be tapered into the upper deck sheerstrake. This plating is to be efficiently stiffened at the upper edge and supported by web plates not more than 1.5 m from the end bulkhead. Proposals for alternative arrangements, including the use of higher tensile steel, will be individually considered.

## 2. 7 Erections contributing to hull strength

2. 7. 1 Where a long superstructure or deckhouse is fitted, extending at least  $0.15L$ , the scantlings of the first tier deck plating and longitudinals may be required to be increased, *See also* [Pt 3, Ch 3, 3.4, Calculation of hull section modulus](#) and [Pt 3, Ch 4, 2.3 Open type ships](#).

## **2. 8 Unusual designs**

2. 8. 1 Where superstructures or deckhouses are of unusual design, the strength is to be not less than that required by this Chapter for a conventional design.

## CHAPTER 8 Superstructures, Deckhouses and Bulwarks

## SECTION 3 Aluminium erections

## 3.1 Scantlings

- 3.1.1 Where an aluminium alloy complying with [Ch 8 Aluminium Alloys](#) of the Rules for Materials (Part 2) is used in the construction of erections, the scantlings of these erections are to be increased (relative to those required for steel construction) by the percentages given in [Table 8. 3. 1: Percentage increase of scantlings](#).

Table 8. 3. 1: Percentage increase of scantlings

| Item  | Percentage increase |
|---|---------------------|
| Fronts, sides, aft ends, unsheathed deck plating  | 20                  |
| Decks sheathed in accordance with <a href="#">Pt 3, Ch 8, 2.3 Deck plating 2.3.3</a>                              | 10                  |
| Deck sheathed with wood, and on which the plating is fixed to the wood sheathing at the centre of each beam space | Nil                 |
| Stiffeners and beams  | 70                  |
| Scantlings of small isolated houses   | Nil                 |

- 3.1.2 The thickness,  $t$ , of aluminium alloy members is to be not less than:

$$t = 2.5 + 0.022d_w \text{ mm need not exceed 10 mm}$$

where

$$d_w = \text{depth of the section, in mm}$$

$$I = 5.25Z l_e \text{ cm}^4$$

Where  $l_e$  is the effective length of the member in metres, as defined in [Pt 3, Ch 8, 1.2 Symbols 1.2.1](#), and  $Z$  is the section modulus of the stiffener and attached plating calculated using the formulae in [Pt 3, Ch 8, 2.2 Stiffeners and their connections 2.2.1](#) and [Pt 3, Ch 8, 2.4 Deck longitudinals and beams 2.4.3](#), as applicable, taking  $k$  as 1.

## 3.2 Bimetallic joints

- 3.2.1 Where aluminium erections are arranged above a steel hull, details of the arrangements in way of the bimetallic connections are to be submitted.

CHAPTER **8 Superstructures, Deckhouses and Bulwarks**SECTION **4 Forecastles****4. 1 Construction**

- 4. 1. 1 Side plating and framing of forecastles are to comply with the requirements of [Pt 3, Ch 5, 3 Shell envelope plating](#) and [Pt 3, Ch 5, 4 Shell envelope framing](#) respectively. The end plating and its stiffening are to comply with the requirements of [Pt 3, Ch 8, 2.1 Thickness of bulkhead and side plating 2.1.1](#) and [Pt 3, Ch 8, 2.2 Stiffeners and their connections 2.2.1](#) respectively.
- 4. 1. 2 The bow height and the extent of the forecastle are to comply with the requirements of [Pt 3, Ch 3, 6 Minimum bow heights, reserve buoyancy and extent of forecastle](#).
- 4. 1. 3 The thickness,  $t$ , of forecastle deck plating is to be not less than:

$$t = (6 + 0.017L) \sqrt{\frac{k_s}{s_b}} \text{ mm}$$

- 4. 1. 4 Deck longitudinals and beams are to comply with [Pt 3, Ch 5, 2.3 Deck stiffening](#), using a head of 1.8 m forward of  $0.075L$  and 1.5 m between  $0.12L$  and  $0.075L$ .
- 4. 1. 5 Girders, transverses and pillars are to be in accordance with [Pt 3, Ch 5, 2.4 Deck supporting structure](#), and the depth of the girder or transverse is to be not less than twice that of the beam or longitudinal supported.

CHAPTER **8 Superstructures, Deckhouses and Bulwarks**SECTION **5 Bulwarks, guard rails and other means for the protection of crew****5. 1 General requirements**

- 5. 1. 1 Bulwarks or guard rails are to be provided around all exposed decks. Bulwarks or guard rails are to be not less than 1.0 m in height measured above sheathing, and are to be constructed as required by this Section. Consideration will be given to cases where this height would interfere with the normal operation of the ship.
- 5. 1. 2 The freeing arrangements in bulwarks are to be in accordance with [Pt 3, Ch 8, 5.3, Freeing arrangements](#).
- 5. 1. 3 Guard rails fitted on superstructure and freeboards decks are to have at least three courses. The opening below the lowest course of guard rails is not to exceed 230 mm. The other courses are to be spaced not more than 380 mm apart. In the case of ships with rounded gunwales, the guard rail supports are to be placed on the flat of the deck. In other locations, guard rails with at least two courses are to be fitted.
- 5. 1. 4 Guard rails are to be fitted with fixed, removable or hinged stanchions fitted no more than 1.5 m apart. Removable or hinged stanchions shall be capable of being locked in the upright position.
- 5. 1. 5 At least every third stanchion is to be supported by a stay. In lieu of this, flat steel stanchions shall be of increased breadth as given in [Figure 8. 5. 1: Support of stanchions](#)
- 5. 1. 6 , and aligned with a member below deck unless the deck plating thickness exceeds 20 mm. Guard rail stanchions of increased breadth are to be welded to the deck with double continuous fillet weld with a minimum leg size of 7 mm or in compliance with a standard recognised by ACS.

**Figure 8. 5. 1: Support of stanchions**

In lieu of at least every third stanchion supported by stay, alternatively:

- (a) at least every third stanchion shall be of increased breadth:  $kb_s = 2,9b_s$
- (b) at least every second stanchion shall be of increased breadth:  $kb_s = 2,4b_s$
- (c) every stanchion shall be of increased breadth:  $kb_s = 1,9b_s$

where

$b_s$  breadth of normal stanchion as specified in an appropriate standard recognised by LR

Stanchions with increased breadth are to be aligned with members below deck, minimum 100 x 12 flat bar welded to deck by double continuous fillet weld. Stanchions with increased breadth need not be aligned with under deck structure for deck plating exceeding 20 mm.

- 5. 1. 7 Where necessary for the normal operation of the ship, steel wire ropes may be accepted in lieu of guard rails. Wires are to be made taut by means of turnbuckles. Chains are only permitted in short lengths in way of access openings.
- 5. 1. 8 Satisfactory means, in the form of guard rails, life-lines, handrails, gangways, underdeck passageways or other equivalent arrangements, are to be provided for the protection of the crew in getting to and from their quarters, the machinery space and all other parts used in the necessary work of the ship in accordance with [Table 8. 5. 1: 1 Protection of crew](#).

- 5. 1. 9 Where gangways on a trunk are provided by means of a stringer plate fitted outboard of the trunk side bulkheads (port and starboard), each gangway is to be a solid plate, effectively stayed and supported, with a clear walkway at least 450 mm wide, at or near the top of the coaming, with guard rails complying with [Pt 3, Ch 8, 5.1 General requirements](#) and hatch cover securing appliances accessible from the gangway.
- 5. 1. 10 Where permitted by the National Authority, gangways or walkways may be omitted on ships engaged on protected or extended protected water service. However, life-lines are to be provided on tankers and flush deck ships, or where the cargo hatch coamings are less than 600 mm high.
- 5. 1. 11 For a Type 'A' ship with freeboards assigned greater than, or equal to, Type 'B', a life-line may be provided in lieu of a walkway.

## 5. 2 Bulwark construction

- 5. 2. 1 Plate bulwarks are to be stiffened by a strong rail section and supported by stays from the deck. The spacing of these stays forward of  $0.07L$  from the forward perpendicular is to be not more than 1.2 m on Type 'A', Type 'B-60' and Type 'B-100' ships (as defined in [Pt 3, Ch 11, 1.1, Application](#)), and not more than 1.83 m on other Types. Elsewhere, bulwark stays are to be not more than 1.83 m apart. Where bulwarks are cut to form a gangway or other opening, stays of increased strength are to be fitted at the ends of the openings. Bulwarks are to be adequately strengthened in way of eyeplates for cargo gear, and in way of mooring pipes the plating is to be doubled or increased in thickness and adequately stiffened.
- 5. 2. 2 Bulwarks should not be cut for gangway or other openings near the breaks of superstructures, and are also to be arranged to ensure their freedom from main structural stresses. *See* shell plating in appropriate Chapters.
- 5. 2. 3 The section modulus,  $Z$ , at the bottom of the bulwark stay is to be not less than:

$$Z = (33.0 + 0.44L) h^2 s \text{ cm}^3$$

Where

- $h$  = height of bulwark from the top of the deck plating to the top of the rail, in metres
- $s$  = spacing of the stays, in metres, in accordance with [Pt 3, Ch 8, 5.2 Bulwark construction 5.2.1](#)
- $L$  = length of ship, in metres (as defined in [Pt 3, Ch 1, 6.1, Principal particulars](#)), but to be not greater than 100 m.

- 5. 2. 4 In the calculation of the section modulus, only the material connected to the deck is to be included. The bulb or flange of the stay may be taken into account where connected to the deck, and where, at the ends of the ship, the bulwark plating is connected to the sheerstrake, a width of plating not exceeding 600 mm may also be included. The free edge of the stay is to be stiffened.
- 5. 2. 5 Bulwark stays are to be supported by, or to be in line with, suitable underdeck stiffening, which is to be connected by double continuous fillet welds in way of the bulwark stay connection.
- 5. 2. 6 It should be noted that the above requirements do not allow for any loading from deck cargoes.

## 5. 3 Freeing arrangements

- 5. 3. 1 The requirements of [Pt 3, Ch 8, 5.3., Freeing arrangements 5.3.2](#) to [Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.11](#) apply to ships of Type 'B'. Additional requirements applicable to ships of Type 'A', Type 'B-100' and Type 'B-60' are indicated in [Pt 3, Ch 8, 5.3 Freeing arrangements](#)

[5.3.18](#) and [Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.20](#). The ship Types are as defined in [Pt 3, Ch 11, 1.1, Application](#).

- 5.3.2 Where bulwarks on the weather portions of freeboard or superstructure decks form wells, ample provision is to be made for rapidly freeing the decks of large quantities of water by means of freeing ports, and also for draining them.
- 5.3.3 The minimum freeing area on each side of the ship, for each well on the freeboard deck or raised quarterdeck, where the sheer in the well is not less than the standard sheer required by the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988*, is to be derived from the following formula:
- where the length,  $l$ , of the bulwark in the well is 20 m or less:  
area required =  $0.7 + 0.035/m^2$
  - where the length,  $l$ , exceeds 20 m:  
area required =  $0.07/m^2$
- $l$  need not be taken greater than  $0.7L_L$ , where  $L_L$  is the length of the ship as defined in [Pt 3, Ch 1, 6.1, Principal particulars](#).
- 5.3.4 If the average height of the bulwark exceeds 1.2 m or is less than 0.9 m, the freeing area is to be increased or decreased, respectively, by  $0.004 \text{ m}^2$  per metre of length of well for each 0.1 m increase or decrease in height respectively.
- 5.3.5 The minimum freeing area for each well on a first tier superstructure is to be half the area calculated from [Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.3](#).
- 5.3.6 Two-thirds of the freeing port area required is to be provided in the half of the well nearest to the lowest point of the sheer curve.
- 5.3.7 When the deck has little or no sheer, the freeing area is to be spread along the length of the well.

**Table 8. 5. 1: 1 Protection of crew**

| Ship Type   | Location in ship  | Assigned Summer Freeboard, in mm   | Acceptable arrangements according to type of freeboard assigned |                        |                        |                        |
|---|---|--|---|------------------------|------------------------|------------------------|
|   |   |  | Type A  | Type (B-100)           | Type (B-60)            | Type (B & B +)         |
| Oil tankers, chemical tankers and gas carriers (See <a href="#">Pt 3, Ch 8, 1.1 Application 1.1.5</a> ) | 1.1 Access to bow   | $\leq(A_r+H_s)$  | a<br>e<br>f(1)<br>f(5)  | a<br>e<br>f(1)<br>f(5) | a<br>e<br>f(1)<br>f(5) | a<br>e<br>f(1)<br>f(5) |
|   | 1.1.1 Between poop and bow or   |  |   |                        |                        |                        |
|   | 1.1.2 Between a deckhouse containing living accommodation or navigation equipment, or both, and bow, or |  |   |                        |                        |                        |
|   | 1.1.3 In the case of a flush deck vessel, between crew accommodation and the forward ends of ship       | $>(A_r+H_s)$   | a<br>e<br>f(1)<br>f(5)  |                        |                        |                        |
|   | 1.2 Access to after end   | As required in item 2.2.4 in <a href="#">Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.7</a> for other types of ships |   |                        |                        |                        |
|   | In the case of a flush deck vessel, between crew accommodation and the after end of ship                |  |   |                        |                        |                        |

|   |  |           |                                     |   |   |   |
|---|--|-----------|-------------------------------------|---|---|---|

| $A_f$ = the minimum summer freeboard calculated as Type A ship regardless of type freeboard actually assigned   |  |           |                                     |   |   |   |
| $H_s$ = the standard height of superstructure as defined in <i>International Convention on Load Lines</i> , Regulation 33   |  |           |                                     |   |   |   |
| Acceptable arrangements:  |  |           |                                     |   |   |   |
| Acceptable arrangements referred to in the Table are defined as follows:  |  |           |                                     |   |   |   |
| a A well lighted and ventilated under-deck passageway (clear opening 0.8 m wide, 2 m high) as close as practicable to the freeboard deck, connecting and providing access to the locations in question.   |  |           |                                     |   |   |   |
| b A permanent and efficiently constructed gangway fitted at or above the level of the superstructure deck on or as near as practicable to the centreline of the ship, providing a continuous platform at least 0.6 m in width and a non-slip surface, with guard rails extending on each side throughout its length. Guard-rails shall be at least 1 m high with courses as required in Pt 3, Ch 8, 5.1, General requirements, and supported by stanchions spaced not more than 1.5 m; a foot-stop shall be provided. |  |           |                                     |   |   |   |
| c A permanent walkway at least 0.6 m in width fitted at freeboard deck level consisting of two rows of guard-rails with stanchions spaced not more than 3 m. The number of courses of rails and their spacing are to be as required by Pt 3, Ch 8, 5.1, General requirements. On Type B ships, hatchway coamings not less than 0.6 m in height may be regarded as forming one side of the walkway, provided that between the hatchways two rows of guard rails are fitted.  |  |           |                                     |   |   |   |

d A 10 mm minimum thickness diameter wire rope life-line supported by stanchions about 10 m apart, or a single hand rail or wire rope attached to hatch coamings, continued and adequately supported between hatchways.

e A permanent and efficiently constructed gangway fitted at or above the level of the superstructure deck on or as near as practicable to the centreline of the ship:

- located so as not to hinder easy access across the working areas of the deck;
- providing a continuous platform at least 1.0 m in width;
- constructed of fire resistant and non-slip material;
- fitted with guard rails extending on each side throughout its length; guard rails should be at least 1.0 m high with courses as required by Regulation 25(3) and supported by stanchions spaced not more than 1.5 m;
- provided with a foot stop on each side;
- having openings, with ladders where appropriate, to and from the deck. Openings should not be more than 40 m apart;
- having shelters of substantial construction set in way of the gangway at intervals not exceeding 45 m if the length of the exposed deck to be traversed exceeds 70 m. Every such shelter should be capable of accommodating at least one person and be so constructed as to afford weather protection on the forward port and starboard sides.

f A permanent and efficiently constructed walkway fitted at freeboard deck level on or as near as practicable to the centre line of the ship having the same specifications as those for a permanent gangway listed in (e) except for foot-stops. On Type B ships (certified for the carriage of liquids in bulk), with a combined height of hatch coaming and fitted hatch cover of together not less than 1 m in height the hatchway coamings may be regarded as forming one side of the walkway, provided that between the hatchways two rows of guard rails are fitted.

Alternative transverse locations for c, d and f:

- (1) At or near centreline of ship; or fitted on hatchways at or near centreline of ship.
- (2) Fitted on each side of the ship.
- (3) Fitted on one side of the ship, provision being made for fitting on either side.
- (4) Fitted on one side of the ship only.
- (5) Fitted on each side of hatchways as near to the centreline as practicable.

**Note 1.** In all cases where wire ropes are fitted, adequate devices are to be provided to ensure their tautness.

**Note 2.** Wire ropes may only be accepted in lieu of guard rails in special circumstances and then only in limited lengths.

**Note 3.** Lengths of chain may only be accepted in lieu of guard rails if fitted between two fixed stanchions.

**Note 4.** Where stanchions are fitted, every third stanchion is to be supported by a bracket or stay.

**Note 5.** Removable or hinged stanchions shall be capable of being locked in the upright position.

**Note 6.** A means of passage over obstructions, if any, such as pipes or other fittings of a permanent nature, should be provided.

**Note 7.** Generally, the width of the gangway or deck-level walkway should not exceed 1.5 m.

5. 3. 8 In ships with no sheer the freeing area as calculated from [Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.3](#) is to be increased by 50 per cent. Where the sheer is less than the standard, the percentage is to be obtained by linear interpolation.

- 5. 3. 9 Where the length of the well is less than 10 m, or where a deckhouse occupies most of the length, the freeing port area will be specially considered but in general need not exceed 10 per cent of the bulwark area.
- 5. 3. 10 Where it is not practical to provide sufficient freeing port area in the bulwark, particularly in small ships, credit can be given for bollard and fairlead openings where these extend to the deck.
- 5. 3. 11 Where a ship fitted with bulwarks has a continuous trunk, or hatch side coamings that are continuous, or substantially continuous, the minimum freeing area is to be not less than 20 per cent of the total bulwark area where the width of trunk or hatchway is  $0.4B$  or less, and not less than 10 per cent of the total bulwark area when the width of the trunk or hatch is  $0.75B$  or greater. The freeing area required for an intermediate width of trunk or hatch is to be obtained by linear interpolation.
- 5. 3. 12 Where the trunk referred to in [Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.11](#) or its equivalent is included in the calculation of freeboard, open rails are to be fitted for at least 50 per cent of the length of the exposed part of the weather deck. Alternatively, if a continuous bulwark is fitted, the minimum freeing area is to be at least 33 per cent of the bulwark area. The freeing area is to be placed in the lower part of the bulwark.
- 5. 3. 13 Where a deckhouse has a breadth less than 80 per cent of the beam of the ship, or the width of the side passageways exceeds 1.5 m, the arrangement is considered as one well. Where a deckhouse has a breadth equal to or more than 80 per cent of the beam of the ship, or the width of the side passageways does not exceed 1.5 m, or when a screen bulkhead is fitted across the full breadth of the ship, this arrangement is considered as two wells, before and abaft the deckhouse.
- 5. 3. 14 Suitable provision is also to be made for the rapid freeing of water from recesses formed by superstructures, deckhouses and deck cargo arrangements, etc. in which water may be shipped and trapped. Deck gear, particularly on fishing vessels, is not to be stowed in such a manner as to obstruct unduly the flow of water to freeing ports.
- 5. 3. 15 The lower edges of freeing ports are to be as near to the deck as practicable, and should not be more than 100 mm above the deck.
- 5. 3. 16 Where freeing ports are more than 230 mm high, vertical bars spaced 230 mm apart may be accepted as an alternative to a horizontal rail to limit the height of the freeing port.
- 5. 3. 17 Where shutters are fitted, the pins or bearings are to be of a non-corrodible material, with ample clearance to prevent jamming. The hinges are to be within the upper third of the port. Shutters are not to be fitted with securing appliances.
- 5. 3. 18 Ships of Type 'A' and Type 'B-100' are to have open rails for at least half the length of the exposed part of the weather deck. Alternatively, if a continuous bulwark is fitted, the minimum freeing area is to be at least 33 per cent of the total area of the bulwark. The freeing area is to be placed in the lower part of the bulwark.
- 5. 3. 19 Where superstructures are connected by trunks, open rails are to be fitted for the whole length of the exposed part of the freeboard deck.
- 5. 3. 20 Ships of Type 'B-60' are to have a minimum freeing area of at least 25 per cent of the total area of the bulwark. The freeing area is to be placed in the lower part of the bulwark.
- 5. 3. 21 Gutter bars greater than 300 mm in height fitted on the weather decks of tankers are to be treated as bulwarks and freeing ports arranged as required by this Section. Closures for use during loading and discharge operations are to be arranged in such a way that jamming cannot occur while at sea.
- 5. 3. 22 In ships having superstructures which are open at either or both ends to wells formed by bulwarks on the open deck, adequate provision for freeing the open spaces are to be provided as follows:

The freeing port area,  $A_w$  for the open well:

$$A_w = (0.07l_w + A_c)(S_c)\left(\frac{0.5h_s}{h_w}\right)$$

The freeing port area,  $A_s$  for the open superstructure:

$$A_s = (0.07l_t)(S_c)\left(\frac{b_o}{l_t}\left(1 - \left(\frac{l_w}{l_t}\right)^2\right)\right)\left(\frac{0.5h_s}{h_w}\right)$$

Where

|       |   |   |
|-------|---|---|
| $l_w$ | = | the length of the open deck enclosed by bulwarks, in metres   |
| $l_s$ | = | the length of the common space within the open superstructure, in metres  |
| $l_t$ | = | $l_w + l_s$ but if 20 m or less then the freeing area is to be calculated in accordance with <a href="#">Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.3</a> |
| $S_c$ | = | sheer correction factor, maximum 1.5 as defined in <a href="#">Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.8</a>   |
| $b_o$ | = | breadth of openings in the end bulkhead of the enclosed superstructure, in metres   |
| $h_w$ | = | distance of the well deck above the freeboard deck, in metres   |
| $h_s$ | = | one standard superstructure height, See <a href="#">Pt 3, Ch 8, 1.3 Definition of tiers 1.3.2</a>   |
| $h_b$ | = | actual height of the bulwark, in metres   |
|       | = | bulwark height correction factor taken as;  |
|       | = | 0 for bulwarks between 0.9 and 1.2 m in height  |
|       | = | $l_w\left(\frac{h_b-1.2}{0.1}\right)(0.004)m^2$ for bulwarks of height greater than 1.2 m, and  |
|       | = | $l_w\left(\frac{h_b-1.9}{0.1}\right)(0.004)m^2$ for bulwarks of height less than 0.9 m.   |

To adjust the freeing port area for the distance of the well deck above the freeboard deck, for decks located more than  $0.5h_s$  above the freeboard deck, multiply by the factor  $0.5 (h_s/h_w)$ .

## 5. 4 Free flow area

5. 4. 1 The effectiveness of the freeing port area in bulwarks of vessels not fitted with a continuous deck obstruction, depends on the free flow across the deck.
5. 4. 2 The free flow area is the net total longitudinal area of the transverse passageways or gaps between hatchways and superstructures or deckhouses, due account being made for any obstructions such as equipment or other fittings. The height of passageways or gaps used in the calculation of the area is the height of the bulwark.
5. 4. 3 The provision of freeing area in bulwarks should be related to the net free flow area as follows:
  - a. If the free flow area is equal to, or greater than the freeing port area calculated from [Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.11](#) when the hatchway coamings are continuous, then the minimum freeing area calculated from [Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.3](#) is sufficient.

- b. If the free flow area is less than the freeing port area calculated from [Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.3](#), then the minimum freeing area is to be that calculated from [Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.11](#).
- c. If the free flow area is less than the freeing port area derived from (a) but greater than that derived from [Pt 3, Ch 8, 5.4 Free flow area 5.4.3.b](#), the minimum freeing area,  $F$ , in the bulwark is to be obtained from the following formula:

$$F = F_1 + F_2 - f_p m^2$$

Where

|       |  |
|-------|--|
| $f_p$ | total net area of passages and gaps between hatchways, superstructures and deckhouses (the free flow area) |
| $F_1$ | minimum area from <a href="#">Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.3</a>                               |
| $F_2$ | minimum area from <a href="#">Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.11</a>                              |

## 5. 5 Special requirements for tugs and offshore supply ships

5. 5. 1 In tugs and offshore supply ships where there is a recess at the after end of the forecastle for the towing winch, the freeing port area in way of the recess is to be calculated as follows:

|     |   |                                  |
|-----|---|----------------------------------|
| $B$ | = | breadth of ship                  |
| $b$ | = | breadth of recess                |
| $L$ | = | length of well                   |
| $l$ | = | mean length of recess            |
| $a$ | = | freeing area for well length $L$ |

Freeing port area in way of recess:

$$A = a \frac{l}{L}$$

Reduction due to breadth of recess:

$$A_1 = A \frac{b}{B}$$

Reduce  $A_1$  by 25 per cent for winch area:

$$A_2 = 0.75A_1$$

= required freeing port area each side in way of the recess

Where the winch is enclosed in a non-weathertight compartment freeing ports are not required but adequate drainage by means of scuppers is to be provided.

CHAPTER **9** **Special Features**SECTION **1** **General****1.1 Application**

- 1.1.1 The requirements of this Chapter are to be taken in conjunction with the Chapters of [Pt 3 Ship Structures \(General\)](#) and [Pt 4 Ship Structures \(Ship Types\)](#) applicable to the particular ship type.

**1.2 Symbols**

- 1.2.1 The following symbols and definitions are applicable to this Chapter:

|       |   |  |
|-------|---|--|
| $k$   | = | higher tensile steel factor, See <a href="#">Pt 3, Ch 2, 1.2, Steel</a>  |
| $l$   | = | overall length, of the stiffening member, in metres  |
| $l_e$ | = | effective length, in metres, of the stiffening member, measured between span points, See <a href="#">Pt 3, Ch 3, 3.3 Determination of span point</a> |
| $s$   | = | spacing, of stiffeners, in mm  |
| $B$   | = | moulded breadth of ship, in metres, See <a href="#">Pt 3, Ch 1, 6.1, Principal particulars</a>   |
| $L$   | = | length of ship, in metres, See <a href="#">Pt 3, Ch 1, 6.1, Principal particulars</a>  |
| $Z$   | = | section modulus of the stiffening member, in cm <sup>3</sup> , See <a href="#">Pt 3, Ch 3, 3.2 Geometric properties of section</a>                   |

- 1.2.2 Other symbols are defined in the appropriate Section.

PART

# 3

CHAPTER **9 Special Features**

SECTION **2 Timber deck cargoes**

## 2. 1 Application

2. 1. 1 Where the ship carries timber as deck cargo and the notation 'timber deck cargoes' is to be assigned, the requirements of this Section are to be complied along with relevant parts of non-mandatory IMO Resolution A.1048(27) *2011 TDC Code – Code of Safe Practice for Ships Carrying Timber Deck Cargoes, 2011 – Resolution A.1048(27)*, irrespective of being assigned timber load line or not.
2. 1. 2 In all other cases, compliance with the relevant parts of this Section or the *2011 TDC Code – Code of Safe Practice for Ships Carrying Timber Deck Cargoes, 2011 – Resolution A.1048(27)* shall be as required by the flag state; the flag state may make the *2011 TDC Code – Code of Safe Practice for Ships Carrying Timber Deck Cargoes, 2011 – Resolution A.1048(27)* a mandatory requirement
  - For ships on their register that carry timber deck cargoes; or
  - For foreign ships in their ports when acting as a port state.
2. 1. 3 Attention is drawn to the International Load Line Convention, 1966, and its 1988 Protocol, with respect to requirements for ships assigned a timber loadline.

## 2. 2 Symbols and definitions

2. 2. 1 The term 'timber deck cargo' means a cargo of timber carried on an uncovered part of the freeboard or superstructure deck. The term does not include wood pulp or similar cargo.
2. 2. 2 The symbols used in this Section are defined as follows:  
 $C$  = mean stowage rate, in m<sup>3</sup>/tonne, of the timber deck cargo, making allowance for normal battens, etc.  
 $h$  = the height, in metres, to which the timber deck cargo is to be stowed, measured vertically from the deck or hatch cover as applicable.
2. 2. 3 Other symbols are defined in [Pt 3, Ch 9, 1.2 Symbols](#).

## 2. 3 General

2. 3. 1 Attention is drawn to the requirements of the *International Convention for the Safety of Life at Sea, 1974, Chapter VI*, as amended, the *International Load Line Convention, 1966*, concerning timber deck cargoes, and its 1988 Protocol, and to National Regulations.
2. 3. 2 Timber deck cargoes are to be loaded, stowed and secured throughout the voyage, in accordance with the Cargo Securing Manual prepared in compliance with the *2011 TDC Code – Code of Safe Practice for Ships Carrying Timber Deck Cargoes, 2011 – Resolution A.1048(27)* and the requirements specified in this Section. The Cargo Securing Manual is to be approved by the Flag

Administration as required by *Chapter VI - Carriage of cargoes and oil fuels*, and a copy is to be placed on board.

2. 3. 3 Each cargo securing arrangement for timber deck cargoes detailed in the ship's Cargo Securing Manual is to be documented by a lashing plan that shows the following:
  - a. maximum cargo weight for which the arrangement is designed;
  - b. maximum stowage height;
  - c. required number and strength of blocking devices, lashings, uprights and loose gear, as applicable;
  - d. required pre-tension in lashings;
  - e. other cargo properties of importance for the securing arrangement, such as friction, rigidity of timber packages;
  - f. illustrations of all securing items that might be used;
  - g. any restrictions regarding maximum accelerations, weather criteria, restricted sea areas and for non-winter conditions only;
  - h. the walkway/life-line arrangements; and
  - i. lashing and stowage arrangements, which are to be in accordance with [Pt 3, Ch 9, 2.6, Lashings](#) and [Pt 3, Ch 9, 2.7 Stowage](#) .
2. 3. 4 All timber deck cargoes must be compactly stowed, lashed and secured. Friction alone is not deemed sufficient and such methods are not endorsed by Asia Classification Society. Loop lashing is recommended where applicable as one of the safest practices for securing timber deck cargoes.
2. 3. 5 Timber freeboards cannot be used where wood pulp is being carried as the deck cargo. Packaged timber (timber which has been prelashed) may be carried on deck with the ship at its timber freeboards.
2. 3. 6 Type 'B-60' ships may have timber freeboards assigned based on ordinary Type 'B' freeboards.
2. 3. 7 Timber freeboards are not appropriate for ships which are assigned freeboards from a second deck. However, where the maximum geometric upper deck draught is restricted, a restricted timber draught may be assigned.
2. 3. 8 It is the Master's responsibility to ensure loose gear (e.g. uprights, wire lashings and life-lines) are supplied and fitted onboard in accordance with the approved timber deck cargo loading and lashing plan when the ship is carrying timber deck cargoes. However, it is not a requirement that loose gear remains permanently on board a ship assigned timber freeboards.

## 2. 4 Arrangements

2. 4. 1 Double bottom tanks within the midship half-length are to have adequate longitudinal subdivision.
2. 4. 2 A forecastle of at least standard height of a superstructure, defined by Regulation 33 of the International Load Line Convention, as amended, and of length at least  $0.07L$  is to be fitted. In addition, in ships of less than 100 m in length, a poop of at least standard height, or a raised quarterdeck with a deckhouse or strong steel hood of at least the same total height, is to be fitted.

## 2. 5 Uprights

2. 5. 1 Uprights designed in accordance with the *2011 TDC Code – Code of Safe Practice for Ships Carrying Timber Deck Cargoes, 2011 – Resolution A.1048(27)* should be used when required by the nature, height or character of the timber deck cargo, as outlined in the *2011 TDC Code – Code of Safe Practice for Ships Carrying Timber Deck Cargoes, 2011 – Resolution A.1048(27)*. Where timber uprights are used, it is the responsibility of the Master to use timber of a type and grade proven satisfactory for the purpose.

- 2. 5. 2 Uprights are to be used for all timber deck cargoes with the exception that, where only packaged timber is to be carried, uprights may be omitted, depending on racking strength and not including uprights or stoppers (low uprights) situated either side of hatch covers.
- 2. 5. 3 The spacing of the uprights is to be suitable for the length and character of the timber to be carried but is not to exceed 3 m.
- 2. 5. 4 Each upright is to extend above the top of the cargo and be fitted with a strap or bracket support at the top of the bulwark to hold it upright whilst loading.
- 2. 5. 5 Strong permanent bulwarks, or efficient rails of specially strong construction, are to be fitted. They are acceptable as supports for uprights, provided they have adequate strength, and substantial sockets are built for each upright.
- 2. 5. 6 Deck sockets, along with locking pin, are to be of adequate strength to hold the uprights in place. They are to be efficiently connected to the hull structure to transfer the loads. They are not to be less than 100 mm in depth with drainage provided. A locking pin or wedge is to be provided to prevent the upright lifting out of the socket.

## 2. 6 Lashings

- 2. 6. 1 The timber deck cargo is to be secured along its length by appropriate top-over lashings or loop lashings of adequate strength.
- 2. 6. 2 The spacing of lashings is to be such that lashings are positioned as close as practicable to the ends of each continuous timber deck stow.
- 2. 6. 3 In order to achieve a more secure stowage of logs when stowed on deck, hog wires are to be utilised. Such hog wires shall be installed in the following manner so as to obtain as even a tension as possible throughout, thus producing an inboard pull on the respective uprights:
  - a. At approximately three quarters of the height of the stow, the hog wire should be rove through a pad eye attached to the uprights at this level so as to run transversely, connecting the respective port and starboard uprights. The hog lashing wire should not be too tight when laid, so that it becomes taut, when overstowed with other logs.
  - b. A second hog wire may be applied in a similar manner, if the height of the hatch cover is less than 2 m. Such second hog wire should be installed approximately 1 m above the hatch covers.
- 2. 6. 4 Where only packaged timber is to be carried, and uprights are omitted, *See [Pt 3, Ch 9, 2.5 Uprights 2.5.2](#)*, lashings are to be spaced not more than 1.5 m apart.
- 2. 6. 5 Eye plates used for lashing are to be of substantial construction and adequate strength. They are to be effectively connected to the hull structure, and placed at intervals appropriate for the lashing arrangement. The distance from a superstructure or deckhouse end bulkhead to the first eye plate and lashing is to be not more than 2 m.
- 2. 6. 6 Open hooks, which may loosen if the lashing becomes slack, are not to be used in securing arrangements for timber deck cargoes, and web lashing is not to be used in combination with chain or wire lashing.
- 2. 6. 7 Slip hooks or other appropriate methods may be used for quick and safe adjustment of lashings. Pelican hooks, when used, are to be moused.
- 2. 6. 8 Corner protectors are to be used to prevent lashings from cutting into the cargo and to protect lashings from damage at sharp corners.
- 2. 6. 9 Lashings and fittings must have adequate strength for the proposed timber loading and must not:
  - a. Have a breaking strength of less than 133 kN;
  - b. Elongate more than 5 per cent at 80 per cent of the breaking strength and;
  - c. Show any permanent deformation at less than 40 percent of the breaking strength.

- 2. 6. 10 Every lashing is to be provided with a tightening device or system, situated so that it can be safely and efficiently operated when required. The magnitude of the components of the resolved load produced by the tightening device or system is not to be less than:
  - a. 27 kN in the horizontal direction; and
  - b. 16 kN in the vertical direction.
- 2. 6. 11 Once the lashings are secured, the tightening device or system is to have not less than half the tightening capacity available for further use.
- 2. 6. 12 If wire rope clips are used to make a joint in a wire lashing, the following conditions are to be observed to avoid a significant reduction in strength:
  - a. at least three rope clips are to be utilised to make a wire joint, where the total number and size of the rope clips utilised are to be in proportion to the diameter of the wire rope used. The rope clips are to be spaced not less than 150 mm apart;
  - b. the saddle portion of the clip is to be applied to the live load segment; and
  - c. rope clips are to be initially tightened so that they visibly compress the wire rope and are subsequently to be re-tightened after the lashing has been stressed.
- 2. 6. 13 Bulldog grips are only suitable for a standard wire rope of right-hand lay having six strands. Such grips are not to be used for wire rope of left-hand lay or different construction.
- 2. 6. 14 Where loose or packaged sawn wood is carried, [Pt 3, Ch 9, 2.6 Lashings 2.6.15](#) to 2.6.18, and in case of logs, poles, cants or similar cargo, [Pt 3, Ch 9, 2.6 Lashings 2.6.19](#) to [Pt 3, Ch 9, 2.6 Lashings 2.6.20](#), are to be complied with.
- 2. 6. 15 Subject to [Pt 3, Ch 9, 2.6 Lashings 2.6.16](#), the maximum spacing of the lashings referred to above should be determined by the maximum height of the timber deck cargo in the vicinity of the lashings:
  - a. for a height of 2.5 m and below, the maximum spacing is to be not more than 3 m;
  - b. for heights of above 2.5 m, the spacing is to be not more than 1.5 m;
  - c. on the foremost and aft-most sections of the deck cargo, the distance between the lashings in accordance with (a) and (b) are to be halved.
- 2. 6. 16 As far as practicable, long and sturdy packages should be stowed in the outer rows of the stow, and the packages stowed at the upper outboard edge should be secured by at least two lashings each.
- 2. 6. 17 When the outboard packages of the timber deck cargo are in lengths of less than 3.6 m, the spacing of the lashings should be reduced as necessary, or other suitable provisions made to suit the length of timber.
- 2. 6. 18 Rounded angle pieces of suitable material and design are to be used along the upper outboard edge of the stow to bear the stress and permit free reeving of the lashings.
- 2. 6. 19 Round wood deck cargo should be supported by uprights and secured throughout its length by independent top-over or loop lashings spaced not more than 1.5 m apart.
- 2. 6. 20 In addition to [Pt 3, Ch 9, 2.6 Lashings 2.6.19](#), round wood timber deck cargo, stowed over and above hatches, is to be further secured by a system of athwartship lashings (See [Pt 3, Ch 9, 2.6 Lashings 2.6.3](#)) connecting respective port and starboard uprights.

## 2. 7 Stowage

- 2. 7. 1 The stowage arrangements are to be detailed within the lashing plan, See [Pt 3, Ch 9, 2.3 General 2.3.3](#).
- 2. 7. 2 Timber deck cargoes are to extend over at least the entire available length, which is the total length of the well or wells between superstructures. Where there is no limiting superstructure at the after end, the timber is to extend at least to the after end of the aftermost hatchway.

- 2. 7. 3 The timber deck cargo is to extend athwartships as close as possible to the ship's side, due allowance being made for obstructions, provided any gap thus created at the side of the ship does not exceed a mean of four per cent of the breadth.
- 2. 7. 4 The timber is to be stowed as solidly as possible to at least the standard height of a superstructure other than a raised quarter deck. It is not to interfere in any way with the safe navigation and necessary work of the ship.
- 2. 7. 5 On a ship within a seasonal winter zone in winter, the height of the deck cargo above the deck exposed to weather must not exceed one third of the extreme breadth of the ship.
- 2. 7. 6 Cargo which overhangs hatch coamings or other structures in the longitudinal direction by more than a third of their individual or packed length is to be supported at the outer end by other cargo stowed on deck or by structure of adequate strength.

## 2. 8 Safety arrangements

- 2. 8. 1 If there is no convenient passage on or below the deck of the ship, a walkway is to be provided over the timber deck cargo. This walkway is either to be:
  - a. At, or near, the centreline of the ship, consisting of two sets of guard wires, spaced 1 m apart, each with more than three courses of wire. The opening below the lowest course is not to exceed 230 mm; the remaining courses are to be spaced not more than 380 mm apart to a height of at least 1 m above the timber deck cargo. The guard wires are to be secured to stanchions. The stanchions are to be not more than 3 m apart, and these are to be secured to the timber cargo by spikes, or other equivalent means.
  - b. Alternatively, where uprights are used, guard wires, spaced vertically not more than 330 mm apart, are to be secured to the uprights along the length of the timber deck cargo on both port and starboard sides to a height of not less than 1 m above the cargo. A wire life-line is also to be fitted at the centreline of the ship, adequately supported by stanchions spaced not more than 10 m apart. A safe walking surface, not less than 600 mm in width, is to be fitted over the cargo and effectively secured to the top of it in line with the walkway or adjacent to the life-line. All lines are to be taut using tightening devices.
- 2. 8. 2 Safe access is to be provided to the top of the timber deck cargo by means of properly constructed ladders, steps or ramps fitted with guard lines or handrails.
- 2. 8. 3 All openings in the weather deck are to be capable of being properly closed and secured tight. Ventilators, air pipes and other fittings enclosing openings are to be efficiently protected against damage.
- 2. 8. 4 Access hatches, vents, air pipes, fire hydrants, hoses, valve operating positions, sounding pipes and other essential equipment are to be clearly marked and left accessible.

## 2. 9 Longitudinal strength

- 2. 9. 1 The proposed timber deck loading conditions are to be taken into account in the longitudinal strength calculations *See [Pt 3, Ch 4 Longitudinal Strength](#)*, and details are to be included in the ship's Loading Manual.

## 2. 10 Deck loading and scantlings

- 2. 10. 1 Adequate deck strength is to be ensured, when the proposed timber deck cargoes will impose a mean cargo loading in excess of 8.5 kN/m<sup>2</sup> on the weather deck.
- 2. 10. 2 In general, the stowage rate, *C*, of timber deck cargoes is to be taken as:

- a. for round timber and logs:

$$C = 2.1 \text{ m}^3 / \text{tonne}$$

- b. for packaged sawn timber:

$$C = 1.45 \text{ m}^3 / \text{tonne}.$$

These values are based on the total volume occupied by the cargo, including normal battens, etc. measured from bulwark to bulwark, and deck, or hatch cover, to top of cargo.

2. 10. 3 Where it is proposed to store timber more densely than that corresponding to the above values, the appropriate value of  $C$  is to be used.
2. 10. 4 The load height,  $h$ , of the cargo at any position is to be determined from the overall heights of cargo stowage as supplied by the Shipbuilder. Where the height of cargo varies, a mean effective load height is to be adopted. Attention is drawn to the limitation on height of cargo contained in the Load Lines Conventions where these apply.
2. 10. 5 A scantling correction factor,  $K$ , is to be determined from  $K = \frac{h}{1.08C}$ , and the hull scantlings are to be increased as follows:
- Deck longitudinals.** The section modulus is to be multiplied by the factor  $0.5(1+K)$ .
  - Deck beams.** The load head contained in the expression for section modulus is to be multiplied by  $K$ , and the section modulus determined using the increased value.
  - Deck girders and transverses.** The section modulus is to be multiplied by the factor  $K$ .
  - Pillars and deck supporting structure.** The design load is to be multiplied by the factor  $K$ , and scantlings determined using the increased value.
  - Side structure.** The arrangement and scantlings of side structure are to be considered, and increased scantlings of framing may be required.

## 2. 11 Scantlings of hatch covers

2. 11. 1 The scantlings of primary supporting members and secondary stiffeners are to comply with [Pt 3, Ch 11, 2.3 Load model 2.3.4](#) for distributed cargo load  $p_L$  using  $p_C = h/C$ .
2. 11. 2 The hatch cover securing and support arrangements, stoppers, etc. and coamings are to be suitably reinforced to take account of increased loading from timber deck cargoes, *See* [Pt 3, Ch 11, 4.2, Steel covers – Clamped and gasketed](#).

## 2. 12 Direct calculations

2. 12. 1 As an alternative to the above, the scantlings of the deck and side structure, and of hatch covers, may be assessed using direct calculations based on the proposed loading of the ship.
2. 12. 2 In the case of hatch covers, the stress and deflection criteria given in [Pt 3, Ch 11, 2.4, Allowable stress and deflection](#) corresponding to a uniformly distributed weather load are not to be exceeded.

CHAPTER 9 **Special Features**SECTION 3 **Decks loaded by wheeled vehicles****3.1 General**

- 3.1.1 Where it is proposed either to stow wheeled vehicles on the deck or to use wheeled vehicles for cargo handling, the deck and supporting structure are to be designed on the basis of the maximum loading to which they may be subjected in service. Where applicable, the hatch covers are to be similarly designed. In no case, however, are the scantlings to be less than would be required as a weather or cargo deck or hatch cover, as applicable.
- 3.1.2 The vehicles, types and axle loads, for which the vehicle carrying decks including, where applicable, hatch covers have been approved, are to be stated in the Loading Manual and be contained in a notice displayed on each deck.

**3.2 Symbols**

- 3.2.1 The symbols used in this Section are defined in [Pt 3, Ch 9, 1.2 Symbols](#) and in the appropriate sub-Section.

**3.3 Loading**

- 3.3.1 Details of the deck loading resulting from the proposed stowage or operation of vehicles are to be supplied by the Shipbuilder. These details are to include the wheel load, axle and wheel spacing, tyre print dimensions and type of tyre for the vehicles.
- 3.3.2 For design purposes, where wheeled vehicles are to be used for cargo handling, the deck is to be taken as loaded with a normal head cargo, except in way of the vehicle.

**3.4 Deck plating**

- 3.4.1 The deck plate thickness,  $t$ , is to be not less than:

$$t = t_1 + t_c \text{ mm}$$

Where

$$\begin{aligned}
 t_c &= \text{wear and wastage allowance determined from [Table 9.3.2: Wear and wastage allowance](#)} \\
 &= \\
 t_1 &= \frac{\alpha S}{1000\sqrt{k}} \text{ mm} \\
 P_1 &= \text{corrected patch load obtained from [Table 9.3.1: Deck plate thickness calculation](#)}
 \end{aligned}$$

$$\alpha = \text{thickness coefficient obtained from Figure 9. 3. 1: Tyre print chart}$$

$$\beta = \text{tyre print coefficient used in Figure 9. 3. 1: Tyre print chart}$$

$$= \log_{10} \left( \frac{P_1 k^2}{s^2} \times 10^7 \right)$$

**Table 9. 3. 1: Deck plate thickness calculation**

| Symbols   | Expression  |   |
|---|---|---|
| $a, s, u,$ and $v$ as defined in <a href="#">Figure 9. 3. 1: Tyre print chart</a>   | $P_1 = \varphi_1 \varphi_2 \varphi_3 \lambda P W$                                     |   |
| $n$ =tyre connection factor, See <a href="#">Table 9. 3. 3: Tyre correction factor, n</a>   | $\varphi_1 = \frac{2v_1 + 1.1s}{u_1 + 1.1s}$  | $v_1 = v, \text{ but } \leq s \quad u_1 = u, \text{ but } \leq a$             |
| $P_w$ =load, in tonnes, on the tyre print. For closely spaced wheels the shaded area shown in <a href="#">Figure 9. 3. 1: Tyre print chart</a> may be taken as the combined print<br>$P_1$ =corrected patch load, in tonnes | $\varphi_2 = 1.0$<br>$= \frac{1}{1.3 - \frac{0.3}{s}(a - u)}$<br>$= 0.77 \frac{a}{u}$ | for $u \leq (a - s)$<br>for $a > u > (a - s)$<br>for $u > a$                  |

Figure 9. 3. 1: Tyre print chart

3. 4. 2 Where transversely framed decks contribute to the hull girder strength, or where secondary stiffening is fitted perpendicular to the direction of vehicle lanes, the thickness,  $t$ , derived from [Pt 3, Ch 9, 3.4 Deck plating 3.4.1](#) is to be increased by 1.0 mm.
3. 4. 3 Where decks are designed for the exclusive carriage of unladen wheeled vehicles, the deck plate thickness,  $t$ , may be reduced as follows:
- $$t = (t_1 - 0.75) + t_c \text{ mm}$$
3. 4. 4 Where it is proposed to carry tracked vehicles, the patch dimensions may be taken as the track print dimensions and  $P_w$  is to be taken as half the total weight of the vehicle. The wear and wastage allowance from [Table 9. 3. 2: Wear and wastage allowance](#) is to be increased by 0.5 mm. Deck fittings in way of vehicle lanes are to be recessed.

Table 9. 3. 2: Wear and wastage allowance

| Location  | $t_c$ , in mm |
|---|---------------|
| Strength deck, weather decks, decks forming crown of tank, inner bottom | 1.5           |
| Internal decks elsewhere  | 0.75          |

3. 4. 5 If wheeled vehicles are to be used on insulated decks or tank tops, consideration will be given to the permissible loading in association with the insulation arrangements and the plating thickness.

**Table 9. 3. 3: Tyre correction factor, n**

| Number of wheels in idealised patch | Pneumatic tyres | Solid rubber tyres | Steel or solid tyres |
|-------------------------------------|-----------------|--------------------|----------------------|
| 1                                   | 0.6             | 0.8                | 1.0                  |
| 2 or more                           | 0.75            | 0.9                | 1.0                  |

### 3. 5 Deck longitudinals and beams

3. 5. 1 The section modulus,  $Z$ , of deck beams or longitudinals is to be not less than that required for a weather or cargo deck as appropriate, nor less than the following:
- For general purpose cargo decks where fork lift trucks are to be used:  

$$Z = (0.375K_1Pl_e + 0.00125 K_2hsl_e^2)k^k \text{ cm}^3$$
  - For permanent vehicle decks in association with a value of  $h$  which need not exceed 2.5 m:  
 $h$  =normal load height on the deck, in metres  
 $P$  =total weight , in tonnes, of the vehicle divided by the number of axles. Where distribution of weight is not uniform,  $P$  is to be taken as the maximum axle load. For fork lift trucks the total weight is to be applied to one axle  

$$Z = (0.536K_1Pl_e + 0.00125 K_2hsl_e^2)k^k \text{ cm}^3$$
=where the values of  $K_1$  and  $K_2$  are given in [Table 9. 3. 4: Values of K<sub>1</sub> and K<sub>2</sub>](#).
  - For decks designed for the carriage of wheeled vehicles only that required to satisfy the most severe arrangement of print wheel loads on the stiffener in association with a bending stress of  $\frac{100}{k} \text{ N/mm}^2$  assuming 100 per cent end fixity.

**Table 9. 3. 4: Values of K<sub>1</sub> and K<sub>2</sub>**

| Wheel spacing*<br>Beam span | $K_1$ | $K_2$ |
|-----------------------------|-------|-------|
| 0.1                         | 15.4  | 1.89  |
| 0.2                         | 14.6  | 1.84  |
| 0.3                         | 13.35 | 1.730 |
| 0.4                         |       | 1.55  |
|                             | 11.8  |       |
| 0.5 and greater             | 10.1  | 1.30  |

\* Outer wheel to outer wheel on axles with multiple wheel arrangements

### 3. 6 Deck girders and transverses

3. 6. 1 Where the load on deck girders and transverses is uniformly distributed, the section modulus is to be not less than:

$$Z = 4.75bhl_e^2k \text{ cm}^3$$

Where

$h$  = is defined in [Pt 3, Ch 9, 3.5 Deck longitudinals and beams 3.5.1](#)

$b$  mean width of plating supported by a deck girder or transverse, in metres

3. 6. 2 Where the member supports point loads, with or without the addition of uniformly distributed load, the section modulus is to be based on a stress of  $\frac{123.6}{k} N/mm^2$ , assuming 100 per cent end fixity.
3. 6. 3 Where it is proposed to carry tracked vehicles, the total weight of the vehicle is to be taken when determining the section modulus of the transverse at the top of a ramp or at other changes of gradient.

### 3. 7 Direct calculations

3. 7. 1 As an alternative to the above, permissible deck loads may be determined by direct calculation. The assumed loadings in these calculations are to include suitable allowance for weather, generally  $2.16 \text{ kN/m}^2$  (0.22 tonne-f/m<sup>2</sup>), where applicable.

### 3. 8 Hatch covers

3. 8. 1 Where wheeled vehicles are to be used, the hatch cover plating is to be not less in thickness than that required by [Pt 3, Ch 9, 3.4, Deck plating](#), and the modulus of the stiffeners is to be not less than:

$$Z = (K_3 P l_e + 0.00167 K_4 h s l_e^2)^k$$

Where

= where the values of  $K_3$  and  $K_4$  are given in [Table 9. 3. 5: Values of  \$K\_3\$  and  \$K\_4\$](#)  and  $P$  and  $h$  are defined in [Pt 3, Ch 9, 3.5 Deck longitudinals and beams 3.5.1](#).

In no case, however, are the scantlings of plating and stiffeners to be less than would be required as a weather or cargo deck hatch cover, as applicable.

**Table 9. 3. 5: Values of  $K_3$  and  $K_4$**

| Wheel spacing*<br>Stiffener span                                       | $K_3$ | $K_4$ |
|--|-------|-------|
| 0.1  | 11.96 | 2.32  |
| 0.2  | 10.69 | 1.89  |
| 0.3  | 9.58  | 1.55  |
| 0.4  | 8.46  | 1.28  |
| 0.5  | 7.46  | 1.07  |
| 0.6  | 6.51  | 0.91  |
| 0.7  | 5.55  | 0.73  |
| 0.8  | 4.23  | 0.36  |
| 0.9  | 2.38  | 0.11  |
| * Outer wheel to outer wheel on axles with multiple wheel arrangements |       |       |

3. 8. 2 Where unusual arrangements of hatch cover stiffening are proposed, the scantlings may be determined by direct calculations using a two-dimensional grillage idealisation, and the parameters given in [Table 11. 2. 3: Effective breadth em of plating of primary supporting members](#) in [Pt 3, Ch 11 Closing Arrangements for Shell, Deck and Bulkheads](#).

### **3. 9 Train decks**

3. 9. 1 Decks for the transport of railway rolling stock on fixed rails will be specially considered.

### **3. 10 Heavy and special loads**

3. 10. 1 Where heavy or special loads, such as machinery transporters, are proposed to be carried, the scantlings and arrangements of the deck structure will be individually considered.

### **3. 11 Securing arrangements**

3. 11. 1 Details of the connections to the hull of vehicle securing arrangements are to be submitted for approval.

## PART

# 3

## CHAPTER 9 Special Features

### SECTION 4 Movable decks

#### 4. 1 Classification

- 4. 1. 1 Movable vehicle decks hoisted by means of a hydraulic or electrical winch, or lifted by a mechanical lift on board the ship, are to comply with [Ch 6 Ro-Ro Access Equipment](#) of *ACS Guideline for Lifting Appliances in a Marine Environment*.
- 4. 1. 2 Movable decks other than described in [Pt 3, Ch 9, 4.1 Classification 4.1.1](#), and which are subjected to general cargo loading, are to comply with the requirements of this Section.

#### 4. 2 Symbols

- 4. 2. 1 The symbols used in this Section are defined in [Pt 3, Ch 9, 1.2 Symbols](#) and in the appropriate sub-Section.

#### 4. 3 Arrangements and design

- 4. 3. 1 Movable decks are generally to be constructed as pontoons comprising a web structure with top decking. Other forms of construction will be individually considered.
- 4. 3. 2 These requirements assume that the pontoons are to be constructed of steel. Other materials will be considered on the basis of equivalent strength.
- 4. 3. 3 Positive means of control are to be provided to secure decks in the lowered position.
- 4. 3. 4 The decks are to be efficiently supported, and hinges, pillars, chains or other means (or a combination of these) are to be designed on the basis of the imposed loads. Where supporting chains and fittings are required, they are to have a factor of safety of at least two on the proof load.
- 4. 3. 5 Plans showing the proposed scantlings and arrangements of the system are to be submitted.
- 4. 3. 6 Where it is proposed to stow the pontoons on deck, when not in use, details of the proposals for racks, fittings, etc. are to be submitted for consideration.

#### 4. 4 Loading

- 4. 4. 1 Design loading for general cargo is to be specified on the plans, together with details of fork lift trucks where appropriate, and submitted for consideration.

#### 4. 5 Pontoon deck plating

- 4. 5. 1 Where the pontoon is constructed of steel decking with stiffening webs, the deck plate thickness,  $t$ , is to be not less than that required by [Pt 3, Ch 9, 3.4, Deck plating](#).

4. 5. 2 The plate thickness,  $t$ , for aluminium pontoons is to be not less than:

$$t = (1.4t_1 + 0.75)\text{mm}$$

where  $t_1$  is the mild steel thickness as determined from [Pt 3, Ch 9, 3.4, Deck plating](#).

For aluminium pontoons designed for the exclusive carriage of unladen wheeled vehicles:

$$t = 1.4t_1 \text{ mm}$$

4. 5. 3 Where it is proposed to use plywood decking, the arrangement and thickness will be considered. Plywood alone, is not, generally, to be used for axle loads in excess of 7.8 kN.
4. 5. 4 Attention is drawn to National fire regulations which in certain cases may ban the use of plywood and certain other materials in 'special category spaces' on passenger ships.

## 4. 6 Pontoon webs and stiffeners

4. 6. 1 The section modulus of webs and stiffening of steel pontoons is to be not less than:

$$Z = (0.375K_1Pl_e + 0.00125K_2hsl_e^2)^k \text{ cm}^3$$

= for general-purpose cargo decks where fork lift trucks may be used where the values of  $K_1$  and  $K_2$  are given in [Table 9. 4. 1: Values of  \$K\_1\$  and  \$K\_2\$](#) , and

= for general-purpose cargo decks where fork lift trucks may be used where the values of  $K_1$  and  $K_2$  are given in [Table 9. 4. 1: Values of  \$K\_1\$  and  \$K\_2\$](#) , and

$h$  = load height of cargo on the deck, where this is proposed to be carried, in metres.

$p$  = the total fork lift truck load, in tonnes, is to be applied to one axle.

**Table 9. 4. 1: Values of  $K_1$  and  $K_2$**

| Wheel spacing*<br>Beam span  | $K_1$ | $K_2$ |
|--|-------|-------|
| 0.1  | 15.4  | 1.89  |
| 0.2  | 14.6  | 1.845 |
| 0.3  | 13.35 | 1.730 |
| 0.4  | 11.8  | 1.55  |
| 0.5 and greater  | 10.1  | 1.30  |
| * Outer wheel to outer wheel on axles with multiple wheel arrangements |       |       |

4. 6. 2 The section modulus of webs and stiffening of aluminium pontoons is to be not less than that defined in [Pt 3, Ch 9, 4.6 Pontoon webs and stiffeners 4.6.1](#) replacing  $k$  by  $k_a$  where  $k_a$  is defined in [Pt 3, Ch 2, 1 Materials of construction](#).
4. 6. 3 Where plywood decking is proposed, or in other arrangements where the decking is not integral with the stiffening webs, the arrangement of the grillage of webs is to be such as to provide the required strength.

## **4. 7 Deflection**

4. 7. 1 Where wheeled vehicles are to be used, the supporting arrangements are to be such that the movement at the edge of one pontoon relative to the next does not exceed 50 mm during loading or unloading operations.

## **4. 8 Direct calculations**

4. 8. 1 As an alternative to [Pt 3, Ch 9, 4.3 Arrangements and design](#) to [Pt 3, Ch 9, 4.7 Deflection](#), the structure may be designed on the basis of a direct calculation using a grillage idealisation. The method adopted and the stress levels proposed for the material of construction are to be submitted for consideration.

PART

**3**

CHAPTER **9 Special Features**

SECTION **5 Helicopter landing areas**

**5. 1 General**

- 5. 1. 1 Attention is drawn to the requirements and guidance of National and other Authorities concerning the construction of helicopter landing platforms and the operation of helicopters as they affect the ship. These include *SOLAS Regulation 18 - Helicopter facilities* and *Reg.III/28* as applicable. as well as the *International Chamber of Shipping (ICS) Guide to Helicopter/Ship Operations* and the *International Aeronautical Search and Rescue Manual (IAMSAR)* and *CAP437 Standards for Offshore Helicopter Landing Areas*.
- 5. 1. 2 Where the requirements of this Section have been adhered to for a designated helicopter landing platform or other deck area and fire-fighting appliances and other equipment necessary for the safe operation of helicopters are provided, the ship will be eligible for the special features notation **Helideck**. *See also SOLAS Regulation 18 - Helicopter facilities*.
- 5. 1. 3 Where the requirements of this Section have been complied with for an area on a ship designated for occasional or emergency landing of helicopters, the ship will be eligible for the special features notation **Occasional Helicopter Landing Area**, *See SOLAS Regulation 18 - Helicopter facilities*.
- 5. 1. 4 The structure is to be designed to accommodate the largest helicopter type which it is intended to use.
- 5. 1. 5 Plans are to be submitted showing the proposed scantlings and arrangements of the structure. The type, size, weight and footprint of helicopters to be used are also to be indicated. Details of the helicopter types to be used are to be included in the Loading Manual (*See [Pt 3, Ch 4, 8.2, Loading Manual](#)*)
- 5. 1. 6 Where the landing area forms part of a weather or erection deck, the scantlings are to be not less than those required for decks in the same position.

**5. 2 Symbols**

- 5. 2. 1 The symbols in this Section are defined in [Pt 3, Ch 9, 1.2 Symbols](#) and in the appropriate sub-Section.

**5. 3 Arrangements**

- 5. 3. 1 The landing area is to be sufficiently large to allow for the landing and manoeuvring of the helicopter, and is to be approached by a clear landing and take-off sector complying in extent with the applicable Regulations, International Standards, or to the satisfaction of the National Authority.

- 5.3.2 The landing area is to be free of any projections above the level of the deck. Projections in the zone surrounding the landing area are to be kept below the heights permitted by the Regulations, International Standards, or to the satisfaction of the National Authority.
- 5.3.3 Suitable arrangements are to be made to minimise the risk of personnel or machinery sliding off the landing area. A non-slip surface and anchoring devices are to be provided.
- 5.3.4 Engine uptake arrangements are to be sited such that exhaust gases cannot be drawn into helicopter engine intakes during helicopter take off or landing operations.

## 5.4 Landing area plating

- 5.4.1 The deck plate thickness,  $t$ , within the landing area is to be not less than:

$$t = t_1 + 1.5 \text{ mm}$$

Where

$$t_1 = \frac{\alpha s}{1000\sqrt{k}} \text{ mm}$$

$\alpha$  = thickness coefficient obtained from [Figure 9.3.1: Tyre print chart](#)

$\beta$  = tyre print coefficient used in [Figure 9.3.1: Tyre print chart](#)

$$= \log_{10} \left( \frac{P_1 k^2}{s^2} \times 10^7 \right)$$

The plating is to be designed for the emergency landing case taking:

$$P_1 = 2.5\varphi_1\varphi_2\varphi_3 f \gamma P_w \text{ tonnes}$$

in which  $\varphi_1, \varphi_2, \varphi_3$  are to be determined from [Table 9.3.1: Deck plate thickness calculation](#)

$f$  = 1.15 for landing decks over manned spaces, e.g. deckhouses, bridges, control rooms, etc.

= 1.0 elsewhere

$P_h$  = the maximum all-up weight of the helicopter, in tonnes

$P_w$  = landing load on the tyre print in tonnes; for helicopters with a single main rotor,  $P_w$  is to be taken as  $P_h$  divided equally between the two main undercarriage wheels for helicopters with tandem main rotors,  $P_w$  is to be taken as  $P_h$  distributed between all main undercarriage wheels in proportion to the static loads they carry For helicopters fitted with landing gear consisting of skids,  $P_w$  is to be taken as  $P_h$  distributed in accordance with the actual load distribution given by the airframe manufacturer. If this is unknown,  $P_w$  is to be taken as  $1/6P_h$  for each of the two forward contact points and  $1/3P_h$  for each of the two aft contact points. The load may be assumed to act as a 300 mm x 10 mm line load at each end of each skid when applying [Figure 9.3.1: Tyre print chart](#).

$\gamma$  = a location factor given in [Table 9.5.1: Location factor](#)

For wheeled undercarriages, the tyre print dimensions specified by the manufacturer are to be used for the calculation. Where these are unknown, it may be assumed that the print area is 300 x 300 mm and this assumption is to be indicated on the submitted plan.

For skids and tyres with an asymmetric print, the print is to be considered oriented both parallel and perpendicular to the longest edge of the plate panel and the greatest corresponding value of  $\alpha$ , taken from [Figure 9. 3. 1: Tyre print chart](#).

**Table 9. 5. 1: Location factor**

| Location                                 | $\gamma$   |
|--|--|
| On decks forming part of the hull girder |  |
| (a) within 0.4L amidships                | 0.71 Values for intermediate locations are to be determined by interpolation |
| (b) at the F.P. or A.P.                  | 0.6 Values for intermediate locations are to be determined by interpolation  |
| Elsewhere                                | 0.6  |

5. 4. 2 The plate thickness for aluminium decks is to be not less than:

$$t = 1.4t_1 + 1.5 \text{ mm}$$

where  $t_1$  is the mild steel thickness as determined from [Pt 3, Ch 9, 5.4 Landing area plating 5.4.1](#).

## 5. 5 Deck stiffening and supporting structure

5. 5. 1 The helicopter deck stiffening and the supporting structure for helicopter platforms are to be designed for the load cases given in [Table 9. 5. 2: Design load cases for deck stiffening and supporting structure](#) in association with the permissible stresses given in [Table 9. 5. 3: Permissible stresses for deck stiffening and supporting structure](#). The helicopter is to be positioned so as to produce the most severe loading condition for each structural member under consideration.

5. 5. 2 The minimum moment of inertia,  $I$ , of aluminium secondary structure stiffening is to be not less than:

$$I = \frac{5.25}{k_a} Z l_e \text{ cm}^4$$

where  $Z$  is the required section modulus of the aluminium stiffener and attached plating and  $k_a$  as defined in [Pt 3, Ch 9, 4.6 Pontoon webs and stiffeners 4.6.2](#).

5. 5. 3 Where a grillage arrangement is adopted for the platform stiffening, it is recommended that direct calculation procedures be used.

## 5. 6 Bimetallic connections

5. 6. 1 Where aluminium alloy platforms are connected to steel structures, details of the arrangements in way of the bimetallic connections are to be submitted.

**Table 9. 5. 2: Design load cases for deck stiffening and supporting structure**

|          | Loads        |                                      |
|----------|--------------|--------------------------------------|
| Loadcase | Landing area | Supporting structure<br>(See Note 1) |

|  | $UDL$ , in $\text{kN/m}^2$ | Helicopter patch load<br>(See Note 2) | Self weight | Horizontal load<br>(See Note 2) |
|--|----------------------------|---------------------------------------|-------------|---------------------------------|
| (1) Overall distributed loading  | 2                          | —                                     | —           | —                               |
| (2) Helicopter emergency landing   | 0.5                        | $2.5P_w f$                            | $W_h$       | $0.5P_h$                        |
| (3) Normal usage   | 0.5                        | $1.5P_w$                              | $W_h$       | $0.5P_h + 0.5W_h$               |
| Symbols  |                            |                                       |             |                                 |

| (2) Helicopter emergency landing   | $\frac{245}{k}$  | $\frac{220.5}{k}$  | $0.9\sigma_c$              | $\frac{\text{Bending}}{\sqrt{3}}$ |
| (3) Normal usage   | $\frac{176}{k}$  | $\frac{147}{k}$  | $0.6\sigma_c$              |                                   |
| Symbols  |  |  |                            |                                   |
| $k$ =a material factor:<br>=as defined in <a href="#">Pt 3, Ch 9, 1.2 Symbols</a> for steel members<br>= $k_a$ as defined in <a href="#">Pt 3, Ch 9, 4.6 Pontoon webs and stiffeners 4.6.2</a> for aluminium alloy members<br>$\sigma_c$ =yield stress, 0.2% proof stress or compressive buckling stress, in $\text{N/mm}^2$ , whichever is the lesser |  |  |                            |                                   |

**Note 1.** For strength deck longitudinals and girders, the permissible bending stresses are to be reduced as follows:

**Note (a)** within  $0.4L$  of amidships - by 30%

**Note (b)** at the F.P. or A.P. - by 0%

Values at intermediate locations are to be determined by interpolation between (a) and (b).

**Note 2.** When determining bending stresses in secondary structure, for compliance with the above permissible stresses, 100% end fixity may be assumed.

CHAPTER **9 Special Features**SECTION **6 Lifting appliances and support arrangements****6.1 General**

- 6.1.1 Masts, derrick posts, crane pedestals and similar supporting structures are classification items, and the scantlings and arrangements are to comply with ACS's requirements whether or not ACS is also requested to issue the Register of Ships' Cargo Gear and Lifting Appliances.
- 6.1.2 Where the lifting appliance is considered to be an essential feature of a classed vessel, the special feature class notation **LA** or **LA** will, in general, be mandatory.
- 6.1.3 Elsewhere, classification of lifting appliances is optional and may be assigned at the request of the Owner on compliance with the appropriate requirements.
- 6.1.4 Certain movable support structures and lifting appliances on special purpose vessels which are considered an essential feature of the vessel are to be included in the classification of the vessel.
- 6.1.5 Proposals to class lifting appliances on unclassified ships will be specially considered.

**6.2 Masts, derrick posts and crane pedestals**

- 6.2.1 The scantlings of masts and derrick posts, intended to support derrick booms, conveyor arms and similar loads, and of crane pedestals, are to comply with the requirements of ACS's *Code for Lifting Appliances in a Marine Environment*, (hereinafter referred to as LAME).
- 6.2.2 In addition to the information and plans requested in ACS's LAME the following details are to be submitted:
  - a. Details of masthouses or other supports for the masts, derrick posts or crane pedestals, together with details of the attachments to the hull structure.
  - b. Details of any reinforcement or additional supporting material fitted to the hull structure in way of the mast, derrick post or crane pedestal.

**6.3 Support Structure for masts, derrick posts and lifting appliance pedestals**

- 6.3.1 The requirements of [Pt 3, Ch 9, 6.3 Support Structure for masts, derrick posts and lifting appliance pedestals 6.3.2](#) and [Pt 3, Ch 9, 6.3 Support Structure for masts, derrick posts and lifting appliance pedestals 6.3.3](#) are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation, See [Pt 1, Ch 2, 2.3 Class notations \(hull\)](#).
- 6.3.2 Masts, derrick posts and crane pedestals are to be efficiently supported and, in general, are to be carried through the deck and satisfactorily scarfed into a transverse hold or 'tween deck bulkhead. Alternatively, the masts, derrick posts or crane pedestals may be carried into a mast house, in

which case the mast house is to be of substantial construction. Proposals for other support arrangements will be specially considered.

- 6.3.3 Deck plating and underdeck structure are to be reinforced under masts, derrick posts or crane pedestals and, where the deck is penetrated, the deck plating is to be suitably increased locally.
- 6.3.4 The deck plating and underdeck stiffening in way of a lifting appliance are to be assessed using the same criteria used to assess the lifting appliance pedestal with due consideration given to the material grade.
- 6.3.5 Insert plates are to be incorporated in the deck plating in way of lifting appliance foundations where considered necessary to limit deflection and reduce stress concentrations. The thickness of the insert plates is to be as required by the designer's calculations but in no case is to be taken as less than 1.5 times the thickness of the adjacent attached plating.
- 6.3.6 Where fitted, all inserts are to have well radiused corners and be suitably edge prepared prior to welding. The connection between the insert plate and the adjacent deck plating is to be full penetration. All other welding in way of the insert plate is generally to be double continuous and full penetration in way of critical locations. Tapers are to be not less than three to one.

## 6.4 Lifting appliances

- 6.4.1 Vessels or offshore units fitted with lifting appliances built in accordance with ACS's LAME in respect of structural and machinery requirements will be eligible to be assigned Special Features class notations as listed in [Table 9.6.1: Special features class notations associated with lifting appliances](#). This notation will be retained so long as the appliances are found upon examination at the prescribed surveys to be maintained in accordance with ACS's requirements.

**Table 9.6.1: Special features class notations associated with lifting appliances**

| Lifting appliance   | Special features class notation     | Remarks   |
|---|-------------------------------------|---|
| Cargo gear, Derricks, derrick cranes or cranes on ships                       | <b>CG</b>                           | <i>Optional notation.</i><br>Indicates that the vessel's cargo gear is included in class.   |
| Cranes on offshore units, offshore installations and offshore support vessels | <b>OC</b>                           | <i>Optional notation.</i><br>Indicates that the installation's, unit's or vessel's main deck cranes are included in class.  |
| Pipe laying system  | <b>PLS</b>                          | <i>Optional notation.</i><br>Indicates that the pipe laying system is included in class.  |
| Personnel transfer system (Walk-to-Work)                                      | <b>W2W</b>                          | <i>Optional notation.</i><br>Indicates that the personnel transfer system is included in class.   |
| Lifts and ramps on vessels  | <b>CL</b><br><b>PL</b><br><b>CR</b> | <i>Optional notations.</i><br>Indicate that the vessel's cargo lifts ( <b>CL</b> ), passenger lifts ( <b>PL</b> ) or cargo ramps ( <b>CR</b> ) are included in class. |

|  |    |  |
|--|----|--|
| Lifting appliances forming an essential feature of the vessel, e.g. cranes on crane barges or pontoons, lifting arrangements for diving on diving support vessels, etc.                                | LA | <i>Mandatory notation.</i><br>Indicates that the lifting appliance is included in class.   |
| Lifting appliances forming an essential feature of the vessel where the appliance(s) has been classed by a recognised classification society other than ACS and later transferred into class with ACS. | LA | <i>Mandatory notation.</i><br>Indicates that the lifting appliance is classed and that initial requirements for the appliance were that of another recognised classification society |

## 6. 5 Support structure for life-saving appliances

6. 5. 1 The support structure for life-saving appliance davits and cranes is to be assessed on the basis of the maximum safe working load assigned and the ultimate strength of the materials used for construction.
6. 5. 2 The following load cases are to be considered as appropriate:
- Vertical forces acting on deck;
  - Overturning moment;
  - Slewing moment.
6. 5. 3 The load cases given in [Pt 3, Ch 9, 6.5 Support structure for life-saving appliances 6.5.2](#) are to be calculated based on the maximum safe working load of the davit and the requirements of the *LSA Code - International Life-Saving Appliance Code – Resolution MSC.48(66)* , Chapter VI - *Launching and Embarkation Appliances*, 6.1.1 General requirements. Each load case is to also consider the self-weight of the davit.
6. 5. 4 Both outboard and inboard load cases are to be considered together with intermediate positions as appropriate.
6. 5. 5 Support structure for appliances used for both life-saving and general shipboard operations are to be considered for both of these aspects.
6. 5. 6 The maximum permissible bending stress is to be taken as the lesser of:

$$\text{a. } \sigma_a = \frac{\sigma_U}{4.5} N/mm^2$$

$$\text{b. } \sigma_a = \frac{\sigma_o}{2.2} N/mm^2$$

Where

$\sigma_U$  = Ultimate tensile strength of material, in  $N/mm^2$

$\sigma_o$  = specified minimum yield stress or 0.2 per cent proof stress, in  $N/mm^2$

6. 5. 7 The maximum permissible shear stress is to be taken as the lesser of:

$$\tau_a = \frac{\sigma_U}{7.8} N/mm^2$$

$$\tau_a = \frac{\sigma_o}{3.8} N/mm^2$$

$\sigma_U$  and  $\sigma_o$  are defined in [Pt 3, Ch 9, 6.5 Support structure for life-saving appliances 6.5.6](#).

## 6. 6 Walk-to-Work (W2W)

- 6. 6. 1 This notation applies to ships designed, constructed and equipped to include personal transfer, e.g. by a motion compensated gangway or similar feature.
- 6. 6. 2 The transfer equipment is to be certified by ACS against appropriate code relevant for the equipment, i.e. ACS's *Code for Lifting Appliances in a Marine Environment*, as applicable or an alternative code deemed applicable by ACS.
- 6. 6. 3 Attention is drawn to the requirements of the Flag Administration concerning the transfer system.
- 6. 6. 4 Information and details of the local strengthening in way of the transfer system are to be submitted to ACS for approval.
- 6. 6. 5 When considering loads, all expected directions of operation are to be taken into account. The foundation for the transfer system is to be designed in accordance with ACS's *Code for Lifting Appliances in a Marine Environment*, [Ch 4, 5.1 General 5.1.6](#).
- 6. 6. 6 Where required by primary or additional bridge functions associated with offshore support the primary conning position in the navigation bridge is to permit adequate monitoring of personal transfer from the aft deck of the ship. Means of ensuring this visibility are to be provided.
- 6. 6. 7 The fields of vision at the fore stations for ship handling and work on the aft deck are to be sufficient to enable operators to supervise personal transfer in all defined operational conditions, See ACS Ship Control Centre Guidance for further details.

## 6. 7 Ramp supporting structure

- 6. 7. 1 The support structure (including hinges) in way of the interface between a ramp and the ship is to be assessed in accordance with the appropriate criteria given in [Ch 6, 2 Loading and design criteria of the Code for Lifting Appliances in a Marine Environment](#).
- 6. 7. 2 The loads that the ramp supporting structure will be subjected to are to be submitted by the designer or Shipbuilder. These loads are to be calculated in accordance with [Ch 6, 2 Loading and design criteria](#) of the *Code for Lifting Appliances in a Marine Environment*. Load cases calculated in accordance with alternative standards can be accepted subject to agreement with ACS.
- 6. 7. 3 Loads already existing in the supporting structure (other than those from the ramp) are to be superimposed if applicable.
- 6. 7. 4 Ramps forming part of the watertight integrity of the hull are also to be assessed in accordance with the applicable scantling requirements.

## CHAPTER 9 Special Features

## SECTION 7 Bottom strengthening for loading and unloading aground

## 7.1 Application

- 7.1.1 Where a ship of length,  $L$ , less than 90 m has the bottom structure additionally strengthened for loading and unloading aground in accordance with [Table 9.7.1: Bottom strengthening for loading and unloading aground](#), it will be eligible for the special features notation 'bottom strengthened for loading and unloading aground'. Ships of length,  $L$ , 90 m or more intended for this service will receive individual consideration.
- 7.1.2 For dredgers intended to operate aground, the requirements of [Pt 4, Ch 12 Dredging and Reclamation Craft](#) are to be applied.

Table 9.7.1: Bottom strengthening for loading and unloading aground

| Item  | Requirement   |  |
|---|---|--|
| The following requirements are to be applied to the bottom structure upon which the ship is likely to be supported whilst aground |   |  |
| (1) Bottom shell and keel plating   | Thickness to be increased by 20% over the minimum requirements given in Part 4 for the particular type of ship with a minimum of 8 mm   |  |
|   | For dry cargo ships, as required in way of double bottoms, <i>See</i> item (3)  |  |
| (2) Bottom longitudinals in way of single bottoms   | For oil tankers, scantlings as required by <a href="#">Table 9. 5. 1: Values of F1</a> in Pt 4, Ch 9 in taking $c_1 = 1.0$  |  |
| (3) Bottom longitudinals in way of double bottoms, <i>See</i> Note 1  | For dry cargo ships, scantlings as required by <a href="#">Table 1. 6. 1: Shell framing (longitudinal)</a> in Pt 4, Ch 1 in taking $c_1 = 1.0$  |  |
| (4) Bilge longitudinals (where fitted)  | Scantlings to be the same as bottom longitudinals   |  |
|   | Transverse framing  | Longitudinal framing   |
| (5) Primary stiffening in way of single bottoms, <i>See</i> Notes 2 and 3   | (a) Floors to be fitted at every frame with vertical stiffeners spaced, in general, not more than 1.25 m apart<br>(b) One side girder is to be fitted on each side of the centreline in addition to the requirements of <a href="#">Pt 4, Ch 1, 7 Single bottom structure</a> and intermediate 150 x 10 bulb plate longitudinals or equivalent fitted | (a) The arrangements and scantlings will receive individual consideration depending on the structural arrangements of the particular ship type<br>(b) The spacing of transverse or floors is, in general, not to exceed 1.85 m |

|  |  |  |
|--|--|--|
| (6) Primary stiffening in way of double bottoms, <i>See</i> Notes 1, 2 and 3   | <p>(a) Plate floors are to be fitted at every frame and vertical stiffening arranged to give panel widths, in general, not exceeding 1.25 m</p> <p>One side girder is to be fitted on each side of the centreline in addition to the requirements of <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a> and intermediate 150 x 10 bulb plate longitudinals or equivalent fitted</p> | <p>(a) The spacing of floors is, in general, not to exceed 1.85 m</p> <p>(b) One side girder is to be fitted on each side of the centreline in addition to the requirements of <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a></p> |
| <p><b>Note 1.</b> For oil tankers, to be specially considered.</p> <p><b>Note 2.</b> The scantlings of floors, girders and transverses are to be determined from <a href="#">Pt 4 Ship Structures (Ship Types)</a>, for the particular ship type.</p> <p><b>Note 3.</b> The number and sizes of holes in floors, girders and transverses are to be kept to a minimum; <i>See</i> <a href="#">Pt 4, Ch 1, 8 Double bottom structure</a> and <a href="#">Pt 4, Ch 9, 6 Inner hull, inner bottom and longitudinal oiltight bulkheads</a>.</p> |  |  |

CHAPTER 9 **Special Features**SECTION 8 **Strengthening for regular discharge by heavy grabs****8.1 Application**

- 8.1.1 For bulk carriers where cargoes are regularly discharged by heavy grabs and the thickness of the plating of the hold inner bottom, hopper and transverse bulkhead bottom stool is increased in accordance with the requirements of this Section, the ship will, at the Owner's option, be assigned the notation 'strengthened for regular discharge by heavy grabs'.
- 8.1.2 It should be noted that damage to the plating cannot be excluded even when complying with these requirements and can result from the mishandling of the grabs during the discharge of cargo.
- 8.1.3 The grab weight given in [Pt 3, Ch 9, 8.2 Inner bottom plating 8.2.1](#) does not preclude the use of heavier grabs. It is intended as an indication to the Builders, Owners and operators of the increased risk of local damage and the possibility of accelerated diminution of the plating thickness if grabs heavier than this are used regularly to discharge cargo.
- 8.1.4 The maximum unladen weight of the grab is to be recorded in the Loading Manual, *See also* [Pt 3, Ch 4, 8.2 Loading Manual 8.2.4.e](#).
- 8.1.5 The requirements in this Section are not applicable to Double Hull Oil Tankers or Bulk Carriers with a CSR notation. *See* [Pt 1, Ch 2, 2.3 Class notations \(hull\)](#).

**8.2 Inner bottom plating**

- 8.2.1 The thickness of the inner bottom plating in the holds is to be not less than required by the greater of the following:

$$a. \quad t = \frac{\left(\log_{10} \left(1.775P \left(\frac{k}{s}\right)^2\right) + 5.7633\right)s - 344.5}{40.875\sqrt{k}} + 1.5\text{mm}$$

- b.  $t$  = the Rule required thickness, in mm in accordance with [Pt 4, Ch 7, 8 Double bottom structure](#) for the intended class notation.

Where

|     |   |  |
|-----|---|--|
| $P$ | = | specified unladen grab weight for the hold, in tonnes, and is not to be taken as less than 25 tonnes |
| $s$ | = | spacing of inner bottom longitudinals, in mm   |
| $k$ | = | higher tensile steel factor as defined in <a href="#">Pt 3, Ch 2, 1.2, Steel</a>                     |

### **8. 3 Hopper side tank sloped bulkhead plating**

8. 3. 1 The thickness of the sloped bulkhead plating adjacent to the inner bottom knuckle is to be as required by [Pt 3, Ch 9, 8.2 Inner bottom plating 8.2.1](#) but based on the actual spacing of stiffeners. The plating of increased thickness is to extend for a minimum distance corresponding to a vertical height of 1.5 m above the line of the inner bottom. Outboard of the plating of increased thickness, the thickness of the adjacent strakes is to be tapered to the Rule thickness for plating, as required by [Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening 8.4.1](#), at the top corner of the tank, *See also* [Pt 4, Ch 7, 9.2 Sloped bulkhead plating 9.2.3](#) where, in addition, the 'strengthened for heavy cargo notation' is desired.

### **8. 4 Transverse bulkhead plating**

8. 4. 1 The thickness of the bulkhead or stool plating adjacent to the inner bottom is to be as required by [Pt 3, Ch 9, 8.2 Inner bottom plating 8.2.1](#) but based on the actual spacing of the bulkhead or stool stiffeners. The plating of increased thickness is to extend for a minimum distance corresponding to a vertical height of 1.5 m above the line of the inner bottom.

## CHAPTER 9 Special Features

## SECTION 9 Strengthening for machinery on deck

## 9.1 Application

- 9.1.1 Where it is intended to install machinery on deck, the requirements of this Section are to be complied with and the notation 'Machinery on deck' will be assigned.
- 9.1.2 Where the concentrated loads calculated in accordance with [Pt 3, Ch 9, 9.2, Loading](#) are less than the specified deck design load required by [Table 3. 5. 1: Design heads and permissible cargo loadings](#) or where the ship has been assigned a 'Heavy deck loads' notation and the machinery loading is less than the assigned heavy deck cargo loading, then the requirements of this Section need not be applied and the notation will not be assigned.
- 9.1.3 The requirements of this Section do not apply to lifting appliances, anchoring and mooring equipment, or towing equipment.

## 9.2 Loading

- 9.2.1 The motions of the ship and the wind loading are to be considered in deriving the loads acting on the ship.
- 9.2.2 The design accelerations are to be calculated in accordance with [Pt 3, Ch 9, 9.2 Loading 9.2.3](#) and applied as considered necessary. Other means of deriving the design accelerations such as direct calculation or model testing will be specially considered.
- 9.2.3 The following formulae are given as guidance for the components of acceleration due to ship motions and apply to ships with a length exceeding 50 metres and where the speed is such that the ship is operating within the displacement mode based on normal ship service speed.

Vertical acceleration due to heave, pitch and roll motions:

$$a_z = \pm \sqrt{a_{\text{heave}}^2 + a_{\text{pitch}}^2 + a_{\text{rollz}}^2}$$

Transverse acceleration due to sway, yaw and roll motions:

$$a_y = \pm \sqrt{a_{\text{sway}}^2 + a_{\text{yaw}}^2 + a_{\text{rolly}}^2}$$

Longitudinal acceleration due to surge motions:

$$a_x = \pm a_0 \sqrt{0.06 + A^2 - 0.25A}$$

Where

$$A = f_{\text{HS}} f_{\text{st}} \left( 0.7 - \frac{L}{1200} + \frac{5(z - T)}{L} \right) \left( \frac{0.6}{C_b} \right)$$

$a_x$ ,  $a_y$  and  $a_z$  are the maximum dimensionless accelerations (i.e. relative to the acceleration of gravity) in their respective directions and are considered as acting separately for calculation purposes.

$a_x$  = is measured positive in the forward direction. Includes the component due to static weight in the longitudinal direction due to pitching.

$a_y$  = is measured positive in the transverse direction to port. Includes the component due to static weight in the transverse direction due to rolling.

$a_z$  = is measured positive in the downwards direction, i.e. adds to g. Does not include the component due to static weight.

$a_0$ ,  $a_{\text{heave}}$ ,  $a_{\text{pitch}}$ ,  $a_{\text{sway}}$ ,  $a_{\text{yaw}}$ ,  $a_{\text{roll}}$ ,  $a_{\text{rollz}}$ ,  $f_{\text{st}}$  and  $A$  are defined in [Table 9. 9. 1: Ship motions](#).

$f_{\text{HS}}$  = is taken as 1 for unrestricted sea going service.

$T$ ,  $L$  and  $C_b$  are defined in [Pt 3, Ch 1, 6.1, Principal particulars](#)

$z$  = is the vertical distance, in metres, from the keel line to the position or centre of gravity of the item being considered.

**Table 9. 9. 1: Ship motions**

| Motion  |   | Acceleration  |
|---|---|---|
| Heave   |   | $a_{\text{heave}} = a_0$  |
| Pitch   |   | $a_{\text{pitch}} = a_0 \left( 5.3 - \frac{45}{L} \right) \left( \frac{x - LCG}{L} \right) \left( \frac{0.6}{C_b} \right)^{0.75}$ |
| Sway  |   | $a_{\text{sway}} = 0.78 a_0$  |
| Yaw   |   | $a_{\text{yaw}} = a_0 1.6 \left( \frac{x - LCG}{L} \right)$   |
| Roll  | Acceleration due to Roll Vertical direction   | $a_{\text{rollz}} = a_0 \frac{0.6 y K^{1.5}}{B}$  |
| Roll  | Acceleration due to Roll Transverse direction | $a_{\text{roll}} = a_0 \sqrt{K} \left( 1 + 0.6 K \left( \frac{z - T}{B} \right) \right)$  |
|   |   | $a_0 = f_{\text{HS}} f_{\text{st}} \left( \frac{0.2 V_a}{\sqrt{L}} + \frac{34 - \left( \frac{600}{L} \right)}{L} \right)$         |
| Relative vertical motion  |   | $H_{\text{rm}} = C_{w.min} \left( 1 + \frac{k_r}{(C_b + 0.2)} \left( \frac{x}{L} - x_m \right)^2 \right)$                         |
| Symbols   |   |   |
| $f_{\text{st}}$ = correction factor for long term (10 <sup>-8</sup> ) acceleration value to average of the highest 1/100 acceleration values<br>= 0.8 |   | $F_n = \frac{0.515 V_a}{\sqrt{g L}}$  |

|   |   |
|---|---|
| $C_w = \text{a wave head, in metres}$<br>$= 7.71 \times 10^{-2} L e^{-0.0044L}$<br>but $L$ is not to be taken greater than 227  | $K = 13 \frac{GM}{B}$ but is not to be taken less than 1  |
| $C_{w.min} = \frac{C_w}{k_m} \sqrt{\frac{2.25}{k_r}}$<br>$k_m = 1 + \frac{k_r(0.5-x_m)^2}{(C_b+0.2)}$<br>$x_m = 0.45 - 0.6F_n$ but $x_m$ is not to be taken less than 0.2   | $GM$ is the metacentric height in metres<br>$f_{HS}$ is defined in <a href="#">Pt 3, Ch 9, 9.2 Loading 9.2.3</a><br>$L, T, B$ and $C_b$ are defined in <a href="#">Pt 3, Ch 1, 6.1, Principal particulars</a> |
| $k_r = 2.25$<br>$V_a = \frac{2}{3} V$<br>$V$ is maximum service speed in knots  | $x$ is the longitudinal position of the location under consideration measured from the aft end of $L$<br>$LCG$ is the longitudinal centre of gravity of the ship measured in metres from the aft end of $L$   |
| <p><b>Note 1</b> Heave motion is measured positive upwards.</p> <p><b>Note 2</b> Pitch motion is measured positive bow downwards.</p> <p><b>Note 3</b> Sway motion is measured positive to port.</p> <p><b>Note 4</b> Yaw motion is measured positive bow to port.</p> <p><b>Note 5</b> Roll motion is measured positive port side upwards.</p> |   |

9. 2. 4 The wind force is to be calculated in accordance with the requirements of [Pt 3, Ch 9, 9.2 Loading 9.2.4](#) and [Pt 3, Ch 9, 9.2 Loading 9.2.5](#). The wind force acting in the most onerous direction for the case being considered is to be applied.

9. 2. 5 The wind pressure,  $p$ , acting on the structure is given by:

$$p = \frac{V^2}{1630} \text{ kN/m}^2$$

Where

$V$  = wind speed, in m/s; to be taken as 63 m/s.

9. 2. 6 The wind force,  $F_w$ , acting on the structure is given by:

$$F_w = A p C_f \quad \text{kN}$$

Where

$A$  = the effective area of the structure concerned, i.e. the solid area projected on to a plane perpendicular to the wind direction, in m<sup>2</sup>

$p$  = the wind pressure as defined in [Pt 3, Ch 9, 9.2 Loading 9.2.5](#)

$C_f$  = the force coefficient in the direction of the wind, as defined in [Table 9.9.2: Force coefficient  \$C\_f\$](#)

**Table 9.9.2: Force coefficient  $C_f$**

| Type  | Description   |                                    | Aerodynamic slenderness $l/b$ or $l/D$ |      |      |      |      |      |
|---|---|------------------------------------|--|------|------|------|------|------|
|   |   |                                    | 5                                      | 10   | 20   | 30   | 40   | 50   |
| Individual members  | Rolled sections, rectangles, hollow sections, flat plates, box sections with $b$ or $d$ less than 0.5 m |                                    | 1.30                                   | 1.35 | 1.60 | 1.65 | 1.70 | 1.80 |

|   | Circular sections, where  | $DV_s < 6 \text{ m}^2/\text{s}$    | 0.75                                   | 0.80 | 0.90 | 0.95 | 1.00 | 1.10 |
|   |   | $DV_s \geq 6 \text{ m}^2/\text{s}$ | 0.60                                   | 0.65 | 0.70 | 0.70 | 0.75 | 0.80 |
|   | Box sections $b/d$ with $b$ or $d$ greater than 0.5 m   |                                    | $\geq 2.00$                            | 1.55 | 1.75 | 1.95 | 2.10 | 2.20 |
|   |   |                                    | 1.00                                   | 1.40 | 1.55 | 1.75 | 1.85 | 1.90 |
|   |   |                                    | 0.50                                   | 1.00 | 1.20 | 1.30 | 1.35 | 1.40 |
| 0.25  |   |                                    | 0.80                                   | 0.90 | 0.90 | 1.00 | 1.00 |      |
| Single lattice frames   | Flat sided sections   |                                    | 1.70                                   |      |      |      |      |      |
|   | Circular sections, where  | $DV_s < 6 \text{ m}^2/\text{s}$    | 1.20                                   |      |      |      |      |      |
|   |   | $DV_s \geq 6 \text{ m}^2/\text{s}$ | 0.80                                   |      |      |      |      |      |
| Plated structure  | Plated structures on solid base (air flow beneath structure prevented)                                  |                                    | 1.10                                   |      |      |      |      |      |
| Symbols   |   |                                    |  |      |      |      |      |      |
| $l$ =length of member<br>$D$ =diameter of circular section<br>$V_s$ =wind speed, in m/s<br>$b$ =breadth of box section, in metres<br>$d$ =depth of box section, in metres |   |                                    |  |      |      |      |      |      |

### 9.3 Support structure for machinery on deck

- 9.3.1 The deck plating and underdeck structure are to be reinforced under machinery. Acceptable stress levels are as follows:

$$\sigma \leq 0.75 \sigma_{\text{ref}}$$

$$\tau \leq 0.47 \sigma_{\text{ref}}$$

$$\sigma_e \leq 0.85 \sigma_{\text{ref}}$$

Where

$\sigma$  = normal stress, in  $\text{N/mm}^2$

$\tau$  = shear stress, in  $\text{N/mm}^2$

$\sigma_e$  = equivalent stress, in N/mm<sup>2</sup>

$\sigma_{ref}$  = reference stress of the material, in N/mm<sup>2</sup>

$$= \frac{235}{k_L}$$

$k_L$  = as defined in [Table 2. 1. 1: Values of kL](#)

9. 3. 2 Insert plates are to be incorporated in the deck plating in way of machinery foundations where considered necessary to limit deflection and reduce stress concentrations. The thickness of the insert plates is to be as required by the designer's calculations but in no case is to be taken as less than 1.5 times the thickness of the adjacent attached plating.
9. 3. 3 Where fitted, all inserts are to have well radiused corners and be suitably edge prepared prior to welding. The connection between the insert plate and the adjacent deck plating is to be full penetration. All other welding in way of the insert plate is generally to be double continuous and full penetration in way of critical locations. Tapers are to be not less than three to one.

CHAPTER **10 Welding and Structural Details**

SECTION **1 General**

**1. 1 Application**

- 1. 1. 1 This Chapter is applicable to all ship types and components.
- 1. 1. 2 Requirements are given in this Chapter for the following:
  - a. Welding-connection details, defined practices and sequence, consumables and equipment, procedures, workmanship and inspection.
  - b. End connection scantlings and constructional details for longitudinals, beams, frames and bulkhead stiffeners.
  - c. Primary member proportions, stiffening and construction details.Additional requirements for primary structure of tankers and similar ships are given in [Pt 4, Ch 9, 6 Inner hull, inner bottom and longitudinal oiltight bulkheads](#).
- 1. 1. 3 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a CSR notation (See [Pt 1, Ch 2, 2.3 Class notations \(hull\)](#)) with the exception of [Pt 3, Ch 10, 2.5 Welding equipment](#) which are to be complied with.

**1. 2 Symbols**

- 1. 2. 1 Symbols are defined as necessary in each Section.
- 1. 2. 2 The Notation **ESP** serves to identify the ships as being subject to an Enhanced Survey Programme as detailed in [Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements](#) and [Pt 1, Ch 3, 7 Special Survey - Oil tankers \(including ore/oil ships and ore/bulk/oil ships\) - Hull requirements](#), See also [Pt 1, Ch 2, 2 Character of classification and class notations](#).

CHAPTER **10 Welding and Structural Details**SECTION **2 Welding****2. 1 General**

2. 1. 1 The plans to be submitted for approval are to indicate clearly details of the welded connections of main structural members, including the type and size of welds. This requirement includes welded connections to steel castings.

The information to be submitted should include the following:

- a. Whether weld sizes given are throat thicknesses or leg lengths.
  - b. Grades and thicknesses of materials to be welded.
  - c. Location, types of joints and angles of abutting members.
  - d. Reference to welding procedures to be used.
  - e. Sequence of welding of assemblies and joining up of assemblies.
2. 1. 2 Unless otherwise indicated, all welding is to be in accordance with the requirements of [Ch 13 Requirements for Welded Construction](#) of the Rules for Materials.

**2. 2 Fillet welds**

2. 2. 1 The throat thickness of fillet welds is to be determined from:

$$\text{Throat thickness} = t_p \times \text{weld factor} \times \frac{d}{s}$$

Where

- $d$  = the distance between start positions of successive weld fillet, in mm
- $s$  = the length, in mm, of correctly proportioned weld fillet, clear of end craters, and is to be not less than 75 mm
- $t_p$  = plate thickness, on which weld fillet size is based, in mm

See also [Figure 10. 2. 1: Weld dimensions and types](#)

Weld factors are given in [Table 10. 2. 1: Weld factors](#), [Table 10. 2. 3: Connections of primary structure](#) and [Table 10. 2. 4: Secondary member end connection welds](#).

Figure 10. 2. 1: Weld dimensions and types

2. 2. 2 Where double continuous fillet welding is proposed, the throat thickness is to be determined taking  $\left(\frac{d}{s}\right)$  equal to 1.0.
2. 2. 3 The leg length of the weld is to be not less than  $\sqrt{2}$  times the specified throat thickness.

2. 2. 4 The plate thickness,  $t_p$ , to be used in the above calculation is generally to be that of the thinner of the two parts being joined. Where the difference in thickness is considerable, the size of fillet will be considered.
2. 2. 5 Where the thickness of the abutting member of the connection (e.g. the web of a stiffener) is greater than 15 mm and exceeds the thickness of the table member (e.g. plating), the welding is to be double continuous and the throat thickness of the weld is to be not less than the greatest of the following:
- 0.21 x thickness of the table member. The table member thickness used need not exceed 25mm.
  - 0.21 (0.27 in tanks) x half the thickness of the abutting member.
  - As required by [Table 10. 2. 2: Throat thickness limits](#).
2. 2. 6 Except as permitted by [Pt 3, Ch 10, 2.2 Fillet welds 2.2.5](#), the throat thickness of the weld is not to be outside the limits specified in [Table 10. 2. 2: Throat thickness limits](#).

**Table 10. 2. 1: Weld factors**

| Item  | Weld factor | Remarks                                       |
|---|-------------|---|
| (1) General application:  |             | except as required below                      |
| Watertight plate boundaries   | 0.34        |   |
| Non-tight plate boundaries  | 0.13        |   |
| Longitudinals, frames, beams, and other secondary members to shell, deck or bulkhead plating    | 0.10        |   |
|   | 0.13        | in tanks                                      |
|   | 0.21        | in way of end connections                     |
| Panel stiffeners, etc.  | 0.10        |   |
| Overlap welds generally   | 0.27        |   |
| Longitudinals of the flat-bar type to plating   |             | See Note 5                                    |
| (2) Bottom construction in way of holds or tanks:   |             |   |
| Non-tight centre girder: to keel  | 0.27        |   |
| to inner bottom   | 0.21        | no scallops                                   |
|   | 0.21        | in way of $0.2 \times$ span at ends           |
| Non-tight boundaries of floors, girders and brackets  | 0.27        | in way of brackets at lower end of main frame |
| Watertight bottom girders   | 0.34        |   |
| Connection of girder to inner bottom in way of longitudinal bulkheads supported on inner bottom | 0.44        |   |

|     |  |                  |   |
|-----|--|------------------|---|
|     | Inner bottom longitudinals or reverse frames   | 0.13             | under holds strengthened for heavy cargoes  |
|     | Connection of floors to inner bottom in way of plane bulkheads, bulkhead stools, or corrugated and double plate bulkheads supported on inner bottom. The supporting floors are to be continuously welded to the inner bottom | 0.44             | Weld size based on floor thickness<br>Weld material compatible with floor material <i>See Note 4</i>  |
| (3) | Hull framing;  |                  |   |
|     | Webs of web frames and stringers:  |                  |   |
|     | to shell   | 0.16             |   |
|     | to face plate  | 0.13             |   |
|     | Tank side brackets to shell and inner bottom   | 0.34             |   |
| (4) | Decks and supporting structure:  |                  |   |
|     | Strength deck plating to shell   |                  | as shown in <a href="#">Table 10.2. 5: Weld connection of strength deck plating to sheerstrake</a> but alternative proposals will be considered |
|     | Other decks to shell and bulkheads (except where forming tank boundaries)  | 0.21             | generally continuous  |
|     | Webs of cantilevers to deck and to shell in way of root bracket  | 0.44             |   |
|     | Webs of cantilevers to face plate  | 0.21             |   |
|     | Pillars: fabricated  | 0.10             |   |
|     | end connections  | 0.34             | <i>See Note 1</i>   |
|     | end connections (tubular)  | full penetration |   |
|     | Girder web connections and brackets in way of pillar heads and heels   | 0.21             | continuous  |
| (5) | Bulkheads and tank construction, <i>See also <a href="#">Pt 4, Ch 7, 10 Bulkheads</a>:</i>   |                  |   |
|     | Plane, double plate and corrugated watertight bulkhead boundary at bottom, bilge, inner bottom, deck and connection to shelf plate, where fitted   | 0.44             | weld size to be based on thickness of bulkhead plating<br><br>weld material to be compatible with bulkhead plating material                     |

|  |                  |  |
|--|------------------|--|
| Shelf plate connection to stool  | 0.44             | weld size to be based on thickness of stool at junction with shelf plate. Weld material to be compatible with stool material |
| Plane, double plate and corrugated bulkhead boundaries in way of deep tanks, holds in bulk carriers (See <a href="#">Pt 3, Ch 10, 1.1 Application 1.1.3</a> ) which are floodable for the sea-going ballast condition or for the carriage of oil cargoes (Holds in bulk carriers (See <a href="#">Pt 3, Ch 10, 1.1 Application 1.1.3</a> ) which are partially flooded for harbour conditions will be specially considered): |                  |  |
| - Boundary at bottom, bilge, inner bottom and deck   | 0.44             |  |
| - Connection of stool and bulkhead to lower stool shelf plating  | full penetration |  |
| - Connection of stool and bulkhead plating to upper stool shelf plate  | 0.44             |  |

| Fabricated housing and structure of thruster units, stabilisers, etc.: |      |   |
| Main structure   | 0.44 |   |
| Elsewhere  | 0.21 |   |
| (15) Miscellaneous fittings and equipment:                             |      |   |

|  |                  |  |
|--|------------------|--|
| Rings for manhole type covers, to deck or bulkhead   | 0.34             |  |
| Frames of shell and weathertight bulkhead doors  | 0.34             |  |
| Stiffening of doors  | 0.21             |  |
| Ventilator, air pipe, etc. coamings to deck  | 0.34             | Load Line Positions 1 and 2  |
|  | 0.21             | elsewhere  |
| Ventilator, etc. fittings  | 0.21             |  |
| Scuppers and discharges, to deck   | 0.44             |  |
| Masts, derrick posts, crane pedestals, etc. to deck  | 0.44             | full penetration welding may be required                             |
| Deck machinery seats to deck   | 0.21             | generally  |
| Mooring equipment seats  | 0.21             | generally, but increased or full penetration welding may be required |
| Bulwark stays to deck  | 0.21             |  |
| Bulwark attachment to deck   | 0.34             |  |
| Guard rails, stanchions, etc. to deck  | 0.34             |  |
| Bilge keel ground bars to shell  | 0.34             | Continuous fillet weld, minimum throat thickness 4 mm                |
| Bilge keels to ground bars   | 0.21             | Light continuous fillet weld, minimum throat thickness 3 mm          |
| Fabricated anchors   | full penetration |  |
| <p><b>Note 1.</b> Where pillars are fitted inside tanks or under watertight flats, the end connection is to be such that the tensile stress in the weld does not exceed 108 N/mm<sup>2</sup>.</p> <p><b>Note 2.</b> <math>t_p</math> need not be taken greater than the thickness determined from item 1(a) or 1(b) and Notes, as appropriate, of <a href="#">Table 9. 6. 1: Inner hull and longitudinal oiltight bulkhead scantlings</a> in <a href="#">Pt 4, Ch 9 Double Hull Oil Tankers</a>, but in no case is the weld throat thickness to be less than 0.34 x actual plate thickness.</p> <p><b>Note 3.</b> <math>t_p</math> need not be taken greater than the Rule thickness determined from <a href="#">Table 9. 7. 1: Transverse oiltight bulkhead scantlings</a> of <a href="#">Pt 4, Ch 9 Double Hull Oil Tankers</a> for stiffener spacing of 760 mm, but in no case is the weld throat thickness to be less than 0.34 × actual plate thickness.</p> <p><b>Note 4.</b> In way of bulkhead stools in ballast holds of bulk carriers or in tanks at longitudinal girder/transverse floor intersection, cut-outs are to be omitted and full penetration welding is to be applied to both floor and girder for a distance of 150 mm on either side of intersection.</p> <p><b>Note 5.</b> The throat thickness of the weld is to be determined by <a href="#">Pt 3, Ch 10, 2.2 Fillet welds 2.2.5</a>. For longitudinals within <math>D/4</math> of the strength deck and with a thickness less than 100 mm, the throat thickness need not exceed 5.5 mm.</p> |                  |  |

2. 2. 7 Double continuous fillet welding is to be adopted in the following locations, and may be used elsewhere if desired:
- Boundaries of weathertight decks and erections, including hatch coamings, companionways and other openings.
  - Boundaries of tanks and watertight compartments.
  - All structure in the after peak and the after peak bulkhead stiffeners.
  - All welding inside tanks intended for chemicals or edible liquid cargoes.
  - All lap welds in tanks.
  - Primary and secondary members to bottom shell in the 0.3L forward.
  - Primary and secondary members to plating in way of end connections, and end brackets to plating in the case of lap connections.
  - Where [Pt 3, Ch 10, 2.2 Fillet welds 2.2.5](#) applies.
  - All water ballast tanks.
  - Other connections or attachments, where considered necessary, and in particular the attachment of minor fittings to higher tensile steel plating.
2. 2. 8 Where intermittent welding is used, the welding is to be made double continuous in way of brackets, lugs and scallops and at the orthogonal connections with other members.
2. 2. 9 As an alternative to intermittent welding, single sided welding may be used. Only mechanised single sided welding is acceptable although manual single sided welding may be used at non-critical locations e.g. deck house stiffeners. Where single sided welding is used, the welding is to be made double continuous in way of brackets, lugs and scallops and at the orthogonal connections with other members.
2. 2. 10 Where structural members pass through the boundary of a tank, and leakage into the adjacent space could be hazardous or undesirable, full penetration welding is to be adopted for the members for at least 150 mm on each side of the boundary. Alternatively a small scallop of suitable shape may be cut in the member close to the boundary outside the compartment, and carefully welded all round.

## 2. 3 Welding of primary structure

2. 3. 1 Weld factors for the connections of primary structure are given in [Table 10. 2. 3: Connections of primary structure](#).

**Table 10. 2. 2: Throat thickness limits**

| Item                                  | Throat thickness, in mm |                     |
|---------------------------------------|-------------------------|---------------------|
|                                       | Minimum                 | Maximum             |
| (1) Double continuous welding         | $0.21t_p$               | $0.44t_p$           |
| (2) Intermittent welding              | $0.27t_p$               | $0.44t_p$<br>or 4.5 |
| (3) All welds, overriding minimum:    |                         |                     |
| (a) Plate thickness $t_p \leq 7.5$ mm |                         |                     |
| Hand or automatic welding             | 3.0                     | —                   |
| Automatic deep penetration welding    | 3.0                     | —                   |
| (b) Plate thickness $t_p > 7.5$ mm    |                         |                     |
| Hand or automatic welding             | 3.25                    | —                   |

|   |     |   |
|---|-----|---|
| Automatic deep penetration welding  | 3.0 | — |
| <p><b>Note 1.</b> In all cases, the limiting value is to be taken as the greatest of the applicable values given above.</p> <p><b>Note 2.</b> Where <math>t_p</math> exceeds 25 mm, the limiting values may be calculated using a notional thickness equal to <math>0.4 (t_p+25)</math> mm.</p> <p><b>Note 3.</b> The maximum throat thicknesses shown are intended only as a design limit for the approval of fillet welded joints. Any welding in excess of these limits is to be to the Surveyor's satisfaction.</p> |     |   |

2. 3. 2 The weld connection to shell, deck or bulkhead is to take account of the material lost in the notch where longitudinals or stiffeners pass through the member. Where the width of notch exceeds 15 per cent of the stiffener spacing, the weld factor is to be multiplied by:

$$\frac{0.85 \times \text{stiffener spacing}}{\text{length of web plating between notches}}$$

2. 3. 3 Where direct calculation procedures have been adopted, the weld factors for the 0.2 x overall length at the ends of the members will be considered in relation to the calculated loads.
2. 3. 4 The throat thickness limits given in [Table 10. 2. 2: Throat thickness limits](#) are to be complied with.

## 2. 4 Welding of primary and secondary member end connections

2. 4. 1 Welding of end connections of primary members is to be such that the area of welding is not less than the cross-sectional area of the member, and the weld factor is to be not less than 0.34 in tanks or 0.27 elsewhere.
2. 4. 2 The welding of secondary member end connections is to be not less than as required by [Table 10. 2. 4: Secondary member end connection welds](#). Where two requirements are given the greater is to be complied with.
2. 4. 3 The area of weld,  $A_w$ , is to be applied to each arm of the bracket or lapped connection.

**Table 10. 2. 3: Connections of primary structure**

| Primary member face area, in cm <sup>2</sup> |               | Position <sup>(1)</sup> | Weld factor         |                     |               |                     |
|--|---------------|-------------------------|---------------------|---------------------|---------------|---------------------|
| Exceeding                                    | Not exceeding |                         | In tanks            |                     | In dry spaces |                     |
|  |               |                         | To face plate       | To plating          | To face plate | To plating          |
|  | 30.0          | At ends                 | 0.21                | 0.27                | 0.21          | 0.21                |
|  |               | Remainder               | 0.10                | 0.16                | 0.10          | 0.13                |
| 30.0   | 65.0          | At ends                 | 0.21                | 0.34                | 0.21          | 0.21                |
|  |               | Remainder               | 0.13                | 0.27                | 0.13          | 0.16                |
| 65.0   | 95.0          | At ends                 | 0.34                | 0.44 <sup>(3)</sup> | 0.21          | 0.27                |
|  |               | Remainder               | 0.27 <sup>(2)</sup> | 0.34                | 0.16          | 0.21                |
| 95.0   | 130.0         | At ends                 | 0.34                | 0.44 <sup>(3)</sup> | 0.27          | 0.34                |
|  |               | Remainder               | 0.27 <sup>(2)</sup> | 0.34                | 0.21          | 0.27                |
| 130.0  |               | At ends                 | 0.44                | 0.44 <sup>(3)</sup> | 0.34          | 0.44 <sup>(3)</sup> |
|  |               | Remainder               | 0.34                | 0.34                | 0.27          | 0.34                |

- Note 1.** The weld factors 'at ends' are to be applied for 0.2 x the overall length of the member from each end, but at least beyond the toes of the member end brackets. On vertical webs the increased welding may be omitted at the top, but is to extend at least 0.3 x overall length from the bottom.
- Note 2.** Weld factor 0.34 in cargo oil tanks.
- Note 3.** Where the web plate thickness is increased locally, the weld size may be based on the thickness clear of the increase, but is to be not less than 0.34 x the increased thickness.
- Note 4.** In tankers over 122 m in length, the weld factor of the connection of bottom transverses to shell, and of side transverses to shell and vertical webs to longitudinal and transverse bulkheads all in the lower half depth, is to be not less than 0.34.
- Note 5.** The final throat thickness of the weld fillet to be not less than  $0.34t_p$  in cargo oil tanks.

**Table 10. 2. 4: Secondary member end connection welds**

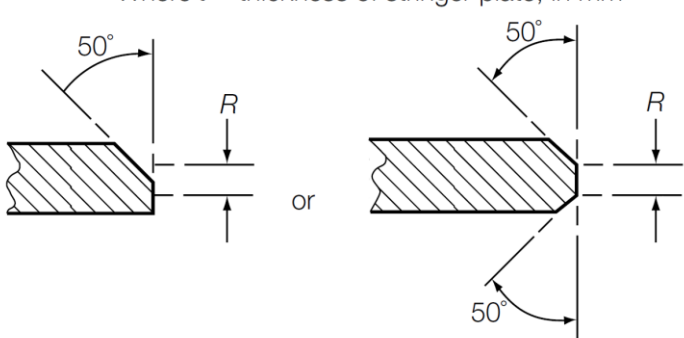

| Connection  | Weld area, $A_w$ , in $\text{cm}^2$                      | Weld factor |
|---|--|-------------|
| (1) Stiffener welded direct to plating  | $0.25A_s$ or $6.5 \text{ cm}^2$ whichever is the greater | 0.34        |
| (2) Bracketless connection of stiffeners or stiffener lapped to bracket or bracket lapped to stiffener:   |  |             |
| (a) in dry space  | $1.2\sqrt{Z}$  | 0.27        |
| (b) in tank   | $1.4\sqrt{Z}$  | 0.34        |
| (c) main frame to tank side bracket in $0.15L$ forward  | as (a) or (b)  | 0.34        |
| (3) Bracket welded to face of stiffener and bracket connection to plating   | —  | 0.34        |
| (4) Stiffener to plating for $0.1 \times$ span at ends, or in way of end bracket if that be greater   | —  | 0.34        |
| Symbols   |  |             |
| $A_s$ = cross sectional area of the stiffener, in $\text{cm}^2$<br>$A_w$ = the area of the weld, in $\text{cm}^2$ , and is calculated as total length of weld, in cm, x throat thickness, in cm<br>$Z$ = the section modulus, in $\text{cm}^3$ , of the stiffener on which the scantlings of the bracket are based, See <a href="#">Pt 3, Ch 10, 3 Secondary member end connections</a> |  |             |
| <b>Note</b> For maximum and minimum weld fillet sizes, See <a href="#">Table 10. 2. 2: Throat thickness limits</a>  |  |             |

**Table 10. 2. 5: Weld connection of strength deck plating to sheerstrake**

| Item | Stringer plate thickness, mm | Weld type |
|------|------------------------------|-----------|
|------|------------------------------|-----------|

|   |                  |   |
|---|------------------|---|
| 1 | $t \leq 15$      | Double continuous fillet weld with a weld factor of 0.44  |
| 2 | $15 < t \leq 20$ | Single vee preparation to provide included angle of $50^\circ$ with root $R \leq \frac{1}{3}t$ in conjunction with a continuous fillet weld having a weld factor of 0.39; or<br><br>Double vee preparation to provide included angles of $50^\circ$ with root $R \leq \frac{1}{3}t$ |
| 3 | $t > 20$         | Double vee preparation to provided included angles of $50^\circ$ with root $R \leq \frac{1}{3}t$ but not to exceed 10 mm  |

Where  $t$  = thickness of stringer plate, in mm

Single vee preparation
Double vee preparation

**Note 1.** Welding procedure, including joint preparation, is to be specified. Procedure is to be qualified and approved for individual Builders.

**Note 2.** See also [Pt 3, Ch 10, 2.2 Fillet welds 2.2.10](#):

**Note 3.** For thickness  $t$  in excess of 20 mm the stringer plate may be bevelled to achieve a reduced thickness at the weld connection. The length of the bevel is in general to be based on a taper not exceeding 1 in 3 and the reduced thickness is in general to be not less than 0.65 times the thickness of stringer plate or 20 mm, whichever is the greater.

**Note 4.** Alternative connections will be considered.

2. 4. 4 Where a longitudinal strength member is cut at a primary support and the continuity of strength is provided by brackets, the area of weld is to be not less than the cross-sectional area of the member.
2. 4. 5 Where the secondary member passes through, and is supported by, the web of a primary member, the weld connection is to be in accordance with the following:
- In strengthening of bottom forward region:  
Comply with the requirements of [Pt 3, Ch 5, 1.5 Strengthening of bottom forward](#).
  - Elsewhere:  
Comply with the requirements of [Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members](#).
2. 4. 6 The throat thickness limits given in [Table 10. 2. 2: Throat thickness limits](#) are to be complied with.

## 2. 5 Welding equipment

2. 5. 1 Welding plant and equipment are to be in accordance with the requirements specified in [Ch 13, 1.8 Welding equipment and welding consumables](#) of the Rules for Materials.

## 2. 6 Welding consumables and equipment

2. 6. 1 Welding consumables used and associated equipment is to be in accordance with the requirements specified in [Ch 13, 1.8 Welding equipment and welding consumables](#) of the Rules for Materials.

## 2. 7 Welding procedures and welder qualifications

2. 7. 1 Welding procedures are to be established for the welding of all joints in accordance with the requirements specified in [Ch 13, 1.9 Welding procedure and welder qualifications](#) of the Rules for Materials.
2. 7. 2 All welding procedures are to be tested and qualified in accordance with the requirements of [Ch 12 Welding Qualifications](#) of the Rules for Materials and are to be approved by the Surveyor prior to construction.
2. 7. 3 Welders and welding operators are to be proficient in the type of work to be undertaken and are to be qualified in accordance with the requirements specified in [Ch 12 Welding Qualifications](#) of the Rules for Materials.

## 2. 8 Workmanship and shipyard practice

2. 8. 1 A sufficient number of skilled supervisors is to be provided to ensure an effective and systematic control at all stages of welding operations.

## 2. 9 Inspection of welds

2. 9. 1 Effective arrangements are to be provided by the Shipbuilder for the inspection of finished welds to ensure that all welding has been satisfactorily completed.
2. 9. 2 All finished welds are to be subjected to non-destructive examination by personnel designated by the Builder in accordance with the requirements specified in [Ch 13, 2.12 Non-destructive examination of welds](#) of the Rules for Materials.
2. 9. 3 In addition to the requirements of [Pt 3, Ch 10, 2.9 Inspection of welds 2.9.2](#), a number of checkpoints are to be examined by volumetric examination as detailed in [Pt 3, Ch 10, 2.9 Inspection of welds 2.9.4](#) to [Pt 3, Ch 10, 2.9 Inspection of welds 2.9.9](#).
2. 9. 4 Typical locations and number of checkpoints to be taken are shown in [Table 10. 2. 6: Checkpoint locations](#). Critical locations as identified by *ACSPlus FDA Guidelines* (See [Pt 3, Ch 16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships](#)) are also to be considered. A plan of the proposed checkpoint locations is to be submitted for approval.

**Table 10. 2. 6: Checkpoint locations**

| Item  | Location  | Checkpoints                       |
|---|---|-----------------------------------|
| Intersections of butts and seams of fabrication and section welds | Throughout:<br><br>(a) hull envelope, shell envelope and deck structure plating:<br><br>at highly stressed areas,<br><i>See Note 1</i><br><br>remainder | all<br><br><br><br><br><br>1 in 2 |

|  | Remainder   | 1 in 40 m                             |
| <p><b>Note 1.</b> Typically those at sheerstrake, deck stringer, keel strake and turn of bilge.</p> <p><b>Note 2.</b> SDA signifies the <i>ACSPlus Structural Design Assessment Guidelines</i>, FDA signifies the <i>ACSPlus Fatigue Design Assessment Guidelines</i>.</p> <p><b>Note 3.</b> Checkpoints in butt welds and seam welds are in addition to those at intersections.</p> <p><b>Note 4.</b> Welds at inserts used to close openings in hull envelope plating are to be checked by non-destructive examination.</p> <p><b>Note 5.</b> Particular attention is to be given to repair rates in butt welds in longitudinals. Additional welds are to be tested if defects such as lack of fusion or incomplete penetration are observed in more than 10 per cent of the welds examined.</p> |   |                                       |

- 2. 9. 5 Checkpoints are not to be identified on the ship's structural components prior to the welding taking place. Special treatment is not to be given at these locations except critical locations as identified by *ACSPlus FDA Guidelines*.
- 2. 9. 6 For ultrasonic examination the length of each checkpoint is to be 0.5 m and for radiographic examination the length is to be a minimum of 0.3 m. At weld intersections, examination is to be in both weld directions.
- 2. 9. 7 The Builder is to provide the Surveyor with all the NDE reports of the checkpoints. These reports are to be available for the Surveyor to review within a short time after inspection, normally considered to be within 10 working days of the examination being carried out. Where welds are repaired the NDE report is to include details of examination of both the defective weld and of the re-weld.
- 2. 9. 8 Where the Surveyor notes that a checkpoint has been repaired without record of the original defect, the shipyard is to carry out additional examinations on additional lengths of weld. These lengths are to be adjacent to and on both sides of the defective checkpoint. These additional examinations are to be carried out in the presence of the Surveyor and reported in accordance with [Pt 3, Ch 10, 2.9 Inspection of welds 2.9.7](#).
- 2. 9. 9 Where checkpoints are found to contain continuous or semi-continuous defects, additional lengths of weld adjacent to and on both sides of the defective length are to be subject to further volumetric examination. The NDE reports are to be submitted in accordance with [Pt 3, Ch 10, 2.9 Inspection of welds 2.9.7](#).
- 2. 9. 10 The following non-destructive examination is to be carried out on ships to be assigned the class notation '**Chemical tanker**':
  - a. All crossings of butts and seams of cargo tank bulkhead plating which are welded in assembly areas or on the berth.
  - b. Where cargo tank boundary welding is completed in assembly areas or on the berth, a minimum of 10 per cent of the total weld length is to be crack detected.
  - c. Where side and bottom longitudinal framing and longitudinal stiffeners terminate at transverse bulkheads, a minimum of 10 per cent of the bulkhead boundary connections is to be crack detected in addition to the requirement given in [Pt 3, Ch 10, 2.9 Inspection of welds 2.9.10.b](#).
  - d. Where longitudinal framing and longitudinal bulkhead stiffeners are continuous through transverse bulkheads, 30 per cent each of the bottom and shipside boundaries and 20 per cent of the longitudinal bulkhead boundaries are to be crack detected in addition to the requirement given in [Pt 3, Ch 10, 2.9 Inspection of welds 2.9.10.b](#).
  - e. Where transverse framing members are continuous through the cargo tank boundary, a minimum of 10 per cent of boundary connections is to be crack detected.

CHAPTER **10 Welding and Structural Details**SECTION **3 Secondary member end connections****3. 1 General**

- 3. 1. 1 Secondary members, that is longitudinals, beams, frames and bulkhead stiffeners forming part of the hull structure, are generally to be connected at their ends in accordance with the requirements of this Section. Where it is desired to adopt bracketless connections, the proposed arrangements will be individually considered.
- 3. 1. 2 Where end connections are fitted in accordance with these requirements, they may be taken into account in determining the effective span of the member.
- 3. 1. 3 Where the section modulus of the secondary member on which the bracket is based (*See [Pt 3, Ch 10, 3.3 Basis for calculation 3.3.2](#)*) exceeds 2000 cm<sup>3</sup>, the scantlings of the connection will be considered.

**3. 2 Symbols**

- 3. 2. 1 The symbols used in this Section are defined as follows:
  - $a, b$  = the actual lengths of the two arms of the bracket, in mm, measured from the plating to the toe of the bracket
  - $b_f$  = the breadth of the flange, in mm
  - $t$  = the thickness of the bracket, in mm
  - $Z$  = the section modulus of the secondary member, in cm<sup>3</sup>.

**3. 3 Basis for calculation**

- 3. 3. 1 Where a longitudinal strength member is cut at a primary support and the continuity of strength is provided by brackets, the scantlings of the brackets are to be such that their section modulus and effective cross-sectional area are not less than those of the member. Care is to be taken to ensure correct alignment of the brackets on each side of the primary member.
- 3. 3. 2 In other cases the scantlings of the bracket are to be based on the modulus as follows:
  - a. Bracket connecting stiffener to primary member:  
modulus of the stiffener.
  - b. Bracket at the head of a main transverse frame where frame terminates:  
modulus of the frame.  
Brackets connecting lower deck beams or longitudinals to the main frame in the forward.15L:  
modulus of the frame.
  - c. Elsewhere: the lesser modulus of the members being connected by the bracket.

- 3.3.3 Typical arrangements of stiffener end brackets are shown diagrammatically in [Figure 10.3.1: Diagrammatic arrangements of stiffener end brackets.](#)

### 3.4 Scantlings of end brackets

- 3.4.1 The lengths,  $a$  and  $b$ , of the arms are to be measured from the plating to the toe of the bracket and are to be such that:
- $a + b \geq 2.0l$
  - $a \geq 0.8l$
  - $b \geq 0.8l$

Where

$$l = 90 \left( 2 \sqrt{\frac{Z}{14 + \sqrt{Z}}} - 1 \right) \text{ mm}$$

but in no case is  $l$  to be taken as less than twice the web depth of the stiffener on which the bracket scantlings are to be based.

The scantlings of main frames are normally to be based on these standard brackets at top and bottom, while the scantlings of 'tween deck frames are normally to be based on a standard bracket at the top only. Where the actual arm lengths fitted,  $a_1$  and  $b_1$  (in mm) are smaller than Rule size, or bracket is omitted, an equivalent arm length,  $l_a$ , for the calculation of end connection factor, See [Table 1.6.3: Shell framing \(transverse\)](#), is to be derived from:

- $l_a = \frac{(a_1 + b_1)}{2}$
  - $a_1 \geq 0.8l_a$
  - $b_1 \geq 0.8l_a$
  - $l_a = 0$ , where:
    - bracket is omitted from the upper or lower ends of the frame, or
    - lower frame bracket at bilge is at same level as the inner bottom, or
    - lower frame is welded directly to the inner bottom.
- 3.4.2 The length of arm of tank side and hopper side brackets is to be not less than 20 per cent greater than that required above.
- 3.4.3 The thickness of the bracket is to be not less than as required by [Table 10.3.1: Thickness of brackets.](#)
- 3.4.4 The free edge of the bracket is to be stiffened where any of the following apply:
- The section modulus,  $Z$ , exceeds  $2000 \text{ cm}^3$ .
  - The length of free edge exceeds  $50t$  mm.
  - The bracket is fitted at the lower end of main transverse side framing.
- 3.4.5 Where a flange is fitted, its breadth is to be not less than:

$$b_f = 40 \left( 1 + \frac{Z}{1000} \right) \text{ mm}$$

= but not less than 50 mm

- 3.4.6 Where the edge is stiffened by a welded face flat, the cross-sectional area of the face flat is to be not less than:
- $0.009b_ft \text{ cm}^2$  for offset edge stiffening.
  - $0.014b_ft \text{ cm}^2$  for symmetrically placed stiffening.

**Figure 10. 3. 1: Diagrammatic arrangements of stiffener end brackets**

**Table 10. 3. 1: Thickness of brackets**

| Bracket   | Thickness, in mm  | Limits                 |         |
|---|---|------------------------|---------|
|   |   | Minimum                | Maximum |
| With edge stiffened:  |   |                        |         |
| (a) in dry spaces   | $3.5 + 0.25\sqrt{Z}$                                    | 6.5                    | 12.5    |
| (b) in tanks  | $4.5 + 0.25\sqrt{Z}$                                    | 7.5<br><i>See Note</i> | 13.5    |
| Unstiffened brackets:   |   | 7.5                    | —       |
| (a) in dry spaces   | $5.5 + \frac{Z}{55} - \left(\frac{Z}{168}\right)^{1.3}$ |                        |         |
| (b) in tanks  | $6.5 + \frac{Z}{55} - \left(\frac{Z}{168}\right)^{1.3}$ | 8.5<br><i>See Note</i> | —       |
| <b>Note</b> In the cargo tank region of tankers, the minimum thickness is to be not less than the compartment minimum thickness, <i>See</i> <a href="#">Pt 4, Ch 9, 10 Construction details and minimum thickness</a> . |   |                        |         |

3. 4. 7 Where the stiffening member is lapped on to the bracket, the length of overlap is to be adequate to provide for the required area of welding. In general, the length of overlap should be not less than  $10\sqrt{Z}$  mm, or the depth of stiffener, whichever is the greater.
3. 4. 8 Where the free edge of the bracket is hollowed out, it is to be stiffened or increased in size to ensure that the modulus of the bracket through the throat is not less than that of the required straight edged bracket.

### **3. 5 Arrangements and details**

- 3. 5. 1 The arrangement of the connection between the stiffener and the bracket is to be such that at no point in the connection is the modulus reduced to less than that of the stiffener with associated plating.
- 3. 5. 2 The design of end connections and their supporting structure is to be such as to provide adequate resistance to rotation and displacement of the joint.
- 3. 5. 3 For arrangements where end brackets are not perpendicular to the adjacent plating the strength of the brackets, in terms of lateral stability, may need to be specially considered.

CHAPTER **10 Welding and Structural Details**SECTION **4 Construction details for primary members****4. 1 General**

- 4. 1. 1 The requirements for section modulus and inertia (if applicable) of primary members are given in the appropriate Chapter. This Section includes the requirements for proportions, stiffening and construction details for primary members in dry spaces and in tanks of all ship types other than tankers.
- 4. 1. 2 The requirements for construction details for the primary structure of tankers are given in [Pt 4, Ch 9, 10 Construction details and minimum thickness](#).
- 4. 1. 3 The requirements of this Section may be modified where direct calculation procedures are adopted to analyse the stress distribution in the primary structure.

**4. 2 Symbols**

- 4. 2. 1 The symbols used in this Section are defined as follows:

$d_w$  = depth of member web, in mm

$k_L, k$  = higher tensile steel factor, See [Pt 3, Ch 2, 1.2, Steel](#)

$t_w$  = thickness of member web, in mm

$A_f$  = area of member face plate or flange, in cm<sup>2</sup>

$F_D$  = local scantlings reduction factor as defined in [Pt 3, Ch 4, 5.6 Permissible hull vertical bending stresses](#)

$S_w$  = spacing of stiffeners on member web, or depth of unstiffened web, in mm.

**4. 3 Arrangements**

- 4. 3. 1 Primary members are to be so arranged as to ensure effective continuity of strength, and abrupt changes of depth or section are to be avoided. Where members abut on both sides of a bulkhead, or on other members, arrangements are to be made to ensure that they are in alignment. Primary members in tanks are to form a continuous line of support and wherever possible, a complete ring system.
- 4. 3. 2 The members are to have adequate lateral stability and web stiffening and the structure is to be arranged to minimise hard spots and other sources of stress concentration. Openings are to have well rounded corners and smooth edges and are to be located having regard to the stress distribution and buckling strength of the panel.

- 4. 3. 3 Primary members are to be provided with adequate end fixity by end brackets or equivalent structure. The design of end connections and their supporting structure is to be such as to provide adequate resistance to rotation and displacement of the joint and effective distribution of the load from the member.
- 4. 3. 4 Where the primary member is supported by structure which provides only a low degree of restraint against rotation, the member is generally to be extended for at least two frame spaces, or equivalent, beyond the point of support before being tapered.
- 4. 3. 5 Where primary members are subject to concentrated loads, particularly if these are out of line with the member web, additional strengthening may be required.

#### 4. 4 Geometric properties and proportions

- 4. 4. 1 The geometric properties of the members are to be calculated in association with an effective width of attached plating determined in accordance with [Pt 3, Ch 3, 3.2 Geometric properties of section](#).
- 4. 4. 2 The minimum thickness or area of material in each component part of the primary member is given in [Table 10. 4. 1: Minimum thickness of primary members](#).
- 4. 4. 3 Primary members constructed of higher tensile steel are to comply with [Table 10. 4. 1: Minimum thickness of primary members](#).

**Table 10. 4. 1: Minimum thickness of primary members**

| Item   | Requirement   |
|--|---|
| (1) Member web plate <i>See Note</i>   | $t_w = 0.01 S_w$ but not less than 7 mm in dry spaces and not less than 8 mm in tanks   |
| (2) Member face plate  | $A_f$ not to exceed $\frac{d_w t_w}{150} cm^2$  |
| (3) Deck plating forming the upper flange of underdeck girders   | Plate thickness not less than $\sqrt{\frac{A_f}{1.8k}}$ mm and 10 per cent greater for hatch side girders Width of plate not less than 700 mm |
| (4) Primary members in cargo oil tanks in tankers  | As required by <a href="#">Pt 4, Ch 9, 10 Construction details and minimum thickness</a>  |
| NOTE<br>For primary members having a web depth exceeding 1500 mm, the arrangement of stiffeners will be individually considered, and stiffening parallel to the member face plate may be required. |   |

#### 4. 5 Web stability

- 4. 5. 1 Primary members are to be supported by tripping brackets. The tripping brackets supporting asymmetrical sections are to be spaced no more than two secondary frames apart. The tripping brackets supporting symmetrical sections are to be spaced no more than four secondary frames apart.
- 4. 5. 2 Tripping brackets are also to be fitted at the toes of end brackets and in way of heavy or concentrated loads such as the heels of pillars.

- 4. 5. 3 Where the ratio of unsupported width of face plate (or flange) to its thickness exceeds 16:1, the tripping brackets are to be connected to the face plate and on members of symmetrical section, the brackets are to be fitted on both sides of the web.
- 4. 5. 4 Intermediate secondary members may be welded directly to the web or connected by lugs.
- 4. 5. 5 Where the depth of web of a longitudinal girder at the strength deck within  $0.4L$  amidships exceeds:
  - a.  $55t_w$  for mild steel members
  - b.  $55t_w\sqrt{\frac{k_L}{F_D}}$  for higher tensile steel members
 additional longitudinal web stiffeners are to be fitted at a spacing not exceeding the value given in (a) or (b) as appropriate, with a maximum of  $65t_w\sqrt{k_L}$  for higher tensile steel members. In cases where this spacing is exceeded, the web thickness is, in general, to be suitably increased.
- 4. 5. 6 The arm length of unstiffened end brackets is not to exceed  $100t_w$ . Stiffeners parallel to the bracket face plate are to be fitted where necessary to ensure that this limit is not exceeded.
- 4. 5. 7 Web stiffeners may be flat bars of thickness  $t_w$  and depth  $0.1d_w$ , or 50 mm, whichever is the greater. Alternative sections of equivalent moment of inertia may be adopted.

## 4. 6 Openings in the web

- 4. 6. 1 Where openings are cut in the web, the depth of opening is not to exceed 25 per cent of the web depth, and the opening is to be so located that the edges are not less than 40 per cent of the web depth from the face plate. The length of opening is not to exceed the web depth or 60 per cent of the secondary member spacing, whichever is the greater, and the ends of the openings are to be equidistant from the corners of cut-outs for secondary members. Where larger openings are proposed, the arrangements and compensation required will be considered.
- 4. 6. 2 Openings are to have smooth edges and well rounded corners.
- 4. 6. 3 Cut-outs for the passage of secondary members are to be designed to minimise the creation of stress concentrations. The breadth of cut-out is to be kept as small as practicable and the top edge is to be rounded, or the corner radii made as large as practicable. The extent of direct connection of the web plating, or the scantlings of lugs or collars, is to be sufficient for the load to be transmitted from the secondary member.

## 4. 7 End connections

- 4. 7. 1 End connections of primary members are generally to comply with the requirements of [Pt 3, Ch 10, 3 Secondary member end connections](#), taking  $Z$  as the section modulus of the primary member.
- 4. 7. 2 The thickness of the bracket is to be not less than that of the primary member web. The free edge of the bracket is to be stiffened.
- 4. 7. 3 Where a deck girder or transverse is connected to a vertical member on the shell or bulkhead, the scantlings of the latter may be required to be increased to provide adequate stiffness to resist rotation of the joint.
- 4. 7. 4 Where a member is continued over a point of support, such as a pillar or pillar bulkhead stiffener, the design of the end connection is to be such as to ensure the effective distribution of the load into the support. Proposals to fit brackets of reduced scantlings, or alternative arrangements, will be considered.
- 4. 7. 5 Connections between primary members forming a ring system are to minimise stress concentrations at the junctions. Integral brackets are generally to be radiused or well rounded at

their toes. The arm length of the bracket, measured from the face of the member, is to be not less than the depth of the smaller member forming the connection.

**5. 1 Continuity and alignment**

- 5. 1. 1 The arrangement of material is to be such as will ensure structural continuity. Abrupt changes of shape or section, sharp corners and points of stress concentration are to be avoided.
- 5. 1. 2 Where members abut on both sides of a bulkhead or similar structure, care is to be taken to ensure good alignment.
- 5. 1. 3 Pillars and pillar bulkheads are to be fitted in the same vertical line wherever possible, and elsewhere arrangements are to be made to transmit the out of line forces satisfactorily. The load at head and heel of pillars is to be effectively distributed and arrangements are to be made to ensure the adequacy and lateral stability of the supporting members.
- 5. 1. 4 Continuity is to be maintained where primary members intersect and where the members are of the same depth, a suitable gusset plate is to be fitted.
- 5. 1. 5 End connections of structural members are to provide adequate end fixity and effective distribution of the load into the supporting structure.
- 5. 1. 6 The toes of brackets, etc. should not land on unstiffened panels of plating. Special care should be taken to avoid notch effects at the toes of brackets, by making the toe concave or otherwise tapering it off.
- 5. 1. 7 Where primary and/or secondary members are constructed of higher tensile steel, particular attention is to be paid to the design of the end bracket toes in order to minimise stress concentrations. Sniped face plates which are welded onto the edge of primary member brackets are to be carried well around the radiused bracket toe and are to incorporate a taper not exceeding 1 in 3. Where sniped face plates are welded adjacent to the edge of primary member brackets, adequate cross sectional area is to be provided through the bracket toe at the end of the snipe. In general, this area measured perpendicular to the face plate, is to be not less than 60 per cent of the full cross-sectional area of the face plate, *See [Figure 10. 5. 1: Bracket toe construction](#). See also [Pt 4, Ch 1, 4.3 Deck stiffening](#), [Pt 4, Ch 1, 6.1, General](#), [Pt 4, Ch 9, 5.7 Connections of longitudinals](#) and [Pt 4, Ch 9, 10.13 Brackets connecting primary members](#).*

**Figure 10. 5. 1: Bracket toe construction**

## 5. 2 Arrangements at intersections of continuous secondary and primary members

5. 2. 1 Cut-outs for the passage of secondary members through the web of primary members, and the related collaring arrangements, are to be designed to minimise stress concentrations around the perimeter of the opening and in the attached hull envelope or bulkhead plating. The critical shear buckling stress of the panel in which the cut-out is made is to be investigated. Cut-outs for longitudinals will be required to have double lugs in areas of high stress, e.g. in way of cross tie ends and floors under bulkhead stools in ore and ballast holds.
5. 2. 2 Cut-outs are to have smooth edges, and the corner radii are to be as large as practicable, with a minimum of 20 per cent of the breadth of the cut-out or 25 mm, whichever is the greater. It is recommended that the web plate connection to the hull envelope or bulkhead should end in a smooth tapered 'soft toe'. Recommended shapes of cut-out are shown in [Figure 10. 5. 3: Cut-outs and connections](#), but consideration will be given to other shapes on the basis of maintaining equivalent strength and minimizing stress concentration. Consideration is to be given to the provision of adequate drainage and unimpeded flow of air and water when designing the cut-outs and connection details.
5. 2. 3 Asymmetrical secondary members are to be connected on the heel side to the primary member web plate. Additional connection by lugs on the opposite side may be required.
5. 2. 4 Symmetrical secondary members are to be connected by lugs on one or both sides, as necessary.
5. 2. 5 The cross-sectional areas of the connections are to be determined from the proportion of load transmitted through each component in association with its appropriate permissible stress.
5. 2. 6 The total load  $P$ , transmitted to the primary member is to be derived in accordance with [Table 10. 5. 1: Total load transmitted to connection of secondary members](#).
5. 2. 7 This load is to be apportioned between the connections as follows:
  - a. Transmitted through the collar arrangement:

$$P_1 = P \left( \frac{s_1}{S_w} + \frac{A_1}{4C_f A_f + A_1} \right)$$

where  $A_1$  is derived in accordance with [Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members 5.2.8](#) and  $\frac{s_1}{s_w}$  is not to be taken as greater than 0.25

The collar load factor,  $C_f$ , is to be derived as follows:

Symmetrical secondary members

$$C_f = 1.85 \quad \text{for } A_f \leq 18$$

$$C_f = 1.85 - 0.0341 (A_f - 18) \quad \text{for } 18 < A_f \leq 40$$

$$C_f = 1.1 - 0.01 (A_f - 40) \quad \text{for } A_f > 40$$

Asymmetrical secondary members

$$C_f = 0.68 + 0.0224 \frac{b_1}{A_f}$$

Where

$A_f$  = the area, in  $\text{cm}^2$ , of the primary member web stiffener in way of the connection including backing bracket, where fitted (See [Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members 5.2.10](#))

$b_1$  = the length of lug or direct connection, in mm, as shown in [Figure 10. 5. 3: Cut-outs and connections](#). Where the lug or direct connections differ in length a mean value of  $b_1$  is to be used.

b. Transmitted through the primary member web stiffener:

$$P_2 = P - P_1 \text{ kN}$$

c. Where the web stiffener is not connected to the secondary member,  $P_1$  is to be taken equal to  $P$ .

**Table 10. 5. 1: Total load transmitted to connection of secondary members**

| Ship type   | Head, $h_1$ , in metres  | Total load, $P$ , transmitted to connection                    |
|---|--|--|
| (1) Oil tankers, bulk chemical tankers and combination carriers, See <a href="#">Pt 3, Ch 10, 1.1 Application 1.1.3</a> | $h_1$ = load height, in metres, derived in accordance with the following provisions, but to be taken as not less than $\frac{L_1}{56}$ or $(0.01L_1 + 0.7)$ m whichever is the greater |  |
|   | For shell framing members:   |  |
|   | (a) With mid-point of span at base line, $h_1 = 0.8D_2$  |  |
|   |  |  |
|   | (b) With mid-point of span at a distance $0.6D_2$ above base line, $h_1 = fD_2B_f$   |  |
|   | (c) With mid-point of span intermediate between (a) and (b). The value of $h_1$ is to be obtained by linear interpolation between values from (a) and (b).                             | (a) In general<br>$P = 11.77(S_{yx} - s_1/2)s_1h_1 \text{ kN}$ |
|   | (d) With mid-point of span higher than $0.6D_2$ above base line.   | (b) For wash bulkheads   |
|   | The value of $h_1$ is to be obtained by linear interpolation between the values from (b) and the values at the following points:   | $P = 10.06(S_w - s_1/2)s_1h_1 \text{ kN}$                      |

|   |   |   |  |
|---|---|---|--|
|   | (i) For framing members located at and abaft $0.2L$ from the forward perpendicular ( <i>See</i> )   | Zero value at the level of the deck edge amidships  |  |
|   | (ii) For framing members forward of cargo tank region ( <i>See</i> Fig. 10.5.2(b))  | Value of $f D_2(B_T-1)$ at the level 3 m above the minimum bow height determined from the Load Lines Convention |  |
|   | (iii) Intermediate values between locations (i) and (ii) are to be determined by linear interpolation   |   |  |
|   | For secondary stiffening members of transverse and longitudinal bulkheads, and inner hull an inner bottom of double hull tankers, <i>See</i> <a href="#">Pt 3, Ch 10, 1.1 Application 1.1.3</a> :   |   |  |
|   | $h_1$ = distance from the mid-point of span to top of tank but need not exceed $0.8D_2$   |   |  |
|   | Side and bottom shell longitudinals   |   |  |
| (2) Other ship types for which oil tanker ( <i>See</i> <a href="#">Pt 3, Ch 10, 1.1 Application 1.1.3</a> ) requirements are not applicable             | As for (1) except as follows:<br>(a) $h_1$ to be derived in accordance with (1) above but to be taken as not less than $\frac{L_1}{56}$ m for type 'B-60' and the greater of $\frac{L_1}{70}$ , or 1.20 m for Type 'B' ships  |   | $P = 10.06(S_w - s_1/2)s_1h_1 \text{ kN}$  |
|   | (b) $h_1$ for item (1)(d)(ii) above to extend forward of $0.15L$ from the forward perpendicular   |   |  |
| (3) Other ship types for which oil tanker ( <i>See</i> <a href="#">Pt 3, Ch 10, 1.1 Application 1.1.3</a> ) requirements are not applicable (continued) | Internal tank boundaries<br>(a) Topside tank longitudinals<br>$h_1$ = distance from the longitudinal under consideration to the highest point of the tank with the ship inclined $30^\circ$ either way, or<br>= the greater of the distance from the longitudinal under consideration to the top of the tank, or half the distance to the top of the overflow, or<br>= 1.5 m<br>= whichever is the greatest |   | $P = 10.06(S_w - s_1/2)s_1h_1 \text{ kN}$  |
|   | (b) Inner bottom and hopper longitudinals   |   | $P = 9.81(S_{yx} - s_1/2)s_1h_1/C \text{ kN}$  |
|   |   |   | = but not to be taken less than the load derived from (b)(iv), (b)(v), (b)(vi) or (c) where applicable |
|   | (i) For cargo ships and bulk carriers ( <i>See</i> <a href="#">Pt 3, Ch 10, 1.1 Application 1.1.3</a> ) without the notation 'strengthened for heavy cargoes' $h_1=1.39T$   |   |  |
|   | (ii) For cargo ships and bulk carriers ( <i>See</i> <a href="#">Pt 3, Ch 10, 1.1 Application 1.1.3</a> ) with the notation 'strengthened for heavy cargoes' $h_1=H$   |   |  |
|   | (iii) For longitudinal bulkheads of ore carriers $h_1=HK_c$   |   |  |
|   | (iv) For bulk carriers ( <i>See</i> <a href="#">Pt 3, Ch 10, 1.1 Application 1.1.3</a> ) where the topside wing tank is interconnected with hopper side and double bottom tanks $h_1$ = the distance from the longitudinal under consideration to the top of the topside tank with the ship inclined $25^\circ$ either way  |   | $P = 10.06(S_w - s_1/2)s_1h_1 \text{ kN}$  |

|  |  |                                  |
|--|--|----------------------------------|
|  | (v) For bulk carriers (See <a href="#">Pt 3, Ch 10, 1.1 Application 1.1.3</a> ) in way of ballast hold $h_1$ = the distance from the longitudinal under consideration to the top of the hatchway coaming | $P = 10.06(S_w - s_1/2)s_1h_1kN$ |
|  | (vi) For cargo ships and bulk carriers (See <a href="#">Pt 3, Ch 10, 1.1 Application 1.1.3</a> ) with double hull where tank at side interconnected with double bottom $h_1=H$                           | $P = 10.06(S_w - s_1/2)s_1h_1kN$ |
|  |  |                                  |
|  | (c) Longitudinals of inner hull of double hull cargo ships and bulk carriers (See <a href="#">Pt 3, Ch 10, 1.1 Application 1.1.3</a> )   | $P = 10.06(S_w - s_1/2)s_1h_1kN$ |
|  | $h_1$ = the distance from the longitudinal under consideration to the top of the tank, or half the distance to the top of the overflow, whichever is the greater   |                                  |

$B_f$  = bow fullness factor determined from [Figure 10. 5. 4: Arrangement with offset stiffener](#) factor determination in Chapter 5 to be considered. To be taken as 1 for framing members located at and abaft 0.2L from the forward perpendicular  
 $f$  = load height factor at level 0.6D above base line, See [Table 10. 5. 2: Load height factor, f](#)  
 $h_1$  = load height, in metres, See also  
 $C$  = stowage rate, in m<sup>3</sup> /tonne, as defined in [Pt 3, Ch 3, 5.2, Symbols](#). For cargo ships without the notation 'strengthened for heavy cargoes', the value to be used is 1.39 m<sup>3</sup>/tonne. For cargo ships and bulk carriers (See [Pt 3, Ch 10, 1.1 Application 1.1.3](#)) with the notation 'strengthened for heavy cargoes', the actual stowage rate is to be used, but the value is not to be taken greater than 0.865 m<sup>3</sup>/tonne  
 $H$  = height from inner bottom at position under consideration, to deck at side amidships, in metres, for inner bottom longitudinals  
= height from the longitudinal under consideration to the underside of the topside tank sloped bulkhead, in metres, for hopper longitudinals  
 $S_w$  = spacing of primary members, in metres  
 $s_1$  = spacing of secondary members, in metres  
 $T$  = the summer draught, in metres, measured from top of keel  
 $D_2 = D$  in metres, but need not be taken greater than 1.6T  
 $L_1 = L$  but need not be taken as greater than 190 m  
 $K_c$  = as defined in [Table 11. 7. 1: Longitudinal and transverse bulkhead scantlings for ore loading](#) in [Pt 4, Ch 11 Ore Carriers](#)

**Table 10. 5. 2: Load height factor,  $f$**

|  | Ship depth, $D$ metres |       |       |       |       |       |
|--|------------------------|-------|-------|-------|-------|-------|
|  | $\leq 17.5$            | 20    | 22.5  | 25    | 27.5  | 30    |
| (1) (a) For oil tankers, bulk chemical tankers and combination carriers (See <a href="#">Pt 3, Ch 10, 1.1 Application 1.1.3</a> ), tank boundaries wholly within parallel mid-body               | 0.6                    | 0.6   | 0.582 | 0.556 | 0.535 | 0.517 |
| (b) For other ship types, at an abaft of $0.2L$ from the forward perpendicular   |                        |       |       |       |       |       |
| (2) (a) For oil tankers, bulk chemical tankers and combination carriers (See <a href="#">Pt 3, Ch 10, 1.1 Application 1.1.3</a> ), tank boundaries wholly or partially outside parallel mid-body | 0.7                    | 0.685 | 0.685 | 0.628 | 0.6   | 0.577 |
| (b) For other ship types, forward of $0.15L$ from the forward perpendicular  |                        |       |       |       |       |       |
| <b>Note</b> Intermediate values to be obtained by linear interpolation   |                        |       |       |       |       |       |

**Figure 10. 5. 2: Load height diagrams for framing members (a) at and abaft 0.2L from the forward perpendicular and (b) forward of cargo tank region for oil tankers, bulk chemical tankers and combination carriers (See [Pt 3, Ch 10, 1.1 Application 1.1.3](#)) and forward of 0.15L from the forward perpendicular for other ship types**

5. 2. 8 The effective cross-sectional area  $A_1$  of the collar arrangements is to be taken as the sum of cross-sectional areas of the components of the connection as follows:

- Direct connection:  
 $A_1 = 0.01 b_l t_w \text{ cm}^2$
- Lug connection:  
 $A_1 = 0.01 f_1 b_l t_l \text{ cm}^2$

Where

- $f_1$  = 1.0 for symmetrical secondary member connections  
=  $\frac{140}{w_l}$  but not greater than 1.0, for asymmetrical secondary member connections.
- $t_w$  = thickness of primary member web, in mm
- $t_2$  = thickness, in mm, of lug connection, and is to be taken not greater than the thickness of the adjacent primary member web plate
- $w$  = overall width of the cut-out, in mm
- $w_2$  = width for cut-out asymmetrical to secondary member web, in mm

See [Figure 10. 5. 3: Cut-outs and connections](#)

5. 2. 9 The values of  $A_f$  and  $A_1$  are to be such that the stresses given in [Table 10. 5. 3: Permissible stresses](#) are not exceeded.
5. 2. 10 Where a bracket is fitted to the primary member web plate in addition to a connected stiffener it is to be arranged on the opposite side to, and in alignment with the stiffener. The arm length of the bracket is to be not less than the depth of the stiffener, and its cross-sectional area through the throat of the bracket is to be included in the calculation of  $A_f$ .
5. 2. 11 In general where the primary member stiffener is connected to the secondary member it is to be aligned with the web of the secondary member, except where the face plate of the latter is offset and abutted to the web, in which case the stiffener connection is to be lapped. Lapped connections of primary member stiffeners to mild steel bulb plate or rolled angle secondary members may also be permitted. Where such lapped connections are fitted, particular care is to be taken to ensure

that the primary member stiffener wrap around weld connection is free from undercut and notches, See also [Pt 3, Ch 10, 2.9, Inspection of welds](#).

**Figure 10. 5. 3: Cut-outs and connections**

5. 2. 12 Fabricated longitudinals having the face plate welded to the underside of the web, leaving the edge of the web exposed, are not recommended for side shell and longitudinal bulkhead longitudinals. Where it is proposed to fit such sections, a symmetrical arrangement of connection to transverse members is to be incorporated. This can be achieved by fitting backing brackets on the opposite side of the transverse web or bulkhead. The primary member stiffener and backing brackets are to be lapped to the longitudinal web, See [Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members 5.2.11](#).
5. 2. 13 For ship types for which oil tanker (See [Pt 3, Ch 10, 1.1 Application 1.1.3](#)) requirements are not applicable, the collar arrangement is to satisfy the requirements of [Pt 3, Ch 10, 5.2., Arrangements at intersections of continuous secondary and primary members 5.2.1](#) to [Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members 5.2.12](#) inclusive. In addition the weld area of the connections is to be not less than the following:
  - a. Connection of primary member stiffener to the secondary member:
 
$$A_w = 0.25 A_f \text{ or } 6.5 \text{ cm}^2, \text{ whichever is the greater, corresponding to a weld factor of } 0.34 \text{ for the throat thickness}$$
  - b. Connection of secondary member to the web of the primary member:

Where

$A = 0.5\sqrt{Z}$  corresponding to a weld factor of 0.34 in tanks or 0.27 in dry spaces for the throat thickness

$A =$  weld area, in  $\text{cm}^2$ , and is calculated as total length of weld, in cm, multiplied by throat thickness, in cm

$A_f =$  cross-sectional area of the primary member web stiffener, in  $\text{cm}^2$ , in way of connection

$Z =$  the section modulus, in  $\text{cm}^3$ , of the secondary member.

**Table 10. 5. 3: Permissible stresses**

| Item   |        | Direct stress, in N/mm <sup>2</sup><br>(See Notes 1 and 2)                |  | Shear stress, in N/mm <sup>2</sup><br>(See Note 1)                    |   |
|--|--------|---|--|---|---|
|  |        | Oil tankers   | Other ship types for which oil tanker requirements are not applicable    | Oil tankers and ship types where primary member stiffener unconnected | Other ship types for which oil tanker requirements are not applicable |
| Primary member web plate stiffener within distance <i>a</i> of end See <a href="#">Figure 10. 5. 3: Cut-outs and connections</a> |        | 147.2   | 157  | —   | —   |
| Welding of primary member web plate stiffener to secondary member  | Butted | 98.1 (double continuous fillet)<br><br>147.2 (automatic deep penetration) | 117.7 (double continuous fillet)<br><br>157 (automatic deep penetration) | —<br><br>—  | —<br><br>—  |
|  | Lapped | —   | —  | 83.4 See Note 2   | 98.1 See Note 2   |
| Lug or collar plate and weld   | Single | —   | —  | 68.6  | 98.1  |
|  | Double | —   | —  | 83.4 See Note 3   |   |

**Note 1.** The welding requirements of [Pt 3, Ch 10, 2 Welding](#), and where applicable [Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members 5.2.13](#) are also to be complied with, See [Pt 3, Ch 10, 1.1 Application 1.1.3](#).

**Note 2.** Where longitudinals are of higher tensile steel having a yield stress of 315 kg/mm<sup>2</sup> or more, these stresses are to be divided by the factor 1.2 for application to side longitudinals above 0.3*D*<sub>2</sub> from the base-line. For definition of *D*<sub>2</sub> See [Table 10. 5. 1: Total load transmitted to connection of secondary members](#).

**Note 3.** When the permissible shear stress is applied in the assessment for the notation **Strengthened to carry cargoes which may liquefy (IMSBC Group A)**, the permissible shear stress shall be divided by *k*, See [Pt 3, Ch 2, 1.2 Steel 1.2.3](#), i.e. <sup>83.4</sup>/*k* N/mm<sup>2</sup>.

5. 2. 14 Where the stiffeners of the double bottom floors, and the hopper primary members are unconnected to the secondary members and offset from them (See [Figure 10. 5. 4: Arrangement with offset stiffener](#)) the collar arrangement is to satisfy the requirements of [Pt 3, Ch 10, 5.2., Arrangements at intersections of continuous secondary and primary members 5.2.1](#) to [Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members 5.2.13](#) inclusive.

In addition, the fillet welds attaching the lugs to the secondary members are to be based on a weld factor of 0.44 for the throat thickness. To facilitate access for welding the offset stiffeners are to be located 50 mm from the slot edge furthest from the web of the secondary member. The ends of the offset stiffeners are to be suitably tapered and softened.

**Figure 10. 5. 4: Arrangement with offset stiffener**

5. 2. 15 Alternative arrangements will be considered on the basis of their ability to transmit load with equivalent effectiveness. Details of the calculations made and testing procedures are to be submitted.

### 5. 3 Openings

5. 3. 1 Manholes, lightening holes and other cut-outs are to be avoided in way of concentrated loads and areas of high shear. In particular, manholes and similar openings are not to be cut in vertical or horizontal diaphragm plates in narrow cofferdams or double plate bulkheads within one-third of their length from either end, nor in floors or double bottom girders close to their span ends, or below the heels of pillars, unless the stresses in the plating and the panel buckling characteristics have been calculated and found satisfactory.
5. 3. 2 Manholes, lightening holes and other openings are to be suitably framed and stiffened where necessary.
5. 3. 3 Air and drain holes, notches and scallops are to be kept at least 200 mm clear of the toes of end brackets and other areas of high stress. Openings are to be well rounded with smooth edges. Details of scalloped construction are shown in [Figure 10. 2. 1: Weld dimensions and types](#). Closely spaced scallops are not permitted in higher tensile steel members. Widely spaced air or drain holes may be accepted, provided that they are of elliptical shape, or equivalent, to minimise stress concentration and are, in general, cut clear of the weld connection.

### 5. 4 Sheerstrake and bulwarks

5. 4. 1 Where an angled gunwale is fitted, the top edge of the sheerstrake is to be kept free of all notches and isolated welded fittings. Bulwarks are not to be welded to the top of the sheerstrake within the 0.5L amidships.
5. 4. 2 Where a rounded gunwale is adopted, the welding of fairlead stools and other fittings to this plate is to be kept to the minimum, and the design of the fittings is to be such as to minimise stress concentration.

- 5. 4. 3 Arrangements are to ensure a smooth transition from rounded gunwale to angled gunwale towards the ends of the ship.
- 5. 4. 4 At the ends of superstructures where the side plating is extended and tapered to align with the bulwark plating, the transition plating is to be suitably stiffened and supported. Where freeing ports or other openings are essential in this plate, they are to be suitably framed and kept well clear of the free edge.

## 5. 5 Fittings and attachments, general

- 5. 5. 1 The quality of welding and general workmanship of fittings and attachments as given in [Pt 3, Ch 10, 5.6, Bilge keels and ground bars](#) and [Pt 3, Ch 10, 5.7 Other fittings and attachments](#) are to be equivalent to that of the main hull structure. Visual examination of all welds is to be supplemented by non-destructive testing as considered necessary by the Surveyor.

## 5. 6 Bilge keels and ground bars

- 5. 6. 1 It is recommended that bilge keels should not be fitted in the forward  $0.3L$  region on ships intended to navigate in severe ice conditions.
- 5. 6. 2 Bilge keels are to be attached to a continuous ground bar as shown in [Figure 10. 5. 5: Bilge keel construction](#). Butt welds in shell plating, ground bar and bilge keels are to be staggered.
- 5. 6. 3 The minimum thickness of the ground bar is to be equal to the thickness of the bilge strake or 14 mm, whichever is the lesser.
- 5. 6. 4 The material class, grade and quality of the ground bar are to be in accordance with [Table 2. 2. 1: Material classes and grades](#).
- 5. 6. 5 The ground bar is to be connected to the shell with a continuous fillet weld and the bilge keel to the ground bar with a light continuous fillet weld.
- 5. 6. 6 Direct connection between ground bar butt welds and shell plating, and between bilge keel butt welds and ground bar is to be avoided.
- 5. 6. 7 The design of single web bilge keels is to ensure that failure to the web occurs before failure of the ground bar. In general, this may be achieved by ensuring the web thickness of bilge keels does not exceed that of the ground bar.

**Figure 10. 5. 5: Bilge keel construction**

- 5. 6. 8 The end details of bilge keels and intermittent bilge keels, where adopted, are to be as shown in [Figure 10. 5. 6: Bilge keel end design](#).
- 5. 6. 9 The ground bar and bilge keel ends are to be tapered or rounded. Where the ends are tapered, the tapers are to be gradual with ratios of at least 3:1, *See* [Figure 10. 5. 6: Bilge keel end design](#). Where the ends are rounded, details are to be as shown in [Figure 10. 5. 6: Bilge keel end design](#). Cut-outs on the bilge keel web within zone 'A' (*See* [Figure 10. 5. 6: Bilge keel end design](#)) are not permitted.
- 5. 6. 10 The end of the bilge keel web is to be between 50 mm and 100 mm from the end of the ground bar, *See* [Figure 10. 5. 6: Bilge keel end design](#).
- 5. 6. 11 An internal transverse support is to be positioned as close as possible to halfway between the end of the bilge keel web and the end of the ground bar, *See* [Figure 10. 5. 6: Bilge keel end design](#).
- 5. 6. 12 Where an internal longitudinal stiffener is fitted in line with the bilge keel web, the longitudinal stiffener is to extend to at least the nearest transverse member outside zone 'A', *See* [Figure 10. 5. 6: Bilge keel end design](#). In this case, the requirement of [Pt 3, Ch 10, 5.6 Bilge keels and ground bars 5.6.10](#) does not apply.
- 5. 6. 13 For ships over 65 m in length, holes are to be drilled in the bilge keel butt welds. The size and position of these holes are to be as illustrated in [Figure 10. 5. 5: Bilge keel construction](#). Where the butt weld has been subject to non-destructive examination the stop hole may be omitted.
- 5. 6. 14 Bilge keels of a different design from that shown in [Figure 10. 5. 5: Bilge keel construction](#) and [Figure 10. 5. 6: Bilge keel end design](#) will be specially considered.
- 5. 6. 15 Within zone 'B', (*See* [Figure 10. 5. 6: Bilge keel end design](#)), welds at the end of the ground bar and bilge plating, and at the end of the bilge keel web and ground bar, are to have weld factors of 0.44 and 0.34 respectively. These welds are to be ground and to blend smoothly with the base materials.

**Figure 10. 5. 6: Bilge keel end design**

5. 6. 16 A plan of the bilge keels is to be submitted for approval of material grades, welded connections and detail design.

## **5. 7 Other fittings and attachments**

5. 7. 1 Gutterway bars at the upper deck are to be so arranged that the effect of main hull stresses on them is minimised.
5. 7. 2 Minor attachments, such as pipe clips, staging lugs and supports, are generally to be kept clear of toes of end brackets, corners of openings and similar areas of high stress. Where connected to asymmetrical stiffeners, the attachments may be in line with the web providing the fillet weld leg length is clear of the offset face plate or flange edge. Where this cannot be achieved the attachments are to be connected to the web, and in the case of flanged stiffeners they are to be kept at least 25 mm clear of the flange edge. On symmetrical stiffeners, they may be connected to the web or to the centreline of the face plate in line with the web.
5. 7. 3 Where necessary in the construction of the ship, lifting lugs may be welded to the hull plating but they are not to be slotted through. Where they are subsequently removed, this is to be done by flame or mechanical cutting close to the plate surface, and the remaining material and welding ground off. After removal the area is to be carefully examined to ensure freedom from cracks or other defects in the plate surface.

PART

# 3

CHAPTER **10 Welding and Structural Details**

SECTION **6 Access arrangements for oil tankers and bulk carriers**

## **6. 1 Application**

6. 1. 1 Access arrangements are to be provided as required by SOLAS.

## **6. 2 Information for approval**

6. 2. 1 Details of the attachment of the access arrangements to the ship's structure are to be submitted for approval and suitable designs are to take into account proper location, strength, detail and reinforcement of all attachments to hull structural members.

## CHAPTER **11** **Closing Arrangements for Shell, Deck and Bulkheads**

## CHAPTER 11 Closing Arrangements for Shell, Deck and Bulkheads

### SECTION 1 General

#### 1. 1 Application

1. 1. 1 This Chapter applies to all ship types detailed in [Pt 4 Ship Structures \(Ship Types\)](#), unless otherwise stated, with the exception of Sections 1 to 5 which are not applicable to Bulk Carriers with a **CSR** notation and Section [Pt 3, Ch 11, 6.1, Small hatchways on exposed decks](#) which is not applicable to Bulk Carriers and Oil Tankers with a **CSR** notation, *See* [Pt 1, Ch 2, 2.3 Class notations \(hull\)](#). Additional provisions regarding access arrangements for oil tankers and chemical carriers are contained in [Pt 4, Ch 9 Double Hull Oil Tankers](#), [Pt 4, Ch 10 Single Hull Oil Tankers](#) and the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk*, (hereinafter referred to as the Rules for Ships for Liquid Chemicals), respectively.
1. 1. 2 Requirements are given for steel and wooden hatch covers, securing arrangements, tarpaulins, coamings and side shell doors for main openings, also closing arrangements for other miscellaneous openings.
1. 1. 3 Where relevant, the contents of this Chapter conform with the requirements of the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988*. Attention should, however, be given to any additional Statutory Requirements of the National Authority of the country in which the ship is to be registered and to the relevant regulations of the *SOLAS - International Convention for the Safety of Life at Sea* and applicable amendments.
1. 1. 4 For the purpose of this Chapter the basic types of ships are those defined in the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988* namely:
 

|              |   |
|--------------|---|
| Type 'A'     | Ships designed solely for the carriage of liquid cargoes.   |
| Type 'B'     | Cargo ships, other than Type 'A', with steel weathertight hatch covers.                                     |
| Type 'B-100' | Cargo ships of type 'B' with reduced freeboards on account of their ability to survive a stipulated damage. |
| Type 'B-60'  | Cargo ships of type 'B' with reduced freeboards on account of their ability to survive a stipulated damage. |
| Type 'B +'   | Cargo ships with increased freeboard on account of hatch cover arrangements.                                |
1. 1. 5 The type of hatch covers on the weather decks of the basic ship types defined in [Pt 3, Ch 11, 1.1 Application 1.1.4](#) are detailed below and may be used in the types of ships as indicated in [Table 11. 1. 1: Covers associated with ship types](#):

- a. Steel plated cargo hatch covers stiffened by webs or stiffeners and secured by clamping devices. Weathertightness to be achieved by means of gaskets. Hatch covers used for holds containing liquid cargoes are included in this category.
- b. Steel plated cargo hatch pontoon covers having interior webs and stiffeners extending for the full width of the hatchway. A pontoon cover is defined as a portable cover, secured weathertight by tarpaulins and battening devices.
- c. Hatch covers of wood or steel used in conjunction with portable beams. Weathertightness to be obtained by tarpaulins.
- d. Access hatch covers for cargo oil tanks and adjacent spaces. The hatch covers are to be of steel and gasketed.
- e. Access hatch covers other than (d). For Type 'A', Type 'B-100' and Type 'B-60' ships, the covers are to be of steel, and weathertightness is to be achieved by means of gaskets.

**Table 11. 1. 1: Covers associated with ship types**

| Type of cover | Type of ship |         |        |                |      |
|---------------|--------------|---------|--------|----------------|------|
|               | 'A'          | 'B-100' | 'B-60' | 'B'            | 'B+' |
| (a)           | –            | X       | X      | X              | X    |
| (b)           | –            | –       | –      | X              | X    |
| (c)           | –            | –       | –      | –              | X    |
| (d)           | X            | X       | X      | Not applicable |      |
| (e)           | X            | X       | X      | X              | X    |

1. 1. 6 The positions of hatches on weather decks are defined in [Pt 3, Ch 1, 6.6 Position 1 and Position 2](#).
1. 1. 7 'Tween deck hatch covers may be any of the types defined in [Pt 3, Ch 11, 1.1., Application 1.1.5](#), but need not be weathertight unless fitted to deep tanks or water ballast holds or compartments, in which case the covers are to be of type (a) and oiltight or watertight as appropriate.
1. 1. 8 The scantlings specified in the following Sections are applicable to covers of mild steel or higher tensile steel. Where other materials are used, equivalent scantlings are to be provided. The scantlings apply basically to rectangular covers, with the stiffening members arranged primarily in one direction and carrying a uniformly distributed load. The covers are assumed to be simply supported. Where covers are stiffened by a grillage formation, and also where point loads are applied to any type of cover, the scantlings are to be determined from direct calculations.
1. 1. 9 In the case of flush hatch covers or of covers on coamings of lesser height than required by [Pt 3, Ch 11, 5.1 General 5.1.1](#), their scantlings, the securing and sealing arrangements and the drainage of gutterways will be specially considered.
1. 1. 10 The scantlings of hatch covers need to be increased only if the loading exceeds that given in [Pt 3, Ch 11, 2.3, Load model](#). The scantlings of the surrounding deck structure are to be sufficient to support this loading. Heavier loading may be permitted only if the scantlings of the cover are capable of withstanding this increased loading, satisfying the stress and deflection criteria given in this Chapter. The deck structure is also to be capable of withstanding this increased loading.
1. 1. 11 Where timber cargo is to be carried on the hatch covers the requirements of [Pt 3, Ch 9, 2.11 Scantlings of hatch covers](#) are to be satisfied in addition to the requirements of this Chapter.
1. 1. 12 Where hatchways are trunked through one or more 'tween decks, and hatchway beams and covers are dispensed with at the intermediate decks, the hatchway beams, coamings and covers immediately below the trunk are to be adequately strengthened. Plans are to be submitted for approval.

1. 1. 13 The net plate thickness,  $t_{net}$ , is the calculated minimum thickness of the plating and stiffeners. The required thickness is the net thickness plus a corrosion addition,  $t_c$ , given in [Table 11. 1. 2: Corrosion addition  \$t\_c\$](#) .

**Table 11. 1. 2: Corrosion addition  $t_c$**

| Application   | Structure  | $t_c$ , in mm |
|---|--|---------------|
| Weather deck hatches of container ships, car carriers, paper carriers, passenger vessels  | Hatch covers   | 1.0           |
|   | Hatch coamings   | 1.0           |
| Weather deck hatches of all other ship types except bulk carriers, ore carriers and combination carriers, See <a href="#">Pt 4, Ch 7, 12.1 General 12.1.2</a> | Hatch covers in general  | 2.0           |
|   | Weather exposed plating and bottom plating of double skin hatch covers | 1.5           |
|   | Internal structure of double skin hatch covers and closed box girders  | 1.0           |
|   | Hatch coamings   | 1.5           |
| Weather deck hatches of all other ship types except bulk carriers, ore carriers and combination carriers, See <a href="#">Pt 4, Ch 7, 12.1 General 12.1.2</a> | Coaming stays and stiffeners   | 1.5           |
| 'Tween deck hatches   | Hatch covers in general  | 1.0           |

**CHAPTER 11 Closing Arrangements for Shell, Deck and Bulkheads****SECTION 2 Steel hatch covers****2.1 General**

- 2.1.1 The requirements of [Pt 3, Ch 11, 2 Steel hatch covers](#) are not applicable to hatch covers of bulk carriers, ore carriers and combination carriers.
- 2.1.2 The requirements of [Pt 3, Ch 11, 2 Steel hatch covers](#) are applicable to hatch covers and coamings made of steel. Hatch covers of alternative materials and innovative design will be specially considered.
- 2.1.3 The strength requirements in [Pt 3, Ch 11, 2.1 General](#) to [Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners](#) are applicable to hatch covers and closing arrangements of stiffened plate construction. The strength requirements are applicable to exposed weather deck hatch covers and 'tween deck hatch covers, unless otherwise stated.
- 2.1.4 Sub-Sections [Pt 3, Ch 11, 2.1 General](#) to [Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners](#) are not applicable to portable covers secured weathertight by tarpaulins and battening devices, or pontoon covers, See [Pt 3, Ch 11, 2.17, Pontoon covers](#).
- 2.1.5 Unless otherwise stated, the thicknesses referred to in the following Sections are net thicknesses. The net thicknesses are the member thicknesses necessary to obtain the minimum net scantlings required in this Section. The required gross thicknesses are obtained by adding corrosion additions,  $t_c$ , given in [Table 11. 1. 2: Corrosion addition  \$t\_c\$](#) . Strength calculations using grillage analysis or FEM are to be performed with net scantlings.
- 2.1.6 Material class I is to be applied for top plate, bottom plate and primary supporting members.
- 2.1.7 The strength and closing arrangements of hatch covers are to comply with [Pt 4, Ch 7, 12 Steel hatch covers](#) in addition to the requirements in this Chapter when hatch covers are subjected to internal ballast or oil cargo pressure.
- 2.1.8 Hatch covers are to comply with [Pt 4, Ch 8, 11 Hatch covers](#) in addition to the requirements in this Chapter when containers are carried on covers.

**2.2 Stiffener arrangement**

- 2.2.1 The primary supporting members and secondary stiffeners of hatch covers are to be continuous over the breadth and length of hatch covers, as far as practical. When this is impractical, sniped end connections are not to be used and appropriate arrangements are to be adopted to ensure sufficient load-carrying capacity.
- 2.2.2 The spacing of primary supporting members parallel to the direction of secondary stiffeners is not to exceed one third of the span of primary supporting members. When strength calculation is carried out by FE analysis using plane strain or shell elements, this requirement can be waived.

2. 2. 3 Secondary stiffeners of hatch coamings are to be continuous over the breadth and length of hatch coamings.
2. 2. 4 Supporting members in way of cut-outs are to have sufficient shear area.

## 2. 3 Load model

2. 3. 1 The structural assessment of hatch covers is to be carried out using the design loads defined in this Section. The following symbols and definitions are applicable to this Section:

$x$  = longitudinal co-ordinate measured from the AP to mid point of assessed structural member

$T_{fb}$  = draught, in metres, corresponding to the assigned summer load line

$h_N$  = standard superstructure height in metres

$$= 1.05 + 0.01L_L, 1.8 \leq h_N \leq 2.3$$

Where

$L_L$  = load line length, as defined in [Pt 3, Ch 1, 6.1 Principal particulars 6.1.8](#).

2. 3. 2 The vertical weather design pressure,  $p_H$ , in kN/m<sup>2</sup>, on the hatch cover panels is to be taken from [Table 11. 2. 1: Design pressure  \$p\_H\$  of weather deck hatches](#). When cargo is carried on the cover, cargo loads according to [Pt 3, Ch 11, 2.3 Load model 2.3.4](#), [Pt 3, Ch 11, 2.3 Load model 2.3.5](#) and [Pt 4, Ch 8, 11.2, Direct calculations](#) are to be considered. The vertical weather design load needs not to be combined with the cargo load. For 'tween deck hatch covers not exposed to weather load, the structural assessment is to be carried out using the cargo loads defined in [Pt 3, Ch 11, 2.3 Load model 2.3.4](#) and [Pt 3, Ch 11, 2.3 Load model 2.3.5](#). Covers carrying wheeled vehicles are also to comply with [Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles](#) and where it is proposed to provide a helicopter landing area, covers are also to comply with [Pt 3, Ch 9, 5 Helicopter landing areas](#). Where an increased freeboard is assigned, the design load for hatch covers according to [Table 11. 2. 1: Design pressure  \$p\_H\$  of weather deck hatches](#) on the actual freeboard deck may be as required for a superstructure deck, provided the summer freeboard is such that the resulting draught will not be greater than that corresponding to the minimum freeboard calculated from an assumed freeboard deck situated at a distance at least equal to the standard superstructure height,  $h_N$ , below the actual freeboard deck, See [Figure 11. 2. 2: Positions 1 and 2 for an increased freeboard](#).

**Table 11. 2. 1: Design pressure  $p_H$  of weather deck hatches**

| Position<br>(See Note) | $p_H$ , in kN/m <sup>2</sup>                   |   |
|------------------------|--|---|
| 1                      | $\frac{x}{L_L} \leq 0.75$                      | $0.75 < \frac{x}{L_L} \leq 1.0$   |
|                        | for $24 \text{ m} \leq L_L \leq 100 \text{ m}$ |   |
|                        | $\frac{g}{76}(1.5L_L + 116)$                   | on freeboard deck<br>$\frac{g}{76} \left[ (4.28L_L + 28) \frac{x}{L_L} - 1.71L_L + 95 \right]$  |
|                        |  | upon exposed superstructure decks located at least one superstructure standard height above the freeboard deck<br>$\frac{g}{76}(1.15L_L + 116)$ |
|                        | for $L_L > 100 \text{ m}$                      |   |

| $L_L$ = load line length, as defined in <a href="#">Pt 3, Ch 1, 6.1 Principal particulars 6.1.8</a>                         |  |   |
| $g$ = acceleration due to gravity, 9.81 m/s <sup>2</sup>  |  |   |
| <b>Note</b> The positions 1 and 2 are illustrated for example ships in <a href="#">Figure 11. 2. 1: Positions 1 and 2</a> . |  |   |

**Figure 11. 2. 1: Positions 1 and 2**

\* reduced load upon exposed superstructure decks located at least one standard height of superstructure above the freeboard deck

\*\* reduced load upon exposed superstructure decks of vessels with  $L_L > 100 \text{ m}$  located at least one superstructure standard height of superstructure above the lowest Position 2 deck

**Figure 11. 2. 2: Positions 1 and 2 for an increased freeboard**

\* reduced load upon exposed superstructure decks located at least one standard height of superstructure above the freeboard deck

\*\* reduced load upon exposed superstructure decks of vessels with  $L_L > 100$  m located at least one superstructure standard height of superstructure above the lowest Position 2 deck

2. 3. 3 The horizontal weather design pressure, in  $\text{kN/m}^2$ , for determining the scantlings of outer edge girders (skirt plates) of weather deck hatch covers and of hatch coamings is:

**Note** The horizontal weather design pressure need not be included in the direct strength calculation of the hatch cover, unless it is utilised for the design of substructures of horizontal support according to [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.10](#).

$$p_A = ac(bc_c, f - z) \text{ kN/m}^2$$

$$f = \frac{L}{25} + 4.1 \text{ for } L < 90 \text{ m}$$

$$= 10.75 - \left( \frac{300-L}{100} \right)^{1.5} \text{ for } 90 \text{ m} \leq L < 300 \text{ m}$$

$$= 10.75 \text{ for } 300 \text{ m} \leq L < 350 \text{ m}$$

$$= 10.75 - \left( \frac{L-350}{100} \right)^{1.5} \text{ for } 350 \text{ m} \leq L \leq 500 \text{ m}$$

$$c_L = \sqrt{\frac{L}{90}} \text{ for } L < 90 \text{ m}$$

$$= 1$$

$$a = 1 \text{ for unprotected front coamings and hatch cover skirt plates}$$

$$= 1$$

$$= 20 + \frac{L_1}{12} \text{ for unprotected front coamings and hatch cover skirt plates}$$

- $a$  =  $10 + \frac{L_1}{12}$  for unprotected front coamings and hatch cover skirt plates, where the distance from the actual freeboard deck to the summer load line exceeds the minimum non-corrected tabular freeboard according to ICLL by at least one standard superstructure height  $h_N$
- $a$  =  $5 + \frac{L_1}{15}$  for side and protected front coamings and hatch cover skirt plates
- $a$  =  $7 + \frac{L_1}{100} - 8 \frac{x'}{L}$  for aft ends of coamings and aft hatch cover skirt plates abaft amidships
- $a$  =  $5 + \frac{L_1}{100} - 4 \frac{x'}{L}$  for aft ends of coamings and aft hatch cover skirt plates forward of amidships
- $L_1$  =  $L$ , need not be taken greater than 300 m
- $b$  =  $1.0 + \left( \frac{\frac{x'}{L} - 0.45}{C_b + 0.2} \right)^2$  for  $\left( \frac{x'}{L} \right) < 0.45$
- $b$  =  $1.0 + 1.5 \left( \frac{\frac{x'}{L} - 0.45}{C_b + 0.2} \right)^2$  for  $\left( \frac{x'}{L} \right) < 0.45$
- =  $0.6 \leq C_b \leq 0.8$ , when determining scantlings of aft ends of coamings and aft hatch cover skirt plates forward of amidships,  $C_b$  need not be taken less than 0.8
- $C_b$  = block coefficient, as defined in [Pt 3, Ch 1, 6.1 Principal particulars 6.1.6](#)
- $x'$  = distance, in metres, between the transverse coaming or hatch cover skirt plate considered and aft end of the length  $L$ . When determining side coamings or side hatch cover skirt plates, the side is to be subdivided into parts of approximately equal length, not exceeding  $0.15L$  each, and  $x'$  is to be taken as the distance between aft end of the length  $L$  and the centre of each part considered
- $z$  = vertical distance in metres from the summer load line to the mid point of stiffener span, or to the middle of the plate field
- $c$  =  $0.3 + 0.7 \frac{b'}{B'}$
- $b'$  = breadth of coaming in metres at the position considered
- $B'$  = actual maximum breadth of ship in metres on the exposed weather deck at the position considered  $b'/B'$  is not to be taken less than 0.25

The design pressure  $p_A$  is not to be taken less than the minimum values given in [Table 11. 2. 2: Minimum design load,  \$p\_{Amin}\$](#) .

**Table 11. 2. 2: Minimum design load,  $p_{Amin}$**

| $L$       | $p_{Amin}$ , kN/m <sup>2</sup> |           |
|-----------|--------------------------------|-----------|
|           | For unprotected fronts         | Elsewhere |
| $\leq 50$ | 30                             | 15        |

|       |                     |                       |
|-------|---------------------|-----------------------|
| > 50  | $25 + \frac{L}{10}$ | $12.5 + \frac{L}{20}$ |
| < 250 |                     |                       |
| ≥ 250 | 50                  | 25                    |

2. 3. 4 The pressure on hatch covers due to distributed cargo loads  $p_L$ , in kN/m<sup>2</sup>, resulting from heave and pitch (i.e. ship in upright condition), is to be determined according to the following formula:

$$p_L = p_c(1 + a_v) \text{ kN/m}^2$$

Where

$$p_c = \text{uniform cargo load, in kN/m}^2$$

**Note** For 'tween deck hatch covers,  $p_c$  is not to be taken less than  $7.07 H_{td}$  kN/m<sup>2</sup>, See [Pt 3, Ch 3, 5.2 Symbols 5.2.1, Table 3. 5. 1: Design heads and permissible cargo loadings](#) and [Figure 3. 5. 1: Heads for 'tween decks](#) for 'tween decks. A design load less than this will be specially considered.

$a_v$  = vertical acceleration addition as follows:

$$a_v = Fm$$

$$F = 0.11 \frac{V_0}{\sqrt{L}}$$

$$m = m_0 - 5(m_0 - 1) \frac{x}{L} \text{ for } 0 \leq \frac{x}{L} \leq 0.2$$

$$= 1.0 \text{ for } 0.2 \leq \frac{x}{L} \leq 0.7$$

$$= 1 + \frac{m_0 + 1}{0.3} \left( \frac{x}{L} - 0.7 \right) \text{ for } 0.7 < \frac{x}{L} \leq 1.0$$

$$m_0 = 1.5 + F$$

$v_0$  = Maximum speed at summer load line draught,  $v_0$  is not to be taken less than  $\sqrt{L}$ , in knots.

2. 3. 5 The point load due to a concentrated force,  $P$ , in kN resulting from heave and pitch is to be determined as follows:

$$P = P_s(1 + a_v) \text{ kN}$$

$P_s$  = single force, in kN.

2. 3. 6 Container loads as defined in [Pt 4, Ch 8, 11.2 Direct calculations 11.2.4](#) are to be applied where containers are stowed on the hatch cover.

2. 3. 7 In addition to the loads defined in this Section, hatch covers are loaded in the ship's transverse direction by forces due to elastic deformations of the ship's hull. Hatch covers may be required to be designed such that the sum of stresses does not exceed the permissible values given in [Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1](#).

## 2. 4 Allowable stress and deflection

2. 4. 1 The equivalent stress,  $\sigma_v$ , in steel hatch cover structures related to the net thickness shall not exceed  $0.8\sigma_0$ , where  $\sigma_0$  is the minimum yield stress, in N/mm<sup>2</sup>, of the material. For design loads according to [Pt 3, Ch 11, 2.3 Load model 2.3.3](#) to [Pt 3, Ch 11, 2.3 Load model 2.3.7](#) and [Pt 4, Ch 8, 11.2,](#)

[Direct calculations](#), the equivalent stress,  $\sigma_v$ , related to the net thickness shall not exceed  $0.9\sigma_o$  when the stresses are assessed by means of FEM.

For grillage analysis, the equivalent stress may be taken as follows:

$$\sigma_v = \sqrt{\sigma^2 + 3\tau^2}, \text{ in N/mm}^2$$

$$\sigma = \text{normal stress in N/mm}^2$$

$$\tau = \text{shear stress in N/mm}^2$$

For FEM calculations, the equivalent stress may be taken as follows:

$$\sigma_v = \sqrt{\sigma_x^2 - \sigma_x\sigma_y + \sigma_y^2 + 3\tau^2}, \text{ N/mm}^2$$

$$\sigma_x = \text{normal stress, in N/mm}^2, \text{ in x-direction}$$

$$\sigma_y = \text{normal stress, in N/mm}^2, \text{ in y-direction}$$

$$\tau = \text{shear stress, in N/mm}^2, \text{ in the x-y plane}$$

Indices x and y are coordinates of a two-dimensional Cartesian system in the plane of the considered structural element.

In the case of FEM calculations using shell or plane strain elements, the stresses are to be read from the centre of the individual element. It is to be recognised that in particular at flanges of unsymmetrical girders, the evaluation of stress from the element centre may lead to non-conservative results. Thus, a sufficiently fine mesh is to be applied in these cases. Where shell elements are used, the stresses are to be evaluated at the mid plane of the element.

Stress concentrations are to be considered by examining design details or FE analysis. FEM calculations are to be carried out in accordance with the ACSPlus procedure *Assessment of Steel Hatch Covers using Finite Element Analysis*.

2. 4. 2 The vertical deflection of primary supporting members due to the vertical weather design load according to [Pt 3, Ch 11, 2.3 Load model 2.3.2](#), is to be not more than  $0.0056l_g$  where  $l_g$  is the greatest span of primary supporting members.

**Note** Where hatch covers are arranged for carrying containers and mixed stowage is allowed, i.e. a 40'-container stowed on top of two 20'-containers, particular attention should be paid to the deflections of hatch covers. Furthermore the possible contact of deflected hatch covers with in-hold cargo has to be avoided.

For 'tween deck hatch covers not exposed to the vertical weather design load according to [Pt 3, Ch 11, 2.3 Load model 2.3.2](#), the vertical deflection of primary supporting members due to the cargo loads according to [Pt 3, Ch 11, 2.3 Load model 2.3.4](#), [Pt 3, Ch 11, 2.3 Load model 2.3.5](#) and [Pt 4, Ch 8, 11.2, Direct calculations](#) is to be not more than  $0.007l_g$  where  $l_g$  is the greatest span of primary supporting members.

## 2. 5 Local net plate thickness

2. 5. 1 The local net plate thickness,  $t$ , in mm, of the hatch cover top plating is not to be less than:

$$t = F_p 0.0158s \sqrt{\frac{p}{0.95\sigma_o}}$$

and to be not less than 1 per cent of the spacing of the stiffener or 6 mm, whichever is greater

$$F_p = \text{factor for combined membrane and bending response}$$

$$= 1.5 \text{ in general}$$

$$= 1.9 \frac{\sigma}{\sigma_a}, \text{ for } \frac{\sigma}{\sigma_a} \geq 0.8$$

for the attached plate flange of primary supporting members

$s$  = stiffener spacing, in mm

$p$  = pressure  $p_H$  and  $p_L$ , in  $\text{kN/m}^2$ , as defined in [Pt 3, Ch 11, 2.3, Load model](#)

$\sigma$  = maximum normal stress, in  $\text{N/mm}^2$ , of hatch cover top plating, determined according to [Figure 11. 2. 3: Determination of normal stress of the hatch cover plating](#)

$\sigma_a$  =  $0.8\sigma_0$ , in  $\text{N/mm}^2$

$\sigma_0$  = minimum yield stress, in  $\text{N/mm}^2$ , of the material

For flange plates under compression, sufficient buckling strength according to [Pt 3, Ch 11, 2.11, Buckling strength of hatch cover structures](#) is to be demonstrated.

**Figure 11. 2. 3: Determination of normal stress of the hatch cover plating**

## 2. 6 Local plate thickness of hatch covers for wheel loading and helicopter landing

2. 6. 1 The local gross plate thickness of hatch covers for wheel loading is to comply with [Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles](#).
2. 6. 2 The local gross plate thickness of hatch covers for helicopter landing is to comply with [Pt 3, Ch 9, 5 Helicopter landing areas](#).

## 2. 7 Lower plating of double skin hatch covers and box girders

2. 7. 1 The thickness to fulfil the strength requirements is to be obtained from the calculation according to [Pt 3, Ch 11, 2.10, Strength calculations](#) under consideration of permissible stresses according to [Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1](#). When the lower plating is taken into account as a strength member of the hatch cover, the net thickness, in mm, of lower plating is to be taken not less than 5 mm. When project cargo is intended to be carried on a hatch cover, the net thickness must not be less than:

$$t = 0.0065s, \text{ in mm}$$

$$s = \text{stiffener spacing, in mm.}$$

**Note** Project cargo means especially large or bulky cargo lashed to the hatch cover. Examples are parts of cranes or wind power stations, turbines, etc. Cargoes that can be considered as uniformly distributed over the hatch cover, e.g. timber, pipes or steel coils, need not be considered as project cargo.

When the lower plating is not considered as a strength member of the hatch cover, the thickness of the lower plating is to be specially considered.

## 2. 8 Net scantling of secondary stiffeners

2. 8. 1 The net section modulus,  $Z$ , and net shear area,  $A_s$ , of uniformly loaded hatch cover stiffeners constrained at both ends is not to be less than:

$$Z = \frac{104psl^2}{\sigma_o} \text{ in cm}^3 \text{ for design load according to } \a href="#">Pt 3, Ch 11, 2.3 Load model 2.3.2$$

$$Z = \frac{93psl^2}{\sigma_o} \text{ in cm}^3 \text{ for design load according to } \a href="#">Pt 3, Ch 11, 2.3 Load model 2.3.4$$

$$A_s = \frac{10.8psl}{\sigma_o}, \text{ in cm}^2 \text{ for design load according to } \a href="#">Pt 3, Ch 11, 2.3 Load model 2.3.2$$

$$A_s = A_s = \frac{9.6psl}{\sigma_o}, \text{ in cm}^2 \text{ for design load according to } \a href="#">Pt 3, Ch 11, 2.3 Load model 2.3.4$$

Where

$$l = \text{secondary stiffener span, in metres, to be taken as the spacing, in metres, of primary supporting members or the distance between a primary supporting member and the edge support, as applicable}$$

$$s = \text{secondary stiffener spacing, in mm}$$

$$p = \text{pressure } p_H \text{ and } p_L, \text{ in kN/m}^2, \text{ as defined in } \a href="#">Pt 3, Ch 11, 2.3 Load model 2.3.2 \a href="#">Pt 3, Ch 11, 2.3 Load model 2.3.4$$
 respectively.

$$\sigma_o = \text{minimum yield stress, in N/mm}^2, \text{ of the material, See } \a href="#">Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1$$

For secondary stiffeners of lower plating of double skin hatch covers, requirements mentioned above are not applicable due to the absence of lateral loads.

The net thickness, in mm, of the stiffener web, except of u-beams/trapeze stiffeners, is to be taken not less than 4 mm.

2. 8. 2 The net section modulus of the secondary stiffeners is to be determined, based on an attached plate width assumed equal to the stiffener spacing.

2. 8. 3 For flat bar secondary stiffeners and buckling stiffeners, the ratio  $h/t_w$  is to be not greater than  $15k^{0.5}$

Where

$h$  = height of the stiffener

$t_w$  = net thickness of the stiffener

$k$  =  $235/\sigma_o$ .

2. 8. 4 Stiffeners parallel to primary supporting members and arranged within the effective breadth according to [Pt 3, Ch 11, 2.10, Strength calculations](#) must be continuous when crossing primary supporting members and may be considered when calculating the cross-sectional properties of primary supporting members. It is to be verified that the combined stress of those stiffeners, induced by the bending of primary supporting members and lateral pressures, does not exceed the permissible stresses according to [Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1](#). The requirements of this paragraph are not applied to stiffeners of lower plating of double skin hatch covers if the lower plating is not considered as strength member.
2. 8. 5 For hatch cover stiffeners under compression, sufficient safety against lateral and torsional buckling according to [Pt 3, Ch 11, 2.15 Lateral buckling of secondary stiffeners](#) and [Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners](#) is to be verified.
2. 8. 6 For hatch covers subject to wheel loading or point loads, stiffener scantlings are to be determined under consideration of the permissible stresses according to [Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles](#) or [Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1](#), as applicable.
2. 8. 7 For hatch covers subject to helicopter landing, stiffener gross scantlings are to comply with [Pt 3, Ch 9, 5 Helicopter landing areas](#).

## 2. 9 Net scantling of primary supporting members

2. 9. 1 Scantlings of primary supporting members are obtained from calculations according to [Pt 3, Ch 11, 2.10, Strength calculations](#), under consideration of permissible stresses according to [Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1](#).
2. 9. 2 For all components of primary supporting members, sufficient safety against buckling must be verified according to [Pt 3, Ch 11, 2.11, Buckling strength of hatch cover structures](#) to [Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners](#). For biaxial compressed flange plates, this is to be verified within the effective widths according to [Pt 3, Ch 11, 2.14 Effective width of top and lower hatch cover plating 2.14.1](#).
2. 9. 3 The net thickness,  $t$ , in mm, of webs of primary supporting members is not to be less than:
- $0.0065s$ , in mm
  - 5 mm

Where

$s$  = stiffener spacing, in mm.

2. 9. 4 Scantlings of edge girders (skirt plates) are obtained from the calculations according to [Pt 3, Ch 11, 2.10, Strength calculations](#), under consideration of permissible stresses according to [Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1](#).
2. 9. 5 The net thickness,  $t$ , in mm, of the outer edge girders exposed to wash of sea is not to be less than the largest of the following values:

- $0.0158s \sqrt{\frac{p_A}{0.95\sigma_o}}$

- b.  $0.0085s$  mm  
c. 5 mm

Where

$p_A$  = horizontal pressure, as defined in [Pt 3, Ch 11, 2.3 Load model 2.3.3](#)

$s$  = stiffener spacing, in mm.

2. 9. 6 The stiffness of edge girders is to be sufficient to maintain adequate sealing pressure between securing devices. The moment of inertia, in  $\text{cm}^4$ , of edge girders is not to be less than:

$$I = 6q s s_D^4$$

$q$  = packing line pressure, in N/mm, minimum 5 N/mm

$s_D$  = spacing, in metres, of securing devices.

## 2. 10 Strength calculations

2. 10. 1 Strength calculation for hatch covers may be carried out by using either grillage analysis or FEM. Double skin hatch covers or hatch covers with box girders are to be assessed using FEM, *See* [Pt 3, Ch 11, 2.10 Strength calculations 2.10.3](#). *See also* [Pt 3, Ch 11, 2.7 Lower plating of double skin hatch covers and box girders](#) for requirement of lower plating of double skin hatch covers and box girders.
2. 10. 2 The effective cross-sectional properties for calculation by grillage analysis are to be determined considering the effective breadth. Cross-sectional areas of secondary stiffeners parallel to the primary supporting member under consideration within the effective breadth can be included, *See* [Figure 11. 2. 5: Stiffening parallel to web of primary supporting member](#). The effective breadth of plating,  $e_m$ , of primary supporting members is to be determined according to [Table 11. 2. 3: Effective breadth  \$e\_m\$  of plating of primary supporting members](#), considering the type of loading. Special calculations may be required for determining the effective breadth of one-sided or non-symmetrical flanges. The effective cross-sectional area of plates is not to be less than the cross-sectional area of the face-plate. For flange plates under compression with secondary stiffeners perpendicular to the web of the primary supporting member, the effective width is to be determined according to [Pt 3, Ch 11, 2.14 Effective width of top and lower hatch cover plating 2.14.1](#).

**Table 11. 2. 3: Effective breadth  $e_m$  of plating of primary supporting members**

| $l/e$      | 0  | 1    | 2    | 3    | 4    | 5    | 6    | 7    | $\geq 8$ |
|------------|--|------|------|------|------|------|------|------|----------|
| $e_{m1}/e$ | 0  | 0.36 | 0.64 | 0.82 | 0.91 | 0.96 | 0.98 | 1.00 | 1.00     |
| $e_{m2}/e$ | 0  | 0.20 | 0.37 | 0.52 | 0.65 | 0.75 | 0.84 | 0.89 | 0.90     |
| Symbols    |  |      |      |      |      |      |      |      |          |
| $e_{m1}$   | is to be applied where primary supporting members are loaded by uniformly distributed loads or else by no fewer than six equally spaced single loads     |      |      |      |      |      |      |      |          |
| $e_{m2}$   | is to be applied where primary supporting members are loaded by three or fewer single loads. Intermediate values may be obtained by direct interpolation |      |      |      |      |      |      |      |          |
| $l$        | length of zero-points of bending moment curve:<br><br>$l = l_0$ for simply supported primary supporting members  |      |      |      |      |      |      |      |          |

|       |   |
|-------|---|
|       | $l = 0.6l_0$ for primary supporting members with both ends constrained                        |
| where |   |
| $l_0$ | is the unsupported length of the primary supporting member                                    |
| $e$   | width of plating supported, measured from centre to centre of the adjacent unsupported fields |

2. 10. 3 FEM calculations are to be done in accordance with the ACSPlus SDA Procedure, *Assessment of Steel Hatch Covers Using Finite Element Analysis*.

## 2. 11 Buckling strength of hatch cover structures

2. 11. 1 For hatch cover structures, sufficient buckling strength is to be demonstrated.

|            |   |   |
|------------|---|---|
| $a$        | = | length of the longer side of a single plate field, in mm                      |
| $b$        | = | breadth of the shorter side of a single plate field, in mm                    |
| $\alpha$   | = | aspect ratio of single plate field  |
|            | = | $a/b$   |
| $n$        | = | number of single plate field breadths within the partial or total plate field |
| $t$        | = | net plate thickness, in mm  |
| $\sigma_x$ | = | membrane stress, in N/mm <sup>2</sup> , in x-direction                        |
| $\sigma_y$ | = | membrane stress, in N/mm <sup>2</sup> , in y-direction                        |
| $\tau$     | = | shear stress, in N/mm <sup>2</sup> , in the x-y plane                         |
| $E$        | = | modulus of elasticity, in N/mm <sup>2</sup> , of the material                 |
|            | = | $2.06 \times 10^5$ N/mm <sup>2</sup> for steel                                |
| $\sigma_o$ | = | minimum yield stress, in N/mm <sup>2</sup> , of the material.                 |

Compressive and shear stresses are to be taken positive, tension stresses are to be taken negative. If stresses in the x- and y-direction already contain the Poisson effect (calculated using FEM), the following modified stress values may be used. Both stresses  $\sigma_x^*$  and  $\sigma_y^*$  are to be compressive stresses, in order to apply the stress reduction according to the following formulae.

$$\sigma_x = \frac{(\sigma_x^* - 0.3\sigma_y^*)}{0.91}$$

$$\sigma_y = \frac{(\sigma_y^* - 0.3\sigma_x^*)}{0.91}$$

$\sigma_x^*$ ,  $\sigma_y^*$  = stresses containing the Poisson effect where compressive stress fulfils the condition

$$\sigma_y^* < 0.3\sigma_x^*, \text{ then } \sigma_y = 0 \text{ and } \sigma_x = \sigma_x^*$$

where compressive stress fulfils the condition

$$\sigma_x^* < 0.3\sigma_y^*, \text{ then } \sigma_x = 0 \text{ and } \sigma_y = \sigma_y^*$$

$F_1$  = correction factor for boundary condition at the longitudinal stiffeners according to [Table 11. 2. 4: Correction factor  \$F\_1\$](#)

$\sigma_e$  = reference stress, in N/mm<sup>2</sup>, taken equal to

$$= 0.9E \left( \frac{t}{b} \right)^2$$

$\psi$  = edge stress ratio taken equal to

$$= \frac{\sigma_2}{\sigma_1}$$

Where

$\sigma_1$  = maximum compressive stress

$\sigma_2$  = minimum compressive stress or tension stress

$S$  = safety factor (based on net scantling approach), taken equal to

= 1.25 for hatch covers when subjected to the vertical weather design load according to [Pt 3, Ch 11, 2.3 Load model 2.3.2](#)

= 1.10 for hatch covers when subjected to loads according to [Pt 3, Ch 11, 2.3 Load model 2.3.3](#) and [Pt 4, Ch 8, 11.2, Direct calculations](#)

$\lambda$  = reference degree of slenderness, taken equal to:

$$= \sqrt{\frac{\sigma_0}{K \sigma_e}}$$

$K$  = buckling factor according to [Table 11. 2. 6: Buckling and reduction factors for plane elementary plate panels](#).

**Table 11. 2. 4: Correction factor  $F_1$**

|  |      |   |
|--|------|---|
| Stiffeners sniped at both ends   | 1.00 |   |
| Guidance values, See Note 1, where both ends are effectively connected to adjacent structures  | 1.05 | for flat bars   |
|  | 1.10 | for bulb sections   |
|  | 1.21 | for angle and tee-sections                                    |
|  | 1.30 | for u-type sections, See Note 2, and girders of high rigidity |
| An average value of $F_1$ , is to be used for plate panels having different edge stiffeners  |      |   |
| <p><b>Note 1.</b> Exact values may be determined by direct calculations.</p> <p><b>Note 2.</b> A higher value, but not greater than 2.0, may be taken if it is verified by a buckling strength check of the partial plate field using non-linear FEA. The calculations are to be submitted to LR for approval.</p> |      |   |

**Table 11. 2. 5: Coefficients  $e_1$ ,  $e_2$ ,  $e_3$  and factor  $B$**

|   |             |
|---|-------------|
| Exponents $e_1$ to $e_3$ and factor $B$ | Plate panel |
|---|-------------|

|  |                                       |
|--|---------------------------------------|
| $e_1$  | $1 + \kappa_x^4$                      |
| $e_2$  | $1 + \kappa_y^4$                      |
| $e_3$  | $1 + \kappa_x \kappa_y \kappa_\tau^2$ |
| $B$<br>$\sigma_x$ and $\sigma_y$ positive (compression stress) | $(\kappa_x \kappa_y)^5$               |
| $B$<br>$\sigma_x$ or $\sigma_y$ negative (tension stress)      | 1                                     |

2. 11. 2 Proof is to be provided that the following condition is complied with for the single plate field  $a$   $b$ :

$$\left(\frac{|\sigma_x|S}{\kappa_x \sigma_0}\right)^{e_1} + \left(\frac{|\sigma_y|S}{\kappa_y \sigma_0}\right)^{e_2} - B \left(\frac{\sigma_x \sigma_y S^2}{\sigma_0^2}\right) + \left(\frac{|\tau|S\sqrt{3}}{\kappa_\tau \sigma_0}\right)^{e_3} \leq 1.0$$

The first two terms and the last term of the above condition shall not exceed 1.0.

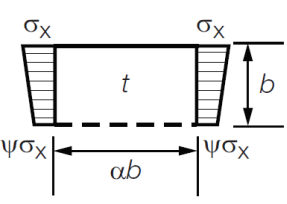

The reduction factors  $\kappa_x$ ,  $\kappa_y$  and  $\kappa_\tau$  are given in [Table 11. 2. 6: Buckling and reduction factors for plane elementary plate panels](#).

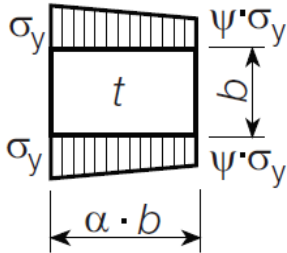

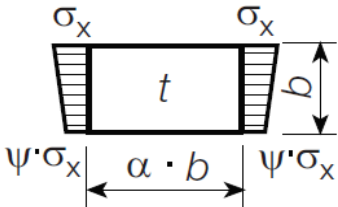

Where  $\sigma_x \leq 0$  (tension stress),  $\kappa_x = 1.0$ .

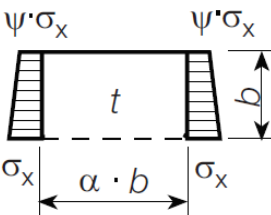

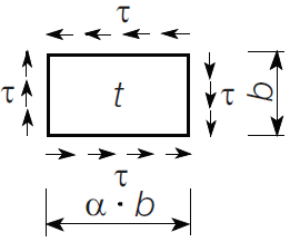

Where  $\sigma_y \leq 0$  (tension stress),  $\kappa_y = 1.0$ .

The exponents  $e_1$ ,  $e_2$  and  $e_3$  as well as the factor  $B$  are to be taken as given by [Table 11. 2. 5: Coefficients  \$e\_1\$ ,  \$e\_2\$ ,  \$e\_3\$  and factor  \$B\$](#) .

**Table 11. 2. 6: Buckling and reduction factors for plane elementary plate panels**

| Buckling load case   | Edge stress ratio $\psi$ | Asp. ratio $\alpha = \frac{a}{b}$ | Buckling factor $K$  | Reduction factor $\kappa$   |
|--|--------------------------|-----------------------------------|--|---|

## 2. 12 Webs and flanges of primary supporting members

2. 12. 1 For non-stiffened webs and flanges of primary supporting members, sufficient buckling strength, as for the hatch cover top and lower plating, is to be demonstrated according to [Pt 3, Ch 11, 2.11 Buckling strength of hatch cover structures 2.11.2](#).

## 2. 13 Longitudinal and transverse secondary stiffeners

2. 13. 1 It is to be demonstrated that the continuous longitudinal and transverse stiffeners of partial and total plate fields comply with the conditions set out in [Pt 3, Ch 11, 2.15 Lateral buckling of secondary stiffeners](#) and [Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners](#). For u-type stiffeners, the verification of torsional buckling strength according to [Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners](#) can be omitted. Single-sided welding is not permitted for secondary stiffeners except for u-type stiffeners.

## 2. 14 Effective width of top and lower hatch cover plating

2. 14. 1 For demonstration of buckling strength according to [Pt 3, Ch 11, 2.15 Lateral buckling of secondary stiffeners](#) and [Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners](#), the effective width of plating may be determined by the following formulae:

$$b_m = \kappa_x b \text{ for longitudinal stiffeners}$$

$$a_m = \kappa_y a \text{ for transverse stiffeners}$$

See also [Figure 11. 2. 4: General arrangement of panel](#).

The effective width of plating is not to be taken greater than the value obtained from [Pt 3, Ch 11, 2.10 Strength calculations 2.10.2](#).

The effective width  $e'_m$  of stiffened flange plates of primary supporting members may be determined as follows:

(a) Stiffening parallel to web of primary supporting member:

$$\blacksquare \quad b < e_m$$

$$e'_m = n b_m$$

$n$  = integer number of stiffener spacings  $b$  inside the effective breadth  $e_m$  according to [Pt 3, Ch 11, 2.10 Strength calculations 2.10.2](#)

$$= \text{int} \left( \frac{e_m}{b} \right)$$

(b) Stiffening perpendicular to web of primary supporting member:

$$\blacksquare \quad a \geq e_m$$

$$e'_m = n_{am} < e_m$$

$$n = 2.7 \frac{e_m}{a} \leq l$$

$e$  = width of plating supported according to [Pt 3, Ch 11, 2.10 Strength calculations 2.10.2](#)

For  $b \geq e_m$  or  $a < e_m$ , respectively,  $b$  and  $a$  are to be exchanged.

$a_m$  and  $b_m$  for flange plates are in general to be determined for  $\psi = 1$ .

Scantlings of plates and stiffeners are in general to be determined according to the maximum stresses  $\sigma_x(y)$  at webs of primary supporting member and stiffeners, respectively. For stiffeners with spacing  $b$  under compression arranged parallel to primary supporting members, no value less than  $0.25\sigma_o$  shall be inserted for  $\sigma_x(y=b)$ .

The stress distribution between two primary supporting members can be obtained by the following formula:

$$\sigma_x(y) = \sigma_{x1} \left\{ 1 - \frac{y}{e} \left[ 3 + c_1 - 4c_2 - 2 \frac{y}{e} (1 + c_1 - 2c_2) \right] \right\}$$

Where

$$c_1 = \frac{\sigma_{x2}}{\sigma_{x1}} \quad 0 \leq c_1 \leq 1$$

$$c_2 = \frac{1.5}{e} (e_{m1}'' + e_{m2}'') - 0.5$$

$e_{m1}''$  = proportionate effective breadth  $e_{m1}$  or proportionate effective width  $e_{m1}'$  of primary supporting member 1 within the distance  $e$ , as appropriate

$e_{m2}''$  = proportionate effective breadth  $e_{m2}$  or proportionate effective width  $e_{m2}'$  of primary supporting member 2 within the distance  $e$ , as appropriate

$\sigma_{x1}, \sigma_{x2}$  = normal stresses in flange plates of adjacent primary supporting member 1 and 2 with spacing  $e$ , based on cross-sectional properties considering the effective breadth or effective width, as appropriate

$y$  = distance of considered location from primary supporting member 1

Shear stress distribution in the flange plates may be assumed linearly.

**Figure 11. 2. 4: General arrangement of panel**

**Figure 11. 2. 5: Stiffening parallel to web of primary supporting member**

Figure 11. 2. 6: Stiffening perpendicular to web of primary supporting member

## 2. 15 Lateral buckling of secondary stiffeners

2. 15. 1 The secondary stiffeners are to comply with the following criteria:

$$\frac{\sigma_a + \sigma_b}{\sigma_o} S \leq 1$$

Where

$\sigma_a$  = uniformly distributed compressive stress, in N/mm<sup>2</sup>, in the direction of the stiffener axis

$\sigma_a$  =  $\sigma_x$  for longitudinal stiffeners

$\sigma_a$  =  $\sigma_y$  for transverse stiffeners

$\sigma_b$  = bending stress, in N/mm<sup>2</sup>, in the stiffener

$$= \frac{M_0 + M_1}{Z_{st} \times 10^3}$$

$M_0$  = bending moment, in Nmm, due to the deformation  $w$  of stiffener, taken equal to:

$$M_0 = F_{Ki} \frac{p_z w}{c_f - p_z} \text{ with } (c_f - p_z) > 0$$

$M_1$  = bending moment, in Nmm, due to the lateral load  $p$  equal to:

$$M_1 = \frac{p b a^2}{24 \times 10^3} \text{ for longitudinal stiffeners}$$

$$M_1 = \frac{p a (n b)^2}{8 c_s \times 10^3} \text{ for transverse stiffeners}$$

- $n$  is to be taken equal to 1 for ordinary transverse stiffeners

Where

$p$  = lateral load, in kN/m<sup>2</sup>

$F_{Ki}$  = ideal buckling force, in N, of the stiffener

$F_{Kix}$  =  $\frac{\pi^2}{a^2} EI_X \times 10^4$  for longitudinal stiffeners

$F_{Kiy}$  =  $\frac{\pi^2}{(nb)^2} EI_Y \times 10^4$  for transverse stiffeners

$I_x, I_y$  = net moments of inertia, in cm<sup>4</sup>, of the longitudinal or transverse stiffener, including effective width of attached plating according to [Pt 3, Ch 11, 2.14 Effective width of top and lower hatch cover plating 2.14.1](#).  $I_x$  and  $I_y$  are to comply with the following criteria:

$$I_x \geq \frac{bt^3}{12 \times 10^4}$$

$$I_y \geq \frac{at^3}{12 \times 10^4}$$

$p_z$  = nominal lateral load, in N/mm<sup>2</sup>, of the stiffener due to  $\sigma_x$ ,  $\sigma_y$  and  $\tau$

$p_{zx}$  =  $\frac{t}{b} \left( \sigma_{xl} \left( \frac{\pi b}{a} \right)^2 + 2c_y \sigma_y + \sqrt{2} \tau_1 \right)$  for longitudinal stiffeners

$p_{zy}$  =  $\frac{t}{a} \left( 2c_x \sigma_{x1} + \sigma_y \left( \frac{\pi a}{nb} \right)^2 \left( 1 + \frac{A_y}{at} \right) + \sqrt{2} \tau_1 \right)$  for transverse stiffeners

$\sigma_{xl}$  =  $\sigma_x \left( 1 + \frac{A_x}{bt} \right)$

$c_x, c_y$  = factor taking into account the stresses perpendicular to the stiffener's axis and distributed variably along the stiffener's length

=  $0.5 (1 + \psi)$  for  $0 \leq \psi \leq 1$

=  $\frac{0.5}{1 - \psi}$  for  $\psi < 0$

$A_x, A_y$  = net sectional area, in mm<sup>2</sup>, of the longitudinal or transverse stiffener, respectively, without attached plating

$\tau_1$  =  $\left[ \tau - t \sqrt{\sigma_o E \left( \frac{m_1}{a^2} + \frac{m_2}{b^2} \right)} \right] \geq 0$

▪ for longitudinal stiffeners:

▪  $\frac{a}{b} \geq 2.0 : m_1 = 1.47m_2 = 0.49$

▪  $\frac{a}{b} < 2.0 : m_1 = 1.96m_2 = 0.37$

▪ for transverse stiffeners:

▪  $\frac{a}{nb} \geq 0.5 : m_1 = 0.37m_2 = \frac{1.96}{n^2}$

▪  $\frac{a}{nb} < 0.5 : m_1 = 0.49m_2 = \frac{1.47}{n^2}$

$w$  =  $w_0 + w_1$

$w_0$  = assumed imperfection, in mm

▪  $w_{0x} \leq \min \left( \frac{a}{250}, \frac{b}{250}, 10 \right)$

$$w_{0y} \leq \min\left(\frac{a}{250}, \frac{nb}{250}, 10\right)$$

NOTE

For stiffeners sniped at both ends,  $w_0$  must not be taken less than the distance from the mid point of plating to the neutral axis of the profile, including effective width of plating.

$w_1$  = deformation of stiffener, in mm, at midpoint of stiffener span due to lateral load  $p$

In the case of uniformly distributed load, the following values for  $w_1$  may be used:

$$w_1 = \frac{pba^4}{384 \times 10^7 EI_x} \text{ for longitudinal stiffeners}$$

$$w_1 = \frac{5ap(nb)^4}{384 \times 10^7 EI_y c_s^2} \text{ for transverse stiffeners}$$

$c_f$  = elastic support provided by the stiffener, in N/mm<sup>2</sup>

a. For longitudinal stiffeners:

$$c_{fx} = F_{Kix} \frac{\pi^2}{a^2} (1 + c_{px})$$

$$c_{px} = \frac{1}{1 + \frac{0.91 \left( \frac{12 \times 10^4 I_x}{t^3 b} - 1 \right)}{c_{xa}}}$$

$$c_{xa} = \left( \frac{a}{2b} + \frac{2b}{a} \right)^2 \text{ for } a \geq 2b$$

$$c_{xa} = \left( 1 + \left( \frac{a}{2b} \right)^2 \right)^2 \text{ for } a < 2b$$

b. For transverse stiffeners:

$$c_{fy} = c_s F_{Kiy} \frac{\pi^2}{(nb)^2} (1 + c_{py})$$

$$c_{py} = \frac{1}{1 + \frac{0.91 \left( \frac{12 \times 10^4 I_y}{t^3 a} - 1 \right)}{c_{ya}}}$$

$$c_{ya} = \left( \frac{nb}{2a} + \frac{2a}{nb} \right)^2 \text{ for } nb \geq 2a$$

$$c_{ya} = \left( 1 + \left( \frac{nb}{2a} \right)^2 \right)^2 \text{ for } nb < 2a$$

$c_s$  = factor accounting for the boundary conditions of the transverse stiffener

= 1.0 for simply supported stiffeners

= 2.0 for partially constrained stiffeners

$Z_{st}$  = net section modulus of stiffener (longitudinal or transverse), in cm<sup>3</sup>, including effective width of plating according to [Pt 3, Ch 11, 2.14](#)  
[Effective width of top and lower hatch cover plating 2.14.1.](#)

If no lateral load  $p$  is acting, the bending stress  $\sigma_b$  is to be calculated at the mid point of the stiffener span for that fibre which results in the largest stress value. If a lateral load  $p$  is acting, the stress calculation is to be carried out for both fibres of the stiffener's cross-sectional area (if necessary for the biaxial stress field at the plating side).

## 2. 16 Torsional buckling of secondary stiffeners

2. 16. 1 The longitudinal secondary stiffeners are to comply with the following criteria:

$$\frac{\sigma_X S}{\kappa_T \sigma_o} \leq 1.0$$

Where

$\kappa_T$  = coefficient taken equal to:

$\kappa_T$  = 1.0 for  $\lambda_T \leq 0.2$

$\kappa_T$  =  $\frac{1}{\varphi + \sqrt{\varphi^2 - \lambda_T^2}}$  for  $\lambda_T > 0.2$

$\Phi$  =  $0.5(1 + 0.21(\lambda_T - 0.2) + \lambda_T^2)$

$\lambda_T$  = reference degree of slenderness taken equal to:

$\lambda_T$  =  $\sqrt{\frac{\sigma_F}{\sigma_{KiT}}}$

$\sigma_{KiT}$  =  $\frac{E}{I_p} \left( \frac{\pi^2 I_\omega 10^2}{a^2} \varepsilon + 0.385 I_T \right)$ , in N/mm<sup>2</sup>

For  $I_p$ ,  $I_T$ ,  $I_\omega$ , See [Figure 11. 2. 7: Dimensions of stiffener](#) and

$I_p$  = net polar moment of inertia of the stiffener, in cm<sup>4</sup>, related to the point C

$I_T$  = net St.Venant's moment of inertia of the stiffener, in cm<sup>4</sup>

$I_\omega$  = net sectorial moment of inertia of the stiffener, in cm<sup>6</sup>, related to the point C

$\varepsilon$  = degree of fixation taken equal to:

$\varepsilon$  =  $1 + 10^{-3} \sqrt{\frac{a^4}{\frac{3}{4} \pi^4 I_\omega \left( \frac{b}{t^3} + \frac{4h_w}{3t^3_w} \right)}}$

$h_w$  = web height, in mm

$t_w$  = net web thickness, in mm

$b_f$  = flange breadth, in mm

$t_f$  = net flange thickness, in mm

$A_w$  = net web area equal to:  $A_w = h_w t_{yl}$

$A_f$  = net flange area equal to:  $A_f = b_f t_f$

$e_f$  =  $h_w + \frac{t_f}{2}$ , in mm

$b$  = stiffener spacing, in mm

$t$  = local net plate thickness of the attached plate, in mm.

Figure 11. 2. 7: Dimensions of stiffener

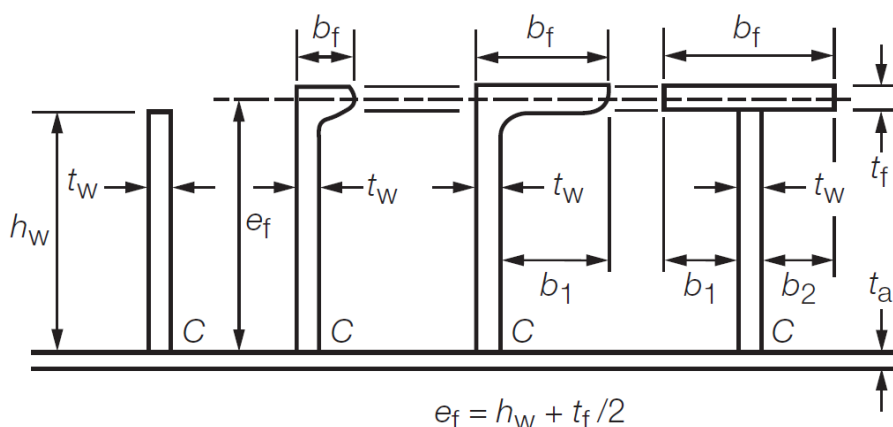

Table 11. 2. 7: Moments of inertia

| Section                      | $I_P$  | $I_T$   | $I_\omega$   |
|------------------------------|--|---|--|
| Flat bar                     | $\frac{h_w^3 t_w}{3 \times 10^4}$                      | $\frac{h_w t_w^3}{3 \times 10^4} \left(1 - 0.63 \frac{t_w}{h_w}\right)$   | $\frac{h_w^3 t_w^3}{36 \times 10^6}$   |
| Sections with bulb or flange | $\left(\frac{A_w h_w^2}{3} + A_f e_f^2\right) 10^{-4}$ | $\frac{h_w t_w^3}{3 \times 10^4} \left(1 - 0.63 \frac{t_w}{h_w}\right) + \frac{b_f t_f^3}{3 \times 10^4} \left(1 - 0.63 \frac{t_f}{b_f}\right)$ | for bulb and angle sections:<br>$\frac{A_f^2 e_f^2 b_f^2}{12 \times 10^6} \left(\frac{A_f + 2.6 A_w}{A_f + A_w}\right)$<br>for tee sections:<br>$\frac{b_f^3 t_f^2 e_f^2}{12 \times 10^6}$ |

2. 16. 2 For transverse secondary stiffeners loaded by compressive stresses and which are not supported by longitudinal stiffeners, sufficient torsional buckling strength is to be demonstrated analogously in accordance with this sub-Section.

## 2. 17 Pontoon covers

2. 17. 1 The structural assessment of pontoon covers, as defined in [Pt 3, Ch 11, 1.1 Application 1.1.5.b](#), is to be carried out by direct calculations, which are to be submitted for approval, using the minimum design pressures acting on the hatch covers defined in [Table 11. 2. 8: Pontoon cover minimum design pressures](#). The permissible stress, deflection and buckling criteria are given in [Table 11. 2. 10: Steel pontoon cover permissible stress, deflection and buckling criteria](#).

Table 11. 2. 8: Pontoon cover minimum design pressures

|   |  |
|---|--|
| For ships of 100 m in length and above: |  |
| (a)                                     | Position 1 hatch covers located in the forward quarter of the ship's length shall be designed for wave pressures at the forward perpendicular, calculated from the following equation:<br><br>Minimum design pressure, $p = 49.05 + 9.81(L_H - 100)a$ in $\text{kN/m}^2$ where<br><br>$L_H$ is $L$ for ships of not more than 340 m but not less than 100 m in length and equal to 340 m for ships of more than 340 m in length:<br><br>$a$ = 0.0074 for Type B freeboard ships<br>= 0.0363 Ships assigned reduced freeboard |

The pressure,  $p$ , is to be reduced linearly to 34.3 kN/m<sup>2</sup> at the end of the forward quarter's length, as shown in [Table 11. 2. 9: Summary of pontoon cover minimum design pressures](#)

The design pressure used for each hatch cover panel shall be that determined at its mid point location:

- (b) All other position 1 hatch covers shall be designed to 34.3 kN/m<sup>2</sup>
- (c) Position 2 hatch covers shall be designed to 25.5 kN/m<sup>2</sup>
- (d) Where a position 1 hatchway is located at least one superstructure standard height higher than the freeboard deck, it may be designed to 34.3 kN/m<sup>2</sup>

For ships 24 m in length:

- (a) Position 1 hatch covers located in the forward quarter of the ship's length shall be designed for wave pressures of 23.8 kN/m<sup>2</sup> at the forward perpendicular and reduced linearly to 19.6 kN/m<sup>2</sup> at the end of the forward quarter's length, as shown in [Table 11. 2. 9: Summary of pontoon cover minimum design pressures](#). The design pressure used for each hatch cover panel shall be that determined at its mid point location
- (b) All other position 1 hatch covers shall be designed to 19.6 kN/m<sup>2</sup>
- (c) Position 2 hatch covers shall be designed to 14.7 kN/m<sup>2</sup>
- (d) Where a position 1 hatchway is located at least one superstructure standard height higher than the freeboard deck, it may be designed to 19.6 kN/m<sup>2</sup>

For ships between 24 m and 100 m in length, and for positions between FP and 0.25L, wave pressures shall be obtained by linear interpolation of the values shown in [Table 11. 2. 9: Summary of pontoon cover minimum design pressures](#)

**Table 11. 2. 9: Summary of pontoon cover minimum design pressures**

| Deck location       | Longitudinal position  |                        |                        |
|---------------------|--|------------------------|------------------------|
|                     | FP   | 0.25 <i>L</i>          | Aft of 0.25 <i>L</i>   |
| <i>L</i> >100 m     |  |                        |                        |

|-----------------------|--|
| Buckling requirements |  |
| Symbols               |  |
| $b$                   | = length of panel (longer panel dimension), in mm, in transverse direction, See <a href="#">Figure 11. 2. 8: Cover with stiffening fitted normal to the axis of primary bending</a>  |
| $s$                   | = spacing of webs and stiffeners (shorter panel dimension), in mm  |
| $t$                   | = thickness of plating, in mm  |
| $\sigma_{ac}$         | = corrected critical buckling stress, in N/mm <sup>2</sup>   |
| $\sigma_b$            | = the compressive bending stress, in N/mm <sup>2</sup> , in the steel cover plating, calculated by taking the cover as a loaded beam simply supported at its ends  |
| $\sigma_c$            | = critical buckling stress of panel, in N/mm <sup>2</sup>  |
| $\sigma_o$            | = yield stress of cover plating material, in N/mm <sup>2</sup>   |
| $\sigma_c$            | = $18.6R_c \left(\frac{t}{b}\right)^2 \times 10^4 \text{ N/mm}^2$  |
| $\sigma_{ac}$         | = $\sigma_o \left(1 - \frac{\sigma_o}{4\sigma_c}\right) \text{ N/mm}^2$  |
| (a)                   | Where primary bending stress acts on longer panel edge $b$ , See <a href="#">Figure 11. 2. 8: Cover with stiffening fitted normal to the axis of primary bending</a> : <div style="text-align: center;"> <math display="block">\frac{\sigma_c}{\sigma_b} \left( \text{or } \frac{\sigma_{ac}}{\sigma_b} \right) \geq 1.3 \quad \text{where } R_c = \left( \frac{s}{b} + \frac{b}{s} \right)^2</math> </div> <p>Where primary bending stress acts on shorter panel edge <math>s</math>:</p> $\frac{\sigma_c}{\sigma_b} \left( \text{or } \frac{\sigma_{ac}}{\sigma_b} \right) \geq 1.2 \quad \text{where } R_c = 4 \left( \frac{b^2}{s^2} \right)$ <p>If <math>\sigma_c &gt; 0.5 \sigma_o</math>, then corrected value <math>\sigma_{ac}</math> is used</p> <p>It is recommended that <math>\frac{b}{s} &lt; 5.0</math></p> |
| (b)                   | Where covers are stiffened in two directions by a grillage formation, buckling checks are to be carried out as per (a) above for bending stresses acting on both the longer and shorter edges of the panel<br><p>For the derivation of the section modulus for primary members, an effective width of plating to achieve a balanced section is to be adopted</p> <p>However, a greater width of plating in accordance with <a href="#">Pt 3, Ch 3, 3.2 Geometric properties of section</a> may be adopted where this is suitably stiffened in the directions being considered from the buckling aspect</p>   |

Figure 11. 2. 8: Cover with stiffening fitted normal to the axis of primary bending

2. 17. 2 The gross thickness of the plating of steel pontoon covers is to be not less than the greater of:
- a.  $t = 0.01s$  mm
  - b.  $t = 6.0$  mm as required by [Table 11. 2. 8: Pontoon cover minimum design pressures](#)

Where

- $s$  = stiffener spacing in mm
- $t$  = thickness as required by [Pt 3, Ch 11, 2.17 Pontoon covers 2.17.1](#).

2. 17. 3 The gross scantlings of steel pontoon cover primary and secondary webs or stiffeners are to be not less than would be required to satisfy the requirements of [Table 11. 2. 11: Steel pontoon cover webs and stiffeners](#). Alternatively, scantlings may be determined by direct calculations, which are to be submitted for approval. In no case are the stresses and deflections given in [Table 11. 2. 10: Steel pontoon cover permissible stress, deflection and buckling criteria](#) to be exceeded.

PART

# 3

CHAPTER **11** **Closing Arrangements for Shell, Deck and Bulkheads**

SECTION **3** **Hatch beams and wood covers**

## **3. 1 Portable hatch beams**

- 3. 1. 1 The section modulus and moment of inertia of portable web plate beams stiffened at their upper and lower edges by continuous flat bars are to satisfy the requirements of [Pt 3, Ch 11, 2.17, Pontoon covers](#) for pontoon covers. Alternatively, direct calculations may be used, provided the requirements of [Pt 3, Ch 11, 2.17, Pontoon covers](#) for pontoon covers are complied with.
- 3. 1. 2 The ends of web plates are to be doubled, or inserts fitted for at least 180 mm along length of web.
- 3. 1. 3 At beams which carry the ends of wood or steel hatch covers, a vertical 50 mm flat is to be arranged on the upper face plate. The width of bearing surface for hatch covers is to be not less than 65 mm.
- 3. 1. 4 Carriers or sockets, or other suitable arrangements, of suitable construction are to provide means for the efficient fitting and securing of portable hatch beams. The width of bearing surface is to be not less than 75 mm.
- 3. 1. 5 Sliding hatch beams are to be provided with an efficient device for locking them in their correct fore and aft positions when the hatchway is closed.

## **3. 2 Wood covers**

- 3. 2. 1 Wood covers are to have a finished thickness of not less than 60 mm in association with an unsupported span of not more than 1.5 m. Where the 'tween deck height measured vertically on the centreline of the ship from 'tween deck to underside of the hatch cover stiffeners on deck above, exceeds 2.6 m, the thickness of the wood covers is to be increased at the rate of 16.5 per cent per metre excess in 'tween deck height.
- 3. 2. 2 The ends of all wood hatch covers are to be protected by encircling galvanised steel bands, about 65 mm wide and 33 mm thick, efficiently secured.

## CHAPTER 11 Closing Arrangements for Shell, Deck and Bulkheads

### SECTION 4 Hatch cover securing arrangements and tarpaulins

#### 4. 1 Cargo oil tank and adjacent spaces

4. 1. 1 For access hatchways to cargo oil tanks and adjacent spaces, See [Pt 3, Ch 11, 7 Tanker access arrangements and closing appliances](#).

#### 4. 2 Steel covers – Clamped and gasketed

4. 2. 1 These requirements, unless stated otherwise, apply to steel hatch covers in Positions 1 and 2 fitted with gaskets and securing devices and situated above dry cargo holds.
4. 2. 2 Where steel hatch covers are fitted to hatch openings on weather decks, the arrangements are to be such that weathertightness can be maintained. A sufficient number of securing devices is to be provided at each side of the hatch cover, considering the requirements of [Pt 3, Ch 11, 2.9 Net scantling of primary supporting members 2.9.4](#) to [Pt 3, Ch 11, 2.9 Net scantling of primary supporting members 2.9.6](#). This applies also to hatch covers consisting of several parts.
4. 2. 3 The weight of the covers and weather loading may be transmitted to the ship's structure by means of continuous steel to steel contact of the cover skirt plate with the ship's structure in association with a maximum bearing pressure of 200 kgf/cm<sup>2</sup>. Alternatively the weight may be transmitted by means of defined bearing pads. For covers loaded by containers or other cargo, the total load together with inertial forces generated by the ship's motion, are to be transmitted by means of defined bearing pads only.
4. 2. 4 For the design of the securing devices against shifting, the horizontal mass forces  $F_h = m \cdot a$  are to be calculated with the following accelerations:

$$a_x = 0.2 \text{ g in longitudinal direction}$$

$$a_y = 0.5 \text{ g in transverse direction}$$

$$m = \text{sum of mass of cargo lashed on the hatch cover and mass of hatch cover.}$$

The accelerations in longitudinal direction and in transverse direction do not need to be considered as acting simultaneously.

4. 2. 5 For the transmission of the support forces resulting from the load cases specified in [Pt 3, Ch 11, 2.3, Load model](#) and of the horizontal mass forces specified in [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.4](#), hatch cover supports are to be provided, which are to be designed such that the nominal surface pressures do not, in general, exceed the following values:

$$p_{n \text{ max}} = dp_n, \text{ in N/mm}^2$$

$$d = 3.75 - 0.015L$$

$$d_{\max} = 3.0$$

$$d_{\min} = 1.0 \text{ in general}$$

$$= 2.0 \text{ for partial loading conditions, See } \text{Pt 4, Ch 8, 11.2 Direct calculations 11.2.5}$$

$$p_n = \text{See Table 11. 4. 1: Permissible nominal surface pressure } p_n$$

For metallic supporting surfaces not subjected to relative displacements, the nominal surface pressure applies:

$$p_{n \max} = 3p_n, \text{ in N/mm}^2$$

When the maker of vertical hatch cover support material can provide proof that the material is sufficient for the increased surface pressure, not only statically but under dynamic conditions including relative motion for an adequate number of cycles, permissible nominal surface pressure may be specially considered. In this case, realistic long-term distribution of spectra for vertical loads and relative horizontal motion is to be required to be considered.

The supports are to be designed such that the permissible stresses according to [Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1](#) are not exceeded.

**Table 11. 4. 1: Permissible nominal surface pressure  $p_n$**

| Support material         | $p_n$ in N/mm <sup>2</sup> when loaded by |                                |
|--------------------------|---|--------------------------------|
|                          | Vertical force                            | Horizontal force (on stoppers) |
| Hull structural steel    | 25  | 40                             |
| Hardened steel           | 35  | 50                             |
| Lower friction materials | 50  | —                              |

4. 2. 6 Drawings of hatch cover supports which specify the permitted maximum pressure, given by the material manufacturer, must be submitted.
4. 2. 7 Where large relative displacements of the supporting surfaces of hatch cover supports are to be expected, the use of material having low wear and frictional properties is recommended.
4. 2. 8 The substructures of the hatch cover supports must be of such a design that a uniform pressure distribution is achieved. Irrespective of the arrangement of stoppers, the supports must be able to transmit the following force  $P_h$  in the longitudinal and transverse direction:

$$P_h = \mu \frac{P_v}{\sqrt{d}}$$

Where

$$P_v = \text{vertical supporting force}$$

$$\mu = \text{frictional coefficient}$$

$$= 0.5 \text{ in general}$$

For non-metallic, low-friction support materials on steel, the friction coefficient may be reduced, but is not to be less than 0.35. The substructures are to be designed such that the permissible stresses according to [Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1](#) are not exceeded.

4. 2. 9 For substructures and adjacent structures of supports subjected to horizontal forces  $P_h$ , as defined in [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.8](#), the fatigue strength is to be considered.
4. 2. 10 Hatch covers are to be sufficiently secured against horizontal shifting. Stoppers are to be provided for hatch covers on which cargo is carried. The greater of the loads resulting from [Pt 3, Ch 11, 2.3 Load model 2.3.3](#) and [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.4](#) is to be applied for the dimensioning of the stoppers and their substructures. The permissible stress in stoppers and their substructures in the cover and in the coamings is to be determined according to [Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1](#). In addition, the provisions in [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.5](#) are to be observed.
4. 2. 11 The sealing is to be obtained by a continuous gasket of relatively soft elastic material compressed to achieve the necessary weathertightness. Similar sealing is to be arranged between cross-joint elements. Where fitted, compression flat bars or angles are to be well rounded where in contact with the gasket and are to be made of a corrosion-restraint material or suitably protected against corrosion.
4. 2. 12 Special consideration is to be given to the gasket and securing arrangements in ships with large relative movements between cover and ship structure or between cover elements. The relative horizontal and vertical deflections are to be calculated and submitted with the hatch cover plans. Where applicable, deflections due to thermal effects and internal pressure loads are also to be included.
4. 2. 13 The suitability of the gasket material and the securing adhesive is the responsibility of the Builder and Owner. When selecting such material, consideration is to be given to its suitability for the environmental conditions likely to be experienced by the ship and its compatibility with the cargo carried. The material and form of gasket selected is to be considered in conjunction with the type of cover, the securing arrangement and the expected relative movement between cover and ship structure. The gasket is to be effectively secured to the cover.
4. 2. 14 Drainage is to be arranged inside the line of gasket by means of a gutter bar or vertical extension of the hatch side and end coaming; drain openings are to be provided at appropriate positions on the drain channels. This requirement need not be complied with for special ships carrying container cargoes when the requirements of [Pt 4, Ch 8, 11 Hatch covers](#) are satisfied.
4. 2. 15 Where the arrangement includes continuous steel to steel contact between hatch cover and coaming or between hatch cover and ship structure or at cross-joints, drainage on both sides of the gasket is to be provided.
4. 2. 16 Drain openings are to be arranged at the ends of drain channels and are to be provided with non-return valves for preventing ingress of water from outside.  
The following requirements are to be complied with:
- If manufactured from steel, the minimum drain pipe wall thickness is to be not less than 4.5 mm.
  - If not manufactured from steel, details of the drain, including the material specification, method of manufacture and details of any tests carried out, are to be submitted for consideration.
  - The drains are to be securely attached to the hatch coaming and adequately protected if in an exposed position.
  - When the drain is fitted to a hold also designed to carry liquids, a shut-off valve is to be incorporated into the assembly.
  - Drain openings in hatch coamings are to be arranged with sufficient distance to areas of stress concentration (e.g. hatch corners, transitions to crane posts).
4. 2. 17 Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced alongside the coamings. The securing devices are not to have a vertical clearance but are to be pre-tensioned when the cover is in the closed position. The devices are also to be arranged

in close proximity horizontally to the gasket. Arrangement and spacing are to be determined with due attention to the effectiveness for weathertightness, depending upon the type and the size of the hatch cover, as well as on the stiffness of the cover edges between the securing devices. A minimum of two securing devices for each side of a panel are to be fitted. The securing devices should be arranged as close to the panel corners as is practicable.

4. 2. 18 Between cover and coaming and at cross-joints, a gasket pressure sufficient to obtain weathertightness is to be maintained by the securing devices. This pressure is to be specified. Securing devices of a design other than rod or bolts will be specially considered, See [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.26](#).

4. 2. 19 The net sectional area of each securing device is to be not less than:

$$A = \frac{1.4S_1W_1}{50f} \text{ cm}^2$$

Where

$$f = \left( \frac{\sigma_c}{235} \right)^e$$

$S_1$  = spacing between securing devices, in metres, not to exceed 6 m and not to be taken less than 2 m

$W_1$  = the gasket loading per unit length, in N/cm, but not less than 50 N/cm

$\sigma_c$  = specified minimum upper yield stress in N/mm<sup>2</sup> of the steel used for cleats or securing devices, to be taken not greater than 70 per cent of the ultimate tensile strength

$e$  = 0.75 for  $\sigma_c \geq 235$

= 1.0 for  $\sigma_c < 235$ .

4. 2. 20 Rods or bolts are to have a gross diameter not less than 19 mm for hatchways exceeding 5 m<sup>2</sup> in area.

4. 2. 21 In order to ensure compression between gasket and compression bar along the full length, the cover edge stiffness is to be examined. The inertia of the cover edge is to be not less than:

$$I_E = 0.6W_1S_1^4 \text{ cm}^4$$

where  $W_1$  and  $S_1$  are as defined in [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.12](#).

4. 2. 22 Securing devices are to be constructed of reliable design and securely attached to the hatchway coamings, decks or covers. Individual securing devices on each cover are to have approximately the same stiffness characteristics.

4. 2. 23 Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

4. 2. 24 Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

4. 2. 25 The cross-joints of multi-panel covers are to be arranged with wedges, or locators (male and female) to retain the hatch covers in the correct sealing position, the number and spacing is to be arranged to suit the size and type of cover, gasket arrangements and stiffness of cover edges at cross-joints. Means are also to be provided to prevent excessive relative vertical deflections between loaded and unloaded panels. The arrangement of the gasket retaining angle and the compression bar at the cross-joints is to be such that the gasket compression is maintained between loaded and unloaded panels.

4. 2. 26 In addition to the requirements given above, all hatch covers, especially those carrying deck cargo are to be effectively secured against horizontal shifting due to the horizontal forces arising from the ship motions.
4. 2. 27 To prevent damage to hatch covers and ship structure, the location of stoppers is to be compatible with the relative movements between hatch covers and ship structure. The number should be as small as practically possible.
4. 2. 28 Towards the ends of the ship, vertical acceleration forces may exceed gravity forces. The resulting lifting forces must therefore be also considered when dimensioning the securing devices. Also lifting forces from cargo secured on the hatch cover during rolling are to be taken into account.
4. 2. 29 Hatch coamings and supporting structure are to be adequately stiffened to accommodate the loading from hatch covers and cargo carried thereon.
4. 2. 30 Upon completion of installation of hatch covers, a hose test with a pressure of water as specified in [Table 1. 9. 1: Testing requirements](#) in Chapter 1 is to be carried out. Alternative methods of tightness testing will be considered. This does not apply to covers with reduced securing arrangements as specified in [Pt 4, Ch 8, 11 Hatch covers](#).
4. 2. 31 All hatch covers are to be tested to prove satisfactory operation.
4. 2. 32 It is recommended that ships with steel hatch covers are supplied with an operation and maintenance manual including:
- opening and closing instructions;
  - maintenance requirements and specifications for packings, securing devices and operating items;
  - cleaning instructions for the drainage system;
  - corrosion prevention instructions;
  - list of spare parts.
4. 2. 33 The spacing and size of securing devices in hatch covers for holds which may be flooded and used for ballast tanks and holds in OBO, ore or oil and similar types of ship are to correspond to the reaction forces at the cover edges found by calculation. The loading is to be as required by [Pt 4, Ch 7, 12.4 Load model 12.4.1.c](#).
- The permissible stress in the securing devices is not to exceed the following:
- $$\sigma_e = 0.9 \times 235 \text{ fN/mm}^2$$
- = Where
- $$f = \text{material factor as defined in } \text{Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.19}$$
- $$\sigma = \text{bending stress in N/mm}^2$$
- $$\sigma_e = \text{equivalent stress, in N/mm}^2$$
- $$= \sqrt{(\sigma^2 + 3\tau^2)}$$
- $$\tau = \text{shear stress in N/mm}^2$$
4. 2. 34 On tank hatch covers in 'tween decks the maximum spacing of cleats is to be 600 mm, but cleats are to be arranged as close to the corners as practicable.
4. 2. 35 Steel hatch covers with special sealing arrangements, insulated covers, flush hatch covers, and covers having coamings less than required by [Pt 3, Ch 11, 5.1, General](#), will be specially considered.
4. 2. 36 The material and weld specifications of stoppers and securing devices are to be shown in the drawings of the hatch covers.

4. 2. 37 Securing devices of special design in which significant bending or shear stresses occur may be designed as anti-lifting devices according to [Pt 4, Ch 8, 11.2 Direct calculations 11.2.6](#). The packing line pressure, as defined in [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.12](#), multiplied by the spacing between securing devices, as defined in [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.12](#), is to be applied as design load.

### **4. 3 Portable covers – Tarpaulins and battening devices**

4. 3. 1 At least two layers of tarpaulin in good condition are to be provided for each hatchway in Positions 1 and 2.
4. 3. 2 Tarpaulins are to be free from jute, waterproof and of ample strength. The minimum mass of the material before treatment is to be 0.65 kg/m<sup>2</sup> if the material is to be tarred, 0.60 kg/m<sup>2</sup> if to be chemically dressed, or 0.55 kg/m<sup>2</sup> if to be dressed with black oil. A certificate to this effect is to be supplied by the makers of the tarpaulins. Special consideration will be given to the use of synthetic materials for tarpaulins.
4. 3. 3 Cleats are to be of an approved pattern, at least 65 mm wide, with edges so rounded as to minimise damage to the wedges, and are to be spaced not more than 600 mm from centre to centre: the first and last cleats along each side or end are to be not more than 150 mm from the hatch corners. Cleats should be so set as to fit the taper of the wedges.
4. 3. 4 Battens and wedges shall be efficient and in good condition. Wedges are to be of tough wood, generally not more than 200 mm in length and 50 mm in width. They should have a taper of not more than 1 in 6 and should not be less than 13 mm at the point.
4. 3. 5 For all hatchways in Positions 1 and 2, steel bars or other equivalent means are to be provided in order to secure each section of hatch covers efficiently and independently after the tarpaulins are battened down. Hatch covers of more than 1.5 m in length are to be secured by at least two such securing appliances. Where hatchway covers extend over intermediate supports, steel bars or their equivalent are to be fitted at each end of each section of covers. At all other hatchways in exposed positions on weather decks, ring bolts or other fittings suitable for lashings are to be provided.

### **4. 4 Packing material**

4. 4. 1 Packing material is to be suitable for all expected service conditions of the ship and is to be compatible with the cargoes to be transported. The packing material is to be selected with regard to dimensions and elasticity in such a way that expected deformations can be carried. Forces are to be carried by the steel structure only.
4. 4. 2 Packing material is to be compressed so as to give the necessary tightness effect for all expected operating conditions. Special consideration will be given to the packing arrangement in ships with large relative movements between hatch covers and coamings or between hatch cover sections.

PART

**3**

CHAPTER **11** **Closing Arrangements for Shell, Deck and Bulkheads**

SECTION **5** **Hatch coamings**

**5. 1 General**

- 5. 1. 1 The height of coamings above the upper surface of the deck, measured above sheathing if fitted, for hatchways closed by portable covers secured weathertight by tarpaulins and battening devices, is to be not less than:
  - 600 mm at Position 1,
  - 450 mm at Position 2.
- 5. 1. 2 Where hatches in locations above Position 2 are included in the consideration of intact and damage stability or are in critical locations above Position 2, then the height of hatch coamings is to be specially considered.
- 5. 1. 3 The height of coamings of hatchways situated in Positions 1 and 2 closed by steel covers fitted with gaskets and clamping devices are to be as specified in [Pt 3, Ch 11, 5.1 General 5.1.1](#), but may be reduced, or the coamings may be omitted entirely, if the safety of the ship is not thereby impaired in any sea condition. Special attention will be given in such cases to the scantlings of the covers, to their gasketing and securing arrangements and to the drainage of recesses in the deck. The agreement of the National Authority concerned will also be required.
- 5. 1. 4 The height of coamings may be required to be increased on ships of Type 'B-100' or Type 'B-60' where this is shown to be necessary by the floatability calculations required by the *International Convention on Load Lines, 1966*.

**5. 2 Construction**

- 5. 2. 1 Vertical cargo hatch coamings 600 mm or more in height are to be stiffened on their upper edges by a horizontal bulb flat or equivalent which is to be not less than 180 mm in width for ships where *L* is greater than 75 m. Additional support is to be afforded by fitting brackets or stays from the bulb flat to the deck at intervals of not more than 3 m. Each bracket or stay is to be aligned with suitable underdeck stiffeners and is to have a softened nose.
- 5. 2. 2 Vertical coamings less than 600 mm in height are to be stiffened at their upper edge by a substantial rolled or fabricated section. Additional support is to be arranged as required by [Pt 3, Ch 11, 5.2 Construction 5.2.2](#).
- 5. 2. 3 Cargo hatchways on other decks, in positions not specified in [Pt 3, Ch 1, 6.6 Position 1 and Position 2](#), are to be suitably framed.
- 5. 2. 4 The scantlings and arrangements of hatch coamings acting as girders will be specially considered. The coamings are to be arranged with intermediate continuous horizontal stiffeners supported by the bracket stays.

- 5.2.5 Sloped cargo hatch coamings will be specially considered. In general, the sloped coaming arrangement is to be restricted to the hatch side coamings with vertical coamings at the ends. The sloped coaming is not to have a knuckle and the angle to the vertical is not to exceed  $30^\circ$ . The scantlings are to be in accordance with [Pt 3, Ch 11, 5.2 Construction 5.2.1](#), [Pt 3, Ch 11, 5.2 Construction 5.2.2](#) and [Pt 3, Ch 11, 5.3 Strength criteria](#), except that the end coamings are to be increased by 20 per cent for a distance of  $0.15b$  from the side coamings where  $b$  is the width of the hatchway at the deck. Particular care is to be taken where the proposed loadings exceed those given in [Pt 3, Ch 11, 2.3, Load model](#) and [Pt 3, Ch 3, 5 Design loading](#), and where the coamings are not in alignment with the topside tank vertical strake in bulk carriers.
- 5.2.6 A radiused coaming plate at the corner junction of the longitudinal and transverse cargo hatch coamings is acceptable for ships where  $L \leq 90$  m and the heights of coamings are not in excess of that specified in [Pt 3, Ch 11, 5.1 General 5.1.1](#). Where  $L > 90$  m the corner junctions are to be rectangular and arranged with continuation brackets as required by [Pt 3, Ch 11, 5.2 Construction 5.2.8](#).
- 5.2.7 The deck plating is to extend inside the coamings and the side coamings are to be extended in the form of tapered brackets. A recommended arrangement is shown in [Figure 11. 5. 1: Coaming continuation bracket - Recommended arrangement](#). Continuation brackets are also to be arranged athwartships in line with the hatch end coamings and the under deck transverse. In bulk carriers the athwartship brackets, in conjunction with the hatch end beams should be arranged to achieve a satisfactory overlap with the top side tank transverses. In cases where the hatch end beam is formed by the transverse bulkhead top stool the horizontal knuckle of the stool should be arranged well clear of the topside tank knuckle line.

**Figure 11. 5. 1: Coaming continuation bracket - Recommended arrangement**

- 5. 2. 8 In bulk carriers where the hatch side coaming does not align with the topside tank vertical strake the arrangement and scantlings will be specially considered. In general, suitable underdeck girders and cantilever brackets are to be arranged taking into consideration the hatch cover loading. The underdeck girders are to continue beyond the hatch end for a distance of  $2H_c$  mm. Alternative arrangements incorporating bulkhead top stool structure or cross-deck structure will be considered.
- 5. 2. 9 Extension brackets or rails arranged approximately in line with the cargo hatch side coamings and intended for the stowage of steel covers are not to be welded to a deckhouse, masthouse or to each other unless they form part of the longitudinal strength members.
- 5. 2. 10 The arrangement and scantlings of continuous hatchway coamings on the strength deck will be specially considered. The material of the coamings is to comply with [Table 2. 2. 1: Material classes and grades](#) and [Table 2. 2. 2: Steel grades](#) in [Pt 3, Ch 2 Materials](#) and is to be of the same strength level as the deck plating. Discontinuous coamings of length greater than  $0.09L$  are also to satisfy this requirement.
- 5. 2. 11 Where containers are carried on multi-panel hatch covers, the hatch coaming in way of the loaded panel will be required to be reinforced to resist the lateral loads imposed on the coaming due to rolling of the ship. Thrust blocks are to be fitted on the coaming rest bar to prevent the covers from moving. Where one-piece hatch covers are fitted with locating devices, the coamings are to be reinforced in way of the locators.
- 5. 2. 12 Cut outs in the top of hatch coamings are to be avoided. Where these are necessary for the securing devices they are to be circular or elliptical in shape. Also any local reinforcements should be given a tapered transition in the longitudinal direction with a taper the rate of which should not exceed 1 in 3. Cut-outs and drain holes are to be avoided in the hatch side coaming continuation brackets. Where these are necessary the size, shape and position will be specially considered.
- 5. 2. 13 Material for hatch coamings is to be steel, according to the requirements for ship's hull. Alternative materials will be subject to special consideration.
- 5. 2. 14 Secondary stiffeners of hatch coamings are to be continuous over the breadth and length of hatch coamings.
- 5. 2. 15 Longitudinal hatch coamings with a length exceeding  $0.1L$  m are to be provided with tapered brackets or equivalent transitions and a corresponding substructure at both ends. At the end of the brackets they are to be connected to the deck by full penetration welds of minimum 300 mm in length.
- 5. 2. 16 Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions. Structures under deck are to be checked against the load transmitted by coaming stays.
- 5. 2. 17 On ships carrying cargo on deck, such as timber, coal or coke, coaming stays are to be spaced not more than 1.5 m apart.
- 5. 2. 18 Coaming plates are to extend to the lower edge of the deck beams; they or hatch side girders are to be fitted that extend to the lower edge of the deck beams. Extended coaming plates and hatch side girders are to be flanged or fitted with face bars or half-round bars. [Figure 11. 5. 2: Example of hatch side girder](#) and [Figure 11. 5. 3: Example of coaming stays](#) give examples.

Figure 11. 5. 2: Example of hatch side girder

### 5. 3 Strength criteria

5. 3. 1 The strength requirements in this Section are applicable to hatch coamings of stiffened plate construction.
5. 3. 2 The local net plate thickness of weather deck hatch coamings is not to be less than the larger of the following values:

$$t = 0.0142s \sqrt{\frac{P_A}{0.95\sigma_0}} \text{ in mm}$$

$$t_{\min} = 6 + \frac{L_1}{100} \text{ in mm}$$

Where

$s$  = stiffener spacing, in mm

$L_1$  =  $L$  need not be taken greater than 300 metres

$p_A$  = pressure, in kN/m<sup>2</sup>, as defined in [Pt 3, Ch 11, 2.3 Load model 2.3.3](#)

= Longitudinal strength aspects are to be observed.

5. 3. 3 Secondary stiffeners of coamings must be continuous at the coaming stays. For stiffeners with both ends constrained, the elastic net section modulus  $Z$  in cm<sup>3</sup> and net shear area  $A_s$  in cm<sup>2</sup>, calculated on the basis of net thickness, are not to be less than:

$$Z = \frac{0.083}{\sigma_0} s l^2 p_A \text{ cm}^3$$

$$A_s = \frac{0.01 s l p_A}{\sigma_0} \text{ cm}^2$$

Where

$l$  = secondary stiffener span, in metres, to be taken as the spacing of coaming stays

$s$  = stiffener spacing in mm

$p_A$  = pressure, in kN/m<sup>2</sup>, as defined in [Pt 3, Ch 11, 2.3 Load model 2.3.3](#).

5. 3. 4 For sniped stiffeners at coaming corners, section modulus and shear area at the fixed support are to be increased by 35 per cent. The gross thickness of the coaming plate at the sniped stiffener end is not to be less than:

$$t = 19.6 \sqrt{\frac{0.001 s p_A (l - 0.0005 s)}{\sigma_o}} \text{ in mm}$$

Where

$p_A$  = pressure, in kN/m<sup>2</sup>, as defined in [Pt 3, Ch 11, 2.3 Load model 2.3.3](#).

5. 3. 5 Coaming stays are to be designed for the loads transmitted through them, and permissible stresses according to [Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1](#).

5. 3. 6 At the connection with deck, the net section modulus  $Z$ , in cm<sup>3</sup>, and the gross thickness  $t_w$ , in mm, of the coaming stays designed as beams with flange (examples 1 and 2 are shown in [Figure 11. 5. 3: Example of coaming stays](#)) are to be taken not less than:

$$Z = \frac{526}{\sigma_o} e h_s^2 p_A \text{ in cm}^3$$

and

$$t_w = \frac{2}{\sigma_o} \frac{e h_s p_A}{h_w} + t_c \text{ in mm}$$

**where**  $e$  = spacing of coaming stays, in metres

$h_s$  = height of coaming stays, in metres

$h_w$  = web height of coaming stay at its lower end, in metres

$t_c$  = corrosion addition, in mm, according to [Table 11. 1. 2: Corrosion addition  \$t\_c\$](#)

$p_A$  = pressure, in kN/m<sup>2</sup>, as defined in [Pt 3, Ch 11, 2.3 Load model 2.3.3](#).

$\sigma_o$  = minimum yield stress, in N/mm<sup>2</sup>.

5. 3. 7 For other designs of coaming stays, such as those shown in examples 3 and 4 in [Figure 11. 5. 3: Example of coaming stays](#), the stresses are to be determined through FEM. The calculated stresses are to comply with the permissible stresses according to [Pt 3, Ch 11, 2.6 Local plate thickness of hatch covers for wheel loading and helicopter landing](#).

**Figure 11. 5. 3: Example of coaming stays**

Example 1

Example 2

Example 3

Example 4

- 5. 3. 8 Coaming stays are to be supported by appropriate substructures. Face-plates may be included in the calculation only if an appropriate substructure is provided and welding ensures an adequate joint.
- 5. 3. 9 Webs of coaming stays are to be connected to the deck by fillet welds on both sides with a throat thickness of  $a = 0.44t_w$ .
- 5. 3. 10 For coaming stays which transfer friction forces at hatch cover supports, fatigue strength is to be considered, See [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.5](#) to [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.8](#).
- 5. 3. 11 Hatch coamings which are part of the longitudinal hull structure are to be designed according to the requirements for longitudinal strength in [Pt 3, Ch 4 Longitudinal Strength](#).
- 5. 3. 12 For structural members welded to coamings and for cut-outs in the top of coamings, sufficient fatigue strength is to be verified.

## **5. 4 Rest bars in hatchways**

5. 4. 1 Rest bars are to provide at least 65 mm bearing surface and are to be aligned if required to suit the slope of the hatches.

## **5. 5 Loading in excess of Rule requirements**

5. 5. 1 For weather deck hatch side coamings forming part of a hatch side girder subjected to loading exceeding that defined in [Pt 3, Ch 11, 2.3, Load model](#), See [Pt 4, Ch 1, 4 Deck structure](#).

CHAPTER **11** **Closing Arrangements for Shell, Deck and Bulkheads**SECTION **6** **Miscellaneous openings****6. 1 Small hatchways on exposed decks**

## 6. 1. 1 Hatches which:

- are designed for access to spaces below the deck;
- are capable of being closed weathertight or watertight, as applicable;
- have an opening 2.5 m<sup>2</sup> or less;
- are located on the exposed deck over the forward 0.25L of the ship's rule length;
- are on a ship of sea-going service of length 80 m or more, where the height of the exposed deck in way of the hatch is less than 0.1L or 22 m above the summer load waterline, whichever is the lesser;

are to comply with the requirements of [Pt 3, Ch 11, 6.6, Small hatchways on exposed fore decks](#). All other small hatchways or access openings in the positions defined in [Pt 3, Ch 11, 1.1 Application 1.1.6](#) are to comply with the following requirements.

- 6. 1. 2 The number and size of hatchways and other access openings are to be kept to the minimum consistent with the satisfactory operation of the ship.
- 6. 1. 3 The height of coamings is to be in accordance with [Pt 3, Ch 11, 5.1 General 5.1.1](#). Lower heights may be considered in relation to operational requirements and the nature of the spaces to which access is given.
- 6. 1. 4 Rope hatches may be accepted with reduced coamings, but generally not less than 380 mm, provided they are well secured and closed before the ship leaves port. A suitable notice is to be displayed at the hatch stating that it is to be closed whilst the ship is at sea.
- 6. 1. 5 The thickness of the coamings is to be not less than the Rule minimum thickness for the deck inside line of openings for that position, or 11 mm, whichever is the lesser. Stiffening of the coaming is to be appropriate to its length and height.
- 6. 1. 6 Hatch covers are to be of steel, weathertight and generally hinged. The means of securing are to be such that weathertightness can be maintained in any sea condition. Where toggles are fitted, their diameter and spacing are to be in accordance with ISO Standard or equivalent.
- 6. 1. 7 Hinges are not to be used as securing devices unless specially considered.
- 6. 1. 8 The thickness of covers is to be not less than the Rule minimum thickness inside the line of openings for the deck at that point, or 8 mm, whichever is the lesser.
- 6. 1. 9 The covers are to be adequately stiffened.

- 6. 1. 10 To facilitate a swift and safe means of escape to the lifeboat and life raft embarkation deck, the following provisions apply to overhead hatches fitted along the escape routes addressed by *SOLAS Regulation 13 - Means of escape*:
  - a. escape hatches and their securing devices shall be of a type which can be opened from both sides;
  - b. the maximum force needed to open the hatch cover should not exceed 150 N; and
  - c. the use of a spring equalising, counterbalance or other suitable device on the hinge side to reduce the force needed for opening is acceptable.
- 6. 1. 11 Small hatches, including escape hatches, are to be situated clear of cargo containment areas, particularly in the case of offshore supply ships.
- 6. 1. 12 Where portable plates are required in decks for unshipping machinery, or for other similar reasons, they may be accepted provided they are of equivalent strength to the unpierced deck and are secured by gaskets and closely spaced bolts at a pitch not exceeding five diameters.
- 6. 1. 13 Satisfactory means are to be provided to prevent inadvertent flooding of chain lockers. See [Pt 3, Ch 13, 8.12 Structural requirements associated with anchoring 8.12.5](#) and [Pt 3, Ch 13, 8.12 Structural requirements associated with anchoring 8.12.7](#).
- 6. 1. 14 Where permitted by the National Authority, access hatch coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable with a minimum height of 230 mm.

## 6. 2 Manholes and flush scuttles

- 6. 2. 1 Manholes and flush scuttles fitted in Positions 1 and 2, or within superstructures other than enclosed superstructures, are to be closed by substantial covers capable of being made watertight. Unless secured by closely spaced bolts, the covers are to be permanently attached.

## 6. 3 Hatchways within enclosed superstructures or 'tween decks

- 6. 3. 1 The requirements of [Pt 3, Ch 11, 6.1, Small hatchways on exposed decks](#) are to be complied with where applicable.
- 6. 3. 2 Access hatches within a superstructure or deckhouse in Position 1 or 2 need not be provided with means for closing if all openings in the surrounding bulkheads have weathertight closing appliances.

## 6. 4 Companionways, doors and accesses on weather decks

- 6. 4. 1 Companionways on exposed decks are to be of equivalent construction, weathertightness and strength to a deckhouse in the same position and effectively secured to the deck.
- 6. 4. 2 Access openings in:
  - a. bulkheads at ends of enclosed superstructures;
  - b. deckhouses or companionways protecting openings leading into enclosed superstructures or to spaces below the freeboard deck; and
  - c. deckhouse on a deckhouse protecting an opening leading to a space below the freeboard deck are to be fitted with doors of steel or other equivalent material, permanently and strongly attached to the bulkhead and framed, stiffened and fitted so that the whole structure is of equivalent strength to the unpierced bulkhead, and weathertight when closed. The doors are to be gasketed and secured weathertight by means of clamping devices or equivalent arrangements, permanently attached to the bulkhead or to the door. Doors are generally to open outwards and are to be capable of being operated and secured from both sides. The sill heights are to be as required by [Pt 3, Ch 11, 6.4](#)

[Companionways, doors and accesses on weather decks 6.4.6](#). See also [Pt 3, Ch 11, 7 Tanker access arrangements and closing appliances](#) and [Pt 4, Ch 9, 13 Access arrangements and closing appliances](#) and [Pt 4, Ch 11, 1 General](#) and the Rules for Ships for Liquid Chemicals, concerning access openings in tankers, chemical tankers and ore or oil ships. Double doors are to be equivalent in strength to the unpierced bulkhead, and in Position 1, a centre pillar is to be provided which may be portable.

- 6. 4. 3 Elsewhere doors may be of hardwood not less than 50 mm in thickness or of equivalent material and strength.
- 6. 4. 4 Fixed lights in doors are to comply with the requirements for side scuttles as given in [Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights 6.5.1](#) and [Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights 6.5.2](#). Hinged steel deadlights may be external.
- 6. 4. 5 The height of doorway sills above deck sheathing of access openings in bulkheads at ends of enclosed superstructures is to be not less than 600mm in Position 1 and not less than 380mm otherwise.
- 6. 4. 6 The height of doorway sills above deck sheathing, if fitted, is to be not less than 600 mm in Position 1, and not less than 380 mm in Position 2.
- 6. 4. 7 Where access is provided from the deck above as an alternative to access from the freeboard deck, the height of sill into a bridge or a poop is to be not less than 380 mm. The same requirement applies to deckhouses on the freeboard deck. The sill height for doorways in a forecabin, if protecting a companionway, is to be 600 mm regardless of whether or not access is provided from above. If not protecting a companionway, the sill height may be 380 mm.
- 6. 4. 8 When the closing appliances of openings in superstructures and deckhouses do not comply with [Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks 6.4.2](#), interior deck openings are to be treated as if exposed on the weather deck.
- 6. 4. 9 Where an access opening, in the top of a deckhouse situated on a raised quarterdeck, gives access below the freeboard deck or to an enclosed superstructure, the closing appliances in the surrounding bulkheads are not required to be gasketed, provided the raised quarterdeck is at least standard height, and the deckhouse is at least standard superstructure height.
- 6. 4. 10 The height of door sills may be required to be increased on ships of Type 'A', Type 'B-100' or Type 'B-60' where this is shown to be necessary by the floatability calculations required by the *International Convention on Load Lines, 1966*.
- 6. 4. 11 Where doors in locations above Position 2 are included in the consideration of intact and damage stability or are in critical locations above Position 2, then the height of door sills is to be specially considered.
- 6. 4. 12 Direct access from the freeboard deck to the machinery space through exposed casings is not permitted on ships of Type 'A', Type 'B-100' or Type 'B-60'. A door complying with [Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks 6.4.2](#) may, however, be fitted in an exposed machinery casing on these ships, provided that it leads to a space or passageway which is of equivalent strength to the casing and is separated from the machinery space by a second weathertight door complying with [Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks 6.4.2](#). The outer and inner weathertight doors are to have sill heights of not less than 600 mm and 230 mm, respectively and the space between is to be adequately drained by means of a screw plug or equivalent.
- 6. 4. 13 For a Type 'A' ship with freeboards assigned greater than, or equal to, Type 'B', inner doors are not required for direct access to the engine-room.
- 6. 4. 14 If internal access is provided from a wheelhouse in Position 2, or below, to spaces below the weather deck either directly or through other spaces, the opening should be protected by a hinged weathertight cover adequately secured, fitted on a coaming appropriate to its position, or by an equivalent arrangement, and the space adequately drained.

- 6. 4. 15 In way of a moonpool, where a working or platform deck is provided below the weather deck, openings in the surrounding bulkheads are to be kept to a minimum. Access or companionway openings are to be provided with weathertight closing appliances as for an exposed superstructure bulkhead, with 600 mm high coamings.
- 6. 4. 16 Where portable plates are required in casings for unshipping machinery, or for other similar reasons, they may be accepted provided they are of equivalent strength to the unpierced bulkhead and are secured by gaskets and close spaced bolts at a pitch not exceeding five diameters.
- 6. 4. 17 The sill heights of accesses closed by covers which are secured by closely spaced bolts or otherwise kept permanently closed at sea will be specially considered.
- 6. 4. 18 Where permitted by the National Authority, companionway coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable with a minimum height of 230 mm. Where the wheelhouse is on the freeboard deck, or located in the forward quarter of the ship's length, with internal access below, a weathertight cover, fitted to a coaming not less than 230 mm high, is to be provided for the access. Alternatively, storm covers are to be provided for windows in exposed positions. The wheelhouse is to be adequately drained.

## 6. 5 Side scuttles, windows and skylights

- 6. 5. 1 Side scuttles are defined as being round or oval openings with an area not exceeding 0.16 m<sup>2</sup>.
- 6. 5. 2 Windows are defined as being rectangular openings generally, having a radius at each corner relative to the window size in accordance with a recognised National or International Standard, and round or oval openings with an area exceeding 0.16 m<sup>2</sup>.
- 6. 5. 3 Deadlights are fitted to the inside of windows and side scuttles while storm covers, of comparable specifications to deadlights, are fitted to the outside of windows, where accessible. Deadlights can be hinged and storm covers can be hinged or portable.
- 6. 5. 4 A plan showing the location of side scuttles and windows is to be submitted. Attention is to be given to any relevant Statutory Requirements of the National Authority of the country in which the ship is to be registered.
- 6. 5. 5 Side scuttles and windows together with their glasses, deadlights and storm covers if fitted, are to be of an approved design or in accordance with a recognised National or International Standard. The minimum design pressures to which windows and side scuttles are to be designed are to be in accordance with [Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks](#) unless otherwise specified by the relevant requirements of [Pt 4 Ship Structures \(Ship Types\)](#)
- 6. 5. 6 Side scuttles and windows are to comply with the relevant requirements given in Pt 4 Ship Structures (Ship Types) for the applicable ship type in conjunction with the requirements of [Pt 3, Ch 11, 6.5, Side scuttles, windows and skylights](#)
- 6. 5. 7 Side scuttles to spaces below the freeboard deck, or to spaces within the first tier of enclosed superstructures, or to first tier deckhouses on the freeboard deck protecting openings leading below or considered buoyant in stability calculations, are to be fitted with efficient, hinged, inside deadlights.
- 6. 5. 8 Deadlights are to be capable of being closed and secured watertight if fitted below the freeboard deck or weathertight if fitted above.
- 6. 5. 9 No side scuttle is to be fitted in such a position that its sill is below a line drawn parallel to the freeboard deck at side and having its lowest point 2.5 per cent of the breadth *B* above the load waterline corresponding to the summer freeboard (or timber summer freeboard if assigned), or 500 mm, whichever is the greater distance, See [Figure 11. 6. 1: Side Scuttle Positioning](#).

6. 5. 10 If the required damage stability or floatability calculations indicate that the side scuttles would become immersed at any intermediate stages of flooding or the final equilibrium waterline, these are to be of the non-opening type.
6. 5. 11 Windows are not to be fitted below the freeboard deck, in first tier end bulkheads or sides of enclosed superstructures, or in first tier deckhouses that are considered buoyant in stability calculations or protecting openings leading below.
6. 5. 12 Where windows are fitted in a deckhouse in the first tier, they are to be provided with strong, hinged, steel, weathertight storm covers. However, if there is an opening leading below deck in this deckhouse, this opening is to be treated as being on an exposed deck and is to be protected as required by [Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks 6.4.2](#).
6. 5. 13 Where windows are permitted in an exposed bulkhead on the weather deck in the forward 0.25 of the load line length, strong external storm covers which can be portable and stored adjacent are to be provided.

**Figure 11. 6. 1: Side Scuttle Positioning**

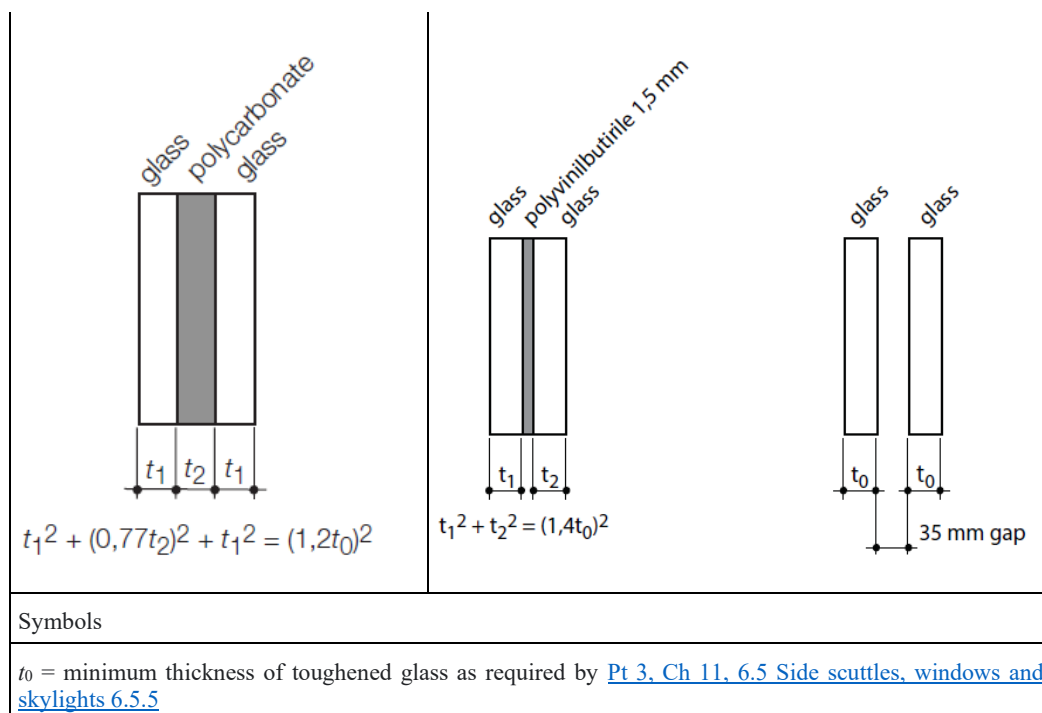

6. 5. 14 Side scuttles and windows at the side shell in the second tier protecting direct access below or spaces considered buoyant in stability calculations are to be provided with efficient inside deadlights capable of being effectively closed and secured weathertight.
6. 5. 15 Side scuttles and windows set inboard from the side shell in the second tier protecting direct access below to spaces listed in [Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights 6.5.7](#), are to be provided with either efficient hinged inside deadlights or, where they are accessible, permanently attached external storm covers of approved design and of substantial construction and capable of being effectively closed and secured weathertight.
6. 5. 16 Cabin bulkheads and doors in the second tier separating side scuttles and windows from a direct access leading below may be accepted in place of deadlights or storm covers fitted to the side scuttles or windows.
6. 5. 17 Side scuttles and windows set inboard from the side shell in the second tier, not protecting direct access below or spaces considered buoyant in the stability calculations, do not require deadlights or storm covers.
6. 5. 18 If fitted in a deckhouse in the second tier located within the forward 0.25 of the load line length windows are to be provided with strong, hinged, steel, weathertight storm covers. However, if there is an opening leading below deck in this deckhouse, this opening is to be treated as being on an exposed deck and is to be protected as required by [Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks 6.4.2](#).

6. 5. 19 Where the wheelhouse is in the second tier located abaft the forward 0.25 of the load line length, in lieu of storm covers being provided for the wheelhouse windows, a weathertight cover, fitted to a coaming of not less than 230 mm in height around the internal stairway opening within the wheelhouse, can be accepted. If this arrangement is accepted, adequate means of draining the wheelhouse are to be provided.
6. 5. 20 Deckhouses or superstructure situated on a raised quarter deck or on the deck of a superstructure of less than standard height or on the deck of a deckhouse of less than standard height can be regarded as being in the second tier as far as the provision of deadlights is concerned, provided that the height of the raised quarter deck, superstructure or deckhouse is equal to, or greater than, the standard quarter deck height.
6. 5. 21 Where the wheelhouse is in the third tier located in the forward 0.25 of the load line length, in lieu of storm covers being provided for the wheelhouse windows, a weathertight cover, fitted to a coaming of not less than 230 mm in height around the internal stairway opening within the wheelhouse, can be accepted. If this arrangement is accepted, adequate means of draining the wheelhouse are to be provided.
6. 5. 22 Windows at the side shell in the third tier are to be provided with strong portable internal storm covers for 25 per cent of each size of window, with means of securing being provided at each window.
6. 5. 23 Windows at the side shell in the fourth tier located in the forward 0.25 of the load line length are to be provided with strong portable internal storm covers for 25 per cent of each size of window, with means of securing being provided at each window.
6. 5. 24 If necessary, for practical considerations, storm covers can be in two parts.
6. 5. 25 For windows in the second tier and higher above the freeboard deck, a glazing equivalent can be fitted in lieu of deadlights/storm covers. The thicknesses and arrangements are to be acceptable to the National Authority with whom the ship is registered. For arrangements of glazing acceptable to LR, See [Table 11. 6. 1: Acceptable arrangements of glazing in lieu of portable storm covers/deadlights](#). Other glazing equivalents will be considered on a case-by-case basis.
6. 5. 26 Windows are not to be fitted in machinery space boundaries. However, this does not preclude the use of glass in control rooms within the machinery space.
6. 5. 27 Skylights, where fitted, are to be of substantial construction and securely attached to their coamings. The height of the lower edge of the opening is to be as required by [Pt 3, Ch 11, 5.1 General 5.1.1](#). The scantlings of the coaming are to be as required by this Section or [Pt 3, Ch 11, 5 Hatch coamings](#), as appropriate. The thickness of glasses in fixed or opening skylights is to be appropriate to their size and position as required for side scuttles or windows. Glasses in any position are to be protected from mechanical damage and, where fitted in Positions 1 or 2, are to be provided with robust deadlights or storm covers permanently attached. Cargo pump room and machinery space skylights are not to contain glass.
6. 5. 28 Skylights to cargo pump rooms are to be capable of being closed from outside the pump room.

**Table 11. 6. 1: Acceptable arrangements of glazing in lieu of portable storm covers/deadlights**

|                                  |  |
|----------------------------------|--|
| In lieu of portable storm covers | In lieu of deadlights and storm covers |
|----------------------------------|--|

6. 5. 29 Laminated toughened safety glass may also be used for windows but the total thickness will need to be greater than that required for the equivalent sized window using toughened safety glass. The equivalent thickness of laminated toughened safety glass is to be determined from the following formula:

$$T_{L1}^2 + T_{L2}^2 + \dots + T_{Ln}^2 = T_s^2$$

$n$  = number of laminates

$T_{Li}$  = thickness of glass laminate

$T_s$  = thickness of toughened safety glass

Alternative arrangements that do not meet the above thickness requirement will be specially considered, provided that equivalent strength and bending stiffness to that of a single, thermally toughened pane of thickness,  $T_s$ , can be demonstrated in a four-point bending test as described in EN-ISO 1288-3 or an equivalent recognised National or International Standard, using not less than ten samples. The lower limit of the 90 per cent confidence level interval for the laminated pane shall not be less than the same for monolithic toughened safety glass. Small scale punch test or ring-in-ring test methods shall not be used.

6. 5. 30 Non-metallic frames are not acceptable for windows in the first and second tiers, and are not generally acceptable in any other position in external casings. Any proposals to fit non-metallic frames are to be submitted for consideration, and are to be acceptable to the Administration. The proposed locations, frame dimensions, glass thicknesses and the results of any tests carried out, are to be forwarded.

## 6. 6 Small hatchways on exposed fore decks

6. 6. 1 For the application of the following requirements, See [Pt 3, Ch 11, 6.1, Small hatchways on exposed decks](#).
6. 6. 2 The number and size of hatchways and other access openings are to be kept to the minimum consistent with the satisfactory operation of the ship.

- 6. 6. 3 The height of coamings is to be in accordance with [Pt 3, Ch 11, 5.1 General 5.1.1](#). Lower heights may be considered in relation to operational requirements and the nature of the spaces to which access is given.
- 6. 6. 4 ope hatches may be accepted with reduced coamings, but generally not less than 380 mm, provided they are well secured and closed before the ship leaves port. A suitable notice is to be displayed at the hatch stating that it is to be closed whilst the ship is at sea.
- 6. 6. 5 Where permitted by the National Authority, access hatch coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable with a minimum height of 230 mm.
- 6. 6. 6 The thickness of the coamings is to be not less than the Rule minimum thickness for the deck inside line of openings for that position, or 11 mm, whichever is the lesser.
- 6. 6. 7 The upper edge of the hatchway coamings is to be suitably reinforced by a horizontal section, normally not more than 170 to 190 mm from the upper edge of the coamings.
- 6. 6. 8 Hatches are to be fitted with primary securing devices such that their hatch covers can be secured in place and weather-tight by means of a mechanism employing any one of the following methods:
  - a. Butterfly nuts tightening onto forks (clamps),
  - b. Quick acting cleats, or
  - c. Central locking device.
 Emergency escape hatches are excluded from options (a) and (b).
- 6. 6. 9 Dogs (twist tightening handles) with wedges are not acceptable as primary securing devices.
- 6. 6. 10 Escape hatches are to be capable of being opened from either side and are to have a quick-acting type securing device, e.g. one action wheel handle central locking device for latching/unlatching the hatch cover.
- 6. 6. 11 For a primary securing method using butterfly nuts, the forks (clamps) are to be of robust design. They are to be designed to minimise the risk of butterfly nuts being dislodged while in use; by means of curving the forks upward, a raised surface on the free end, or a similar method. The plate thickness of unstiffened steel forks is not to be less than 16 mm. An example arrangement is shown in [Figure 11. 6. 3: Example of a primary securing method](#).

Figure 11. 6. 2: Arrangement of stiffeners

**Figure 11. 6. 3: Example of a primary securing method**

6. 6. 12 The hatch cover is to be fitted with a gasket of elastic material. This is to be designed to allow a metal to metal contact at a designed compression and to prevent over compression of the gasket by green sea forces that may cause the securing devices to be loosened or dislodged. The metal-to-metal contacts are to be arranged close to each securing device in accordance with [Figure 11. 6. 2: Arrangement of stiffeners](#), and of sufficient capacity to withstand the bearing force.
6. 6. 13 The primary securing method is to be designed and manufactured such that the designed compression pressure can be achieved by one person without the need of any tools.
6. 6. 14 For small rectangular steel hatch covers, the plate thickness, stiffener arrangement and scantlings are to be in accordance with [Table 11. 6. 2: Scantlings for small steel hatch covers on exposed deck](#) and [Figure 11. 6. 2: Arrangement of stiffeners](#). Stiffeners, where fitted, are to be aligned with the metal-to-metal contact points required in [Pt 3, Ch 11, 6.6 Small hatchways on exposed fore decks 6.6.11](#), See [Figure 11. 6. 2: Arrangement of stiffeners](#). Primary stiffeners are to be continuous. All stiffeners are to be welded to the inner edge stiffener, See [Figure 11. 6. 3: Example of a primary securing method](#).

**Table 11. 6. 2: Scantlings for small steel hatch covers on exposed deck**

| nominal<br>size<br>(mm x mm) | cover<br>plate<br>thickness<br>(mm) | primary<br>stiffeners<br>Flat bar (mm x mm);<br>number | secondary<br>stiffeners |
|------------------------------|-------------------------------------|--|-------------------------|
|------------------------------|-------------------------------------|--|-------------------------|

|             |   |            |            |
|-------------|---|------------|------------|
| 630 x 630   | 8 | —          | —          |
| 630 x 830   | 8 | 100 x 8.1  | —          |
| 830 x 630   | 8 | 100 x 8.1  | —          |
| 830 x 830   | 8 | 100 x 10.1 | —          |
| 1030 x 1030 | 8 | 120 x 12.1 | 80 x 8.2   |
| 1330 x 1330 | 8 | 150 x 12.2 | 100 x 10.2 |

6. 6. 15 For hatch covers constructed of materials other than steel, the required scantlings are to provide equivalent strength.
6. 6. 16 For small hatch covers of circular or similar shape, the cover plate thickness and reinforcement are to be of equivalent strength to that of the small rectangular steel hatch covers described in [Pt 3, Ch 11, 2.2 Stiffener arrangement 2.2.1](#).
6. 6. 17 For hatch covers located on the deck forward of the fore-most cargo hatch, the hinges are to be fitted such that the predominant direction of green sea will cause the cover to close. The hinges are normally to be located on the fore edge.
6. 6. 18 On small hatches located between the main hatches, for example between Numbers 1 and 2, the hinges are to be placed on the fore edge or outboard edge, whichever is practicable for protection from green water in beam sea and bow quartering conditions.
6. 6. 19 Hatches, excluding emergency escape hatches, are to be fitted with an independent secondary securing device, e.g. by means of a sliding bolt, a hasp or a backing bar of slack fit, which is capable of keeping the hatch cover in place, even in the event that the primary securing device became loosened or dislodged. It is to be fitted on the side opposite to the hatch cover hinges.
6. 6. 20 Small hatches, including escape hatches, are to be situated clear of cargo containment areas, particularly in the case of offshore supply ships.
6. 6. 21 Where portable plates are required in decks for unshipping machinery, or for other similar reasons, they may be accepted provided they are of equivalent strength to the unpierced deck and are secured by gaskets and closely spaced bolts at a pitch not exceeding five diameters.
6. 6. 22 Satisfactory means are to be provided to prevent inadvertent flooding of chain lockers, See [Pt 3, Ch 13, 8.12 Structural requirements associated with anchoring 8.12.5](#) and [Pt 3, Ch 13, 8.12 Structural requirements associated with anchoring 8.12.7](#).

**CHAPTER 11 Closing Arrangements for Shell, Deck and Bulkheads****SECTION 7 Tanker access arrangements and closing appliances****7.1 Materials**

- 7.1.1 Covers for access hatches, tank cleaning and other openings to cargo tanks and adjacent spaces are to be manufactured from steel complying with the [Pt 2 Rules for the Manufacture, Testing and Certification of Materials](#).
- 7.1.2 Consideration will be given to the use of bronze, brass or other materials; however, aluminium alloy is not to be used for the covers of any openings to tanks.
- 7.1.3 Synthetic materials will be considered, taking into account their fire resistance and physical and chemical properties in relation to the intended operating conditions. Details of the properties of the material, the design of the cover and the method of manufacture are to be submitted for approval.
- 7.1.4 The hatch cover packing material is to be compatible with the cargoes to be carried and is to be efficiently held in place.

**7.2 Cargo tank access hatchways**

- 7.2.1 Attention is drawn to IMO Resolutions concerning safe access to, and working in, large tanks.
- 7.2.2 Oiltight hatchways are to be kept to the minimum size required to provide reasonable access and ventilation. Where tanks are large or subdivided by wash bulkheads, additional hatchways may be required. In determining the size and location of hatchways, consideration should be given to the handling of materials and staging for maintenance in the tank.
- 7.2.3 The size and location of hatchways should also take into account access for personnel wearing breathing apparatus, and removal of injured personnel (possibly on a stretcher) from the bottom of the tank.
- 7.2.4 The height of hatch coaming is to be not less than 600 mm, measured above the upper surface of the freeboard deck, unless a lower height is permitted by the Administration of the country in which the ship is to be registered.
- 7.2.5 Taking account of sheer and camber, the height of any cargo tank hatch coaming is to be such as to ensure that the top of the hatch coaming is above the highest point of the tank over which it is fitted.
- 7.2.6 The height of the coaming may be required to be increased if this is shown to be necessary by the floatability calculations required by the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988*.

- 7. 2. 7 The thickness of the coaming plate is to be not less than 10 mm, but may be required to be increased, and edge stiffening fitted, where the coaming height exceeds 600 mm.
- 7. 2. 8 Unstiffened plate covers are to be not less than 12.5 mm in thickness, but if the area of the cover exceeds 1.2 m<sup>2</sup> this thickness may be required to be increased or stiffening fitted.
- 7. 2. 9 Unstiffened covers are to be secured by fastenings spaced not more than 600 mm apart on circular hatchways. On rectangular hatchways the spacing of fastenings is generally not to exceed 450 mm, and the distance between hatch corners and adjacent fastenings is to be not more than 230 mm.
- 7. 2. 10 The arrangement of fastenings on stiffened hatchway covers and covers of special design will be specially considered.
- 7. 2. 11 Where the cover is hinged, adequate stiffening of the coaming and cover in way of the hinge is to be provided. In general, hinges are not to be used as securing devices for the cover.

### **7. 3 Enlarged cargo tank access openings**

- 7. 3. 1 Proposals to fit enlarged cargo tank accesses closed by bolted plate covers will be considered. Such openings may be of extended dimensions for ease of access and evacuation of personnel, *See [Pt 3, Ch 11, 7.2 Cargo tank access hatchways 7.2.3](#)*, and may incorporate a smaller access hatch for normal use constructed as required by *[Pt 3, Ch 11, 7.2, Cargo tank access hatchways](#)*.
- 7. 3. 2 The plate cover is to be not less than 15 mm in thickness and is to be secured by closely spaced studs to a ring of suitable dimensions, welded to the deck. The studs are not to penetrate the deck plating.

### **7. 4 Miscellaneous openings**

- 7. 4. 1 Small openings for tank cleaning, ullage and similar purposes may be closed by flush covers which are to be not less than 12.5 mm in thickness and secured by studs not more than 100 mm apart. Studs are to be arranged in a ring of suitable width and thickness attached to the deck, and are not to penetrate the deck plating.
- 7. 4. 2 Small diameter holes provided for staging wires are to be closed by plugs of an approved pattern. The plugs are to be provided with a thick washer of suitable material which is also compatible with the intended cargoes. Spare plugs equal to at least 10 per cent of the number of holes are to be provided and maintained on board, *See also [Pt 4, Ch 9, 4 Hull envelope plating](#)*. If these openings are threaded they are to be protected while in use with a protective sleeve of suitable material.

### **7. 5 Access to spaces other than cargo tanks**

- 7. 5. 1 Access to clean ballast or dry tanks and to cofferdams may be either by access hatch or by manhole generally complying with the preceding requirements.

### **7. 6 Equivalents**

- 7. 6. 1 Alternative access cover designs and securing arrangements will be considered on the basis of equivalence to the above requirements and taking into account any relevant National Requirements.

## **7. 7   ther openings**

7. 7. 1   For access to structure within cargo tanks, See [Pt 4, Ch 9, 13 Access arrangements and closing appliances](#).

## CHAPTER 11 Closing Arrangements for Shell, Deck and Bulkheads

### SECTION 8 Side and stern doors and other shell openings

#### 8.1 Symbols

8.1.1 The symbols used in this Section are defined as follows:

- $d$  = distance between closing devices, in metres
- $k$  = material factor, See [Pt 3, Ch 2, 1.2, Steel](#), but is not to be taken less than 0.72 unless demonstrated otherwise by a direct strength analysis with regard to relevant modes of failure
- $I$  = moment of inertia, in  $\text{cm}^4$ , of the stiffener or girder, in association with an effective width of attached plating determined in accordance with [Pt 3, Ch 3, 3 Structural idealisation](#)
- $\sigma$  = bending stress, in  $\text{N/mm}^2$
- $\sigma_e$  = equivalent stress, in  $\text{N/mm}^2$   

$$= \sqrt{(\sigma^2 + 3\tau^2)}$$
- $\sigma_o$  = minimum yield stress of the bearing material, in  $\text{N/mm}^2$
- $\tau$  = shear stress, in  $\text{N/mm}^2$ .

#### 8.2 General

- 8.2.1 These requirements cover cargo and service doors in the ship side (abaft the collision bulkhead) and stern area, below the freeboard deck and in enclosed superstructures.
- 8.2.2 For the requirements of bow doors, See [Pt 4, Ch 2, 8 Bow doors and inner doors](#).
- 8.2.3 Side and stern doors are to be so fitted as to ensure tightness and structural integrity commensurate with their location and the surrounding structure, See also [Pt 3, Ch 1, 6.4 Weathertight 6.4.2](#) and [Pt 3, Ch 1, 6.5 Watertight 6.5.2](#).
- 8.2.4 In general, and for passenger ships in particular, the lower edge of door openings is not to be below a line drawn parallel to the freeboard deck at side, which has at its lowest point at least 230 mm above the upper edge of the uppermost Load Line.
- 8.2.5 When the lower edge is below the line specified in [Pt 3, Ch 11, 8.2 General 8.2.4](#), the arrangement will be specially considered. Special consideration is to be given to preventing the spread of

leakage water over the deck. The reference to the uppermost Load Line is to be taken as the tropical fresh waterline or, if timber freeboards are assigned, the timber tropical fresh waterline.

8. 2. 6 Watertight doors below the freeboard deck, with the exception of pilot doors which are to open inwards, are to open outwards. Weathertight doors are generally to be arranged to open outwards, however inward opening doors will be considered provided these satisfy the requirements of [Pt 3, Ch 11, 8.2 General 8.2.7](#).
8. 2. 7 Inward opening doors situated in the first two 'tween decks above the summer load waterline are to be fitted with a second independent securing device, such as a strongback or equivalent arrangement, capable of providing weathertight integrity. Where the consequences of water ingress due to failure of the door are minimal, such as a small pilot door giving access to a watertight trunk leading to the bulkhead deck, the required enhancements will be specially considered.
8. 2. 8 For passenger ships the following are also applicable:
  - a. Gangway, cargo and service ports fitted below the margin line, *See* [Pt 3, Ch 3, 4.3 After peak bulkhead](#), are to satisfy the strength requirements given for side doors in this Section. They are to be effectively closed and secured watertight before the ship leaves port, and are to be kept closed during navigation. Such ports are not to have their lowest point below the deepest subdivision Load Line.
  - b. Where the inboard end of a rubbish chute is below the margin line in a passenger ship, the inboard end cover is to be watertight and, in addition to the discharge flap interlock, a screwdown automatic non-return valve is to be fitted in an easily accessible position above the deepest subdivision. The valve is to be controlled from a position above the bulkhead deck and provided with an open/shut indicator, and kept closed when not in use. A suitable notice is to be displayed at the valve position.
8. 2. 9 For ships complying with the requirements of this Section, the securing, supporting and locking devices are defined as follows:
  - a. A securing device is used to keep the door closed by preventing it from rotating about its hinges or other pivoted attachments to the ship.
  - b. A supporting device is used to transmit external and internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure.
  - c. A locking device locks a securing device in the closed position.
8. 2. 10 Ro-ro cargo spaces are spaces not normally subdivided in any way and extending to either a substantial length or the entire length of the ship, in which motor vehicles with fuel in their tanks for their own propulsion and/or goods (packaged or in bulk, in or on rail or road cars, vehicles (including road or rail tankers), trailers, containers, pallets, demountable tanks in or on similar stowage units or other receptacles) can be loaded and unloaded normally in a horizontal direction.
8. 2. 11 Special category spaces are those enclosed spaces above and below the bulkhead deck, into and from which vehicles can be driven and to which passengers have access, and which may be accommodated on more than one deck where total overall clear height for vehicles does not exceed 10 m.

### 8. 3 Scantlings

8. 3. 1 In general the strength of side and stern doors is to be equivalent to the strength of the surrounding structure.

- 8.3.2 Door openings in the side shell are to have well rounded corners and adequate compensation is to be arranged with web frames at sides and stringers or equivalent above and below, See [Pt 4, Ch 1, 5 Shell envelope plating](#).
- 8.3.3 Doors are to be adequately stiffened, and means are to be provided to prevent movement of the doors when closed. Adequate strength is to be provided in the connections of the lifting/manoeuvring arms and hinges to the door structure and to the ship structure.
- 8.3.4 The thickness of the door plating is to be not less than the shell plating calculated with the door stiffener spacing, and in no case to be less than the minimum adjacent shell thickness.
- 8.3.5 Where stern doors are protected against direct wave impact by a permanent external ramp, the thickness of the stern door plating may be reduced by 20 per cent relative to the requirements of [Pt 3, Ch 11, 8.3 Scantlings 8.3.4](#). Those parts of the stern door which are not protected by the ramp are to have the thickness of plating in full compliance with [Pt 3, Ch 11, 8.3 Scantlings 8.3.4](#).
- 8.3.6 Where higher tensile steel is proposed, the plating thickness required in [Pt 3, Ch 11, 8.3 Scantlings 8.3.4](#) and [Pt 3, Ch 11, 8.3 Scantlings 8.3.5](#) may be reduced by  $\sqrt{k}$ .
- 8.3.7 The section modulus of horizontal or vertical stiffeners is to be not less than required for the adjacent shell framing using the actual stiffener spacing. Consideration is to be given, where necessary, to differences in fixity between ship's frames and door stiffeners.
- 8.3.8 Where necessary, door secondary stiffeners are to be supported by primary members constituting the main stiffening elements of the door.
- 8.3.9 The scantlings of such primary members are to be based on direct strength calculations. Normally, formulae for simple beam theory may be applied to determine the bending stress. Members are to be considered to have simply supported end connections. The design load is the uniformly distributed external sea pressure,  $p_e$ , as defined in [Pt 3, Ch 11, 8.2 General 8.2.6](#). For minimum scantlings,  $p_e$  is to be taken as 25 kN/m<sup>2</sup> and the permissible stresses are as follows:

$$\tau = \frac{80}{k} \text{ N/mm}^2$$

$$\sigma = \frac{120}{k} \text{ N/mm}^2$$

$$\sigma_e = \frac{150}{k} \text{ N/mm}^2$$

- 8.3.10 The webs of primary members are to be adequately stiffened, preferably in a direction perpendicular to the shell plating.
- 8.3.11 The stiffness of the edges of the doors and the hull structure in way are to be sufficient to ensure weathertight integrity. Edge stiffeners/girders are to be adequately stiffened against rotation and are to have a moment of inertia not less than:

$$I = 0.8P_1d^4 \text{ cm}^4$$

Where

$$P_1 = \text{packing line pressure along edges, not to be taken less than 50 N/cm.}$$

For edge girders supporting main door girders between securing devices, the moment of inertia is to be increased in relation to the additional force.

- 8.3.12 The buckling strength of primary members is to be specially considered.
- 8.3.13 All load transmitting elements in the design load path from door through securing and supporting devices into the ship structure, including welded connections, are to be to the same strength standard as required for the securing and supporting devices. These elements include pins, supporting brackets and back-up brackets. Where cut-outs are made in the supporting structure, the strength and stiffness will be specially considered.

## 8. 4 Doors serving as ramps

- 8. 4. 1 Where doors also serve as vehicle ramps, the plating and stiffeners are to be not less than required for vehicle decks, See [Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles](#).
- 8. 4. 2 The support structure (including hinges) is to be assessed in accordance with [Pt 3, Ch 9, 6.7 Ramp supporting structure](#).

## 8. 5 Arrangements for the closing, securing and supporting of doors

- 8. 5. 1 Doors are to be fitted with adequate means of closing, securing and support so as to be commensurate with the strength and stiffness of the surrounding structure. The hull supporting structure in way of the doors is to be suitable for the same design loads and design stresses as the securing and supporting devices. Where packing is required, the packing material is to be of comparatively soft type, and the supporting forces are to be carried by the steel structure only. Other types of packing may be considered. Maximum design clearance between securing and supporting devices is generally not to exceed 3 mm.
- 8. 5. 2 Devices are to be simple to operate and easily accessible. They are to be of a design approved by Lloyd's Register for the intended purpose.
- 8. 5. 3 Securing devices are to be equipped with positive locking arrangements. Arrangements are to be such that the securing devices are retained in the closed position within design limits of inclination, vibration and other motion-induced loads and in the event of loss of any actuating power supply.
- 8. 5. 4 Systems for door opening/closing and securing/ locking are to be interlocked in such a way that they can only operate in a proper sequence. Hydraulic systems are to comply with [Pt 5, Ch 14, 9 Hydraulic systems](#).
- 8. 5. 5 Means are to be provided to enable the doors to be mechanically fixed in the open position taking into account the self weight of the door and a minimum wind pressure of 1.5 kN/m<sup>2</sup> acting on the maximum projected area in the open position.
- 8. 5. 6 The spacing for cleats or closing devices should not exceed 2.5 m and there should be cleats or closing devices positioned as close to the corners as practicable. Alternative arrangements for ensuring weathertight sealing will be specially considered.
- 8. 5. 7 Control and monitoring arrangements are to comply with the applicable requirements of [Pt 6, Ch 2, 19 Ship safety systems](#).

## 8. 6 Design loads

- 8. 6. 1 The design force considered for the scantlings of primary members, securing and supporting devices of side shell doors and stern doors are to be taken not less than:
  - a. Design forces for securing or supporting devices of doors opening inwards:

External force:

$$P_e = Ap_e + P_e \text{ kN}$$

Internal force:

$$P_i = P_0 + 10W \text{ kN}$$

- b. Design forces for securing or supporting devices of doors opening outwards:

External force:

$$P_e = Ap_e \text{ kN}$$

Internal force:

$$P_i = P_0 + 10W + P_p \text{ kN}$$

c. Design forces for primary members:

External force:

$$P_e = AP_e + 10\text{KN}$$

Internal force:

$$P_i = P_0 + 10W\text{kN}$$

whichever is the greater.

The symbols used are defined as follows:

|                   |   |   |
|-------------------|---|---|
| $p_e$             | = | external sea pressure, in $\text{kN/m}^2$ , determined at the centre of gravity of the door opening and is not to be taken less than:   |
|                   | = | for $Z_G < T$ $10(T - Z_G) + 25 \text{ kN/m}^2$   |
|                   |   | for $Z_G \geq T$ $25 \text{ kN/m}^2$  |
|                   | = | For stern doors of ships fitted with bow doors, $P_e$ is not to be taken less than:   |
| $p_{\text{emin}}$ | = | $0.6\lambda C_H(0.8 + 0.6L^{0.5})^2 \text{ kN/m}^2$   |
| $T$               | = | summer draught, in metres   |
| $Z_G$             | = | height of the centre of area of the door, in m, above the base line   |
| $L$               | = | length of ship, but need not be taken greater than 200 m  |
| $\lambda$         | = | coefficient depending on the area where the ship is intended to be operated:  |
|                   | = | 1 for sea-going ships   |
|                   | = | 0.8 for ships operated in coastal waters  |
|                   | = | 0.5 for ships operated in sheltered waters  |
| $C_H$             | = | $0.0125L$ for $L < 80 \text{ m}$  |
|                   | = | 1 for $L \geq 80 \text{ m}$   |
| $A$               | = | area, in $\text{m}^2$ , of the door opening   |
| $W$               | = | weight of the door, in tonnes   |
| $P_p$             | = | total packing force, kN. When packing is fitted, the packing line force per unit length is to be specified, normally not to be taken less than: $5 \text{ kN/m}$  |
| $P_0$             | = | the greater of $P_e$ and $5A \text{ kN}$  |
| $P_c$             | = | accidental force, in kN, due to loose cargo, etc. to be uniformly distributed over the area $A$ and not to be taken less than $300 \text{ kN}$ . For small doors such as bunker doors and pilot doors, the value of $P_c$ may be taken as zero, provided an additional structure such as an inner ramp is fitted, which is capable of protecting the door from accidental force due to loose cargoes. |

## 8. 7 Design of securing and supporting devices

8. 7. 1 Securing devices and supporting devices are to be designed to withstand the forces given above using the following permissible stresses:

$$\tau = \frac{80}{k} \text{ N/mm}^2$$

$$\sigma = \frac{120}{k} \text{ N/mm}^2$$

$$\sigma_e = \frac{150}{k} \text{ N/mm}^2$$

The terms 'securing device' and 'supporting device' are defined in [Pt 4, Ch 2, 8.2 General 8.2.8](#).

8. 7. 2 The arrangement of securing and supporting devices is to be such that threaded bolts are not to carry support forces. The maximum tensile stress in way of threads of bolts, not carrying support forces, is not to exceed:

$$\frac{125}{k} \text{ N/mm}^2$$

8. 7. 3 For steel to steel bearings in securing and supporting devices, the normal bearing pressure is not to exceed  $0.8\sigma_o$ , See [Pt 3, Ch 11, 8.1 Symbols 8.1.1](#). For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification. The normal bearing pressure is to be calculated by dividing the design force by the projected bearing area.
8. 7. 4 The distribution of the reaction forces acting on the securing and supporting devices may require to be supported by direct calculations taking into account the flexibility of the hull structure and the actual position and stiffness of the supports. Small and/or flexible devices, such as cleats, intended to provide load compression of the packing material are not generally to be included in these calculations.
8. 7. 5 Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be considered in the calculation of the reaction forces acting on the devices.
8. 7. 6 The number of securing and supporting devices is generally to be the minimum practicable whilst complying with [Pt 3, Ch 11, 8.5 Arrangements for the closing, securing and supporting of doors 8.5.3](#) and taking account of the available space in the hull for adequate support.
8. 7. 7 The arrangement of securing devices and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable of withstanding the reaction forces, without exceeding, by more than 20 per cent, the permissible stresses as defined in [Pt 3, Ch 11, 8.7 Design of securing and supporting devices 8.7.1](#).

## 8. 8 Operating and Maintenance Manual

8. 8. 1 An Operating and Maintenance Manual for the doors is to be provided on board and is to contain necessary information on:
- main particulars and design drawings,
  - service conditions, e.g. service area restrictions, acceptable clearances for supports,
  - maintenance and function testing,
  - register of inspections, repairs and renewals.
8. 8. 2 For passenger/vehicle ferries and roll on-roll off cargo ships, See [Pt 4, Ch 2, 1.1 Application 1.1.1](#), an Operating and Maintenance Manual for the doors, as defined in [Pt 4, Ch 2, 8.7 Operating and Maintenance Manual 8.7.1](#), is to be provided on board instead of that required by [Pt 3, Ch 11, 8.8 Operating and Maintenance Manual 8.8.1](#).
8. 8. 3 The Manual is to be submitted for approval, and is to contain a note recommending that recorded inspections of the door supporting and securing devices be carried out by the ship's staff at monthly intervals or following incidents that could result in damage, including heavy weather or contact in the region of the doors. Any damages recorded during such inspections are to be reported to LR.

| <b>CHAPTER</b> | <b>11</b> | <b>Closing Arrangements for Shell, Deck and Bulkheads</b> |
| <b>SECTION</b> | <b>8</b>  | <b>Side and stern doors and other shell openings</b>      |

---

8. 8. 4 Documented operating procedures for closing and securing the doors are to be kept on board and posted at an appropriate place.

PART

**3**

CHAPTER **11** **Closing Arrangements for Shell, Deck and Bulkheads**

SECTION **9** **Watertight doors in bulkheads below the freeboard deck**

**9. 1 Openings in bulkheads**

9. 1. 1 Certain openings below the freeboard deck are permitted, but these must be kept to a minimum and provided with means of closing to watertight standards. All such openings are to be to the satisfaction of the Surveyor.

**9. 2 Watertight doors**

9. 2. 1 Watertight doors are to be of equivalent strength to the unpierced bulkhead, efficiently constructed and fitted, and are to be capable of being closed watertight when the ship is listed up to 15° either way. They are to be operated under working conditions and hose tested in place, See [Table 1. 9. 1: Testing requirements](#) in Chapter 1.
9. 2. 2 The scantlings of the watertight doors are to comply with [Pt 4, Ch 1, 9 Bulkheads](#) using the actual stiffener spacing of the door.
9. 2. 3 The scantlings of the frames of the watertight doors are to satisfy the requirements of watertight bulkheads given in item 5 of [Table 1. 9. 1: Watertight and deep tank bulkhead scantlings](#) in [Pt 4, Ch 1, 9 Bulkheads](#) taking into account the arrangement of door stiffeners and securing arrangements.
9. 2. 4 Watertight doors of the sliding type are to be capable of being operated both at the door itself and from an accessible position above the bulkhead deck. Means are to be provided at all the remote operating positions to indicate whether the door is open or closed. Doors are to be capable of being remotely closed by power from the bridge. The relevant regulations regarding openings in watertight bulkheads, contained in the *SOLAS - International Convention for the Safety of Life at Sea* and applicable amendments, are also to be complied with.
9. 2. 5 Hinged watertight doors of approved pattern may be fitted in 'tween decks in approved positions. The hinges of these doors are to be fitted with gunmetal pins or gunmetal bushes.
9. 2. 6 The frames of vertical watertight doors shall have no groove at the bottom in which dirt might lodge and prevent the door closing properly.
9. 2. 7 Means are to be provided on the navigating bridge to indicate whether the watertight doors are open or closed. A notice is to be affixed to both sides of each such door or hatch cover to the effect that it is not to be left open.
9. 2. 8 In passenger ships the number and construction of the watertight doors in bulkheads will be specially considered. Each watertight door is to be tested, See [Table 1. 9. 1: Testing requirements](#). The test may be carried out either before or after the door is fitted. The relevant regulations

CHAPTER **12 Ventilators, Air Pipes and Discharges**

SECTION **1 General**

**1.1 Application**

- 1.1.1 This Chapter applies to all ship types detailed in [Pt 4 Ship Structures \(Ship Types\)](#), and provides requirements for ventilators, air and sounding pipes and overboard discharges.
- 1.1.2 The requirements conform, where relevant, with those of the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988* Reference should also be made to any additional requirements of the National Authority of the country in which the ship is to be registered and to the relevant regulations of the *SOLAS - International Convention for the Safety of Life at Sea* and applicable amendments.

**1.2 Protection**

- 1.2.1 In all cargo spaces and other areas where mechanical damage is likely, all air and sounding pipes, scuppers and discharges, including their valves, controls and indicators, are to be well protected. This protection is to be of steel or other equivalent material.

CHAPTER **12 Ventilators, Air Pipes and Discharges**SECTION **2 Ventilators****2. 1 General**

2. 1. 1 Ventilators located on the exposed deck over the forward  $0.25L$  of the rule length, of ships of sea-going service of length 80 m or more, where the height of the exposed deck in way of the item is less than  $0.1L$  or 22 m above the summer load waterline, whichever is the lesser, are to comply with the requirements of [Pt 3, Ch 12, 5 Air pipes, ventilator pipes and their securing devices located on the exposed fore deck](#). All other ventilators are to comply with the following requirements.
2. 1. 2 Special care is to be taken in the design and positioning of ventilator openings and coamings, particularly in the region of the forward end of superstructures and other points of high stress. The deck plating in way of the coamings is to be efficiently stiffened.
2. 1. 3 Ventilators from deep tanks and tunnels passing through 'tween decks are to have scantlings suitable for withstanding the pressures to which they may be subjected, and are to be made watertight.
2. 1. 4 For height and location of cargo tank vent outlets, *See the Rules for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk* (hereinafter referred to as the Rules for Ships for liquefied Gases), or the *Rules for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk* (hereinafter referred to as the Rules for Ships for Liquid Chemicals), where applicable.

**2. 2 Coamings**

2. 2. 1 The scantlings and height of ventilator coamings exposed to the weather are to be not less than required by [Table 12. 2. 1: Ventilator coaming requirements](#) but the thickness need not exceed that of the adjacent deck or bulkhead plating. In particularly exposed positions, the height of coamings and scantlings may be required to be increased.

**Table 12. 2. 1: Ventilator coaming requirements**

| Feature                                     | Requirements  |
|---|---|
| Height (measured above sheathing if fitted) | (1) $z_c = 900$ mm at Position 1 (See <a href="#">Pt 3, Ch 1, 6.6 Position 1 and Position 2</a> ) |
|   | $z_c = 760$ mm at Position 2 (See <a href="#">Pt 3, Ch 1, 6.6 Position 1 and Position 2</a> )     |
| Thickness                                   | (2) $t_c = 5.5 + 0.01\delta_v$ mm<br>where $7.5 \text{ mm} \leq t_c \leq 10.0 \text{ mm}$         |

|   |  |
|---|--|
| Support   | (3) If $z_c > 900$ mm the coaming is to be specially supported |
| Symbols   |  |
| $t_c$ = thickness of coaming, in mm   |  |
| $z_c$ = height of coaming, in mm  |  |
| $\delta_v$ = internal diameter of coaming, in mm  |  |
| <b>Note</b> Where the height of the ventilator exceeds that given in Item (1), the thickness given by (2) may be generally reduced, above that height, to a minimum of 6.5 mm. The ventilator is to be adequately stayed. |  |

2. 2. 2 Where ventilators in locations above Position 2 are included in the consideration of intact and damage stability or are in critical locations above Position 2, then the height of ventilator coamings is to be specially considered.
2. 2. 3 The height of ventilator coamings may be required to be increased on ships of Type 'A', Type 'B-100' and Type 'B-60' where this is shown to be necessary by the floatability calculations required by the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988*.
2. 2. 4 For gooseneck ventilators, the coaming height is to be measured to the underside of the bend, this being the lowest point through which water on deck could pass freely to spaces below.
2. 2. 5 Where wall vents are fitted with an internal baffle which rises above the lower edge of the exterior opening, the coaming height is measured to the top of the baffle.
2. 2. 6 Where permitted by the National Authority, ventilator coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable, with a minimum height of 450 mm in Position 1 and 300 mm in Position 2.

## 2. 3 Closing appliances

2. 3. 1 All ventilator openings are to be provided with efficient weathertight closing appliances of steel or other equivalent material unless:
  - a. the height of the coaming is greater than 4.5 m where [Table 12. 2. 1: Ventilator coaming requirements](#) requires a minimum height of 900 mm; or
  - b. the height of the coaming is greater than 2.3 m where [Table 12. 2. 1: Ventilator coaming requirements](#) requires a minimum height of 760 mm.
2. 3. 2 In ships where the load line length,  $L_L$  (See [Pt 3, Ch 1, 6.1, Principal particulars](#)), is not more than 100 m, the closing appliances are to be permanently attached to the ventilator coaming. Where not so provided in other ships, they are to be conveniently stowed near the ventilator to which they are to be fitted.
2. 3. 3 Where, in ferries, ventilators are proposed to be led overboard in an enclosed 'tween deck, the closing arrangements are to be submitted for approval. If such ventilators are led overboard more than 4.5 m above the main vehicle deck, closing appliances may be omitted, provided that satisfactory baffles and drainage arrangements are provided, as in the case of air intakes or exhaust openings for machinery spaces, which may be arranged in the sides of the ship.
2. 3. 4 On offshore supply ships, to ensure satisfactory operation in all weather conditions, machinery space ventilation inlets and outlets are to be located in such positions that closing appliances will not be necessary.
2. 3. 5 Mushroom ventilators closed by a head revolving on a centre spindle (screw down head) are acceptable in Position 2, and also in sheltered positions in Position 1, excluding those described

in [Pt 3, Ch 12, 2.1 General 2.1.1](#), but the diameter is not to exceed 300 mm if situated within the forward  $0.25L_L$ .

- 2. 3. 6 Mushroom ventilators with a fixed head and closed by a screw down plate (screw down cover) may be accepted in exposed positions within the forward  $0.25L_L$ , excluding those described in [Pt 3, Ch 12, 2.1 General 2.1.1](#), up to a diameter of 750 mm.
- 2. 3. 7 Wall ventilators (jalousies) may be accepted provided they are capable of being closed weathertight by hinged steel gasketed covers secured by bolts or toggles.
- 2. 3. 8 A ventilator head not forming part of the closing arrangements is to be not less than 6.5 mm thick.
- 2. 3. 9 In order to limit the fire growth potential in every space of the ship, the main inlets and outlets of all ventilation systems shall be capable of being closed from outside the spaces being ventilated. The means of closing shall be easily accessible as well as prominently and permanently marked and shall indicate whether the inlet or outlet is open or closed. Battery room ventilators are only to be fitted with a means of closing, whenever:
  - a. the battery room does not open directly on to an exposed deck; or
  - b. the ventilation opening for the battery room is required to be fitted with a closing device according to the Load Line Convention; or
  - c. the battery room is fitted with a fixed gas fire extinguishing system.

Where a battery room ventilator is fitted with a closing device See [Pt 6, Ch 2, 12.5 Thermal management and ventilation 12.5.2](#).

## 2. 4 Machinery spaces

- 2. 4. 1 In general, ventilators necessary to continuously supply the machinery space are to have coamings of sufficient height to comply with [Pt 3, Ch 12, 2.3 Closing appliances 2.3.1](#) without having to fit weathertight closing appliances. Ventilators to emergency generator rooms are to be so positioned that closing appliances are not required.
- 2. 4. 2 Where due to ship size and arrangement this is not practicable, lesser heights for machinery space ventilator coamings fitted with weathertight closing appliances may be permitted by the administration in combination with other suitable arrangements to ensure uninterrupted, adequate supply of ventilation to these spaces.
- 2. 4. 3 Where closing appliances are fitted to ventilators serving emergency generator rooms or ventilation louvres are used for emergency generator rooms, the following requirements are to be applied in addition to the requirements of [Pt 3, Ch 12, 2.4 Machinery spaces 2.4.2](#):
  - a. Ventilation louvres and closing appliances may either be hand-operated or power-operated (hydraulic/pneumatic/electric) and are to be operable under a fire condition.
  - b. Hand-operated ventilation louvres and closing appliances are to be kept open during the normal operation of the vessel. Corresponding instruction notices are to be provided at the location where hand operation is provided.
  - c. Power-operated ventilation louvres and closing appliances are to open automatically whenever the emergency generator is starting/in operation. Closed ventilation louvres and closing appliances are acceptable during normal operation of the vessel. In the event of power failure, the default position of the ventilation louvres or closing appliances is to be the open position.
  - d. Ventilation openings are to be capable of being operated manually from a clearly marked safe position outside the space where the closing operation can be easily confirmed. The louver status (open/closed) is to be indicated at this position. Such closing is not to be possible from any other remote position.

PART

**3**

CHAPTER **12 Ventilators, Air Pipes and Discharges**

SECTION **3 Air and sounding pipes**

**3. 1 General**

3. 1. 1 Air pipes located on the exposed deck over the forward 0.25*L* of the rule length, of ships of sea-going service of length 80 m or more, where the height of the exposed deck in way of the item is less than 0.1*L* or 22 m above the summer load waterline, whichever is the lesser, are to comply with the requirements of Section 5. All other air and sounding pipes are to comply with the following requirements in addition to the applicable requirements of [Pt 5, Ch 13, 12 Air, overflow and sounding pipes](#) and [Pt 5, Ch 15, 2 Piping systems for bilge, ballast, fuel oil, etc.](#).
3. 1. 2 Striking plates of suitable thickness, or their equivalent, are to be fitted under all sounding pipes.
3. 1. 3 On offshore supply ships, air pipes are to be situated clear of the cargo containment areas.

**3. 2 Height of air pipes**

3. 2. 1 The height of air pipes from the upper surface of decks exposed to the weather, to the point where water may have access below, is normally to be not less than:
  - 760 mm on the freeboard deck;
  - 450 mm on the superstructure deck;
  - these heights being measured above deck sheathing, where fitted.
3. 2. 2 Lower heights may be approved in cases where these are essential for the working of the ship, provided that the design and arrangements are otherwise satisfactory. In such cases, efficient, permanently attached closing appliances of an approved automatic type will generally be required.
3. 2. 3 The height of air pipes may be required to be increased on ships of Type 'A', Type 'B-100' and Type 'B-60' where this is shown to be necessary by the floatability calculations required by the *International Convention on Load Lines, 1966*. An increase in height may also be required or recommended by individual Administrations when air pipes to fuel oil and settling tanks are situated in positions where sea water could be temporarily entrapped, e.g. in recesses in the sides and ends of superstructures or deckhouses, between hatch ends, behind high sections of bulwark, etc. This may entail an increase in tank scantlings, *See also* [Pt 3, Ch 3 Structural Design](#).
3. 2. 4 Air pipes are generally to be led to an exposed deck. For alternative arrangements in an enclosed space on a main vehicle deck, *See* [Pt 4, Ch 2, 9 Subdivision structure on vehicle deck](#).
3. 2. 5 Where air pipes are led through the side of superstructures, the opening is to be at least 2.3 m above the summer load waterline.
3. 2. 6 The minimum wall thickness of air pipes in positions indicated in [Pt 3, Ch 12, 3.2 Height of air pipes 3.2.1](#) is to be:
  - 6.0 mm for pipes of 80 mm external diameter or smaller;

- 8.5 mm for pipes of 165 mm external diameter or greater.

Intermediate minimum thicknesses are to be determined by linear interpolation.

- 3.2.7 Where permitted by the National Authority, air pipe coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable, with a minimum height of 450 mm on the freeboard deck and 300 mm on a superstructure deck.

### **3.3 Closing appliances**

- 3.3.1 All openings of air and sounding pipes are to be provided with permanently attached, satisfactory means of closing to prevent the free entry of water, *See also* [Pt 3, Ch 12, 3.2 Height of air pipes 3.2.2](#).
- 3.3.2 Closing appliances are to be of an approved automatic type.
- 3.3.3 Pressure/vacuum valves as required by [Pt 5, Ch 15, 4 Cargo tank venting, purging and gas-freeing](#) may be accepted as closing appliances for cargo tanks.

PART

**3**

CHAPTER **12 Ventilators, Air Pipes and Discharges**

SECTION **4 Scuppers and sanitary discharges**

**4. 1 General**

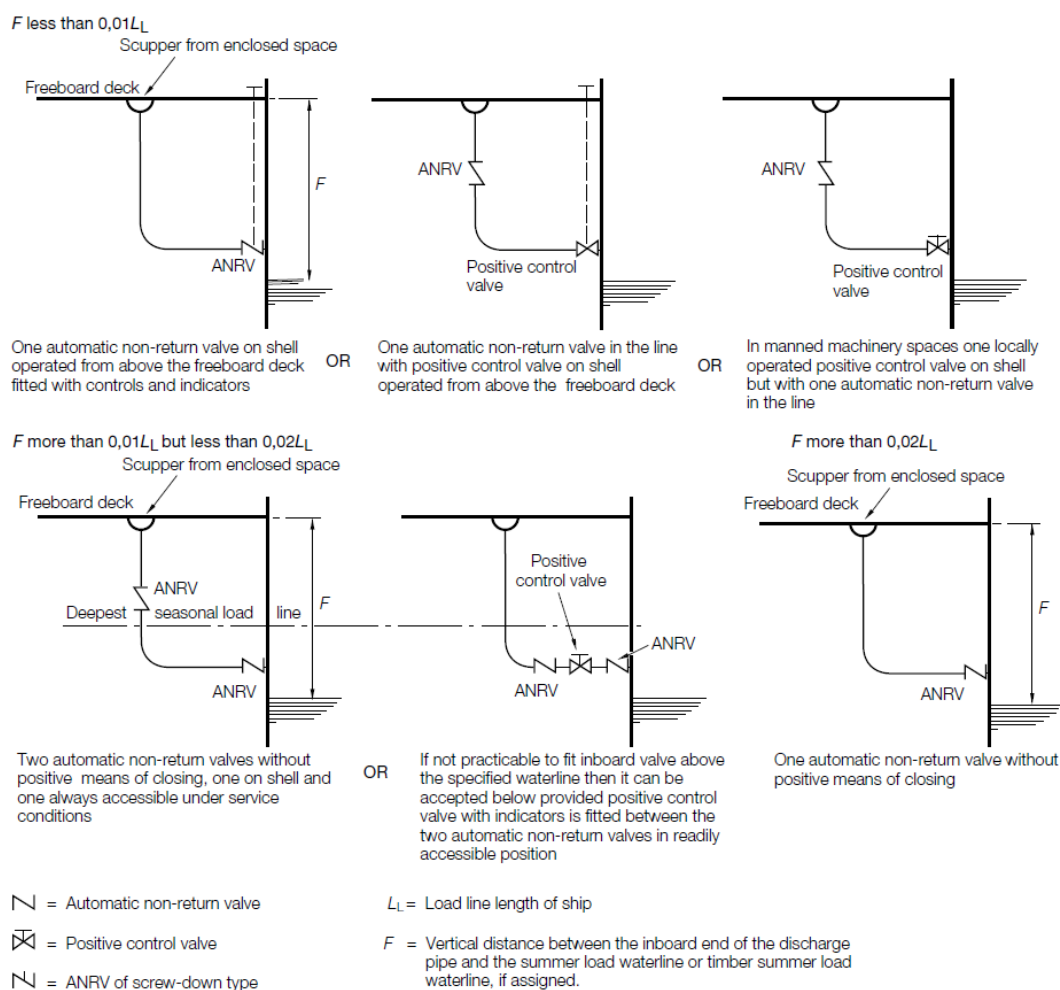

4. 1. 1 Scuppers sufficient in number and size to provide effective drainage are to be fitted in all decks.
4. 1. 2 Scuppers draining weather decks and spaces within superstructures or deckhouses not fitted with efficient weathertight doors are to be led overboard.
4. 1. 3 Where the freeboard is such that the freeboard deck edge is immersed when the ship heels 5° or less, scuppers and discharges which drain spaces below the freeboard deck, or spaces within intact superstructures or deckhouses on the freeboard deck fitted with efficient weathertight doors, are to be led to the bilges in the case of scuppers or to suitable sanitary tanks in the case of sanitary discharges. Where the freeboard is such that the freeboard deck edge is immersed when the ship heels greater than 5° then they may be led overboard and fitted with means of preventing water from passing inboard in accordance with [Pt 3, Ch 12, 4.2, Closing appliances](#).
4. 1. 4 In ships where an approved fixed pressure water spray fire-extinguishing system is fitted in vehicle or cargo spaces, deck scuppers of not less than 150 mm diameter are to be provided port and starboard, spaced about 9.0 m apart. The scupper area will require to be increased if the design capacity of the drencher system exceeds the Rule required capacity by 10 per cent or more. After installation, the two adjacent sections with the greatest aggregate drencher capacity are to be tested in operation to ensure that there is no build up of water on the deck, *See also* [Pt 4, Ch 2, 11.2 Openings in main vehicle deck 11.2.2](#). The mouth of the scupper is to be protected by bars.
4. 1. 5 Where a sewage system is fitted, the shipside valves on the discharge pipe from the effluent tank(s) and the by-pass system are to comply with [Pt 3, Ch 12, 4.2, Closing appliances](#).
4. 1. 6 The minimum wall thickness of pipes not indicated in [Pt 3, Ch 12, 4.2 Closing appliances 4.2.6](#) is to be:
  - 4.5 mm for pipes of 155 mm external diameter or smaller.
  - 6.0 mm for pipes of 230 mm external diameter or greater.Intermediate minimum thicknesses are to be determined by linear interpolation.
4. 1. 7 For the use of non-metallic pipe, *See* [Pt 5, Ch 12, 5 Plastic pipes](#).
4. 1. 8 Scuppers and discharge pipes should not normally pass through fuel oil or cargo oil tanks. Where scuppers and discharge pipes pass, unavoidably, through fuel oil or cargo oil tanks, and are led through the shell within the tanks, the thickness of the piping should be at least the same thickness as Rule shell plating in way, derived from the appropriate Chapters, but need not exceed 19 mm.
4. 1. 9 Piping within tanks is to be tested in accordance with [Pt 3, Ch 1, 8 Inspection and workmanship](#).
4. 1. 10 All piping is to be adequately supported.

4. 1. 11 See also the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk* or the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk*, where applicable.
4. 1. 12 For additional requirements for scuppers and sanitary discharges on dredging and reclamation craft, See [Pt 4, Ch 12, 15 Spoil space weirs and overflows](#).

## 4. 2 Closing appliances

4. 2. 1 In general, each separate overboard discharge is to be fitted with a screw-down non-return valve capable of being operated from a position always accessible and above the freeboard deck. An indicator is to be fitted at the control position showing whether the valve is open or closed. A machinery space, whether manned or unattended (i.e. with UMS notation), is considered accessible. Cargo holds or spaces with access only by hatches or bolted manholes are not considered accessible.
4. 2. 2 Where a drencher fire-extinguishing system is provided in an enclosed vehicle space of a ferry, the scupper controls are to be operated from a position above the bulkhead deck, and outside the vehicle space protected by the drencher system, and are to be protected from mechanical damage.
4. 2. 3 Where the vertical distance from the summer load waterline to the inboard end of the discharge pipe exceeds  $0.01L_L$  the discharge may be fitted with two automatic non-return valves without positive means of closing, instead of the screw-down non-return valve, provided that the inboard valve is always accessible for examination under service conditions.
4. 2. 4 Where the vertical distance from the summer load waterline to the inboard end of the discharge pipe exceeds  $0.02L_L$ , a single automatic non-return valve without positive means of closing may be fitted, See [Figure 12. 4. 1: Diagrammatic arrangement of discharge valves](#).

**Figure 12. 4. 1: Diagrammatic arrangement of discharge valves**

4. 2. 5 The requirements for non-return valves are applicable only to those discharges which remain open during the normal operation of the ship. For discharges which are closed at sea, such as gravity drains from topside ballast tanks, a single screw down valve operated from the freeboard deck is considered to provide sufficient protection.
4. 2. 6 Scuppers and discharge pipes originating at any level which penetrate the shell either more than 450 mm below the freeboard deck or less than 600 mm above the summer load waterline, are to be fitted with an automatic non-return valve at the shell. This valve, unless required by [Pt 3, Ch 12, 4.1 General 4.1.3](#), may be omitted provided the piping has a minimum wall thickness of:
- 7.0 mm for pipes of 80 mm external diameter or smaller;
  - 10.0 mm for pipes of 180 mm external diameter;
  - 12.5 mm for pipes of 220 mm external diameter or greater.

Intermediate minimum thicknesses are to be determined by linear interpolation. Unless required by [Pt 3, Ch 12, 4.1 General 4.1.8](#), the maximum thickness need not exceed 12.5 mm.

4. 2. 7 The outboard valve is to be mounted directly on the shell and secured in accordance with [Pt 5, Ch 13, 2.5 Ship-side valves and fittings \(other than those on scuppers and sanitary discharges\) 2.5.1](#). If this is impracticable, a short distance piece of rigid construction may be introduced between the valve and the shell. Valves should not be fitted in cargo tanks.

- 4. 2. 8 If a valve is required by [Pt 3, Ch 12, 4.1 General 4.1.3](#), this valve should preferably be fitted as close as possible to the point of entry of the pipe into the tank. If fitted below the freeboard deck, the valve is to be capable of being controlled from an easily accessible position above the freeboard deck. Local control is also to be arranged, unless the valve is inaccessible. An indicator is to be fitted at the control position showing whether the valve is open or closed.
- 4. 2. 9 In a ship to which timber freeboards are assigned, the summer load waterline is to be regarded as that corresponding to the timber summer freeboard.
- 4. 2. 10 For ship side valves and fittings (other than those on scuppers and sanitary discharges), See [Pt 5, Ch 13, 2 Construction and installation](#) and [Pt 6, Ch 1, 2 Essential features for control, alarm, monitoring and safety systems](#) .

### 4. 3 Rubbish chutes, offal and similar discharges

- 4. 3. 1 Rubbish chutes, offal and similar discharges should be constructed of mild steel piping or plating of shell thickness. Other materials will be specially considered. Openings are to be kept clear of the sheerstrake and areas of high stress concentration.
- 4. 3. 2 Rubbish chute hoppers are to be provided with a hinged weathertight cover at the inboard end with an interlock so that the discharge flap and hopper cover cannot be open at the same time. The hopper cover is to be secured closed when not in use, and a suitable notice displayed at the control position.
- 4. 3. 3 Where the inboard end of the hopper is less than  $0.01L_L$  above the summer load waterline, a suitable valve with positive means for closing is to be provided in addition to the cover and flap in an easily accessible position above the deepest seasonal waterline. The valve is to be controlled from a position adjacent to the hopper and provided with an open/shut indicator. The valve is to be kept closed when not in use, and a suitable notice displayed at the valve operating position.
- 4. 3. 4 Where damage stability requirements apply and the inboard end of the chute is below the equilibrium waterlines, or in passenger ships, where the inboard end of a rubbish chute is below the margin line; See [Pt 3, Ch 11, 8.2 General 8.2.8.b](#).
- 4. 3. 5 In trawlers or fish factory ships, offal discharges in the fish working spaces are to be provided with either a non-return flap, preferably fitted at the shell which can be positively secured weathertight, or a separate positively controlled valve kept closed when not in use. A suitable notice is to be displayed at the flap or valve operating position.

### 4. 4 Materials for valves, fittings and pipes

- 4. 4. 1 All shell fittings and valves required by [Pt 3, Ch 12, 4.2, Closing appliances](#) are to be of steel, bronze or other approved ductile material; ordinary cast iron or similar material is not acceptable. Materials are to satisfy the requirements of the [Pt 2 Rules for the Manufacture, Testing and Certification of Materials](#).
- 4. 4. 2 All these items, if made of steel or other approved material with low corrosion resistance, are to be suitably protected against wastage.
- 4. 4. 3 The lengths of pipe attached to the shell fittings, elbow pieces or valves are to be of galvanised steel or other equivalent approved material.

**5.1 General**

- 5.1.1 For the application of the following requirements relating to ventilators, *See* [Pt 3, Ch 12, 2.1 General 2.1.1](#). For the application of the following requirements relating to air pipes, *See* [Pt 3, Ch 12, 3.1 General 3.1.1](#). Air pipes complying with the following requirements are also to comply with the applicable requirements of [Pt 5, Ch 13, 12 Air, overflow and sounding pipes](#) and [Pt 5, Ch 15, 2.5 Air and sounding pipes](#).
- 5.1.2 Special care is to be taken in the design and positioning of ventilator openings and coamings, particularly in the region of the forward end of superstructures and other points of high stress. The deck plating in way of the coamings is to be efficiently stiffened.
- 5.1.3 Ventilators from deep tanks and tunnels passing through 'tween decks are to have scantlings suitable for withstanding the pressures to which they may be subjected, and are to be made watertight.
- 5.1.4 For height and location of cargo tank vent outlets, *See* the Rules for Ships for Liquefied Gases, or Rules for Ships for Liquid Chemicals, where applicable.
- 5.1.5 On offshore supply ships, air pipes are to be situated clear of the cargo containment areas.

**5.2 Loading**

- 5.2.1 The design pressure acting on air pipes, ventilator pipes and their closing devices is to be taken as not less than:

$$p = 0.5\rho V^2 C_d C_s C_p \text{ kN/m}^2$$

Where

$$\rho = \text{density of sea water (1.025 t/m}^3\text{)}$$

$$V = \text{velocity of water over the fore deck}$$

$$= 13.5 \text{ m/sec for } d \leq 0.5d_1$$

$$= 13.5 \sqrt{2\left(1 - \frac{d}{d_1}\right)} \text{ for } d > 0.5d_1$$

$$d = \text{distance from summer load waterline to exposed deck}$$

$d_1$  = 0.1L but need not be taken as greater than 22 m

$C_d$  = shape coefficient (0.5 for pipes, 1.3 for air pipe or ventilator heads in general and 0.8 for an air pipe or ventilator head of cylindrical form with its axis in the vertical direction)

$C_s$  = slamming coefficient (3.2)

$C_p$  = protection coefficient (0.7 for pipes and ventilator heads located immediately behind a breakwater or forecastle and 1.0 elsewhere and immediately behind a bulwark).

- 5.2.2 Forces acting in the horizontal direction on the pipe and its closing device are to be not less than those calculated from [Pt 3, Ch 12, 5.2 Loading 5.2.1](#) using the largest projected area of each component.

## 5.3 Strength requirements

- 5.3.1 Bending moments and stresses in air and ventilator pipes are to be calculated at critical positions:
- at penetration pieces;
  - at weld or flange connections; and
  - at toes of supporting brackets.
- 5.3.2 Bending stresses in the net section are not to exceed  $0.8\sigma_y$ , where  $\sigma_y$  is the specified minimum yield stress or 0.2 per cent proof stress of the steel at room temperature. Irrespective of corrosion protection, a corrosion addition to the net section of 2.0 mm is then to be applied.
- 5.3.3 For standard air pipes of 760 mm coaming height closed by heads of not more than the tabulated projected area, pipe thicknesses and bracket heights are specified in [Table 12. 5. 1: Air pipe thickness and bracket standards](#). Where brackets are required, three or more radial brackets are to be fitted. Brackets are to be of gross thickness 8 mm or more, of minimum length 100 mm, and height according to [Table 12. 5. 1: Air pipe thickness and bracket standards](#) but need not extend over the joint flange for the head. Bracket toes at the deck are to be suitably supported.

**Table 12. 5. 1: Air pipe thickness and bracket standards**

|              | Minimum      | Maximum            |                          |
|--------------|--------------|--------------------|--------------------------|
| Nominal pipe | fitted gross | projected area     | Height <sup>(1)</sup> of |
| diameter,    | thickness,   | of head,           | brackets,                |
| in mm        | in mm        | in cm <sup>2</sup> | in mm                    |
| 65A          | 6.0          | -                  | 480                      |
| 80A          | 6.3          | -                  | 460                      |
| 100A         | 7.0          | -                  | 380                      |
| 125A         | 7.8          | -                  | 300                      |
| 150A         | 8.5          | -                  | 300                      |
| 175A         | 8.5          | -                  | 300                      |

|   |  |      |                    |
|---|--|------|--------------------|
| 200A  | 8.5 <sup>(2)</sup>   | 1900 | 300 <sup>(2)</sup> |
| 250A  | 8.5 <sup>(2)</sup>   | 2500 | 300 <sup>(2)</sup> |
| 300A  | 8.5 <sup>(2)</sup>   | 3200 | 300 <sup>(2)</sup> |
| 350A  | 8.5 <sup>(2)</sup>   | 3800 | 300 <sup>(2)</sup> |
| 400A  | 8.5 <sup>(2)</sup>   | 4500 | 300 <sup>(2)</sup> |
| (1)   | Brackets (See <a href="#">Pt 3, Ch 12, 5.3 Strength requirements 5.3.3</a> ) need not extend over the joint flange for the head.         |      |                    |
| (2)   | Brackets are required where the as fitted (gross) thickness is less than 10.5mm, or where the tabulated projected head area is exceeded. |      |                    |
| <b>Note</b> For other pipe heights, the relevant requirements of <a href="#">Pt 3, Ch 12, 5.3, Strength requirements</a> are to be applied. |  |      |                    |

5. 3. 4 For other configurations, loads according to [Pt 3, Ch 12, 5.2, Loading](#) are to be applied, and means of support determined in order to comply with the requirements of [Pt 3, Ch 12, 5.3 Strength requirements 5.3.1](#) and [Pt 3, Ch 12, 5.3 Strength requirements 5.3.2](#). Brackets, where fitted, are to be of suitable thickness and length according to their height. Pipe thickness is not to be taken less than as indicated in [Pt 5, Ch 12 Piping Design Requirements](#).

**Table 12. 5. 2: 900 mm Ventilator pipe thickness and bracket standards**

|   | Minimum      | Maximum            |           |
|---|--------------|--------------------|-----------|
| Nominal pipe  | fitted gross | projected area     | Height of |
| diameter,   | thickness,   | of head,           | brackets, |
| in mm   | in mm        | in cm <sup>2</sup> | in mm     |
| 80A   | 6.3          | -                  | 460       |
| 100A  | 7.0          | -                  | 380       |
| 150A  | 8.5          | -                  | 300       |
| 200A  | 8.5          | 550                | -         |
| 250A  | 8.5          | 880                | -         |
| 300A  | 8.5          | 1200               | -         |
| 350A  | 8.5          | 2000               | -         |
| 400A  | 8.5          | 2700               | -         |
| 450A  | 8.5          | 3300               | -         |
| 500A  | 8.5          | 4000               | -         |
| <b>Note</b> For ventilator heights other than 900 mm, the relevant requirements of 5.3 are to be applied. |              |                    |           |

|                |           |  |
|----------------|-----------|--|
| <b>PART</b>    | <b>3</b>  | <b>Ship Structures</b>   |
| <b>CHAPTER</b> | <b>12</b> | <b>Ventilators, Air Pipes and Discharges</b>   |
| <b>SECTION</b> | <b>5</b>  | <b>Air pipes, ventilator pipes and their securing devices located on the exposed fore deck</b> |

---

- 5. 3. 5 For standard ventilators of 900 mm coaming height closed by heads of not more than the tabulated projected area, pipe thicknesses and bracket heights are specified in [Table 12. 5. 2: 900 mm Ventilator pipe thickness and bracket standards](#). Brackets, where required, are to be as specified in [Pt 3, Ch 12, 5.3 Strength requirements 5.3.3](#).
- 5. 3. 6 For ventilators of coaming height greater than 900 mm, the coaming support will be specially considered. Pipe thickness is not to be taken less than as indicated in [Pt 5, Ch 12 Piping Design Requirements](#).
- 5. 3. 7 All component parts and connections of the air pipe or ventilator are to be capable of withstanding the loads defined in [Pt 3, Ch 12, 5.2, Loading](#).

## 5. 4 Ventilator coamings

- 5. 4. 1 The height of ventilator coamings is to be not less than 900 mm, this height being measured above deck sheathing, where fitted. In particularly exposed positions, the heights of coamings and scantlings may be required to be increased.
- 5. 4. 2 The height of ventilator coamings may be required to be increased on ships of Type 'A', Type 'B-100' and Type 'B-60' where this is shown to be necessary by the floatability calculations required by the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988*.
- 5. 4. 3 For gooseneck ventilators, the coaming height is to be measured to the underside of the bend, this being the lowest point through which water on deck could pass freely to spaces below.
- 5. 4. 4 Where wall vents are fitted with an internal baffle which rises above the lower edge of the exterior opening, the coaming height is measured to the top of the baffle.
- 5. 4. 5 Where permitted by the National Authority, ventilator coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable, with a minimum height of 450 mm.

## 5. 5 Height of air pipes

- 5. 5. 1 The height of air pipes from the upper surface of decks exposed to the weather, to the point where water may have access below is normally to be not less than 760 mm, this height being measured above deck sheathing, where fitted.
- 5. 5. 2 Lower heights may be approved in cases where these are essential for the working of the ship, provided that the design and arrangements are otherwise satisfactory. In such cases, efficient, permanently attached closing appliances of an approved automatic type will generally be required.
- 5. 5. 3 The height of air pipes may be required to be increased on ships of Type 'A', Type 'B-100' and Type 'B-60' where this is shown to be necessary by the floatability calculations required by the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988*. An increase in height may also be required or recommended by individual Administrations when air pipes to fuel oil and settling tanks are situated in positions where sea-water could be temporarily entrapped, e.g. in recesses in the sides and ends of superstructures or deckhouses, between hatch ends, behind high sections of bulwark, etc. This may entail an increase in tank scantlings, *See also* [Pt 3, Ch 3 Structural Design](#).
- 5. 5. 4 Air pipes are generally to be led to an exposed deck. For alternative arrangements in an enclosed space on a main vehicle deck, *See* [Pt 4, Ch 2, 9 Subdivision structure on vehicle deck](#).
- 5. 5. 5 Where air pipes are led through the side of superstructures, the opening is to be at least 2.3 m above the summer load waterline.

|                |           |  |
|----------------|-----------|--|
| <b>PART</b>    | <b>3</b>  | <b>Ship Structures</b>   |
| <b>CHAPTER</b> | <b>12</b> | <b>Ventilators, Air Pipes and Discharges</b>   |
| <b>SECTION</b> | <b>5</b>  | <b>Air pipes, ventilator pipes and their securing devices located on the exposed fore deck</b> |

---

5. 5. 6 Where permitted by the National Authority, air pipe coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable, with a minimum height of 450 mm.

## **5. 6 Closing appliances for ventilators**

5. 6. 1 All ventilator openings are to be provided with efficient weathertight closing appliances unless the height of the coaming is greater than 4.5 m.
5. 6. 2 In ships where the load line length,  $L_L$  (See [Pt 3, Ch 1, 6.1, Principal particulars](#)), is not more than 100 m, the closing appliances are to be permanently attached to the ventilator coaming. Where not so provided in other ships, they are to be conveniently stowed near the ventilator to which they are to be fitted.
5. 6. 3 Where, in ferries, ventilators are proposed to be led overboard in an enclosed 'tween deck, the closing arrangements are to be submitted for approval. If such ventilators are led overboard more than 4.5 m above the main vehicle deck, closing appliances may be omitted, provided that satisfactory baffles and drainage arrangements are provided, as in the case of air intakes or exhaust openings for machinery spaces, which may be arranged in the sides of the ship.
5. 6. 4 On offshore supply ships, to ensure satisfactory operation in all weather conditions, machinery space ventilation inlets and outlets are to be located in such positions that closing appliances will not be necessary.
5. 6. 5 Rotating type mushroom ventilator heads are unsuitable for application on the exposed fore deck.
5. 6. 6 Wall ventilators (jalousies) may be accepted provided they are capable of being closed weathertight by hinged steel gasketed covers secured by bolts or toggles.
5. 6. 7 A ventilator head not forming part of the closing arrangements is to be not less than 6.5 mm thick.

## **5. 7 Closing appliances for air pipes**

5. 7. 1 All openings of air pipes are to be provided with permanently attached, satisfactory means of closing to prevent the free entry of water, *See also* [Pt 3, Ch 12, 5.5 Height of air pipes 5.5.2](#).
5. 7. 2 Closing appliances are to be of an approved automatic type where, with the ship at its summer load waterline, the openings are immersed at an angle of heel of 40° or, the angle of down flooding if this is less than 40°. *See also* [Pt 3, Ch 3, 6 Minimum bow heights, reserve buoyancy and extent of forecastle](#).
5. 7. 3 Where the closing appliances are not of an automatic type, provision is to be made for relieving vacuum when the tanks are being pumped out.
5. 7. 4 In a ship to which timber freeboards are assigned, air pipes which will be inaccessible when the deck cargo is carried are to be provided with approved automatic closing appliances.
5. 7. 5 Pressure/vacuum valves as required by [Pt 5, Ch 15, 4 Cargo tank venting, purging and gas-freeing](#) may be accepted as closing appliances for cargo tanks.

CHAPTER **13 Ship Control Systems**SECTION **1 General****1.1 Application**

- 1.1.1 This Chapter applies to all the ship types detailed in [Pt 4 Ship Structures \(Ship Types\)](#), and requirements are given for rudders, nozzles, steering gear, bow and stern thrust unit structure, stabiliser structure, anchoring and mooring equipment, and emergency towing arrangements.
- 1.1.2 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a CSR notation (See [Pt 1, Ch 2, 2.3 Class notations \(hull\)](#)) with the exception of the following:
- For Double Hull Tankers; Sections [Pt 3, Ch 13, 2 Rudders](#) to [Pt 3, Ch 13, 6 Stabiliser structure](#) are to be complied with as applicable.
  - For Bulk Carriers; Sections [Pt 3, Ch 13, 3 Fixed and steering nozzles](#) to [Pt 3, Ch 13, 6 Stabiliser structure](#) and Section [Pt 3, Ch 13, 12 Emergency towing arrangements](#) are to be complied with as applicable.

**1.2 General symbols**

- 1.2.1 The following symbols and definitions are applicable to this Chapter, unless otherwise stated:  
 $L$ ,  $B$  and  $C_b$  as defined in [Pt 3, Ch 1, 6.1, Principal particulars](#)
- $\sigma_o$  = minimum yield stress or 0.5 per cent proof stress of the material, in  $\text{N/mm}^2$
- $k$  = higher tensile steel factor, See [Pt 3, Ch 2, 1.2, Steel](#).

**1.3 Navigation in ice**

- 1.3.1 Where an ice class notation is included in the class of a ship, additional requirements are applicable as detailed in [Pt 8 Rules for Ice and Cold Operations](#).

**1.4 Podded propulsion**

- 1.4.1 Where podded propulsion is included in the class of a ship, additional requirements as detailed in [Pt 5, Ch 9 Podded Propulsion Units](#) are to be complied with, as applicable.

PART

3

CHAPTER 13 Ship Control Systems

SECTION 2 Rudders

2. 1 Application

- 2. 1. 1 This Section applies to ordinary profile rudders, and to some enhanced profile rudders with special arrangements for increasing the rudder force, as defined in [Table 13. 2. 2: Rudder profiles](#).

2. 2 Design considerations

- 2. 2. 1 Effective means are to be provided for supporting the weight of the rudder without excessive bearing pressure, e.g. by a rudder carrier attached to the upper part of the rudder stock. The hull structure in way of the rudder carrier is to be suitably strengthened.
- 2. 2. 2 Suitable arrangements are to be provided to prevent the rudder from lifting.
- 2. 2. 3 In rudder trunks which are open to the sea, a seal or stuffing box is to be fitted above the deepest load waterline, to prevent water from entering the steering gear compartment and the lubricant from being washed away from the rudder carrier. If the top of the rudder trunk is below the deepest load waterline, two separate stuffing boxes are to be provided. Rudder trunk boundaries, where exposed to the sea, are to have a corrosion protection coating applied in accordance with the manufacturer's instructions.

2. 3 Materials

- 2. 3. 1 The requirements for materials are contained in the Part 2
- 2. 3. 2 Stern frames, rudder horns, shaft brackets, rudder stocks, pintles, coupling bolts, keys, and other rudder members are to be made of rolled, forged or cast carbon-manganese steel in accordance with [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#), [Ch 4 Steel Castings](#) and [Ch 5 Steel Forgings](#) of the Part 2. The requirements for stern frames, rudder horns and shaft brackets are to be in accordance with [Pt 3, Ch 6, 7 Sternframes and appendages](#).
- 2. 3. 3 For rudder stocks, pintles, coupling bolts and keys the minimum yield stress is not to be less than 200 N/mm<sup>2</sup>.
- 2. 3. 4 For all parts of the rudder, including rudder stocks, pintles, coupling bolts and keys having a specified minimum yield stress differing from 235 N/mm<sup>2</sup>, the material factor, *k* is to be determined in accordance with :

Table 13. 2. 1: Rudder material factor, *k*

|  |          |
|--|----------|
| Specified minimum<br>yield stress, $\sigma_o$ (N/mm <sup>2</sup> ) | <i>k</i> |
|--|----------|

|   |  |
|---|--|
| $\sigma_o > 235$  | $k = \left(\frac{235}{\sigma_o}\right)^{0.75}$ |
| $\sigma_o \leq 235$   | $k = \frac{235}{\sigma_o}$                     |
| <p><b>Note 1.</b> The specified minimum yield stress is not to be taken as greater than 70 per cent of the ultimate tensile strength.</p> <p><b>Note 2.</b> The specified minimum yield stress is not to be taken as greater than 450 N/mm<sup>2</sup>.</p> |  |

## 2. 4 Welding and design details

2. 4. 1 Slot-welding is to be limited as far as possible. Slot welding is not to be used in areas subject to large in-plane stresses transverse to the slots or in way of cut-outs of semi-spade rudders. Continuous butt welding with backing may be accepted in lieu of slot welds. When continuous butt welding is applied, the root gap is to be between 6-10 mm. The bevel angle is to be at least 15°.
2. 4. 2 When slot welding is applied, the length of individual slots is to be not less than 75 mm with a minimum breadth of 2 times the plate thickness. The distance between ends of adjacent slots is to be not greater than 125 mm. The slots are to be fillet welded around the edges and filled with a suitable compound, e.g. epoxy putty. Slots are not to be filled with weld. The ends of slots are to be rounded.
2. 4. 3 The rudder, in way of rudder horn recesses of semi-spade rudders, are to have well radiused corners. The corner radii are not to be less than 5 times the local rudder plate thickness, but in no case less than 100 mm. Welding in the rudder side plating is to be positioned away from these corner radii. The weld connecting the side plate and the leading edge plate in way of these radiused corners is to be ground smooth.
2. 4. 4 Welds between plates and forged or cast parts or very thick plating are to be made as full penetration welds. In way of highly stressed areas e.g. cut-outs of semi-spade rudders and upper parts of spade rudders, cast or welded on ribs are to be arranged. Two sided full penetration welding is normally to be arranged. Where back welding is impossible welding is to be performed against ceramic backing bars or equivalent. Steel backing bars may be used and are to be continuously welded on one side to the heavy piece.

## 2. 5 Equivalence

2. 5. 1 Asia Classification Society (*hereinafter referred to as ACS*) may accept alternatives to the requirements given in this Section, provided they are deemed to be equivalent.
2. 5. 2 Direct analyses adopted to justify an alternative design are to take into consideration all relevant modes of failure, on a case by case basis. These failure modes may include, amongst others: yielding, fatigue, buckling and fracture. Possible damages caused by cavitation are also to be considered.
2. 5. 3 If deemed necessary by *ACS*, lab tests, or full scale tests may be requested to validate the alternative design approach.

## 2. 6 Rudder force

2. 6. 1 The lateral rudder force at the centre of pressure is to be determined for both ahead and astern conditions as follows:

$$C_R = 132K_1K_2K_3AV^2 \text{ N}$$

Where

$A$  = rudder blade area, in  $\text{m}^2$ .

$V$  = maximum service speed, in knots, for both the ahead and astern conditions.

=  $V_{\text{ahead}}$  is to be taken as the maximum service speed at the summer load waterline at maximum propeller RPM and corresponding engine MCR. Where this speed is less than 10 knots,  $V_{\text{ahead}}$  is to be replaced by the following expression:

$$V_{\min} = \frac{V_{\text{ahead}} + 20}{3}$$

=  $V_{\text{astern}}$ , is to be taken as the maximum astern speed or  $0.5V_{\text{ahead}}$ , whichever is the greater.

$K_1$  = aspect ratio correction factor

$$= \frac{\lambda + 2}{3}$$

$\lambda$  =  $\frac{h_R^2}{A_t}$  but is not to be taken greater than 2.

$h_R$  = mean height, in m, of the rudder blade, See [Figure 13. 2. 1: Rudder co-ordinate system](#);

$A_t$  = sum of rudder blade area  $A$  and area of rudder post or rudder horn, if any, within the mean height  $h_R$ , in  $\text{m}^2$ .

$K_2$  = rudder profile coefficient, See [Table 13. 2. 2: Rudder profiles](#);

$K_3$  = 0.8 for rudders outside the propeller jet.

= 1.15 for rudders behind a fixed propeller nozzle.

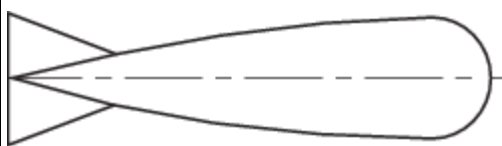

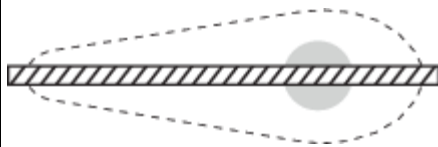

= 1.0 otherwise.

**Figure 13. 2. 1: Rudder co-ordinate system**

**Table 13. 2. 2: Rudder profiles**

| Profile Type      | K2              |                            |
|-------------------|-----------------|----------------------------|
|                   | Ahead condition | Astern condition           |
| NACA-00 series    | 1.10            | 0.80                       |
| Flat sided        | 1.10            | 0.90                       |
| Hollow            | 1.35            | 0.90                       |
| High lift rudders | 1.70            | To be specially considered |
| Fish tail         | 1.40            | 0.80                       |

|  |      |      |
|--|------|------|
|   |      |      |
| Single plate   | 1.00 | 1.00 |
|   |      |      |
| Mixed profiles   | 1.21 | 0.90 |
| <b>Note</b> For rudder profiles not defined above, the value of $K_2$ may be determined on the basis of experimental results. These results are to be submitted for consideration. |      |      |

## 2. 7 Rudder torque for rudder blades without cut-outs

2. 7. 1 The maximum rudder torque,  $Q_R$ , is to be determined from both the ahead and astern conditions as follows:

$$Q_R = C_{R2}Nm$$

Where

$C_R$  = lateral force acting on the rudder, as defined in [Pt 3, Ch 13, 2.6 Rudder force 2.6.1.](#)

$r$  = distance from the centre of pressure to the centreline of the rudder stock.  
=  $c(\alpha - k_1)$ , in  $m$ .

$c$  = mean breadth of the rudder blade, (the mean chord length), in  $m$ , See [Figure 13. 2. 1: Rudder co-ordinate system.](#)

$\alpha$  = relative centre of pressure along the chord length, See [Table 13. 2. 3: Relative centre of pressure along the chord length,  \$\alpha\$ .](#)

$k_1$  = ratio of the rudder blade area forward of the rudder stock centreline, to the rudder blade area:

$$= \frac{A_f}{A}$$

$A_f$  = portion of the rudder blade area situated ahead of the centreline of the rudder stock.

For the ahead condition the rudder torque,  $Q_R$  is not to be taken less than:

$$Q_R = 0.1cC_RNm$$

**Table 13. 2. 3: Relative centre of pressure along the chord length,  $\alpha$**

| Condition | Behind fixed structure | Not behind a fixed structure |
|-----------|------------------------|------------------------------|
| Ahead     | 0.25                   | 0.33                         |
| Astern    | 0.55                   | 0.66                         |

**Note** Fixed structure is defined as any relatively stationary structure immediately ahead of the rudder, for example rudder horns of semi-spade rudders.

## 2. 8 Rudder torque for rudder blades with cut-outs (semi-spade rudders)

2. 8. 1 The maximum rudder torque,  $Q_R$ , is to be determined from both the ahead and astern conditions, for rudder blades with cut-outs, as follows. The pressure distribution for rudder blades with cut-outs is assumed to be proportional to the areas above and below the base of the cut-out. The rudder blade area,  $A$ , is to be divided into parts as per [Figure 13. 2. 2: Rudder Areas](#).

$$Q_R = Q_{R1} + Q_{R2} \text{ Nm}$$

Where

$$Q_{R1} = C_{R1} r_1$$

$$Q_{R2} = C_{R2} r_2$$

$$C_R = \text{lateral force acting on the rudder, as defined in [Pt 3, Ch 13, 2.6 Rudder force 2.6.1](#)}$$

$$C_{R1} = C_R \frac{A_1}{A}$$

$$C_{R2} = C_R \frac{A_2}{A}$$

$$r_1 = c_1(\alpha - k_1), \text{ in m.}$$

$$r_2 = c_2(\alpha - k_2), \text{ in m.}$$

$$c_1 = \text{mean breadth, in m, of partial area } A_1.$$

$$c_2 = \text{mean breadth, in m, of partial area } A_2.$$

$$\alpha = \text{relative centre of pressure along the chord length, See [Table 13. 2. 3: Relative centre of pressure along the chord length, \alpha](#) .}$$

$$K_1 = \frac{A_{1f}}{A_1}$$

$$K_2 = \frac{A_{2f}}{A_2}$$

For the ahead condition the rudder torque,  $Q_R$  is not to be taken less than:

$$Q_R = 0.1 \frac{A_1 c_1 + A_2 c_2}{A} C_R \text{ Nm}$$

Figure 13. 2. 2: Rudder Areas

## 2. 9 Rudder strength calculation

2. 9. 1 The rudder force and resulting rudder torques as given in [Pt 3, Ch 13, 2.6, Rudder force](#), [Pt 3, Ch 13, 2.7 Rudder torque for rudder blades without cut-outs](#) or [Pt 3, Ch 13, 2.8 Rudder torque for rudder blades with cut-outs \(semi-spade rudders\)](#), cause bending moments and shear forces in the rudder body, bending moments and torques in the rudder stock, supporting forces in pintle bearings and rudder stock bearings and bending moments, shear forces and torques in rudder horns and heel pieces. The rudder body is to be stiffened by horizontal and vertical webs enabling it to act as a bending girder.
2. 9. 2 The bending moments, shear forces and torques as well as the reaction forces described in [Pt 3, Ch 13, 2.9 Rudder strength calculation 2.9.1](#) are to be determined by direct calculations or where otherwise stated by an approximate simplified formulae. For rudders supported by sole pieces or rudder horns these structures are to be included in the calculation model in order to account for the elastic support of the rudder body.

## 2. 10 Rudder stock scantlings

2. 10. 1 The scantlings of the rudder stock are to be not less than required by [Table 13. 2. 4: Rudder stock diameter](#).  
The rudder stock diameter is to be dimensioned such that the stresses do not exceed the permissible stresses given in [Table 13. 2. 5: Rudder stock permissible stresses](#).
2. 10. 2 Before significant reductions in rudder stock diameter due to the application of steels with yield stresses exceeding  $235 \text{ N/mm}^2$  are granted, ACS may require the evaluation of the rudder stock deformations. Large deformations of the rudder stock are to be avoided in order to avoid excessive edge pressures in way of bearings.
2. 10. 3 For spade rudders the stock diameter corrected for higher tensile steel is to be greater than 90 per cent of the uncorrected stock diameter unless direct calculations are submitted showing that the slope of the stock at the lowest main bearing does not exceed 0.0035 when the rudder blade is

loaded by a lateral force of  $C_R$ , as defined in [Pt 3, Ch 13, 2.6 Rudder force 2.6.1](#), acting at the center of pressure.

2. 10. 4 For rudders having an increased diameter of the rudder stock in way of the rudder, the increased diameter is to be maintained to a point as far as practicable above the top of the lowest bearing. The diameter may then be tapered to the diameter required in way of the tiller. The length of the taper is to be at least three times the reduction in diameter. Particular care is to be taken to avoid the formation of a notch at the upper end of the taper, See [Figure 13. 2. 3: Rudder stock taper](#).
2. 10. 5 Sudden changes of section or sharp corners in way of the rudder coupling, jumping collars and shoulders for rudder carriers, are to be avoided. Jumping collars are not to be welded to the rudder stock. Keyways in the rudder stock are to have rounded ends and the corners at the base of the keyway are to be radiused.

**Table 13. 2. 4: Rudder stock diameter**

| Item  | Requirement  |
|---|--|
| (1) Rudder stock diameter due to combined loads   | $d_c = d_t \sqrt[6]{1 + \frac{4}{3} \left( \frac{M}{Q_R} \right)^2}$ |
| (2) Rudder stock diameter required for transmission of the rudder torque (e.g. in way of tiller)  | $d_t = 4.2 \sqrt[3]{Q_R k}$  |
| Symbols   |  |
| $Q_R$ = maximum rudder torque, in Nm, as calculated in <a href="#">Pt 3, Ch 13, 2.8 Rudder torque for rudder blades with cut-outs (semi-spade rudders)</a>  |  |
| $M$ = bending moment, in Nm, at the section of the rudder stock under consideration, See <a href="#">Pt 3, Ch 13, 2.9 Rudder strength calculation 2.9.2</a> .   |  |
| <p><b>Note</b> 1. If direct calculations are not carried out, then the following approximate formulae may be applied:</p> <p>For rudders with a heel support;</p> $M = \frac{h_R}{10 \left( \frac{c^2}{A} \right)} C_R$ <p>For spade rudders;</p> $M = C_R h_c$ <p>For semi-spade rudders;</p> $M = \frac{h_R}{10 \left( 1 + \frac{c^2}{A} \right)} C_R$ <p>where</p> <p><math>h_R</math> = mean height, in m, of the rudder blade, See <a href="#">Figure 13. 2. 1: Rudder co-ordinate system</a>.</p> |  |

$h_c$  = the distance, in m, from the centroid of the rudder blade area to the centre of the lowest main bearing;

$c$  = mean breadth of the rudder blade, (the mean chord length), in m, See [Figure 13. 2. 1: Rudder co-ordinate system](#).

$A$  = rudder blade area, in  $m^2$ .

**Figure 13. 2. 3: Rudder stock taper**

**Table 13. 2. 5: Rudder stock permissible stresses**

| Mode                                 | Permissible stress, $N/mm^2$ |
|--------------------------------------|------------------------------|
| (1) Torsional shear stress, $\tau_t$ | $\frac{68}{k}$               |
| (2) Equivalent stress, $\sigma_e$    | $\frac{118}{k}$              |
| Symbols                              |                              |

Equivalent stress:

$$\sigma_c = \sqrt{\sigma_b^2 + 3\tau_t^2} \text{ N/mm}^2$$

Bending stress:

$$\sigma_b = 10.2 \times 10^3 \frac{M}{d_c^3} \text{ N/mm}^2$$

Torsional stress:

$$\tau_t = 5.1 \times 10^3 \frac{Q_R}{d_c^3} \text{ N/mm}^2$$

M = bending moment, in Nm, at the section of the rudder stock under consideration, See [Pt 3, Ch 13, 2.9 Rudder strength calculation 2.9.2.](#)

$d_c$  = actual stock diameter, in mm.

## 2. 11 Rudder blade

2. 11. 1 The scantlings of a double plated rudder are to be not less than required by [Table 13. 2. 6: Double plated rudder construction.](#)
2. 11. 2 The scantlings of single plate rudders are to be not less than required by [Table 13. 2. 7: Single plate rudder construction.](#)
2. 11. 3 All rudders are to be dimensioned such that the stresses do not exceed the permissible stresses given in [Table 13. 2. 8: Rudder blade permissible stresses.](#)
2. 11. 4 In way of rudder couplings, pintles, and cut-outs of semi-spade rudders the plating thickness is to be suitably increased. Adequate hand or access holes are to be arranged in the rudder plating in way of pintles as required, and the rudder plating is to be reinforced locally in way of these openings, See [Table 13. 2. 9: Thickness of side plating and vertical web plates in way of solid parts.](#)
2. 11. 5 For spade rudders fitted with a fabricated rectangular mainpiece, the mainpiece is to be designed with its forward and aft transverse sections at similar distances forward and aft of the rudder stock transverse axis.
2. 11. 6 Internal surfaces of double plate rudders are to be efficiently coated. Alternatively, where it is intended to fill the rudder with plastic foam or use a corrosion inhibitor, details are to be submitted. Means for draining the rudder are to be provided.

**Table 13. 2. 6: Double plated rudder construction**

| Item                                    | Requirement  |
|---|--|
| (1) Rudder side, top and bottom plating | $t = 5.5s\beta \sqrt{k(T + \frac{C_R 10^{-4}}{A})} + 2.5 \text{ mm}$ |
| (2) Webs, vertical and horizontal       | $tw \geq 0.7t$ but is not to be less than 8 mm                       |
| (3) Nose plate                          | $tn \geq 1.25t$ but need not exceed 22 mm                            |

|   |                             |   |  |
|---|-----------------------------|---|--|
| (4) Mainpiece,<br>(See Notes 1 and 2)   | Rectangular<br>(fabricated) | Breadth and width $\geq d_c$<br>The side plating of the mainpiece is to extend $0.2c$ and is to be in accordance with (1) and the vertical webs as per (2), but in no case are either to be less than $t_M$ . | $t_M \geq 8.5 + 0.56\sqrt{d_c^3 k}$ mm<br>(See Note 3 and 4) |
|   | Tubular                     | Inside diameter $\geq d_c$  |  |
| Symbols   |                             |   |  |
| $T$ = draught, in m, as given in <a href="#">Pt 3, Ch 1, 6.1, Principal particulars</a> ;   |                             |   |  |
| $C_R$ = rudder force, in N, as defined in <a href="#">Pt 3, Ch 13, 2.6 Rudder force 2.6.1</a> ;   |                             |   |  |
| $A$ = rudder area, in $m^2$ ;   |                             |   |  |
| $\beta = \sqrt{1.1 - 0.5 \left(\frac{s}{b}\right)^2}$ ; max. 1.00 if $b/s \geq 2.5$   |                             |   |  |
| $k$ = material factor, as defined in <a href="#">Pt 3, Ch 13, 2.3 Materials 2.3.4</a>   |                             |   |  |
| $s$ = smallest unsupported width of plating in m  |                             |   |  |
| $b$ = greatest unsupported width of plating in m  |                             |   |  |
| $c$ = chord length in m, as defined in <a href="#">Figure 13. 2. 1: Rudder co-ordinate system</a> .   |                             |   |  |
| <b>Note 1.</b> The mainpiece bending stresses are to be not greater than those in <a href="#">Table 13. 2. 8: Rudder blade permissible stresses</a> .   |                             |   |  |
| <b>Note 2.</b> The mainpiece plating attached to solid forged or cast parts, is not to be less than that required by <a href="#">Pt 3, Ch 13, 2.12 Connections of rudder blade structure with solid parts</a> .   |                             |   |  |
| <b>Note 3.</b> The stock diameter to be used for calculating the mainpiece plate thickness is to be based on the mild steel stock scantlings, as given in <a href="#">Table 13. 2. 4: Rudder stock diameter</a> . |                             |   |  |
| <b>Note 4.</b> The requirement of $t_M$ need only be applied to the upper part of the rudder plate:   |                             |   |  |
| for semi spade rudders; above a point midway between the lowest pintle and the bottom of the rudder.  |                             |   |  |
| for spade rudders; above a point one third of the height of the rudder above the base.  |                             |   |  |

**Table 13. 2. 7: Single plate rudder construction**

| Item  | Requirement  |
|---|--|
| (1) Blade thickness   | The greater of; $t_b = 1.5sV\sqrt{k + 2.5}$ ; or 10 mm.  |
| (2) Arms  | $t_a = t_b$<br><br>The section modulus is not to be less than:<br><br>$Z_a = 0.5 s C_1^2 V^2 k cm^3$ |
| (3) Mainpiece, See Note 1   | As per <a href="#">Table 13. 2. 4: Rudder stock diameter</a>   |
| Symbols   |  |
| <p><math>s</math> = spacing of stiffening arms, in m, but is not to exceed 1 m.</p> <p><math>V</math> = speed in knots, as defined in <a href="#">Pt 3, Ch 13, 2.6 Rudder force 2.6.1</a>.</p> <p><math>C_1</math> = horizontal distance from the aft edge of the rudder to the centreline of the rudder stock, in m.</p> |  |

Note 1. For spade rudders the lower third may be taper down to 0.75  $d_c$ .

**Table 13. 2. 8: Rudder blade permissible stresses**

| Item   | Permissible stress, N/mm <sup>2</sup> |                      |                               |
|--|---------------------------------------|----------------------|-------------------------------|
|  | Bending stress, $\sigma_b$            | Shear stress, $\tau$ | Equivalent stress, $\sigma_e$ |
| Rudder blade, clear of cut-outs                        | $\frac{110}{k}$                       | $\frac{50}{k}$       | $\frac{120}{k}$               |
| Rudder blade in way of cut-outs, of semi-spade rudders | 75                                    | 50                   | 100                           |

## 2. 12 Connections of rudder blade structure with solid parts

2. 12. 1 Solid parts in forged or cast steel, which house the rudder stock or the pintle, are to be provided with protrusions, except as follows, See [Figure 13. 2. 4: Cross-section of the connection between rudder blade structure and rudder stock housing](#). These protrusions are not required when the web plate thickness is less than:
  - a. 10 mm for web plates welded to the solid part on which the lower pintle of a semi-spade rudder is housed and for vertical web plates welded to the solid part of the rudder stock coupling of spade rudders.
  - b. 20 mm for other web plates.
2. 12. 2 The solid parts are in general to be connected to the rudder structure by means of two horizontal web plates and two vertical web plates, See [Figure 13. 2. 4: Cross-section of the connection between rudder blade structure and rudder stock housing](#).
2. 12. 3 The minimum section modulus of the cross-section of the structure of the rudder blade formed by vertical web plates and rudder plating, which is connected with the solid part where the rudder stock is housed is to be not less than:

$$w_s = c_s d_c^3 \left( \frac{H_E - H_X}{H_E} \right) \frac{k}{k_s} 10^{-4} \text{ cm}^3$$

Where

- $c_s$  = coefficient, to be taken equal to:
- = 1.0 if there is no opening in the rudder plating or if such openings are closed by a full penetration welded plate.
  - = 1.5 if there is an opening in the considered cross-section of the rudder.
- $d_c$  = rudder stock diameter, in mm.
- $H_E$  = vertical distance between the lower edge of the rudder blade and the upper edge of the solid part, in m.
- $H_X$  = vertical distance between the considered cross-section and the upper edge of the solid part, in m.
- $k$  = material factor for the rudder blade plating, See [Pt 3, Ch 13, 2.3 Materials 2.3.4](#).
- $k_s$  = material factor for the rudder stock, See [Pt 3, Ch 13, 2.3 Materials 2.3.4](#).

2. 12. 4 The actual section modulus of the cross-section of the structure of the rudder blade is to be calculated with respect to the symmetrical axis of the rudder, *See the x-x axis in [Figure 13. 2. 4: Cross-section of the connection between rudder blade structure and rudder stock housing](#)*. The breadth of the rudder plating to be considered for the calculation of section modulus is to be not greater than:

$$b = s_v + \frac{2H_x}{3} \quad m$$

Where

$s_v$  = spacing between the two vertical webs, in m.

Where openings for access to the rudder stock nut are not closed by a full penetration welded plate, they are not to be included in the section modulus calculations.

**Figure 13. 2. 4: Cross-section of the connection between rudder blade structure and rudder stock housing**

2. 12. 5 The thickness of the horizontal web plates connected to the solid parts as well as that of the rudder blade plating between these webs, is to be not less than the greater of the following values:

$$t_H = 1.2 t \text{ mm}$$

$$t_H = 0.045 \frac{d_s^2}{S_H} \text{ mm}$$

Where

$$t = \text{as calculated in [Table 13. 2. 6: Double plated rudder construction](#)}$$

$d_s$  = stock diameter, in mm, to be taken equal to:

=  $d_c$  for the solid part housing the rudder stock, as calculated in [Table 13. 2. 4: Rudder stock diameter](#).

=  $d_p$  for the solid part housing the pintle, as calculated in [Table 13. 2. 12: Pintle requirements](#).

$S_H$  = spacing between the two horizontal web plates, in mm.

The increased thickness of the horizontal webs is to extend fore and aft of the solid part at least to the next vertical web.

2. 12. 6 The thickness of the vertical web plates welded to the solid part where the rudder stock is housed as well as the thickness of the rudder side plating above and below this solid part is to be not less than the values obtained from [Table 13. 2. 9: Thickness of side plating and vertical web plates in way of solid parts](#). The increased thickness is to extend above and below the solid piece at least to the next horizontal web.

**Table 13. 2. 9: Thickness of side plating and vertical web plates in way of solid parts**

| Type of rudder   | Thickness of vertical web plates, in mm |                           | Thickness of rudder plating, in mm, <i>See</i> Note 1 | Area with opening |
|--|---|---------------------------|---|-------------------|
|  | Rudder blade without opening            | Rudder blade with opening | Rudder blade without opening                          |                   |
| Rudder supported by sole piece   | 1.2 t                                   | 1.6 t                     | 1.2 t   | 1.4 t             |
| Semi-spade and spade rudders   | 1.4 t                                   | 2.0 t                     | 1.3 t   | 1.6 t             |
| Symbols  |   |                           |   |                   |
| $t$ = thickness of the rudder plating, in mm, as calculated in <a href="#">Table 13. 2. 6: Double plated rudder construction</a> |   |                           |   |                   |
| $c$ = chord length in m, as defined in <a href="#">Figure 13. 2. 1: Rudder co-ordinate system</a> .                              |   |                           |   |                   |
| <b>Note 1.</b> The side plating of the mainpiece is to extend at least 0.2c.   |   |                           |   |                   |

## 2. 13 Rudder stock flange couplings

2. 13. 1 Rudder stock horizontal and vertical flange couplings are to be in accordance with [Table 13. 2. 10: Horizontal and Vertical flange couplings](#).
2. 13. 2 For rudders with horizontal coupling arrangements the rudder stock should be forged when the stock diameter exceeds 350 mm. Where the stock diameter does not exceed 350 mm the rudder stock may be either forged or fabricated. Where the upper flange is welded to the rudder stock, a full penetration weld is required and its integrity is to be confirmed by non-destructive examination. The flange material is to be from the same welding materials group as the stock. Such rudder stocks are to be subjected to a furnace post-weld heat treatment (PWHT) after completion of all welding operations. For carbon or carbon manganese steels, the PWHT temperature is not to be less than 600°C.
2. 13. 3 For a horizontal flange coupling of a spade rudder, the palm radius, between the rudder stock and the flange, is not to be less than that calculated from [Figure 13. 2. 5: Rudder stock horizontal](#)

[flange palm radius for spade rudders](#), See also [Figure 13. 2. 7: Rudder stock horizontal flange coupling](#).

Where

$d_c$ ,  $R$ ,  $t_f$  are defined in [Table 13. 2. 10: Horizontal and Vertical flange couplings](#)

$b_f$  = breadth of flange, in mm.

2. 13. 4 For all rudder types, with a horizontal welded flange connection to the rudder stock, the connection details are in general to be in accordance with [Figure 13. 2. 6: Welded joint between rudder stock and coupling flange](#).
2. 13. 5 The connecting bolts for coupling the rudder to the rudder stock are to be positioned with sufficient clearance to allow the fitting and removal of the bolts and nuts without contacting the palm radius. The surface forming the palm radius is to be free of hard and sharp corners and is to be machined smooth to the Surveyor's satisfaction. The surface in way of bolts and nuts is to be machined smooth to the Surveyor's satisfaction.
2. 13. 6 Coupling bolts are to be fitted bolts and their nuts are to be locked effectively.

**Table 13. 2. 10: Horizontal and Vertical flange couplings**

| Item  | Requirement  |  |
|---|--|--|
|   | Horizontal coupling  | Vertical coupling                          |
| Number of coupling bolts  | $n \geq 6$   | $n \geq 8$                                 |
| Diameter of coupling bolts, in mm   | $d_b = 0.62 \sqrt{\frac{d_c^3 k_b}{n e_m k_s}}$  | $d_b = 0.81 d_c \sqrt{\frac{k_b}{n k_s}}$  |
| Thickness of coupling flange, in mm   | The greater of the following, (See Note 1):<br>$t_f = d_b \sqrt{\frac{k_f}{k_b}}$<br>(b) $t_f = 0.9 d_b$<br>(c) $t_f = 0.33 d_c \sqrt[3]{k_s}$ (See Notes 2 and 3) | $t_f = d_b$                                |
| Width of flange material outside the bolt holes, in mm  | $W_f = 0.67 d_b$   | $W_f = 0.67 d_b$                           |
| First moment of area of bolts about centre of coupling, in cm <sup>3</sup>                              | $m = 0.00071 n d_c d_b^2 \sqrt{\frac{k_b}{k_s}}$   | $m = 0.00043 d_c^3 \sqrt{\frac{k_b}{k_s}}$ |
| Stress concentration factor for as built scantlings   | $\alpha_{asbuilt} \leq \alpha_{max}$ ( See Note 2)   | -  |
| Symbols   |  |  |
| $d_c$ = stock diameter, in mm, as calculated in <a href="#">Table 13. 2. 4: Rudder stock diameter</a> . |  |  |
| $n$ = total number of bolts.  |  |  |
| $e_m$ = mean distance, in mm, of the bolt axes from the centre of the bolt system.                      |  |  |
| $k_s$ = material factor for the stock.  |  |  |
| $k_b$ = material factor for the bolts.  |  |  |

$k_f$  = material factor for flange.

$d_b$  = bolt diameter, in mm.

$w_f$  = width of flange material outside the bolt holes, in mm.

$m$  = first moment of area of bolts about the centre of the coupling, in cm<sup>3</sup>.

$$\alpha_{\text{asbuilt}} = \frac{0.73}{\sqrt{\frac{R}{d}}}$$

$\alpha_{\text{asbuilt}}$  = stress concentration factor for as built scantlings.

$\alpha_{\text{max}}$  = maximum allowable stress concentration factor.

$$\alpha_{\text{max}} = \left( (53.82 - 35.29k_{\text{max}}) \frac{d^3}{hC_R 10^3} \right) - \left( \left( 1.8 - 6.3 \frac{R}{d} \right) \left( \frac{t_f - t_{fa}}{t_{fa}} \right) \right)$$

$h$  = vertical distance, in m, between the centre of pressure and the centre point of the palm radius, See [Figure 13. 2. 7: Rudder stock horizontal flange coupling](#).

$k_{\text{max}}$  = the greater of  $k_s$  or  $k_f$

$R$  = palm radius, in mm, between the rudder stock and connection flange.

$t_f$  = minimum thickness of coupling flange, in mm.

$t_{fa}$  = as built flange thickness, in mm.

**Note 1.** Where the value of  $d_b$  is to be calculated for a number of bolts not exceeding 8.

**Note 2.** This requirement is only applicable for spade rudders with horizontal couplings, See [Figure 13. 2. 7: Rudder stock horizontal flange coupling](#).

**Note 3.** For a twin spade rudder arrangement with a single screw, and where the rudders are positioned within the slipstream of the propeller:

the thickness of the palm plate/coupling flange is not to be less than  $0.35d\sqrt{k_s}$

where the stock is welded to the palm plate, the stock diameter is to be increased by 14 per cent

Figure 13. 2. 5: Rudder stock horizontal flange palm radius for spade rudders

Figure 13. 2. 6: Welded joint between rudder stock and coupling flange

**Figure 13. 2. 7: Rudder stock horizontal flange coupling**

## 2. 14 Cone couplings with key

2. 14. 1 Cone couplings without hydraulic arrangements for mounting and dismounting the coupling are to have a taper ratio,  $\theta_t$  on diameter of 1:8 to 1:12;

Where

$$\theta_t = \frac{d_c - d_u}{l}$$

The cone shapes are to fit exactly. The cone coupling is to be secured by a nut and the nut itself is to be secured, e.g. by a securing plate, See [Figure 13. 2. 8: Cone coupling with key](#).

2. 14. 4 The effective surface area of the key (without rounded edges) between key and rudder stock or cone coupling is not to be less than:

$$a_k = \frac{5Q_F}{d_k \sigma_{F2}} \text{ cm}^2$$

where

$\sigma_{F2}$  = minimum specified yield stress of the key, stock or coupling material, in N/mm<sup>2</sup>, whichever is less.

2. 14. 5 2.14.5 The dimensions of the securing nut are to be in accordance with [Table 13. 2. 11: Securing nut dimensions](#), See also [Figure 13. 2. 8: Cone coupling with key](#):

**Table 13. 2. 11: Securing nut dimensions**

| Item   | Requirement   |
|--|---|
| External thread diameter   | $d_g \geq 0.65d_c$  |
| Height   | $h_n \geq 0.6d_g$   |
| Outer diameter   | The greater of the following:<br>$d_n \geq 1.2d_i$ ,<br>$d_n \geq 1.5d_u$ |
| Symbols, See <a href="#">Figure 13. 2. 8: Cone coupling with key</a> . |   |
| $d_c$ = stock diameter, in mm  |   |
| $d_g$ = external thread diameter, in mm                                |   |
| $h_n$ = height of securing nut, in mm                                  |   |
| $d_n$ = minimum distance across flats of securing nut, in mm           |   |
| $d_u$ = inner diameter of securing nut, in mm                          |   |

2. 14. 6 It is to be proved that 50 per cent of the design yield moment is solely transmitted by friction in the cone couplings. This can be done by calculating the required push-up pressure and push-up length in accordance with [Pt 3, Ch 13, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.4](#) and [Pt 3, Ch 13, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.5](#) for a torsional moment  $Q'F = 0.5Q_F$ .

## 2. 15 Cone couplings with special arrangements for mounting and dismounting the couplings

2. 15. 1 Where the stock diameter exceeds 200 mm, the press fit is recommended to be effected by a hydraulic pressure connection. In such cases the cone is to be more slender, and is to have a taper ratio,  $\theta_t$ , on diameter of 1:12 to 1:20.
2. 15. 2 In the case of hydraulic pressure connections the nut is to be effectively secured against the rudder stock or the pintle.
2. 15. 3 For the safe transmission of the torsional moment by the coupling between rudder stock and rudder body the push-up pressure and the push-up length are to be determined in accordance with [Pt 3, Ch 13, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.4](#) and [Pt 3, Ch 13, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.5](#).

2. 15. 4 The push-up pressure,  $P_{\text{req}}$  is not to be less than the greater of the two following values:

$$p_{\text{req1}} = \frac{2Q_F}{d_m^2 l \pi \mu_0} 10^3 \text{ N/mm}^2$$

$$p_{\text{req2}} = \frac{6M_b}{l^2 d_m} 10^3 \text{ N/mm}^2$$

Where

$Q_F$  = design yield moment of rudder stock, in Nm, as defined in [Pt 3, Ch 13, 2.14 Cone couplings with key 2.14.3](#).

$d_m$  = mean cone diameter in, mm =  $\frac{(d_u + d_c)}{2}$

$l$  = cone length in, mm, See [Figure 13. 2. 8: Cone coupling with key](#).

$M_b$  = bending moment in the cone coupling (e.g. in case of spade rudders), in Nm.

$\mu_0$  = frictional coefficient, to be taken as 0.15.

$d_u$  = upper cone diameter, See [Figure 13. 2. 8: Cone coupling with key](#)

$d_c$  = lower cone diameter, See [Figure 13. 2. 8: Cone coupling with key](#)

It has to be proved by the designer that the push-up pressure does not exceed the permissible surface pressure in the cone. The permissible surface pressure is to be determined by the following formula:

$$p_{\text{perm}} = \frac{0.95\sigma_g(1 - \alpha^2)}{\sqrt{3 + \alpha^4}} P_b \text{ N/mm}^2$$

Where

$$P_b = \frac{3.5M_b}{d_m l^2} 10^3$$

$\sigma_g$  = minimum specified yield stress of the material of the gudgeon in N/mm<sup>2</sup>.

$$\alpha = \frac{d_m}{d_a}$$

$d_m$  = mean cone diameter in, mm.

$d_a$  = outer diameter of the gudgeon to be not less than 1.25  $d_c$ , in mm, See [Figure 13. 2. 8: Cone coupling with key](#).

$l$  = cone length in, mm, See [Figure 13. 2. 8: Cone coupling with key](#).

$m_b$  = bending moment in the cone coupling (e.g. in case of spade rudders), in Nm.

2. 15. 5 The push-up length  $\Delta\ell$ , is to comply with the following formula:

$$\Delta\ell_1 \leq \Delta\ell \leq \Delta\ell_2$$

Where

$$\Delta\ell_1 = \frac{p_{\text{req}} d_m}{E \left( \frac{1 - \alpha^2}{2} \right) \theta_t} + \frac{0.8R_{\text{tm}}}{\theta_t} \text{ mm}$$

$$\Delta \ell_2 = \frac{p_{\text{perm}} d_m}{E \left( \frac{1 - \alpha^2}{2} \right) \theta_t} + \frac{0.8 R_{\text{tm}}}{\theta_t} \text{ mm}$$

Where

$p_{\text{req}}, p_{\text{perm}}, \alpha, d_m$  are defined in [Pt 3, Ch 13, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.4](#)

$R_{\text{tm}}$  = mean roughness, in mm, taken equal to 0.01

$E$  = Young's modulus of the material, in N/mm<sup>2</sup>

$\theta_t$  = taper on diameter, See [Pt 3, Ch 13, 2.14, Cone couplings with key](#)

2. 15. 6 In case of hydraulic pressure connections the required push-up force  $P_e$ , for the cone may be determined by the following formula:

$$P_e = P_{\text{req}} d_m \Pi l \left( \frac{\theta_t}{2} + 0.02 \right) N$$

The value 0.02 is a reference for the friction coefficient using oil pressure. It varies and depends on the mechanical treatment and roughness of the details to be fixed. Where due to the fitting procedure a partial push-up effect caused by the rudder weight is given, this may be taken into account when fixing the required push-up length, subject to approval by ACS.

## 2. 16 Pintles

2. 16. 1 Rudder pintles and their bearings are to be in accordance with the requirements of this sub-section and [Pt 3, Ch 13, 2.17, Bearings](#).
2. 16. 2 The bottom pintle on semi-spade rudders and all pintles over 500 mm in diameter are if inserted into their sockets from below, to be keyed to the rudder or sternframe as appropriate or to be hydraulically assembled, with the nut adequately locked, See [Pt 3, Ch 13, 2.14, Cone couplings with key](#) and [Pt 3, Ch 13, 2.15, Cone couplings with special arrangements for mounting and dismounting the couplings](#).
2. 16. 3 Where liners are fitted to pintles, they are to be shrunk on or otherwise efficiently secured. If liners are to be shrunk on, the shrinkage allowance is to be indicated on the plans. Where liners are formed by stainless steel weld deposit, the pintles are to be of weldable quality steel and details of the procedure are to be submitted, See also [Pt 3, Ch 13, 2.17 Bearings 2.17.2](#).
2. 16. 4 Where an \*IWS (In-water Survey) notation is to be assigned, means are to be provided for ascertaining the rudder pintle and bush clearances and for verifying the security of the pintles in their sockets with the vessel afloat.

**Table 13. 2. 12: Pintle requirements**

| Item                       | Requirement   |                     |
|----------------------------|---|---------------------|
| (1) Pintle diameter, in mm | $d_p = 0.35 \sqrt{B k_p}$   |                     |
| (2) Pintle taper           | Method of assembly  | Taper (on diameter) |
|                            | Keyed and other manually assembled pintles applying locking by securing nut | 1:8 – 1:12          |

|  |  |             |
|--|--|-------------|
|  | Pintles mounted with oil injection and hydraulic nut | 1:12 – 1:20 |
| (3) Pintle bearing length  | $d_{p1} \leq l_p \leq 1.2 d_{pl}$                    |             |
| (4) Pintle housing/gudgeon   | $b_g \geq 0.25 d_{pl}$                               |             |
| (5) Liner or bush in way of pintle bearings, in mm   | $t = 0.01\sqrt{B}$                                   |             |
| Symbols  |  |             |
| $k_p$ = material factor for pintle   |  |             |
| $B$ = bearing force, in N  |  |             |
| $d_p$ = actual pintle diameter measured to the inside of the liner, in mm  |  |             |
| $d_{pl}$ = diameter measured to the outside of the pintle liner, in mm   |  |             |
| $b_g$ = thickness of pintle housing/gudgeon in way of pintles (measured from the outside of bush if fitted).   |  |             |
| <b>Note</b> 1. The minimum dimensions of threads and nuts are to be determined according to <a href="#">Table 13. 2. 11: Securing nut dimensions</a> . |  |             |

2. 16. 5 The required push-up pressure for pintle is to be determined by the following formula:

$$p_{\text{req}} = 0.4 \frac{B_1 d_p}{d_m^2 l} \text{ N/mm}^2$$

Where

$d$  and  $l$  are defined in [Pt 3, Ch 13, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.4](#).

$B_1$  = supporting force in the pintle, in N

$d_p$  = actual pintle diameter, in mm.

The push-up length is to be calculated in accordance with [Pt 3, Ch 13, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.5](#), using the required push-up pressure and properties for the pintle.

## 2. 17 Bearings

2. 17. 1 Bearings are to comply with the requirements of [Table 13. 2. 13: Bearings](#). The fitting of bearings is to be carried out in accordance with the manufacturer's recommendations to ensure that they remain secure under all foreseeable operating conditions.
2. 17. 2 Where it is proposed to use stainless steel for liners or bearings for rudder stocks and/or pintles, the chemical composition is to be submitted for approval. Synthetic rudder bearing materials are to be of a type approved by ACS. When this type of lining material is used, arrangements to ensure an adequate supply of sea-water to the bearing are to be provided.

**Table 13. 2. 13: Bearings**

| tem | Requirement |
|-----|-------------|
|-----|-------------|

|  |   |                                 |
|--|---|---------------------------------|
| (1) Bearing surface area   | $A_B = \frac{B}{q_a} \text{ mm}^2$  |                                 |
| (2) Bearing length   | The length/diameter ratio of the bearing surface is not to be greater than 1.2. |                                 |
| (3) Clearance  | Bearing material  | Minimum clearance (on diameter) |
|  | Metal   | $0.001d + 1.0$                  |
|  | Synthetic   | See Notes 1, 2, 3 and 4         |
| (4) Liners and bushes  | Material  | Minimum thickness               |
|  | Metal and synthetic material  | 8 mm                            |
|  | Lignum vitae  | 22 mm                           |
| (5) Main bearing housing wall thickness, See Note 5  | Greater than $0.2d_c$   |                                 |
| Symbols  |   |                                 |
| $A_B$ = bearing surface, in $\text{mm}^2$ , defined as the projected area (length x outer diameter) of liner   |   |                                 |
| $d$ = stock diameter, as calculated in <a href="#">Table 13. 2. 4: Rudder stock diameter</a> , or pintle diameter as calculated in <a href="#">Table 13. 2. 12: Pintle requirements</a>  |   |                                 |
| $B$ = bearing force, in N  |   |                                 |
| $q_a$ = allowable surface pressure, See <a href="#">Table 13. 2. 14: Maximum surface pressure</a> .  |   |                                 |
| <b>Note 1.</b> If non-metallic bearing material is applied, the bearing clearance is to be specially determined considering the material's swelling and thermal expansion properties. This clearance is not to be less than 1.5 mm on bearing diameter unless a smaller clearance is supported by the manufacturer's recommendation and there is documented evidence of satisfactory service history with a reduced clearance. |   |                                 |
| <b>Note 2.</b> For bearings which are pressure lubricated the clearance must be restricted to enable the pressure to be maintained.  |   |                                 |
| <b>Note 3.</b> The value of the proposed minimum clearance is to be indicated on plans submitted for approval.   |   |                                 |
| <b>Note 4.</b> Proposals for higher pressures or other materials will be specially considered on the basis of satisfactory test results.   |   |                                 |
| <b>Note 5.</b> Where web stiffening is fitted on the bearing, a reduction in wall thickness will be considered.  |   |                                 |

**Table 13. 2. 14: Maximum surface pressure**

|   |   |
|---|---|
| Bearing material  | $q_a$ (N/mm <sup>2</sup> ) (See Note 1) |
| Lignum vitae  | 2.5                                     |
| White metal, oil lubricated   | 4.5                                     |
| Synthetic material with hardness between 60 and 70 Shore D (See Note 2) | 5.5 (See Note 3)                        |

|   |     |
|---|-----|
| Steel ( <i>See</i> Note 4) and bronze and hot-pressed bronze-graphite materials   | 7.0 |
| <p><b>Note</b> 1. Proposals for higher pressures will be specially considered on the basis of satisfactory test results.</p> <p><b>Note</b> 2. Indentation hardness test at 23°C and with 50 per cent moisture according to a recognised standard. Synthetic bearing materials are to be of an approved type.</p> <p><b>Note</b> 3. Surface pressures exceeding 5.5 N/mm<sup>2</sup> may be accepted in accordance with bearing manufacturer's specification and tests, but in no case more than 10 N/mm<sup>2</sup>.</p> <p><b>Note</b> 4. Stainless and wear-resistant steel in an approved combination with stock liner.</p> |     |

CHAPTER **13 Ship Control Systems**SECTION **3 Fixed and steering nozzles****3.1 General**

- 3.1.1 The requirements given in this Section are applicable to fixed and steering nozzles with an inner diameter of not greater than 5 metres.
- 3.1.2 For nozzles with an inner diameter greater than 5 metres, the maximum pressure acting on the nozzle is to be submitted by the designer. This pressure is to be used to determine the nozzle scantlings in accordance with the requirements of [Pt 3, Ch 13, 3.3 Nozzle scantlings](#) to [Pt 3, Ch 13, 3.5 Nozzle headbox](#).
- 3.1.3 Suitable arrangements are to be provided to prevent the steering nozzle from lifting.
- 3.1.4 Effective means are to be provided for supporting the weight of the nozzle. The hull structure, in way of the nozzle supports, is to be suitably strengthened.
- 3.1.5 Care is to be taken in the manufacture of the nozzle to ensure its internal preservation and watertightness. The preservation and testing are to be as required for rudders, *See* [Pt 3, Ch 13, 2.11 Rudder blade](#), [Table 1.9. 1: Testing requirements](#) and [Table 1.8. 1: Trial trip and operational tests](#).

**3.2 Design pressure**

- 3.2.1 The design pressure for propeller nozzles, in kN/m<sup>2</sup>, is to be determined as follows: این جدول پایین فرق داره با

$$P_d = c_z P_{d0}$$

$$P_{d0} = 9 + 0.0025 N \delta_p \text{ for } N_N \leq 63$$

$$P_{d0} = 13 + 0.002 N \delta_p \text{ for } 63 < N_N \leq 200$$

$$P_{d0} = \varepsilon C_f \frac{N}{A_p} \text{ for } N_N > 200$$

Where

$N_N$  = is the nozzle numeral

$$= 0.01 N \delta_p$$

$N$  = is the maximum shaft power in kW

$A_p$  = is the propeller disc area, in m<sup>2</sup>, taken equal to:

$$= \frac{\pi \delta_p^2}{4}$$

$\delta_p$  = is the propeller diameter in m

$\varepsilon$  = is a factor obtained from the following formula:

$$\varepsilon = 0.21 - 2 \times 10^{-4} \frac{N}{A_p} \text{ but not to be taken less than } 0.1$$

$c_z$  = is a coefficient taken equal to:

$c_z$  = 1.0 in Zone 2 (propeller zone)

$c_z$  = 0.5 in Zone 1

See also [Figure 13. 3. 1: Nozzle construction](#)

$c_f$  = is a coefficient taken equal to:

$c_f$  = 1.0 for fixed nozzles

$c_f$  = 1.25 for steering nozzles

**Figure 13. 3. 1: Nozzle construction**

### 3. 3 Nozzle scantlings

3. 3. 1 The scantlings of propeller nozzles are to be not less than required by [Table 13. 3. 1: Nozzle construction](#).

**Table 13. 3. 1: Nozzle construction**

| Item               | Requirement   |
|--------------------|---|
| (1) Nozzle plating | $t = 5s\sqrt{P_d k} + t_k$ but not less than 7.5 mm |

|   |  |
|---|--|
| (2) Ring webs and web stiffeners  | Not less than the attached nozzle plating in way of Zone 1 |
| (3) Webs in way of headbox and pintle support structure   | $t_w = t + 4 \text{ mm}$                                   |
| (4) Section modulus of nozzle profile about its neutral axis  | $Z = n\delta_p^2 L_d V^2 \text{ cm}^3$                     |
| Symbols   |  |
| <p><math>P_d</math> = nozzle design pressure, in kN/m<sup>2</sup>, See <a href="#">Pt 3, Ch 13, 3.2 Design pressure</a></p> <p><math>t</math> = thickness of nozzle plating, in mm</p> <p><math>t_w</math> = thickness of web plating, in mm</p> <p><math>s</math> = spacing of web rings, in m</p> <p><math>k</math> = material factor, as defined in <a href="#">Pt 3, Ch 13, 1.2 General symbols</a></p> <p><math>t_k</math> = corrosion thickness, to be taken as:<br/> <math>t_k = 2.5</math> in general<br/> <math>t_k = 1.5</math> for fresh water environments<br/> <math>t_k = 0</math> for stainless steel</p> <p><math>\delta_p</math> = propeller diameter, in m</p> <p><math>L_d</math> = nozzle length, in m</p> <p><math>n</math> = coefficient taken equal to:<br/> <math>n = 1.0</math> for steering nozzles<br/> <math>n = 0.7</math> for fixed nozzles</p> <p><math>V</math> is as defined in <a href="#">Pt 3, Ch 1, 6.1, Principal particulars</a></p> |  |

3. 3. 2 The Zone 2 nozzle plating is to be carried well forward and aft of the propeller tips with due allowance being made on steering nozzles for the rotation of the nozzle in relation to the propeller, and is to extend at least  $0.25L_d$  in length.
3. 3. 3 Fore and aft web stiffeners are to be fitted between the inner and outer skins of the nozzle. Both sides of the headbox and pintle support structure, are to be connected to fore and aft webs of increased thickness.
3. 3. 4 The adjacent ring webs fore and aft of those connected to the headbox and pintle support structure are to be of a similar thickness to the ring webs connected to the headbox and pintle support structure.
3. 3. 5 Local stiffening is to be fitted in way of the top and bottom supports which are to be integrated with the web stiffeners and ring webs. Continuity of bending strength is to be maintained in these regions.
3. 3. 6 The plating thickness of attached fins is to be not less than the Zone 1 nozzle plating thickness. Solid fins should be not less than 25 mm thick.

### 3. 4 Nozzle stock

3. 4. 1 The requirements for the nozzle stock are to be derived, in accordance with [Pt 3, Ch 13, 2.10 Rudder stock scantlings](#), using the lateral nozzle force and maximum nozzle torque obtained in this sub-Section.

3. 4. 2 The lateral nozzle force,  $C_R$ , at the centre of pressure is to be determined as follows:

$$C_R = P_d A_t 10^3 \text{ N}$$

Where

$P_d$  = nozzle design pressure in Zone 2, in kN/m<sup>2</sup>

$A_t$  = total projected area of nozzle and supporting structure, in m<sup>2</sup>

$A_t = A_n + A_f + A_s$

Where

$A_n$  = projected area of nozzle, in m<sup>2</sup>, to be taken as  $1.57\delta_p L_d$

$A_f$  = projected area of nozzle flap, in m<sup>2</sup>

$A_s$  = projected area of support structure in the longitudinal plane, in m<sup>2</sup>

where  $\delta_p$  and  $L_d$  are defined in [Table 13. 3. 1: Nozzle construction](#).

3. 4. 3 The maximum nozzle torque,  $Q_R$ , is to be determined as follows:

$$Q_R = C_R \times r \text{ Nm}$$

Where

$r$  = distance from the centre of pressure to the stock, in m, to be taken as:  
 $c(a - k_1)$

$c$  = nozzle length plus the length of the nozzle flap if present

$a$  = relative centre of pressure along the nozzle length, to be taken as:

$a = 0.25$  for fixed nozzles

$a = 0.33$  for steering nozzles

$k_1$  = ratio of the nozzle area forward of the stock centreline to the combined area of the nozzle and flap

$$k_1 = \frac{A_1}{A_n + A_f}$$

$A_1$  is the portion of the projected nozzle area located forward of the stock centreline, *See also* [Figure 13. 3. 2: Nozzle geometry](#)

$C_R$ ,  $A_n$  and  $A_f$  are given in [Pt 3, Ch 13, 3.4 Nozzle stock 3.4.2](#).

**Figure 13. 3. 2: Nozzle geometry**

### 3. 5 Nozzle headbox

3. 5. 1 The section modulus of the headbox,  $Z$ , about the longitudinal axis is to be not less than:

$$Z = 0.143P_d A_t D_h \times 10^2 \text{ cm}^3$$

Where

$P_d$  = nozzle design pressure in Zone 2, in  $\text{kN/m}^2$

$$D_H = \delta_h + \frac{\delta_p}{2}$$

Where

$\delta_h$  = depth of headbox, in m

$\delta_p$  = propeller diameter, in m

$A_t$  = is given in [Pt 3, Ch 13, 3.4 Nozzle stock 3.4.2.](#)

3. 5. 2 Plans detailing the integration of the headbox into the sternframe are to be submitted.

### 3. 6 Ancillary items

3. 6. 1 Requirements for ancillary items such as bearings, couplings, pintles, etc. are given in [Pt 3, Ch 13, 2 Rudders](#).

### 3. 7 Welding

3. 7. 1 Double continuous welds are to be used as far as practicable for the connection between the inner and outer nozzle plating and the internal stiffening rings and webs. Slot welding is not permitted for the inner nozzle plating.
3. 7. 2 Additional welding requirements are given in [Pt 3, Ch 13, 2.4 Welding and design details](#).

### 3. 8 Azimuth thrusters

3. 8. 1 In general, the scantlings of similar structures, such as azimuth thrusters, are to be calculated in accordance with the requirements of [Pt 3, Ch 13, 3.3 Nozzle scantlings](#) where the design pressure,  $P_d$ , is to be derived from loads specified by the designer. The stock may be assessed using these loads and the permissible design stresses given in [Table 13. 2. 5: Rudder stock permissible stresses](#).

CHAPTER **13 Ship Control Systems**

SECTION **4 Steering gear and allied systems**

## **4. 1 General**

4. 1. 1 For the requirements of steering gear, See [Pt 5, Ch 19 Steering Systems](#).

PART

# 3

CHAPTER **13 Ship Control Systems**

SECTION **5 Bow and stern thrust unit structure**

## **5.1 Unit wall thickness**

- 5.1.1 The wall thickness of the unit is, in general, to be in accordance with the manufacturer's practice, but is to be not less than either the thickness of the surrounding shell plating plus 10 per cent or 15 mm, whichever is greater.

## **5.2 Framing**

- 5.2.1 The unit is to be framed to the same standard as the surrounding shell plating.
- 5.2.2 The unit is to be adequately supported and stiffened.

**6. 1 Fin stabilisers**

- 6. 1. 1 The box into which the stabilisers retract is to have perimeter plating of the same thickness as the surrounding Rule shell plating plus 2 mm, but is to be not less than 12.5 mm, and is to be stiffened to the same standard as the shell.
- 6. 1. 2 The stabiliser machinery and surrounding structure is to be adequately supported and stiffened. Where bending stresses are induced in the structure under fatigue conditions the maximum stress is not to exceed 39.0 N/mm<sup>2</sup>.

**6. 2 Stabiliser tanks**

- 6. 2. 1 The general structure of the tank is to comply with the Rule requirements for deep tanks. Sloshing forces in the tank structure are to be taken into account. Where such forces are likely to be significant, the scantlings will be required to be verified by additional calculation.

## CHAPTER 13 Ship Control Systems

### SECTION 7 Equipment

#### 7.1 General

- 7.1.1 To entitle a ship to the figure 1 in its character of classification, equipment in accordance with the requirements of [Table 13. 7. 1: Equipment requirements](#) is to be provided. The regulations governing the assignment of the character figure 1 for equipment are given in [Pt 1, Ch 2, 2 Character of classification and class notations](#).
- 7.1.2 For ships intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.6](#) to [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.10](#), equipment differing from these requirements may be approved if considered suitable for the particular service on which the ship is to be engaged, *See also* [Table 13. 7. 1: Equipment requirements](#).
- 7.1.3 Where the Committee has agreed that anchoring and mooring equipment need not be fitted in view of the particular service of the ship, the character letter N will be assigned, *See also* [Pt 1, Ch 2, 2.2 Character symbols 2.2.2](#).

**Table 13. 7. 1: Equipment requirements**

| Ship type  | Service   | Required equipment   |
|--|---|--|
| Cargo ships, bulk carriers, tankers, ferries, dredgers, etc. (See <a href="#">Pt 3, Ch 13, 1.1 Application 1.1.2</a> ) | Unrestricted service  | <p>(1) The equipment is to be selected from the following sub-Sections as appropriate, using <math>N_C</math></p> <p>Anchor and chain cables See <a href="#">Table 13. 7. 2: Equipment - Bower anchors and chain cables</a></p> <p>Mooring lines See <a href="#">Pt 3, Ch 13, 7.5 Mooring lines (Equipment Number &lt; 2000)</a> or <a href="#">Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number &gt; 2000)</a> as appropriate.</p> <p>Towing line See <a href="#">Pt 3, Ch 13, 7.8 Towline and towing arrangement</a></p> |
| Ferries  | Certain restricted services, See <a href="#">Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.9</a> | <p>(2) As per item (1), using <math>N_C</math> and <math>N_A</math> as appropriate</p> <p>Mass of bower anchor <math>N_A = \text{one grade below } N_C</math></p> <p>Chain cable length and diameter <math>N_A = \text{one grade below } N_C</math></p> <p>Stream anchor may be omitted</p>  |
|  |   | (3) As per item (2), and   |

|   |  |  |
|---|--|--|
|   | Specified coastal service, <i>See</i> <a href="#">Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.8</a>         | Chain cables <p>Where <math>L &lt; 40</math> m, wire ropes may be used in place of chain cables when the requirements specified under <a href="#">Pt 3, Ch 13, 7.4 Chain cables and chain locker 7.4.7</a> and <a href="#">Pt 3, Ch 13, 7.4 Chain cables and chain locker 7.4.9</a> are complied with.</p> <p>Where <math>40 \text{ m} \leq L \leq 90 \text{ m}</math>, chain cables may be replaced with wire rope of equal minimum breaking strength when:</p> <p>(a) the requirements specified for <math>L &lt; 40</math> m are complied with and</p> <p>(b) have a minimum mass per unit length of 30% that of Grade U2 chain cable required by <a href="#">Table 13. 7. 2: Equipment - Bower anchors and chain cables</a>.</p> |
| Dredging and reclamation craft            | Extended protected waters service, <i>See</i> <a href="#">Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.7</a> | (4) As per item (1), using $N_C$ and $N_A$ as appropriate<br>$N_A = N_C$ reduced by two grades, except for stream anchors or mooring lines<br>Stream anchor – not required if ship fitted with positioning spuds   |
|   | Protected waters service, <i>See</i> <a href="#">Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.6</a>          | (5) As per item (1), using $N_C$ and $N_A$ as appropriate<br>Mass of bower anchor $N_A = 0.5N_C$<br>Chain cable diameter $N_A = 0.5N_C$<br>Bower anchors powered ships – two anchors<br>Bower anchors unpowered (manned) ships – one anchor<br>Chain cable length – greater of $2L$ m or $10.07D$ m, but need not exceed requirements for an ordinary cargo ship with anchors of the same mass<br>Mooring lines – as required for $N_C$<br>Wire ropes – may be substituted for chain cable on bower anchors if breaking strength $\geq 1.5$ times that of the chain cable  |
| Trawlers, stern trawlers, fishing vessels | Unrestricted service   | (6) The equipment for fishing vessels is to be selected from Pt 3, Ch 13, <a href="#">Table 13. 7. 4: Equipment – Stream anchors, stream wires, towlines and mooring lines</a><br>Chain cables Where $L < 40$ m, wire ropes (including those fitted to trawl winches) may be used in place of chain cables when the requirements specified under <a href="#">Pt 3, Ch 13, 7.4 Chain cables and chain locker 7.4.7</a> and <a href="#">Pt 3, Ch 13, 7.4 Chain cables and chain locker 7.4.9</a> are complied with.<br>Hawsers and warps – Sufficient in number and strength for proper working of the ship  |

|                              |  |   |
|------------------------------|--|---|
| Tugs                         | Unrestricted and restricted service  | (7) As per item (1) using $N_C$ except as stated below<br><br>Stream anchor – not required<br><br>Towlines – adequate for tug's maximum bollard pull with factor of safety $\geq 2.0$   |
|                              | Service restricted, See <a href="#">Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.7 to Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.10</a>                          | (8) As per item (1) using $N_C$<br><br>Mass of bower anchor reduced to correspond to two Equipment Letters below that required for $N_C$<br><br>Chain cable diameter reduced to correspond to two Equipment Letters below that required for $N_C$<br><br>Anchor chains As item (3) in this Table  |
|                              | Protected waters service, See <a href="#">Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.6</a>   | (9) As per item (1) using $N_A$<br><br>Mass of bower anchor $N_A = 0.5N_C$<br><br>Chain cable diameter $N_A = 0.5N_C$<br><br>Chain cable length = 0.5 times length required by $N_A$<br><br>Where $N_C < 90$ , the requirements for anchors and chain cable will be specially considered<br><br>Anchor chains As item (3) in this Table |
| Offshore supply ships        | Unrestricted service   | (10) As per item (1) using $N_C$<br><br>Chain cable length and diameter – increased to correspond to two Equipment Letters above that required for $N_C$ . Need not be applied for ships with <b>DP(AAA)</b> , <b>DP(AA)</b> or <b>DP(AM)</b> notations   |
| Manned barges and pontoons   | Service restricted, See <a href="#">Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.7 to Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.10</a>                          | (11) As per item (4) in this Table  |
| Unmanned barges and pontoons | Unrestricted service, or service restricted, See <a href="#">Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.7 to Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.10</a> | (12) As per item (1) using $N_C$ and $N_A$ as appropriate<br><br>Anchors $L < 30$ m, no anchor need be carried<br><br>Anchors $L \geq 30$ m, one anchor to be fitted<br><br>Anchor cable length – greater of 40 m or $2L$ m   |
|                              |  | (a) Unrestricted service:<br><br>mass of anchors and chain cable diameters as for $N_C$<br><br>(b) Protected water service, See <a href="#">Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.6</a> : mass of anchors and chain cable diameters, $N_A = 0.5N_C$  |

|   |               |  |

|   |               | (c) Service restriction, <i>See</i> <a href="#">Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.7</a> to <a href="#">Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.10</a> : mass of anchor and chain cable diameter, $N_A$ reduced to correspond to two Equipment Letters below $N_C$  |
|   | Mooring lines | $L < 65$ m, two mooring lines to be fitted   |
|   |               | $L \geq 65$ m, three mooring lines to be fitted<br>length of mooring lines to be the greater of $2L$ or 80 m, but need not exceed that for manned ships<br>Strength of each line to be that required by NC<br>Consideration will be given to proposals to omit anchoring equipment in association with the assignment of the character figure 1, <i>See</i> <a href="#">Pt 1, Ch 2, 2.2, Character symbols</a> .<br>Where $L < 65$ m consideration will be given to the omission of anchoring and mooring equipment, in which case the character letter N will be assigned in the character of classification, <i>See</i> <a href="#">Pt 1, Ch 2, 2.2, Character symbols</a> |
| Symbols   |               |  |
| $L$ = length of ship as defined in <a href="#">Pt 3, Ch 1, 6.1, Principal particulars</a>                                   |               |  |
| $N_A$ = actual equipment number to be used, if different from $N_C$   |               |  |
| $N_C$ = calculated equipment number for ship as required by <a href="#">Pt 3, Ch 1, 7.1 Calculation of Equipment Number</a> |               |  |
| $T_D$ = maximum depth at which ship is designed to dredge, in metres  |               |  |

7. 1. 4 Where the ship is intended to perform its primary designed service function only while it is anchored, moored, towed or linked, the character letter T will be assigned, *See also* [Pt 1, Ch 2, 2.2 Character symbols 2.2.2](#).
7. 1. 5 For classification purposes, the character figure 1, or either of the character letters N or T, is to be assigned.
7. 1. 6 The anchoring equipment required herewith is intended for temporary mooring of a ship within a harbour or sheltered areas when the ship is awaiting berth, tide, etc. It is designed to hold a ship only in good holding ground conditions to avoid dragging of the anchor. In poor holding ground, the holding power of the anchors would be significantly reduced.
7. 1. 7 It is assumed that under normal circumstances a ship uses only one bower anchor and chain cable at a time.
7. 1. 8 All anchors and chain cables are to be tested at establishments and on machines recognised by the Committee and under the supervision of ACS's Surveyors or other Officers recognised by the Committee, and in accordance with [Ch 10 Equipment for Mooring and Anchoring](#) of the Rules for Materials.
7. 1. 9 Test certificates showing particulars of weights of anchors, or size and weight of cable and of the test loads are applied to be furnished. These certificates are to be examined by the Surveyors when the anchors and cables are placed on board the ship.
7. 1. 10 Steel wire and fibre ropes are to be tested as required by [Ch 10 Equipment for Mooring and Anchoring](#) of the Rules for Materials.

## 7.2 Anchors

- 7.2.1 Anchors are to be of an approved design. The design of all anchor heads is to be such as to minimise stress concentrations, and in particular, the radii on all parts of cast anchor heads are to be as large as possible, especially where there is considerable change of section.
- 7.2.2 Anchors which must be specially laid the right way up, or which require the fluke angle or profile to be adjusted for varying types of sea bed, will not generally be approved for normal ship use, but may be accepted for offshore units, floating cranes, etc. In such cases suitable tests may be required.
- 7.2.3 The mass of each bower anchor given in [Table 13. 7. 2: Equipment - Bower anchors and chain cables](#) is for anchors of equal mass. The masses of individual anchors may vary by  $\pm 7$  per cent of the masses given in the Table, provided that the total mass of the anchors is not less than would have been required for anchors of equal mass.
- 7.2.4 The mass of the head, including pins and fittings, of an ordinary stockless anchor is to be not less than 60 per cent of the total mass of the anchor.
- 7.2.5 When stocked bower or stream anchors are to be used, the mass excluding the stock is to be not less than 80 per cent of the mass given in [Table 13. 7. 2: Equipment - Bower anchors and chain cables](#) for ordinary stockless bower anchors. The mass of the stock is to be 25 per cent of the total mass of the anchor, including the shackle, etc. but excluding the stock.
- 7.2.6 It is recommended that anchor lashings, e.g. a 'devil's claw', be fitted to hold the anchor tight against the hull or the anchor pocket. Anchor lashings are to be designed to resist at least a load corresponding to twice the anchor mass plus 10 m of cable without exceeding 40 per cent of the yield strength of the material.

**Table 13. 7. 2: Equipment - Bower anchors and chain cables**

| Equipment number |               | Equipment Letter | Stockless bower anchors |                       | Stud link chain cables for bower anchors |                       |                                  |  |
|------------------|---------------|------------------|-------------------------|-----------------------|--|-----------------------|----------------------------------|--|
| Exceeding        | Not Exceeding |                  | Number                  | Mass of anchor, in kg | Total length, in metres                  | Diameter, in mm       |                                  |  |

### 7. 3 High holding power anchors

7. 3. 1 When high holding power anchors are used as bower anchors, the mass of each such anchor may be 75 per cent of the mass given in the Table for ordinary stockless bower anchors.
7. 3. 2 Anchor designs for which approval is sought as high holding power anchors are to be tested at sea to show that they have holding powers of at least twice those of approved standard stockless anchors of the same mass. For holding power test requirements relating to high holding power anchors, See [Ch 10, 1.3 Anchor holding power tests for HHP and SHHP anchors](#) of the Part 2.
7. 3. 3 The anchor is to be suitable for the ship's use and is not to require prior adjustment or special placement on the sea bottom.
7. 3. 4 High holding power anchors are to be of a design that will ensure that the anchors will take effective hold of the sea bed without undue delay and will remain stable, for holding forces up to those required by [Pt 3, Ch 13, 7.3 High holding power anchors 7.3.2](#), irrespective of the angle or position at which they first settle on the sea bed when dropped from a normal type of hawse pipe. In case of doubt, a demonstration of these abilities may be required.

### 7. 4 Chain cables and chain locker

7. 4. 1 An easy lead of the cables from the windlass to the anchors and chain lockers is to be arranged.

7. 4. 2 Chain cables may be of mild steel, special quality steel or extra quality steel in accordance with the requirements of [Ch 10 Equipment for Mooring and Anchoring](#) of the Part 2 and are to be graded in accordance with [Table 13. 7. 3: Chain cable steel grades](#). The total length of chain cable given in [Table 13. 7. 2: Equipment - Bower anchors and chain cables](#) is to be divided in approximately equal parts between the two bower anchors.
7. 4. 3 Grade U1 material having a tensile stress of less than 400 N/mm<sup>2</sup> is not to be used in association with high holding power anchors. Grade U3 material is to be used only for chain 20.5 mm or more in diameter.
7. 4. 4 Where stream anchors are used in association with chain cable, this cable may be either stud link or short link. Also for Equipment Number ≤ 90, short link chain cables may be used for bower anchors as an alternative to stud link chain cables.
7. 4. 5 The form and proportion of links and shackles are to be in accordance with [Ch 10 Equipment for Mooring and Anchoring](#) of the Part 2.
7. 4. 6 Where Owners require equipment for anchoring at depths greater than 82.5 m and up to 120 m, the recommendations specified in [Pt 3, Ch 13, 10 Anchoring equipment in deep and unsheltered water](#) shall be complied with.
7. 4. 7 Wire rope may be used in place of chain cable for bower anchors on ships with Rule length *L* less than 40 m when subjected to the following conditions:
- The length of the wire rope is to be equal to 1.5 times the corresponding tabular length of chain cable specified by [Table 13. 7. 2: Equipment - Bower anchors and chain cables](#) or [Table 13. 7. 5: Equipment for fishing vessels](#) as appropriate.
  - The breaking strength is to be equal to that of tabular chain cable of Grade U1.
7. 4. 8 Wire ropes or chain cable are to be used for stream anchors as specified by [Table 13. 7. 4: Equipment – Stream anchors, stream wires, towlines and mooring lines](#).
7. 4. 9 When wire ropes are used instead of chain cable in accordance with [Pt 3, Ch 13, 7.4 Chain cables and chain locker 7.4.7](#) or [Pt 3, Ch 13, 7.4 Chain cables and chain locker 7.4.8](#):
- A short length of chain cable is to be fitted between the wire rope and bower or stream anchor having a length of 12.5 m or the distance between the anchor in the stowed position and the winch, whichever is less.
  - All surfaces being in contact with the wire need to be rounded with a radius of not less than 10 times the wire rope diameter (including stem).
7. 4. 10 Where wire rope is used in lieu of chain cable for anchoring, galvanised wire rope with an independent wire core in accordance with [Ch 10, 6 Steel wire ropes](#) of the Part 2 is to be used. Wire rope terminal fittings are to comply with an acceptable code or standard. The strength of terminations, connecting fittings, shackles or links is not to be less than that of the anchor line.
7. 4. 11 The chain locker is to be of adequate capacity and depth to provide an easy direct lead of the cables through the chain pipes and facilitate self-stowing of the cables. The chain locker is to be provided with an internal division so that the port and starboard chain cables can be separately stowed.
7. 4. 12 The chain locker boundaries are to be watertight up to the weather deck. Where the means of access to the chain locker is located below the weather deck, the access cover and its securing arrangement in general are to be in accordance with recognised standards for watertight manhole with bolted covers (e.g. ISO 5894 Ships and marine technology – Manholes with bolted covers). Butterfly nuts and/or hinged bolts are prohibited as the securing mechanism for the access cover.
7. 4. 13 The chain locker is to be provided with adequate drainage facilities.

**Table 13. 7. 3: Chain cable steel grades**

|  |  |                  |
|--|--|------------------|
|  |  | Tensile strength |
|--|--|------------------|

| Grade  | Material                        | N/mm <sup>2</sup> |
|--------|---------------------------------|-------------------|
| U1     | Mild steel                      | 300 - 490         |
| U2 (a) | Special quality steel (wrought) | 490 - 690         |
| U2 (b) | Special quality steel (cast)    | 490 - 690         |
| U3     | Extra special quality steel     | 690 min.          |

## 7. 5 Mooring lines (Equipment Number ≤ 2000)

7. 5. 1 It is recommended that the breaking strength, length and number of mooring lines provided on board ships with equipment number of less than or equal to 2000 be not less than those specified in [Table 13. 7. 4: Equipment – Stream anchors, stream wires, towlines and mooring lines](#). The Equipment Number is to be calculated in accordance with [Pt 3, Ch 1, 7.1 Calculation of Equipment Number](#). Deck cargo as given by the loading manual is to be included in the determination of side-projected area  $A$  to be used in this sub-Section including the equipment number calculations.
7. 5. 2 It is the Owners responsibility to ensure the adequacy of the mooring equipment. The equipment should be verified through carrying out ship specific mooring calculations. The mooring calculations are to be representative of the anticipated mooring configurations, as well as accounting for operational and environmental considerations. This section details minimum recommendations only, and where the calculations provide a lesser specification it is recommended that they be increased in accordance with this section.
7. 5. 3 For ships having the ratio of side projected area  $A$  and equipment number as defined in [Pt 3, Ch 1, 7.1 Calculation of Equipment Number](#) greater than 0.9, the following number of lines is to be added to the number of mooring lines as given by the [Table 13. 7. 4: Equipment – Stream anchors, stream wires, towlines and mooring lines](#):
- One line where  $0.9 < \frac{A}{\text{Equipment Number}} \leq 1.1$
  - Two lines where  $1.1 < \frac{A}{\text{Equipment Number}} \leq 1.2$
  - Three lines where  $1.2 < \frac{A}{\text{Equipment Number}}$ .
7. 5. 4 It is permitted to reduce the individual mooring line lengths specified by [Table 13. 7. 4: Equipment – Stream anchors, stream wires, towlines and mooring lines](#) by up to 7 per cent provided the total length of mooring lines is not less than the total length, if all the lines were of equal given lengths.

## 7. 6 Mooring lines (Equipment Number > 2000)

7. 6. 1 The recommended minimum breaking strength, length and number of mooring lines for ships with equipment number greater than 2000, calculated in accordance with [Pt 3, Ch 1, 7.1 Calculation of Equipment Number](#) are provided in this sub-Section. Deck cargo as given by the Loading Manual is to be included in the determination of side-projected area  $A$  to be used in the equipment number calculations.
7. 6. 2 It is the Owners responsibility to ensure the adequacy of the mooring equipment. The equipment should be verified through carrying out ship specific mooring calculations. The mooring calculations are to be representative of the anticipated mooring configurations, as well as accounting for operational and environmental considerations. This section details minimum recommendations only, and where the calculations provide a lesser specification it is recommended that they be increased in accordance with this section. A typical mooring arrangement is indicated in [Figure 13. 7. 1: Typical mooring arrangement](#) and the following is defined with respect to mooring lines.

- a. Breast line: A mooring line that is deployed perpendicular to the ship, restraining the ship in the off-berth direction.
  - b. Spring line: A mooring line that is deployed almost parallel to the ship, restraining the ship in the fore or aft direction.
  - c. Head/stern line: A mooring line that is oriented between longitudinal and transverse direction, restraining the ship in the off-berth and in the fore or aft direction. The amount of restraint in fore or aft and off-berth direction depends on the line angle relative to these directions.
7. 6. 3 The strength of mooring lines and the number of head, stern, and breast lines for ships with an Equipment Number > 2000 are based on the side-projected area  $A_1$ . Side projected area  $A_1$  is to be calculated similar to the side-projected area  $A$  according to [Pt 3, Ch 1, 7.1 Calculation of Equipment Number](#) but considering the following conditions:
- a. For oil tankers, chemical tankers, bulk carriers, and ore carriers, the lightest ballast draft is to be considered for the calculation of the side-projected area  $A_1$ . For other ships the lightest draft of usual loading conditions is to be considered if the ratio of the freeboard in the lightest draft and the full load condition is equal to or above two. Usual loading conditions mean loading conditions as given by the trim and stability booklet that are to be expected to regularly occur during operation and, in particular, excluding light weight conditions, propeller inspection conditions, etc.
  - b. Wind shielding of the pier can be considered for the calculation of the side-projected area  $A_1$  unless the ship is intended to be regularly moored to jetty type piers. The lower part of the side projected area above the waterline for the considered loading condition can be disregarded up to the pier height in the calculation of the side-projected area  $A_1$ . Actual height of the pier above the waterline is to be used in the calculation but in general not to exceed 3 m.
  - c. Deck cargo as given by the Loading Manual is to be included for the determination of side-projected area  $A_1$ . Deck cargo need not be considered if the usual light draft condition without cargo on deck generates a larger side-projected area  $A_1$  than the full load condition with cargo on deck. The larger of both side-projected areas should be chosen as side-projected area  $A_1$ .
7. 6. 4 The mooring lines specified are based on a maximum current speed of 1.0 m/s and the following maximum wind speed  $V_w$ :
- $$\begin{aligned}
 V_w &= 25.0 - 0.002 (A_1 - 2000) \text{ m/s for passenger ships, ferries and car carriers with } 2000 \text{ m}^2 < A_1 \leq 4000 \text{ m}^2 \\
 &= 21.0 \text{ m/s for passenger ships, ferries and car carriers with } A_1 > 4000 \text{ m}^2 \\
 &= 25.0 \text{ m/s for other ships}
 \end{aligned}$$
7. 6. 5 The maximum wind speed  $V_w$  is representative of the mean wind speed over a 30 second period from any direction and at a height of 10 m above the ground. The current speed considered is a representative of the maximum current speed acting on bow or stern ( $\pm 10^\circ$ ) at a depth of one-half of the mean draft. Furthermore, it is considered that the ships are moored to solid piers that provide shielding against cross currents.
7. 6. 6 Additional loads caused by higher wind or current speeds, cross currents, additional wave loads, or reduced shielding from non-solid piers, for example are to be specially considered. Consideration is also to be given to the fact that unfavourable mooring layouts can significantly increase the loads on individual mooring lines.

**Figure 13. 7. 1: Typical mooring arrangement**

7. 6. 7 The minimum breaking strength, in kN, of the mooring lines (MBL) is to be taken as:

$$MBL = 0.1 \times A_1 + 350$$

Where

$A_1$  = Side projected area as defined by [Pt 3, Ch 13, 7.6 Mooring lines \(Equipment Number > 2000\) 7.6.3](#)

7. 6. 8 The minimum breaking strength may be limited to 1275 kN (130 tonnes). However in these cases, the moorings are to be considered as not sufficient for the environmental conditions given by [Pt 3, Ch 13, 7.6 Mooring lines \(Equipment Number > 2000\) 7.6.4](#). For these ships, the acceptable wind speed  $V_w^*$ , in m/s, to be calculated as follows:

$$V_w^* = V_w \times \sqrt{\frac{MBL^*}{MBL}}$$

Where

$V_w$  = wind speed as per [Pt 3, Ch 13, 7.6 Mooring lines \(Equipment Number > 2000\) 7.6.4](#)

$MBL^*$  = the breaking strength of the mooring lines intended to be supplied

$MBL$  = required breaking strength provided by [Pt 3, Ch 13, 7.6 Mooring lines \(Equipment Number > 2000\) 7.6.7](#)

However, the intended minimum breaking strength  $MBL^*$  is not to be taken less than that corresponding to an acceptable wind speed of 21 m/s:

$$MBL^* \geq \left(\frac{21}{V_w}\right)^2 \times MBL$$

7. 6. 9 If the mooring lines are intended to be supplied for an acceptable wind speed  $V_w^*$ , higher than  $V_w$  as per [Pt 3, Ch 13, 7.6 Mooring lines \(Equipment Number > 2000\) 7.6.4](#), the minimum breaking strength to be taken as:

$$MBL^* = \left(\frac{V_w^*}{V_w}\right)^2 \times MBL$$

Where

$MBL$  = required breaking strength provided by [Pt 3, Ch 13, 7.6 Mooring lines \(Equipment Number > 2000\) 7.6.7](#)

7. 6. 10 The total number of head, stern and breast lines is specified as:

$$n = 8.3 \times 10^{-4} \times A_1 + 6$$

Where

$A_1$  = side projected area as defined by Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number > 2000) 7.6.3

However, for oil tankers, chemical tankers, bulk carriers and ore carriers the total number of head, stern and breast lines is to be taken as:

$$n = 8.3 \times 10^{-4} \times A_1 + 4$$

The total number of head, stern and breast lines is to be rounded to the nearest whole number. The number may be increased or decreased in conjunction with an adjustment to the strength of the lines. The adjusted strength,  $MBL^*$ , is to be taken as:

$$MBL^* = 1.2 \times MBL \times \frac{n}{n^*} \leq MBL, \text{ for increased number of lines}$$

$$MBL^* = MBL \times \frac{n}{n^*}, \text{ for reduced number of lines}$$

Where

$n$  = number of lines for the considered ship type as calculated by the above formula without rounding

$n^*$  = increased or decreased total number of head, stern and breast lines

Vice versa, the strength of head, stern and breast lines may be increased or decreased in conjunction with an adjustment to the number of lines.

7. 6. 11 The total number of spring lines is to be taken not less than:

- Two lines where  $EN < 5000$ ,
- Four lines where  $EN \geq 5000$ .

The strength of spring lines is to be the same as that of the head, stern and breast lines. If the number of head, stern and breast lines is increased in conjunction with an adjustment to the strength of the lines, the number of spring lines is also to be increased likewise, but rounded up to the nearest even number.

7. 6. 12 The length of mooring lines is to be taken as 200 m. It is permitted to reduce the length of individual mooring line by up to 7 per cent provided that the total length of mooring lines is not less than the total length, if all the lines were of equal given lengths.

## 7. 7 Mooring Arrangement and winches

- 7. 7. 1 The recommendations with respect to the mooring arrangement and mooring winches are provided by this sub-Section.
- 7. 7. 2 Mooring lines in the same service (e.g. breast lines) are to be of the same characteristics in terms of strength and elasticity.
- 7. 7. 3 As far as possible, a sufficient number of mooring winches is to be fitted so as to allow all mooring lines to be belayed on winches. This allows for an efficient distribution of the load to all mooring lines in the same service and for the mooring lines to shed the load before they break. If the mooring arrangement is designed such that mooring lines are partly to be belayed on bitts or bollards, it is to be understood that these lines may not be as effective as the mooring lines belayed on winches.
- 7. 7. 4 In the case of ships with Rule length  $L$  greater than 90 m, all ropes having breaking strengths in excess of 736.0 kN and used in normal mooring operations are to be handled by, and stored on,

suitably designed winches. Alternative methods of storing shall give due consideration to the difficulties experienced in manually handling ropes having breaking strengths in excess of 490.0 kN.

- 7. 7. 5 The mooring winch is to be fitted with brakes, the holding capacity of which is sufficient to prevent unreeling of the mooring line when the rope tension is equal to 80 per cent of the minimum breaking strength of the rope as fitted on the first layer. The winch is to be fitted with brakes that will allow for the reliable setting of the brake rendering load.
- 7. 7. 6 For powered winches the maximum hauling tension which can be applied to the mooring line (the reeled first layer) is to be not less than 2/9, nor to be more than, 1/3, of the rope's minimum breaking strength. For automatic winches these figures apply when the winch is set to the maximum power with automatic control.
- 7. 7. 7 For powered winches on automatic control, the rendering tension which the winch can exert on the mooring line (the reeled first layer) is not to exceed 1.5 times, nor be less than 1.05 times, the hauling tension for that particular power setting of the winch. The winch is to be marked with the range of rope strengths for which it is designed.
- 7. 7. 8 Mooring lines are to have a straight lead from the mooring drum to the fairlead as far as practicable.
- 7. 7. 9 When a mooring line changes direction, the contact surface on the fitting shall have a large radius so as to minimise the wear experienced by the mooring lines. Recommendations from the rope manufacturer for the intended rope type are also to be complied with.

## 7. 8 Towline and towing arrangement

- 7. 8. 1 The recommended towlines are given in [Table 13. 7. 4: Equipment – Stream anchors, stream wires, towlines and mooring lines](#) and are intended as ship's own towline, for being towed by a tug or another ship. This sub-Section also provides recommendations with respect to the towing arrangement.
- 7. 8. 2 The equipment number used for the selection of the towline is to be calculated in accordance with [Pt 3, Ch 1, 7.1 Calculation of Equipment Number](#). Deck cargo as given by the Loading Manual is to be included in the determination of side-projected area *A* to be used in the equipment number calculations.
- 7. 8. 3 Towing lines are to be led through a closed chock. The use of open fairleads with rollers or closed roller fairleads is to be avoided.
- 7. 8. 4 For the purpose of towing, it is recommended to provide at least one chock close to centreline of the ship forward and aft. It is also beneficial to provide additional chocks on port and starboard side at the transom and at the bow.
- 7. 8. 5 Towing lines are to have a straight lead from the towing bitt or bollard to the chock.
- 7. 8. 6 For the purpose of towing, bitts or bollards serving a chock are to be located slightly offset and at a distance of at least 2 m away from the chock, See [Figure 13. 7. 2: Typical towing arrangement](#).
- 7. 8. 7 Attention is to be given to the arrangement of the equipment for towing and mooring operations in order to prevent interference of mooring and towing lines as far as practicable. It is beneficial to provide dedicated towing arrangements separate from the mooring equipment.

**Figure 13. 7. 2: Typical towing arrangement**

7. 8. 8 For emergency towing arrangements for tankers, reference is made to [Pt 3, Ch 13, 12 Emergency towing arrangements](#). For all ships other than tankers, towing arrangements of sufficient strength are to be provided fore and aft, as defined by ‘other towing service’ in [Pt 3, Ch 13, 9.2, Towing](#).

## 7. 9 Mooring and towline construction

7. 9. 1 Towlines and mooring lines are to be of wire, natural fibre or synthetic fibre construction or of a mixture of wire and fibre. For synthetic fibre ropes it is recommended that lines with reduced risk of recoil (snap-back) be used to mitigate the risk of injuries or fatalities in the case mooring line failure.
7. 9. 2 Notwithstanding the strength recommendations, no fibre rope shall be less than 20 mm in diameter. For polyamide ropes the minimum breaking strength is to be increased by 20 per cent and for other synthetic ropes by 10 per cent to account for strength loss due to, among other causes, aging and wear.
7. 9. 3 Wire ropes used for towlines and mooring lines are generally to be of a flexible construction with not less than 144 wires in six strands with seven fibre cores for strengths up to 490 kN, and 222 wires in six strands with one fibre core for strengths exceeding 490 kN. The wires laid round the fibre centre of each strand are to be made up in not less than two layers.
7. 9. 4 Wire ropes for towlines and mooring lines used in association with mooring winches (on which the rope is stored on the winch drum) are to be of suitable construction.
7. 9. 5 The towing and mooring lines are to be tested in accordance with [Ch 10, 6 Steel wire ropes](#) and [Ch 10, 7 Fibre ropes](#) of the Part 2 for wire ropes and fibre ropes, respectively.

**Table 13. 7. 4: Equipment – Stream anchors, stream wires, towlines and mooring lines**

| Equipment Number |               | Stockless stream anchor | Stream wire or chain (See Note 1) |                        | Mooring lines (See Note 2) |                                 |                                | Towline            |                                |
|------------------|---------------|-------------------------|-----------------------------------|------------------------|----------------------------|---------------------------------|--------------------------------|--------------------|--------------------------------|
| Exceeding        | Not exceeding | Mass per anchor (kg)    | Length (m)                        | Breaking strength (kN) | No. of mooring lines       | Minimum length of each line (m) | Minimum breaking strength (kN) | Minimum length (m) | Minimum breaking strength (kN) |
| 50               | 70            | 60                      | 80                                | 64.7                   | 3                          | 80                              | 37                             | 180                | 98                             |

| 3600 | -    |  |  |  |  |  |  | 300 | 1471 |

**Note 1.** The rope used for stream wire is to be constructed of not less than 72 wires, made up into six strands.

**Note 2.** The mooring lines are to be selected only for ships with equipment number less than or equal to 2000.

**Note 1.** For equipment number  $\leq 110$ , short link chain cables may be considered as an alternative to stud link chain cables.

CHAPTER **13 Ship Control Systems**SECTION **8 Anchor windlass design and testing****8.1 General**

- 8.1.1 A windlass used for handling anchors, suitable for the size of chain cable required by [Pt 3, Ch 13, 7 Equipment](#) and complying with the following criteria is to be fitted. Where Owners require equipment significantly in excess of Rule requirements, it is their responsibility to specify increased windlass power.
- 8.1.2 The design, construction and testing of windlasses are to conform with a relevant National or International Standard or code of practice acceptable to *ACS*. To be considered acceptable, the standard, or code of practice, is to specify criteria for evaluation of stresses, performance and testing.
- 8.1.3 Operation and maintenance procedures for the anchor windlass are to be incorporated in the vessel operations manual.

**8.2 Plans and particulars to be submitted**

- 8.2.1 The following plans showing the design specifications, the standard of compliance, engineering analyses and details of construction, as applicable, are to be submitted for evaluation:
  - Windlass design specifications, anchor and chain cable particulars, performance criteria, and standard of compliance.
  - Windlass foundation drawings including the supporting structure below deck. The details shall include bolts, chocks, shear stoppers etc., along with the foot print loads for the specified windlass ratings.
  - Chain stopper foundation drawings including the supporting structure below deck. The details shall include bolts, chocks, shear stoppers etc., along with the foot print loads for the specified rating.
  - Windlass arrangement plans showing all the components of the anchoring/mooring system such as the prime mover, shafting, cable lifter, anchors and chain cables; mooring winches, wires and fairleads, if they form part of the windlass machinery, brakes, controls, etc.
  - Dimensions, materials, welding details, as applicable, of all torque-transmitting components (shafts, gears, clutches, couplings, coupling bolts, etc.) and all load-bearing components (shaft bearings, cable lifter, sheaves, drums, bed-frames, etc.) of the windlass and of the winch, where applicable, including brakes, chain stopper (if fitted), and foundation.
  - Hydraulic system, to include:
    - i. piping diagram along with system design pressure;

- ii. safety valves arrangement and settings;
- iii. material specifications for pipes and equipment;
- iv. typical pipe joints, as applicable;
- v. technical data and details for hydraulic motors;
- vi. cooling systems arrangements for hydraulic system oil.
- Electrical one-line diagram along with cable specification and size, motor controller, protective device rating or setting, as applicable.
- Control, monitoring and instrumentation arrangements.
- Engineering analyses for torque-transmitting and load-bearing components demonstrating their compliance with recognised standards or codes of practice. Analyses for gears are to be in accordance with a recognised standard.
- Calculations proving satisfactory inertia loads for the intended windlass, *See* [Pt 3, Ch 13, 8.4 Windlass design 8.4.1.b](#).
- Plans and data for windlass electric motors including associated gears rated 100 kW and over.
- Calculations demonstrating that the windlass prime mover is capable of attaining the hoisting speed, the required continuous duty pull, and the overload capacity are to be submitted if the 'load testing' including 'overload' capacity of the entire windlass unit is not carried out at the shop (*See* [Pt 3, Ch 13, 8.9 Shop inspection and testing 8.9.1.b](#)).

### 8. 3 Materials and fabrication

- 8. 3. 1 Materials used in the construction of torque-transmitting and load-bearing parts of windlasses are to comply with *ACS*'s Part 2 or an appropriate National or International Standard acceptable to *ACS*, provided that the Standard gives reasonable equivalence to the requirements of *ACS*. The proposed materials are to be indicated in the construction plans and are to be approved in connection with the design. All such materials are to be certified by the material manufacturers and are to be traceable to the manufacturers' certificates.
- 8. 3. 2 Weld joint designs are to be shown in the submitted construction plans and are to be appraised in association with the approval of the windlass design in accordance with an appropriate National or International Standard acceptable to *ACS*.
- 8. 3. 3 Welding procedures, welding consumables and welders are to comply with the *ACS* Part 2 or an appropriate National or International Standard acceptable to *ACS*.
- 8. 3. 4 The degree of non-destructive examination of welds and post-weld heat treatment, if any, are to be specified and submitted for consideration.

### 8. 4 Windlass design

- 8. 4. 1 In addition to the requirements of the National or International Standard or code of practice acceptable to *ACS* (*See* [Pt 3, Ch 13, 8.1 General 8.1.2](#)) the following performance requirements are to be complied with:
  - a. Holding Loads: Calculations are to be made to show that, in the holding condition (single anchor, brake fully applied and chain cable lifter declutched) and under a load equal to 80 per cent of the specified minimum breaking strength of the chain cable, the maximum stress in each load bearing component will not exceed the maximum permissible yield. For installations fitted with a chain cable stopper, 45 per cent of the specified minimum breaking strength of the chain cable may instead be used for the calculation.

- b. Inertia Loads: The design of the drive train, including prime mover, reduction gears, bearings, clutches, shafts, cable lifter and bolting is to consider the dynamic effects of sudden stopping and starting of the prime mover or chain cable, so as to limit inertial load.
- c. Continuous Duty Pull: The windlass is to have sufficient power to exert a continuous duty pull,  $Z_{\text{cont1}}$ , over a period of 30 minutes corresponding to the grade and diameter,  $d_c$ , of the chain cables as follows:

- i. for specified design anchorage depths up to 82.5 m when using ordinary stockless anchors:

|                   |                        |
|-------------------|------------------------|
| Chain cable grade | $Z_{\text{cont1}} (N)$ |
| U1                | $37.5d_c^2$            |
| U2                | $42.5d_c^2$            |
| U3                | $47.5d_c^2$            |

- ii. for specified design anchorage depths greater than 82.5 m a continuous duty pull  $Z_{\text{cont2}}$  is:

$$Z_{\text{cont2}} = Z_{\text{cont1}} + (D_a - 82.5)0.27d_c^2N$$

Where

$d_c$  = is the chain diameter, in mm

$D_a$  = is the specified design anchorage depth, in metres

The anchor masses are assumed to be the masses as given in [Table 13. 7. 2: Equipment - Bower anchors and chain cables](#). The value of  $Z_{\text{cont}}$  is based on the hoisting of one anchor at a time, and assumes that the effects of buoyancy and hawse pipe efficiency (assumed to be 70 per cent) have been accounted for. In general, stresses in each torque-transmitting component are not to exceed 40 per cent of yield strength (or 0.2 per cent proof stress) of the material under these loading conditions.

- d. Overload Capability: The windlass prime mover is to be able to provide, for a period of at least two minutes, the necessary temporary overload capacity for breaking out the anchor. This temporary overload capacity is to be a pull equal to the greater of:
  - i. short term pull:
    - 1.5 times the continuous duty pull as defined in [Pt 3, Ch 13, 8.4 Windlass design 8.4.1.c](#),
    - or
  - ii. anchor breakout pull:

$$12.18W_a + \frac{7.0L_c d_c^2}{100} N$$

Where

$L_c$  = is the total length of chain cable on board, in metres, as given by [Table 13. 7. 2: Equipment - Bower anchors and chain cables](#)

$W_a$  = is the mass of bower anchor (kg) as given in [Table 13. 7. 2: Equipment - Bower anchors and chain cables](#).

Note The speed in this period may be lower than normal.

- e. Hoisting Speed: The mean speed of the chain cable during hoisting of the anchor and cable is to be 0.15 m/s.
- f. Brake Capacity: The capacity of the windlass brake is to be sufficient to stop the anchor and chain cable when paying out the chain cable in a controlled manner. Where a chain cable

stopper is not fitted, the brake is to produce a torque capable of withstanding a pull equal to 80 per cent of the specified minimum breaking strength of the chain cable without any permanent deformation of strength members and without brake slip. Where a chain cable stopper is fitted, 45 per cent of the breaking strength may instead be applied. The following simplified formula is to be used to calculate the required brake capacity:

$$K_b d_c^2 (44 - 0.08 d_c) N$$

where  $K_b$  is given in [Table 13. 8. 1: Values of  \$K\_b\$](#) .

**Table 13. 8. 1: Values of  $K_b$**

| Cable grade | $K_b$   |                          |
|-------------|---|--------------------------|
|             | Windlass used in conjunction with chain stopper | Chain stopper not fitted |
| U1          | 4.41  | 7.85                     |
| U2          | 6.18  | 11.0                     |
| U3          | 8.83  | 15.7                     |

8. 4. 2 As an alternative to conducting the engineering analyses required by [Pt 3, Ch 13, 8.4., Windlass design 8.4.1](#), approval of the windlass mechanical design can be based on a type test, in which case the testing procedure is to be submitted for consideration.
8. 4. 3 Calculations for torque transmitting components are to be based on 1500 hours of operation with a nominal load spectrum factor of  $K_m = 1.0$ . Alternatively unlimited hours with  $K_m = 0.8$  can be applied.
8. 4. 4 The following criteria are to be used for gearing design:
  - a. Torque is to be based on the performance criteria specified in [Pt 3, Ch 13, 8.4., Windlass design 8.4.1](#).
  - b. The use of an equivalent torque,  $T_{eq}$ , for dynamic strength calculations is acceptable but the derivation is to be submitted to ACS for consideration.
  - c. The application factor for dynamic strength calculation,  $K_A$ , is to be 1.15.
  - d. Calculations are to be based on 1500 hours of operation.
  - e. The static torque is to be  $1.5 \times T_n$  where  $T_n$  is the nominal torque.
  - f. The minimum factors of safety for load capacity of spur and helical gears, as derived using ISO 6336 or a relevant National or International standard acceptable to ACS, are to be 1.5 for bending stress and 0.6 for contact stress.

Gears intended to transmit power greater than 100 kW are to be certified by, and the gears are to meet the requirements of [Pt 5, Ch 5 Gearing](#).

## 8. 5 Hydraulic systems

8. 5. 1 Hydraulic systems, where employed for driving windlasses, are to comply with the requirements of [Pt 5, Ch 14, 9 Hydraulic systems](#).

## 8. 6 Electrical systems

8. 6. 1 Electric motors are to meet the requirements of [Pt 6, Ch 2, 9 Rotating machines](#). Motors exposed to weather are to have enclosures suitable for their location, *See also* [Pt 6, Ch 2, 1.11 Location and construction 1.11.1](#).

8. 6. 2 Motor branch circuits are to be protected in accordance with the applicable Rules, and cable sizing is to be in accordance with the requirements of the [Pt 6, Ch 2, 11 Electric cables, optical fibre cables and busbar trunking systems \(busways\)](#).

## 8. 7 Control arrangements

8. 7. 1 All control devices are to be capable of being controlled from readily accessible positions and protected against unintentional operation.
8. 7. 2 The maximum travel of the levers is not to exceed 600 mm if movable in one direction only, or 300 mm to either side from a central position if movable in both directions. They are to move toward the right when hauling and toward the left when paying out. Alternatively, they are to move backward when hauling and forward when paying out.
8. 7. 3 Wherever practical, the lever is to move in the direction of the intended movement.
8. 7. 4 For lever-operated brakes, the brake is to engage when the lever is pulled and disengage when the lever is pushed. The physical effort on the brake for the operator is not to exceed 160 N.
8. 7. 5 For pedal-operated brakes the maximum travel is not to exceed 250 mm and the physical effort for the operator is not to exceed 320 N.
8. 7. 6 The handwheel or crankhandle is to actuate the brake when turned clockwise and release it when turned counterclockwise. The physical effort for the operator is not to exceed 250 N for speed regulation and 500 N at any moment.
8. 7. 7 When not provided with automatic sequential control, separate push-buttons are to be provided for each direction of operation.
8. 7. 8 The push-buttons are to actuate the machinery when depressed and stop and effectively brake the machinery when released.
8. 7. 9 The above mentioned individual push-buttons may be replaced by two 'start' and 'stop' push-buttons.
8. 7. 10 Control systems, whether electric, pneumatic or hydraulic, are to comply with the general requirements of [Pt 6, Ch 1, 2 Essential features for control, alarm, monitoring and safety systems](#).

## 8. 8 Protection arrangements

8. 8. 1 Where applicable, moving parts of windlass machinery are to be provided with suitable railings and/or guards to prevent injury to personnel.
8. 8. 2 Protection is to be provided for preventing persons from coming into contact with surfaces having temperatures over 50°C.
8. 8. 3 Steel surfaces not protected by lubricant are to be protected by a coating in accordance with the requirements of a relevant National or International Standard acceptable to ACS.
8. 8. 4 For arrangements of power transmission systems and relief requirements See [Pt 5, Ch 14, 9.1 General](#).
8. 8. 5 Electrical cables installed in exposed locations on open deck are to be provided with effective mechanical protection.
8. 8. 6 Means are to be provided to contain potential debris resulting from severe damage of the prime mover due to over-speed in the event of uncontrolled rendering of the cable, particularly when an axial piston type hydraulic motor forms the prime mover.
8. 8. 7 An arrangement to release the anchor and chain in the event of windlass power failure is to be provided. Windlasses are to be fitted with couplings which are capable of disengaging between

the cable lifter and the drive shaft. Hydraulically or electrically operated couplings are to be capable of being disengaged manually.

- 8.8.8 The design of the windlass is to be such that the following requirements or equivalent arrangements will minimise the probability of the chain locker or forecastle being flooded in bad weather:
- a weathertight connection can be made between the windlass bedplate, or its equivalent, and the upper end of the chain pipe by means of a cover or seal, and
  - access to the chain pipe is adequate to permit the fitting of a cover or seal, of sufficient strength and proper design, over the chain pipe while the ship is at sea.

## 8.9 Shop inspection and testing

- 8.9.1 Windlasses are to be inspected during fabrication at the manufacturers' facilities by a Surveyor for conformance with the approved plans. Acceptance tests, as specified in the specified Standard (See [Pt 3, Ch 13, 8.1 General 8.1.2](#)), are to be witnessed by the Surveyor and include the following tests, as a minimum:
- No-load test. The windlass is to be run without load at nominal speed in each direction for a total of 30 minutes. If the windlass is provided with a gear change, an additional run in each direction for 5 minutes at each gear change is required.
  - Load test. The windlass is to be tested to verify that the continuous duty pull, overload capacity and hoisting speed as specified in [Pt 3, Ch 13, 8.4, Windlass design 8.4.1](#) can be achieved. Where the manufacturer's works does not have adequate facilities, these tests, including the adjustment of the overload protection, can be carried out on board ship. In these cases, functional testing in the manufacturer's works is to be performed under no-load conditions.
  - Brake capacity test. The holding power of the brake is to be verified through testing if not verified by calculation.
- 8.9.2 Windlass performance characteristics specified in [Pt 3, Ch 13, 8.9, Shop inspection and testing 8.9.1](#) are based on the following assumptions:
- one cable lifter only is connected to the drive shaft;
  - continuous duty and short term pulls are measured at the cable lifter;
  - hawse pipe efficiency assumed to be 70 per cent.

## 8.10 On-board testing

- 8.10.1 Each windlass is to be tested under working conditions after installation on board to demonstrate satisfactory operation. Each unit is to be independently tested for braking, clutch functioning, lowering and hoisting of the chain cable and anchor, proper riding of the chain over the cable lifter, proper transit of the chain through the hawse pipe and the chain pipe, and effecting proper stowage of the chain and the anchor. It is to be confirmed that anchors properly seat in the stored position and that chain stoppers function as designed, if fitted. The braking capacity is to be tested by intermittently paying out and holding the chain cable by means of the application of the brake.
- 8.10.2 The mean hoisting speed, as specified in [Pt 3, Ch 13, 8.4 Windlass design 8.4.1.e](#) is to be measured and verified. For testing purposes, the speed is to be measured over two shots of chain cable and initially with at least three shots of chain (82.5 m or 45 fathoms in length) and the anchor submerged and hanging free. Following trials, the ship will be eligible to be assigned a descriptive note **specified design anchorage depth . . . metres**, which will be entered in column 6 of the *Register Book*.
- 8.10.3 Load testing is to be carried out if this was not previously completed as required by [Pt 3, Ch 13, 8.9 Shop inspection and testing 8.9.1.b](#).

8. 10. 4 Where the depth of water in the trial area is inadequate, suitable equivalent simulating conditions will be considered as an alternative.

## 8. 11 Marking and identification

8. 11. 1 The windlass is to be permanently marked with the following information:
- Nominal size of the cable chain including mean diameter, grade and percentage of the breaking load the windlass is designed to hold (e.g. 100/3/45).
  - Maximum anchorage depth, in metres.

## 8. 12 Structural requirements associated with anchoring

8. 12. 1 The windlass or winch is to be efficiently bedded and secured to the deck. The thickness of the deck in way of the windlass or winch is to be increased and the supporting structure for the anchor windlass is to be examined for the brake holding loads specified by [Pt 3, Ch 13, 8.4, Windlass design](#). The allowable stresses specified in [Table 13. 8. 2: Allowable stresses in windlass and chain stopper supporting structure](#) are to be used to derive the net scantlings of the supporting structure. A corrosion addition of 2 mm is to be added to the net thickness derived. The structural design integrity of the bedplate is the responsibility of the Shipbuilder and windlass or winch manufacturer.
8. 12. 2 Where cables pass through stoppers, these stoppers are to be manufactured from ductile material and be designed to minimise the possibility of damage to, or snagging of, the cable. They are to be capable of withstanding without permanent deformation a load equal to 80 per cent of the Rule breaking load of the cable passing over them. The allowable stresses specified in [Table 13. 8. 2: Allowable stresses in windlass and chain stopper supporting structure](#) are to be used to derive the net scantlings of the supporting structure. A corrosion addition of 2 mm is to be added to the net thickness derived.

**Table 13. 8. 2: Allowable stresses in windlass and chain stopper supporting structure**

|  | Permissible stress<br>N/mm <sup>2</sup> |
|--|---|
| Normal stress ( <i>See Note 1</i> )  | 1.00 $\sigma_0$                         |
| Shear stress   | 0.58 $\sigma_0$                         |
| Symbols  |   |
| $\sigma_0$ = specified minimum yield stress, N/mm <sup>2</sup>                   |   |
| <b>Note 1</b> Normal stress is defined as the sum of bending and axial stresses. |   |

8. 12. 3 Hawse pipes and anchor pockets are to be of ample thickness and of a suitable size and form to house the anchors efficiently, preventing, as much as practicable, slackening of the cable or movements of the anchor being caused by wave action. The shell plating and framing in way of the hawse pipes are to be reinforced as necessary. Reinforcing is also to be arranged in way of those parts of bulbous bows liable to be damaged by anchors or cables. Substantial chafing lips are to be provided at shell and deck. These are to have sufficiently large, radiused faces to minimise the probability of cable links being subjected to high bending stresses. Alternatively, roller fairleads of suitable design may be fitted. Where unpocketed rollers are used, it is recommended that the roller diameter be not less than eleven times the chain diameter. Where hawse pipes are not fitted, alternative arrangements will be specially considered.

- 8. 12. 4 The chain locker is to be of a capacity and depth adequate to provide an easy direct lead for the cable into the chain pipes, when the cable is fully stowed. Chain or spurling pipes are to be of suitable size and provided with chafing lips. The port and starboard cables are to be separated by a division in the locker.
- 8. 12. 5 Where means of access is provided to the chain locker it is to be closed by a substantial cover and secured by closely spaced bolts. Where a means of access to spurling pipes or cable lockers is located below the weather deck, the access cover and its securing arrangements are to be in accordance with ISO 5894-1999, or an equivalent National Standard acceptable to ACS, recognised standards or equivalent for watertight manhole covers. Butterfly nuts and/or hinged bolts are prohibited as the securing mechanism for the access cover.
- 8. 12. 6 Chain lockers and spurling pipes are to be watertight up to the exposed weather deck and the space is to be efficiently drained. However, bulkheads between separate chain lockers, or which form a common boundary of chain lockers, need not be watertight.
- 8. 12. 7 Spurling pipes are to be provided with permanently attached closing appliances to minimise water ingress. Examples of acceptable arrangements are:
  - a. steel plates with cutouts to accommodate chain links, or
  - b. canvas hoods with a lashing arrangement that maintains the cover in the secured position.
- 8. 12. 8 Provision is to be made for securing the bitter end of the chain cable to the ship structure. The fastening for securing the bitter end is to be capable of withstanding a force of not less than 15 per cent and not greater than 30 per cent of the minimum breaking strength of the as fitted chain cable. It is to be provided with suitable means such that, in case of emergency, the chain cable may be easily slipped to sea from an accessible position outside the chain cable locker. Where the mechanism for slipping the chain cable to sea penetrates the chain locker bulkhead, this penetration is to be made watertight.
- 8. 12. 9 Alternatively the cable end connection may be accepted where it has been designed and constructed to a recognised National or International Standard.
- 8. 12. 10 The cable clench supporting structure is to be adequately stiffened in accordance with the breaking strength of the fastening provided.
- 8. 12. 11 Satisfactory arrangements are to be made for the stowage and working of the stream anchor, if provided.
- 8. 12. 12 On dredging and reclamation craft the following are to be complied with:
  - a. On unpowered ships, the windlass may be hand operated.
  - b. On split type vessels, the arrangements are to be such that jamming of the anchor cable during opening and closing operations of the hull will not occur.
- 8. 12. 13 When wire rope instead of chain is used for the anchor cable, it is to be stored on a suitably designed drum or reel. Fairleads intended for use with wire rope cable are to be designed to minimise wear and to avoid kinking or other damage occurring to the rope. Fairleads should, in general, be fitted with rollers having a diameter not less than eleven times the diameter of the anchor cable or as specified/ recommended by the rope manufacturer.

## 8. 13 Structural requirements for windlasses on exposed fore decks

- 8. 13. 1 Windlasses located on the exposed deck over the forward 0.25L of the rule length, of ships of sea-going service of length 80 m or more, where the height of the exposed deck in way of the item is less than 0.1L or 22 m above the summer load waterline, whichever is the lesser, are to comply with the following requirements. Where mooring winches are integral with the anchor windlass, they are to be considered as part of the windlass.
- 8. 13. 2 The following pressures and associated areas are to be applied, See [Figure 13. 8. 1: Windlass loading](#):

- 200 kN/m<sup>2</sup> normal to the shaft axis and away from the forward perpendicular, over the projected area in this direction;
- 150 kN/m<sup>2</sup> parallel to the shaft axis and acting both inboard and outboard separately, over the multiple of  $f$  times the projected area in this direction;

Where

$$f = 1 + B/H, \text{ but not greater than } 2.5$$

$B$  = width of windlass measured parallel to the shaft axis, in metres

$H$  = overall height of windlass, in metres.

**Figure 13. 8. 1: Windlass loading**

**Note**  $P_y$  is to be examined from both inboard and outboard directions separately, See [Pt 3, Ch 13, 8.13 Structural requirements for windlasses on exposed fore decks 8.13.2](#). The sign convention for  $y_i$  is reversed when  $P_y$  is from the opposite direction as shown.

8. 13. 3 Forces in the bolts, chocks and stoppers securing the windlass to the deck are to be calculated. The windlass is supported by  $N$  bolt groups, each containing one or more bolts, See [Figure 13. 8. 2: Direction of forces and weight](#).

**Figure 13. 8. 2: Direction of forces and weight**

8. 13. 4 The axial force  $R_i$  in bolt group (or bolt)  $i$ , positive in tension, may be calculated from:

$$\begin{aligned}
 R_{xi} &= P_x h x_i A_i / I_x \text{ in kN} \\
 R_{yi} &= P_y h y_i A_i / I_y \text{ in kN, and} \\
 R_i &= R_{xi} + R_{yi} - R_{si} \text{ in kN}
 \end{aligned}$$

where

$$\begin{aligned}
 P_x &= \text{force acting normal to the shaft axis, in kN} \\
 P_y &= \text{force acting parallel to the shaft axis, either inboard or outboard whichever gives the greater force in bolt group } i, \text{ in kN} \\
 h &= \text{shaft height above the windlass mounting, in cm} \\
 x_i, y_i &= x \text{ and } y \text{ coordinates of bolt group } i \text{ from the centroid of all } N \text{ bolt groups, positive in the direction opposite to that of the applied force, in cm} \\
 A_i &= \text{cross sectional area of all bolts in group } i, \text{ in cm}^2 \\
 I_x &= \sum A_i x_i^2 \text{ for } N \text{ bolt groups, in cm}^4 \\
 I_y &= \sum A_i y_i^2 \text{ for } N \text{ bolt groups, in cm}^4 \\
 R_{si} &= \text{static reaction at bolt group } i, \text{ due to weight of windlass, in kN.}
 \end{aligned}$$

8. 13. 5 Shear forces  $F_{xi}$ ,  $F_{yi}$  applied to the bolt group  $i$ , and the resultant combined force  $F_i$  may be calculated from:

$$\begin{aligned}
 F_{xi} &= (P_x - \mu g M) / N \text{ in kN} \\
 F_{yi} &= (P_y - \mu g M) / N \text{ in kN} \\
 F_i &= \sqrt{(F_{xi}^2 + F_{yi}^2)} \text{ kN}
 \end{aligned}$$

Where

- $\alpha$  = coefficient of friction (0.5)  
 $M$  = mass of windlass, in tonnes  
 $g$  = gravity acceleration (9.81 m/sec<sup>2</sup>)  
 $N$  = number of bolt groups.

8. 13. 6 Tensile axial stresses in the individual bolts in each bolt group  $i$  are to be calculated. The horizontal forces  $F_{xi}$  and  $F_{yi}$  are normally to be reacted by shear chocks. Where 'fitted' bolts are designed to support these shear forces in one or both directions, the von Mises equivalent stresses in the individual bolts are to be calculated, and compared to the stress under proof load. Where pourable resins are incorporated in the holding down arrangements, due account is to be taken in the calculations.
8. 13. 7 The safety factor against bolt proof strength is to be not less than 2.0.
8. 13. 8 Bolts are to be of ISO 898/1 material Grade 8.8, 10.9 or 12.9 or equivalent and are to be pretensioned by controlled means to 70 to 90 per cent of their yield stress. Pretensioning is to be in accordance with the manufacturer's instructions and, in general, pretensioning by bolt torquing up to bolt size M30 may be used. Beyond this, pretensioning is to be carried out by an hydraulic tensioning device and the elongation of the bolts measured to determine pre-load. Where resin chocks are proposed plans and calculations are to be submitted for consideration.
8. 13. 9 The windlass is to be efficiently bedded and secured to the deck. The thickness of the deck in way of the windlass is to be increased. Adequate stiffening of the deck in way of the windlass is to be provided. The scantlings of the supporting structure and deck are to be determined by additional calculations applying the weight of the windlass combined with the resultant force on the seat due to the application of the following design loads:
- $P_x$  (as defined in [Pt 3, Ch 13, 8.13 Structural requirements for windlasses on exposed fore decks 8.13.4](#));
  - $P_y$ ;
  - $P_x$  and  $P_y$  combined;

The allowable stresses given in [Table 13. 8. 3: Allowable stress in windlass supporting structure for green sea loading](#) are not to be exceeded.

**Table 13. 8. 3: Allowable stress in windlass supporting structure for green sea loading**

|   | Bending stress,<br>in N/mm <sup>2</sup> | Shear stress,<br>in N/mm <sup>2</sup> | Combined stress,<br>in N/mm <sup>2</sup> |
|---|---|---------------------------------------|--|
| Allowable stress  | $\frac{150}{k}$                         | $\frac{87}{k}$                        | $\frac{213}{k}$                          |
| $k$ = material factor, See <a href="#">Pt 3, Ch 2, 1.2, Steel</a> |   |                                       |  |

8. 13. 10 The axial tensile and compressive forces in [Pt 3, Ch 13, 8.13 Structural requirements for windlasses on exposed fore decks 8.13.4](#) and the lateral forces in [Pt 3, Ch 13, 8.13 Structural requirements for windlasses on exposed fore decks 8.13.5](#) are also to be considered in the design of the supporting structure.

CHAPTER **13 Ship Control Systems**SECTION **9 Structural requirements associated with towing and mooring****9. 1 General**

- 9. 1. 1 This Section applies to the design and construction of shipboard fittings and supporting structures used for the normal towing and mooring operations. Normal towing means towing operations necessary for manoeuvring in ports and sheltered waters associated with the normal operations of the ship.
- 9. 1. 2 The arrangements, equipment and fittings of sufficient safe working load are to be provided to enable the safe conduct of all towing and mooring operations associated with the normal operations of the ship.
- 9. 1. 3 For ships, not subject to SOLAS Regulation II-1/3-4 Paragraph 1, but intended to be fitted with equipment for towing by another ship or a tug, e.g. such as to assist the ship in case of emergency as given in SOLAS Regulation II-1/3-4 Paragraph 2, the requirements designated as 'other towing' in this Section are to be applied to the design and construction of those shipboard fittings and supporting hull structures.
- 9. 1. 4 This Section is not applicable to the design and construction of shipboard fittings and supporting hull structures used for special towing services such as escort towing, canal transit towing, emergency towing for tankers etc. These requirements are also not applicable to special purpose ships.
- 9. 1. 5 Shipboard fittings means bollards and bitts, fairleads, stand rollers, chocks used for the normal mooring of the ship, and the similar components used for normal or other towing of the ship. Any weld or bolt or equivalent device connecting the shipboard fitting to the supporting structure is part of the shipboard fitting. Other components such as capstans, winches, etc. are not covered by this Section.
- 9. 1. 6 Supporting hull structures means that part of the ship structure on/in which the shipboard fitting is placed and which is directly submitted to the forces exerted on the shipboard fitting. The supporting hull structure of capstans, winches, etc. used for normal or other towing and mooring operations mentioned above is also to comply with the requirements specified in this Section.

**9. 2 Towing**

- 9. 2. 1 The strength of shipboard fittings used for normal towing operations at bow, sides and stern and their supporting hull structures are to comply with the requirements specified in this sub-Section.
- 9. 2. 2 Where a ship is equipped with shipboard fittings intended to be used for other towing services, the strength of these fittings and their supporting hull structures are also to comply with the requirements specified.

9. 2. 3 Shipboard fittings for towing are to be located on stiffeners and/or girders which are part of the deck construction so as to facilitate efficient distribution of the towing load. Other arrangements are acceptable (for chocks in bulwarks, etc.), provided that the strength is confirmed adequate for the intended service.
9. 2. 4 The design load applied to shipboard fittings and supporting hull structure is not to be less than that given in [Table 13. 9. 1: Minimum design load for deck fittings and supporting structure – Towing](#).

**Table 13. 9. 1: Minimum design load for deck fittings and supporting structure – Towing**

| Use/Item  | Minimum design load (See Notes 1 to 3)  |
|---|---|
| Normal towing<br>(harbour/manoeuvring)  | 1.25 times the intended maximum towing load (e.g. static bollard pull) as indicated on the towing and mooring arrangements plan |
| Other towing service<br>(SOLAS Regulation II-1/3-4 Paragraph 2)   | Minimum breaking strength of the towline  |
| For fittings intended to be used for both normal towing and other towing service  | The greater of the specified loads in each case   |
| <p><b>Note 1.</b> When a safe towing load TOW greater than that determined according to <a href="#">Pt 3, Ch 13, 9.2 Towing 9.2.12</a> is requested, then the design load is to be increased in accordance with the appropriate TOW/design load relationship given in this sub-Section.</p> <p><b>Note 2.</b> Side projected area including that of deck cargoes as given by the loading manual is to be taken into account for selection of towing lines and the loads applied to shipboard fittings and supporting hull structure.</p> <p><b>Note 3.</b> The increase of the minimum breaking strength for synthetic ropes need not to be taken into account for the loads applied to shipboard fittings and supporting hull structure.</p> |   |

9. 2. 5 The design load is to be applied to fittings in all directions that could occur by taking into account the arrangement shown on the towing and mooring arrangements plan. Where the towing line takes a turn at a fitting, the total design load applied to the fitting is equal to the resultant of the design loads acting on the line, See [Figure 13. 9. 1: Design load applied to fittings](#). However, in no case does the design load applied to the fitting need to be greater than twice the design load on the line.

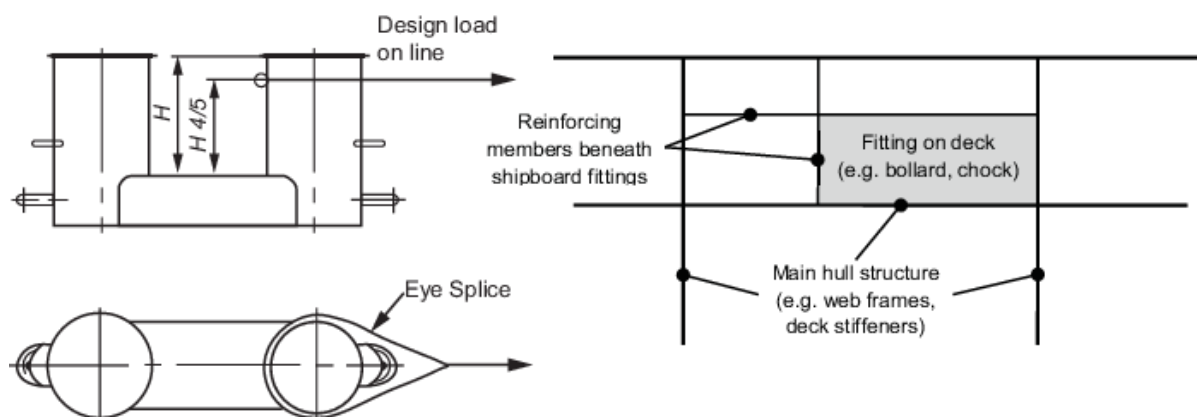

**Figure 13. 9. 1: Design load applied to fittings**

9. 2. 6 Shipboard fittings are to be selected from an acceptable National or International standard and to be based on the following minimum loads.
- For normal towing operations, the intended maximum towing load (e.g. static bollard pull) as indicated on the towing and mooring arrangements plan;
  - For other towing service, the minimum breaking strength of the towline in accordance with [Pt 3, Ch 13, 7.8 Towline and towing arrangement](#) (See Notes 2 and 3 of [Table 13. 9. 1: Minimum design load for deck fittings and supporting structure – Towing](#));
  - For fittings intended to be used for both, i.e. normal and other towing operations, the greater of the loads specified in each case is to be used.
9. 2. 7 Towing bitts (double bollards) are to be chosen for the towing line attached with an eye splice if the industry standard distinguishes between different methods to attach the line, i.e. figure-of eight or eye splice attachment.
9. 2. 8 When the shipboard fitting is not selected from an accepted industry standard, the strength of the fitting based on net scantlings and its attachment to the ship is to be adequate for the loads specified by the [Table 13. 9. 1: Minimum design load for deck fittings and supporting structure – Towing](#) based on the acceptance criteria given in [Pt 3, Ch 13, 9.2 Towing 9.2.10](#) or [Pt 3, Ch 13, 9.2 Towing 9.2.11](#) as appropriate. Towing bitts (double bollards) are required to resist the loads caused by the towing line attached with an eye splice. For strength assessment, beam theory or finite element analysis using net scantlings is to be applied, as appropriate. Corrosion additions and wear down allowance is to be added to the net scantlings as defined in this Section.
9. 2. 9 The net scantlings of the supporting hull structure for the fittings are to be adequate for the loads specified by the [Table 13. 9. 1: Minimum design load for deck fittings and supporting structure – Towing](#) based on the acceptance criteria given in by [Pt 3, Ch 13, 9.2 Towing 9.2.10](#) or [Pt 3, Ch 13, 9.2 Towing 9.2.11](#) as appropriate. The reinforced members beneath shipboard fittings are to be effectively arranged for any variation of direction (horizontally and vertically) of the towing forces acting upon the shipboard fittings, See [Figure 13. 9. 2: Supporting hull structure](#) for a sample arrangement. Proper alignment of the fitting and its supporting hull structure is to be ensured. The acting point of the towing force on a shipboard fitting is to be taken at the attachment point of a towing line or at a change in its direction. For bollards and bitts the attachment point of the towing line is to be taken not less than 4/5 of the tube height above the base as indicated in [Figure 13. 9. 2: Supporting hull structure](#). Corrosion additions are to be added to the net scantlings as defined in this Section.

**Figure 13. 9. 2: Supporting hull structure**

9. 2. 10 In the case of strength assessment using beam theory or grillage analysis, the stress within the supporting structure of fittings is not to exceed that given in [Table 13. 9. 2: Allowable stress within the supporting structure of shipboard fittings](#).
9. 2. 11 For strength calculations by means of finite element analysis, the geometry is to be idealised as realistically as possible. The ratio of element length to width is not to exceed 3. Girders are to be modelled using shell or plane stress elements. Symmetric girder flanges are generally to be modelled by beam or truss elements. At least three elements are to be used across the depth of the girder. In way of small openings in girder webs the web thickness is to be reduced to a mean thickness over the web height. Large openings are to be modelled. Stiffeners are generally to be modelled by using shell, plane stress, or beam elements. Stresses are to be read from the centre of the individual element. For shell elements the stresses are to be evaluated at the mid plane of the element. The equivalent stress within the supporting structure of fittings is not to exceed the specified minimum yield strength of the material.

**Table 13. 9. 2: Allowable stress within the supporting structure of shipboard fittings**

|   | Normal stress, in<br>N/mm <sup>2</sup> | Shear stress, in<br>N/mm <sup>2</sup> |
|---|--|---------------------------------------|
| Allowable stress  | $\frac{235}{k}$                        | $\frac{141}{k}$                       |
| where<br>$k = \frac{235}{\sigma_0}$<br>$\sigma_0$ = specified minimum yield strength of the material in N/mm <sup>2</sup><br><b>Note</b> Normal stress is defined as the sum of bending and axial stresses. No stress concentration factors accounted for and as such may need to be considered separately. |  |                                       |

9. 2. 12 The safe towing load (TOW) is the load limit for towing purposes. TOW used is not to exceed 80 per cent of the design loads specified by [Table 13. 9. 1: Minimum design load for deck fittings and supporting structure – Towing](#).
9. 2. 13 TOW, in tonnes, of each shipboard fitting is to be marked (by weld bead or equivalent) on the deck fittings used for towing. For fittings intended to be used for both, towing and mooring, SWL, in tonnes, according to [Pt 3, Ch 13, 9.3, Mooring](#) is to be marked in addition to TOW.

9. 2. 14 The above requirements on TOW apply for the use with no more than one towline line. If not otherwise chosen, for towing bitts (double bollards) TOW is the load limit for a towing line attached with an eye-splice.
9. 2. 15 The towing and mooring arrangements plan mentioned in [Pt 3, Ch 13, 9.4, Towing and mooring arrangements plan](#) is to define the method of use of towing lines.

### 9. 3 Mooring

9. 3. 1 The strength of shipboard fittings used for mooring operations and their supporting hull structures as well as the strength of supporting hull structures of winches and capstans are to comply with the requirements specified in this sub-Section.
9. 3. 2 Shipboard fittings, winches and capstans for mooring are to be located on stiffeners and/or girders which are part of the deck construction so as to facilitate efficient distribution of the mooring load. Other arrangements are acceptable (for chocks in bulwarks, etc.) provided that the strength is confirmed adequate for the service.
9. 3. 3 The design load applied to shipboard fittings and supporting hull structure is not to be less than that given in [Table 13. 9. 3: Minimum design load for deck fittings and supporting structure - Mooring](#).
9. 3. 4 The design load is to be applied to fittings in all directions that could occur by taking into account the arrangement shown on the towing and mooring arrangements plan. Where the mooring line takes a turn at a fitting, the total design load applied to the fitting is equal to the resultant of the design loads acting on the line, See [Figure 13. 9. 1: Design load applied to fittings](#). However, in no case does the design load applied to the fitting need to be greater than twice the design load on the line.

**Table 13. 9. 3: Minimum design load for deck fittings and supporting structure - Mooring**

| Use/Item   | Minimum design load (See Notes 1 to 3)  |
|--|---|
| Moorings<br>(Fittings and their supporting hull structure)   | 1.15 times the breaking strength of the mooring lines given in <a href="#">Pt 3, Ch 13, 7.5 Mooring lines (Equipment Number ≤ 2000)</a> or <a href="#">Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number &gt; 2000)</a> as appropriate.  |
| Winches<br>(Supporting hull structure only)  | 1.25 times the intended maximum brake holding load, where the maximum brake holding load is to be assumed not less than 80% of the minimum breaking strength of the mooring line given in <a href="#">Pt 3, Ch 13, 7.5 Mooring lines (Equipment Number ≤ 2000)</a> or <a href="#">Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number &gt; 2000)</a> as appropriate. |
| Capstans<br>(Supporting hull structure only)   | 1.25 times the maximum hauling in force, where hauling in force is defined as the maximum pull of the capstan or 1.25 times the intended maximum brake holding load if that be greater.   |
| <p><b>Note 1.</b> When a safe working load SWL greater than that determined according to the Rules is requested, the design load is to be increased in accordance with the appropriate SWL/design load relationship given in <a href="#">Pt 3, Ch 13, 9.3 Mooring 9.3.12</a>.</p> <p><b>Note 2.</b> Side projected area including that of deck cargoes as given by the loading manual is to be taken into account for the selection of mooring lines and the loads applied to shipboard fittings and supporting hull structure.</p> <p><b>Note 3.</b> The increase of the minimum breaking strength for synthetic ropes need not to be taken into account for the loads applied to shipboard fittings and supporting hull structure.</p> |   |

- 9.3.5 Shipboard fittings are to be selected from an acceptable National or International standard and to be based on the minimum breaking strength of the mooring line as given in [Pt 3, Ch 13, 7.5 Mooring lines \(Equipment Number ≤ 2000\)](#) or [Pt 3, Ch 13, 7.6 Mooring lines \(Equipment Number > 2000\)](#), corresponding to the ship's equipment number (See Notes 2 and 3, [Table 13. 9. 3: Minimum design load for deck fittings and supporting structure - Mooring](#)).
- 9.3.6 Mooring bitts (double bollards) are to be chosen for the mooring line attached in figure-of-eight fashion if the industry standard distinguishes between different methods to attach the line, i.e. figure-of-eight or eye-splice attachment.
- 9.3.7 When the shipboard fitting is not selected from an accepted industry standard, the strength of the fitting based on net scantlings and its attachment to the ship is to be adequate for the loads specified in [Table 13. 9. 3: Minimum design load for deck fittings and supporting structure - Mooring](#) based on the acceptance criteria given in [Pt 3, Ch 13, 9.3 Mooring 9.3.10](#) or [Pt 3, Ch 13, 9.3 Mooring 9.3.11](#) as appropriate. Mooring bitts (double bollards) are required to resist the loads caused by the mooring line attached in figure-of-eight fashion. For strength assessment, beam theory or finite element analysis using net scantlings is to be applied, as appropriate. Corrosion additions and wear down allowance is to be added as defined in this Section.
- 9.3.8 The net scantlings of the supporting hull structure for the fittings are to be adequate for the loads given in [Table 13. 9. 3: Minimum design load for deck fittings and supporting structure - Mooring](#) based on the acceptance criteria given in [Pt 3, Ch 13, 9.3 Mooring 9.3.10](#) or [Pt 3, Ch 13, 9.3 Mooring 9.3.11](#) as appropriate. The arrangement of reinforced members beneath shipboard fittings, winches and capstans is to consider any variation of direction (horizontally and vertically) of the mooring forces acting upon the shipboard fittings, See [Figure 13. 9. 3: Supporting hull structure](#) for a sample arrangement. Proper alignment of fitting and supporting hull structure is to be ensured. The acting point of the mooring force on shipboard fittings is to be taken at the attachment point of a mooring line or at a change in its direction. Corrosion additions are to be added to the net scantlings as defined in this Section.
- 9.3.9 For bollards and bitts the attachment point of the mooring line is to be taken not less than 4/5 of the tube height above the base, See [Figure 13. 9. 3: Supporting hull structure](#). However, if fins are fitted to the bollard tubes to keep the mooring line as low as possible, then the attachment point of the mooring line is to be taken at the location of the fins, See [Figure 13. 9. 3: Supporting hull structure](#).

**Figure 13. 9. 3: Supporting hull structure**

9. 3. 10 In the case of strength assessment using beam theory or grillage analysis, the stress within the supporting structure of fittings is not to exceed that given in [Table 13. 9. 2: Allowable stress within the supporting structure of shipboard fittings](#).
9. 3. 11 For strength calculations by means of finite element analysis, the geometry is to be idealised as realistically as possible. The ratio of element length to width is not to exceed 3. Girders are to be modelled using shell or plane stress elements. Symmetric girder flanges are generally to be modelled by beam or truss elements. At least three elements are to be used across the depth of the girder. In way of small openings in girder webs the web thickness is to be reduced to a mean thickness over the web height. Large openings are to be modelled. Stiffeners are generally to be modelled by using shell, plane stress, or beam elements. Stresses are to be read from the centre of the individual element. For shell elements the stresses are to be evaluated at the mid plane of the element. The equivalent stress within the supporting structure of fittings is not to exceed the specified minimum yield strength of the material.
9. 3. 12 The Safe Working Load (SWL) is the load limit for mooring purposes. Unless a greater SWL is requested, the SWL assigned shall be the minimum breaking strength of the mooring line given in [Pt 3, Ch 13, 7.5 Mooring lines \(Equipment Number ≤ 2000\)](#) and [Pt 3, Ch 13, 7.6 Mooring lines \(Equipment Number > 2000\)](#), corresponding to the ship's equipment number (See Notes 2 and 3 of ). Design load on line Double bollard without fins Fitting on deck (e.g. bollard, chock) Main hull structure (e.g. web frames, deck stiffeners) Reinforcing members beneath shipboard fittings Double bollard with fins Fin
9. 3. 13 The SWL, in tonnes, of each shipboard fitting is to be marked (by weld bead or equivalent) on the deck fittings used for mooring. For fittings intended to be used for both, mooring and towing, the TOW, in tonnes, according to [Pt 3, Ch 13, 9.2, Towing](#) is to be marked in addition to the SWL.
9. 3. 14 The above requirements on SWL apply for the use with no more than one mooring line.
9. 3. 15 The towing and mooring arrangements plan mentioned in [Pt 3, Ch 13, 9.4, Towing and mooring arrangements plan](#) is to define the method of use of mooring lines.

## 9. 4 Towing and mooring arrangements plan

9. 4. 1 The SWL and TOW for the intended use for each shipboard fitting is to be noted in the towing and mooring arrangements plan available on board for the guidance of the Master. It is to be noted that TOW is the load limit for towing purpose and SWL that for mooring purpose. If not otherwise chosen, for towing bitts it is to be noted that TOW is the load limit for a towing line attached with an eye splice.
9. 4. 2 Information provided on the plan is to include in respect for each shipboard fitting:
- location on the ship;
  - fitting type;
  - SWL/TOW;
  - purpose (mooring/harbour towing/other towing);
  - manner of applying towing or mooring line load, including limiting fleet angles.
  - the arrangement of mooring lines showing number of lines ( $N$ );
  - the minimum breaking strength of each mooring line (MBL);
  - the acceptable environmental conditions as given in [Pt 3, Ch 13, 7.6 Mooring lines \(Equipment Number > 2000\)](#) for the recommended minimum breaking strength of mooring lines for ships with EN > 2000:
    - 30 second mean wind speed from any direction ( $V_W$  or  $V_W^*$ )
    - Maximum current speed acting on bow or stern ( $\pm 10^\circ$ ).
- Note Item (c) with respect to items (d) and (e), is subject to approval. Fleet angle is defined as the maximum angle the line deviates from a direction perpendicular to the drum axis of a mooring/towing winch.
9. 4. 3 The above information as given [Pt 3, Ch 13, 9.4 Towing and mooring arrangements plan 9.4.2](#) is to be incorporated into the pilot card in order to provide the pilot with proper information on harbour and other towing operations.

## 9. 5 Corrosion addition

9. 5. 1 An allowance for corrosion is to be added to the net thickness derived as indicated below:
- For the supporting hull structure, a corrosion addition of 2 mm is to be added to the net thickness derived.
  - For pedestals and foundations on deck which are not part of a fitting according to an accepted industry standard, 2.0 mm.
  - For shipboard fittings not selected from an accepted industry standard, 2.0 mm.

## 9. 6 Wear allowance

9. 6. 1 In addition to the corrosion addition given in [Pt 3, Ch 13, 9.5 Corrosion addition](#), the wear allowance,  $t_w$ , for shipboard fittings that are not selected from an acceptable National or International standard, is not to be less than 1.0 mm, added to surfaces which are intended to regularly contact the line.

CHAPTER **13 Ship Control Systems**SECTION **10 Anchoring equipment in deep and unsheltered water****10. 1 General**

10. 1. 1 It is recommended that the equipment requirements specified in this Section are complied with if the vessel intends to anchor in deep and unsheltered water. Where a ship's anchoring equipment complies with the requirements of this Section, the ship will be eligible to be assigned the special features notation **DWA**.
10. 1. 2 The equipment specified is for ships intended to anchor in water with depth up to 120 m, current with speed up to 1.54 m/s, wind with speed up to 14 m/s and waves with significant height of up to 3 m. The scope of chain cable, being the ratio between the length of chain paid out and water depth, is assumed to be not less than 3 to 4. These requirements are applicable only to ships with a Rule length  $L$  of not less than 135 m.
10. 1. 3 The requirements specified in other Sections of this Chapter need to be complied with unless alternative requirements are provided.

**10. 2 Anchor and chain cable**

10. 2. 1 Anchors and chain cables to be in accordance with [Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m](#) and based on the Equipment Number  $EN_1$  obtained from the following equation.

$$EN_1 = 0.628 \left[ a \left( \frac{EN}{0.628} \right)^{1/2.3} + b(1 - a) \right]^{2.3}$$

Where

$$a = 1.83 \times 10^{-9} \times L + 2.09 \times 10^{-6} \times L^2 - 6.21 \times 10^{-4} L + 0.0866$$

$$b = 0.156 \times L + 8.372$$

$$L = \text{Rule length, in metres, See } \text{Pt 3, Ch 1, 6.1 Principal particulars 6.1.1}$$

$$EN = \text{Equipment Number calculated in accordance with } \text{Pt 3, Ch 1, 7.1 Calculation of Equipment Number}$$

10. 2. 2 The bower anchors are to be connected to their chain cables and positioned on board ready for use.
10. 2. 3 Anchors are to be of the stockless High Holding Power (HHP) type. The mass of the head of a stockless anchor, including pins and fittings, is to be not less than 60 per cent of the total mass of the anchor.

10. 2. 4 The mass, per anchor, of bower anchors given in [Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m](#) is for anchors of equal mass. The mass of individual anchors may vary to 7 per cent of the tabular mass, but the total mass of anchors is not to be less than that specified for anchors of equal mass.
10. 2. 5 Bower anchors are to be associated with stud link chain cables of special (U2) or extra special (U3) quality. The total length of chain cable, as given in [Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m](#) is to be approximately divided between the two bower anchors.

### 10. 3 Anchor windlass and chain stopper

10. 3. 1 The windlass unit prime mover is to be able to supply for at least 30 minutes a continuous duty pull  $Z_{\text{cont}}$ , in N, given by:

$$Z_{\text{cont}} = 35d^2 + 13.4 m_A$$

Where

$d$  = chain diameter, in mm, as per [Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m](#)

$m_A$  = HHP anchor mass, in kg, as per [Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m](#)

10. 3. 2 The windlass is to have sufficient power to exert, over a period of at least two minutes, a pull equal to the greater of:
- short term pull:  
1.5 times the continuous duty pull as defined in [Pt 3, Ch 13, 10.3 Anchor windlass and chain stopper 10.3.1](#)
  - anchor breakout pull:

$$12.18m_A + \frac{7.0L_c d^2}{100} N$$

Where

$L_c$  = is the total length of chain cable on board, in metres, as given by [Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m](#)

$m_A$  = is the mass of HHP bower anchor (kg) as given in [Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m](#)

$d$  = chain diameter, in mm, as per [Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m](#)

10. 3. 3 The capacity of the windlass brake is to be sufficient to stop the anchor and chain cable when paying out the chain cable. Where a chain cable stopper is not fitted, the brake is to produce a torque capable of withstanding a pull equal to 80 per cent of the specified minimum breaking strength of the chain cable without any permanent deformation of strength members and without brake slip. Where a chain cable stopper is fitted, 45 per cent of the breaking strength is to be applied instead.
10. 3. 4 As far as practicable, for testing purposes the speed of the chain cable during hoisting of the anchor and cable is to be measured over 37.5 m of chain cable and initially with at least 120 m of chain

and the anchor submerged and hanging free. The mean speed of the chain cable during hoisting of the anchor from the depth of 120 m to the depth of 82.5 m is to be at least 4.5 m/min.

10. 3. 5 The chain cable stopper, if fitted, along with its attachments is to be designed to withstand, without any permanent deformation, 80 per cent of the specified minimum breaking strength of the chain cable.

PART

# 3

CHAPTER **13 Ship Control Systems**

SECTION **11 Mooring of ships at single point moorings**

## **11. 1 General**

- 11. 1. 1 These requirements are applicable to conventional oil tankers which intend to utilise the fittings standardised for single point moorings. For other ship types, the applicability would be specially considered. The requirements specified include the type, strength and location of the required fittings.
- 11. 1. 2 A ship provided with mooring arrangements in accordance with the requirements of this Section will be eligible to be assigned the Class notation **SPM4** where a single mooring line arrangement is provided for and **DSPM4** where a dual mooring line arrangement is provided for, See [Figure 13. 11. 1: Positioning of forward fairleads, bow chain stoppers and pedestal roller leads.](#)

**Figure 13. 11. 1: Positioning of forward fairleads, bow chain stoppers and pedestal roller leads**

Note [Pt 3, Ch 13, 11.2 Arrangements 11.2.7.c](#)

## 11. 2 Arrangements

11. 2. 1 The ship is to be fitted with bow chain stoppers and bow fairleads. In addition, pedestal roller fairleads may be required for alignment purposes but a direct straight lead from the chain stopper to the winch storage drum is the preferred arrangement. However, consideration of safety and protection from risk of injury to mooring personnel should take priority in determining whether pedestal rollers should be fitted as well as their number and positioning.
11. 2. 2 In order to ensure matching with terminal mooring equipment, the requirements for shipboard fittings are specified in association with ranges of ship deadweight as shown in [Table 13. 11. 1: Deadweight group for shipboard fittings requirements](#).

**Table 13. 11. 1: Deadweight group for shipboard fittings requirements**

| Group | Deadweight in tonnes |
|-------|----------------------|
| I     | ≤100 000             |
| II    | >100 000 ≤150 000    |
| III   | >150 000             |

11. 2. 3 Bow chain stoppers:
- The number, chain cable size and minimum safe working load of bow chain stoppers should be as given in [Table 13. 11. 2: Fittings requirements for deadweight group](#).
  - Bow chain stoppers should be located between 2.7 m and 3.7 m aft of the bow fairlead and should be positioned so as to give correct alignment with the bow fairlead and the pedestal fairlead or the storage drum of the winch, See [Figure 13. 11. 1: Positioning of forward fairleads, bow chain stoppers and pedestal roller leads](#).
  - The leading edge of the stopper base plate is to be suitably faired to allow unimpeded entry of the combination chafe chain into the stopper. The chain referred to, forms part of the standardised SPM equipment.
  - The safety factor on yield of bow chain stoppers should be a minimum of 2 when the safe working load is applied.
  - The bow chain stopper(s) are to be type approved confirming that they are constructed in strict compliance with a standard recognised by ACS which specifies SWL, yield strength and safety factors.

**Table 13. 11. 2: Fittings requirements for deadweight group**

| Group   | Chain size, in mm | No. of chain stoppers | SWL, in kN (tonnes) |
|---|-------------------|-----------------------|---------------------|
| I   | 76                | 1, See Note           | 1960 (200)          |
| II  | 76                | 1, See Note           | 2450 (250)          |
| III   | 76                | 2                     | 3430 (350)          |
| <b>Note</b> Ships in this size range may elect to fit two stoppers to ensure full range terminal acceptance, See <a href="#">Pt 3, Ch 13, 11.1 General 11.1.2</a> . |                   |                       |                     |

11. 2. 4 The deck in way of bow chain stoppers is to have a minimum thickness of 15 mm. Their foundations, welds attaching them to the ship and associated ship supporting structure are to be demonstrated adequate to resist horizontal loads equal to 2 x SWL as given in [Table 13. 11. 2: Fittings requirements for deadweight group](#). This is to be accomplished by suitable engineering analysis or calculations together with an inspection of the installation.

- 11.2.5 Bow chain stoppers are to be permanently marked with the SWL and appropriate serial numbers so that the certificates can be easily cross-referenced to the fitted equipment.
- 11.2.6 Bow fairleads:
- One centrally located bow fairlead should be provided for ships fitted with one bow chain stopper. Two bow fairleads should be provided for ships fitted with two bow chain stoppers, See [Figure 13.11.1: Positioning of forward fairleads, bow chain stoppers and pedestal roller leads](#).
  - Bow fairlead openings should be at least 600 x 450 mm for 76 mm chafe chain size. Where more than one bow fairlead is installed, the spacing of centres should be between 2 m and 3 m.
  - The height of the centre of the bow fairlead opening above the deck should be determined by the extension, parallel to the deck, of the lead line of the chain cable to the bow chain stopper, See [Figure 13.11.1: Positioning of forward fairleads, bow chain stoppers and pedestal roller leads](#). The fairlead should have a minimum radius equal to seven times the chain radius.
  - The scantlings of the fairlead are to be determined in association with a load of 2 x SWL with hawser angles up to 90 degrees from the ship's centre line, both port and starboard in the horizontal plane and to 30 degrees above and below horizontal in the vertical plane.
  - The bow fairleads are to be type approved confirming that they are constructed in strict compliance with a standard recognised by ACS which specifies SWL and safety factors.
  - Their foundations and associated ship supporting structure are to be demonstrated adequate by detailed engineering analysis or calculations together with an inspection of the installation.
- 11.2.7 Pedestal roller fairleads:
- Pedestal roller fairleads should have a minimum radius equal to 10 times the radius of wire mooring ropes with a fibre core, seven times the radius of wire mooring ropes with a steel core or three times the radius of synthetic mooring ropes.
  - The number of pedestal roller fairleads used for each bow chain stopper should not exceed two and the angle subtended by the change of direction of the pick-up rope should be minimal.
  - The minimum distance of pedestal roller fairleads from the bow chain stopper should be 3.0 m. Any variation in the minimum distance will be specially considered.
  - Details of local strengthening of the deck in way of pedestal roller fairleads should be submitted for approval.
- 11.2.8 The winch drum used for handling the mooring gear should be capable of exerting a continuous duty pull of not less than 147 kN and be of sufficient size to accommodate 150 m of 80 mm diameter rope. Winch drum ends (warping ends) to handle pick-up ropes should be avoided. Remotely-operated winch storage drums are recommended.

CHAPTER **13 Ship Control Systems**SECTION **12 Emergency towing arrangements****12. 1 Structural requirements**

12. 1. 1 This Section applies to ships equipped with emergency towing arrangements in accordance with *IMO Resolution MSC.35(63) - Adoption of Guidelines for Emergency Towing Arrangements on Tankers - (adopted on 20 May 1994) Amended by Resolution MSC.132(75)*.
12. 1. 2 Where a ship is provided with an emergency towing arrangement and the supporting structure complies with the requirements of this Section, the ship will be eligible to be assigned the descriptive note **ETA** which will be entered in column 6 of the *Register Book*.
12. 1. 3 The design load for strong points and associated fairleads shall be at least the specified breaking strength of the weakest component of the emergency towing arrangement, for angles of tow as specified in *IMO Resolution MSC.35(63) - Adoption of Guidelines for Emergency Towing Arrangements on Tankers - (adopted on 20 May 1994) Amended by Resolution MSC.132(75)*.
12. 1. 4 The deck and its supporting structure in way of strongpoints and fairleads are to be suitably reinforced to resist design loads of at least 1.3 times the specified breaking strength of the weakest component of the emergency towing arrangement, for angles of tow as specified in *IMO Resolution MSC.35(63) - Adoption of Guidelines for Emergency Towing Arrangements on Tankers - (adopted on 20 May 1994) Amended by Resolution MSC.132(75)*. The deck in way of strongpoints and fairleads is to have a minimum thickness of 15 mm.
12. 1. 5 Stresses induced in the strongpoints, fairleads and associated ship supporting structure, determined using the design loads from [Pt 3, Ch 13, 12.1 Structural requirements 12.1.3](#) and [Pt 3, Ch 13, 12.1 Structural requirements 12.1.4](#) as appropriate, are not to exceed the permissible values given in [Table 13. 12. 1: Permissible stress values](#). The capability of the structure to withstand buckling is also to be assessed.

**Table 13. 12. 1: Permissible stress values**

|   | Permissible stress N/mm <sup>2</sup> |
|---|--------------------------------------|
| Direct stress   | $\sigma_0$                           |
| Shear stress  | $\frac{\sigma_0}{\sqrt{3}}$          |
| Combined stress   | $\sigma_0$                           |
| Symbols   |                                      |
| $\sigma_0$ = specified minimum yield stress, in N/mm <sup>2</sup> |                                      |

12. 1. 6 The weld between the fittings and the deck shall be capable of resisting the design load specified in [Pt 3, Ch 13, 12.1 Structural requirements 12.1.3](#).

12. 1. 7 The structural arrangement is to be such that continuity will be ensured. Abrupt changes of shape or section, sharp corners and other points of stress concentration are to be avoided.
12. 1. 8 Designs of emergency towing arrangements shall be prototype-tested as required by the IMO Resolution MSC.35(63) - Adoption of Guidelines for Emergency Towing Arrangements on Tankers - (adopted on 20 May 1994) Amended by Resolution MSC.132(75)

## 12. 2 Chafing chain and wire or fibre rope for Emergency Towing Arrangements

12. 2. 1 Chafing chains are to be manufactured, tested and certified in accordance with [Ch 10, 2 Stud link chain cables for ships](#) of the Rules for Materials Grades U2 and U3.
12. 2. 2 The outboard end of the chafing chain is to include a pear-shaped link allowing connection to a shackle corresponding to the type of ETA and chain grade. A typical arrangement is shown in [Figure 13. 12. 1: Typical outboard chafing chain end](#).

Figure 13. 12. 1: Typical outboard chafing chain end

12. 2. 3 The chafing chain is to be able to withstand a breaking load not less than twice the safe working load (SWL). The nominal diameter of common link for chafing chains is to comply with the value indicated in [Table 13. 12. 2: Nominal diameter of common link for chafing chains for ETA](#).

Table 13. 12. 2: Nominal diameter of common link for chafing chains for ETA

| Type of ETA | Nominal diameter of common link, $d$ min |          |
|-------------|--|----------|
|             | Grade U2                                 | Grade U3 |
| ETA 1000    | 62 mm                                    | 52 mm    |
| ETA 2000    | 90 mm                                    | 76 mm    |

12. 2. 4 Steel wire ropes are to be manufactured, tested and certified in accordance with [Ch 10, 6 Steel wire ropes](#) of the Rules for Materials.
12. 2. 5 Fibre ropes are to be manufactured, tested and certified in accordance with [Ch 10, 7 Fibre ropes](#) of the Rules for Materials.

# 3

## CHAPTER 14 Cargo Securing Arrangements

### SECTION 1 General

#### 1.1 Application

- 1.1.1 All cargo ships, regardless of tonnage, except those engaged solely in the carriage of either liquid or solid bulk cargoes, are to be provided with a Cargo Securing Manual approved by the Flag Administration, as required by SOLAS 1974 (as amended). [Pt 3, Ch 14, 2 Fixed cargo securing fittings, materials and testing](#), [Pt 3, Ch 14, 4 Ship structure](#), [Pt 3, Ch 14, 7 Container securing arrangements for stowage using cell guides](#) (if applicable) and [Pt 3, Ch 14, 10 Surveys](#) apply to all ships for which a Cargo Securing Manual is required. It is recommended that the container securing arrangements in the Cargo Securing Manual be designed in accordance with [Pt 3, Ch 14, 3 Loose container securing fittings, materials and testing](#), [Pt 3, Ch 14, 5 Container securing arrangements for stowage on exposed decks without cell guides](#), [Pt 3, Ch 14, 6 Container securing arrangements for underdeck stowage without cell guides](#), [Pt 3, Ch 14, 8 Determination of forces for container securing arrangements](#) and [Pt 3, Ch 14, 9 Strength of container securing arrangements](#). Furthermore, it is recommended that the container securing arrangements be submitted to ACS, for formal approval. In cases where ACS is authorised to carry out the approval of the Cargo Securing Manual on behalf of a National Administration and the container securing arrangements have not been designed on the basis of the ACS Rules nor received formal ACS approval, the Cargo Securing Manual will be annotated accordingly, highlighting this fact. In general, Cargo Securing Manuals can be approved by ACS if authorised by the National Authority.
- 1.1.2 Fixed fittings which are part of the container lashing equipment or which may affect the strength of the ship's hull are subject to approval on the basis of the requirements of this Chapter. Details of the connection and the supporting ship structure require approval to satisfy the design loads determined in accordance with [Pt 3, Ch 14, 8 Determination of forces for container securing arrangements](#) or the safe working load of the fixed fitting, as applicable. Drawings are to be submitted showing details of the fittings, the attachment, the local foundations and information about the intended materials and welding.
- 1.1.3 The requirements for container securing arrangements have been framed in relation to ISO Standard Series 1 ISO 1496-1:1990, including Amendment Nos. 1, 2 and 3, Freight Containers. For previous ISO 1496-1:1984 containers, reference should be made to ACS Rules. Proposals to consider higher allowable forces in accordance with ISO 1496-1, including Amendment No. 4, 2006, will be specially considered. Proposals for the securing of other types of containers will be specially considered.
- 1.1.4 Containers are to be loaded so as not to exceed the weights and distribution within the stack according to the Cargo Securing Manual (CSM). The permissible loading patterns are to be clearly indicated on the Container Securing Arrangement Plan carried on board the ship.
- 1.1.5 Containers may be approved and certified using ACS *Container Certification Scheme*.
- 1.1.6 Where it is intended and specified that loose or fixed parts of the container securing system are used for lifting appliance purposes, e.g. pedestal sockets and fittings used for lifting of hatch covers, or twistlocks used for vertical tandem lifting, the requirements of ACS Guideline for

Lifting Appliances in a Marine Environment-are applicable. If no approval from lifting aspects is sought, the devices will be considered as part of a container securing arrangement only.

1. 1. 7 For ships having the class notation **Container Ship**, an effective breakwater is to be fitted to protect the containers against green sea impact loads. For other ships which are equipped for the carriage of containers on deck, protection of the cargo is recommended by the provision of a breakwater. *See also* [Pt 3, Ch 14, 8.2, Ship motion, wind and green sea forces acting on containers](#).
1. 1. 8 Forward of 0.75L, it is recommended that all door ends face aft in order to improve the performance of the container walls to withstand green sea loads.
1. 1. 9 Improper ship handling related to course and speed or threshold phenomena like parametric rolling can create adverse forces acting on the ship and the cargo which are in excess of the forces determined on the basis of Section [Pt 3, Ch 14, 8 Determination of forces for container securing arrangements](#). It is the responsibility of the Master to apply good seamanship in order to mitigate excessive ship motions to reduce forces acting on the cargo stowage arrangements.

## 1. 2 Classification notations and descriptive notes

1. 2. 1 Ships with container securing arrangements which are designed and constructed in accordance with this Chapter will be eligible to be assigned the special features notation **CCSA** (certified container securing arrangements). In addition to the fixed fittings, the Initial and Periodical Survey requirements of Section [Pt 3, Ch 14, 10 Surveys](#) for all loose fittings are applicable. Where loose container securing fittings are supplied for part container stowage only, the special features notation will be suitably modified.
1. 2. 2 Ships with container securing arrangements which are designed and constructed in accordance with this Chapter, but where the Initial and Periodical Survey requirements for loose fittings in Section [Pt 3, Ch 14, 10 Surveys](#) are not requested, will be eligible to be assigned the descriptive note **CSA** (container securing arrangement).
1. 2. 3 The advantage of having an onboard lashing program to calculate forces acting on the stowage arrangement is highlighted. It is recommended that all ships carrying containers on a regular basis be equipped with such a tool. This may be an extension to the loading instrument covered under [Pt 3, Ch 4, 8.3 Loading instrument](#). It is recommended that the program be approved by ACS. If the program to carry out lashing calculations is approved by ACS and installed and maintained in accordance with the requirements of [Pt 3, Ch 4, 8.4 Onboard lashing program](#), the ship will be eligible to be assigned the special features notation **BoxMax**.
1. 2. 4 It is a prerequisite for assignment of the special features notation **BoxMax** that the container securing arrangements in the Cargo Securing Manual are designed in accordance with this Chapter and submitted to ACS for formal approval.
1. 2. 5 The container securing arrangements of a container ship may take into account specific voyage routes and seasons, provided the ship has been assigned the special features notation **BoxMax** with one of the following supplementary letter sequences: **V** or **V,W** or **V,W,L** or **M**. The features offered by these supplementary letter sequences are defined in [Table 14. 1. 1: BoxMax notation features](#).
1. 2. 6 The onboard lashing program is to be capable of performing calculations specific to defined sea areas and seasons, and the weather dependent factors for these areas and seasons have been supplied by ACS.
  - If the weather dependent factors have been supplied by ACS for specific sea areas, the ship will be eligible to be assigned the special features notation **BoxMax(V)**.
  - If the factors have been supplied by ACS for specific sea areas in combination with seasons, the ship will be eligible to be assigned the special features notation **BoxMax(V,W)**.

- If the factors have been supplied by ACS for limited voyages, the ship will be eligible to be assigned the special features notation **BoxMax(V,W,L)**.
- If the factors have been supplied by ACS for ship motions and environmental conditions, the ship will be eligible to be assigned the special features notation **BoxMax(M)**.

See also [Pt 3, Ch 4, 8.4 Onboard lashing program](#).

1. 2. 7 For details of the individual features for the **BoxMax** notation, See [Table 14. 1. 1: BoxMax notation features](#).
1. 2. 8 A ship designed to carry containers that is provided with safe access and securing arrangements in accordance with the *Rules for Ergonomic Container Lashing*-will be eligible to be assigned the special features notation **ECL** (Ergonomic Container Lashing), with supplementary descriptor.

**Table 14. 1. 1: BoxMax notation features**

| Notation           | Additional feature description   |
|--------------------|--|
| <b>BoxMax(V)</b>   | <p><b>V:</b> Voyage dependencies</p> <p>The assessment of the loads acting on the containers and the container securing arrangements may take account of the areas on the trading route of the ship. The North Atlantic represents one of the most severe weather areas in the world. For other areas the weather conditions may be less severe, and hence the assignment of the <b>BoxMax(V)</b> notation allows weather dependent factors to be applied to the environmental (dynamic) loads acting on the container stacks in-hold or on-deck.</p> <p>For the <b>V</b> feature, the weather dependent factors are determined on the basis of the annual environmental wave data, See Note 1.</p> <p>The weather dependent factors applicable to annual environmental wave data for the requested sea areas will be supplied by ACS, See Note 2.</p> |
| <b>BoxMax(V,W)</b> | <p><b>W:</b> Weather dependency (Season dependency)</p> <p>The <b>BoxMax(V,W)</b> notation allows the change in weather conditions for various seasons to be taken into account for the assessment of the environmental loads acting on container stacks in-hold or on-deck. For example, this allows enhanced flexibility for the carriage of containers in the summer season, when the weather conditions are usually less severe than in the winter months.</p> <p>For the <b>W</b> feature, the weather dependent factors are determined on the basis of the seasonal environmental wave data.</p> <p>The weather dependent factors applicable to seasonal environmental wave data for the requested sea areas will be supplied by ACS, See Note 2.</p>  |

|  |  |
|--|--|
| <b>BoxMax(V,W,L)</b>   | <p><b>L:</b> Limited duration voyages</p> <p>The <b>BoxMax(V,W,L)</b> notation potentially allows increased flexibility for the carriage of containers on board the ship for limited duration voyages. When applying the <b>L</b> feature, limited duration voyage factors are applicable for voyages of less than 48 hours. They are suitable for short coastal voyages, for example between ports such as Hamburg and Rotterdam or between Hong Kong and Xiamen (China). Typically it will allow enhanced flexibility for the carriage of containers and may allow reduced lashing requirements between local ports.</p> <p>The process of application of the <b>BoxMax(V,W,L)</b> limited duration voyage feature is given in <a href="#">Pt 3, Ch 14, 1.3 Application of the BoxMax(V,W,L) notation</a>.</p> <p>The weather dependent factors applicable to limited duration voyages based on wave heights predicted by weather forecasts will be supplied by ACS.</p> |
| <b>BoxMax(M)</b>   | <p><b>M:</b> Ship motion monitoring</p> <p>The <b>BoxMax(M)</b> notation allows maximum flexibility in the way containers are carried for any voyage. The degree of lashing can be fully appropriate to operation, <i>See Note 3</i>.</p> <p>The Master will be required to manage the motion of the ship during the voyage by good seamanship and by weather routing, and not exceed the declared ship motions.</p> <p>The maximum motion of the ship during the voyage is to be recorded and compared to the declared ship motion.</p> <p>The process of application of the <b>BoxMax(M)</b> ship motion monitoring feature is given in <a href="#">Pt 3, Ch 14, 1.4 Application of the BoxMax(M) notation</a>.</p>  |
| <p><b>Note 1:</b> The weather dependent factors are described in <a href="#">Pt 3, Ch 14, 1.7 Symbols and definitions 1.7.1</a>.</p> <p><b>Note 2:</b> ACS will supply weather dependent factors applicable to the list of sea areas requested by the owner. The requested sea areas must cover the whole of the voyage route to be used. If the vessel sails outside of the requested sea areas then all the weather dependent factors should be set to 1.0.</p> <p><b>Note 3:</b> ACS will supply weather dependent factors in the form of a look up table specific to the ship; the voyage factors shall be selected based on the maximum ship motion being declared.</p> |  |

### 1.3 Application of the BoxMax(V,W,L) notation

- 1.3.1 The **BoxMax(V,W,L)** notation requires the following process to be applied by the Ship's Master.
- 1.3.2 For the limited duration voyage feature to be applicable the following process must be in place:
  - a. The ship must subscribe to an ocean weather forecast service provided by a recognised and reputable met ocean weather forecasting organisation. The forecast is to include wind speed and wave heights for a minimum period of 5 days and preferably 10 days. The responsibility for selection of the weather forecasting organisation lies with the Master.
  - b. The limited voyage feature shall not hazard safe navigation and adverse weather conditions should be avoided as far as possible.
- 1.3.3 The limited duration voyage feature can only be applied in the following scenarios:
  - a. The maximum length of a limited duration voyage is 48 hours in Open Water. A limited duration voyage may be slightly extended at the Master's discretion provided the forecast is favourable. Voyages longer than this will need to be considered using the **BoxMax(V,W)** approaches.

- b. There should be no warnings for major storms with maximum sustained winds of more than 119 km per hour for an area within 500 miles from the long-range weather forecast.

where

Open Water May be taken as starting at the outer harbour limits or harbour breakwater, as applicable. The concept of Open Water here is used to define the point at which the ship will leave the confines of the port and any estuaries or inshore navigation confines.

$T_{\text{depart}}$  Is to be taken as the estimated time in hours after the initial forecast that the ship enters Open Water after leaving the port of departure.

$T_{\text{arrive}}$  Is to be taken as the estimated time in hours after the initial forecast that the ship leaves Open Water prior to entering the port of arrival.

1. 3. 4 The supplied weather dependent factors applicable to limited duration voyages are based on the significant wave height.
1. 3. 5 The Master needs to select the appropriate significant wave height for the limited duration voyage,  $H_{\text{SL}}$ . The significant wave height for the limited duration voyage is to be rounded up to the next integer and is to be selected as follows:

$$H_{\text{SL}} = H_{\text{forecast}} \text{ if the } T_{\text{arrive}} \text{ is less than 72 hours after the time of the initial forecast.}$$

$$= H_{\text{forecast}} + 1 \text{ m if the } T_{\text{arrive}} \text{ is more than 72 hours after the time of the initial forecast.}$$

Where  $H_{\text{forecast}} + 2 \text{ m}$  if the  $T_{\text{arrive}}$  is more than hours after the time of the initial forecast.

$H_{\text{forecast}}$  is the maximum significant wave height predicted for the limited duration voyage. It is to be extracted from the forecast at the time of planning the cargo stowage up to the time when the vessel leaves Open Water prior to entering the port of arrival. The forecast period is not to be less than 5 days.

The time of the initial forecast is to be taken as the most recent forecast prior to commencement of cargo planning operations.

1. 3. 6 When the ship departs, if the latest forecast is more severe than the earlier forecasts, then is to be taken as the maximum significant wave height from the latest forecast for the period up to the time the ship leaves Open Water prior to entering the port of arrival +24 hours for the planned voyage, if this exceeds from [Pt 3, Ch 14, 1.3 Application of the BoxMax\(V,W,L\) notation 1.3.5](#).
1. 3. 7 The significant wave height used for the limited duration voyage should be recorded in the cargo plan information and the onboard lashing computer for the voyage. The ship specific weather dependent coefficients for a range of significant wave heights will be provided by ACS as part of the **BoxMax(V,W,L)** notation.
1. 3. 8 Example of application of **BoxMax(V,W,L)**:

Scenario 1

| Date            | 14 July                     | 15 July | 16 July | 17 July   | 18 July   | 19 July |

## 1. 4 Application of the BoxMax(M) notation

1. 4. 1 The **BoxMax(M)** notation requires the following process to be applied by the Ship's Master.
1. 4. 2 For the ship motion monitoring notation to be applicable the following process must be in place:
  - a. At the start of a voyage, the Master shall declare the maximum expected ship motions and environmental conditions and assign weather dependent factors accordingly. The responsibility for selection of appropriate ship motions and environmental conditions lies with the Master.
  - b. The ship motion monitoring feature shall not hazard safe navigation and adverse weather conditions should be avoided as far as possible.
1. 4. 3 The supplied weather dependent factors applicable to ship motion notation are based on the declared ship motion and environmental conditions.
1. 4. 4 The maximum ship motion, environmental conditions and weather dependent factors planned for the voyage should be recorded in the cargo plan information and the onboard lashing computer for the voyage. The ship specific weather dependent coefficients for a range of ship motion and environmental conditions will be provided by ACS as part of the **BoxMax(M)** notation.
1. 4. 5 ACS can provide ship specific guidance with regard to voyage ship motion predictions and environmental loading.

## 1. 5 Plans and information required

1. 5. 1 For all fixed cargo securing arrangements, except container securing arrangements, the following information and plans are to be submitted:
  - a. Details of certification including safe working load (SWL) of fixed cargo securing fittings.
  - b. Plans of structure in way of fixed cargo securing fittings.
  - c. Direction of loads imposed on the ship's fixed cargo securing fittings.
  - d. A general arrangement of fixed cargo securing fittings.
1. 5. 2 For container securing arrangements, the following plans and information are to be submitted:
  - a. General arrangement plan showing the disposition and design weights of the containers.
  - b. Details of materials, design, scantlings of cell guides structure, lashing bridges, pedestals, and other container securing arrangements, where fitted.
  - c. Details of certification, including safe working load (SWL), of fixed and loose container securing fittings.
  - d. Plans of structure in way of fixed container securing fittings and arrangements.
  - e. Design values of the following ship parameters for the container load departure and arrival conditions:
    - i. Moulded draught ( $T_c$ )
    - ii. Transverse metacentric height ( $GM$ ).
  - f. Cargo Securing Manual, *See* [Pt 3, Ch 14, 1.5 Plans and information required 1.5.3](#).
1. 5. 3 The Cargo Securing Manual is to include the following information:
  - a. For vessels with an approved onboard lashing program, representative lashing calculations based on one design  $GM$  value within the following range:
    - i. A lower design  $GM$  value of 2.5 per cent of the breadth  $B$ .
    - ii. An upper design  $GM$  value of 7.5 per cent of  $B$  for ships with a breadth less than 52 m and 10 per cent of  $B$  for ships where  $B \geq 52$  m.
  - b. For vessels without an approved onboard lashing program, representative lashing calculations based on design  $GM$  values as follows:
    - i. A lower design  $GM$  value of 2.5 per cent of the breadth  $B$ .

- ii. An upper design  $GM$  value of 7.5 per cent of  $B$  for ships with a breadth less than 52 m and 10 per cent of  $B$  for ships where  $B \geq 52$  m.
  - iii. Actual  $GM$  values of the ship in the container loaded condition from the approved Trim and Stability Booklet or Loading Manual when the actual design  $GM$  values are outside the range specified in i) and ii).
  - c. For vessels with notation **BoxMax(V)**, **BoxMax(V,W)**, **BoxMax(V,W,L)** or **BoxMax(M)** representative calculations based on applicable weather reduction factors are to be included in the Cargo Securing Manual.
1. 5. 4 Where containers of types other than ISO containers are to be incorporated in the stowage arrangement, the Cargo Securing Manual is to indicate clearly the locations where these containers are stowed. The manual is also to indicate the container weights and required securing arrangements for stacks composed entirely of ISO Standard containers.

## 1. 6 Securing systems

1. 6. 1 Containers are to be secured by one, or a combination, of the following systems:

- Corner locking devices.
- Rod, wire or chain lashings.
- Buttresses, shores or equivalent structural restraint.
- Cell guides.

Alternative systems will be considered on the basis of their suitability for the intended purpose.

1. 6. 2 Dunnage is not to be used in association with approved container securing systems except where forming part of an approved line load stowage, See [Pt 3, Ch 14, 5.5 Line Load stowage](#).

## 1. 7 Symbols and definitions

1. 7. 1 The following definitions are applicable to this Chapter, except where otherwise stated:

- $a$  = breadth of the container, in metres (for longitudinally stowed containers)
- $b$  = length of the container, in metres (for longitudinally stowed containers)
- $c_i$  = height of container  $i$ , in metres
- $d_i$  = flange thickness of container securing device (e.g. twistlock) below container  $i$ , in metres
- $a_0$  = acceleration parameter
 
$$= f_{HS}(1.58 - 0.47C_b)\left(\frac{2.4}{\sqrt{L}} + \frac{34}{L} - \frac{600}{L^2}\right)$$
- $a_{\text{surge}}$  = longitudinal acceleration due to surge, in  $\text{m/s}^2$ 

$$= 0.275a_0 \text{ g}$$
- $a_{\text{sway}}$  = transverse acceleration due to sway, in  $\text{m/s}^2$ 

$$= 0.55a_0 \text{ g}$$
- $a_{\text{heave}}$  = vertical acceleration due to heave, in  $\text{m/s}^2$

$$= a_0 \text{ g}$$

$$a_{\text{roll}} = \text{roll acceleration at the centre of motion of the vessel, in rad/s}^2$$

$$= 0.69 \cdot \frac{\varphi}{T_r^2}$$

$$a_{\text{pitch}} = \text{acceleration due to pitch, in rad/s}^2$$

$$0.69 \left( 1 + \frac{0.98}{\sqrt{L}} \right) \frac{\Psi}{T_p^2}$$

$$T_p = \text{period of pitch of the ship, in seconds}$$

$$= 0.80 \sqrt{C_1 L}$$

where

$$C_1 = 0.95 \text{ for Motion Case 1}$$

$$= 0.52 \text{ for all other Motion Cases}$$

$$T_r = \text{period of roll of the ship, in seconds}$$

$$= \frac{0.82B}{\sqrt{GM}}$$

$$\varphi = \text{design roll angle for container securing arrangements, in degrees}$$

$$= f_{\text{HsR}} \varphi_f \text{ but not less than 12 degrees}$$

Where

$$\varphi_f = 55 f_{BK} e^{(-0.025B)} \text{ but need not be taken greater than 30 degrees}$$

If  $\varphi_f$  is less than  $\varphi_m$ :

$$\varphi_f = 55 f_{gm} f_V f_{BK} e^{(-0.025B)} \text{ but is not to be taken greater than } \varphi_m$$

Where

$\varphi_m$  the minimum unrestricted roll angle, in degrees, is to be taken as:

For ships with a breadth greater than 58 m:

$$= 22 \text{ degrees for } GM \text{ values below 7.5 per cent of the breadth, } B$$

$$= 18 \text{ degrees for } GM \text{ values above 10 per cent of the breadth, } B$$

for  $GM$  values between 7.5 and 10 per cent of the breadth,  $B$ , the minimum unrestricted roll angle is to be determined by linear interpolation.

For ships with a breadth less than 54 m

$$= 22 \text{ degrees}$$

For ships with breadth,  $B$ , between 54 m and 58 m, the minimum unrestricted roll angle is to be determined by linear interpolation.

$$f_v = \text{is to be taken as } 1.0$$

$$f_{gm} = \frac{7.5GM}{B} + 0.6 \text{ but is not to be taken less than } 1.0$$

**Note** The calculations assume that the Master takes action to avoid synchronous rolling and parametric rolling. ACS can provide ship specific guidance with regard to synchronous rolling and parametric rolling.

$$\begin{aligned} \Psi &= \text{design pitch angle, in degrees,} \\ &= 1350L^{-0.94} \left( 1.0 + \left( \frac{0.82}{\sqrt{L}} \right)^{1.2} \right) f_{H_3p} \end{aligned}$$

but need not exceed  $8^\circ$

$$\begin{aligned} e &= \text{base of natural logarithms} \\ &= 2.7183 \end{aligned}$$

$$\begin{aligned} f_{ap} &= \text{hull form coefficient} \\ &= \text{for Motion Case MC1:} \\ &= 1.2R_A^{0.3} \text{ for } R_A > 1.0 \\ &= 1.2 \text{ for } R_A \leq 1.0 \\ &= \text{for all other Motion Cases:} \\ &= 1.0 \end{aligned}$$

$$R_A = \text{area ratio factor for combined stern and bow shape, defined in [Pt 4, Ch 2, 2.4 Design vertical wave bending moments](#). For the purpose of container stowage calculation, } R_A \text{ is to be taken as } 1.5 \text{ if this value is not available}$$

$$\begin{aligned} f_{BK} &= \text{bilge keel coefficient} \\ &= 1.2 \text{ for ships without bilge keels} \\ &= 1.0 \text{ for ships with bilge keels} \end{aligned}$$

$$\begin{aligned} f_{Hs} &= \text{weather-dependent factor for acceleration} \\ &= 1.0 \text{ for unrestricted worldwide service} \end{aligned}$$

$$\begin{aligned} f_{HsP} &= \text{weather-dependent factor for pitch} \\ &= 1.0 \text{ for unrestricted worldwide service} \end{aligned}$$

$$\begin{aligned} f_{HsVw} &= \text{weather-dependent factor for wind} \\ &= 1.0 \text{ for unrestricted worldwide service} \end{aligned}$$

$$\begin{aligned} C_{p1} &= \text{hull whipping factor} \\ &= 1 + f_{MC} f_{wh} \end{aligned}$$

$$\begin{aligned} f_{MC} &= \text{Motion Case coefficient} \\ &= 1.0 f_{w1} \text{ for MC1} \end{aligned}$$

|           |   |  |
|-----------|---|--|
|           | = | 0 for MC2  |
|           | = | $0.5f_{w1}$ for MC3  |
|           | = | $0.25f_{w1}$ for MC4   |
|           |   | $0.5f_{w1}$ for MC5  |
|           |   | 0 for MC6  |
| $f_{wh}$  | = | whipping coefficient   |
|           | = | 0.55 for $x_c/L \leq 0.25$   |
|           | = | 0.20 at $x_c/L = 0.5$  |
|           | = | 0.45 for $x_c/L \geq 0.75$   |
|           |   | intermediate values are to be obtained by linear interpolation   |
| $f_{w1}$  | = | length-dependent factor for whipping   |
|           | = | 0 for $L \leq 250$ m   |
|           | = | 1.0 for $L \geq 350$ m   |
|           |   | intermediate values are to be obtained by linear interpolation   |
| $g$       | = | acceleration due to gravity and is to be taken as $9.81 \text{ m/s}^2$   |
| $x_c$     | = | longitudinal centre of gravity of a container forward of the aft end of $L$ , in metres  |
| $z_c$     | = | vertical centre of gravity of a container above the keel, in metres  |
| $c_{veg}$ | = | vertical location of the centre of gravity of the container measured positive upward from the bottom of the corner castings. To be taken at 33 percent of the height of the container. Other values of $c_{veg}$ will be specially considered. |
| $x_i$     | = | longitudinal coordinate of the centre of gravity of container $i$ , in metres, from $O_m$ measured positive forwards in ship coordinate system, <i>See</i> Figure 14.1.1 Diagrammatic representation of symbols                                |
|           | = | $x_c - x_{om}$   |
| $y_i$     | = | transverse coordinate of the centre of gravity of container $i$ , in metres, from $O_m$ measured positive to port in ship coordinate system, <i>See</i> Figure 14.1.1 Diagrammatic representation of symbols                                   |
| $z_i$     | = | vertical coordinate of the centre of gravity of container $i$ , in metres, from $O_m$ measured positive upwards in ship coordinate system, <i>See</i> Figure 14.1.1 Diagrammatic representation of symbols                                     |
|           | = | $z_c - z_{om}$   |
| $x_{om}$  | = | longitudinal centre of motion forward of the aft end of $L$ . To be taken at the LCF of the ship   |
| $z_{om}$  | = | vertical centre of motion above the keel. To be taken as the greater of $2T_c/3 + KG/3$ , $T_c$ or $D/2$   |

|       |   |  |
|-------|---|--|
| $A$   | = | side area of the container, in $m^2$   |
| $GM$  | = | transverse metacentric height of the ship, in metres   |
| $KG$  | = | vertical distance of the centre of gravity of the ship above the keel, in metres   |
| $L$   | = | Rule length, in metres, <i>See</i> <a href="#">Pt 3, Ch 1, 6.1 Principal particulars 6.1.1</a>   |
| $C_b$ | = | block coefficient, <i>See</i> <a href="#">Pt 3, Ch 1, 6.1 Principal particulars 6.1.6</a>  |
| $MCn$ | = | Motion Case $n$  |
| $LCF$ | = | longitudinal centre of flotation. To be taken at $0.48L$ from the aft end of $L$   |
| $O_m$ | = | centre of motion, to be taken on the centreline at $x_{om}$ and $z_{om}$ , <i>See</i> Figure 14.1.1 Diagrammatic representation of symbols and <a href="#">Figure 14. 1. 2: Ship coordinate system and sign convention of motion</a> |
| $R$   | = | the rating, or maximum operating gross weight for which the container is certified, and is equal to the tare weight plus payload of the container, in tonnes   |
| $T_c$ | = | moulded draught in the container load condition, in metres   |
| $V_w$ | = | wind speed, in m/s.  |
|       | = | $40fH_sV_w$  |
| $W$   | = | weight of the container and contents, in tonnes. The following minimum weights $W$ are to be used:   |
|       | = | 2.5 tonnes for 20 ft containers  |
|       | = | 3.5 tonnes for 40 ft containers  |
|       | = | 4.0 tonnes for 45 ft containers  |
|       | = | 4.5 tonnes for 48 ft and 53 ft containers.   |

**Figure 14. 1. 1: Diagrammatic representation of symbols**

**Figure 14. 1. 2: Ship coordinate system and sign convention of motion**

1. 7. 2 The sign convention for ship motions and accelerations is shown in [Figure 14. 1. 2: Ship coordinate system and sign convention of motion](#). This is based on a right-handed coordinate system. The roll, pitch and yaw motions are defined positive clockwise as shown. For instance, positive sway is defined as the translation toward port and positive pitch as the rotation of the bow down and stern up.

CHAPTER **14 Cargo Securing Arrangements**SECTION **2 Fixed cargo securing fittings, materials and testing****2. 1 General**

- 2. 1. 1 Randomly selected samples of fixed cargo securing fittings are to be subjected to prototype testing and, upon satisfactory completion, will be granted General Approval.
- 2. 1. 2 Randomly selected samples drawn from production runs are to be subjected to production testing prior to delivery to the ship.
- 2. 1. 3 Cargo securing fittings, certified by an organisation other than ACS, will be accepted where the certification scheme is to the satisfaction of ACS.

**2. 2 Materials and design**

- 2. 2. 1 Steel used for the construction of the fixed cargo securing fittings is to comply with the requirements of the [Pt 2 Rules for the Manufacture, Testing and Certification of Materials](#) or with an equivalent specification acceptable to ACS. Due account is to be taken of the grade and tensile strength of the hull material in way of the attachment. The chemical composition of the steel is to be such as to ensure acceptable qualities of weldability. Where necessary, tests are to be carried out to establish specific welding procedures.
- 2. 2. 2 Where securing arrangements are intended to operate at low ambient temperatures, special consideration is to be given to the specification of the steel.
- 2. 2. 3 Proposals for the use of materials other than steel will be specially considered.
- 2. 2. 4 Attention is drawn to the need for measures to be taken to prevent water accumulation in pockets or recesses that could lead to excessive corrosion.

**2. 3 Prototype testing**

- 2. 3. 1 Prototype tests to determine the breaking or failure loads are to be carried out on at least two randomly selected samples of each item used in the securing system. The relationship between design breaking load and safe working load (SWL) is to be as indicated in [Table 14. 2. 1: Design breaking loads and proof loads for fixed cargo securing fittings](#).

**Table 14. 2. 1: Design breaking loads and proof loads for fixed cargo securing fittings**

| Minimum design breaking load |                     | Minimum proof load       |                     |
|------------------------------|---------------------|--------------------------|---------------------|
| for SWL $\leq$ 400 kN        | for SWL<br>> 400 kN | for SWL<br>$\leq$ 400 kN | for SWL<br>> 400 kN |

|   |              |           |              |
|---|--------------|-----------|--------------|
| 2 x SWL   | SWL + 400 kN | 1.5 x SWL | SWL + 200 kN |
| <b>Note</b> Breaking and proof loads for fixed cargo securing fittings of a material other than steel will be specially considered. |              |           |              |

2. 3. 2 The Surveyor is to be satisfied that the design and materials of the fittings are in accordance with the approved plans.
2. 3. 3 For acceptance, no permanent deformation (other than due to initial embedding of component parts) is to be induced by test loads up to the proof load given in [Table 14. 2. 1: Design breaking loads and proof loads for fixed cargo securing fittings](#).
2. 3. 4 When considering the test modes, all expected directions of operation are to be taken into account. Jigs are to be employed, where necessary, in order that satisfactory simulation is obtained.
2. 3. 5 In the interest of standardisation of the strength of container securing fittings, safe working loads in accordance with [Table 14. 2. 2: Test loads and test modes for fixed container securing fittings](#) are recommended.

**Table 14. 2. 2: Test loads and test modes for fixed container securing fittings**

| Item No.   | Description     | Required test modes   |                 | Recommended minimum, in kN |            |               |
|--|-----------------|---|-----------------|----------------------------|------------|---------------|
|  |                 |   |                 | SWL                        | Proof load | Breaking load |
| 1  | Flush socket    |  | Pull-out load   | 250                        | 375        | 500           |
|  |                 |  | Pull-out load   | 250                        | 375        | 500           |
| 2  | Pedestal socket |  | Tangential load | 200                        | 300        | 400           |
| 3  | ‘D’ ring        |  | Tensile load    | 250                        | 375        | 500           |
| 4  | Lashing plate   |  | Tensile load    | 250                        | 375        | 500           |
| <p><b>Note1.</b> For items 3 and 4, where specifically designed for use with chain or steel wire rope (SWR) lashings, a lesser SWL may be considered.</p> <p><b>Note2.</b> For items 1 and 2, where multiple flush sockets or pedestal sockets are involved, test loads are to be applied simultaneously to each socket opening which can be loaded simultaneously in service.</p> <p><b>Note3.</b> For item 4, where multiple lashing points are fitted in one deck plate fitting, testing is to be similarly arranged as for Note 2.</p> <p><b>Note4.</b> Where containers with strength higher than required for ISO containers are used, consideration will be given to the required minimum loads.</p> <p><b>Note5.</b> The test modes illustrated above are diagrammatic only.</p> |                 |   |                 |                            |            |               |

2. 3. 6 Where one of the required two randomly selected test samples fails before the design breaking load is reached, this can be accepted, provided that:

- a. the failure is not less than 95 per cent of the design breaking load;
- b. an additional randomly selected sample is tested satisfactorily; and
- c. the average failure load of the three randomly selected samples is equal to or greater than the design breaking load.

## 2. 4 Production testing

- 2. 4. 1 The nature and extent of proposed production testing will be considered by ACS, but the arrangements are to be at least equivalent to one of the following testing procedures:
  - a. One randomly selected sample from every 50 pieces, or from each batch if fewer than 50 pieces, is to be proof loaded in accordance with [Table 14. 2. 1: Design breaking loads and proof loads for fixed cargo securing fittings](#).
  - b. All fittings are to be loaded to the SWL of the item.
- 2. 4. 2 Consideration will be given to a reduced frequency of the mechanical production testing proposed in [Pt 3, Ch 14, 2.4 Production testing 2.4.1](#), provided that:
  - a. the prototype test results indicate a breaking load at least 50 per cent greater than that required by [Table 14. 2. 1: Design breaking loads and proof loads for fixed cargo securing fittings](#); and
  - b. a suitable non-destructive inspection procedure is agreed.
- 2. 4. 3 Permanent deformation (other than that due to initial embedding of component parts) will not be accepted unless tests are conducted in accordance with [Pt 3, Ch 14, 2.4 Production testing 2.4.1](#) and the SWL of the sample is 250 kN or greater. In this case, consideration may be given to acceptance of permanent deformation in the load range between SWL + 125 kN and the proof load, provided that satisfactory manual operation can be achieved after completion of tests.
- 2. 4. 4 In the event of premature failure or serious plastic deformation occurring in a test sample, a further randomly selected sample is to be selected for testing. In the event that this sample is found to be unsatisfactory, the associated batch will be rejected.

CHAPTER **14 Cargo Securing Arrangements**SECTION **3 Loose container securing fittings, materials and testing****3. 1 General**

- 3. 1. 1 Randomly selected samples of loose container securing fittings are to be subjected to prototype testing and, upon satisfactory completion, will be granted General Approval.
- 3. 1. 2 Randomly selected samples drawn from production runs are to be subjected to production testing prior to delivery to the ship in accordance with [Pt 3, Ch 14, 3.4, Production testing](#).
- 3. 1. 3 Loose container securing fittings, certified by an organisation other than LR, will be accepted where the certification scheme is to the satisfaction of ACS.
- 3. 1. 4 In the following, the term ‘fully automatic fitting’ is used to describe fittings which do not require manual operation during unloading of the containers. It should be noted that usually these fittings do not mechanically secure the container in the vertical direction (perpendicular to the hatch cover) in the upright condition when subjected to pure vertical motions. Other modes of operation and novel design will be specially considered.

**3. 2 Materials and design**

- 3. 2. 1 Steel used for loose container securing fittings is to comply with the requirements of the Rules for Materials or with an equivalent specification acceptable to ACS.
- 3. 2. 2 Where loose container securing fittings are intended to operate at low ambient temperatures, special consideration is to be given to the specification of the steel.
- 3. 2. 3 Proposals for the use of materials other than steel will be specially considered.
- 3. 2. 4 Locking devices and other fittings which are inserted into the container castings on the quayside before lifting on board are to be such as to minimise the risk of them working loose under the effects of vibration and the risk of them falling out.
- 3. 2. 5 For twistlocks, bottom twistlocks, midlocks, stackers with intermediate plates and fully automatic fittings, the contact areas, for both tension and compression between the fitting and the corner castings of the containers, are to be such as not to exceed a bearing stress of 300 N/mm<sup>2</sup> under the safe working load of the fitting. No increase in the permissible stress level will be given due to higher strength material of the fittings. In the case where the design is such that the contact area is sloped or inclined and not parallel to the container corner casting, the effective contact area will be specially considered.

### 3.3 Prototype testing

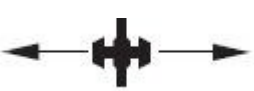

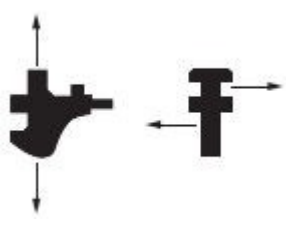

- 3.3.1 Prototype tests are to be in accordance with [Pt 3, Ch 14, 2.3 Prototype testing 2.3.1](#), except that [Table 14.3.1: Design breaking loads and proof loads for loose container securing fittings](#) and [Table 14.3.2: Test loads and test modes for loose container securing fittings](#) are to be applied in lieu of [Table 14.2.1: Design breaking loads and proof loads for fixed cargo securing fittings](#) and [Table 14.2.2: Test loads and test modes for fixed container securing fittings](#) respectively. For vertical lashing, See [Pt 3, Ch 14, 5.4 Containers in more than two tiers 5.4.9.b](#).

**Table 14.3.1: Design breaking loads and proof loads for loose container securing fittings**

| Item   |                      |  | Min. proof load |              | Min. design breaking load |              |
|--|----------------------|--|-----------------|--------------|---------------------------|--------------|
|  |                      |  | SWL ≤ 400 kN    | SWL > 400 kN |                           | SWL > 400 kN |
| Lashings   |                      |  |                 |              |                           |              |
| Wire rope  |                      |  |                 |              | 3 x SWL                   |              |
| Rod:   | higher tensile steel |  | 1.5 x SWL       | SWL + 200 kN | 2 x SWL                   |              |
| Chain:   | mild steel           |  |                 |              | 3 x SWL                   | SWL + 400 kN |
|  | higher tensile steel |  |                 |              | 2.5 x SWL                 |              |
| Other loose container securing fittings  |                      |  | 1.5 x SWL       |              | 2 x SWL                   |              |
| <p><b>Note1.</b> Higher tensile steel is defined for this purpose as steel having a yield stress not less than 315 N/mm<sup>2</sup>.</p> <p><b>Note2.</b> Breaking and proof loads for lashings of material other than steel will be considered.</p> |                      |  |                 |              |                           |              |

**Table 14.3.2: Test loads and test modes for loose container securing fittings**

| Item No. | Description             | Required test modes  | Recommended minimum, in kN |            |               |
|----------|-------------------------|--|----------------------------|------------|---------------|
|          |                         |  | SWL                        | Proof load | Breaking load |
| 1        | Lashing rod             |              | 180                        | 270        | 360           |
| 2        | Lashing rod (HTS)       |  | 250                        | 375        | 500           |
| 3        | Lashing chain (MS)      |  | 80                         | —          | 200           |
| 4        | Lashing chain (HTS)     |  | 100                        | —          | 300           |
| 5        | Lashing steel wire rope |  | 120                        | —          | 360           |
| 6        | Turnbuckle              |  Tensile load | 250                        | 375        | 500           |
| 7        | Twistlock (manual,      |  Shear load   | 200                        | 300        | 400           |

|   |  |   |              |     |     |     |
|---|--|---|--------------|-----|-----|-----|
|   | semi-automatic and fully automatic fittings) |  | Tensile load | 250 | 375 | 500 |
| 8   | Midlock                                      |  | Shear load   | 200 | 300 | 400 |
|   |  |   | Tensile load | 250 | 375 | 500 |
| 9   | Stacker                                      |  | Shear load   | 200 | 300 | 400 |
| <b>Note1.</b> Where containers with strength higher than required for ISO containers are used, special consideration will be given to the required minimum loads.               |  |   |              |     |     |     |
| <b>Note2.</b> The test modes illustrated above are diagrammatic only.   |  |   |              |     |     |     |
| <b>Note3.</b> Other fittings not covered in this Table may be specially considered, <i>See also</i> <a href="#">Pt 3, Ch 14, 3.5 Function and environmental testing 3.5.1</a> . |  |   |              |     |     |     |

### 3. 4 Production testing

3. 4. 1 The nature and extent of proposed production testing will be considered by ACS, but the arrangements are to be at least equivalent to one of the following testing procedures:
  - a. For:
    - i. **Loose container securing fittings except chain or wire rope lashings.** One randomly selected sample from every 50 pieces, or from each batch if fewer than 50 pieces, is to be proof loaded in accordance with [Table 14. 3. 1: Design breaking loads and proof loads for loose container securing fittings](#).
    - ii. **Chain or wire rope lashings.** One randomly selected sample from every 50 pieces, or from each batch if fewer than 50 pieces, is to be tested to breaking.
  - b. All fittings, securing devices and lashings are to be proof loaded to the SWL of the item and in addition, one randomly selected sample from every batch of chain or wire rope lashings is to be tested to breaking.
3. 4. 2 Permanent deformation (other than that due to initial embedding of component parts) will not be accepted unless tests are conducted in accordance with [Pt 3, Ch 14, 3.4 Production testing 3.4.1.a.ii](#) and the SWL of the sample is 250 kN or greater. In this case, consideration may be given to acceptance of permanent deformation in the load range between SWL + 125 kN and the proof load, provided that satisfactory manual operation can be achieved after completion of tests.
3. 4. 3 In the event of premature failure or serious plastic deformation occurring in a test sample, a further randomly selected sample is to be selected for testing. In the event that this sample is found to be unsatisfactory, the associated batch will be rejected.

### 3. 5 Function and environmental testing

3. 5. 1 For fittings of novel design or with special features, in addition to the prototype and production testing, a function test may be required to demonstrate that the fitting is fit for purpose. Details of the function test will be considered on an individual basis, taking into consideration the mode of operation of the fitting. In addition, ACS reserves the right to require environmental tests. The

|                |           |   |
|----------------|-----------|---|
| <b>PART</b>    | <b>3</b>  | <b>Ship Structures</b>  |
| <b>CHAPTER</b> | <b>14</b> | <b>Cargo Securing Arrangements</b>                              |
| <b>SECTION</b> | <b>3</b>  | <b>Loose container securing fittings, materials and testing</b> |

---

actual test depends on the individual design of the fitting. The tests are to verify that environmental and ageing effects, such as corrosion, icing, debris contamination, etc. do not impinge on the safe operation of the fitting. In this case, ACS reserves the right to require the submission of maintenance instructions as part of the approval procedure.

CHAPTER **14 Cargo Securing Arrangements**SECTION **4 Ship structure****4. 1 General**

4. 1. 1 The ship structure and hatch covers in way of fixed cargo securing fittings are to be strengthened as necessary, *See* [Pt 3, Ch 14, 1.1 Application 1.1.2](#).
4. 1. 2 A breakwater may be required, *See* [Pt 3, Ch 14, 1.1 Application 1.1.7](#).

**4. 2 Strength**

4. 2. 1 The SWL of the fixed cargo securing fitting is to be used as the design load when approving the weld attachments and the support structure of the fixed cargo securing fitting.
4. 2. 2 For container securing arrangements, the design load when approving the weld attachment and supporting structure is to be calculated in accordance with [Pt 3, Ch 14, 9 Strength of container securing arrangements](#).
4. 2. 3 When considering the loads, all expected directions of operation are to be taken into account.
4. 2. 4 Stresses induced in the weld attachments, supporting structure, cell guides and other structures serving as fixed cargo securing points, determined using the design loads as defined in [Pt 3, Ch 14, 4.2 Strength 4.2.1](#) to [Pt 3, Ch 14, 4.2 Strength 4.2.3](#), are not to exceed the permissible values given in [Table 14. 4. 1: Permissible stress values](#).

**Table 14. 4. 1: Permissible stress values**

|   | Permissible stress,<br>N/mm <sup>2</sup> |
|---|--|
| Normal stress (bending, tension, compression)                     | $0.67\sigma_o$                           |
| Shear stress  | $0.4\sigma_o$                            |
| Combined stress   | $0.86\sigma_o$                           |
| Symbols   |  |
| $\sigma_o$ = specified minimum yield stress, in N/mm <sup>2</sup> |  |

4. 2. 5 Structural strength of container lashing bridges is to be assessed in accordance with the ACSPlus SDA Guideline for the Assessment of Container Ship Lashing Bridge Structures.

CHAPTER **14 Cargo Securing Arrangements**SECTION **5 Container securing arrangements for stowage on exposed decks without cell guides****5.1 General**

- 5.1.1 Containers stowed on deck or on hatch covers are generally to be aligned in the fore and aft direction (longitudinally stowed), but alternative arrangements will be considered.
- 5.1.2 Containers are to be stowed so that they do not extend beyond the ship's side. Adequate support is to be provided where they overhang hatch coamings or other deck structures. The stowage arrangements are to be such as to permit safe access for personnel in the necessary working of the ship, and to provide sufficient access for operation and inspection of the securing devices.
- 5.1.3 Where containers are stowed on hatch covers, the covers are to be effectively restrained against sliding by approved type stoppers or equivalent. Details of the locations of stoppers relative to the supporting structure are to be submitted at an early stage.
- 5.1.4 Stanchions and similar structure supporting containers and securing devices, such as D-rings for lashings, are to be of adequate strength for the imposed loads and of sufficient stiffness to minimise any deflection which could lead to a reduction in the effectiveness of the securing device.
- 5.1.5 In the region forward of  $0.75L$ , additional securing devices may be required due to green sea forces, *See* [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.4](#).
- 5.1.6 In general, stowage of heavy containers on top of lighter containers is to be avoided, unless validated as being satisfactory by an approved onboard lashing program or covered by the approved container securing arrangement.
- 5.1.7 Approved semi-automatic and fully-automatic fittings and twistlocks are to be used.

For fittings where the locking method requires defined clearances between the corner castings and the fixed foundations, such fittings are not to be used at the lowest tier of a stack which is resting with one side on a hatch cover panel and bridging to a container stanchion. The same applies if the stack is resting on different hatch cover panels or foundations where relative deflection during ship operation can occur.

**5.2 Containers in one tier**

- 5.2.1 Containers are to be secured at their lower corners by approved locking devices.
- 5.2.2 Alternatively, containers may be secured by lashings fitted diagonally or vertically at both ends of each container, in association with cone fittings at each container corner.

### 5.3 Containers in two tiers

- 5.3.1 Containers are to be secured at their lower corners at each tier by approved locking devices.
- 5.3.2 Where the calculations indicate that separation forces will not occur at any point in the stack, double stacking cones may be fitted at all internal corners of the stack and bridge fittings used to connect the tops of the rows in the transverse direction. Locking devices are to be fitted at all external corners.
- 5.3.3 Alternatively, containers may be secured by lashings in association with stacking cones or, where the calculations indicate that separation forces may occur, with locking devices.

### 5.4 Containers in more than two tiers

- 5.4.1 Containers are to be secured at their lower corners at each tier by approved locking devices.
- 5.4.2 Alternatively, containers may be secured by lashings. One or two tiers of lashings may be fitted in association with stacking cones or, where the calculations indicate that separation forces may occur, with locking devices.
- 5.4.3 When lashings are employed, they are usually fitted to the bottom corner casting of a container. Proposals to attach lashings to the top casting of a container will be considered. The reduced strength of the upper corner casting compared to the lower corner castings is to be taken into account.
- 5.4.4 Internal lashings arranged in pairs (internal para-lash arrangements) are acceptable. Lashings in pairs are generally to be attached one to the bottom corner casting of the upper tier and the other to the top corner casting of the lower tier container. Suitable connections are to be provided at the lower ends. *See also* [Table 14.3.2: Test loads and test modes for loose container securing fittings](#).
- 5.4.5 Approved semi-automatic or fully-automatic fittings may be used with internal lashing or external lashing arrangements.
- 5.4.6 or external lashing arrangements, if the stack forces are such that lifting occurs at the uppermost lashing connection point, then the force in the lashing device is to include allowance for the lifting force. The effect of lifting at lashing point connections below the uppermost connection may be ignored.
- 5.4.7 The ACS approval process for fully-automatic fittings includes a requirement that the fitting passes a tensile load test. This test specifies a maximum allowable vertical separation under the tensile load and therefore the effect of the magnitude of the opening clearance under tensile loads may be ignored in the calculation of the additional vertical force in the lashing rod. For semi-automatic twistlocks used with external lashings, the nominal clearance of the fitting is not to exceed the maximum values specified in the ACS test procedure. Non-ACS approved fittings will be specially considered, *See* [Pt 3, Ch 14, 3.1 General 3.1.3](#).
- 5.4.8 Proposals to use horizontal lashings connected to lashing bridges will be specially considered. The forces in such securing systems are to be determined by direct calculations, taking into account the following effects:
  - stiffness of the container walls, the lashings and the lashing bridge; and
  - the possible horizontal displacements of the containers relative to the lashing bridge due to the clearances of the hatch cover stoppers and the container securing fittings.
- 5.4.9 When vertical lashings are used in combination with container securing fittings, consideration is to be given to the vertical clearances between the fittings and the container corner castings:
  - a. The lashing assembly is to remain elastic when subject to an elongation equating to the number of interface fittings fitted below the point where the vertical lashing is applied to the stack. In

order to avoid overstressing of the rod and the turnbuckle, provision of spring or elastic elements incorporated into the turnbuckle may be advantageous. When lashing from lashing bridge level, the number of interfaces is to be counted down to the level where the lowest container is resting. The lashing rod is to be fitted to the bottom casting of the container. For container securing fittings having design clearances in accordance with ISO 3874, a nominal clearance per fitting of 10 mm is to be taken to determine the total elongation of the lashing system. For fittings having clearances in excess of 10 mm, the total elongation is to be calculated, taking into consideration the higher clearances.

- b. A prototype test is to be carried out to demonstrate that the vertical lashing has a safe working load of 150 kN when elongated up to the calculated total design clearance plus 10 per cent without plastic deformation.
  - c. It is recommended that the load-bearing effect of vertical lashing arrangements be explicitly taken into account when performing lashing calculations. Where this is not done, it is acceptable to either:
    - i. allow the permissible calculated lifting force to be increased to SWL+150 kN where SWL is the safe working load of the container securing fittings below the fitting position of the vertical lashing. The nominal lifting force for these fittings is not to exceed 400 kN at the securing fittings below the fitting position of the vertical lashing; or
    - ii. calculate the force in the lashing rod taking into account the lifting force at the rod connection point.
5. 4. 10 For stowage arrangements incorporating fully-automatic fittings which do not mechanically secure the container in pure vertical direction when subject to vertical motions, it is to be ensured that no separation occurs under the load cases specified in [Pt 3, Ch 14, 8 Determination of forces for container securing arrangements](#). In addition, where stacks in the outermost position, anywhere in the length of the vessel, are secured with fully-automatic fittings without lashings, provisions such as breakwaters, effective side screens, plated bulwarks or similar, are to be provided to prevent the possibility of green sea buoyancy forces causing the containers to disengage, *See* [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.10](#). Alternatively, the lowest tier of containers is to be secured by manual or semi-automatic twistlocks.
5. 4. 11 If the carriage of one or more tiers of 20 ft containers being overstowed with at least one tier of 40 ft containers, the so-called ‘Russian Stow Arrangement’, is desired, the following requirements apply.
- a. At the 20 ft gap the containers are to be secured by means of midlocks, whereas the fore and aft ends are to be secured by twistlocks and if necessary supplemented by lashing rods.
  - b. The 40 ft overstow container is to be secured by twistlocks or if necessary with a combination of twistlocks and lashing rods. The stack is to be assessed in a twostep procedure, as follows:
    - i. For location at the 40 ft ends, the entire mixed stack is to be considered as a 40 ft stack. The weights of the 40 ft containers are to be considered in the calculations. For the tiers of 20 ft containers, the weight of one 20 ft container is to be taken as the basis for the calculation at each tier.
    - ii. For the location of the 20 ft tiers at the mid-bay position, the assessment is to be carried out as for an unlashed stack. The 40 ft overstow container does not need to be taken into consideration.
5. 4. 12 No lashings are to be applied to the ends of a 45 ft, 48 ft or 53 ft container if stowed on top of a shorter unit.

## 5. 5 Line Load stowage

5. 5. 1 Where the containers are supported on bearers placed to distribute the stackweight as Line Loads, the following requirements are to be complied with:

- a. The stack is, in general, to comprise a maximum of two tiers of loaded containers.
  - b. The load from the upper tier is to be transferred through the container corners. Line loading is not to be used between tiers.
  - c. The load on each vertical corner post of the bottom tier, calculated in accordance with [Pt 3, Ch 14, 9 Strength of container securing arrangements](#), is not to exceed one half of the Rated Load of the container.
  - d. Where the calculations indicate that lifting forces may occur, locking devices are to be fitted at the container corners.
  - e. The clearance below the bottom container corner casting is to be such that the stacking cone or equivalent cannot be dislodged under shear loading.
5. 5. 2 Where an approved Line Load stowage system is installed, the special features notation will be suitably modified.

## **5. 6 Systems incorporating structural restraint**

- 5. 6. 1 Containers may be secured by the use of a fixed structure providing permanent buttresses in association with portable frameworks. Proposals to adopt such systems will be considered on the basis of the loads developed in the structure and the corresponding stresses.
- 5. 6. 2 The framework or other devices securing the containers are to be aligned with the container corner castings and any clearance gap is to be kept to the minimum to reduce shifting.

PART

**3**

CHAPTER **14 Cargo Securing Arrangements**

SECTION **6 Container securing arrangements for underdeck stowage without cell guides**

**6. 1 General**

- 6. 1. 1 Containers are generally to be stowed in holds in the fore and aft direction, but alternative arrangements will be considered. The securing arrangements are to be designed on the basis of the most severe distribution of loads which may arise in the container stack.
- 6. 1. 2 Containers may be secured by locking devices only or by a combination of locking devices, buttresses, shores or lashings. Containers are, in general, to be restrained at every corner at the base of the stack and at all intermediate levels.
- 6. 1. 3 Where stacks consist of one or two tiers only, consideration will be given to the omission of corner locking devices. Containers must, however, be secured by a minimum of two corner locking devices.
- 6. 1. 4 Where the calculations indicate that separation forces could occur at any particular level, twistlocks or equivalent means of securing are to be fitted at that level. Elsewhere, consideration will be given to the use of double stacking cones.
- 6. 1. 5 Where the calculations indicate that separation forces will not occur between containers at any level, consideration will be given to the use of stacking cones in lieu of locking devices throughout.
- 6. 1. 6 Buttresses are generally to be of the tension and compression type and are to be provided with means of adjustment to ensure tightness when fitted in place. Where applicable, the attachment to the ship's structure is also to include means for vertical adjustment of the buttress to match container stacks of different heights.
- 6. 1. 7 Shores of the compression-only type may be permanently attached to the ship structure or they may be hinged or portable. When in place they are to abut the container corner castings with minimal clearance. Means are to be provided to prevent slackening of the device.
- 6. 1. 8 Adjacent stacks of containers are to be linked in line with buttresses or shores in order to transmit lateral loads. The fittings used for these linkages are to be of adequate strength to transmit the loads imposed.
- 6. 1. 9 The ship's structure supporting shores and buttresses is to be reinforced as necessary.
- 6. 1. 10 Proposals for alternative securing systems, including systems relying on minimal clearance between containers and hull structure, will be specially considered.
- 6. 1. 11 6.1.11 Attention is drawn to the safety at work aspects for fittings which require operation on top of containers, e.g. double stacking cones, bridge fittings, buttresses and shores. Where these fittings are used, fall protection is to be provided.

PART

**3**

CHAPTER **14 Cargo Securing Arrangements**

SECTION **7 Container securing arrangements for stowage using cell guides**

**7. 1 General**

- 7. 1. 1 Cell guide systems may be fitted to support containers stowed in holds or on exposed decks.
- 7. 1. 2 The cell guides are not to form an integral part of the ship's structure. The guide system is generally to be so designed as to keep it free of the main hull stresses.
- 7. 1. 3 Cell guides are to be designed to resist loads caused by loading and unloading of the containers, to prevent shifting of the containers and to transmit the loads caused by motions of the ship into the main hull structure.

**7. 2 Arrangement and construction**

- 7. 2. 1 Cell guides are to be of robust construction and generally fabricated from steel plate and rolled sections. They are to have sufficient vertical extent and continuity to provide efficient support to containers. Guide bars are to be effectively attached to the supporting structure to prevent tripping or distortion resulting from container loading.
- 7. 2. 2 The intersection between cell guide and cross ties is to provide adequate torsional stability.
- 7. 2. 3 Intermediate brackets are to be fitted to vertical cell guides at suitable intervals.
- 7. 2. 4 The cell guides are to give a total clearance between the container and guide bars not exceeding 25 mm in the transverse direction and 40 mm in the longitudinal direction. The deviation of the cell guide bar from its intended line is not generally to exceed 4 mm in the transverse direction and 5 mm in the longitudinal direction.
- 7. 2. 5 Athwartship cross ties are to be fitted between cell guides at a spacing determined from the loading on the guides but, generally, not more than 3.0 m apart. Wherever possible, cross ties are to be arranged in line with the corners of the containers as stowed and are to be supported against fore and aft movement at a minimum of two points across the breadth of the hold. Where, however, the maximum fore and aft deflection in the cross tie can be shown not to exceed 20 mm, one support point may be accepted.
- 7. 2. 6 Longitudinal tie bars may be required to be fitted where shown necessary by the force calculations for the structure. Where fitted, they are to comply with the requirements of [Pt 3, Ch 14, 7.2 Arrangement and construction 7.2.5](#).
- 7. 2. 7 Where, at the sides or ends of holds, the guide rails are fitted to transverse or longitudinal bulkheads, the bulkhead is to be locally reinforced to resist the additional loads.
- 7. 2. 8 If the carriage of 45 ft Euro containers complying with EU Directive 96/53 is specified to be carried in 45 ft cell guides, attention is to be paid to the arrangement of the corner castings,

See Figure 14.7.1 45 ft euro container in cell guides. The guide bars need to be increased in order to ensure that a minimum design overlap,  $a$ , of 20 mm is achieved, taking into account the design clearances and tolerances defined in [Pt 3, Ch 14, 7.2 Arrangement and construction 7.2.4](#). Consideration is to be given to the torsional loads being applied to the guide bars.

**Figure 14. 7. 1: ft euro container in cell guides**

### 7. 3 Carriage of 20 ft containers in 40 ft cell guides in holds

7. 3. 1 Where the cell guides are arranged for the carriage of 40 ft containers, provision may be made for the installation of temporary intermediate cell guides for 20 ft containers. The permanent structure is to be designed such that it is suitable for either loading pattern.
7. 3. 2 Alternatively, permanent means for the support of 20 ft containers at the mid-length of a cell arranged for 40 ft containers will be considered. Such means may include the following:
  - a. A pillar (inboard) and vertical rest bar (on the longitudinal bulkhead) against which the container stack may rest. The pillar is to be supported laterally by the deck structure over and is to be sufficiently stiff to control lateral deflection of the container stacks.
  - b. Guide bars supported transversely by slim structure within the gap between containers and with longitudinal ties as necessary.

Details of proposals will be individually considered, taking into account the loads on the support structure and the resulting deflections.
7. 3. 3 Where it is desired to stow 20 ft containers without external support at the mid-bay location with or without 40 ft overstow, so-called 'mixed stowage' arrangements meeting the following requirements are applicable:
  - a. Maximum homogeneous container weights for 20 ft containers stowed in cell guides with no 40 ft container overstowed can be derived from [Table 14. 7. 1: Maximum container weights of Wh 20 ft containers stowed in 40 ft cell guides with no overstow](#), depending on the transverse acceleration and the number of tiers in the stack.
  - b. Maximum homogeneous container weights for 20 ft containers stowed in cell guides with one or more 40 ft containers overstowed can be derived from:
    - i. [Table 14. 7. 2: Maximum containers weights, Wh of 20 ft containers stowed in 40 ft cell guides with overstow, diagonal stacking cone arrangement](#)
    - ii. [Table 14. 7. 3: Maximum container weights Wh of 20 ft containers stowed in 40 ft cell guides with overstow, other stacking cone arrangement](#)
  - c. All inhold mixed stowage tables have been derived on the basis of all 20 ft containers having the same weight. However it is acceptable to carry non-homogeneous stacks provided the following two conditions are met:
    - i. 20 ft containers heavier than specified in the weight  $W_h$  can be loaded provided that the average container weight excluding the lowest container in the stack does not exceed  $W_h$ , i.e.

$$\sum_{i=2}^N W_i \leq (N-1)W_h$$

- ii. The total moment of 20 ft containers in a stacks about the base is not to be greater than the moment exerted by an equivalent homogeneous stack of weight  $W_h$ , i.e.

$$\sum_{i=2}^N (W_i \cdot e_a(i-1)) \leq (N-1) \cdot W_h \cdot \frac{c_a \cdot N}{2}$$

where

$W_i$  weight of container  $i$ .

$c_i$  height of container  $i$ .

$W_h$  is the homogeneous container weight as determined from [Table 14. 7. 1: Maximum container weights of  \$W\_h\$  20 ft containers stowed in 40 ft cell guides with no overstay](#), [Table 14. 7. 2: Maximum containers weights,  \$W\_h\$  of 20 ft containers stowed in 40 ft cell guides with overstay, diagonal stacking cone arrangement](#) or [Table 14. 7. 3: Maximum container weights  \$W\_h\$  of 20 ft containers stowed in 40 ft cell guides with overstay, other stacking cone arrangement](#) as applicable. Where  $W_h$  is corrected by Note 5 of the tables,  $W_h$  is to be taken as  $W_{hc}$ .

$c_a$  average height of the 20 ft containers in the stack.

$N$  Number of 20 ft containers.

- d. The weight of the lowest container in the stack may be increased to its rated value.  
e. The force in the corner post in the lowest container is not to exceed the permissible compression value given in [Table 14. 9. 6: Allowable forces in containers in stacks with the same base size](#). The force is to be determined by:

$$V = - \frac{a_z(w_{40s} + W_{20s-1})}{4}$$

where

$V$  is the compressive force in the corner post

$W_{40s}$  is the total weight of the 40 ft containers, in tonnes

$W_{20s-1}$  is the total weight of the 20 ft containers excluding the weight of the lowest container, in tonnes

$a_z$  is the maximum vertical acceleration of all containers in the stack, See [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.5](#)

- f. Means are to be provided to prevent transverse sliding of the bottom of the stacks of 20 ft containers at the mid-bay position. This is to be in the form of permanently attached chocks at the inner bottom or equivalent. The design clearance is to be the same as for the cell guides and in accordance with [Pt 3, Ch 14, 7.2 Arrangement and construction 7.2.4](#).  
g. 20 ft containers stowed with no stacking cones are to be restrained to avoid transverse movement, e.g. all containers at the same tier height in a bay are to be of the same height and structural constraints between the containers and the hull are to be provided.  
h. The 20 ft containers are to have closed steel walls and top (no open frame containers, e.g. tank or bulk containers).

**Table 14. 7. 1: Maximum container weights of Wh 20 ft containers stowed in 40 ft cell guides with no overstay**

|   | Maximum homogeneous container weights, in tonnes<br>(number of 20 ft containers) |         |         |         |         |         |         |          |          |          |

| 0.65 | 27.9 | 19.6 | 15.8 | 12.9 | 10.9 | 9.4  | 8.4  | 7.5 | 6.8 | 6.2 |

**Note 1.** Linear interpolation is to be used to determine intermediate values.

**Note 2.** 40 ft overstay containers not included in the number of tiers.

**Note 3.** Maximum container weights for transverse acceleration and number of tiers outside of those presented will be specially considered.

**Note 4.** The maximum container weight should not exceed the rated weight of the container.

**Note 5.** Where the homogeneous container weight ( $W_h$ ) derived from the table is lower than the rated weight of the container, the maximum homogeneous weight is to be corrected to account for the height of the containers used, as follows:  $W_{hc} = W_h w_{ac}$  Where:  $W_{ac} = \frac{2.591}{c_a}$  which is not to be taken greater than 1  $c_a$  is the average height of the 20 ft containers

**Table 14. 7. 2: Maximum containers weights,  $W_h$  of 20 ft containers stowed in 40 ft cell guides with overstay, diagonal stacking cone arrangement**

7. 3. 4 Alternative proposals for stowage arrangements will be individually considered and are to be accompanied by supporting calculations.

## 7. 4 Cell guide systems on exposed decks

7. 4. 1 Analysis methods for the strength of the cell guide structure are to take due account of the interactive effects between guide structure and supporting deck structure and also of the deformation of the hull girder.
7. 4. 2 At its lower end the guide structure is to be efficiently connected to the deck structure. Cross ties are to be arranged between guides in a transverse direction at a spacing determined by the loading on the guides but in general not more than 3 m apart. Cross-bracing members of adequate strength and sufficient number are to be fitted in the transverse and longitudinal directions to prevent excessive deflection of the guide structure.
7. 4. 3 The height of guide bars above the deck is to be sufficient to ensure adequate restraint to the uppermost container tiers.
7. 4. 4 Where the cell guide structure is attached to highly stressed hull or deck elements, such as sheerstrakes, special attention is to be given to the design of the connection and the grade and quality of steel utilised.

## **7. 5 Entry guide devices**

7. 5. 1 A device to pre-centre the container and direct it into the cell guides is normally to be fitted at the top of the guide bars. Such devices include:
- fixed even peaks,
  - fixed high and low peaks,
  - ‘flip-flop’ systems,
- but other devices will be considered. The device is to be of robust construction.

CHAPTER **14 Cargo Securing Arrangements**SECTION **8 Determination of forces for container securing arrangements****8. 1 General**

8. 1. 1 The forces acting in the securing system are to be determined for each loading condition and associated set of motions of the ship. Although the operation of anti-roll devices or other systems may improve the behaviour of the ship in a seaway, the effect of such devices is not to be taken into account to reduce the determination of the forces for container securing arrangements.
8. 1. 2 The following forces are to be taken into account:
- Static gravity forces.
  - Inertial forces generated by the ship motions in a seaway.
  - Wind forces.
  - Forces imposed by the securing arrangements.
  - Wave impact forces and effects of consequential hull girder whipping.
8. 1. 3 Forces due to pre-tensioning the securing devices need not, in general, be included in the calculation, provided that they do not exceed 5 kN in any one item. Special consideration will be given to cases where forces obtained from pre-stressing are an integral part of the design of the system.

**8. 2 Ship motion, wind and green sea forces acting on containers**

8. 2. 1 The forces acting on each container due to gravity, ship motion accelerations, ship rolling and pitching angles and wind forces and green sea forces are to be calculated as follows.
8. 2. 2 The equations for ship motion accelerations and other motion parameters are given in [Pt 3, Ch 14, 1.7, Symbols and definitions](#). These are to be used for the calculation of accelerations to derive the forces for the container securing arrangements. Alternatively, the ship motion values may be derived by direct calculation methods using the same principles as those used to derive the Rule equations. The formulae in [Pt 3, Ch 14, 1.7, Symbols and definitions](#) are applicable to container ships. Values for other ship types will be specially considered.
8. 2. 3 The following six Motion Cases (MCs) are to be considered:
- MC1: Head sea case that maximises vertical acceleration
  - MC2: Beam sea case that maximises roll motion
  - MC3: Oblique sea case that maximises pitch acceleration

MC4: Oblique sea case with forward speed that maximises roll motion

MC5: Oblique sea case that maximises combined transverse and vertical accelerations

MC6: Beam sea case that maximises heave acceleration

Each Motion Case comprises 2 Motion Combination Factor (MCF) sets. Each MCF set represents an Equivalent Design Wave (EDW) that generates response values equivalent to the long-term response values of the critical load components for ship motion forces acting on containers. The Motion Combination Factors are given in [Table 14. 8. 3: Motion Combination Factors \(MCFs\)](#).

8. 2. 4 The individual force components for each Motion Case due to gravity, ship motions, wind and green seas acting on a container  $i$  are to be determined as follows, See [Figure 14. 1. 1: Diagrammatic representation of symbols](#) and [Table 14. 9. 1: Acceleration force application](#):

$H_{Di}$  = force acting on container  $i$  in kN in transverse direction parallel to deck, positive to port

$$= Wa_y$$

$J_{Di}$  = force acting on container  $i$  in kN in longitudinal direction parallel to deck, positive forward

$$= Wa_x$$

$P_{Di}$  = force acting on container  $i$  in kN in vertical direction normal to deck, positive upward

$$= Wa_z$$

$Q_{Di}$  = wind force acting on exposed container  $i$  in kN in transverse direction parallel to deck, positive to port

$$= Q_{DSi}Q_{DMi}$$

Where

$Q_{DMi}$  = wind force magnitude acting on exposed container  $i$  in kN in transverse direction parallel to deck

$$= 0.5bc\rho_a C_{rml} C_z C_{wh} V_{wh}^2 10^{-3}$$

where

$C_{roll}$  wind force coefficient to include effect of roll angle

$$= \left( \frac{1}{1 + 0.026 |C_y d \varphi|} \right) + 0.65$$

$\rho_a$  density of air in kg/m<sup>3</sup> is to be taken as

$$= 1.204$$

$C_z$  wind force height distribution coefficient

$$= \left( 1 - \frac{z_{ci} - z_{bc}}{z_{tc} - z_{bc}} \right)^{0.25}$$

$V_{wh}$  mean wind speed over the stack in m/s

$$= 0.63V_m \frac{z_{tc}^{1.11} - z_{bc}^{1.11}}{z_{tc} - z_{bc}}$$

$z_{tc}$  height above moulded draught,  $T_c$ , of the top of the highest container in the stack under consideration, in m

$z_{bc}$  height above moulded draught,  $T_c$ , of the underside of the lowest container in the outermost stack, in m

Where

$z_{ci}$  height above moulded draught,  $T_c$ , of the centre of the side wall of container  $i$ , in m

$C_{wh}$  wind heading coefficient, given in [Table 14. 8. 1: Wind heading coefficient  \$C\_{wh}\$](#)

$C_{yG}$  transverse acceleration motion combination factor  $C_{yG}$ , given in [Table 14. 8. 3: Motion Combination Factors \(MCFs\)](#)

Other symbols are defined in [Pt 3, Ch 14, 1.7, Symbols and definitions](#).

می باشد Rull در سطرهای بعدی 3 تا فرمول در

$Q_{DSi}$  = Wind force direction coefficient

= 1 if  $H_{Di} > 0\text{ kN}$

= -1 if  $H_{Di} \leq 0\text{ kN}$

$H_{Gi}$  = green sea force acting on container  $i$ , in kN in transverse direction parallel to deck, positive to port

=  $-bc_i P_{gs}$  for port side exposed containers

=  $bc_i P_{gs}$  for starboard side exposed containers

**Note 1.**  $H_{Gi}$  is only to be applied when  $H_{Gi}$  will increase the transverse force  $H_{Di}$ .

**Note 2.** See also [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.8](#) and [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.11](#).

$J_{Gi}$  = green sea force acting on container  $i$ , in kN in longitudinal direction parallel to deck, positive forward

=  $-ac_i P_{gs}$

**Note 1.**  $J_{Gi}$  is only to be applied when  $J_{Gi}$  will increase the longitudinal force  $J_{Di}$ .

**Note 2.** See also [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.10](#) and [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.11](#).

$P_{Gi}$  = green sea force acting on container  $i$ , in kN in the upwards direction normal to deck

=  $1.5ab$

**Note 1.**  $P_{Gi}$  is only to be applied when the vertical acceleration  $a_z > -9.81 \text{ m/s}^2$  (downward acceleration less than gravitational acceleration).

**Note 2.** See also [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.10](#) and [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.11](#).

Where

$P_{gs}$  = green sea pressure in  $\text{kN/m}^2$ , See [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.11](#) and [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.12](#).

**Table 14. 8. 1: Wind heading coefficient  $C_{wh}$**

| MC5   | 0.866  |
| MC6   | 1.00   |
| <b>Note 1.</b> For definition of Motion Cases, See <a href="#">Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.7</a> .<br><b>Note 2.</b> No wind loads are to be applied to Motion Case MC1. |  |

8. 2. 5 The total instantaneous acceleration values acting on container  $i$ , including the static gravitational term, are to be taken as:

- Longitudinal acceleration (parallel to deck, positive forward)

$$a_x = C_{xS}a_{\text{surge}} + C_{xP}a_{\text{pitch}} z_i - g \sin(C_{xG}\psi) \text{ m/s}^2$$

- Transverse acceleration (parallel to deck, positive to port)

i. For containers on the port side and on the centreline:

$$a_y = C_{yS}a_{\text{sway}} - C_{yR}a_{\text{roll}} z_i + g \sin(C_{yG}\varphi) \text{ m/s}^2$$

ii. For containers on the starboard side:

$$a_y = -C_{yS}a_{\text{sway}} + C_{yR}a_{\text{roll}} z_i - g \sin(C_{yG}\varphi) \text{ m/s}^2$$

- Vertical acceleration (normal to deck, positive upwards)

i. For containers on the port side and on the centreline:

$$a_z = C_{p1}(C_{zH}a_{\text{heave}} + C_{zR}a_{\text{roll}} y_i - f_{ap}C_{zP}a_{\text{pitch}} x_i) - g \cos(C_{xG}\psi) \cos(C_{yG}\varphi) \text{ m/s}^2$$

ii. For containers on the starboard side

$$a_z = C_{p1}(C_{zH}a_{\text{heave}} - C_{zR}a_{\text{roll}} y_i - f_{ap}C_{zP}a_{\text{pitch}} x_i) - g \cos(C_{xG}\psi) \cos(C_{yG}\varphi) \text{ m/s}^2$$

where the Motion Combination Factors  $C_{XS}, C_{XP}, C_{XG}, C_{YS}, C_{YR}, C_{YG}, C_{ZH}, C_{ZR}$  and  $C_{ZP}$  for each Motion Case are given in [Table 14. 8. 3: Motion Combination Factors \(MCFs\)](#).

8. 2. 6 Wind forces are to be applied to the outer faces of the outermost container stack in accordance with [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.4](#). Wind forces may also need to be applied to inboard stacks in accordance with [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.7](#). The wind forces are to be taken as acting in the athwartships direction. Only positive forces of wind pressure are to be applied; suction forces need not be included. See Figure 14.8.1 Application of wind forces
8. 2. 7 Wind forces are to be applied to containers in inboard stacks if the centre of the windward side wall of the container is above the wind shear line, See [Figure 14. 8. 1: Application of wind forces](#). The wind shear line is to be taken at an angle of 35 degrees to the horizontal and passing through the upper corner of the uppermost container of any windward stack, See [Figure 14. 8. 1: Application of wind forces](#). The roll angle is to be ignored in the assessment of the wind shear line. The wind force is to be derived in accordance with [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.4](#) but See also [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.8](#).

Hence wind forces are to be applied to containers in inboard stacks if:

$$z_{ci} > z_{ws} + (|y_{ws} - y_{ci}|)\tan(35)$$

Where

$z_{ci}$  is the vertical position of the centre of the windward side wall of container  $i$  of the stack under consideration

$y_{ws}$  is the transverse position of the windward top corner of the uppermost container of the stacks windward of the stack under consideration

$z_{ws}$  is the vertical position of the windward top corner of the uppermost container of the stacks windward of the stack under consideration

$y_{ci}$  is the transverse position of the centre of the windward side wall of container  $i$  of the stack under consideration

Figure 14. 8. 1: Application of wind forces

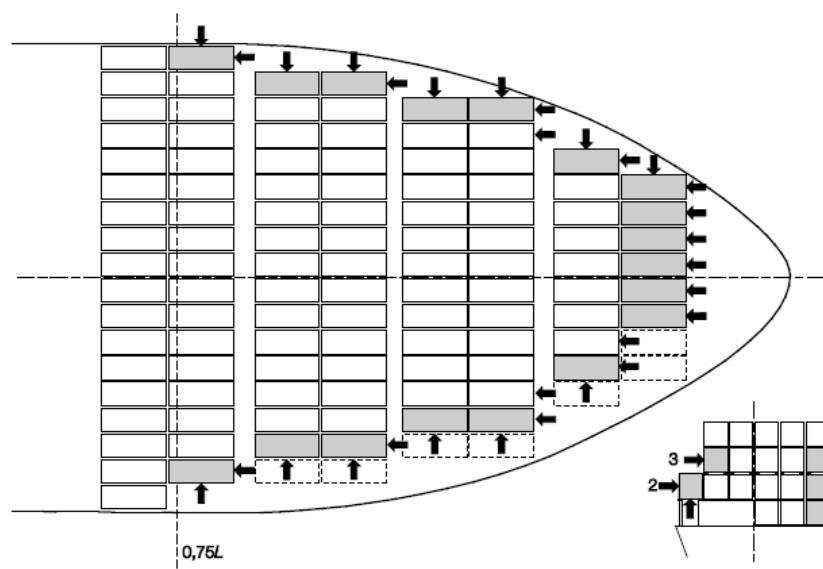

Note. The formula in [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.7](#) compares points at the container base and centre. The drawing compares points at the side. Both comparisons yield the same result.

Figure 14. 8. 2: Example of application of green sea forces

(a) Green sea loading on lowest three tiers only – Effective breakwaters (Forward and wrap around)

(b) Green sea loading on lowest three tiers only – No effective breakwater

8. 2. 8 A container is considered protected from wind in the transverse direction or from green sea loads in the longitudinal or transverse direction if an effective breakwater or similar extends above mid height of the container.
8. 2. 9 A container is considered partially protected from wind if an outboard container partially shields an inboard container as follows:
- An outboard 40ft container is considered to fully protect a longer inboard container.
  - An outboard 20ft container is considered to partially protect a longer inboard container from wind. In this case the full wind force is to be applied over the exposed portion of the longer inboard container when the exposed length is more than 3m. The resulting wind force is to be applied solely to the end wall of the exposed portion.
8. 2. 10 A container is considered protected from green sea loads in the vertical direction if:

- the underside is less than 0.5 m above the hatch cover or deck; or
- an effective breakwater or similar extends above the bottom of the container.

8. 2. 11 Green sea loads need only be applied to a container when (See [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.7](#)):

- the container  $x_c > 0.75L$ ;
- the container is in the lowest three tiers of a stack;
- the container is in one of the two most outboard positions on the deck; and
- the container is not protected, See [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.8](#) and [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.10](#).

**Note** In general, Tier 1 position corresponds to lowest tier of containers sitting just above the deck and Tier 2 position corresponds to the lowest tier of containers sitting just above the hatch covers, See [Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.7](#).

8. 2. 12 The green sea pressure is given by:

for  $L > 100$

$$P_{gs} = C_{G1}L^2 + C_{G2}L + C_{G3} \text{ kN/m}^2 \text{ but not less than } 0$$

for  $L \leq 100$ ,  $P_{gs}$  is to be taken as:

$$= 1.5 \text{ for Tier 1}$$

$$= 1.0 \text{ for Tier 2}$$

$$= 0.5 \text{ for Tier 3}$$

where

$C_{G1}$ ,  $C_{G2}$ ,  $C_{G3}$  are defined in [Table 14. 8. 2: Green sea pressure coefficients](#)

Proposals to use other values for green sea forces will be specially considered

**Table 14. 8. 2: Green sea pressure coefficients**

|        | $C_{G1}$  | $C_{G2}$ | $C_{G3}$ |

**CHAPTER 14 Cargo Securing Arrangements****SECTION 9 Strength of container securing arrangements****9.1 General**

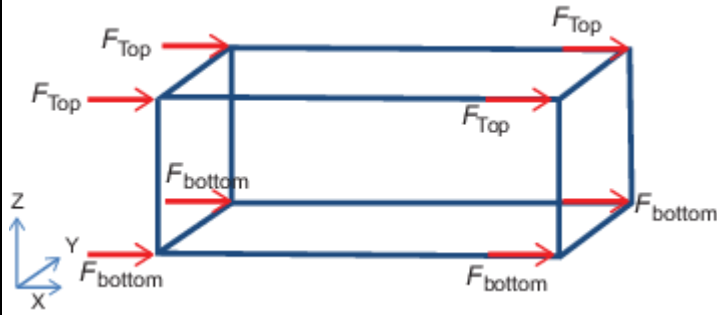

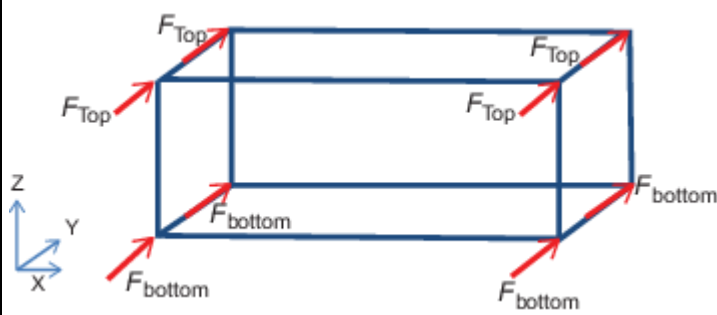

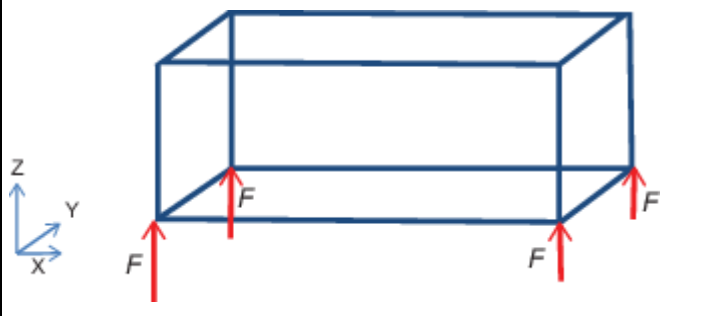

- 9.1.1 The securing system is to be designed on the basis of the most severe combination of the forces specified in [Pt 3, Ch 14, 8 Determination of forces for container securing arrangements](#) in such a manner that the resultant forces on the containers and securing devices are within allowable limits., the forces are to be calculated for the most severe condition applicable to each arrangement.
- 9.1.2 The resultant forces in the containers are not to exceed the allowable values given in [Pt 3, Ch 14, 9.4, Allowable forces on containers, fittings and lashing devices](#).
- 9.1.3 The resultant forces in the securing devices and supports are not to exceed the allowable working loads for which the device has been approved, *See* [Pt 3, Ch 14, 2 Fixed cargo securing fittings, materials and testing](#) and [Pt 3, Ch 14, 3 Loose container securing fittings, materials and testing](#).
- 9.1.4 The container orientation is to follow the cargo securing manual, however, if unknown the container door end is assumed to face aft.
- 9.1.5 The forces in lashing devices, where fitted, are not to exceed the allowable safe working loads (SWLs) of the lashings as determined from [Pt 3, Ch 14, 3 Loose container securing fittings, materials and testing](#).
- 9.1.6 For containers that are stowed in the fore and aft direction, it is sufficient to calculate the forces in the lashing rods based on assessment of the transverse and vertical loads acting on the containers. The vertical forces in the corner posts are to include the effects of transverse and longitudinal loads acting on the containers.
- 9.1.7 For containers that are stowed athwartships, the transverse, longitudinal and vertical loads acting on the containers will need to be taken into account in calculating the forces in the lashing rods. The vertical forces in the corner posts are to include the effects of transverse and longitudinal loads acting on the containers. The approach to be adopted should be agreed with ACS.

**9.2 Forces applied to each container**

- 9.2.1 Forces due to acceleration, green water and wind in accordance with [Pt 3, Ch 14, 8 Determination of forces for container securing arrangements](#), are to be applied as follows:
  - Acceleration forces are to be calculated about the centre of gravity of the container.
  - Vertical acceleration forces and self-weight are to be distributed to the four bottom corner castings.
  - Vertical, transverse and longitudinal green sea loads act uniformly over the exposed panel of the container.
  - Wind loads act uniformly over the exposed panel of the container.

9. 2. 2 [Table 14. 9. 1: Acceleration force application](#) shows a method to apply the forces to a container, assuming centre of gravity of the container is to be taken as half way along its length, midway between the port and starboard wall, and  $c_{VCGi}$  off the container floor.

**Table 14. 9. 1: Acceleration force application**

| Acceleration Force                  | Figure   |
|-------------------------------------|--|
| (a) Longitudinal acceleration force |  <p>where</p> $F_{Top} = \frac{J_{Di}}{4} \cdot \left(1 - \frac{c_{VCGi}}{c_i}\right)$ $F_{Bottom} = \frac{J_{Di}}{4} \cdot \left(1 - \frac{c_{VCGi}}{c_i}\right)$   |
| (b) Transverse acceleration force   |  <p>where</p> $F_{Top} = \frac{J_{Di}}{4} \cdot \left(1 - \frac{c_{VCGi}}{c_i}\right)$ $F_{Bottom} = \frac{J_{Di}}{4} \cdot \left(1 - \frac{c_{VCGi}}{c_i}\right)$ |
| (c) Vertical acceleration force     |  <p>Where</p> $F = \frac{p_{Di}}{4}$   |

**Note** The force application assumes the centre of gravity of the container is to be taken as half way along its length, midway between the port and starboard wall and  $cvc_{Gi}$  off the container floor.

### 9.3 Analysis of the container stack

- 9.3.1 ACS Guidance Notes for *Calculation Procedure of Container Stack Analysis* describes a methodology that complies with these requirements.
- 9.3.2 The application of ship motion and environmental loads will induce forces in the container boxes and lashing devices which result in distortion of the container stack. The key structural items resisting this distortion are as follows:
- The shear stiffness of the container end and side panels;
  - The axial stiffness of the container corner posts;
  - The stiffness of the lashing devices, including lashing bridge structure, when present;
  - Under certain conditions and lashing arrangements, the twistlock can experience lifting forces which result in increased stack distortion.

All these aspects need to be considered in the stack analysis.

- 9.3.3 The forces in the containers, twistlocks and lashing devices are calculated from the stack distortion. Using the forces applied to the stack in *9.2 Forces applied to each container* and the stiffness of the stack, the overall stack deformation is calculated using the standard force-displacement equations. Non-linearity of the system as a consequence of twistlock separation and lashing rods is to be considered in evaluating the deformation. The inclusion of twistlock separation and corner post stiffness results in an increase in the loads in the lashing devices. The inclusion of a lashing bridge structure significantly affects the support a lashing device can provide for the stack and hence must be considered.
- 9.3.4 The overall distortion behaviour of a container is a combination of its shear stiffness and corner post stiffness. A container is to be modelled as a combination of shear only panels representing the walls, and rod elements representing the corner posts and horizontal frame structures. The shear stiffness of the container walls is to be taken as specified in [Table 14.9.2: Shear spring stiffness of container walls](#). The area and Young's Modulus of the corner posts and horizontal frame members is to be taken as specified in [Table 14.9.3: Container post properties](#).

**Table 14.9.2: Shear spring stiffness of container walls**

| Container height    | Door end<br>kN/mm | Closed end<br>kN/mm | Side wall<br>kN/mm |
|---------------------|-------------------|---------------------|--------------------|
| 2.438 m (8 ft)      | 3.7               | 16.7                | 6.1                |
| 2.591 m (8 ft 6 in) | 3.5               | 15.4                | 5.7                |
| 2.743 m (9 ft)      | 3.3               | 14.3                | 5.4                |
| 2.896 m (9 ft 6 in) | 3.2               | 13.3                | 5.1                |

**Table 14.9.3: Container post properties**

| Property        | Corner post properties | Horizontal post properties |
|-----------------|------------------------|----------------------------|
| Effective Area  | 3800 mm <sup>2</sup>   | 2000 mm <sup>2</sup>       |
| Young's Modulus | 206 kN/mm <sup>2</sup> | 206 kN/mm <sup>2</sup>     |

- 9.3.5 Lashing devices are to be taken into account and their properties modelled to capture their behaviour. These include but are not limited to lashing rods and shore devices.
- 9.3.6 Lashing rods are to be modelled using tension only rod elements. Elongation may be determined by reference to an effective cross-sectional area and an effective modulus of elasticity of the lashing (allowance for straightening and stretching), which in the absence of actual test values, is to be taken as specified in [Table 14.9.4: Effective modulus of elasticity of lashing devices](#).
- 9.3.7 Lashing rod stiffness,  $k_{l,r}$ , in kN/mm may be derived as follows:

$$k_{l,r} = \frac{E_r A_r}{l_r}$$

Where

$E_r$  = effective modulus of elasticity, in kN/mm<sup>2</sup>, See [Table 14.9.4: Effective modulus of elasticity of lashing devices](#)

$A_r$  = cross sectional area of lashing device, in mm<sup>2</sup>

$l_r$  = length of lashing rod device, in mm

- 9.3.8 For external and internal para-lash arrangements, each lashing rod is to be individually modelled and connected to the relevant container casting.
- 9.3.9 Other lashing rod arrangements, e.g. an internal para-lash with load equaliser arrangements, will need to be specially considered.

**Table 14.9.4: Effective modulus of elasticity of lashing devices**

| Lashing equipment  | Effective modulus of elasticity |
|--|---------------------------------|
| Steel rod lashings of hook type, including turnbuckle                                  | 98 kN/mm <sup>2</sup>           |
| Short (one tier) steel rod lashings (knob type), including turnbuckle and lashing eyes | 140 kN/mm <sup>2</sup>          |
| Long (two tier) steel rod lashings (knob type), including turnbuckle and lashing eyes  | 175 kN/mm <sup>2</sup>          |
| Steel wire rope lashings   | 90 kN/mm <sup>2</sup>           |
| Steel chain lashings (based on the nominal diameter of the chain)                      | 80 kN/mm <sup>2</sup>           |
| Adjustable tension/compression buttress  | 120 kN/mm <sup>2</sup>          |
| Aluminium or other materials   | To be specially considered      |

- 9.3.10 Any other element introducing flexibility into the structure between the lashing point and the base of the container stack is to be evaluated and taken into account. Examples of this could be flexibility of the lashing bridge, sliding of a hatch cover or torsional deformations of the hull.
- 9.3.11 Where lashing devices are attached to a lashing bridge, the lashing bridge transverse stiffness is to be taken into account and may be modelled as an additional rod element. For lashing bridge designs with multiple lashing platforms, a lashing bridge rod element is required for each platform.

All the lashing bridge rod elements are to be connected in series. The bottom of the lashing bridge can be assumed to be rigidly fixed.

A default Rule stiffness for each platform of the lashing bridge is to be modelled with a rod with a transverse spring stiffness ( $K_{lbyi}$ ) calculated from the following:

$$K_{lbyi} = \frac{C_{lb}}{H_{lbi}} \text{ kN/mm}$$

Where

$H_{lbi}$  is the height of lashing bridge tier  $i$ , taken in m, See Figure 14.9.1 Lashing bridge transverse spring stiffness

$C_{lb}$  is the lashing bridge stiffness coefficient, taken as 50 for single elevated lashing bridge tiers at the outer stack, See Figure 14.9.1 Lashing bridge transverse spring stiffness, and 70 otherwise.

**Figure 14. 9. 1: Lashing bridge transverse spring stiffness**

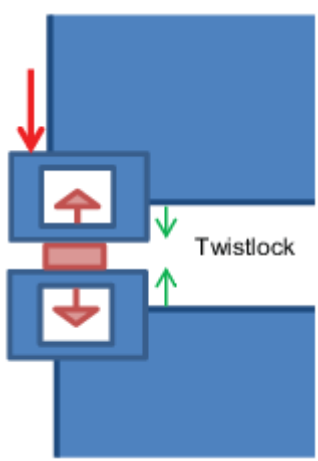

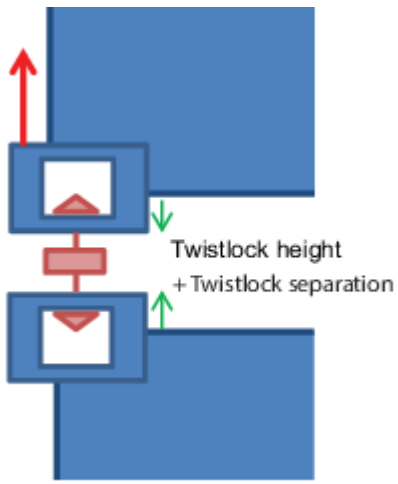

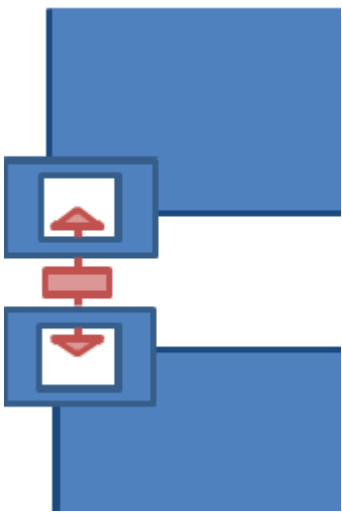

- 9.3.12 For lashing bridge designs having a higher transverse stiffness than the default stiffness value of  $70/H_{lbi}$ , in kN/mm, the stack analysis can be based on the actual stiffness value determined in accordance with the *ACSPlus ADP Guideline for the Assessment of Container Ship Lashing Bridge Structures*.
- 9.3.13 Alternative proposals for the transverse stiffness of the lashing bridge will be individually considered.
- 9.3.14 Inherent in the twistlock design is a need for play in order to be able to fit the device. This play allows easy installation of the twistlocks, but this also means that vertical lifting of the top container occurs before the twistlock comes in to tension. Twistlocks therefore have three states, See [Table 14.9.5: Twistlock separation and states](#). This vertical lifting distance is referred to as twistlock separation. If this separation occurs then it can significantly increase the transverse stack deformation and the forces in the lashing devices. The assessment of the effects of twistlock separation is particularly critical for external lashing arrangements.

**Table 14. 9. 5: Twistlock separation and states**

| State | Figure | Description |
|-------|--------|-------------|
|-------|--------|-------------|

|                  |   |   |
|------------------|---|---|
| Twistlock closed |    | Twistlock closed and in compression.<br>The distance between the container castings is equal to the twistlock height.                     |
| Twistlock open   |   | Twistlock open and in tension.<br>The distance between the container castings is equal to the twistlock height plus twistlock separation. |
| Twistlock float  |  | Float condition with zero axial force.<br>The distance between the container castings is in between closed and open state.                |

9. 3. 15 Twistlock separation and height is to be provided by the lashing manufacturer. If this information is not available, the twistlock flange height is to be taken as 28 mm and the twistlock separation as 18 mm for FATs, SATs and manual twistlocks.
9. 3. 16 In the analysis of container stacks, it may be assumed that shear deformation of twistlocks can be ignored.

- 9.3.17 Initial displacement of containers due to tolerances in container fittings will be considered in conjunction with the stowage arrangement proposed. Generally, initial displacement may be neglected in calculation procedures for conventional stowages.

## 9.4 Allowable forces on containers, fittings and lashing devices

- 9.4.1 The racking force of the container panels is calculated from the transverse shear deformation and the shear stiffness. The absolute racking force on the container end and side panels must not exceed the allowable racking force specified in [Table 14.9.6: Allowable forces in containers in stacks with the same base size](#)
- 9.4.2 The vertical force in the corner post is to be calculated from the compression of the post plus the vertical force due to shear in the end wall acting on the post. The maximum compressive force in each corner post of the container must not exceed the vertical forces at each top corner casting and in each corner post specified in [Table 14.9.6: Allowable forces in containers in stacks with the same base size](#).
- 9.4.3 The maximum vertical compressive force in the twistlock is not to be greater than the allowable vertical forces at each bottom corner casting, compression and the maximum vertical tensile force in the twistlock is not to be greater than the allowable vertical corner pull-out force at each bottom corner casting.
- 9.4.4 The twistlock tensile load is to be less than the safe working load.
- 9.4.5 The forces and force components in the lashing devices must not be greater than the allowable lashing forces on the corner castings and the safe working load of the lashing device.
- 9.4.6 [Table 14.9.6: Allowable forces in containers in stacks with the same base size](#) and [Pt 3, Ch 14, 9.4 Allowable forces on containers, fittings and lashing devices 9.4.12](#) show the values for allowable forces for ISO containers according to ISO 1496-1:1990 including Amendment Nos. 1, 2, 3 and 4. Other configurations will be specially considered.
- 9.4.7 The allowable forces for containers of other dimensions, e.g. 24 ft, 48 ft and 53 ft, will be determined on the basis of the values in [Table 14.9.6: Allowable forces in containers in stacks with the same base size](#) and of the forces for which the container has been certified.
- 9.4.8 The resultant forces in the securing devices and supports are not to exceed the allowable safe working loads for which the device has been approved, *See* [Pt 3, Ch 14, 2 Fixed cargo securing fittings, materials and testing](#) and [Pt 3, Ch 14, 3 Loose container securing fittings, materials and testing](#).
- 9.4.9 The forces in lashing devices, where fitted, are not to exceed the allowable safe working loads (SWLs) of the lashings as determined from [Pt 3, Ch 14, 3 Loose container securing fittings, materials and testing](#).
- 9.4.10 [Table 14.2.2: Test loads and test modes for fixed container securing fittings](#) and [Table 14.3.2: Test loads and test modes for loose container securing fittings](#) show the allowable safe working loads for loose fittings, including twistlocks, and securing devices. The forces in lashing devices are not to exceed the safe working loads (SWLs).
- 9.4.11 [Table 14.3.2: Test loads and test modes for loose container securing fittings](#) show the allowable shear force of the twistlocks. The calculated twistlock shear force is to be increased by 10 per cent due to misalignment, corrosion and design tolerances before comparing to the safe working load.
- 9.4.12 When Fully Automatic Twistlocks (FATs) are used, it is to be ensured that at least one of the port and starboard FATs at each end is in compression. This is to ensure that the FATs would not become disengaged.

**Table 14. 9. 6: Allowable forces in containers in stacks with the same base size**

|   | 20 ft  | 40 ft                                   | 45 ft   |
|---|--|---|---|
|   | in kN  |   |   |
| Horizontal force from a container casting acting parallel to the side face  | 150  | 150                                     | 150   |

| Vertical force from lashing on lower container casting acting parallel to the end or side face, <i>See</i> Note 1   | 250  | 250                                     | 250   |
| Resultant force from lashing on upper container casting acting parallel to the end or side face   | 188  | 188                                     | 188   |
| Racking force on container end  | 150  | 150                                     | 150   |
| Racking force on container side   | 150  | 150                                     | 150   |
| Vertical forces at each top corner casting, tension   | 250  | 250                                     | 250   |
| Vertical forces at each bottom corner casting, tension  | 250  | 250                                     | 250   |
| Vertical forces at each top corner casting and in each corner post, compression   | 848<br><i>See</i> Note 4                                   | 848<br><i>See</i> Note 4                | 942   |
| Vertical forces at each bottom corner casting, compression  | $848 + \left(\frac{1.8R_g}{4}\right)$<br><i>See</i> Note 3 | $848 + (1.8R_g/4)$<br><i>See</i> Note 3 | $942 + \frac{1.8R_g}{4}$<br><i>See</i> Note 3 |
| Transverse forces acting at the level of and parallel to the top face, tension or compression, <i>See</i> Note 2  | 340  | 340                                     | 340   |
| Transverse forces acting at the level of and parallel to the bottom face, tension or compression, <i>See</i> Note 2   | 500  | 500                                     | 500   |
| <p><b>Note1.</b> In no case is the resultant of the horizontal and the vertical forces to exceed the limiting values derived from <a href="#">Figure 14. 9. 2: Allowable forces for 20 ft or 40 ft containers constructed to ISO 1496-1:1990 including Amendment Nos. 1, 2 and 3</a>. The horizontal and vertical forces are the maximum components of a diagonal force and are not to be used as the maximum load if horizontal or vertical lashings are employed.</p> <p><b>Note2.</b> Where a buttress supports the stack at an intermediate level, the total transverse force in the containers at the level is not to exceed the sum of the appropriate top and bottom forces.</p> |  |   |   |

**Note 3.** The vertical compression force on the lower corner casting on the closed end of the lowest container may exceed  $848 + (1.8R_g/4)$  kN or  $942 + (1.8R_g/4)$  as applicable, provided the following conditions are complied with:

The vertical compression force acting on the lowest container from the container above does not exceed 848 kN.

The horizontal racking force acting on the lowest container from the container above does not exceed 150 kN.

The local ship side or hatch cover container foundation is designed and approved for the increased design compression force.

The loose bottom container securing fittings should have a contact area fulfilling the requirements of [Pt 3, Ch 14, 3.2 Materials and design 3.2.5](#).

**Note 4.** Containers that are certified to comply with ISO 1496-1:1990 including Amendment 4 may have the top corner casting and post compression increased to 942 kN.

CHAPTER **14 Cargo Securing Arrangements**

SECTION **10 Surveys**

## **10. 1 Initial Survey**

10. 1. 1 The following requirements are mandatory for fixed fittings, including cell guides, if fitted, on all ships. For ships having a CCSA class notation the requirements are also applicable for loose fittings.
10. 1. 2 The Surveyor is to be satisfied that the materials, workmanship and arrangements are satisfactory and in accordance with the requirements and the approved plans. Any items found not to be in accordance with the requirements or the approved plans, or any material, workmanship or arrangements found to be unsatisfactory are to be rectified.
10. 1. 3 A Register or plan is to be kept on board and up to date, and is to be made available to the Surveyor upon request. The Register or plan is to contain sufficient details to enable all fittings to be identified, including:
  - a simple sketch;
  - the name of the item;
  - the number supplied;
  - the manufacturer's mark or code; and
  - the safe working load with the corresponding breaking load.
10. 1. 4 For container securing arrangements, a suitable Container Stowage Arrangement Plan is to accompany the Register. Where containers of types other than ISO containers are proposed to be carried, their stowage locations are to be clearly indicated on the plan.
10. 1. 5 The Register and stowage plans, if applicable, may be included in the Cargo Securing Manual.

## **10. 2 Periodical Surveys**

10. 2. 1 For the requirements for Periodical Surveys, See [Pt 1, Ch 3, 2.2 Annual Surveys](#) and [Pt 1, Ch 3, 5.3 Examination and testing](#).

## CHAPTER 15 **Quality Assurance Scheme for the Hull Construction of Ships**

| 9. 1             | General .....   | 1426        |

**CHAPTER 15 Quality Assurance Scheme for the Hull Construction of Ships****SECTION 1 General****1. 1 Definitions**

1. 1. 1 **Quality Assurance Scheme.** Asia Classification Society (hereinafter referred to as ‘ACS’) Quality Assurance requirements for the hull construction of ships are defined as follows:

- **Quality Assurance.** All activities and functions concerned with the attainment of quality including documentary evidence to confirm that such attainment is met.
- **Quality system.** The organisation structure, responsibilities, activities, resources and events laid down by Management that together provide organised procedures (from which data and other records are generated) and methods of implementation to ensure the capability of the shipyard to meet quality requirements.
- **Quality programme.** A documented set of activities, resources and events serving to implement the quality system of an organisation.
- **Quality plan.** A document derived from the quality programme setting out the specific quality practices, special processes, resources and activities relevant to a particular ship or series of sister ships. This document will also indicate the stages at which, as a minimum, direct survey and/or system monitoring will be carried out by the Classification Surveyor.
- **Quality control.** The operational techniques and activities used to measure and regulate the quality of hull construction to the required level.
- **Inspection.** The process of measuring, examining, testing, gauging or otherwise comparing the item with the approved drawings and the shipyard's written standards including those which have been agreed by ACS for the purposes of classification of the specific ship type concerned.
- **Assessment.** The initial comprehensive review of the shipyard's quality systems, prior to the granting of approval, to establish that all the requirements of these Rules have been met.
- **Audit.** A documented activity aimed at verifying by examination and evaluation that the applicable elements of the quality programme continue to be effectively implemented.
- **Hold point.** A defined stage of manufacture beyond which the work must not proceed until the inspection has been carried out by all the relevant personnel.
- **System monitoring.** The act of checking, on a regular basis, the applicable processes, activities and associated documentation that the Shipbuilder's quality system continues to operate as defined in the quality programme.

- **Special process.** A process where some aspects of the required quality cannot be assured by subsequent inspection of the processed material alone. Manufacturing special processes include welding, forming and the application of protective treatments. Inspection and testing processes classified as special processes include non-destructive examination and pressure and leak testing.

## **1. 2 Scope of the Quality Assurance Scheme**

1. 2. 1 This Chapter specifies the minimum Quality System requirements for a shipyard to construct ships under ACS Quality Assurance Scheme.
1. 2. 2 For the purposes of this Chapter of the Rules, hull construction comprises the hull structure; containment systems, including those which are independent of the main hull structure; appendages; superstructures; deckhouses; and closing appliances all as required by the Rules.
1. 2. 3 Although the requirements of this Scheme are, in general, for steel ships of all welded construction, other materials for use in hull construction will be considered.

**CHAPTER 15 Quality Assurance Scheme for the Hull Construction of Ships****SECTION 2 Application****2. 1 Certification of the shipyard**

2. 1. 1 ACS will give consideration to a shipyard's Quality Assurance System provided, at all times, there is full commitment by all the shipyard personnel to the implementation and maintenance of this system. On satisfactory completion of assessments and audits ACS will issue certificates of approval to the shipyard as indicated in [Pt 3, Ch 15, 2.1 Certification of the shipyard 2.1.2](#).
2. 1. 2 ACS Quality Assurance Scheme comprises:
- Part 1 The requirements of the Quality System for hull construction which are applicable to shipyards operating a quality programme but not necessarily constructing to ACS Class. Certificates of approval valid for three years will be issued, with intermediate audits at intervals of 6 months.
- Part 2 The Quality System requirements for hull construction for application to ships under construction to ACS Class as part of the Special Survey. ACS particular requirements for construction of ships to its Class, and the continuous involvement in the hull construction process by a combination of direct survey and systems monitoring by ACS Surveyors, are provided for by Part 2. Where ACS considers that there is a stage in construction at which a high degree of direct inspection by the Surveyors is desirable, this stage will be described on the Part 2 Approval Certificate.
- Certificates of approval for Part 2 will be valid for one year, and will be issued after satisfactory assessment/audit carried out at a suitable stage during construction to ACS Class. Part 1 certification will automatically be issued, or re-issued as applicable, on attainment of Part 2 approval.
2. 1. 3 Chemical carriers with cargo tank structure of material other than carbon manganese steel and the cargo containment system on ships for liquefied gases will be specially considered. The procedure relating to the construction of such structure on chemical carriers and liquefied gas containment systems is to be separately prescribed in the Quality Plan which will be subject to approval by ACS.
2. 1. 4 The Quality System at a shipyard will be examined for compliance with these Rules by the assessments and audits as laid down in [Pt 3, Ch 15, 4 Requirements of Parts 1 and 2 of the Scheme](#), [Pt 3, Ch 15, 5 Additional requirements for Part 2 of the Scheme](#) and [Pt 3, Ch 15, 6 Initial assessment of the shipyard](#). Initial and periodical approval of the system will be considered by the Committee on receipt of satisfactory assessment and audit reports.
2. 1. 5 All information and data submitted by a Shipbuilder for approval under this Scheme and for maintenance of approval will be treated by ACS in strict confidence and will not be disclosed to any third party without the prior written consent of the Shipbuilder.

2. 1. 6 A list of shipyards approved under the Scheme will be held in the *List of Shipyards Approved to the Requirements of the Quality Assurance Scheme*.

PART

# 3

CHAPTER **15** **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION **3** **Particulars to be submitted**

## **3. 1 Documentation and procedures**

- 3. 1. 1 Under either Part of the Scheme, the documentation to meet the requirements of [Pt 3, Ch 15, 4 Requirements of Parts 1 and 2 of the Scheme](#) is to be submitted. This documentation includes the Quality Manual, Quality Plans, documented procedures and work instructions.
- 3. 1. 2 Additionally, under Part 2 of the Scheme the documentation to meet the requirements of [Pt 3, Ch 15, 5 Additional requirements for Part 2 of the Scheme](#) is to be submitted for approval. Construction plans and all necessary particulars are also to be submitted for approval in accordance with the relevant requirements of the Rules. *See* [Pt 1, Ch 2, 3.2 New construction surveys 3.2.1](#).

## **3. 2 Amendments**

- 3. 2. 1 Any major changes to the documentation or procedures required by [Pt 3, Ch 15, 4 Requirements of Parts 1 and 2 of the Scheme](#) or [Pt 3, Ch 15, 5 Additional requirements for Part 2 of the Scheme](#) are to be re-submitted.

CHAPTER **15** **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION **4** **Requirements of Parts 1 and 2 of the Scheme**

**4. 1 General**

- 4. 1. 1 The requirements of this Section are applicable to shipyards *Seeking* approval under Parts 1 and 2 of the Scheme.

**4. 2 Policy statement**

- 4. 2. 1 A policy statement, signed by the chief executive of the shipyard concerned, confirming the full commitment of all levels of personnel in the shipyard to the implementation and sustained operation of quality assurance methods is to be included in the Quality Manual.

**4. 3 Responsibility**

- 4. 3. 1 Personnel responsible for functions affecting quality are to have defined responsibility and authority to identify, control and evaluate quality.

**4. 4 Management Representative**

- 4. 4. 1 The Shipbuilder is to appoint a Management Representative, who is to be independent of other functions unless specifically agreed otherwise by ACS, and who is to have the necessary authority and responsibility for ensuring that the requirements of the Scheme are complied with.
- 4. 4. 2 The Management Representative is to have the authority to stop production if serious quality problems arise.

**4. 5 Quality control and testing personnel**

- 4. 5. 1 The Shipbuilder is to utilise quality control and testing personnel whose performance and continued freedom of influence from production pressures is to be systematically confirmed by the Management Representative.

**4. 6 Resources**

- 4. 6. 1 Sufficient resources shall be provided by the shipyard to enable the requirements identified by the Quality Management System to be effectively implemented.

## 4. 7 The Quality Management System

- 4. 7. 1 The Shipbuilder is to establish, document and maintain an effective Quality Management System that will ensure and demonstrate that materials and consumables used, and working processes employed, conform to the requirements for hull construction.
- 4. 7. 2 **Quality Manual.** The basic documentation is to be in the form of a Quality Manual which sets out the general quality policies and which references the detailed procedures, standards, etc. and includes the requirements of [Pt 3, Ch 15, 4.2 Policy statement](#) to [Pt 3, Ch 15, 4.24, Sub-contracted personnel, services and components](#) and, where appropriate, [Pt 3, Ch 15, 5.1 Quality System procedures](#) to [Pt 3, Ch 15, 5.10 Sub-contracted personnel, services and components](#).
- 4. 7. 3 **Procedures.** The Shipbuilder is to establish, document and maintain an adequate and defined control of the hull construction process comprising:
  - a. defined and documented controls, processes, procedures, tolerances, acceptance/rejection criteria and workmanship standards; and
  - b. the provision of Quality Plans for each ship or series of sister ships for the processes and procedures for manufacture, inspection and testing involved from receipt of material through to completion of the hull construction process.
- 4. 7. 4 **Work instructions.** The Shipbuilder is to develop and maintain clear and complete documented work instructions for the processes and standards involved in the construction of the hull. Such instructions are to provide directions to various levels of personnel.

## 4. 8 Regulatory requirements

- 4. 8. 1 The Shipbuilder is to establish that the requirements of all applicable Regulations are clearly specified and agreed with the Owner/Classification Society/Regulatory Authority. These Regulations are to be made available for all functions that require them and their suitability is to be reviewed.
- 4. 8. 2 The Shipbuilder is to establish a design verification procedure to ensure that the regulatory requirements have been incorporated into the design output.

## 4. 9 Control of hull drawings

- 4. 9. 1 The Shipbuilder is to establish, document and maintain a procedure for the submission to the Classification Society and other regulatory bodies of all the necessary drawings required for approval sufficiently early and in such a manner that the requirements of the Classification Society and other regulatory bodies can be included in the design before construction commences. This procedure is to include a provision which ensures that all amendments to approved drawings are incorporated in the working drawings and that design revisions are re-submitted for approval.

## 4. 10 Documentation and change control

- 4. 10. 1 The Shipbuilder is to establish a procedure to ensure that:
  - a. valid drawings, specifications, procedures, work instructions and other documentation necessary for each phase of the fabrication process are prepared;
  - b. all necessary documents and data are made readily available at all appropriate work, testing and inspection locations;
  - c. all amended drawings and changes to documentation are processed in a timely manner to ensure inclusion in the production process;
  - d. records are maintained of amendments and changes to documentation; and
  - e. provision is made for the prompt removal or immediate identification of all superseded drawings and documentation throughout the shipyard.

## 4. 11 Purchasing data and receipt

- 4. 11. 1 The Shipbuilder is to maintain purchasing documents containing a clear description of the materials ordered for use in hull construction and the standards to which material must conform, and the identification and certification requirements.
- 4. 11. 2 For the requirements for receiving inspection of purchased items See [Pt 3, Ch 15, 4.15 Control of inspection and testing](#).

## 4. 12 Owner supplied material

- 4. 12. 1 The Shipbuilder is to have procedures for the inspection, storage and maintenance of Owner supplied materials and equipment.

## 4. 13 Identification and traceability

- 4. 13. 1 The Shipbuilder is to establish and maintain a procedure to ensure that materials and consumables used in the hull construction process are identified (by colour-coding and/or marking as appropriate) from arrival at the shipyard through to erection in such a way as to enable the type and grade to be readily recognised. The procedure is to ensure that the Shipbuilder has the ability to identify material in the completed vessel and ensure traceability to the mill sheets.

## 4. 14 Fabrication control

- 4. 14. 1 The Shipbuilder is to establish, document and maintain suitable procedures to ensure that fabrication and construction operations are carried out under controlled conditions. Controlled conditions are to include:
  - a. clearly documented work instructions defining material treatment, marking, cutting, forming, sub-assembly, assembly, erection, fitting of closing appliances, use of fabrication aids and associated fit-up, weld preparation, welding and dimensional control procedures;
  - b. criteria for workmanship and manufacturing tolerances. These are to be documented in a clear manner and made available to the appropriate workforce, and are to include acceptance/rejection criteria; and
  - c. documented instructions for the control of equipment and machines used in fabrication. These are to be made available to the appropriate workforce and supplied to individuals where necessary.
- 4. 14. 2 The Shipbuilder is to establish and control welding, non-destructive examination and painting which are part of the fabrication system, the equipment used in such processes and the environment in which they are employed. Operators of these special processes are to be properly qualified. Details of these processes are to be included in the relevant Quality Plans.
- 4. 14. 3 A list of approved welding procedures is to be maintained and made available to relevant personnel. Records of the results of testing for approval are also to be maintained. Lists of appropriately qualified welders are to be maintained. Procedures for distribution and recycling of welding consumables are to be implemented.
- 4. 14. 4 The Shipbuilder is to establish, document and maintain adequate maintenance schedules and standards for all equipment associated with the hull construction process.

## 4. 15 Control of inspection and testing

- 4. 15. 1 The Shipbuilder is to be responsible for ensuring that all incoming plates, sections, castings, components, fabrications and consumables and other materials used in the hull construction process are inspected or otherwise verified as conforming to purchase order requirements.

4. 15. 2 The Shipbuilder is to provide an inspection system at suitable stages of the fabrication process from the material delivery to the completion of hull construction. The inspection system is to confirm and record the inspections carried out.

#### **4. 16 Indication of inspection status**

4. 16. 1 The Shipbuilder is to establish and maintain a system for identifying the inspection status of structural components at appropriate stages of the fabrication process. This may include the direct marking of components. Records of inspection and measurements are to be identifiable to components to which they refer and be readily accessible to production and inspection personnel and to Classification Surveyors.

#### **4. 17 Inspection, measuring and test equipment**

4. 17. 1 The Shipbuilder is to be responsible for the control, calibration, and maintenance of the inspection, measuring and test equipment used in the fabrication and non-destructive examination of the hull structure.
4. 17. 2 The calibration system is to allow traceability back to appropriate National Standards. Where these do not exist the basis of calibration is to be defined.

#### **4. 18 Non-conforming materials and corrective action**

4. 18. 1 The Shipbuilder is to establish and define procedures to provide for:
- the clear identification and segregation from production areas of all plates, sections, castings, components, fabrications, consumables and other materials which do not conform to the agreed specification; and
  - the initiation of authorised corrective or alternative action.

#### **4. 19 Protection and preservation of quality**

4. 19. 1 The Shipbuilder is to establish and maintain a procedure to control handling and preservation processes for both the material used in fabrication and the structural components at all stages of the fabrication process. This procedure is to ensure conformance to specified requirements and established standards.
4. 19. 2 Welding consumables are to be stored, handled and recycled according to maker's recommendations.

#### **4. 20 Records**

4. 20. 1 The Shipbuilder is to develop and maintain records that demonstrate achievement of the required quality and the effective operation of the Quality System. Records demonstrating sub-contractor achievement of these requirements are to be maintained. These records are to be retained and available for a defined period. These records are to include identification of materials and consumables used in fabrication, the number and class of defects found during fabrication and information regarding corrective action taken. Records of particular processes, e.g. plate surface preparation and priming, marking, cutting, forming, accuracy control, non-destructive examination, audits and all other records pertaining to the operation of the Quality System are also to be maintained.

## **4. 21 Internal audit and management review**

- 4. 21. 1 Internal audits of the performance of all aspects of the systems relating to design, production and testing are to be carried out systematically by appointed staff and recorded under the authority of the Management Representative. These staff members will not normally audit functions for which they are directly responsible.
- 4. 21. 2 Using data obtained from the audits and any other available relevant information, management reviews are to take place at specified intervals or more frequently as deemed necessary in order to review the performance of the Quality System.
- 4. 21. 3 The Shipbuilder is to establish, document and maintain a procedure for corrective application of data feedback from previous construction, including previous ships during the guarantee period.
- 4. 21. 4 The Shipbuilder is to establish, document and maintain a procedure to provide for the analysis of departures from manufacturing standards, steel material scrapped, reworked or repaired during the fabrication and construction process in order to detect trends, investigate the cause to determine the action needed to correct the processes and work procedures, or to identify the further training of operators as appropriate.
- 4. 21. 5 Agreed improvements to the Quality System are to be implemented within a time scale appropriate to the nature of the improvement.

## **4. 22 Training**

- 4. 22. 1 The Shipbuilder is to establish and maintain a system to identify training needs and ensure that all personnel involved in the fabrication, erection and quality-involved functions have adequate experience, training and qualifications. This requirement extends to sub-contractor personnel working within the shipyard. Records are to be available to the Classification Surveyor.

## **4. 23 Sampling**

- 4. 23. 1 Any sampling processes used by the Shipbuilder are to be in accordance with specified or Statutory Requirements or to the satisfaction of the Classification Surveyor as applicable.

## **4. 24 Sub-contracted personnel, services and components**

- 4. 24. 1 The requirements of the Scheme are applicable, as appropriate, to all sub-contractor personnel and sub-contracted services operating within the shipyard.
- 4. 24. 2 The requirements of the Scheme are not applicable to sub-contractor personnel or sub-contracted services operating at locations outside the shipyard. In these circumstances it will be necessary for inspections to be carried out by the ACS Surveyor using conventional survey methods.

PART

**3**

CHAPTER **15** **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION **5** **Additional requirements for Part 2 of the Scheme**

**5. 1 Quality System procedures**

- 5. 1. 1 The procedures detailed in [Pt 3, Ch 15, 4.7, The Quality Management System](#) are to be submitted for approval.

**5. 2 Quality Plans**

- 5. 2. 1 Quality Plans for ships which are to be classed by ACS are to be submitted for approval well in advance of commencement of work, irrespective of any submissions that may have been made for sister ships under Part 1 of the Scheme. Such Quality Plans are to outline all of the manufacturing, testing and inspection operations to be performed by the Shipbuilder and by which personnel they will be carried out. The Quality Plans are then to be submitted to the ACS Surveyors who will indicate all the stages at which they will perform system monitoring, carry out direct inspection and participate in hold point inspections. These hold points will include, but not be limited to, the following:
  - a. Radiographs and other test records of non-destructive examinations as required for Classification purposes, *See* [Ch 13, 2.12 Non-destructive examination of welds](#) of the Rules for Materials.
  - b. The items described in [Pt 3, Ch 1, 8 Inspection and workmanship](#) relevant to the scope of this Chapter.
- 5. 2. 2 Notwithstanding what may have been agreed in the Quality Plans, the ACS Surveyors have the discretion to increase their involvement, *See also* [Pt 3, Ch 15, 8.1 General 8.1.5](#).

**5. 3 Material supplier approval**

- 5. 3. 1 The Shipbuilder is to ensure that hull construction materials and consumables used are selected from manufacturers who are approved by ACS.

**5. 4 Identification and traceability**

- 5. 4. 1 The procedure required by [Pt 3, Ch 15, 4.13 Identification and traceability 4.13.1](#) is to be submitted for approval.

**5. 5 Fabrication control**

- 5. 5. 1 The information required by [Pt 3, Ch 15, 4.14 Fabrication control 4.14.1.b](#) will be examined for acceptability.

- 5. 5. 2 Procedures for material treatment, forming, weld preparation and welding are to be submitted for approval.
- 5. 5. 3 Procedures required by [Pt 3, Ch 15, 4.14 Fabrication control 4.14.3](#) are to be submitted to the ACS Surveyors for approval.

## **5. 6 Control of inspection and testing**

- 5. 6. 1 The inspection stages incorporated into the Scheme are to include specific checks for fit-up and welding which are to be carried out at each sub-assembly, assembly, pre-erection and erection stage as well as self-checking by the operator. The number of recorded checks to each stage will be agreed with the ACS Surveyor, after consideration of documentary evidence of quality being achieved. Repairs, where required, are to be effected after each check. Collated Quality Control data to demonstrate the efficiency of the above self-check system are to be made available to the ACS Surveyor by the Shipbuilder. The Quality Plans referred to in [Pt 3, Ch 15, 4.7 The Quality Management System 4.7.3.b](#) provide the opportunity for the Shipbuilder and the ACS Surveyor to consider the structural design and ship type fully in order to determine the most efficient and effective inspection stages.

## **5. 7 Control of non-conforming materials and corrective action**

- 5. 7. 1 All predetermined repair procedures are to be consistent with the requirements of [Pt 3, Ch 15, 4.7., The Quality Management System 4.7.3](#) and are to be to the satisfaction of the ACS Surveyor. Where a defect is found, whether by the ACS Surveyor or through shipyard inspection, for which no agreed repair procedure exists, approval is to be obtained from the ACS Surveyor before any corrective action is effected.

## **5. 8 Records**

- 5. 8. 1 The shipyard is to make data available to the ACS Surveyor, to demonstrate the efficiency of the inspection system, *See* [Pt 3, Ch 15, 5.6 Control of inspection and testing 5.6.1](#).

## **5. 9 Training**

- 5. 9. 1 The competence of the welding operators, non-destructive examination and other personnel involved in special processes and inspection are to be to the satisfaction of the ACS Surveyor.

## **5. 10 Sub-contracted personnel, services and components**

- 5. 10. 1 The requirements of the Scheme are not applicable to those services operating at locations outside the shipyard. It will be necessary for inspections to be carried out by the ACS Surveyor using conventional survey methods.
- 5. 10. 2 The methods of control for the requirements of [Pt 3, Ch 15, 4.24 Sub-contracted personnel, services and components 4.24.1](#) are to be submitted to the ACS Surveyor.

CHAPTER **15** **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION **6** **Initial assessment of the shipyard**

**6. 1 General**

- 6. 1. 1 In the first instance applications for approval under this Scheme will be considered on the recommendation of the local Surveyors.
- 6. 1. 2 After receipt and appraisal of the main quality documentation, an assessment of the shipyard is to be carried out by the Surveyors to examine all aspects of the Quality System applicable to hull construction.
- 6. 1. 3 The Surveyors will review the quality arrangements proposed by the Shipbuilder at the shipyard. They may advise as to how the proposed Quality System might be improved and where it is considered inadequate, advise how it might be revised to be acceptable to ACS.
- 6. 1. 4 For assessment to Part 1 of the Scheme, the Surveyors will review the Quality System in association with the quality documentation and will check that all aspects of the System are established and in accordance with the requirements of [Pt 3, Ch 15, 3 Particulars to be submitted](#).
- 6. 1. 5 For assessment of Part 2 of the Scheme, the Surveyors will confirm that the requirements given in [Pt 3, Ch 15, 3 Particulars to be submitted](#) have been fully implemented and are complied with by a detailed examination of work in progress and by confirming that workmanship and the quality level being consistently achieved are to their satisfaction.

PART

# 3

CHAPTER **15** **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION **7** **Approval of the shipyard**

## **7. 1 General**

- 7. 1. 1 If the initial assessment confirms that the shipyard's quality arrangements are satisfactory, the Committee will issue Part 1 or Part 2 and Part 1 of ACS Quality Assurance Approval Certificates as appropriate. Maintenance of approval will be subject to the provisions of [Pt 3, Ch 15, 8 Maintenance of approval](#).
- 7. 1. 2 Approval by another organisation will not be accepted as sufficient evidence that the arrangements for hull construction comply with these requirements.

PART

**3**

CHAPTER **15** **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION **8** **Maintenance of approval**

**8. 1 General**

- 8. 1. 1 For Part 2 of the Scheme, the arrangements approved at the shipyard are to be kept under review by the Surveyors to ensure that the approved Quality System is being maintained in a satisfactory manner. This is to be carried out by:
  - a. Regular and systematic audits by the ACS Surveyor.
  - b. Comprehensive Annual Audits. The audit team leader will be formally nominated by ACS.
- 8. 1. 2 Where a comprehensive audit cannot be carried out due to lack of a current building programme to Class, demonstration that the requirements of Part 1 of the Scheme are being maintained may be confirmed by audit review at intervals of six months, normally by the local Surveyors. Where necessary a comprehensive triennial audit would be carried out by a Surveyor formally nominated by ACS. The degree of re-assessment for re-approval at the recommencement of building to ACS Class would be at the discretion of the Committee.
- 8. 1. 3 All documentation, including reports, is to be available to the Surveyors.
- 8. 1. 4 Minor alterations in the approved procedures may be permitted provided that the Surveyors are advised and their prior concurrence obtained. Major alterations would need to be submitted for approval and may require an additional audit.
- 8. 1. 5 In a shipyard constructing ships to ACS Class, the following are applicable:
  - a. The ACS Surveyor is to be allowed access at all reasonable times to all records pertaining to quality and to all parts of the shipyard involved in the implementation and maintenance of the Quality Assurance Programme.
  - b. The ACS Surveyor is immediately to advise the Management Representative of any matter pertaining to the Quality System with which he is not satisfied.
  - c. When minor deficiencies in the approved procedures are discovered during audits, or if workmanship is considered unsatisfactory, the ACS Surveyor will apply more intensive auditing and inspection.
  - d. Notwithstanding any of the provisions of the Quality System, all work related to Classification of ships with ACS is to be to the satisfaction of the ACS Surveyor.

PART

**3**

CHAPTER **15** **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION **9** **Suspension or withdrawal of approval**

**9. 1 General**

- 9. 1. 1 When the Surveyors have drawn attention to significant faults or deficiencies in the Quality System or its operation and these have not been rectified within a period of time acceptable to ACS, the approval of the system, together with the associated certification, will be withdrawn and the shipyard's name deleted from the *List of Shipyards Approved to the Requirements of the Quality Assurance Scheme*.
- 9. 1. 2 If a significant period of time elapses between such withdrawal and any application for reinstatement, the reapproval procedures, if agreed to by the Committee, may require a restructuring of the Quality Management System and will always require a complete re-examination as for an initial assessment.

## CHAPTER 16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships

CHAPTER **16** **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**

SECTION **1** **General**

**1. 1 Application**

1. 1. 1 Where one or more of ACSPlus Guidelines have been satisfactorily applied whether on a mandatory or voluntary basis, the associated ACSPlus notation or descriptive note as detailed in [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.17](#) or [Pt 1, Ch 2, 2.8 Descriptive notes 2.8.2](#) will be assigned.
1. 1. 2 In addition to the ACSPlus Guidelines indicated in this Chapter, details of all ACSPlus Guidelines are given in the *ACSPlus Guidelines Overview* document. Details of machinery ACSPlus Guidelines can also be found in [Pt 5, Ch 21 Requirements for Condition Monitoring and Condition-Based Maintenance Systems](#).

CHAPTER **16** **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**

SECTION **2** **Construction monitoring**

**2. 1 Construction Monitoring notation – CM**

2. 1. 1 Extended controls on structural alignment, fit up and workmanship standards are to be applied in accordance with the *ACSPlus Construction Monitoring Guideline*, to areas of the ship structure that have been requested or have been shown by other ACSPlus Guidelines to be in need of particular attention. The ACSPlus Construction Monitoring Guideline is mandatory when one or more of the Guidelines indicated in [Pt 3, Ch 16, 3 Structural design assessment](#), [Pt 3, Ch 16, 4 Fatigue design assessment](#), or [Pt 3, Ch 16, 5 Whipping design assessment](#) have been applied, whether voluntarily or on a mandatory basis. Where the relevant Guidelines have been applied, the ACSPlus notation CM is to be assigned, *See also* [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.17](#).

**CHAPTER 16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships****SECTION 3 Structural design assessment****3. 1 Structural Design Assessment notation - SDA**

3. 1. 1 Where specified in the Rules the ship structure is to be assessed using finite element modelling in accordance with the applicable ACSPlus SDA Guidelines. Where the relevant Guidelines have been applied whether on a voluntary or mandatory basis the ACSPlus notation **SDA** will be assigned, *See also* [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.17](#). In general the mandatory application criteria for implementation of one of the associated ACSPlus SDA Guidelines is as follows:
- a. bulk carriers and oil tankers without a **CSR** notation greater than 190 m in length;
  - b. ore carriers equal to and greater than 150 m in length;
  - c. container ships with a beam greater than 32 m;
  - d. the primary structure of LNG ships fitted by membrane cargo tanks;
  - e. the primary structure of LNG ships fitted with independent Type B spherical cargo tanks;
  - f. the primary structure of LPG ships fitted with Independent Type A cargo tanks;
  - g. passenger ships where it is required to utilise the load carrying capability of the superstructure for longitudinal strength; or where it is considered that the superstructure will be subjected to a significant load from flexure of the hull girder; or, where a limited number of transverse bulkheads above the bulkhead deck are present to carry the racking response;
  - h. other ships of abnormal hull form or where the type, size and structural configuration demand; and
  - i. upon application of any of the following ACSPlus notations: **FDA**, **FDA plus()**, **FDA ICE**, **FDA SPR** and **WDA1** and **WDA2**, *See also* [Pt 3, Ch 16, 4 Fatigue design assessment](#) and [Pt 3, Ch 16, 5 Whipping design assessment](#).

In addition to the above, and where applicable, the structural capability to withstand dynamic loadings from partially filled tanks or the influence of thermal loadings may also be required to be assessed.

CHAPTER **16** **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**SECTION **4** **Fatigue design assessment****4. 1 Fatigue Design Assessment notations – FDA, FDA plus, and FDA ICE and FDA SPR**

4. 1. 1 Where specified in the Rules the fatigue performance of the hull structure is to be assessed in accordance with the applicable ACSPlus FDA Guidelines. Where an appraisal has been made whether on a voluntary or mandatory basis of the fatigue performance of the hull structure in accordance with the relevant Guidelines and found to comply with the requirement of 20 years fatigue life based on the 100A1 Fatigue Wave Environment (World-wide) trading pattern the ACSPlus notation **FDA** will be assigned, *See also* [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.17](#). In general the ACSPlus FDA Guideline is mandatory for all bulk carriers and oil tankers without a CSR notation and of length greater than 190 m or where the type, size and structural configuration demand. The ACSPlus notation **FDA** is not applicable to ships approved using the IACS Common Structural Rules.
4. 1. 2 Where an appraisal is requested for a higher level of fatigue performance of the hull structure than that made for the assignment of the ACSPlus notation **FDA**, the relevant Guidelines for the application of the ACSPlus notation **FDA plus()** are to be applied. The appraisal may be made based upon a specific trading pattern, which is to be expressed in terms of either a Worldwide trading route, as defined in the relevant ACSPlus Guidelines, or a North Atlantic trading route (that utilises the wave data from IACS Recommendation 34). The ACSPlus notation **FDA plus()** is to be followed by the number of years that the vessel has been assessed for the specific trading pattern shown in brackets, for either the Worldwide or North Atlantic trading routes, denoted by **WW** and **NA** respectively, e.g. **FDA plus(25, NA)**. This Guideline is applicable to all ships including those built in accordance with the IACS Common Structural rules.
4. 1. 3 Where an appraisal is requested for the fatigue performance of the hull structure when navigating through ice, the relevant ACSPlus FDA ICE Guidelines are to be applied. Where the relevant Guidelines have been applied the ACSPlus notation **FDA ICE** will be assigned, *See also* [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.17](#).
4. 1. 4 Where specified in the Rules an appraisal is to be made of the fatigue performance of the hull structure taking into account of the effects due to the continuous vibrational response of the hull girder in waves (springing) in accordance with the relevant ACSPlus Guidelines. Where the relevant Guidelines have been applied the ACSPlus notation **FDA SPR** will be assigned, *See also* [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.17](#).

CHAPTER **16** **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**

SECTION **5** **Whipping design assessment**

**5. 1 Whipping Design Assessment notations – WDA1 and WDA2**

- 5. 1. 1 Where specified in the Rules an appraisal is to be made of the dynamic response of the hull structure due to wave impact loads (Whipping) in accordance with the relevant ACSPlus Guidelines. Where the relevant Guidelines have been applied the ACSPlus notation Whipping Design Assessment Level 1 **WDA1** will be assigned, *See also* [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.17](#).
- 5. 1. 2 Where specified in the Rules an appraisal is to be made of the dynamic response of the hull structure due to wave impact loads (Whipping) in accordance with the relevant ACSPlus Guidelines. Where the relevant Guidelines have been applied the ACSPlus notation Whipping Design Assessment Level 2 **WDA2** will be assigned, *See also* [Pt 1, Ch 2, 2.3 Class notations \(hull\)](#).

CHAPTER **16** **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**SECTION **6** **Ship Event Analysis****6. 1 Ship Event Analysis**

6. 1. 1 At the Owner's request and in order to enhance safety and awareness on board during ship operation, the *ACSPlus Ship Event Analysis Guideline* applies to all ships where it is intended to provide a hull surveillance system for:
- a. Monitoring of the ship's hull girder stresses and motions, and warning the ship's personnel that these stress levels or the frequency and magnitude of slamming motions are approaching a level where corrective action is advisable.
  - b. Monitoring of the ship's hull girder stresses and local ice loads when the ship is navigating in ice, and warning the ship's personnel that the load levels or the frequency and magnitude of ice impacts are approaching a level where corrective action is advisable.
- The descriptive note is to be appended by HSS followed by the number of strain gauges fitted shown in brackets. In addition the extension of one or more of the following associated supplementary characters may be shown, e.g. **ACSPlus(SEA(HSS-2,VDR))**:
- **L** The display of the relevant information in the cargo control area;
  - **M** The display and recording of the ship's motion;
  - **N** The facility to display and record navigational information;
  - **VDR** An interface with the ship's voyage data recorder system to enable the recording of hull stress, ship motion and hull pressure information.

PART

# 3

CHAPTER **16** **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**

SECTION **7** **Enhanced scantlings**

## **7. 1 Enhanced Scantlings - Descriptive note ES**

- 7. 1. 1 Where scantlings in excess of the approved Rule minimum are fitted at defined locations, a descriptive note ES, Enhanced Scantlings. For example, the note ES+1 will indicate that an extra 1 mm has been fitted to the hull envelope plating (i.e. deck, side and bottom).

**CHAPTER 16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships****SECTION 8 Corrosion protection of internal tanks and spaces****8. 1 Protective coating systems in dedicated sea-water ballast tanks and double-side skin spaces – ACSPlus Notations AS(B) or AS(B,D)**

8. 1. 1 For ships that are required to comply with IMO *Resolution MSC.215(82) - Performance Standard for Protective Coatings for Dedicated Seawater Ballast Tanks in all Types of Ships and Double-Side Skin Spaces of Bulk Carriers - (Adopted on 8 December 2006)*, all dedicated sea-water ballast tanks for all ship types and double-side skin spaces of bulk carriers are to have type approved coating systems applied in accordance with ACSPlus Guideline *Anti-Corrosion Systems Notation*, See [Ch 15 Corrosion Prevention of the Rules for Materials](#) and [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.17](#) for the list of ACSPlus AS notations.
8. 1. 2 AS(B) or AS(B,D) notations indicate that the ship's sea water ballast tanks and double-side skin spaces of bulk carriers are coated with approved coating systems according to IMO *Resolution MSC.215(82) - Performance Standard for Protective Coatings for Dedicated Seawater Ballast Tanks in all Types of Ships and Double-Side Skin Spaces of Bulk Carriers - (Adopted on 8 December 2006)*.

**8. 2 Protective coating systems in the cargo oil tanks of crude oil tankers – ACSPlus Notation AS(C)**

8. 2. 1 For ships that are required to comply with IMO *Resolution MSC.291(87) – Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as Amended – (Adopted on 21 May 2010)*, Owners may request to receive the optional notation AS(C), which indicates that the cargo oil tanks are protected in compliance with IMO *Resolution MSC.288(87) – Performance Standard for Protective Coatings for Cargo Oil Tanks of Crude Oil Tankers – (Adopted on 14 May 2010)*, and are to have type approved coating systems applied in accordance with ACSPlus Guideline *Anti-Corrosion System Notation* and [Ch 15 Corrosion Prevention of the Rules for Materials](#).
8. 2. 2 AS(C) notation indicates that the ship's cargo oil tanks are protected using approved materials in accordance with IMO *Resolution MSC.291(87) – Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as Amended – (Adopted on 21 May 2010)*.
8. 2. 3 When in compliance with IMO *Resolution MSC.291(87) – Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as Amended – (Adopted on 21 May 2010)*, but the AS(C) notation is not requested, this compliance may be indicated on the applicable certification, [Ch 15 Corrosion Prevention of the Rules for Materials](#).

### 8. 3 Alternative means of corrosion protection for cargo oil tanks of crude oil tankers – ACSPlus notation AS(C\*)

8. 3. 1 For ships that are required to comply with the IMO *Resolution MSC.291(87) – Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as Amended – (Adopted on 21 May 2010)* , as amended, Owners may request to receive the optional notation AS(C\*), which indicates that all cargo tanks are protected in accordance with IMO *Resolution MSC.289(87) – Performance Standard for Alternative Means of Corrosion Protection for Cargo Oil Tanks of Crude Oil Tankers – (Adopted on 14 May 2010)* , by application of corrosion resistant steel, See [Ch 3, 1.3 Corrosion resistant steels for cargo oil tanks of crude oil tankers](#) of the Rules for Materials and ACSPlus Guideline *Anti-Corrosion System Notation*.
8. 3. 2 AS(C\*) notation indicates that the ship's cargo oil tanks are protected using approved materials in accordance with IMO *Resolution MSC.291(87) – Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as Amended – (Adopted on 21 May 2010)* , as amended.
8. 3. 3 When in compliance with IMO *Resolution MSC.291(87) – Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as Amended – (Adopted on 21 May 2010)* , but the AS(C\*) notation is not requested, this compliance may be indicated on the applicable certificate.

### 8. 4 Protective coatings for void spaces on bulk carriers and oil tankers – ACSPlus Notation AS(V)

8. 4. 1 For ships within the scope of IMO *Resolution MSC.244(83) - Adoption of Performance Standard for Protective Coatings for Void Spaces on Bulk Carriers and Oil Tankers - (Adopted on 5 October 2007)*, Owners may request to receive the optional notation AS(V), which indicates that the void spaces are protected according to the ACSPlus Guideline *Anti- Corrosion System Notation*.
8. 4. 2 AS(V) notation indicates that the ship's void spaces are protected in accordance with IMO *Resolution MSC.244(83) - Adoption of Performance Standard for Protective Coatings for Void Spaces on Bulk Carriers and Oil Tankers - (Adopted on 5 October 2007)*.
8. 4. 3 When in compliance with IMO *Resolution MSC.244(83) - Adoption of Performance Standard for Protective Coatings for Void Spaces on Bulk Carriers and Oil Tankers - (Adopted on 5 October 2007)*, but the AS(V) notation is not requested, this compliance may be indicated on the applicable certificate.

### 8. 5 Protective coating systems in dedicated seawater ballast tanks – Descriptive note PCWBT ()

8. 5. 1 For ships that are not required to comply with IMO *Resolution MSC.215(82) - Performance Standard for Protective Coatings for Dedicated Seawater Ballast Tanks in all Types of Ships and Double-Side Skin Spaces of Bulk Carriers - (Adopted on 8 December 2006)* , all sea-water ballast spaces having boundaries formed by the hull envelope are to have a corrosion protection coating applied, See ACSPlus Guideline *Protective Coatings in Water Ballast Tanks (PCWBT)*. The month and year that the coating is approved is to be appended to the descriptive note within brackets.
8. 5. 2 Where requested, a descriptive note PCWBT () (Protective Coating in Water Ballast Tanks) indicates that all sea-water ballast spaces having boundaries formed by the hull envelope have a corrosion protection coating applied, and that the coating remains efficient and is maintained in good condition. The month and year that the coating is approved is to be appended to the descriptive note within brackets.

CHAPTER **16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**

SECTION **9 Ship Emergency Response Service**

## **9. 1 Ship Emergency Response Service - Descriptive note SERS**

- 9. 1. 1 This service, offered by ACS, provides a rapid computer assisted analysis of a damaged ship's stability and damaged longitudinal strength in the event of a casualty to the ship.
- 9. 1. 2 Where an Owner adopts this service, the descriptive note **SERS**, 'Ship is registered with ACS Ship Emergency Response Service', will be assigned.

SECTION **10 Assessment of Ballast Water Management Plans**

## **10. 1 Ballast Water Management Plan – Descriptive note BWMP**

10. 1. 1 Compliance with this Guideline is optional. A ship meeting the requirements of this Guideline will be eligible for an appropriate **BWMP ()** descriptive note. The extension of one or more of the following associated supplementary characters may be shown in brackets, detailing the method(s) used:
- S Sequential method
  - F Flow through method
  - D Dilution method
  - T Treatment method.

CHAPTER **1 General Cargo Ships**SECTION **1 General****1.1 Application**

- 1.1.1 This Chapter applies to sea-going ships designed primarily for the carriage of general cargo. The requirements are intended to cover the midship region, but may also apply with suitable modification to the taper regions forward and aft in way of cargo spaces.

**1.2 Structural configuration**

- 1.2.1 The Rules provide for a basic structural configuration of a multi-deck or a single deck hull which includes a double bottom, or a single bottom arrangement. The structural configuration may also include a single or multiple arrangement of cargo hatch openings, and side tanks.
- 1.2.2 Individual consideration may be required where the ship incorporates double hull construction, large deck openings or other special design features.
- 1.2.3 Longitudinal framing is, in general, to be adopted at the strength deck outside line of openings and at the bottom, but special consideration will be given to proposals for transverse framing in these regions.

**1.3 Class notations**

- 1.3.1 In general, ships complying with the requirements of this Chapter will be eligible to be classed **100A1**.
- 1.3.2 Where a ship has been specially strengthened for heavy cargoes in accordance with the requirements listed in [Pt 4, Ch 7, 8.2 Carriage of heavy cargoes](#), it will be eligible to be classed **100A1 strengthened for heavy cargoes**.
- 1.3.3 The following additional notations and annotations can be appended to the main class notation giving further detailed description of the loading criteria incorporated into the design:
  - a. **RD** (Relative density):  
Where a ship has tanks appraised for a maximum permissible relative density greater than 1.025, the notation **RD(specified tank names, density)** may be added.
  - b. **WDL(+)** (Weather deck load):  
The notation **WDL(+)** may be added. If requested, the maximum permissible weather deck load and extent can be identified in the notation, e.g. **WDL(5.0 t/m<sup>2</sup> from Aft to Fr. 26)**.
- 1.3.4 Ships intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.6](#) to 2.3.10, will receive individual consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval.

1. 3. 5 The Regulations for classification and the assignment of class notations are given in [Pt 1, Ch 2 Classification Regulations](#), to which reference should be made.

## 1. 4 Information required

1. 4. 1 For the information required, See [Pt 3, Ch 1, 5 Information required](#). In addition the following are to be supplied:
- Cargo loadings on decks, hatchways and inner bottom if these are to be in excess of Rule. Where concentrated or point loads occur, their magnitude and points of application are to be defined.
  - The maximum pressure head in service on tanks, also details of any double bottom tanks interconnected with side tanks.
  - Details of the proposed depths of any partial fillings where water ballast or liquid cargo is intended to be carried in the holds, or large deep tanks.

## 1. 5 Symbols and definitions

1. 5. 1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

|                         |  |
|-------------------------|--|
| $L, B, D, T$<br>and $V$ | = as defined in <a href="#">Pt 3, Ch 1, 6 Definitions</a>  |
| $k_L, k$                | = higher tensile steel factor, See <a href="#">Pt 3, Ch 2, 1 Materials of construction</a>                               |
| $e$                     | = base of natural logarithms 2.7183  |
| $l$                     | = overall length of stiffening member, or pillar, in metres, See <a href="#">Pt 3, Ch 3, 3 Structural idealisation</a>   |
| $l_e$                   | = effective length of stiffening member, or pillar, in metres, See <a href="#">Pt 3, Ch 3, 3 Structural idealisation</a> |
| $t$                     | = thickness of plating, in mm  |
| $s$                     | = spacing of secondary stiffeners, in mm   |
| $A$                     | = cross-sectional area of stiffening member, in cm <sup>2</sup>  |
| $C$                     | = stowage rate, in m <sup>3</sup> /tonne, See <a href="#">Pt 3, Ch 3, 5 Design loading</a>                               |
| $C_w$                   | = a wave head in metres<br>= $7.71 \times 10^{-2} L e^{-0.0044} L$ where $L$ is not to be taken greater than 227         |
| $I$                     | = inertia of stiffening member, in cm <sup>4</sup> , See <a href="#">Pt 3, Ch 3, 3 Structural idealisation</a>           |
| $S$                     | = spacing or mean spacing of primary members, in metres  |
| $Z$                     | = section modulus of stiffening member, in cm <sup>3</sup> , See <a href="#">Pt 3, Ch 3, 3 Structural idealisation</a>   |
| $\rho$                  | = relative density (specific gravity) of liquid carried in a tank but is not to be taken less than 1.025.                |

## CHAPTER 1 General Cargo Ships

## SECTION 2 Materials and protection

**2. 1 Materials and grades of steel**

2. 1. 1 Materials and grades of steel are to comply with the requirements of [Pt 3, Ch 2 Materials](#).

**2. 2 Protection of steelwork**

2. 2. 1 For the protection of steelwork, in addition to the requirements specified in [Pt 3, Ch 2, 3 Corrosion protection](#) the requirements of [Pt 4, Ch 1, 2.2 Protection of steelwork 2.2.2](#) are to be complied with.
2. 2. 2 Ceiling is to be laid on the inner bottom under cargo hatchways, but may be omitted provided that the inner bottom plating is increased by 2 mm. In any ship which is regularly to be discharged by grabs, ceiling is to be laid on the inner bottom, and the inner bottom plating increased by 3 mm. Alternatively, the ceiling may be omitted provided that the inner bottom plating is increased in thickness by a minimum of 5 mm. The ceiling is to be 76 mm thick in softwood or 65 mm thick in hardwood, and is to be laid at right angles to the inner bottom stiffening. Where it is intended to use plywood or other forms of ceiling of an approved type instead of planking, the thickness will be considered for each case. Ceiling is also to be laid over bilges, and fitted with portable sections which are to be readily removable. The spaces between the frames at the top of the bilge ceiling are to be closed by steel plates, wood chocks, cement or other suitable means. Inner bottom manhole covers or fittings, where projecting above the inner bottom plating, are to be provided with a steel protection coaming around each manhole, and a wood or steel cover is to be fitted.
2. 2. 3 Where plated decks are sheathed with wood or approved compositions, the minimum thicknesses given in [Pt 4, Ch 1, 4.2 Deck plating](#), [Pt 3, Ch 5, 2 Deck structure](#) and [Pt 3, Ch 6, 2 Deck structure](#) may be reduced by 10 per cent for a 50 mm sheathing thickness or five per cent for 25 mm, with intermediate values in proportion. The steel deck is to be coated with a suitable material in order to prevent corrosive action, and the sheathing or composition is to be effectively secured to the deck. *See also* the fire protection requirements relating to deck coverings in the relevant *SOLAS - International Convention for the Safety of Life at Sea Regulations* or [Pt 6, Ch 3, 4 Refrigeration plant, pipes, valves and fittings](#) as applicable.
2. 2. 4 Where cargo battens or equivalent are fitted in the holds of dry cargo ships, the descriptive note 'SF' (*Sparring Fitted*) will be entered in the *Register Book*. The battens, when fitted, are to extend from above the upper part of the bilge to the underside of beam knees in the holds, and in all cargo spaces in the 'tween decks and superstructures, up to the underside of beam knees. Wood cargo battens are to be not less than 50 mm in thickness, and the clear space between adjacent rows is, in general, not to exceed 230 mm. The dimensions and spacing of battens made of other materials will be considered. Nets may be adopted in lieu of battens, and other alternative proposals will be specially considered. For arrangements in way of a refrigerated hold, *See* [Pt 6, Ch 3, 4 Refrigeration plant, pipes, valves and fittings](#).

## CHAPTER 1 General Cargo Ships

## SECTION 3 Longitudinal strength

## 3.1 General

- 3.1.1 Longitudinal strength calculations are to be made in accordance with the requirements given in [Pt 3, Ch 4 Longitudinal Strength](#).
- 3.1.2 The requirements of [Pt 3, Ch 4, 8.3 Loading instrument](#) regarding loading instruments are not applicable to general cargo ships under 120 m.

## 3.2 Fast cargo ships

- 3.2.1 The hull section modulus for ships of length,  $L$ , between 120 m, and 170 m, and maximum service speed greater than 17.5 knots in association with a bow shape factor,  $\psi$ , of more than 0.15, is to comply with the requirements of this sub-Section.
- 3.2.2 The bow shape factor is defined as:

$$\psi = \frac{100 \sum A_b}{L^{1.5} B}$$

Where

- $a_0$  = projection of upper deck at waterline (F.P.), in metres
- $a_1$  = projection of upper deck at waterline (0.1L from F.P.), in metres
- $a_2$  = projection of upper deck at waterline (0.2L from F.P.), in metres
- $b$  = projection of upper deck at waterline (F.P. to bow line), in metres

$$\sum A_b = \frac{ba_0}{2} + 0.1L(a_1 + a_2)$$

See also [Figure 1.3.1: Derivation of bow shape factor](#).

- 3.2.3 For longitudinal strength requirements, the Rule minimum hull midship section modulus and the distribution of longitudinal material in the forward half-length will be considered. In general, the following requirements are to be complied with:
  - a. The vertical hull midship section modulus, about the horizontal neutral axis, at deck is to be not less than  $331Lk\sum A_b \text{ cm}^3$ , or that required by [Pt 3, Ch 4, 5 Hull bending strength](#), whichever is the greater.  $\sum A_b$  is defined in [Pt 4, Ch 1, 3.2 Fast cargo ships 3.2.2](#).
  - b. The horizontal hull midship section modulus, about a vertical axis through the ship centreline, is to be not less than  $32.5L^2D \text{ cm}^3$ .
  - c. In the forward half-length, the hull section modulus is not to be a lesser percentage of the midship value than that shown in [Table 1.3.1: Fast cargo ships](#).

- d. Any load or ballast condition resulting in a sagging still water bending moment, or a hogging moment less than 80 per cent of the Rule value of still water bending moment, will be specially considered with a view to minimising the compressive stresses in the deck in waves.

**Figure 1. 3. 1: Derivation of bow shape factor**

**Table 1. 3. 1: Fast cargo ships**

| Position                    | Percentage of midship vertical modulus(modulus about horizontal axis) | Percentage of midship horizontal modulus(modulus about vertical axis) |
|-----------------------------|---|---|
| Station 10 (mid- $L_{pp}$ ) | 100   | 100   |
| 12                          | 98  | 87  |
| 14                          | 95  | 62  |
| 16                          | 81  | 38  |
| 18                          | 44  | 17  |
| 20 (F.P.)                   | 0   | 0   |

**Note 1.** Intermediate values to be obtained by interpolation.

**Note 2.**  $L_{pp}$  as defined in [Pt 3, Ch 1, 6 Definitions](#).

3. 2. 4 For local strength, in general the following requirements are to be complied with:
- Longitudinal deck stiffening is to be carried forward to the fore peak bulkhead or as far forward as practical. Where a long forecastle is fitted, the buckling strength of the proposed structure will be specially considered.
  - Substantial web frames in way of deck transverses are to be fitted in the forward half-length. Scantlings of webs and frames are to be based on actual lengths, not 'tween deck heights, and collars are to be fitted at ends of members in way of high shear.
  - Scantlings of bottom structure in forward part are to be specially considered.
  - Deck and side shell panels forward of  $0.5L$  from F.P. are to be examined to establish the critical buckling stress from the following formula:

$$\sigma_{\varepsilon} = \frac{\pi^2 E}{12(1 - \nu^2)} \left(\frac{t}{s}\right)^2 K_c \text{ N/mm}^2$$

Where

- $s$  = length of shorter edge, in mm
- $t$  = thickness of plating, in mm
- $E$  = Young's modulus, in N/mm<sup>2</sup>
- $K_c$  = a factor depending on aspect ratio and boundary restraint
- = 4 for longitudinally stiffened plating or as shown in [Figure 1. 3. 2: Plate factor,  \$K\_C\$](#)  for transversely stiffened plating
- $\nu$  = Poisson's ratio (0.3 for steel and aluminium alloy).

Where the buckling stresses, as evaluated, exceed 50 per cent of yield stress, the actual critical buckling stress is given by:

$$\sigma_{ac} = \sigma_0 \left(1 - \frac{\sigma_0}{4\sigma_c}\right) \text{ N/mm}^2$$

Where

- $\sigma_{ac}$  = corrected critical buckling stress, in N/mm<sup>2</sup>
- $\sigma_0$  = yield stress, in N/mm<sup>2</sup>

The critical buckling stress from the above formulae must be not less than 176.6 N/mm<sup>2</sup> within  $0.4L$  amidships, nor less than 147.2 N/mm<sup>2</sup> for the deck forward of this, nor less than 117.7 N/mm<sup>2</sup> for the side shell between the first and second deck forward of  $0.5L$  from F.P. For higher tensile steel plating, the above permissible stresses are to be divided by  $k$ .

- In order to obtain the necessary critical buckling strength, either of the following is to be applied:
  - plate thickness to be increased, or
  - panel aspect ratio to be altered by the fitting of additional panel stiffening.

Figure 1. 3. 2: Plate factor,  $K_c$

**CHAPTER 1 General Cargo Ships****SECTION 4 Deck structure****4. 1 General**

4. 1. 1 Longitudinal framing is, in general, to be adopted at the strength deck outside line of openings, but special consideration will be given to proposals for transverse framing. Requirements are given in this Section for longitudinal and transverse framing systems of all deck structure, except decks in way of erections. For erection decks, *See* [Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks](#).

**4. 2 Deck plating**

4. 2. 1 The thickness of strength/weather deck plating in the midship region is to comply with the requirements of [Table 1. 4. 1: Strength/weather deck plating](#). Outside the line of openings the thickness is also to be that necessary to give the hull section modulus required by [Pt 3, Ch 4, 5 Hull bending strength](#).
4. 2. 2 The thickness of lower deck plating in the midship region is to comply with the requirements of [Table 1. 4. 2: Lower deck plating](#).
4. 2. 3 The thickness of the strength deck stringer plate is to be increased by 20 per cent at the ends of bridges, poop and forecastle.
4. 2. 4 The deck plating thickness and supporting structure are to be suitably reinforced in way of cranes, masts, derrick posts and deck machinery.
4. 2. 5 Where long, wide hatchways are arranged on lower decks, it may be necessary to increase the deck plating thickness to ensure effective support for side framing.

**4. 3 Deck stiffening**

4. 3. 1 The scantlings of strength/weather deck longitudinals in the midship region are to comply with the requirements of [Table 1. 4. 3: Strength/weather deck longitudinals](#).
4. 3. 2 The lateral and torsional stability of longitudinals together with web and flange buckling criteria are to be verified in accordance with [Pt 3, Ch 4, 7 Hull buckling strength](#).
4. 3. 3 The scantlings of cargo and accommodation deck longitudinals are to comply with the requirements of [Table 1. 4. 4: Cargo and accommodation deck longitudinals](#).
4. 3. 4 End connection of longitudinals to bulkheads are to provide adequate fixity and, so far as is practicable, direct continuity of longitudinal strength. Where  $L$  exceeds 215 m, the deck longitudinals are to be continuous through transverse structure, including bulkheads, but alternative arrangements will be considered. Higher tensile steel deck longitudinals are to be continuous irrespective of the ship length.

- 4.3.5 The scantlings of strength/weather, cargo and accommodation deck transverse beams are to comply with the requirements of [Table 1.4.5: Strength/weather, cargo and accommodation deck beams](#).
- 4.3.6 The end connections of beams are to be in accordance with the requirements of [Pt 3, Ch 10, 3 Secondary member end connections](#).

**Table 1.4.1: Strength/weather deck plating**

| Location   | Minimum thickness, in mm  |  |
|--|---|--|
|  | Longitudinal framing  | Transverse framing   |
| (1) Outside line of openings (See Notes 1 and 2)   | The greater of the following:<br><br>(a) $t = 0.001_{s1}(0.059L_1 + 7)\sqrt{\frac{F_D}{k_L}}$<br><br>(b) $t = 0.00083_{s1}\sqrt{LK} + 2.5$  | The greater of the following:<br><br>(a) $t = 0.001_{s1}f_1(0.083L_1 + 10)\sqrt{\frac{F_D}{k_L}}$<br><br>(b) $t = 0.001_{s1}\sqrt{LK} + 2.5$ |
| (2) Inside line of openings (See Note 2)   | (b) $t = 0.00083_{s1}\sqrt{LK} + 2.5$<br>but not less than 6.5  | $t = 0.00083_{s1}\sqrt{LK} + 1.5$<br>but not less than 6.5   |
| (3) In way of the crown of a tank  | $t = 0.004sf\sqrt{\frac{pkh_4}{1.025}} + 3.5$<br><br>or as (1) or (2), whichever is the greater,<br>but not less than 7.5 mm where $L \geq 90\text{m}$ ,<br>or 6.5 mm where $L < 90\text{ m}$ |  |
| Symbols  |   |  |
| $L, k_L, k, \rho, s, S$ as defined in <a href="#">Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1</a><br>$f = 1.1 - \frac{s}{2500}$ but not to be taken greater than 1.0<br>$f_1 = \frac{1}{1 + \left(\frac{s}{1000S}\right)^2}$<br>$h_4 =$ tank head, in metres, as defined in <a href="#">Pt 3, Ch 3, 5 Design loading</a><br>$s_1 = s$ but is not to be taken less than the smaller of $470 + \frac{L}{0.6}$ mm or 700 mm<br>$F_D =$ as defined in <a href="#">Pt 3, Ch 4, 5.7 Local reduction factors</a><br>$L_1 = L$ but need not be taken greater than 190 m. |   |  |
| <b>Note 1.</b> The thickness derived in accordance with (1) is also to satisfy the buckling requirements of <a href="#">Pt 3 Ch 4, 7 Hull buckling strength</a> .  |   |  |
| <b>Note 2.</b> The deck thickness is to be not less than the basic deck end thickness for taper as given in <a href="#">Pt 3 Ch 3 Structural Design, Table 3. 2. 1: Taper requirements for hull envelope</a>   |   |  |

**Table 1.4.2: Lower deck plating**

| Location                     | Minimum thickness, in mm                       |   |
|------------------------------|--|---|
|                              | Second deck                                    | Third or platform decks                       |
| (1) Outside line of openings | $t = 0.012_{s1}\sqrt{k}$ but not less than 6.5 | $t = 0.01_{s1}\sqrt{k}$ but not less than 6.5 |

|  |   |

| $h_{T1}$             | = $\frac{L_1}{56}$ for Type 'B-60' ships<br>= the greater of $\frac{L_1}{70}$ or 1.20 m for Type 'B' ships          |
| $L_1$                | = $L$ but need not be taken greater than 190 m  |
| $L_2$                | = $L$ but need not be taken greater than 215 m  |

**Note 1.** Where weather decks are intended to carry deck cargo and the load is in excess of  $8.5 \text{ kN/m}^2$  ( $0.865 \text{ tonne-f/m}^2$ ), the scantlings of longitudinals may be required to be increased to comply with the requirements for location (1) [Table 1. 4. 4: Cargo and accommodation deck longitudinals](#) using the equivalent design head, for specified cargo loading, for weather decks given in [Table 3. 5. 1: Design heads and permissible cargo loadings](#) in [Pt 3, Ch 3 Structural Design](#).

**Note 2.** The buckling requirements of [Pt 3, Ch 4, 7 Hull buckling strength](#) are to be complied with. The ratio of the web depth  $d_w$  to web thickness  $t$  is to comply with the following requirements: (a) Built up profiles and rolled angles:

$$\frac{d_w}{t} \leq 60\sqrt{k_L} \text{ Flat bars:}$$

$$\frac{d_w}{t} \leq 18\sqrt{k_L} \text{ when continuous at bulkheads}$$

$$\frac{d_w}{t} \leq 15\sqrt{k_L} \text{ when non-continuous at bulkheads}$$

**Note 3.** The web depth of longitudinals,  $d_w$  is to be not less than 60 mm.

**Table 1. 4. 4: Cargo and accommodation deck longitudinals**

| Location                  | Modulus, in $\text{cm}^3$                        | Inertia, in $\text{cm}^4$ |

| $K_1$                 | = a factor dependent on the number of decks (including poop and bridge superstructures) at the position of the beam under consideration: |
|                       | = 1 deck 20.0  |
|                       | = 2 decks 13.3   |
|                       | = 3 decks 10.5   |
|                       | = 4 or more 9.3  |
| $K_2$                 | = a factor dependent on the location of the beam:  |
|                       | = at short bridge and poops 133  |
|                       | = elsewhere 530  |
| $K_3$                 | = a factor dependent on the location of the beam:  |
|                       | = elsewhere 3.3  |
|                       | = span adjacent to the ship side 3.6   |
| $\gamma$              | = 1.4 for rolled or built sections   |
|                       | = 1.6 for flat bars  |

**Note 1.** Where weather decks are intended to carry deck cargo and the load is in excess of 8.5 kN/m<sup>2</sup>, the scantlings of beams may be required to be increased to comply with the requirements for location (2) using the equivalent design head, for specified cargo loading, for weather decks given in [Table 3. 5. 1: Design heads and permissible cargo loadings](#).

**Note 2.** The web depth of beams,  $d_w$ , is to be not less than 60 mm.

## 4. 4 Deck supporting structure

4. 4. 1 **Girders and transverses** supporting deck longitudinals and beams, also hatch side girders and hatch end beams, are to comply with the requirements of [Table 1. 4. 6: Deck girders, transverses and hatch beams](#). In general, transverses, webs or frames of increased scantlings, *See* [Table 1. 6. 3: Shell framing \(transverse\)](#), are to be arranged in way of hatch end beams and deck transverses, and these are to be in line with the double bottom floors where practicable. Equivalent transverse ring scantling arrangements will be considered.
4. 4. 2 **Transverses** supporting deck longitudinals are, in general, to be spaced not more than 3.8 m apart where the length,  $L$ , is 100 m or less, and  $(0.006L + 3.2)$ m apart where  $L$  is greater than 100 m.
4. 4. 3 The web thickness, stiffening arrangements and end connection of primary supporting members are to be in accordance with [Pt 3, Ch 10, 4 Construction details for primary members](#).
4. 4. 4 Where a girder is subject to concentrated loads, such as pillars out of line, the scantlings are to be suitably increased. Also, where concentrations of loading on one side of the girder may occur, the girder is to be adequately stiffened against torsion. Reinforcements may be required in way of localised areas of high stress.
4. 4. 5 **Pillars** are to comply with the requirements of [Table 1. 4. 7: Pillars](#).

- 4. 4. 6 Pillars are to be fitted in the same vertical line wherever possible, and effective arrangements are to be made to distribute the load at the heads and heels of all pillars. Where pillars support eccentric loads, they are to be strengthened for the additional bending moment imposed upon them.
- 4. 4. 7 Tubular and hollow square pillars are to be attached at their heads to plates supported by efficient brackets, in order to transmit the load effectively. Doubling or insert plates are to be fitted to the inner bottom under the heels of tubular or hollow square pillars, and to decks under large pillars. The pillars are to have a bearing fit and are to be attached to the head and heel plates by continuous welding. At the heads and heels of pillars built of rolled sections, the load is to be well distributed by means of longitudinal and transverse brackets.
- 4. 4. 8 In double bottoms under widely spaced pillars, the connections of the floors to the girders, and of the floors and girders to the inner bottom, are to be suitably increased. Where pillars are not directly above the intersection of plate floors and girders, partial floors and intercostals are to be fitted as necessary to support the pillars. Manholes are not to be cut in the floors and girders below the heels of pillars. Where longitudinal framing is adopted in the double bottom, equivalent stiffening under the heels of pillars is to be provided, and where the heels of pillars are carried on a tunnel, suitable arrangements are to be made to support the load.
- 4. 4. 9 Where pillars are fitted inside tanks or under watertight flats, the tensile stress in the pillar and its end connections is not to exceed 108 N/mm<sup>2</sup> at the test heads. In general, such pillars should be of built sections, and end brackets may be required.
- 4. 4. 10 Pillars are to be fitted below deckhouses, windlasses, winches, capstans and elsewhere where considered necessary.
- 4. 4. 11 **Non-watertight pillar bulkheads** are to comply with the requirements of [Table 1. 4. 8: Non-watertight pillar bulkheads](#).
- 4. 4. 12 **Cantilevers** and their supporting frames are to comply with the requirements of [Table 1. 4. 9: Cantilever beams](#).

## 4. 5 Deck openings

- 4. 5. 1 The corners of main cargo hatchways in the strength deck within 0.5L amidships are to be elliptical, parabolic or rounded, with a radius generally not less than  $\frac{1}{24}$  of the breadth of the opening. Rounded corners are to have a minimum radius of 300 mm if the deck plating extends inside the coaming, or 150 mm if the coamings are welded to the inner edge of the plating in the form of a spigot. Where elliptical corners are arranged, the major axis is to be fore and aft, the ratio of the major to minor axis is to be not less than 2 to 1 nor greater than 2.5 to 1, and the minimum half-length of the major axis is to be defined by  $l_1$  in [Figure 1. 4. 5: Elliptical and parabolic corners](#). Where parabolic corners are arranged, the dimensions are also to be as shown in [Figure 1. 4. 5: Elliptical and parabolic corners](#).
- 4. 5. 2 Where the corners of large openings in the strength deck are parabolic or elliptical, insert plates are not required. For other shapes of corner, insert plates of the size and extent shown in [Figure 1. 4. 6: Insert plates for large openings](#) will, in general, be required. The required thickness of the insert plate is to be not less than 25 per cent greater than the adjacent deck thickness, outside line of openings with a minimum increase of 4 mm. The increase need not exceed 7 mm.
- 4. 5. 3 Welded attachments close to or on the free edge of the hatch corner plating are to be avoided (e.g. welded protection strips or shedder plates) and the butt welds of corner insert plates to the adjacent deck plating are to be located well clear of butts in the hatch coaming.
- 4. 5. 4 Openings in the strength deck outside the line of hatch openings are to be kept to the minimum number consistent with operational requirements. Openings are to be arranged clear of hatch corners and, so far as possible, clear of one another. Where, within 0.4L amidships, deck openings have a total breadth or shadow area breadth, in one transverse section that exceeds the limitation given in [Pt 3, Ch 3, 3.4 Calculation of hull section modulus 3.4.6](#) and [Pt 3, Ch 3, 3.4 Calculation](#)

of hull section modulus 3.4.7, compensation will be required to restore the excess. This is generally to be arranged by increasing the deck plate thickness, but other proposals will be considered. Plate panels in which openings are cut are to be adequately stiffened, where necessary, against compression and shear buckling. The corners of all openings are to be well rounded and the edges smooth.

**Table 1. 4. 6: Deck girders, transverses and hatch beams**

| Location and arrangements  | Modulus, in cm <sup>3</sup>   | Inertia, in cm <sup>4</sup> |
|--|---|-----------------------------|
| (1) Girders and transverses in way of dry cargo spaces and clear of hatch openings:<br><br>(a) supporting up to three point loads<br><br>(b) supporting four or more point loads or a uniformly distributed load   | <i>See also</i> Note<br><br>$Z$ to be determined from calculations using Note and stress $\frac{123.5}{k}$ N/mm <sup>2</sup> ( $\frac{12.6}{k}$ kgf/mm <sup>2</sup> ) and assuming fixed ends.<br><br>$Z = 5.85kS_1Hgl_e^2$ | $I = \frac{1.85}{k}l_eZ$    |
| (2) Hatch side girders in way of dry cargo spaces at weather decks (with deep coamings):<br><br>(a) supporting up to three point loads<br><br>(b) supporting four or more point loads or a uniformly distributed load  | $Z$ to be determined from calculations using Note and stress $\frac{100.4}{k}$ N/mm <sup>2</sup> ( $\frac{10.25}{k}$ kgf/mm <sup>2</sup> ) and assuming fixed ends<br><br>$Z = 5.85kS_1H_gl_e^2$                            | $I = \frac{2.3}{k}l_eZ$     |
| (3) Hatch side girders in way of dry cargo spaces at lower decks (without deep coamings):<br><br>(a) supporting up to three point loads<br><br>(b) supporting four or more point loads or a uniformly distributed load   | $Z$ to be determined from calculations using stress ( $\frac{112.5}{k}$ ) N/mm <sup>2</sup> ( $\frac{11.5}{k}$ kgf/mm <sup>2</sup> )<br><br>$Z = 5.20kS_1H_gl_e^2$  | $I = \frac{2.8}{k}l_eZ$     |
| (4) Hatch end beams in way of dry cargo spaces and supported at centreline, <i>See Figure 1. 4. 1: Hatch end beam arrangements:</i><br><br>(a) In association with longitudinal framing when there is no transverse between the hatch end beam and adjacent transverse bulkhead or equivalent supporting structure | $Z = 19kK_1H_gl_eS_1l_1 + 2.37kS_eH_gl_e^2$   |                             |

|  |   |                           |
|--|---|---------------------------|
| (b) In association with longitudinal framing where there is one or more transverse between the hatch end beam and adjacent transverse bulkhead or equivalent supporting structure  | $Z = 19kK_1H_g l_e(S_1 l_1 + S_2 l_2)$                                  | $I = \frac{2.8}{k} l_e Z$ |
| (c) In association with transverse framing when the hatch end beam supports the hatch side girder and in line girder only  | $Z = 19kK_1H_g l_e(S_1 l_1 + S_3 l_3)$                                  |                           |
| (d) In association with transverse framing when the hatch end beam supports the hatch side girder, an in line girder and an additional girder between the hatch side and the centreline  | $Z = 19kH_g l_e(K_1(S_1 l_1 + S_4 l_4) + K_2 S_5 l_5)$                  |                           |
| (5) Girders and transverses in way of the crown or bottom of a tank  | $Z = 11.7\rho k h_4 S l_e^2$  | $I = \frac{2.8}{k} l_e Z$ |
| Symbols  |   |                           |

**Table 1. 4. 7: Pillars**

| Symbols | Parameter | Requirement |
|---------|-----------|-------------|
|---------|-----------|-------------|

|  |  |  |
|--|--|--|
| <p><math>b</math> = breadth of side of a hollow rectangular pillar or breadth of flange or web of a built or rolled section, in mm</p> <p><math>d_p</math> = mean diameter of tubular pillars, in mm</p>   | (1) Cross-sectional area of all types of pillar  | $A_p = \frac{kP}{12.36 - 51.5 \frac{l_e}{r\sqrt{k}}} \text{ cm}^2$ <p>See Note</p>   |
| <p><math>k</math> = local scantling higher tensile steel factor, See <a href="#">Pt 3, Ch 2, 1.2 Steel 1.2.3</a>, but not less than 0.72</p> <p><math>l</math> = overall length of pillar, in metres</p> <p><math>l_e</math> = effective length of pillar, in metres, and is taken as: for hold pillars <math>0.65l</math> for 'tween deck pillars <math>0.80l</math></p> <p><math>l_p</math> = distance, in metres, between centres of two adjacent spans of girders or transverses supported by the pillar.</p>                                      | (2) Minimum wall thickness of tubular pillars  | <p>The greater of the following:</p> <p>(a) <math>t = \frac{P}{d_p(0.392 - 1.53 \frac{l_e}{r})} \text{ mm}</math></p> <p>(b) <math>t = \frac{d_p}{40} \text{ mm}</math></p> <p>but not to be less than</p> <p>(c) <math>t = 5.5 \text{ mm}</math> where <math>L &lt; 90 \text{ m}</math>, or</p> <p><math>= 7.5 \text{ mm}</math> where <math>L \geq 90 \text{ m}</math></p>   |
| <p><math>r</math> = least radius of gyration of pillar cross-section, in mm, and may be taken as:</p> $r = 10 \sqrt{\frac{I}{A_p}} \text{ mm}$ <p><math>A_p</math> = cross-sectional area of pillar, in <math>\text{cm}^2</math></p> <p><math>C, S</math> as defined in <a href="#">Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1</a></p> <p><math>H_g</math> as defined in <a href="#">Table 1. 4. 6: Deck girders, transverses and hatch beams</a></p> <p><math>I</math> = least moment of inertia of cross-section, in <math>\text{cm}^4</math></p> | (3) Minimum wall thickness of hollow rectangular pillars or web plate thickness of $I$ or channel sections | <p>The lesser of (b) and (c) and not to be less than (a):</p> <p>(a) <math>t = \frac{P}{b(0.5 - 1.95 \frac{l_e}{r})} \text{ mm}</math></p> <p>(b) <math>t = \frac{br}{600l_e} \text{ mm}</math></p> <p>(c) <math>t = \frac{b}{55} \text{ mm}</math></p> <p>but to be not less than</p> <p><math>t = 5.5 \text{ mm}</math> where <math>L &lt; 90 \text{ m}</math>, or</p> <p><math>= 7.5 \text{ mm}</math> where <math>L \geq 90 \text{ m}</math></p> |
| <p><math>P</math> = load, in kN, supported by the pillar and is to be taken as</p> $\frac{9.81SH_g l_p}{C} + P_a$ <p>but not less than 19.62 kN</p>  | (4) Minimum thickness of flanges of angle or channel sections  | <p>The lesser of the following:</p> <p>(a) <math>t_f = \frac{br}{200l_e} \text{ mm}</math></p> <p>(b) <math>t_f = \frac{b}{18} \text{ mm}</math></p>   |
| <p><math>P_a</math> = load, in kN, from pillar or pillars above (zero if no pillars over)</p>  | (5) Minimum thickness of flanges of built or rolled $I$ sections   | <p>The lesser of the following:</p> <p>(a) <math>t_f = \frac{br}{400l_e} \text{ mm}</math></p> <p>(b) <math>t_f = \frac{b}{36} \text{ mm}</math></p>   |
| <p><b>Note</b> As a first approximation <math>A_p</math> may be taken as <math>\frac{\sqrt{kP}}{9.32}</math> and the radius of gyration estimated for a suitable section having this area.</p> <p><b>Note</b> If the area calculated using this radius of gyration differs by more than 10 per cent from the first approximation, a further calculation using the radius of gyration corresponding to the mean area of the first and second approximation is to be made.</p>   |  |  |

4. 5. 5 Openings in the strength deck outside the line of hatch openings having a stress concentration factor in excess of 2.4 will require edge reinforcements in the form of a spigot of adequate

dimensions, but alternative arrangements will be considered. The area of any edge reinforcement which may be required is not to be taken into account in determining the required sectional area of compensation for the opening. Alternatively, the shape of the opening is to be such that a stress concentration factor of 2.4 is not exceeded. In this respect, reinforcement will not in general, be required in way of:

- elliptical openings having their major axis fore and aft and a ratio of length to breadth not less than 2 to 1, or
- openings of other shapes provided that it has been shown by suitable tests that the stress concentration factor does not exceed 2.4.

**Table 1. 4. 8: Non-watertight pillar bulkheads**

| Parameter  | Requirement  |   |
|--|--|---|
|  | Ships with $L < 90$ m  | Ships with $L \geq 90$ m                  |
| (1) Minimum thickness of bulkhead plating  | 5.5 mm in holds and 'tween decks   | 7.5 mm in holds<br>6.5 mm in 'tween decks |
| (2) Maximum stiffener spacing  | 1500 mm  | 1500 mm                                   |
| (3) Minimum depth of stiffeners or corrugations  | 100 mm in holds  | 150 mm in holds                           |
|  | 75 mm in 'tween decks  | 100 mm in 'tween decks                    |
| (4) Cross-sectional area (including plating) for rolled, built or swedged stiffeners supporting beams, longitudinals, girders or transverses   | (a) Where $\frac{s}{t} \leq 80$ $A=A_1$<br>(b) Where $\frac{s}{t} \geq 120$ $A=A_2$<br>(c) Where $80 < \frac{s}{t} < 120$ $A$ is obtained by interpolation between $A_1$ and $A_2$ |   |
| (5) Cross-sectional area (including plating) for symmetrical corrugation   | (a)Where $\frac{b}{t_p} \leq \frac{750\lambda l_e}{(\lambda+0.25)r}$ $A=A_1$<br>(b)Where $\frac{b}{t_p} > \frac{750\lambda l_e}{(\lambda+0.25)r}$ $A=A_2$                          |   |
| Symbols  |  |   |
| $d_w, t_p, b, c$ as defined in <a href="#">Pt 3, Ch 3, 3 Structural idealisation</a><br>$r$ = radius of gyration, in mm, of stiffener and attached plating<br>$= 10\sqrt{\frac{I}{A}}$ mm for rolled, built or swedged stiffeners<br>$= d_w\sqrt{\frac{3b+c}{12(b+c)}}$ mm for symmetrical corrugation<br>$I$ = moment of inertia, in $\text{cm}^4$ , of stiffener and attached plating<br>$s$ = spacing of stiffeners, in mm<br>$A$ = cross-sectional area, in $\text{cm}^2$ , of stiffener and attached plating<br>$A_1 = \frac{P}{12.36 - 51.5\frac{l_e}{r}} \text{cm}^2$<br>As a first approximation $A_1$ may be taken as |  |   |

$$\frac{P}{9.32}$$

$$A_2 = \frac{P}{4.9 - 14.7 \frac{l_e}{r}} \text{ cm}^2$$

As a first approximation  $A_2$  may be taken as

$$\frac{P}{3.92}$$

$P$ ,  $l_e$  as defined in [Table 1. 4. 7: Pillars](#)

$$\lambda = \frac{b}{c}$$

4. 5. 6 Lower deck openings should be kept clear of main hatch corners and the areas of high stress, so far as possible. Compensation will not, in general, be required unless the total width of openings in any frame space, or between any two transverses, exceeds 15k per cent of the original effective plating width. The requirements of [Pt 4, Ch 1, 4.5 Deck openings 4.5.4](#) also apply to lower deck openings except that:
- the thickness of inserts, if required, for the second deck hatch corners is to be 2.5 mm greater than the deck thickness,
  - inserts will not generally be required for hatch corners on third decks, platform decks and below, and
  - reinforcement will not generally be required for circular openings, provided that the plate panels in which they are situated are otherwise adequately stiffened against compression and shear buckling.
4. 5. 7 All openings are to be adequately framed; attention is to be paid to structural continuity, and abrupt changes of shape, section or plate thickness are to be avoided. Arrangements in way of corners and openings are to be such as to minimise the creation of stress concentrations. Where a deck longitudinal is cut, compensation is to be arranged to ensure full continuity of strength.

**Table 1. 4. 9: Cantilever beams**

| Location and supporting arrangements  | Required modulus, in cm <sup>3</sup> , <i>See Notes</i>   |  |
|---|---|--|
|   | Cantilever beam   | Supporting frame   |
| (1) Any position - no support from end girders  | $Z_o = 8.67kM_o (Z_o = 85kM_o)$   | $Z_v = \frac{v}{H_1} \left( \frac{fZ_o}{u} - kZ_t \right)$ |
| (2) At hatch side - uniform loading, partial support received from hatch side girder, <a href="#">See Figure 1. 4. 3: Section moduli of hatch end beams</a> : |   |  |
| (a) Hatch side girder supported by Rule hatch end beams or pillars at hatch corners   | $Z_u = 0.9Z_o - kG$   | $Z_v = \frac{v}{H_1} \left( \frac{fZ_u}{u} - kZ_t \right)$ |
| (b) Hatch side girder supported by end bulkheads of hold - no Rule hatch end beams or pillars   | $Z_u$ as in (a) or the following formula, whichever is the greater:<br>$\left( \frac{n+1}{n} \right) \left( 0.45 \left( 1 + \frac{1}{\beta} \right) Z_o - k\beta G - (1 - \beta)kE \right)$ |  |

|  |   |   |
|--|---|---|
| (c) No transverse bulkheads between hatchways, no Rule hatch end beams or pillars, <i>See</i> Notes  | $Z_u$ as in (a) or the following formula, whichever is the greater:<br>$\left(\frac{n+1}{n}\right)\left(\frac{Z_o}{\beta} - 0.5kE\right)$ |   |
| (d) At hatch side - concentrated loading   | $Z_u$ as in (a), (b) or (c), whichever is applicable, or as the following formula, whichever is the greater:<br>$I_o - kG_1$              |   |
| Case (1) or (2)  | Required inertia, in cm <sup>4</sup>  |   |
|  | $I_u = \frac{9u}{k} Z_u$  | — |
| <p><b>Note 1.</b> Where a transverse bulkhead is fitted at only one end of a hatchway the section modulus of cantilever beams is to be a mean of the values obtained from (2)(b) and (2)(c).</p> <p><b>Note 2.</b> Where only cantilevers in the length of a hatchway consist of two or three close together at the mid-length of hatchway, their modulus is to be determined by calculating the modulus of a single cantilever at mid-length and dividing this by the actual number of cantilevers.</p> <p><b>Note 3.</b> If a negative value is obtained for the required section modulus, cantilevers are not necessary for the arrangement considered.</p> <p><b>Note 4.</b> In calculating the actual section modulus of a cantilever or supporting frame, the effective area of attached plating is to be as given in <a href="#">Pt 3, Ch 3, 3 Structural idealisation</a>. Intermediate beams or frames within the effective breadth may be included in the calculation.</p> <p><b>Note 5.</b> Rule hatch end beams are those with scantlings determined from <a href="#">Table 1. 4. 6: Deck girders, transverses and hatch beams</a>, assuming that the hatch side girder has a span between hatch end beams.</p> <p><b>Note 6.</b> The section modulus of cantilever beams is to be not less than that determined from <a href="#">Table 1. 4. 5: Strength/weather, cargo and accommodation deck beams</a> for beams in the same position.</p> <p><b>Note 7.</b> The section modulus of side frames, pillars or pillar bulkhead stiffeners supporting cantilevers is to be not less than that required for ordinary side frames, pillars or pillar bulkhead stiffeners, as determined from the appropriate Sections of the Rules.</p> |   |   |

**Note 8.** The scantlings of the cantilever bracket within the shaded area shown in [Figure 1. 4. 2: Deck cantilevers](#) are to be as follows:

(a) Where tripping brackets are not fitted:

$$t = (0.0075d_c + 5)\sqrt{k}\text{mm}$$

$$A_f = \left( \frac{27Z_d}{e} \left( 1 - \frac{e}{1420f} \right) - \frac{et}{300} \right) k\text{cm}^2$$

(b) Where tripping brackets are fitted at the positions indicated in [Figure 1. 4. 2: Deck cantilevers](#):

$$t = (0.0075d_c + 5)\sqrt{k}\text{mm}$$

$$A_f = \left( \frac{20Z_d}{e} \left( 1 - \frac{e}{1420f} \right) - \frac{et}{200} \right) k\text{cm}^2$$

In general the radius at the throat of the cantilever bracket is to be not less than  $d_c$ .

**Note 9.** The cantilever beam and supporting frame face plates may be gradually tapered from the limits of the shaded area shown in [Figure 1. 4. 2: Deck cantilevers](#). The web depth of the supporting frame may be tapered to a minimum of  $0.5d_f$  at the base.

**Note 10.** Where the web thickness of cantilevers or supporting frames is less than  $\frac{d_w}{60\sqrt{k}}$  transverse web stiffeners are to be fitted spaced approximately  $1.5d_w$  apart. In no case is the web thickness outside the limits of the cantilever brackets to be less than  $\frac{d_w}{85\sqrt{k}}$

Where stiffeners are fitted parallel to the face plates, the stiffening arrangements will be specially considered.

#### Symbols

$f$  = overall length of cantilever, in metres Where there is no centreline support:

$k$  = higher tensile steel factor as defined in [Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1](#)  $d_c$  = web depth of cantilever, at root of bracket, in mm, See [Figure 1. 4. 2: Deck cantilevers](#)

$l_b$  = distance, in metres, between transverse bulkheads, See [Figure 1.4.4 Deck supporting structure](#). Where there is no bulkhead midway between hatchways,  $l_b$  is to be measured to a point midway between hatchways  $d_f$  = web depth of frame at root of bracket, in mm, See [Figure 1. 4. 2: Deck cantilevers](#)

$l_h$  = length of hatchway, in metres, See [Figure 1. 4. 2: Deck cantilevers](#)  $d_w$  = web depth of cantilever or frame, in mm

$C$  = cargo stowage rate in  $\text{m}^3/\text{tonne}$  as defined in [Pt 3, Ch 3, 5 Design loading](#), and is to be taken as  $1.39 \text{ m}^3/\text{tonne}$  unless specified otherwise  $e$  = web depth, in mm, as shown in [Figure 1. 4. 2: Deck cantilevers](#)

|  |   |
|--|---|
| <p><math>Z_a</math> = section modulus, in <math>\text{cm}^3</math>, of hatch side girder which is to be not less than that calculated from <a href="#">Table 1. 4. 6: Deck girders, transverses and hatch beams</a>, taking the span between cantilevers</p>   | <p><math>n</math> = number of cantilevers between the hatch end beams</p>   |

## CHAPTER 1 General Cargo Ships

## SECTION 5 Shell envelope plating

## 5.1 General

- 5.1.1 Requirements are given in this Section for longitudinal or transversely framed shell plating, and attention is drawn to the requirements of [Pt 4, Ch 1, 6.1 General 6.1.1](#). In ships with a transversely framed bottom construction, the bottom shell plating is, in general, to be reinforced with additional continuous, or intercostal, longitudinal stiffeners, *See also* [Pt 4, Ch 1, 7.1 General 7.1.2](#). Alternative arrangements will be considered.
- 5.1.2 For ships intended to load or unload while aground, *See* [Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground](#).

## 5.2 Keel

- 5.2.1 5.2.1 The cross-sectional area and thickness of bar keels, and the width and thickness of plate keels, are to comply with the requirements of [Table 1. 5. 1: Bar and plate keels](#). Forged or rolled bar keels are also to comply with the material requirements of [Ch 3 Rolled Steel Plates, Strip, Sections and Bars of the Pt 2 Rules for the Manufacture, Testing and Certification of Materials](#)).

Table 1. 5. 1: Bar and plate keels

| Item and parameter   | Requirement  |
|----------------------|--|
| (1) Bar keels:       |  |
| Cross-sectional area | $A = (1.8L - 16) \text{ cm}^2$   |
| Thickness            | $t = (0.6L + 8) \text{ mm}$  |
| (2) Plate keels:     |  |
| Breadth              | $b = 70B \text{ mm}$<br>but need not exceed 1800 mm and is not to be less than 750 mm  |
| Thickness            | $t = (t_1 + 2) \text{ mm}$<br>where $t_1$ is as in location (1) in <a href="#">Table 1. 5. 2: Bottom shell and bilge plating</a> , using the spacing in way of the keel plate $t$ is to be taken not less than the adjacent bottom shell thickness |
| Symbols              |  |

$L, B$  as defined in [Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1](#)

$b$  = breadth of keel, in mm

$t$  = thickness of keel, in mm

$A$  = cross-sectional area, in cm<sup>2</sup>

## 5.3 Bottom shell and bilge

- 5.3.1 In the midship region the thickness of bottom shell plating to the upper turn of bilge is to be that necessary to give the hull section modulus required by [Pt 3, Ch 4, 5 Hull bending strength](#), and is to be not less than the minimum values given by [Table 1.5.2: Bottom shell and bilge plating](#).

## 5.4 Side shell

- 5.4.1 In the midship region, the thickness of side shell and sheerstrake plating including the sides of bridge superstructures is to be not less than the values given by [Table 1.5.3: Side shell plating](#), but may be required to be increased locally on account of high shear forces in accordance with [Pt 3, Ch 4, 6 Hull shear strength](#).
- 5.4.2 Sea inlets, or other openings, are to have well rounded corners and so far as possible, are to be kept clear of the bilge radius. Openings on, or near to, the bilge radius are to be elliptical. The thickness of sea inlet box plating is to be the same as the adjacent shell, but not less than 12.5 mm and need not exceed 25 mm.
- 5.4.3 Where a rounded sheerstrake is adopted the radius should, in general, be not less than 15 times the thickness.
- 5.4.4 The sheerstrake thickness is to be increased by 20 per cent at the ends of a bridge superstructure extending out to the ship's side. In the case of a bridge superstructure exceeding  $0.15L$ , the side plating at the ends of the superstructure is also to be increased by 25 per cent and tapered gradually into the upper deck sheerstrake.
- 5.4.5 In general, compensation will not be required for holes in the sheerstrake which are clear of the gunwale or any deck openings situated outside the line of the main hatchways and whose depth does not exceed 20 per cent of the depth of the sheerstrake or 380 mm, whichever is the lesser. Openings are not to be cut in a rounded gunwale. Cargo door openings are to have well rounded corners, and the proposed compensation for the door openings will be individually considered.

**Table 1.5.2: Bottom shell and bilge plating**

| Location                              | Minimum thickness, in mm   |   |
|---------------------------------------|--|---|
|                                       | Longitudinal framing   | Transverse framing  |
| (1) Bottom plating, See Notes 1 and 2 | <p>The greater of the following:</p> <p>(a) <math>t = 0.001s_1(0.043L_1 + 10) \sqrt{\frac{F_B}{k_L}}</math></p> <p>(See Note 4)</p> <p>(b) <math>t = 0.0063s_1 \sqrt{\frac{h_{T2}k}{1.8 - F_B}}</math></p> | <p>The greater of the following:</p> <p>(a) <math>t = 0.001s_1f_1(0.056L_1 + 16.7) \sqrt{\frac{F_B}{k_L}}</math></p> <p>(See Note 4)</p> <p>(b) <math>t = 0.0063s_1 \sqrt{\frac{h_{T2}k}{1.8 - F_B}}</math></p> |

|   |  |                |
|---|--|----------------|
| (2) Bilge plating<br>- where framed,<br><i>See</i> Notes 1 and 2  | $t$ as for (1)   | $t$ as for (1) |
| (3) Bilge plating<br>-where<br>unframed, <i>See</i><br>Note 3   | Provided that transverses or adequate bilge brackets are spaced not more than<br>$\frac{8t^2}{DR_B} \sqrt{\frac{t}{R_B}} \times 10^6 \text{mm apart}$<br>$t = \frac{R_B F_B}{165k_L}$ but is to be not less than the adjacent bottom plating |                |
| Symbols   |  |                |

- Note 1.** The thickness is also to satisfy the buckling requirements of [Pt 3, Ch 4, 7 Hull buckling strength](#).
- Note 2.** The thickness of side shell or sheerstrake plating is to be not less than the basic shell end thickness for taper, as given in [Pt 3, Ch 3 Structural Design, Table 3.2. 1: Taper requirements for hull envelope](#). The width of the sheerstrake (where of different thickness from the side shell) is to be not less than that required by [Table 2.2. 1: Material classes and grades](#) in [Pt 3, Ch 2 Materials](#).
- Note 3.** The thickness of side shell need not exceed that determined from [Table 1.5. 2: Bottom shell and bilge plating](#) for bottom shell, but using the spacing of side frames or longitudinals.
- Note 4.** For the expressions contained in (i), where separate maximum sagging and hogging still water bending moments are assigned,  $F_D$  may be based on the sagging moment and  $F_B$  on the hogging moment.

CHAPTER 1 **General Cargo Ships**SECTION 6 **Shell envelope framing****6.1 General**

- 6.1.1 Longitudinal framing is, in general, to be adopted at the bottom, but special consideration will be given to proposals for transverse framing in this region. Transverse or longitudinal framing can be adopted for the side shell. Requirements are given in this Section for longitudinal and transverse framing systems.
- 6.1.2 End connections of longitudinals to bulkheads are to provide adequate fixity and, so far as practicable, direct continuity of longitudinal strength. Where  $L$  exceeds 215 m, the bottom longitudinals are to be continuous in way of both watertight and non-watertight floors, but alternative arrangements will be considered. Higher tensile steel longitudinals within 10 per cent of the ship's depth at the bottom and deck are to be continuous irrespective of the ship length, *See also* [Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members](#).
- 6.1.3 Stiffeners and brackets on side transverses, where fitted on one side and connected to higher tensile steel longitudinals between the base line and  $0.8D_2$  above the base line, are to have their heels well radiused to reduce stress concentrations. Where a symmetrical arrangement is fitted, i.e. bracket or stiffening on both sides, and it is connected to higher tensile steel longitudinals, the toes of the stiffeners or brackets are to be well radiused. Alternative arrangements will be considered if supported by appropriate direct calculations, *See also* [Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members](#).
- 6.1.4 Where higher tensile steel side longitudinals pass through transverse bulkheads in the cargo area, well radiused brackets of the same material are to be fitted on both the fore and aft side of the connection between the upper turn of bilge and  $0.8D_2$  above the base line. Particular attention should be given to ensuring the alignment of these brackets. Alternative arrangements will be considered if supported by appropriate direct calculations, *See also* [Pt 4, Ch 1, 6.2 Longitudinal stiffening 6.2.3](#).
- 6.1.5 For ships intended to load or unload while aground, *See* [Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground](#).

**6.2 Longitudinal stiffening**

- 6.2.1 For non-CSR tankers, bulk carriers and ore carriers (*See* [Pt 1, Ch 2, 2.3 Class notations \(hull\)](#)) the scantlings of bottom and side longitudinals in the midship region are to comply with the requirements given in [Table 1. 6. 2: Shell framing \(longitudinal\)](#). In general other ships are to comply with [Table 1. 6. 1: Shell framing \(longitudinal\)](#).
- 6.2.2 The lateral and torsional stability of longitudinals together with web and flange buckling criteria are to be verified in accordance with [Pt 3, Ch 4, 7 Hull buckling strength](#).

- 6.2.3 Where higher tensile steel asymmetrical sections are adopted in double bottom tanks which are interconnected with double skin side tanks or combined hopper and topside tanks the requirements of [Pt 4, Ch 1, 6.1 General 6.1.3](#) and [Pt 4, Ch 1, 6.1 General 6.1.4](#) are to be complied with regarding arrangements to reduce stress concentrations. Alternatively, it is recommended that bulb plate or symmetrical sections are adopted.

## 6.3 Transverse stiffening

- 6.3.1 The scantlings of main and 'tween deck frames, and bottom frames in way of bracket floors, in the midship region are to comply with the requirements given in [Table 1. 6. 3: Shell framing \(transverse\)](#).
- 6.3.2 The scantlings of main frames are normally to be based on Rule standard brackets at top and bottom, whilst the scantlings of 'tween deck frames are normally to be based on a Rule standard bracket at the top only.
- 6.3.3 End connections of transverse main and 'tween deck frames are to be in accordance with [Pt 3, Ch 10, 3 Secondary member end connections](#).

## 6.4 Primary supporting structure

- 6.4.1 Side transverses supporting longitudinal stiffening, and webs and stringers supporting transverse side stiffening, are to comply with the requirements of [Table 1. 6. 4: Primary structure](#).
- 6.4.2 Side transverses are to be spaced not more than 3.8 m apart when the length,  $L$ , is less than 100 m and  $(0.006L + 3.2)$  m apart where  $L$  is greater than 100 m.

**Table 1. 6. 1: Shell framing (longitudinal)**

| Location   | Modulus, in $\text{cm}^3$  |
|--|--|
| (1) Side longitudinals in way of dry spaces, including double skin construction, <i>See Note 2</i> | The lesser of the following:<br>(a) $Z = 0.056skh_{T1}l_e^2F_1F_S$<br>(b) $Z$ from (3)(a) evaluated using $s$ , $k$ and $l_e$ for the longitudinal under consideration and the remaining parameters evaluated at the base line |
| (2) Side longitudinals in way of double skin tanks or deep tanks, <i>See Note 2</i>                | The greater of the following:<br>(a) $Z$ as from (1)<br>(b) As required by Ch1, 9 for deep tanks   |
| (3) Bottom and bilge longitudinals, <i>See Notes 1, 2, 3 and 4</i>                                 | The greater of the following:<br>(a) $Z = \gamma skh_{T2}l_e^2F_1$<br>(b) $Z = \gamma skh_{T3}l_e^2F_{sb}$   |
| Symbols  |  |

$L, D, T, s, k, k_L, \rho$ , as defined in [Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1](#)

$l_e$  = as defined in [Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1](#), but is not to be taken less than 1.5 m except in way of the centre girder brackets required by [Pt 4, Ch 1, 8.5 Floors 8.5.3](#) where a minimum span of 1.25 m may be used

$l_{e1}$  =  $l_e$  in metres, but is not to be taken less than 2.5 m and need not be taken greater than 5.0 m

$C_1$  =  $\frac{60}{225-165F_D}$  at deck

$C_1$  = 1.0 at  $\frac{D_2}{2}$

$C_1$  =  $\frac{75}{225-150F_B}$  at baseline

Intermediate values of  $c_1$  are to be obtained by interpolation.

$D_1$  =  $D_2$ , in metres, but is not to be taken less than 10 and need not be taken greater than 16

$D_2$  =  $D$ , in metres, but need not be taken greater than  $1.6T$

$F_B, F_D$  as defined in [Pt 3, Ch 4, 5.7 Local reduction factors](#)

$F_1$  =  $\frac{D_2 c_1}{4D_2 + 20h_s}$  for side longitudinals above  $\frac{D_2}{2}$

$F_1$  =  $\frac{D_2 c_1}{25D_2 + 20h_s}$  for side longitudinals below  $\frac{D_2}{2}$  and for bottom longitudinals

$F_1$  is not to be taken less than = 0.14

$L_1$  =  $L$  but need not be taken greater than 190 m

$F_s$  is a fatigue factor for side longitudinals to be taken as follows:

(a) For built sections and rolled angle bars

$F_s$  =  $\frac{1.1}{k} \left[ 1 - \frac{2b_{f1}}{b_f} (1 - k) \right]$  at  $0.6D_2$  above the base line

$F_s$  = 1.0 at  $D_2$  and above

$F_s$  =  $F_{SB}$  at the base line.

Intermediate values of  $F_s$  are to be obtained by interpolation.

b) For flat bars and bulb plates  $\frac{b_{f1}}{b_f}$  may be taken as 0.5

$F_{sb}$  is a fatigue factor for bottom longitudinals =  $0.5(1 + F_s)$  at  $0.6D_2$ )

Where

$b_{f1}$  = the minimum distance, in mm, from the edge of the face plate of the side longitudinal under consideration to the centre of the web plate, See [Pt 4, Ch 9, 5.2 Symbols 5.2.1](#)

$h_{T1}$  =  $C_w \left( 1 - \frac{h_6}{D_2 - T} \right)$  in metres, for longitudinals above the waterline, at draught  $T$

Where  $C_w \left( 1 - \frac{h_6}{D_2 - T} \right)$  is not to be taken less than  $\frac{L_1}{56}$  m for Type 'B-60' ships or less than the greater of  $\frac{L_1}{70}$  or 1.20 for Type 'B' ships

$h_{T1}$  =  $\left[ h_6 + C_w \left( 1 - \frac{h_6}{2T} \right) \right] F_{\lambda}$ , in metres, for longitudinals below the waterline at draught  $T$ .

$h_{T1}$  need not exceed  $0.86 \left( h_5 + \frac{D_1}{8} \right)$  for  $F_1 \leq 0.14$  and  $\left( h_5 + \frac{D_1}{8} \right)$  for  $F_1 > 0.14$

$h_{T2}$  =  $(T + 0.5C_w)$ , in metres for bottom longitudinals but need not be taken greater than  $1.2T$

$h_{T3}$  =  $h_4 - 0.25T$ , in metres

$h_4$  = load head required by [Pt 4, Ch 1, 9.1 General](#) for deep tanks

|             |  |
|-------------|--|
| $h_5$       | = vertical distance, in metres, from longitudinal to deck at depth, $D_2$  |
| $h_6$       | = vertical distance, in metres, from the waterline at draught $T$ to the longitudinal under consideration                                    |
| $b_f$       | = the width of the face plate, in mm, of the side longitudinal under consideration, <i>See</i> <a href="#">Pt 4, Ch 9, 5.2 Symbols 5.2.1</a> |

| $F_\lambda$ | = 1.0 for $L \leq 200$ m<br>= $[1.0 + 0.0023(L - 200)]$ for $L > 200$ m  |
| $\gamma$    | = $0.002l_{e1} + 0.046$  |

**Note 1.** The buckling requirements of [Pt 3, Ch 4, 7 Hull buckling strength](#) are to be complied with. The ratio of the web depth,  $d_w$ , to web thickness,  $t$ , is to comply with the following requirements:

(a) Built up profiles and rolled angles:

$$\frac{d_w}{t} \leq 60\sqrt{k_L}$$

(b) Flat bars:

$$\frac{d_w}{t} \leq 18\sqrt{k_L} \text{ when continuous at bulkheads}$$

$$\frac{d_w}{t} \leq 15\sqrt{k_L} \text{ when non-continuous at bulkheads}$$

**Note 2.** Where struts are fitted midway between transverses in way of double bottom tanks, or double skin construction, the modulus of the bottom or side longitudinals may be reduced by 50% per cent from that obtained from the locations (1), (2), or (3) as applicable.

**Note 3.** Where the bilge radius exceeds the Rule height of a double bottom the modulus of the longitudinal above this nominal height is to be derived from the location (1) or (2) as applicable.

**Note 4.** Where no bilge longitudinals are fitted and bilge brackets are required by location (3) in [Table 1. 5. 2: Bottom shell and bilge plating](#), at least two brackets are to be fitted.

**Table 1. 6. 2: Shell framing (longitudinal)**

| Location   | Modulus, in cm <sup>3</sup>  |
|--|--|
| (1) Side longitudinals in way of dry spaces, including double skin construction, <i>See</i> Note 2 | The lesser of the following:<br>(a) $Z = 0.056skh_{T1}l_e^2F_1F_S$<br>(b) $Z$ from (3)(a) evaluated using $s$ and $l_e$ for the longitudinal under consideration and the remaining parameters evaluated at the base line   |
| (2) Side longitudinals in way of double skin tanks or deep tanks, <i>See</i> Note 2                | The greater of the following:<br>(a) $Z$ as from (1)<br>As required by <a href="#">Pt 4, Ch 1, 9.1 General</a> for deep tanks using $h_{T3}$ instead of $h_4$ , but need not exceed $Z$ from (3)(b) evaluated using $\gamma$ , $s$ and $f_{ig}$ for the longitudinal under consideration and the remaining parameters evaluated at the base line |
| (3) Bottom and bilge longitudinals, <i>See</i> Notes 1, 2, 3 and 4                                 | The greater of the following:<br>(a) $Z = \gamma skh_{T2}l_e^2F_{sb}$<br>(b) $Z = \gamma skh_{T3}l_e^2F_{sb}$  |

### Symbols

$L, D, T, s, k, \rho$ , as defined in [Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1](#)  
 $l_e$  = as defined in [Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1](#), but is not to be taken less than 1.5 m except in way of the centre girder brackets required by [Pt 4, Ch 1, 8.5 Floors 8.5.3](#) where a minimum span of 1.25 m may be used

$l_{e1} = l_e$  in metres, but is not to be taken less than 2.5 m and need not be taken greater than 5.0 m

$$c_1 = \frac{60}{225 - 165F_D} \text{ at deck}$$

$$c_1 = 1.0 \text{ at } \frac{D_2}{2}$$

$$c_1 = \frac{75}{225 - 150F_B} \text{ at baseline}$$

intermediate values  $c_1$  are to be obtained by interpolation

$D_1 = D_2$ , in metres, but is not to be taken less than 10 and need not be taken greater than 16

$D_2 = D$ , in metres, but need not be taken greater than  $1.6T$

$F_B, F_D$  as defined in [Pt 3, Ch 4, 5.7 Local reduction factors](#)

$$F_1 = \frac{D_2 c_1}{4D_2 + 20h_s} \text{ for side longitudinals above } \frac{D_2}{2}$$

$$F_1 = \frac{D_2 c_1}{25D_2 + 20h_s} \text{ for side longitudinals below } \frac{D_2}{2} \text{ and bottom longitudinals}$$

$F_1$  is not to be taken less than 0.14

$L_1 = L$  but need not be taken greater than 190 m

$F_s$  is a fatigue factor for side longitudinals to be taken as follows:

(a) For built sections and rolled angle bars

$$F_s = \frac{1.1}{k} \left[ 1 - \frac{2b_{f1}}{b_f} (1 - k) \right] \text{ at } 0.6D_2 \text{ above the base line}$$

$F_s = 1.0$  at  $D_2$  and above,

$F_s = F_{SB}$  at the base line

Intermediate values of  $F_s$  are to be obtained by linear interpolation.

(b) For flat bars and bulb plates  $\frac{b_n}{b_f}$  may be taken as 0.5

$F_{sb}$  is a fatigue factor for bottom longitudinals =  $0.5(1 + F_s \text{ at } 0.6D_2)$

Where

$b_{f1}$  = the minimum distance, in mm, from the edge of the face plate of the side longitudinal under consideration to the centre of the web plate, See [Pt 4, Ch 9, 5.2 Symbols 5.2.1](#)

$h_{T1} = C_w \left( 1 - \frac{h_6}{D_2 - T} \right) F_{\lambda}$ , in metres, for longitudinals above the waterline, at draught  $T$

Where  $\left( 1 - \frac{h_6}{D_2 - T} \right)$  is not to be taken less than 0.7

$h_{T1} = \left[ h_6 + C_w \left( 1 - \frac{h_6}{2T} \right) \right] F_{\lambda}$ , in metres, for longitudinals below the waterline at draught  $T$ .

|  |
|--|
| <p><math>h_{T1}</math> and <math>h_{T2}</math> need not exceed <math>0.86 \left( h_5 + \frac{D_1}{8} \right)</math> for <math>F_1 \leq 0.14</math> and <math>\left( h_5 + \frac{D_1}{8} \right)</math> for <math>F_1 &gt; 0.14</math></p> <p><math>h_{T2} = (T + 0.5C_W) F_\lambda</math>, in metres for bottom longitudinals</p> <p><math>h_{T3} = h_4 - 0.25T</math>, in metres at the base line</p> <p><math>h_{T3} = h_4</math> in metres, at and above <math>T/4</math> from the base line</p> <p>Intermediate values of <math>h_{T3}</math> are to be obtained by linear interpolation</p> <p><math>h_4</math> = load head required by <a href="#">Pt 4, Ch 1, 9.1 General</a> for deep tanks</p> <p><math>h_5</math> = vertical distance, in metres, from longitudinal to deck at depth, <math>D_2</math></p> <p><math>h_6</math> = vertical distance, in metres, from the waterline at draught <math>T</math> to the longitudinal under consideration</p> <p><math>b_f</math> = the width of the face plate, in mm, of the side longitudinal under consideration, See <a href="#">Pt 4, Ch 9, 5.2 Symbols 5.2.1</a></p> <p><math>C_W</math> = a wave head, in metres = <math>7.71 \times 10^{-2} L e^{-0.0044L}</math> where <math>e</math> = base of natural logarithms 2.7183</p> <p><math>F_\lambda = 1.0</math> for <math>L \leq 200</math> m</p> <p><math>= [1.0 + 0.0023(L - 200)]</math> for <math>L &gt; 200</math> m</p> <p><math>\gamma = 0.002l_{e1} + 0.046</math></p> |

| $h_{T1}$    | <p>= head, in metres, at middle of <math>H</math></p> <p>= <math>C_w \left(1 - \frac{h_6}{D_1 - T}\right) F_\lambda</math>, in metres for frames where the mid-length of frame is above the waterline, at draught <math>T</math></p> <p>where <math>\left(1 - \frac{h_6}{D_1 - T}\right)</math> is not to be taken less than 0.7</p> <p>= <math>[h_6 + C_w \left(1 - \frac{h_6}{2T}\right)] F_\lambda</math>, in metres for frames where the mid-length of frame is below the waterline at draught <math>T</math></p>   |
| $h$         | = $h_4$ or $h_5$ , whichever is the greater   |
| $h_4$       | = tank head, in metres, as defined in <a href="#">Pt 3, Ch 3, 5 Design loading</a>  |
| $h_5$       | = head, in metres, measured from the mid-length of $H$ , to the deck at side  |
| $h_6$       | = vertical distance in metres, from waterline at draught $T$ to the mid-length of $H$   |
| $l_s$       | = distance, in metres, from side shell to inboard support of beam or transverse   |
| $l_e$       | = effective length, in metres, of bottom frames for double bottom bracket floors  |
| $l_h$       | = length, in metres, of hatch side girder   |
| $C_w$       | <p>= a wave head, in metres,</p> <p>= <math>7.71 \times 10^{-2} L e^{-0.0044 L}</math></p> <p>= where <math>e</math> = base of natural logarithm 2.7183</p>   |
| $F_\lambda$ | <p>= 1.0 for <math>L \leq 200</math> m</p> <p>= <math>(1.0 + 0.0023 (L - 200))</math> for <math>L &gt; 200</math> m</p>   |
| $D_1$       | = $D$ , but need not be taken greater than $1.6T$   |
| $H$         | = $H_{MF}$ or $H_{TF}$ as applicable, See Note 1  |
| $MF$        | = vertical framing depth, in metres, of main frames, as shown in <a href="#">Figure 1.6.1: Framing depths for various structural configurations</a> , but is to be taken not less than 3.5 m  |
| $H_{TF}$    | = vertical framing depth, in metres, of 'tween deck frames, as shown in <a href="#">Figure 1.6.1: Framing depths for various structural configurations</a> , but is to be taken not less than 2.5 m   |
| $H_1$       | = $H$ , but need not be taken greater than 3.5 m  |
| $H_2$       | = $H$ , where $H_{MF}$ is to be taken not less than 2.5 m   |
| $H_9$       | = weather head, $h_1$ , or cargo head, $h_2$ , in metres, as defined in <a href="#">Pt 3, Ch 3, 5 Design loading</a> , whichever is applicable  |
| $S$         | = spacing, in metres, of deck transverses   |

$$S_1 = \frac{l_h}{4} \text{ for hatch end beams}$$

$$= S \text{ for transverses}$$

**Note 1.** Where frames are inclined at more than 15° to the vertical,  $H_{MF}$  or  $H_{TF}$  is to be measured along a chord between span points of the frame.

**Note 2.** If the modulus obtained from (3) for frames under deck transverses exceeds that obtained from (1) and (2), the intermediate frames may be reduced provided that the combined modulus is maintained and the reduction in any intermediate frame is not greater than 35 per cent. The reduced modulus is to be not less than that given by (1)(b).

**Note 3.** The scantlings of main frames are not to be less than those of the 'tween deck frames above.

## CHAPTER 1 General Cargo Ships

## SECTION 7 Single bottom structure

### 7.1 General

- 7.1.1 Requirements are given in this Section for single bottom construction in association with transverse framing, and are generally applicable to the following ships:
- Cargo ships of less than 500 tons gross tonnage,
  - Ships not propelled by mechanical means, and
  - Trawlers and fishing vessels.
- Cases where a single bottom structure is adopted in association with longitudinal framing will be considered.
- 7.1.2 Ships with single bottoms are to have a centre girder fitted. In addition, one side girder is to be fitted on each side of the centreline where  $B$  does not exceed 10 m, and two side girders on each side where  $B$  is greater than 10 m and does not exceed 17 m. In addition, continuous or intercostal longitudinal stiffeners are to be fitted where the panel size exceeds the ratio 4 to 1. Centre and side girders are to extend as far forward and aft as practicable, and where they cut at bulkheads the longitudinal strength is to be maintained.
- 7.1.3 Plate floors are to be fitted at every frame, and the tops of floors, in general, may be level from side to side, but in ships having considerable rise of floor, and towards the ends, the depth of the floor plates is to be increased. Floor plates forming part of a watertight or deep tank bulkhead are to be not less than 900 mm in depth measured at the centreline, and the thickness is to be not less than that required for the bottom strake of a bulkhead.
- 7.1.4 For ships intended to load or unload while aground, [See Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.](#)

**Table 1. 7. 1: Single bottom girders and floors**

| Item              | Depth, in mm  | Thickness, in mm                                    | Face plate area, in cm <sup>2</sup>   |   |
|-------------------|---|---|---|---|
| (1) Centre girder | As for floors   | $t = \sqrt{Lk} + 2$ but not less than 6.0           | $A_f = 0.67Lk$<br>but not less than 12.5 <i>See</i> Notes 2 and 3                       |   |
| (2) Side girders  | As for floors   | $t = \sqrt{Lk}$<br>but not less than 6.0            | $A_f = (0.25L + 5)k$<br>but not less than 10.0 <i>See</i> Note 3                        |   |
| (3) Floors        | Where $B \leq 10$ m<br><br>Where $B > 10$ m<br>( <i>See</i> Note 1) | $d_f = 40(B + T)$<br><br>$d_f = 40(1.5B + T) - 200$ | $t = \frac{s\sqrt{k}}{s_1} \left( \frac{d_f}{100} + 3 \right)$<br>but not less than 6.0 | $A_f = \frac{5Tsk}{s_1} \left( 1 - \frac{2.5}{B} \right)$<br><i>See</i> Notes 2 and 3 |

|   |   |
|---|---|
| Symbols   |   |
| $L, B, T, s, k$ = as defined in <a href="#">Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1</a>   |   |
| $b_f$   | = breadth of face plate, in mm  |
| $d_f$   | = overall depth of floor at the centreline, in mm                     |
| $s_1$   | = a standard frame spacing, in mm, and is to be taken as $2(L + 240)$ |
| $A_f$   | = cross-sectional area of face plate, in $\text{cm}^2$                |
| <p><b>Note 1.</b> If the side frames are attached to the floors by brackets, the Rule depth of floor may be reduced by 15 per cent and the floor thickness determined using the reduced depth. The brackets are to be flanged and have the same thickness as the floors, and their arm lengths clear of the frame and are to be the same as the reduced floor depth given above.</p> <p><b>Note 2.</b> The face plate thickness of floors and centre girder is to be not less than the floor plate thickness.</p> <p><b>Note 3.</b> The thickness of face plates is to be: not less than <math>\frac{b_f}{16\sqrt{k}}</math> nor more than <math>\frac{b_f}{8}</math></p> |   |

7. 1. 5 Provision is made for the free passage of water from all parts of the bottom to the suction, taking into account the pumping rates required.

## 7. 2 Girders and floors

7. 2. 1 The scantlings of girders and floors are to comply with the requirements of [Table 1. 7. 1: Single bottom girders and floors](#).

## CHAPTER 1 General Cargo Ships

## SECTION 8 Double bottom structure

## 8.1 Symbols and definitions

8.1.1 The symbols used in this Section are defined as follows:

$L, B, T$  = as defined in [Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1](#)

$d_{DB}$  = Rule depth of centre girder, in mm

$d_{DBA}$  = actual depth of centre girder, in mm

$h_{DB}$  = head from top of inner bottom to top of over-flow pipe, in metres

$s$  = spacing of stiffeners, in mm

$H_{DB}$  = height from tank top, at position under consideration, to deck at side amidships, in metres

$Z_{BF}$  = section modulus of bottom frame at bracket floor, in cm<sup>3</sup>.

## 8.2 General

- 8.2.1 Except as specified in [Pt 4, Ch 1, 8.2 General 8.2.5](#), cargo ships other than tankers are to be fitted with a double bottom extending from the collision bulkhead to the after peak bulkhead, as far as this is practicable and compatible with the design and proper working of the ship.
- 8.2.2 Where a double bottom is required to be fitted, its depth at the centreline,  $d_{DB}$ , is to be in accordance with [Pt 4, Ch 1, 8.3, Girders 8.3.1](#) and the inner bottom is to be continued out to the ship's side in such a manner as to protect the bottom to the turn of the bilge.
- 8.2.3 Small wells constructed in the double bottom, in connection with drainage arrangements, are not to extend in depth more than necessary. In no case shall the vertical distance from the bottom of such a well to a plane coinciding with the keel line be less than 500 mm or  $B/40$  whichever is greater for passenger ships and cargo ships other than tankers unless compliance for that part of the ship with paragraph 8 of SOLAS Chapter II-1 *Regulation 9 - Double bottoms in passenger ships and cargo ships other than tankers* is demonstrated. Keel line is defined in SOLAS Chapter II-1, Part A, *Regulation 2 - Definitions* and  $B$  is defined in [Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1](#).
- 8.2.4 Other well arrangements (e.g. for lubricating oil under main engines) can be considered provided they give protection equivalent to that afforded by the double bottom. For a cargo ship of 80 m in length and upwards or for a passenger ship, proof of equivalent protection is to be shown by demonstrating that the ship is capable of withstanding bottom damages as specified in paragraph 8 of SOLAS Chapter II-1 *Regulation 9 - Double bottoms in passenger ships and cargo ships other than tankers*. Alternatively, wells for lubricating oil below main engines can protrude into the

double bottom below the boundary line defined by the distance  $B/20$  provided that the vertical distance between the well bottom and a plane coinciding with the keel line is not less than  $B/40$  or 500 mm, whichever is greater. For cargo ships of less than 80 m in length, the arrangements shall provide a level of safety satisfactory to the Flag Administration.

8. 2. 5 A double bottom need not be fitted in way of watertight compartments used exclusively for the carriage of liquids, provided the safety of the ship in the event of bottom damage is not thereby impaired. In addition, a double bottom need not be fitted on the following ships:
  - a. Cargo ships of less than 500 tons gross tonnage.
  - b. Ships not propelled by mechanical means.
  - c. Trawlers and fishing vessels.
8. 2. 6 This Section provides for longitudinal or transverse framing in the double bottom, but for ships exceeding 120 m in length and for ships strengthened for heavy cargoes, longitudinal framing is, in general, to be adopted. For the additional requirements for ships specially strengthened for heavy cargoes, See [Pt 4, Ch 7, 1.3 General class notations](#).
8. 2. 7 For ships intended to load or unload while aground, See [Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground](#).
8. 2. 8 Girders and the side walls of duct keels are to be continuous, and the structure in way is to be sufficient to withstand the forces imposed by dry-docking the ship.
8. 2. 9 Adequate access is to be provided to all parts of the double bottom. The edges of all holes are to be smooth. The size of opening should not, in general, exceed 50 per cent of the double bottom depth, unless edge reinforcement is provided. In way of ends of floors and fore and aft girders at transverse bulkheads, the number and size of holes are to be kept to a minimum, and the openings are to be circular or elliptical. Edge stiffening may be required in these positions.
8. 2. 10 Provision is to be made for the free passage of air and water from all parts of the tank to the air pipes and suctions, account being taken of the pumping rates required. To ensure this, sufficient air holes and drain holes are to be provided in all longitudinal and transverse non-watertight primary and secondary members. The drain holes are to be located as close to the bottom as is practicable, and air holes are to be located as close to the inner bottom as is practicable, See also [Pt 3, Ch 10, 5.3 Openings](#) and [Pt 4, Ch 9, 5.8 Openings in longitudinals](#).

### 8. 3 Girders

8. 3. 1 The minimum depth of the centre girder is to be taken as the greater of the following:
  - a.  $d_{DB} = 28B + 205\sqrt{T}$  mm
  - b.  $d_{DB} = 50B$  mm, but need not be taken as greater than 2000 mm
  - c.  $d_{DB} = 760$  mm.
8. 3. 2 The centre girder thickness is to be not less than:
 
$$t = (0.008d_{DB} + 4)\sqrt{k}$$
 mm  
 nor less than 6.0 mm. The thickness may be determined using the value for  $d_{DB}$  without applying the minimum depths specified in [Pt 4, Ch 1, 8.3 Girders 8.3.1.b](#) and [Pt 4, Ch 1, 8.3 Girders 8.3.1.c](#).
8. 3. 3 **In transversely framed ships** where the breadth,  $B$ , does not exceed 10 m, no side girders are required, and one vertical stiffener is to be fitted to the floors on each side, about midway between the centreline and the margin plate. One side girder is to be fitted where the breadth,  $B$ , exceeds 10 m but does not exceed 20 m, and for greater breadths two girders are to be fitted on each side of the centreline. The non-watertight side girders are to extend as far forward and aft as practicable and are to have a thickness not less than:
 
$$t = (0.008d_{DB} + 1)\sqrt{k}$$
 mm  
 nor less than 6.0 mm.

- 8.3.4 Vertical stiffeners are to be fitted at every bracket floor (See [Pt 4, Ch 1, 8.5 Floors 8.5.7](#)), and are to have a depth not less than the depth of the tank top frame or 150 mm, whichever is the greater. For ships with a length,  $L$ , less than 90 m, stiffeners are to have a depth of not less than  $1.65L$  mm with a minimum of 50 mm. The thickness is to be as required for the girder. Watertight side girders are to have a thickness 1 mm greater than required by [Pt 4, Ch 1, 8.3 Girders 8.3.3](#) for non-watertight side girders. Where the double bottom tanks are interconnected with side tanks or cofferdams, the thickness is to be as for deep tanks (See [Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1](#)) with  $h$ , in metres, measured to the highest point at the side tank or cofferdam.
- 8.3.5 **In longitudinally framed ships** one side girder is to be fitted where the breadth,  $B$ , exceeds 14 m, and two girders are to be fitted on each side of the centreline where  $B$  exceeds 21 m. The girders are to extend as far forward and aft as practicable and are to have a thickness not less than:
- $$t = (0.0075d_{DB} + 1)\sqrt{k}\text{mm}$$
- nor less than 6.0 mm.
- In general, a vertical stiffener, having a depth not less than 100 mm and a thickness equal to the girder thickness, is to be arranged midway between floors.
- 8.3.6 **Watertight side girders** are to have a plating thickness corresponding to the greater of the following:
- $t = (0.0075d_{DB} + 2)\sqrt{k}\text{mm}$ , or
  - thickness  $t$  as for deep tanks (See [Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1](#)) with  $h$ , in metres, measured to the highest point of the side tank, or cofferdam if the double bottom is interconnected with these tanks.
- 8.3.7 Watertight side girder stiffeners are to be in accordance with the requirements for watertight floors, See [Pt 4, Ch 1, 8.5 Floors 8.5.4](#) and [Pt 4, Ch 1, 8.5 Floors 8.5.5](#).
- 8.3.8 **Duct keels**, where arranged, are to have a thickness of side plates corresponding to the greater of the following:
- $t = (0.008d_{DB} + 2)\sqrt{k}\text{mm}$ , or
  - thickness  $t$ , as for deep tanks, (See [Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1](#)) with  $h$ , in metres, measured to the highest point of the side tank, or cofferdam if the double bottom tank is interconnected with these tanks.
- 8.3.9 The sides of duct keels are, in general, to be spaced not more than 2.0 m apart. Where the sides of the duct keels are arranged on either side of a centreline or side girder, each side is, in general, to be spaced not more than 2.0 m from the centreline or side girder. The inner bottom and bottom shell within the duct keel are to be suitably stiffened. The primary stiffening in the transverse direction is to be suitably aligned with the floors in the adjacent double bottom tanks. Where the duct keels are adjacent to double bottom tanks which are interconnected with side tanks or cofferdams, the stiffening is to be in accordance with the requirements for deep tanks, See [Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1](#). Access to the duct keel is to be by watertight manholes or trunks.
- 8.3.10 The buckling requirements of [Pt 3, Ch 4, 7 Hull buckling strength](#) are also to be satisfied.

## 8.4 Inner bottom plating and stiffening

- 8.4.1 The thickness of the inner bottom plating in the holds is to be not less than:
- $$t = 0.00136(s + 660)\sqrt[4]{k^2LTnm}$$
- nor less than 6.5 mm in holds and 7.5 mm under hatchways if no ceiling is fitted.
- 8.4.2 The thickness of the inner bottom plating as determined in [Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening 8.4.1](#) is to be increased by 2 mm under the hatchways if no ceiling is fitted. If cargo is to be regularly discharged by grabs, See [Pt 4, Ch 1, 2.2 Protection of steelwork 2.2.2](#).

8. 4. 3 A margin plate, if fitted, is to have a thickness throughout 20 per cent greater than that required for inner bottom plating.
8. 4. 4 Where the double bottom tanks are common with side tanks or cofferdams, the thickness of the inner bottom plating is to be not less than that required for deep tanks (See [Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1](#)), with  $h$ , in metres, taken to the highest point of the side tank or cofferdam, and  $K_1$  is to be taken as 'elsewhere'.
8. 4. 5 Inner bottom longitudinals, or tank top frames at bracket floors within the range of cargo holds, are to have a section modulus not less than 85 per cent of the Rule value for bottom longitudinals (See [Pt 4, Ch 1, 6.2 Longitudinal stiffening 6.2.1](#)) or bottom frames in way of bracket floors (See [Pt 4, Ch 1, 6.3 Transverse stiffening 6.3.1](#)), whichever is applicable. The unsupported span of tank top frames is generally not to exceed 2.5 m. Where the double bottom tanks are interconnected with side tanks, hopper and topside tanks or cofferdams, the scantlings are to be not less than those required for deep tanks, See [Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1](#). For higher tensile steel inner bottom longitudinals the requirements of [Pt 4, Ch 1, 6.2 Longitudinal stiffening 6.2.2](#) are to be complied with where applicable.
8. 4. 6 The buckling requirements of [Pt 3, Ch 4, 7 Hull buckling strength](#) are also to be satisfied.

## 8. 5 Floors

8. 5. 1 **In longitudinally framed ships**, plate floors are to be fitted under bulkheads and elsewhere at a spacing not exceeding 3.8 m. The thickness of non-watertight plate floors is to be not less than:
- $$t = (0.009d_{DB} + 1)\sqrt{k}\text{mm}$$
- nor less than 6.0 mm. The thickness need not be greater than 15 mm, but the ratio between the depth of the double bottom and the thickness of the floor is not to exceed  $130\sqrt{k}$ . This ratio may, however, be exceeded if suitable additional stiffening is fitted. Vertical stiffeners are to be fitted at each longitudinal, having a depth not less than 150 mm and a thickness equal to the thickness of the floors. For ships of length,  $L$ , less than 90 m, the depth is to be not less than  $1.65L$  mm, with a minimum of 50 mm.
8. 5. 2 The thickness of watertight floors for longitudinally framed ships is to be not less than:
- $t = (0.008d_{DB} + 3)\sqrt{k}\text{mm}$ , or
  - $t = (0.009d_{DB} + 1)\sqrt{k}\text{mm}$
  - whichever is the greater,
- but need not exceed 15 mm on floors of normal depth. The thickness is also to satisfy the requirements for deep tanks (See [Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1](#)) with  $h$ , in metres, taken to the highest point of the side tank, or cofferdam if the double bottom tank is interconnected with these tanks. The scantlings of stiffeners are to be in accordance with the requirements of [Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1](#) for deep tanks, or as required by [Pt 4, Ch 1, 8.5 Floors 8.5.4](#) whichever is the greater. The stiffeners are to be connected to the inner bottom and shell longitudinals.
8. 5. 3 Between plate floors, transverse brackets having a thickness not less than  $0.009d_{DB}$  mm are to be fitted, extending from the centre girder and margin plate to the adjacent longitudinal. The brackets, which are to be suitably stiffened at the edge, are to be fitted at every frame at the margin plate, and those at the centre girder are to be spaced not more than 1.25 m.
8. 5. 4 **In transversely framed ships**, plate floors are to be fitted under bulkheads, in way of change in depth of double bottom and elsewhere at a spacing not exceeding 3.0 m. The shell inner bottom plating between these floors is to be supported by bracket floors. The thickness of non-watertight plate floors is to be not less than:
- $$t = (0.008d_{DB} + 1)\sqrt{k}\text{mm}$$

but need not exceed 15 mm and is to be not less than 6 mm. Watertight or strengthened floors are to be fitted below, or in the vicinity of, watertight bulkheads, and their thickness is to be 2 mm greater than that derived above for non-watertight floors, but need not exceed 15 mm on floors of normal depth. If the depth of such floors exceeds 915 mm but does not exceed 2000 mm, the floors are to be fitted with vertical stiffeners spaced not more than 915 mm apart and having a section modulus not less than:

$$Z = 5.41d_{DBA}^2 h_{DB} s k \times 10^{-9} \text{ cm}^3$$

The ends of the stiffeners are to be sniped.

8. 5. 5 Where the double bottom tanks are interconnected with side tanks or cofferdams, or where the depth of floor exceeds 2000 mm, the scantlings of watertight floors are to be not less than those required for deep tanks (*See Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1*), and the ends of the stiffeners are to be bracketed top and bottom.
8. 5. 6 Where floors form the boundary of a sea inlet box, the thickness of the plating is to be the same as the adjacent shell, but not less than 12.5 mm and need not exceed 25 mm. The scantlings of stiffeners, where required are, in general, to comply with [Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1](#) for deep tanks. Sniped ends for stiffeners on the boundaries of these spaces are to be avoided wherever practicable. The stiffeners should be bracketed or the free end suitably supported to provide alignment with backing structure.
8. 5. 7 **Where bracket floors** are fitted, the bottom frames are to be derived from [Pt 4, Ch 1, 6.3 Transverse stiffening 6.3.1](#). The unsupported span of the frames is not to exceed 2.5 m. The breadth of the brackets attaching the frames and the reverse frames to the centre girder and margin plate is to be three-quarters of the depth of the centre girder. The brackets are to be flanged on the unsupported edge and are to have the same thickness as the plate floors.
8. 5. 8 **Where struts** are fitted to reduce the unsupported span of the frames, reverse frames and longitudinals, they are to have a cross-sectional area of not less than:
  - a.  $A = 0.32Z_{BF}\text{cm}^2$  for  $Z_{BF} \leq 83.5$ , or
  - b.  $A = 23.2 + \frac{Z_{BF}}{25} \text{cm}^2$  for  $Z_{BF} > 83.5$

where  $Z_{BF}$  is the modulus, in  $\text{cm}^3$ , of the frame or longitudinal based on the effective length between floors as defined in [Pt 3, Ch 3, 3 Structural idealisation](#).

PART

# 4

CHAPTER **1 General Cargo Ships**

SECTION **9 Bulkheads**

## 9.1 General

- 9.1.1 The requirements of this Section cover watertight and deep tank transverse and longitudinal bulkheads. Requirements are also given for shaft tunnel boundaries and non-watertight bulkheads. For transverse bulkheads in way of ballast holds, stools may be required, *See [Pt 4, Ch 7, 10.2 Bulkheads supported by stools](#)*.
- 9.1.2 The requirements of this Section apply to a vertical system of stiffening on bulkheads. They may also be applied to a horizontal system of stiffening provided that equivalent end support and alignment are provided.
- 9.1.3 For number and disposition of transverse watertight bulkheads, *See [Pt 3, Ch 3, 4 Bulkhead requirements](#)*.
- 9.1.4 The buckling requirements of [Pt 3, Ch 4, 7 Hull buckling strength](#) are also to be satisfied.

## 9.2 Watertight and deep tank bulkheads

- 9.2.1 The scantlings of watertight and deep tank bulkheads are to comply with the requirements of [Table 1. 9. 1: Watertight and deep tank bulkhead scantlings](#) to [Table 1. 9. 3: Bulkhead end constraint factors](#). Where bulkhead stiffeners support deck girders, transverses or pillars over, the requirements of [Pt 4, Ch 1, 4.4 Deck supporting structure 4.4.11](#) are also to be satisfied.
- 9.2.2 In way of partially filled holds or tanks, the scantlings and structural arrangements of the boundary bulkheads are to be capable of withstanding the loads imposed by the movement of the liquid in those spaces. The magnitude of the predicted loadings, together with the scantling calculations may require to be submitted, *See [Pt 3, Ch 3, 5.4 Design pressure for partially filled tanks](#)*.
- 9.2.3 In deep tanks, fuel oil or oil carried as cargo is to have a flash point of 60°C or above (closed-cup test). Where tanks are intended for other liquid cargoes of a special nature the scantlings and arrangements will be considered in relation to the nature of the cargo.
- 9.2.4 Where watertight bulkhead stiffeners are cut in way of watertight doors in the lower part of a bulkhead, the opening is to be suitably framed and reinforced. Where stiffeners are not cut but the spacing between the stiffeners is increased on account of watertight doors, the stiffeners at the sides of the doorways are to be increased in depth and strength so that the efficiency is at least equal to that of the unpierced bulkhead, without taking the stiffness of the door frame into consideration. Watertight recesses in bulkheads are generally to be so framed and stiffened as to provide strength and stiffness equivalent to the requirements for watertight bulkheads.
- 9.2.5 A centreline bulkhead is, generally, to be fitted in deep tanks which extend from side to side of the ship and are intended for the carriage of fuel oil for the ship's use. The bulkhead may be intact or perforated as desired. If intact, the scantlings are to be as required for boundary bulkheads. If perforated, the modulus of the stiffeners may be 50 per cent of that required for boundary

bulkheads, using  $h_4$  measured to the crown of the tank. The stiffeners are to be bracketed at top and bottom. The area of perforation is to be not less than five per cent nor more than 10 per cent of the total area of the bulkhead. Where brackets from horizontal girders on the boundary bulkheads terminate at the centreline bulkhead, adequate support and continuity are to be maintained.

### 9.3 Shaft tunnels

- 9.3.1 Where shaft tunnels are required as specified in [Pt 3, Ch 3, 4 Bulkhead requirements](#) the thickness of the tunnel plating is to comply with [Table 1.9.1: Watertight and deep tank bulkhead scantlings](#) for holds or deep tanks as appropriate. If the top plating is well curved, the thickness may be reduced by 10 per cent in dry cargo holds. If the top plating is flat, it is to be not less than 1.1 times the thickness required for watertight bulkheads in dry cargo holds. Under hatchways the top plating is to be increased by 2 mm, unless covered with wood not less than the thickness specified in [Pt 4, Ch 1, 2.2 Protection of steelwork 2.2.2](#), which is to be secured by fastenings which do not penetrate the plating. Where it is intended to use plywood or other forms of ceiling of an approved type instead of planking, the thickness will be considered in each case. The tunnel stiffeners are to comply with [Table 1.9.1: Watertight and deep tank bulkhead scantlings](#) for holds or deep tanks, as appropriate. When the section modulus of curved stiffeners is determined, the values of  $\omega_1$  and  $\omega_2$  are to be taken as 1.0. The span of the stiffener,  $l_e$ , is to be taken as the overall height of the tunnel, measured vertically at the centreline of the tunnel. If the tunnel top is flat, scantlings of the stiffeners are also to comply with [Pt 4, Ch 1, 4.3 Deck stiffening](#). The lower end connection to the tank top is to be welded. Additional strengthening is to be fitted under the heels of pillars or masts stepped on the tunnel.

**Table 1.9.1: Watertight and deep tank bulkhead scantlings**

| Item and requirement   | Watertight bulkheads  | Deep tank bulkheads  |
|--|---|--|
| (1) Plating thickness for plane, symmetrically corrugated and double plate bulkheads                     | $t = 0.004sf\sqrt{h_4k}$ mm<br>but not less than 5.5 mm   | $t = 0.004sf\sqrt{\frac{\rho h_4 k}{1.025}} + 2.5$ mm<br>but not less than 6.5 mm, where $L < 90$ m<br>not less than 7.5 mm, where $L \geq 90$ m |
|  | In the case of symmetrical corrugations, $s$ is to be taken as $b$ or $c$ in <a href="#">Figure 3.3.1: Corrugation dimensions</a> in Pt 3, Ch 3, whichever is the greater |  |
| (2) Modulus of rolled and built stiffeners, swedges, double plate bulkheads and symmetrical corrugations | $Z = \frac{skh_4 l_e^2}{71\gamma(\omega_1 + \omega_2 + 2)} \text{ cm}^3$<br>In the case of symmetrical corrugations, $s$ is to be taken as $p$ , See also Note 2          | $Z = \frac{skh_4 l_e^2}{22\gamma(\omega_1 + \omega_2 + 2)} \text{ cm}^3$   |
| (3) Inertia of rolled and built stiffeners and swedges   | —   | $I = \frac{2.3}{k} l_e Z \text{ cm}^4$   |

|  |  |  |
|--|--|--|
| (4) Symmetrical corrugations and double plate bulkheads  | Additional requirements to be complied with as detailed in <a href="#">Table 1.9. 2: Symmetrical corrugations and double plate bulkheads (additional requirements)</a> |  |
| (5) Stringers or webs supporting vertical or horizontal stiffening   |  |  |
| (a) Modulus  | $Z = 5.5kh_4Sle^2 \text{ cm}^3$  | $Z = 11.7\rho kh_4Sl_e^2 \text{ cm}^3$ |
| (b) Inertia  | —  | $I = \frac{2.5}{k} l_e Z \text{ cm}^4$ |
| Symbols  |  |  |
| <p><math>s, S, I, k, \rho</math> as defined in <a href="#">Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1</a></p> <p><math>d_w</math> = web depth of stiffening member, in mm</p> <p><math>f</math> = <math>1.1 - \frac{s}{2500S}</math> but not to be taken greater than 1.0</p> <p><math>h_4</math> = load head, in metres measured as follows:</p> <p>For watertight bulkhead plating, the distance vertically from a point one-third of the height of the plate above its lower edge to a point 0.91 m above the bulkhead deck at side or perpendicular to the deepest equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater, <i>See also</i> <a href="#">Figure 3.5. 2: Heads for watertight and deep tank bulkheads</a> in Pt 3, Ch 3</p> <p>For deep tank bulkhead plating, the distance from a point one-third of the height of the plate above its lower edge to the top of the tank, or half the distance to the top of the overflow, whichever is the greater, <i>See also</i> <a href="#">Figure 3.5. 2: Heads for watertight and deep tank bulkheads</a> in Pt 3, Ch 3</p> <p>For watertight bulkhead stiffeners or girders, the distance vertically from the middle of the effective length to a point 0.91 m above the bulkhead deck at sideside, or perpendicular to the deepest equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater, <i>See also</i> <a href="#">Figure 3.5. 2: Heads for watertight and deep tank bulkheads</a> in Pt 3, Ch 3</p> <p>For deep tank bulkhead stiffeners or girders, the distance from the middle of the effective length to the top of the tank, or half the distance to the top of the overflow, whichever is the greater, <i>See also</i> <a href="#">Figure 3.5. 2: Heads for watertight and deep tank bulkheads</a></p> <p><math>l_e</math> = effective length of stiffening member, in metres, and for bulkhead stiffeners, to be taken as <math>l - e_1 - e_2</math>, <i>See also</i> <a href="#">Figure 1.9. 1: End connections</a></p> <p><math>p</math> = spacing of corrugations as shown in Figure 3.3.1 Corrugation dimensions</p> <p><math>\gamma</math> = 1.4 for rolled or built sections and double plate bulkheads</p> <p style="padding-left: 20px;">= 1.6 for flat bars</p> <p style="padding-left: 20px;">= 1.1 for symmetrical corrugations of deep tank bulkheads</p> <p style="padding-left: 20px;">= 1.0 for symmetrical corrugations of watertight bulkheads</p> <p><math>\omega_e</math> = as defined in <a href="#">Table 1.9. 3: Bulkhead end constraint factors</a>, <i>See also</i> <a href="#">Figure 1.9. 1: End connections</a></p> |  |  |

**Note 1.** In no case are the scantlings of deep tank bulkheads to be less than the requirements for watertight bulkheads where watertight bulkheads are required by [Pt 3, Ch 3, 5 Design loading](#).

**Note 2.** In calculating the actual modulus of symmetrical corrugations the panel width  $b$  is not to be taken greater than that given by [Pt 3, Ch 3, 3.2, Geometric properties of section](#)

**Note 3.** For rolled or built stiffeners with flanges or face plates, the web thickness is to be not less than  $\frac{d_w}{60\sqrt{k}}$  whilst for flat bar stiffeners the web thickness is to be not less than  $\frac{d_w}{60\sqrt{k}}$

**Figure 1. 9. 1: End connections**

|   |   | $d$             | —   | To be not less than: $39l_e$ mm   |
|   |   | $\theta$        | To be not less than $40^\circ$  |   |
| <b>Note 1.</b> The plating thickness at the middle of span $l_e$ of corrugated or double plate bulkheads is to extend not less than $0.2l_e$ m above mid span.<br><b>Note 2.</b> Where the span of corrugations exceeds 15 m, a diaphragm plate is to be arranged at about mid-span.<br><b>Note 3.</b> <i>See also</i> <a href="#">Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members 5.2.1.</a>  | Double plate, <i>See also</i> Notes 1 and 3             | $\frac{s}{t}$   | Not to exceed: $75\sqrt{k}$ at top, and $65\sqrt{k}$ at bottom  |   |
|   |   | $\frac{d}{t_w}$ | Not to exceed: $85\sqrt{k}$ at top, and $75\sqrt{k}$ at bottom  |   |
|   |   | $d$             | —   | To be not less than: $39l_e$ mm   |
|   |   | $A_w$           | To be not less than: $\frac{0.12Z}{l_e} \text{cm}^2$ at top and $\frac{0.18Z}{l_e} \text{cm}^2$ at bottom | To be not less than: $\frac{0.07Z}{l_e} \text{cm}^2$ at top and $\frac{0.10Z}{l_e} \text{cm}^2$ at bottom |

**Table 1. 9. 3: Bulkhead end constraint factors**

| Type                                   | End connection ( <i>See</i> <a href="#">Figure 1. 9. 1: End connections</a> )                                      |  | $\omega$  | $e$                | $\mu$ |
|--|--|--|---|--------------------|-------|
| Rolled or built stiffeners and swedges |  |  |   |                    |       |
| 1                                      | End of stiffeners unattached or attached to plating only   |  | 0   | 0                  | —     |
| 2                                      | Members with webs and flanges (or bulbs) in line and attached at deck or horizontal girder, <i>See also</i> Note 1 | Adjacent member of B of smaller modulus        | The lesser of<br>$\frac{4.5Z_B}{M_1}$<br>or 1.0 | 0                  | —     |
| 3                                      |  | Adjacent member of B of same or larger modulus | 1.0   | 0                  | —     |
| 4                                      | Bracketless connection to longitudinal member  | Member A within length $l$                     | 1.0   | $\frac{d_A}{1000}$ | —     |
| 5                                      |  | Member A outside length $l$                    | 1.0   | 0                  | —     |

|  |   |   |                          |  |                                   |  |
|--|---|---|--------------------------|--|-----------------------------------|--|
| 6  | Bracketed connection  | To transverse member  | Bracket extends to floor | 1.0  | The lesser of $\beta a$ or $0.1l$ | —  |
| 7  |   | Otherwise   | 1.0                      | 0  | —                                 |  |
| 8  |   | To longitudinal member  |                          | 1.0  | The lesser of $\beta a$ or $0.1l$ | —  |
| Symmetrical corrugations or double plate bulkheads |   |   |                          |  |                                   |  |
| 9  | Welded directly to deck—no bulkhead in line   | No longitudinal brackets  |                          | 0  | 0                                 | —  |
| 10   |   | With longitudinal brackets and transverse stiffeners supporting corrugated bulkhead |                          | The lesser of $\frac{\delta t_e}{t_m}$ or 1.0  | 0                                 | —  |
| 11   | Welded directly to deck or girder   | Bulkhead B, having same section, in line  |                          | The least of $\frac{\delta t_f}{t_m}$ or $\frac{\delta t_e}{t_m}$ or 1.0   | 0                                 | —  |
| 12   | Welded directly to tank top and effectively supported by floors in line with each bulkhead flange, <i>See also</i> Note 2 | Thickness at bottom same as that at mid-span  |                          | The least of $\frac{\delta t_f}{t_m}$ or $\frac{\delta t_e}{t_m}$ or 1.0   | 0                                 | —  |
| 13   |   | Thickness at bottom greater than that at mid-span                                   |                          | The least of $\frac{\delta t_f}{t_m}$ or $\frac{\delta t_e}{t_m}$ or 1.0   | The lesser of $a/l$ or $a$        | The lesser of $\frac{t_f}{t_m}$ or $\frac{t_e}{t_m}$ |
| 14   | Welded to stool efficiently supported by ship's structure   |   |                          | For deep tank bulkheads 1.0<br>For watertight bulkheads the least of $\frac{\delta t_s}{t_m}$ or $\frac{\delta t_e}{t_m}$ or 1.0 | The lesser of $a/l$ or $a$        | $\frac{10Z_s}{M_2}$                                  |
| Symbols  |   |   |                          |  |                                   |  |

|                  | 1. 1 Application .....                                  | 1513        |
|                  | 1. 2 Structural configuration .....                     | 1514        |
|                  | 1. 3 Class notations.....                               | 1515        |
|                  | 1. 4 Information required .....                         | 1516        |
|                  | 1. 5 Symbols .....                                      | 1516        |
| <b>SECTION 2</b> | <b>Longitudinal strength</b> .....                      | <b>1518</b> |
|                  | 2. 1 General .....                                      | 1518        |
|                  | 2. 2 Calculation of hull section modulus .....          | 1518        |
|                  | 2. 3 Still water bending moments and shear forces ..... | 1519        |
|                  | 2. 4 Design vertical wave bending moments .....         | 1519        |
|                  | 2. 5 Design wave shear force.....                       | 1522        |
|                  | 2. 6 Buckling strength.....                             | 1523        |
| <b>SECTION 3</b> | <b>Deck structure</b> .....                             | <b>1525</b> |
|                  | 3. 1 Loading .....                                      | 1525        |
|                  | 3. 2 Deck stiffening.....                               | 1527        |
|                  | 3. 3 Deck supporting primary structure.....             | 1528        |
| <b>SECTION 4</b> | <b>Shell envelope plating</b> .....                     | <b>1529</b> |
|                  | 4. 1 Bottom and side shell .....                        | 1529        |
|                  | 4. 2 Bow flare and wave impact pressures .....          | 1530        |
|                  | 4. 3 Strengthening for wave impact loads.....           | 1534        |
| <b>SECTION 5</b> | <b>Shell envelope framing</b> .....                     | <b>1536</b> |
|                  | 5. 1 Side structure.....                                | 1536        |
|                  | 5. 2 Strengthening for wave impact loads.....           | 1537        |
| <b>SECTION 6</b> | <b>Double bottom</b> .....                              | <b>1542</b> |

|                   |   |             |
|-------------------|---|-------------|
| 6. 1              | General .....   | 1542        |
| 6. 2              | Transmission of pillar loads .....  | 1542        |
| 6. 3              | Ferries and passenger ships with a specified operating area service ..... | 1543        |
| <b>SECTION 7</b>  | <b>Peak, watertight and deep tank bulkheads.....</b>                      | <b>1544</b> |
| 7. 1              | General .....   | 1544        |
| 7. 2              | Ferries and passenger ships with a specified operating area service ..... | 1544        |
| <b>SECTION 8</b>  | <b>Bow doors and inner doors .....</b>                                    | <b>1545</b> |
| 8. 1              | Symbols .....   | 1545        |
| 8. 2              | General .....   | 1548        |
| 8. 3              | Scantlings .....  | 1548        |
| 8. 4              | Vehicle ramps .....   | 1550        |
| 8. 5              | Arrangements for the closing, securing and supporting of doors ...        | 1550        |
| 8. 6              | Design of securing and supporting devices .....                           | 1550        |
| 8. 7              | Operating and Maintenance Manual.....                                     | 1553        |
| <b>SECTION 9</b>  | <b>Subdivision structure on vehicle deck .....</b>                        | <b>1555</b> |
| 9. 1              | General .....   | 1555        |
| 9. 2              | Design loads .....  | 1555        |
| 9. 3              | Height of subdivision structure .....                                     | 1557        |
| 9. 4              | Material .....  | 1557        |
| 9. 5              | Scantlings of subdivision structure other than doors.....                 | 1557        |
| 9. 6              | Scantlings of subdivision doors .....                                     | 1557        |
| 9. 7              | Closing, securing and supporting of subdivision doors .....               | 1558        |
| 9. 8              | Access doors .....  | 1559        |
| 9. 9              | Watertightness and drainage.....  | 1559        |
| 9. 10             | Ventilation of vehicle deck spaces.....                                   | 1560        |
| 9. 11             | Operating and Maintenance Manual.....                                     | 1560        |
| <b>SECTION 10</b> | <b>Masts and standing rigging .....</b>                                   | <b>1561</b> |
| 10. 1             | General .....   | 1561        |
| 10. 2             | Design loadings and allowable stresses .....                              | 1561        |
| 10. 3             | Materials of mast construction.....                                       | 1562        |
| 10. 4             | Standing rigging .....  | 1562        |
| 10. 5             | Design loadings.....  | 1563        |
| 10. 6             | Shroud and stay attachment points .....                                   | 1563        |
| 10. 7             | Materials for rigging.....  | 1564        |

|                   |   |             |
|-------------------|---|-------------|
| 10. 8             | Testing and certification .....                               | 1564        |
| <b>SECTION 11</b> | <b>Miscellaneous openings .....</b>                           | <b>1565</b> |
| 11. 1             | General .....   | 1565        |
| 11. 2             | Openings in main vehicle deck.....                            | 1565        |
| 11. 3             | Strength assessment of windows in large passenger ships ..... | 1566        |
| 11. 4             | Frame design and testing .....                                | 1568        |
| 11. 5             | Strength of mullions .....                                    | 1568        |
| 11. 6             | Bonded windows and side scuttles.....                         | 1569        |
| <b>SECTION 12</b> | <b>External glass balustrades .....</b>                       | <b>1572</b> |
| 12. 1             | General .....   | 1572        |
| 12. 2             | Design considerations .....                                   | 1572        |

CHAPTER 2 **Ferries, Roll On-Roll Off Ships and Passenger Ships**SECTION 1 **General****1. 1 Application**

1. 1. 1 This Chapter applies to seagoing passenger ships and ferries, including those with roll on-roll off capability, as well as passenger yachts, sailing passenger ships, roll on-roll off cargo ships and vehicle carriers defined as follows:
- a. A **passenger ship** is defined as a ship specially designed and constructed for the carriage of more than 12 passengers.
  - b. A **passenger ferry** is defined as a ship specially designed and constructed for the carriage of more than 12 passengers on a regular scheduled service between specified ports operating in reasonable weather conditions. Reasonable weather is defined in [Pt 1, Ch 2, 2.1 Definitions 2.1.5](#)
  - c. A **roll on-roll off passenger ship** is defined as a ship specially designed and constructed for the carriage of more than 12 passengers, as well as the carriage of vehicles accessed by means of ramps and doors located at the bow, stern or through the side shell, or any combination thereof.
  - d. A **roll on-roll off passenger ferry** is defined as a ship specially designed and constructed for the carriage of more than 12 passengers, as well as the carriage of vehicles accessed by means of ramps and doors located at the bow, stern or through the side shell, or any combination thereof where the ferry is on regular scheduled service between specified ports operating in reasonable weather. Reasonable weather is defined in [Pt 1, Ch 2, 2.1 Definitions 2.1.5](#)
  - e. A **passenger/vehicle ferry** has the same definition as a roll on-roll off passenger ferry.
  - f. A **passenger yacht** is defined as a yacht that is specially designed and constructed in accordance with National Administration requirements for passenger yachts.
  - g. A **sailing passenger ship** is defined as a ship specially designed and constructed for the carriage of more than 12 passengers and incorporating sail devices which are intended to be the primary means of propulsion.
  - h. A **roll on-roll off cargo ship** is defined as a ship specially designed and constructed for the carriage of vehicles and cargo in pallet form or in containers, loaded/unloaded by wheeled vehicles and accessed by means of ramps and doors located at the bow, stern or through the side shell, or any combination thereof.
  - i. A **vehicle carrier**, sometimes referred to as a pure car carrier or a pure car/truck carrier, is defined as a ship specially designed and constructed for the carriage of large numbers of vehicles, accessed by means of ramps and doors located at the stern and/or through the side shell.
1. 1. 2 Ships intended to operate only in certain areas or conditions which have been agreed by the Committee, as defined in [Pt 1, Ch 2 Classification Regulations](#), will receive individual

consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval.

1. 1. 3 The scantlings and arrangements are to be as required by [Pt 4, Ch 1 General Cargo Ships](#) except as otherwise specified in this Chapter.
1. 1. 4 The scantlings of the primary supporting structure for multi-decked passenger ships are to be assessed by direct calculation, in accordance with the *ACSPlus Structural Design Assessment Guideline* for passenger ships, wherever:
  - a. the superstructure will be subjected to significant load from flexure of the hull girder; or
  - b. it is required to utilise the load-carrying capability of the superstructure for longitudinal strength; or
  - c. a limited number of transverse bulkheads above the bulkhead deck are present to carry the racking response ; or
  - d. as required by ACS.

See also [Pt 4, Ch 2, 1.3 Class notations 1.3.7](#) and [Pt 4, Ch 2, 1.3 Direct calculation](#).
1. 1. 5 A multi-decked ship is generally defined as a ship having one or more continuous decks above the bulkhead deck which contribute to the global strength of the ship. The efficiency of decks can vary in conjunction with their length, scantlings arrangement and materials.
1. 1. 6 The scantlings of the primary supporting structure of a vehicle ferry, passenger/vehicle ferry, roll on–roll off cargo ship, roll on–roll off passenger ship or vehicle carrier are to be assessed by direct calculation in accordance with the *ACSPlus Structural Design Assessment Guideline* for Ro–Ro ships and the *ACSPlus Construction Monitoring Guideline*. See also [Pt 4, Ch 2, 1.3 Class notations 1.3.7](#) and [Pt 4, Ch 2, 1.3 Direct calculation](#).
1. 1. 7 For the purpose of providing operational information to the Master for safe return to port after a flooding casualty, passenger ships having a Load Line length of 120 m or more or having three or more main vertical zones are to have:
  - a. an onboard stability computer; or
  - b. shore-based support.

Where an onboard computer system having a stability computation capability is provided, the system is to be certified in accordance with ACS’s document entitled *Approval of Longitudinal Strength and Stability Calculations Programs*, See also [Pt 1, Ch 2, 1.1 General 1.1.11](#).

## 1. 2 Structural configuration

1. 2. 1 The requirements provide for a basic structural configuration of a multi-deck hull which includes a double bottom, and in some cases wing tanks up to the lowest deck.
1. 2. 2 For passenger ships, the structural arrangements detailed in Chapter II-1, Part B, of the *International Convention for the Safety of Life at Sea, 1974*, and applicable amendments as they apply to passenger ships are to be complied with in their entirety.
1. 2. 3 Where bulkheads are omitted in accordance with [Pt 3, Ch 3, 4 Bulkhead requirements](#), a system of partial bulkheads, web frames and deck transverses should be fitted to provide equivalent transverse strength.
1. 2. 4 Longitudinal framing is, in general, to be adopted at the strength deck and at the bottom, but special consideration will be given to proposals for transverse framing in these regions.
1. 2. 5 Reference should be made to the Regulations of the *International Convention for the Safety of Life at Sea, 1974* and applicable amendments and to the relevant Statutory Requirements of the National Authority of the country in which the ship is to be registered.
1. 2. 6 Attention is also drawn to the requirements for passenger ships given in:
  - Bulkhead requirements, See [Pt 3, Ch 3, 4 Bulkhead requirements](#)

- Closing arrangements for shell, deck and bulkheads, *See* [Pt 3, Ch 11, 6 Miscellaneous openings](#), [Pt 3, Ch 11, 8 Side and stern doors and other shell openings](#) and [Pt 3, Ch 11, 9 Watertight doors in bulkheads below the freeboard deck](#)
  - Electrical installations, *See* [Pt 6, Ch 2 Electrical Engineering](#)
  - Fire protection, detection and extinction, *See* SOLAS Reg. II-2 *Part B - Prevention of fire and explosion* and *Part C - Suppression of fire*.
1. 2. 7 Attention is drawn to National Authority requirements relating to the stowage and securing of vehicles and cargo units on board roll on-roll off ships. Steel used for the construction of fixed securing fittings attached to the ship's structure is to comply with the requirements of [Pt 2 Rules for the Manufacture, Testing and Certification of Materials](#) , or with an equivalent acceptable specification. Due account is to be taken of the grade and tensile strength of the hull material in way of the attachment and the chemical composition of the steel is to be such as to ensure acceptable qualities of weldability.
1. 2. 8 Sailing passenger ships are to be fitted with auxiliary propulsive power to ensure adequate speed and manoeuvrability of the vessel in conditions when the sail systems are not available for use. The auxiliary propulsion and other essential machinery are to comply with the requirements of [Pt 5 Main and Auxiliary Machinery](#) of the Rules, as applicable.
1. 2. 9 Sail systems may be made up in the form of soft sails, semi-rigid and rigid sail configurations including wind turbines or systems incorporating rotating cylinders.
1. 2. 10 For sailing vessels, a continuous visual read out of the apparent wind speed and direction is to be available to the ship's master when the vessel is under way. Sail control and service systems are to provide adequate speed of response to neutralise the sail system in the event of high wind conditions. Sufficient information and evidence is to be submitted to substantiate that the foregoing arrangements are in place.
1. 2. 11 For sailing passenger ships, the Rules for classification will, in principle, apply to the mast arrangements and standing gear, but will exclude running gear, yards, booms and sail arrangements.
1. 2. 12 For sailing passenger ships, the equipment requirements will be in accordance with the letter and numeral two grades higher than that corresponding to the calculated Equipment Numeral.

### 1. 3 Class notations

1. 3. 1 In general, ships complying with the requirements of this Chapter will be eligible to be classed:
- '100A1 passenger ship', or
  - '100A1 passenger ferry', or
  - '100A1 roll on-roll off passenger ship', or
  - '100A1 roll on-roll off passenger ferry', or
  - '100A1 passenger/vehicle ferry', or
  - '100A1 passenger yacht', or
  - '100A1 sailing passenger ship', or
  - '100A1 roll on-roll off cargo ship', or
  - '100A1 vehicle carrier'.
1. 3. 2 متنى وجود ندارد

1. 3. 3 A ship assigned a class notation incorporating the word 'passenger', which is also designed to fulfil other functions not associated with passenger carrying is to comply with the requirements of this Chapter for passenger ships together with the requirements of the relevant Chapter of this Part for the particular ship type.
1. 3. 4 Where ferries are specially reinforced for the carriage of trains on fixed rails, the class notation will also include the word 'train'.
1. 3. 5 The Regulations for the classification and assignment of class notations are given in [Pt 1, Ch 2 Classification Regulations](#), to which reference should be made.
1. 3. 6 The 'ACSPPlus Guidelines' for hull construction of ships are detailed in [Pt 3, Ch 16 ACSPPlus Guidelines for the Design, Construction and Lifetime Care of Ships](#) and the classification notations and descriptive notes associated with these procedures are given in [Pt 1, Ch 2, 2 Character of classification and class notations](#).
1. 3. 7 The 'Structural Design Assessment' (SDA) and 'Construction Monitoring' (CM) Guidelines detailed in the *ACSPPlus Guidelines Manual*, published by ACS, are mandatory for multi-decked passenger ships where it is considered that the superstructure will be subjected to a significant load from flexure of the hull girder; or, where it is required to utilise the load carrying capability of the superstructure for longitudinal strength, and for other passenger ships of abnormal hull form, or of unusual structural configuration or complexity.

## 1. 4 Information required

1. 4. 1 In addition to the information and plans required by [Pt 3, Ch 1, 5 Information required](#), the following details are to be submitted:
  - The intended service areas required for ships designed to operate within specified geographical limits.
  - Stern or bow ramps.
  - Bow, stern and side doors.
  - Movable decks, if fitted, including stowing arrangements for portable components.
  - Sail plans and associated operational and design conditions, including apparent wind speeds (sailing ships).
  - Masts and all structural components of the standing rigging (sailing ships).
  - The standing rigging and all standing rigging attachments (sailing ships).
  - The design deck loadings including details of wheeled vehicles, *See* [Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles](#), and trains, where applicable.
  - Locations of fixed securing points for wheeled vehicles, with indication of the magnitude and direction of the imposed lashing force.

## 1. 5 Symbols

1. 5. 1 For the definition of symbols not defined in this Chapter, *See* [Pt 4, Ch 1, 1.5, Symbols and definitions](#).
1. 5. 2 The following definitions apply to ships employing sails:
 

Standing rigging    –    Rigging of fixed length used to support masts/bowsprit.

Running rigging – Rigging used to control yards, booms and sails and which may pass over revolving sheaves.

Apparent wind speed – The vector resultant of the combination of real wind speed and ship velocity.

CHAPTER **2** **Ferries, Roll On-Roll Off Ships and Passenger Ships**SECTION **2** **Longitudinal strength****2. 1 General**

- 2. 1. 1 Longitudinal strength calculations are to be made in accordance with the requirements given in [Pt 3, Ch 4 Longitudinal Strength](#) and the additional notes contained in this Section.
- 2. 1. 2 The design vertical wave bending moments and design wave shear forces to be used in [Pt 3, Ch 4 Longitudinal Strength](#) are to be determined in accordance with [Pt 4, Ch 2, 2.5, Design wave shear force](#) and [Pt 4, Ch 2, 2.4, Design vertical wave bending moments](#) below. For ships of unusual hullform or where their design parameters are outwith the applicability of the Rules, See [Pt 3, Ch 4 Longitudinal Strength](#), special consideration will be given to the values and distributions of the wave induced global loads.
- 2. 1. 3 The still water bending moment and shear force envelopes are to take into account the requirements of [Pt 4, Ch 2, 2.3, Still water bending moments and shear forces](#).
- 2. 1. 4 For ships where the side shell or side casings contain large openings or where the effectiveness of the superstructures in resisting hull girder bending loads is expected to be reduced by the presence of large numbers of windows or openings, the combined hull and superstructure response may require to be verified using direct calculation techniques.

**2. 2 Calculation of hull section modulus**

- 2. 2. 1 The calculation of section modulus is to be in accordance with [Pt 3, Ch 3, 3.4, Calculation of hull section modulus](#) and the additional notes in this Section. In general, the effective sectional area of continuous longitudinal strength members, after deduction of openings, is to be used for the calculation of midship section modulus. For ships where the effectiveness of the superstructure is only partial due to the presence of large or numerous shell openings or discontinuities in the shell envelope, an equivalent section modulus for the purposes of this Section may be derived using direct calculations in accordance with the SDA Guideline relevant to the ship type.
- 2. 2. 2 Structural members which contribute to the overall hull girder strength are to be carefully aligned so as to avoid discontinuities resulting in abrupt variations of stresses and are to be kept clear of any form of openings which may affect their structural performances.
- 2. 2. 3 In general, short superstructures, See also [Pt 3, Ch 3, 3.4 Calculation of hull section modulus 3.4.2](#), or deckhouses will not be accepted as contributing to the global longitudinal or transverse strength of the ship. However, where it is proposed to include substantial continuous stiffening members, special consideration will be given to their inclusion on submission of the designer's/ Builder's calculations, See also [Pt 4, Ch 2, 2.6 Buckling strength](#).
- 2. 2. 4 Adequate transition arrangements are to be fitted at the ends of effective continuous longitudinal strength members in the deck and bottom structures.

2. 2. 5 Scantlings of all continuous longitudinal members of the hull girder based on the minimum section stiffness requirements determined from [Pt 4, Ch 4, 5 Lifting appliances, equipment integration and foundations](#) are to be maintained within  $0.4L$  amidships. However, in special cases, based on consideration of type of ship, hull form and loading conditions, the scantlings may be gradually reduced towards the ends of the  $0.4L$  part, bearing in mind the desire not to inhibit the ship's loading and operational flexibility.
2. 2. 6 Structural material which is longitudinally continuous but which is not considered to be fully effective for longitudinal strength purposes may be specially considered. The global longitudinal strength assessment must take into account the presence of such material when it can be considered effective. The consequences of failure of such structural material and subsequent redistribution of stresses into or additional loads imposed on the remaining structure is to be considered.
2. 2. 7 In particular, all longitudinally continuous material will be fully effective in tension whereas this may not be so in compression due to a low buckling capability. In this case, it may be necessary to derive and apply different hull girder section moduli to the hogging and sagging bending moment cases.

## 2. 3 Still water bending moments and shear forces

2. 3. 1 The design still water hogging and sagging bending moment distribution envelope,  $M_s$ , is to be taken as the maximum sagging (negative) and maximum hogging (positive) still water bending moments, calculated at each position along the ship. The maximum moments from all loading conditions are to be used to define the still water bending moment distribution envelope.
2. 3. 2 It is normal for ships which have a low deadweight requirement or a uniform loading rate in association with a low block coefficient to have a hogging still water bending moment in all conditions of loading. For these ships, the maximum design sagging still water bending moment may be taken as the minimum actual hogging bending moment.
2. 3. 3 The design still water shear force distribution envelope,  $Q_s$ , is to be taken as the maximum positive and negative shear force values, calculated at each position along the ship. The maximum shear forces from all loading conditions are to be used to define the still water shear force distribution envelope.

## 2. 4 Design vertical wave bending moments

2. 4. 1 The minimum value of vertical wave bending moment,  $M_w$  at any position along the ship may be taken as follows:

$$M_w = f_1 f_2 C_2 M_{w0} \text{ kNm}$$

where

$$M_{w0} = 0.1 C_1 L^2 B_{WL} (C_b + 0.7) \text{ kNm}$$

$$B_{WL} = \text{maximum waterline breadth, in metres}$$

$$= C_1, C_2, L \text{ and } C_b \text{ are given in } \text{Pt 3, Ch 4, 5 Hull bending strength}$$

$$= \text{and}$$

$$f_1 = \text{is given in } \text{Pt 3, Ch 4, 5 Hull bending strength}$$

$$f_2 = \text{is the hogging, } f_{IH}, \text{ or sagging, } f_{IS}, \text{ correction factor based on the amount of bow flare, stern flare, length and effective buoyancy of the aft end of the ship above the waterline}$$

$f_{\text{IS}}$  = is the sagging (negative) moment correction factor and is to be taken as

$$f_{\text{IS}} = -1.10R_A^{0.3} \text{ for values of } R_A > 1.0$$

$$f_{\text{IS}} = -1.10 \text{ for values of } R_A \leq 1.0$$

$f_{\text{IH}}$  = is the hogging (positive) moment correction factor and is to be taken as

$$f_{\text{IH}} = \frac{1.9C_b}{(C_b + 0.7)^d}$$

=  $R_A$  is an area ratio factor, See [Pt 4, Ch 2, 2.4 Design vertical wave bending moments 2.4.2](#).

2. 4. 2 The area ratio factor,  $R_A$ , for the combined stern and bow shape is to be derived as follows:

$$R_A = \frac{30(A_{\text{BF}} + 0.5A_{\text{SF}})}{LB_{\text{WL}}}$$

Where

$A_{\text{BF}}$  = is the bow flare area, in  $\text{m}^2$

$A_{\text{SF}}$  = is the stern flare area, in  $\text{m}^2$

2. 4. 3 The bow flare area,  $A_{\text{BF}}$ , is illustrated in [Figure 2. 2. 1: Derivation of bow and stern flare areas](#) and may be derived as follows:

$$A_{\text{BF}} = A_{\text{UB}} - A_{\text{LB}} \text{ m}^2$$

Where

$A_{\text{UB}}$  = is half the water plane area at a waterline of  $T_{\text{C,U}}$  of the bow region of the hull forward of  $0.8L$  from the AP

$A_{\text{LB}}$  = is half the water plane area at the design draught of the bow region of the hull forward of  $0.8L$  from the AP

= Note the AP is to be taken at the aft end of  $L$

= The design draught is to be taken as  $T$ , See [Pt 3, Ch 1, 6.1, Principal particulars](#).

Alternatively the following formula may be used

$$A_{\text{BF}} = 0.005L(b_0 + 2b_1 + b_2) + b_0a/2\text{m}^2$$

Where

$b_0$  = projection of  $T_{\text{C,U}}$  waterline outboard of the design draught waterline at the FP, in metres, See [Figure 2. 2. 1: Derivation of bow and stern flare areas](#)

$b_1$  = projection of  $T_{\text{C,U}}$  waterline outboard of the design draught waterline at  $0.9L$  from the AP, in metres

$b_2$  = projection of  $T_{\text{C,U}}$  waterline outboard of the design draught waterline at  $0.8L$  from the AP, in metres

$a$  = projection of  $T_{\text{C,U}}$  waterline forward of the FP, in metres

$T_{\text{C,U}}$  = is a waterline taken  $C_1/2$  m above the design draught

$$T_{C,U} = T + \frac{C_1}{2} m$$

$C_1$  = is given in [Pt 3, Ch 4 Longitudinal Strength Table 4. 5. 1: Wave bending moment factor](#)

= For ships with large bow flare angles above the  $T_{C,U}$  waterline the bow flare area may need to be specially considered.

**Figure 2. 2. 1: Derivation of bow and stern flare areas**

2. 4. 4 The stern flare area,  $A_{SF}$ , is illustrated in [Figure 2. 2. 1: Derivation of bow and stern flare areas](#) and is to be derived as follows:

$$A_{SF} = A_{US} - A_{LS} m^2$$

$A_{US}$  = is half the water plane area at a waterline of  $T_{C,U}$  the stern region of the hull aft of  $0.2L$  from the AP

$A_{LS}$  = is half the water plane area at a waterline of  $T_{C,L}$  the stern region of the hull aft of  $0.2L$  from the AP

$T_{C,L}$  = is a waterline taken  $C_1/2$  m below the design draught

$$T_{C,L} = T - \frac{C_1}{2} \text{ m}$$

= For ships with tumblehome in the stern region, the maximum breadth at any waterline less than  $T_{C,U}$  is to be used in the calculation of  $A_{US}$ . The effects appendages including bossings are to be ignored in the calculation of  $A_{LS}$ .

2. 4. 5 Direct calculation methods may be used to derive the vertical wave bending moments, See [Pt 3, Ch 4, 2.5 Direct calculation procedures](#).
2. 4. 6 The sagging correction factor,  $f_{IS}$ , in the vertical wave bending moment formulation in [Pt 4, Ch 2, 2.3 Still water bending moments and shear forces 2.3.1](#) may be derived by direct calculation methods. Appropriate direct calculation methods include a combination of long-term ship motion analysis, non linear ship motion analysis and static balance on a wave crest or trough.

## 2. 5 Design wave shear force

2. 5. 1 The design vertical wave shear force,  $Q_w$ , at any position along the ship is given by:

$$Q_w = K_f K_2 Q_{w0} \text{ kN}$$

where

$Q_{w0}$  and  $K_2$  are given in [Pt 3, Ch 4, 6.3 Design wave shear force](#)

$K_f$  is to be taken as follows, See also [Figure 2. 2: Shear force factor  \$K\_f\$](#) :

- a. Positive shear force:

$$\begin{aligned} K_f &= 0 \text{ at aft end of } L \\ &= +0.836f_{IH} \text{ between } 0.2L \text{ and } 0.3L \text{ from aft} \\ &= +0.70 \text{ at } 0.4L \\ &= -0.65f_{IS} \text{ at } 0.6L \\ &= -0.91f_{IS} \text{ between } 0.7L \text{ and } 0.85L \text{ from aft} \\ &= 0 \text{ at forward end of } L \end{aligned}$$

- b. Negative shear force:

$$\begin{aligned} K_f &= 0 \text{ at aft end of } L \\ &= +0.836f_{IS} \text{ between } 0.15L \text{ and } 0.3L \text{ from aft} \\ &= +0.65f_{IS} \text{ at } 0.4L \\ &= -0.70 \text{ at } 0.6L \\ &= -0.91f_{IH} \text{ between } 0.7L \text{ and } 0.85L \text{ from aft} \\ &= 0 \text{ at forward end of } L \end{aligned}$$

Intermediate values of  $K_f$  to be obtained by linear interpolation.

$f_{IS}$  and  $f_{IH}$  are defined in [Pt 4, Ch 2, 2.4 Design vertical wave bending moments 2.4.1](#).

Figure 2. 2. 2: Shear force factor  $K_f$

## 2. 6 Buckling strength

2. 6. 1 The buckling requirements in [Pt 3, Ch 4, 7 Hull buckling strength](#) are to be applied to plate panels and longitudinals subject to hull girder compression and shear stresses. The design stresses are to be based on the design values of still water and wave bending moments and shear forces and are given in [Pt 4, Ch 2, 2.4 Design vertical wave bending moments 2.4.1](#) and [Pt 4, Ch 2, 2.5 Design wave shear force 2.5.1](#).
2. 6. 2 The standard deduction for corrosion,  $d_t$ , to be applied to plating and longitudinals is to be taken in accordance with [Table 4. 7. 1: Standard deduction for corrosion,  \$d\_t\$](#)  in [Pt 3, Ch 4 Longitudinal Strength](#).
2. 6. 3 The buckling factors of safety,  $\lambda$ , to be applied to the corrected critical buckling stress,  $\sigma_{CRB}$ , of plate panels and longitudinals subjected to hull girder compression are given in [Table 2. 2. 1: Buckling factors of safety,  \$\lambda\$](#) , where the corrected critical buckling stress is to be determined in accordance with [Pt 3, Ch 4, 7.3 Elastic critical buckling stress](#).
2. 6. 4 The shear buckling requirements of [Pt 3, Ch 4, 7.3 Elastic critical buckling stress](#) are to be applied.

Table 2. 2. 1: Buckling factors of safety,  $\lambda$

| Structural item  | Buckling factor of safety, $\lambda$ |
|--|--------------------------------------|
| Longitudinally effective plating   | 1.0                                  |
| Longitudinal stiffeners<br>when the buckling failure mode of the attached plating is elasto-plastic, <i>See Note</i> | 1.1                                  |
| Longitudinal stiffeners<br>when the buckling failure mode of the attached plating is elastic, <i>See Note</i>        | 1.25                                 |
| <b>Note</b> The buckling mode of failure of the attached plating is defined as follows:                              |                                      |
| elastic  | $\sigma_E \leq 0.5 \sigma_0$         |

elasto-plastic

$$\sigma_E > 0.5 \sigma_0$$

where

Note

$\sigma_E$  = the elastic critical buckling stress, See [Pt 3, Ch 4, 7.3 Elastic critical buckling stress](#)

$\sigma_0$  = specified minimum yield stress, in N/mm<sup>2</sup>.

## CHAPTER 2 Ferries, Roll On-Roll Off Ships and Passenger Ships

### SECTION 3 Deck structure

#### 3. 1 Loading

3. 1. 1 In general, loadings for decks should comply with the requirements of [Pt 4, Ch 1 General Cargo Ships](#) except where specified in this Section.
3. 1. 2 Vehicle decks for the carriage of cars, trucks, etc. are to have a loading for wheeled vehicles as specified in [Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles](#). Where vehicle decks are also used for the carriage of cargo, the loadings derived from [Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles](#) are to be not less than would be required by [Pt 4, Ch 1 General Cargo Ships](#).
3. 1. 3 For ferries and passenger ships classed **100A1**, the minimum design loadings for decks are not to be taken as less than those in [Table 2. 3. 1: Design deck loadings \(ferries and passenger ships only\)](#).
3. 1. 4 For ferries and passenger ships classed **100A1** with a specified operating area service notation, the loadings for decks in way of baggage and accommodation spaces are to be in accordance with [Table 2. 3. 1: Design deck loadings \(ferries and passenger ships only\)](#).
3. 1. 5 Mooring decks, afterward and forward, other than when part of the strength deck, are to comply with the requirements for forecastles, *See* [Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks](#). Canopy decks or aprons protecting mooring decks are to be designed using the weather head for forecastle decks reduced by 0.3 m.
3. 1. 6 For movable decks, *See* [Pt 3, Ch 9, 4 Movable decks](#).
3. 1. 7 For train decks, the minimum design loading will be specially considered.

**Table 2. 3. 1: Design deck loadings (ferries and passenger ships only)**

| Deck           |   | Design pressures<br>$P_s$ , in kN/m <sup>2</sup> |                    |
|----------------|---|--|--------------------|
|                |   | Secondary structures                             | Primary structures |
| Internal Decks | Decks in way of accommodation and public spaces (including internal muster stations), <i>See</i> Note | 6.38   | 3.19               |
|                | Stairwell landing areas where people may congregate   | 6.38   | 6.38               |

|  |   |   |           |
|--|---|---|-----------|
|  | Deck supporting baggage spaces  | $3.53H_t$   | $3.53H_t$ |
|  | Decks in way of stores and refrigerated spaces                                | 14.13   | 14.13     |
|  | Decks in way of workshop and machinery spaces (excludes A/C machinery spaces) | 18.34   | 18.34     |
| External Decks   | Magradomes  | 2.45  | 2.45      |
|  | Balconies   | 3.92  | 1.96      |
|  | Weather exposed superstructure decks  | 2.26  | 2.26      |
|  | Weather exposed lifeboat deck, external muster stations                       | 8.44  | 8.44      |
|  | Exposed decks subjected to sea loads  | See <a href="#">Pt 3 Ship Structures (General)</a> , <a href="#">Table 3. 5. 1: Design heads and permissible cargo loadings</a> |           |
| Symbols  |   |   |           |
| $H_t$ = 'tween deck height, in metres  |   |   |           |
| <b>Note</b> The design pressure, $P_s$ , may be reduced by 12 per cent for ferries and passenger ships with a specified operating area service notation. |   |   |           |

**Table 2. 3. 2: Thickness of deck plating for ferries and passenger ships where a relevant SDA is applied**

| Deck location   | Plating thickness (mm)          |
|---|---------------------------------|
| Accommodation and public spaces   | $t = 0.008s\sqrt{k}$            |
| Baggage handling and storage  | $t = 0.009s\sqrt{k}$            |
| Storerooms  | $t = 0.01s\sqrt{k}$             |
| Workshops and machinery spaces  | $t = 0.01s\sqrt{k}$             |
| Weather exposed lifeboat deck   | $t = 0.00083s_1\sqrt{Lk} + 2.5$ |
| Symbols   |                                 |
| $L, k, s$ as defined in <a href="#">Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1</a><br>$s_1 = s$ but is not to be taken less than the smaller of $470 + \frac{L}{0.6}$ mm or 700 mm |                                 |
| <b>Note</b> The thickness of deck plating is in no case to be less than 5.0 mm  |                                 |

3. 1. 8 For ferries, roll on-roll off cargo ships and passenger ships (other than for vehicle decks), the minimum thicknesses of decks are to be in accordance with [Pt 4, Ch 1 General Cargo Ships](#) or [Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks](#) as appropriate.

3. 1. 9 For ferries and passenger ships where direct calculations have been carried out in accordance with the SDA Guideline relevant to the ship type (including multi-decked ships), the minimum thicknesses of decks are to be in accordance with [Table 2. 3. 2: Thickness of deck plating for ferries and passenger ships where a relevant SDA is applied](#).
3. 1. 10 For roll on-roll off cargo ships, the thickness of deck plating (other than for vehicle decks) will generally be in accordance with [Pt 4, Ch 1 General Cargo Ships](#).
3. 1. 11 Where decks are required to resist hull girder bending, the thickness is to satisfy the requirements of [Pt 3, Ch 4, 7 Hull buckling strength](#).
3. 1. 12 Where deck plating is required to form the effective flange of deck primary members, the thickness may need to be increased locally taking account of the compressive forces acting, *See also* [Pt 3, Ch 10 Welding and Structural Details](#), [Table 10. 4. 1: Minimum thickness of primary members](#).
3. 1. 13 Vehicle deck plating is to satisfy the requirements for plating loaded by wheeled vehicles as specified in [Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles](#). Where vehicle decks are also to be used for the carriage of cargo, the thickness of plating derived from [Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles](#) is to be not less than would be required by [Pt 4, Ch 1, 4.2 Deck plating](#).
3. 1. 14 The thickness of all other decks will generally be in accordance with [Pt 4, Ch 1 General Cargo Ships](#).

### 3. 2 Deck stiffening

3. 2. 1 For ferries, roll on-roll off cargo ships and passenger ships, the deck stiffening (other than for vehicle decks) is generally to be in accordance with [Pt 4, Ch 1 General Cargo Ships](#) or [Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks](#) as appropriate.
3. 2. 2 For ferries and passenger ships where direct calculations have been carried out in accordance with the SDA Guideline relevant to the ship type (including multi-decked ships), the deck stiffening is to be in accordance with.
3. 2. 3 Vehicle deck beams and longitudinals are to have scantlings in accordance with the requirements for wheeled vehicles as specified in [Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles](#). Where vehicle decks are also to be used for the carriage of cargo, the scantlings derived from [Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles](#) are to be not less than would be required by [Pt 4, Ch 1, 4.3 Deck stiffening](#).

**Table 2. 3. 3: Modulus of deck beams and longitudinals for ferries and passenger ships where a relevant SDA is applied**

| Position of beam/longitudinal  | Modulus, in cm <sup>3</sup>  |
|--|--|
| Decks, excluding those for the stowage of cargo or vehicles  | $Z = 0.00083 f_R P_s l_e^2 s k$<br>but not less than: $Z = 0.025s$ |
| Symbols  |  |
| $l_e, s, Z$ , and $k$ as defined in <a href="#">Pt 4, Ch 1, 1.5, Symbols and definitions</a>   |  |
| $P_s$ = deck loading, in kN/m <sup>2</sup> , <i>See</i> <a href="#">Table 2. 3. 1: Design deck loadings (ferries and passenger ships only)</a> . |  |
| $f_R = 1$ , for ships with unrestricted service  |  |
| $f_R = 0.81$ for ships with a specified operating area service notation  |  |

### 3. 3 Deck supporting primary structure

3. 3. 1 For ferries, roll on-roll off cargo ships, and passenger ships the primary structure supporting four or more point loads or a uniformly distributed load is to be in accordance with [Table 1. 4. 6: Deck girders, transverses and hatch beams](#).

3. 3. 2 For ferries and passenger ships where direct calculations have been carried out in accordance with the SDA Guideline relevant to the ship type (including multi-decked ships), the section modulus of primary members supporting four or more point loads or a uniformly distributed load is not to be taken as less than:

$$Z = 0.673SP_s k l_e^2 (\text{ cm}^3)$$

Where

$l_e$ ,  $S$ ,  $Z$  and  $k$  are as defined in [Pt 4, Ch 1, 1.5, Symbols and definitions](#)

$P_s$  = deck design loading, in kN/m<sup>2</sup>, See [Table 2. 3. 1: Design deck loadings \(ferries and passenger ships only\)](#).

3. 3. 3 For ferries and passenger ships where direct calculations have been carried out in accordance with the SDA Guideline relevant to the ship type (including multi-decked ships), the moment of inertia of primary members supporting more than four point loads is not to be taken as less than:

$$I = \frac{1.85}{k} l_e Z (\text{ cm}^4)$$

Where

$Z$ ,  $l_e$  and  $k$  are defined in [Pt 4, Ch 1, 1.5, Symbols and definitions](#).

3. 3. 4 Scantlings of primary structure are to be verified for the following cases using direct calculation methods.
- The structural support arrangement is complex either due to arrangement or loading pattern.
  - Large openings are incorporated in the webs of primary members.
  - The structure is of novel or unusual design.
  - Primary members supporting up to three point loads.

The stress criteria in [Table 1. 4. 6: Deck girders, transverses and hatch beams](#) in Chapter 1 are to be complied with.

3. 3. 5 Direct calculations should be carried out in accordance with the SDA Guideline relevant to the ship type.
3. 3. 6 Vehicle deck structure is to be of adequate strength for the upward forces imposed at fixed securing points. Local reinforcement is to be fitted as necessary.

## CHAPTER 2 Ferries, Roll On-Roll Off Ships and Passenger Ships

### SECTION 4 Shell envelope plating

#### 4. 1 Bottom and side shell

4. 1. 1 For ferries and passenger ships classed **100A1** with a specified operating area service notation the keel thickness for  $0.4L$  amidships is to be as required by [Pt 4, Ch 1, 5 Shell envelope plating](#). At ends, the keel thickness may be reduced by 25 per cent from the above value, but is to be not less than that of the adjacent shell plating.

4. 1. 2 The thickness of side shell plating above  $1.6T$  including superstructures may require special consideration depending on the particular structural arrangement, hull vertical bending and shear stresses and position of the shell above the waterline. In no case are the shell scantlings above  $1.6T$  to be less than the following:

a.  $t_{zm} = t_{shell} - (Z_m - 1.6T)(0.24 + 0.0012L)\sqrt{\frac{ks_1}{s_b}}$

b.  $t_{zm} = (4 + 0.02L)\sqrt{\frac{ks_1}{s_b}}$

c. as required by [Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks](#)

Where

$t_{shell}$  = minimum required shell thickness above  $D/2$  for the specific location, as calculated in [Pt 4, Ch 1, 5 Shell envelope plating](#)

$t_{zm}$  = minimum shell thickness at  $Z_m$

$Z_m$  = vertical height in metres above base

=  $L$  and  $T$  as defined in [Pt 3, Ch 1, 1.5 Intact stability](#).

=  $s_1$ ,  $s_b$  as defined in [Table 5. 3. 1: Shell plating forward](#) in [Pt 3, Ch 5 Fore End Structure](#) for fore end or [Table 6. 3. 1: Shell plating aft](#) in [Pt 3, Ch 6 Aft End Structure](#) for aft end.

4. 1. 3 Openings in the side shell and superstructure plating for windows and doors are to be suitably stiffened and the thickness and grade of plating in way will be specially considered.

4. 1. 4 For ships with broad flat counter stern sections which are liable to be subjected to large wave impact loading, the effect of wave impact loading on the plating and framing of the local shell structure is to be additionally considered, See [Pt 4, Ch 2, 4.3, Strengthening for wave impact loads](#) and [Pt 4, Ch 2, 5.2, Strengthening for wave impact loads](#).

4. 1. 5 The plating and framing of the forward shell structure for ships with significant bow flare is to be additionally considered with regard to wave impact loading, *See* [Pt 4, Ch 2, 4.3, Strengthening for wave impact loads](#) and [Pt 4, Ch 2, 5.2, Strengthening for wave impact loads](#).
4. 1. 6 The minimum thickness of the shell plating at ends and for taper is to be not less than the values given in [Table 2. 4. 1: End shell thickness](#), and is in no case to be less than 6 mm.
4. 1. 7 For ferries and passenger ships classed **100A1** with a specified operating area service notation, the bottom and side shell minimum thickness at ends may be taken 20 per cent less than that required by [Table 2. 4. 1: End shell thickness](#) and [Pt 3, Ch 5 Fore End Structure](#) and [Pt 3, Ch 6 Aft End Structure](#), but is in no case to be less than 6 mm.

**Table 2. 4. 1: End shell thickness**

| Scantling length   | Thickness, in mm   |
|--|--|
| 70 m and below   | $(6.5 + 0.033L) \sqrt{\frac{ks_1}{s_b}} - 1.0$   |
| Between 70 m and 110 m   | $(6.5 + 0.033L) \sqrt{\frac{ks_1}{s_b}} - 0.5$   |
| Over 110 m   | <a href="#">Pt 3, Ch 5 Fore End Structure</a> and <a href="#">Pt 3, Ch 6 Aft End Structure</a> |
| Symbols  |  |
| $L$ as defined in <a href="#">Pt 3, Ch 1, 1.5 Intact stability</a>   |  |
| $s_1, s_b$ as defined in <a href="#">Table 5. 3. 1: Shell and deck plating</a> in <a href="#">Pt 3, Ch 5 Fore End Structure</a> for fore end or <a href="#">Table 6. 3. 1: Shell plating aft</a> in <a href="#">Pt 3, Ch 6 Aft End Structure</a> for aft end |  |

## 4. 2 Bow flare and wave impact pressures

4. 2. 1 This Section is applicable to:
- bow flare region;
  - sides and undersides of sponsons; and
  - other parts of the side shell plating close to and above the design waterline that are expected to be subjected to wave impact pressures.

The wave impact pressure,  $P_{bf}$ , in kN/m<sup>2</sup> due to relative motion is to be taken as:

$$P_{bf} = 0.5(K_{bf}V_{bf}^2 + K_{rv}H_{rv}V_{rv}^2)\text{kN/m}^2$$

Where

$$K_{bf} = \text{hull form shape coefficient for wave impacts}$$

$$= \frac{\pi}{\tan \psi} \text{ for } \psi \geq 10$$

$$= 28 (1 - \tan (2\psi)) \text{ for } \psi < 10$$

$$V_{bf} = \text{wave impact velocity, in m/s, and is given by}$$

$$= \sqrt{V_{thbf}^2 + 2m_1 \ln(N_{bf})} \text{ for } N_{bf} \geq 1$$

$$= 0 \text{ for } N_{bf} < 1$$

$$V_{thbf} = \text{threshold velocity for wave impact, in m/s, to be taken as:}$$

$$= \frac{\sqrt{10}}{\cos \alpha_p}$$

$\ln ( )$  is the natural logarithm

$N_{bf}$  = No. of wave impacts in a three hour period and is given by

$$= 1720PR_{bf} \sqrt{\frac{m_1}{m_0}}$$

$PR_{bf}$  = probability of a wave impact and is given by

$$= e^{-u}$$

$$u = \left( \frac{Z_{wl}^2}{2m_0} + \frac{V_{thbf}^2}{2m_1} \right)$$

$Z_{wl}$  = distance of the centroid of the area of plating or stiffener above the local design waterline

$m_1$  = variance of the relative vertical velocity

$$= 0.25(\omega_e f_{s1} H_{rm})^2$$

$m_0$  = variance of the relative vertical motion

$$= 0.25(f_{s1} H_{rm})^2$$

$\omega_e$  = effective encounter wave frequency

$$= \omega \left( 1 + \frac{0.4q\omega V_{sl}}{g} \right)$$

where

$$q = 1.0 \text{ for } \frac{x}{L} \geq 0.5$$

$$= -0.6 \text{ for } \frac{x}{L} < 0.5$$

$\omega$  = effective wave frequency based on 80 per cent ship length

$$= \sqrt{\frac{2\pi g}{0.8L_{wl}}}$$

$f_{sl}$  = probability level correction factor for relative vertical motion

$$= 1.0 \text{ for } C_b \leq 0.6$$

$$= 1.2 \text{ for } C_b > 0.6$$

$V_{sl}$  = 0.515V, in m/s

$K_{rv}$  = hull form shape coefficient for impact due to forward speed

$$= \frac{\pi}{\tan(90-\alpha_p)} \text{ for } \alpha_p \leq 80$$

$$= 28 \left( 1 - \tan \left( 2(90 - \alpha_p) \right) \right) \text{ for } \alpha_p > 80$$

$H_{rv}$  = relative wave heading coefficient

$$\text{for } \frac{x}{L} \geq 0.5$$

$$= 1 \text{ for } \gamma_p > 45$$

$$= \cos(45 - \gamma_p) \text{ for } \gamma_p \leq 45$$

$$\text{for } \frac{x}{L} < 0.5$$

$$= 0$$

The point at which the following angles are to be measured for assessment of plating and stiffeners is detailed in [Table 2. 4. 2: Positions at which  \$\alpha\_p\$ ,  \$\beta\_p\$  and  \$\gamma\_p\$  are to be measured](#):

$V_{rv}$  = relative forward speed, in m/s

$$= 0.515V \sin \gamma_p$$

$\alpha_p$  = buttock angle measured in the longitudinal plane, in degrees, See [Figure 2. 4. 1: Bow flare and bottom slamming angles](#) and [Table 2. 4. 2: Positions at which  \$\alpha\_p\$ ,  \$\beta\_p\$  and  \$\gamma\_p\$  are to be measured](#)

$\psi$  = effective deadrise angle, in degrees

For  $C_b > 0.6$ ,  $\psi$  is to be taken as the maximum of  $\alpha_p$  and  $\beta_p$ , See [Figure 2. 4. 1: Bow flare and bottom slamming angles](#) and [Table 2. 4. 2: Positions at which  \$\alpha\_p\$ ,  \$\beta\_p\$  and  \$\gamma\_p\$  are to be measured](#)

For  $C_b \leq 0.6$ ,  $\psi$  is to be taken as the maximum of  $\alpha_p$  and  $\beta$

where

$$\beta = \beta_p - 10^\circ, \text{ but is to be taken as not less than } 0^\circ$$

NOTE

The  $10^\circ$  deduction is to allow for the effects of roll motion on the impact pressures.

$\gamma_p$  = waterline angle measured in the horizontal plane, in degrees, See [Figure 2. 4. 1: Bow flare and bottom slamming angles](#) and [Table 2. 4. 2: Positions at which  \$\alpha\_p\$ ,  \$\beta\_p\$  and  \$\gamma\_p\$  are to be measured](#).

NOTE

Where only two angles are known and are measured in orthogonal planes, the third angle may be obtained by the following expression:

$$\alpha_p = \tan^{-1} (\tan \beta_p \tan \gamma_p)$$

The relative vertical motion,  $H_{rm}$ , is to be taken as

$$H_{rm} = C_{w,min} \left( 1 + \frac{4.5}{(C_b + 0.2)} \left( \frac{X_{WL}}{L_{WL}} - x_m \right)^2 \right)$$

Where

$$C_{w,min} = \frac{C_w}{k_m \sqrt{2}}$$

$C_w$  = a wave head in metres

Where

$$= 0.0771 L_{WL} (C_b + 0.2)^{0.3} e^{(-0.0044 L_{WL})}$$

$$k_m = 1 + \frac{4.5(0.5 - x_m)2}{(C_b + 0.2)}$$

$x_m$  =  $0.45 - 0.6F_n$  but is not to be less than 0.2

$$F_n = \frac{0.515V}{\sqrt{gL_{WL}}}$$

$L_{WL}$  = waterline length at summer load draught

$X_{WL}$  = longitudinal distance, in metres, measured forwards from the aft end of the  $L_{WL}$  to the location being considered

$V$  = speed, in knots

for  $\frac{x}{L} \geq 0.5$

= is to be taken as the maximum service speed, in knots, as defined in [Pt 3, Ch 1, 6 Definitions](#) For passenger yachts not required to maintain high speeds in severe weather, the value of  $V$  may be specially considered, but is not to be taken as less than the greater of  $\frac{V}{3}$  or 5 knots. Where  $V$  has been specially considered it is to be noted in the classification records as a memorandum that should state: "A design speed of ... knots has been used for the assessment of bow structure with regards to bow flare impacts. It should be noted that this speed may not be appropriate for all conditions and it is the responsibility of the Master to apply good Seamanship to minimise bow flare slamming."

for  $\frac{x}{L} < 0.5$

= 0 knots, for passenger ships

= 5 knots, for all other ship types

$C_b$  = Rule block coefficient.

**Table 2. 4. 2: Positions at which  $\alpha_p$ ,  $\beta_p$  and  $\gamma_p$  are to be measured**

| Framing system        | Plating   | Secondary stiffeners                 |
|-----------------------|---|--------------------------------------|
| Longitudinally framed | Mid-distance between longitudinals                              | Mid-distance between frames          |
| Transversely framed   | 0.5s from the bottom edge of the plate strake or primary member | Mid-distance between primary members |

4. 2. 2 Alternatively,  $P_{bf}$  may be derived by the direct calculations carried out in accordance with a procedure agreed by ACS.

### 4. 3 Strengthening for wave impact loads

4. 3. 1 The shell envelope in the forward and after portions of the hull are to be strengthened against bow flare or wave impact pressure. Typically, strengthening is to be considered over the following areas:
- over the after body in way of a flat counter stern which is close to the waterline;
  - over the fore end side and bow structure above the waterline and up to the deck at side;
  - other areas where the hull exhibits significant flare.

**Figure 2. 4. 1: Bow flare and bottom slamming angles**

4. 3. 2 The thickness of the side shell plating is to be not less than:

$$t = 3.2s_c\sqrt{kh_5}C_R \times 10^{-2} \text{ mm}$$

Where

- $s_c$  = is the length of the shorter edge of a plating panel framed by primary and secondary members, See [Figure 2. 4. 2: Chord spacing and mean chord spacing for secondary members](#)
- $h_s$  = equivalent wave impact head, in metres
- $h_s = 0.1P_{bf} \text{ m}$
- $P_{bf}$  = is defined in [Pt 4, Ch 2, 4.2 Bow flare and wave impact pressures 4.2.1](#)
- $C_R$  = panel ratio factor
- $C_R = \left(\frac{l}{s_c}\right)^{0.41}$  but is not to be taken less than 0.06 or greater than 0.1
- $l$  = overall panel length, in metres, measured along a chord between the primary members.

- 4.3.3 The structural scantlings required in areas strengthened against bow flare slamming are to be tapered to meet the normal shell envelope requirements.
- 4.3.4 The side structure scantlings required by this Section must in no case be taken less than those required by the remaining Sections of [Pt 4, Ch 2 Ferries, Roll On-Roll Off Ships and Passenger Ships](#).

**Figure 2. 4. 2: Chord spacing and mean chord spacing for secondary members**

## CHAPTER 2 Ferries, Roll On-Roll Off Ships and Passenger Ships

### SECTION 5 Shell envelope framing

#### 5.1 Side structure

- 5.1.1 The scantlings of frames, or side longitudinals, web frames or transverses, and stringers below  $1.6T$  above base are to satisfy the requirement of [Pt 4, Ch 1 General Cargo Ships](#) and this Section, but may be required to be confirmed by direct calculation. The scantlings of these members above  $1.6T$  from base may require special consideration on the basis of the particular structural arrangements, design deck loading, hull vertical bending stresses, and position of the member above the waterline.
- 5.1.2 The scantlings of side transverses supporting shell longitudinals above  $1.6T$  are to satisfy the requirements of:
- [Pt 4, Ch 1, 6 Shell envelope framing](#), [Pt 3, Ch 5, 4 Shell envelope framing](#) and [Pt 3, Ch 6, 4 Shell envelope framing](#).
  - The minimum geometric properties required in order to provide rotational constraint to the end of the deck transverse in way:

$$Z_s = \frac{0.677SkP_sL_d^3}{\left(\left(\frac{I_d}{I_s}\right)L_s + L_d\right)} \text{ cm}^3$$

but is not to be less than  $0.339SkP_sL_d^2 \text{ cm}^3$

$I_s$  is not to be less than  $I_d \left(\frac{L_s}{L_d}\right) \left(\frac{Z_{dR}}{Z_d}\right) \text{ cm}^4$

Where

$P_s$  = deck design loading, in  $\text{kN/m}^2$ , See [Table 2. 3. 1: Design deck loadings \(ferries and passenger ships only\)](#)

$L_d$  = span of adjacent deck transverse, in metres

$Z_d$  = actual modulus of adjacent deck transverse, in  $\text{cm}^3$

$Z_{dR}$  = Rule modulus of adjacent deck transverse, in  $\text{cm}^3$

$I_d$  = moment of inertia of adjacent deck transverse, in  $\text{cm}^4$

$L_s$  = span of side shell transverse, in metres

$I_s$  = moment of inertia of side shell transverse, in  $\text{cm}^4$

$S, k$  = as defined in [Pt 4, Ch 2, 1.5 Symbols 1.5.1](#)

= Due account should be taken of the shell window dimensions when determining the effective width of attached plating.

5. 1. 3 The required modulus of transverse main and 'tween deck frames, which may have reasonably constant convex curvature over their entire length, may be corrected for curvature as follows:

$$Z_{\min} = Z_{\text{rule}} \left( \frac{1}{\cosh\left(\frac{2\pi Y_c}{l_e}\right)} \right)^3 \text{ cm}^3$$

Where

$Z_{\text{rule}}$  = modulus requirement, in  $\text{cm}^3$ , from [Pt 4, Ch 1 General Cargo Ships](#) using  $l_e$

$l_e$  = distance between span support points, in metres, as shown in [Figure 2. 5. 1: Distance between span support points and curvature](#)

$Y_c$  = curvature measured from a line intersecting the end support points to the frame at mid-span, in metres, as shown in [Figure 2. 5. 1: Distance between span support points and curvature](#)

$Z_{\min}$  = is not to be less than  $0.5Z_{\text{rule}}$

**Figure 2. 5. 1: Distance between span support points and curvature**

5. 1. 4 Where ramp openings are fitted adjacent to the ship's side, adequate support for the side framing is to be provided.

## 5. 2 Strengthening for wave impact loads

5. 2. 1 The side structure in the forward and after portions of the hull is to be strengthened against bow flare or wave impact pressure. Typically, strengthening is to be considered over the following areas:
- over the after body in way of a flat counter stern which is close to the waterline.
  - over the fore end side and bow structure above the waterline and up to the deck at side.
  - other areas where the hull exhibits significant flare.
5. 2. 2 The scantlings of secondary stiffeners are not to be less than:

- a. Effective plastic section modulus of stiffeners:

$$Z_p = 3.75 h_s s_{cm} k l_e^2 \times 10^{-3} \text{ cm}^3$$

Where

$h_s$  = wave impact head, in metres, as defined in [Pt 4, Ch 2, 4.3 Strengthening for wave impact loads 4.3.2](#)

$s_{cm}$  = mean spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in [Figure 2. 4. 2: Chord spacing and mean chord spacing for secondary members](#)

Other symbols are as defined in [Pt 4, Ch 2, 1.5 Symbols 1.5.2](#)

- b. Web area of secondary stiffeners

$$A = 3.7 s_{cm} k h_s \left( l_e - \frac{s_{cm}}{2000} \right) \times 10^{-4} \text{ cm}^2$$

Where

$s_{cm}$  = mean spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in [Figure 2. 4. 2: Chord spacing and mean chord spacing for secondary members](#)

$h_s$  = wave impact head, in metres, as defined in [Pt 4, Ch 2, 4.3 Strengthening for wave impact loads 4.3.2](#)

Other symbols are as defined in [Pt 4, Ch 2, 1.5 Symbols 1.5.2](#).

5. 2. 3 The effective section properties of secondary stiffeners are to be taken as:

- a. Plastic section modulus of secondary stiffeners,  $Z_p$ , is to be taken as:

$$Z_p = (2.8 \times 10^{-4} s_{cm} t_p^2) - (10^{-3} b_f b_{fc} t_f \sin \theta_e) + (5 \times 10^{-4} (h_w^2 t_w + 2 b_f t_f h_w) \cos \theta_e) \text{ cm}^3$$

Where

$$\theta_e = C_0(90 - \varphi)$$

$$C_0 = 1.1$$

$\varphi$  = the angle between the stiffener and the side shell, in degrees

$$b_{fc} = 0.5(b_f - t_w) \text{ for L profiles}$$

$$= 0 \text{ for flat bar and T profiles}$$

$$= \frac{c}{2} \text{ for bulb profiles, See } \a href="#">\text{Figure 4. 7. 1: Dimensions of longitudinals} \text{ in } \a href="#">\text{Pt 3, Ch 4 Longitudinal Strength}, for  $c$$$

$h_w$  = height of stiffener web, in mm

$t_w$  = web thickness, in mm

$b_f$  = breadth of flange, in mm

$t_f$  = flange thickness, in mm

$t_p$  = thickness of attached plating, in mm

- a. Web area of secondary stiffeners,  $A_s$ , is to be taken as:

$$A_s = 0.01(h_w + t_p)t_w \sin \varphi \text{ cm}^2$$

5. 2. 4 Where the stiffener web is not perpendicular to the plating, tripping brackets have to be fitted in order to obtain adequate lateral stability.

5. 2. 5 The scantlings of primary members are not to be less than:

a. Section modulus of primary members

$$Z = 2\gamma_z k h_s q v l_e^2 \text{ cm}^3$$

b. Web area of primary members

$$A = 0.2\gamma_A k h_s q v_e \text{ cm}^2$$

Where

$h_s$  = wave impact head, in metres, as defined in [Pt 4, Ch 2, 4.3 Strengthening for wave impact loads 4.3.2](#)

= and

$\gamma_A$  and  $\gamma_z$  are strength factors dependent on the load position

for  $q < 1$   $\gamma_A = q^3 - 2q^2 + 2$  and  $\gamma_z = 3q^3 - 8q^2 + 6q$

for  $q = 1$   $\gamma_A = 1$  and  $\gamma_z = 1$

$$q = \frac{u}{l_e} \text{ but } \leq 1$$

for web frames:

$u$  = is the minimum of  $g_{bfv}$  or  $l_e$

$v$  = is the minimum of  $g_{bfh}$  or  $S_{cm}$

for primary stringers:

$u$  = is the minimum of  $g_{bfh}$  or  $l_e$

$v$  = is the minimum of  $g_{bfv}$  or  $S_{cm}$

Where

$l_e$  = is the effective length of the primary member, in metres

$S_{cm}$  = is the mean spacing between primary members along the plating, in metres, See [Figure 2. 5. 2: Mean spacing between primary members,  \$S\_{cm}\$ , and the extents of wave impact pressure  \$g\_{bfh}\$  and  \$g\_{bfv}\$](#)

=  $g_{bfv}$  and  $g_{bfh}$  are defined in [Pt 4, Ch 2, 5.2 Strengthening for wave impact loads 5.2.6](#)

= Other symbols are as defined in [Pt 4, Ch 2, 1.5 Symbols 1.5.2](#).

c. The web of the primary member is to be adequately stiffened.

**Figure 2. 5. 2: Mean spacing between primary members,  $S_{cm}$ , and the extents of wave impact pressure  $g_{bfh}$  and  $g_{bfv}$**

5. 2. 6 The extents of the wave impact pressure are to be derived as follows:
- the vertical extent,  $g_{bfv}$ , is to be taken as:

$$g_{bfv} = \frac{4}{\sin \psi \sqrt{8 K_{bf}}} \text{ m}$$

- the horizontal extent,  $g_{bfh}$ , is to be taken as:

$$g_{bfh} = 4 \text{ m}$$

Where

=  $K_{bf}$  and  $\psi$  are given in [Pt 4, Ch 2, 4.2 Bow flare and wave impact pressures 4.2.1.](#)

5. 2. 7 For primary members with cut-outs for the passage of secondary stiffeners, and which may have web stiffeners connected to the secondary stiffener, buckling checks are to be carried out to ensure that the primary member web plating and web stiffener will not buckle under the design load. The buckling procedure to be followed is given in [Table 5. 1. 3: Buckling procedure for primary member web plating and web stiffener](#) in [Pt 3, Ch 5 Fore End Structure](#). Where the web stiffener

is fitted with a bracket, the buckling capability of the web stiffener in way of the cut-out is to take account of the bracket. Where no web stiffener is fitted, the buckling capability of the primary member web plating is to be checked for the total load transmitted to the connection.

- 5. 2. 8 Where the angle between primary structure web and the plating is less than 70°, the effective section modulus and shear area are to take account of the non-perpendicularity.
- 5. 2. 9 The structural scantlings required in areas strengthened against bow flare slamming are to be tapered to meet the normal shell envelope requirements.
- 5. 2. 10 The side structure scantlings required by this Section must in no case be taken less than those required by the remaining Sections of [Pt 4, Ch 2 Ferries, Roll On-Roll Off Ships and Passenger Ships](#).

## CHAPTER 2 Ferries, Roll On-Roll Off Ships and Passenger Ships

### SECTION 6 Double bottom

#### 6.1 General

- 6.1.1 A double bottom is to be fitted in accordance with [Pt 4, Ch 1, 8 Double bottom structure](#).
- 6.1.2 Where podded drive systems are to be employed, adequate floors and girders are to be arranged in order to efficiently integrate the unit into the aft structure. The adequacy of the hull structure supporting the unit is to be verified using the maximum external forces and moments stated by the manufacturer. Due account is to be taken of additional forces induced by ship motion accelerations.

#### 6.2 Transmission of pillar loads

- 6.2.1 In ships where the deck centreline supports are widely spaced, transmission of the pillar loads to the double bottom structure will be specially considered, and additional reinforcement may be required if high shear and bending stresses are induced by the concentrated loads. The reinforcement should take the form of additional floors, and fore and aft girders. The final reinforcement is to be confirmed by direct calculation.
- 6.2.2 Where, in multi-decked passenger ships, the Rule deck loadings from [Table 2.3.1: Design deck loadings \(ferries and passenger ships only\)](#) have been used to determine the primary deck supporting structure, the cumulative pillar load  $P_p$  may be taken as:

$$P_p = \sum (b_p S_p) P_s \text{ kN}$$

where

$b_p$  = breadth of deck supported by pillar

$S_p$  = mean spacing between pillars

$P_s$  = See [Table 2.3.1: Design deck loadings \(ferries and passenger ships only\)](#).

- 6.2.3 Pillars are to be provided with suitable pads at their heels. Long pillars, and those terminating at the inner bottom are to be bracketed. At pillar heads, the free edges of deck primary structure face plates are to be at least 20 mm clear of the pillar head attachment weld. Where necessary, gusset plates are to be fitted at primary member intersections in way of pillars. These gussets may be applied as doublers onto the primary member face plates and should be at least equal in thickness to the pillar or the face plate, whichever is greater. Where pillars act in tension, the gussets are to be integral with the primary member face plates. The axial stress in tensile pillars is not to exceed 110/k N/mm<sup>2</sup> and full penetration welds are to be arranged in way of the end connections.

## **6. 3 Ferries and passenger ships with a specified operating area service**

6. 3. 1 The thickness of double bottom centre girders may be reduced by 10 per cent, and the thickness of double bottom side girders and floors may be reduced by five per cent, from the values required by [Pt 4, Ch 1, 8 Double bottom structure](#), but is in no case to be less than 6 mm.

**CHAPTER 2 Ferries, Roll On-Roll Off Ships and Passenger Ships****SECTION 7 Peak, watertight and deep tank bulkheads****7.1 General**

- 7.1.1 The scantlings of watertight and deep tank bulkheads are to comply with the requirements of [Pt 4, Ch 1 General Cargo Ships](#).
- 7.1.2 The load head,  $h_4$  to be used in watertight bulkhead scantlings for passenger ships is, in addition, to comply with the following:
- For watertight bulkhead plating, the distance from a point one-third of the height of the plate above its lower edge to a point 0.91 m above the bulkhead deck at side, or to the deepest intermediate/equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater.
  - For watertight bulkhead stiffeners or girders, the distance from the middle of the effective length to a point 0.91 m above the bulkhead deck at side, or to the deepest intermediate/equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater.
- 7.1.3 Partial watertight bulkheads and webs fitted above the bulkhead deck which are to be included in damage stability calculations, are to be assessed as watertight, See [Pt 4, Ch 2, 7.1 General 7.1.2](#).

**7.2 Ferries and passenger ships with a specified operating area service**

- 7.2.1 The thickness of bulkhead plating for peak tanks and deep tanks, other than the collision bulkhead, may be reduced by 0.5 mm, and the modulus of bulkhead stiffeners, swedges, corrugations and girders may, in general, be reduced by 20 per cent from the values required by [Pt 4, Ch 1, 9 Bulkheads](#).

## CHAPTER 2 Ferries, Roll On-Roll Off Ships and Passenger Ships

### SECTION 8 Bow doors and inner doors

#### 8. 1 Symbols

8. 1. 1 The symbols used in this Section are defined as follows:

- $a$  = vertical distance, in metres, from the bow door pivot to the centroid of the vertical projected area of bow door, See [Figure 2. 8. 1: Bow door \(upward hinging\)](#)
- $b$  = horizontal distance, in metres, from the bow door pivot to the centroid of the horizontal projected area of bow door, See [Figure 2. 8. 1: Bow door \(upward hinging\)](#)
- $c$  = horizontal distance, in metres, from bow door pivot to centre of gravity of bow door, See [Figure 2. 8. 1: Bow door \(upward hinging\)](#)
- $d$  = vertical distance, in metres, from bow door pivot to the centre of gravity of the bow door, See [Figure 2. 8. 1: Bow door \(upward hinging\)](#)
- $h$  = height of the door, in metres, between the levels of the bottom of the door and the upper deck or between the bottom of the door and the top of the door, whichever is the lesser, See [Figure 2. 8. 2: Definition of  \$\alpha\$  and  \$\beta\$](#)
- $k$  = material factor (See [Pt 3, Ch 2, 1.2 Steel](#)), but is not to be taken less than 0.72 unless demonstrated otherwise by a direct strength analysis with regard to relevant modes of failure
- $l$  = projected length, in metres, of the door at a height of  $\frac{h}{2}$  above the bottom of the door, See [Figure 2. 8. 2: Definition of  \$\alpha\$  and  \$\beta\$](#)
- $w$  = width of bow door at half height, in metres
- $A_z$  = area, in  $m^2$ , of the horizontal projection of the bow door, between the bottom of the door and the top of the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, See [Figure 2. 8. 1: Bow door \(upward hinging\)](#). Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is the lesser
- $A_s$  = area of stiffener web, in  $cm^2$

- $A_x$  = area, in  $m^2$ , of the transverse vertical projection of the bow door, between the bottom of the door and the top of the door or between the bottom of the door and the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, See [Figure 2. 8. 1: Bow door \(upward hinging\)](#) Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is lesser. In determining the height from the bottom of the door to the upper deck or to the top of the door, the bulwark is to be excluded
- $A_y$  = area, in  $m^2$ , of the longitudinal vertical projection of the bow door, between the bottom of the door and the top of the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, See [Figure 2. 8. 1: Bow door \(upward hinging\)](#) Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is the lesser
- $W$  = weight of bow visor, in tonnes
- $q$  = distance, in metres, from the centroid of the hydrostatic head profile, to the top of the cargo space
- $C_H$  = 0.0125L where  $L < 80$  m  
= 1.0 where  $L \geq 80$  m
- $L$  = length of ship, but need not be taken greater than 200 m
- $V$  = as defined in [Pt 4, Ch 2, 1.5 Symbols 1.5.1](#)
- $\lambda$  = coefficient depending on the area where the ship is intended to be operated  
= 1.0 for sea-going ships  
= 0.8 for ships operated in coastal waters  
= 0.5 for ships operated in sheltered waters
- $\sigma$  = bending stress, in  $N/mm^2$
- $\sigma_e$  = equivalent stress, in  $N/mm^2$   
=  $\sqrt{\sigma^2 + 3\tau^2}$
- $\sigma_y$  = yield stress of the bearing material, in  $N/mm^2$
- $\tau$  = shear stress, in  $N/mm^2$ .

**Figure 2. 8. 1: Bow door (upward hinging)**

**Figure 2. 8. 2: Definition of  $\alpha$  and  $\beta$**

## 8.2 General

- 8.2.1 Bow doors are defined by the following types:
  - a. Visor doors opened by rotating upwards and outwards about a horizontal axis through two or more hinges located near the top of the door and connected to the primary structure of the door by longitudinally arranged lifting arms.
  - b. Side-opening doors opened either by rotating outwards about a vertical axis through two or more hinges located near the outbound edges or by horizontal translation by means of linking arms arranged with pivoted attachments to the door and the ship. It is expected that side-opening bow doors will be arranged in pairs.
 Other bow door types will be specially considered.
- 8.2.2 Bow doors are to be situated above the freeboard deck. A watertight recess in the freeboard deck located forward of the collision bulkhead and above the deepest waterline, fitted for arrangement of ramps or other related mechanical devices, may be regarded as a part of the freeboard deck for the purpose of this requirement.
- 8.2.3 Where bow doors lead to a complete or long forward enclosed superstructure, or to a long non-enclosed superstructure which is fitted to attain minimum bow height equivalence, an inner door is to be fitted. The inner door is to be part of the collision bulkhead. Where a sloping vehicle ramp forming the collision bulkhead above the freeboard deck is arranged, the inner door may be omitted if the ramp is weathertight over its complete length and fulfils the requirements of [Pt 3, Ch 3 Structural Design](#) concerning the position of the collision bulkhead.
- 8.2.4 Bow doors are to be fitted with arrangement for ensuring weathertight sealing, such as gaskets, and to give effective protection to inner doors.
- 8.2.5 Inner doors forming part of the collision bulkhead are to be watertight over the full height of the cargo space and arranged with fixed sealing supports on the aft side of the doors.
- 8.2.6 Bow doors and inner doors are to be arranged so as to preclude the possibility of the bow door causing structural damage to the inner door or to the collision bulkhead in the case of damage to or detachment of the bow door. If this is not possible, a second separate inner weathertight door, complying with [Pt 4, Ch 2, 8.2 General 8.2.5](#), is to be installed.
- 8.2.7 The requirements for inner doors are based on the assumption that vehicles and cargo are effectively lashed and secured against movement from the stowed position.
- 8.2.8 For ships complying with the requirements of this Section, the securing, supporting and locking devices are defined as follows:
  - a. A securing device is used to keep the door closed by preventing it from rotating about its hinges.
  - b. A supporting device is used to transmit external and internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure.
  - c. A locking device locks a securing device in the closed position.
- 8.2.9 The scantlings and arrangements of side shell and stern doors are to be in accordance with the requirements of [Pt 3, Ch 11, 8 Side and stern doors and other shell openings](#).

## 8.3 Scantlings

- 8.3.1 The strength of the bow door is to be equivalent to the surrounding structure, as given in [Pt 3, Ch 5, 6 Fore peak structure](#).
- 8.3.2 For bow doors, including bulwark, of unusual form or proportions, the areas and angles used for the determination of design values of external forces are to be specially considered.

- 8.3.3 Bow doors of the visor or hinged opening type are to be adequately stiffened, and means are to be provided to prevent lateral or vertical movement of the doors when closed. Care is to be taken to ensure that adequate strength is provided in the connections of the hinge or linking arms to the door structure and to the ship structure.
- 8.3.4 The thickness of the bow door plating is not to be less than the side shell plating calculated with the door stiffener spacing, and in no case to be less than the minimum shell plate end thickness or forecastle side thickness as appropriate.
- 8.3.5 The section modulus of horizontal or vertical stiffeners is not to be less than required for end framing. Consideration is to be given, where necessary, to differences in fixity between ship frames and bow door stiffeners.
- 8.3.6 The stiffener webs are to have a net sectional area not less than:

$$A_s = \frac{10Q}{\tau} \text{ cm}^2$$

$\tau$  is to be taken as  $\frac{100}{k}$  N/mm<sup>2</sup>

Where

$Q$  = shear force, in kN calculated using the uniformly distributed external sea pressure,  $p_e$ , defined in [Pt 4, Ch 2, 8.6, Design of securing and supporting devices 8.6.1](#)

- 8.3.7 Bow door secondary stiffeners are to be supported by primary members constituting the main stiffening elements of the door.
- 8.3.8 The scantlings of such primary members are to be based on direct strength calculations. Normally, formulae for simple beam theory may be applied to determine the bending stress. Members are to be considered to have simply supported end connections. The design load,  $P_e$ , is the uniformly distributed external sea pressure. The formulae for  $P_e$  given in [Pt 4, Ch 2, 8.6, Design of securing and supporting devices 8.6.1](#), may be used with  $\alpha$  and  $\beta$  defined as:
- $\alpha$  = flare angle, in degrees, generally to be measured normal to the shell between the vertical axis and the vertical tangent to the outer shell of the door measured at the point on the bow door, one half of the projected length ( $l/2$ ) aft of the stern line on the plane at the half height of the door ( $h/2$ ) (See [Figure 2. 8. 2: Definition of  \$\alpha\$  and  \$\beta\$](#) )
- $\beta$  = entry angle, in degrees, generally to be measured on the outer shell of the door between the longitudinal axis and the waterplane tangent measured at the point on the bow door, one half of the projected length ( $l/2$ ) aft of the stem line on the plane at the half height of the door ( $h/2$ ) (See [Figure 2. 8. 2: Definition of  \$\alpha\$  and  \$\beta\$](#) )

The permissible stresses are as follows:

$$\tau = \frac{80}{k} \text{ N/mm}^2$$

$$\sigma = \frac{120}{k} \text{ N/mm}^2$$

$$\sigma_e = \frac{150}{k} \text{ N/mm}^2$$

- 8.3.9 The webs of primary members are to be adequately stiffened, preferably in a direction perpendicular to the shell plating.
- 8.3.10 The primary members of the bow doors and hull structure in way are to have sufficient stiffness to ensure the integrity of the boundary support of the doors.

- 8. 3. 11 All load transmitting elements in the design load path, from door through securing arrangements and supporting devices into the ship structure, including welded connections, are to be to the same strength standard. These elements include pins, supporting brackets and back-up brackets. Where cut-outs are made in the supporting structure, the strength and stiffness will be specially considered.
- 8. 3. 12 For bow doors and inner doors, the distribution of forces acting on the securing devices and the supporting devices is to be supported by direct calculations taking into account the flexibility of the structure and the actual position and stiffness of the supports.
- 8. 3. 13 The buckling strength of primary members is to be specially considered.

## 8. 4 Vehicle ramps

- 8. 4. 1 Where doors also serve as vehicle ramps, the scantlings are to be not less than would be required by [Pt 4, Ch 2, 3.2 Deck plating 3.2.3](#) and [Pt 4, Ch 2, 3.3 Deck stiffening 3.3.3](#) and where they form part of the collision bulkhead the arrangement is to be in accordance with [Pt 3, Ch 3, 4.5 Watertight recesses, flats and loading ramps](#).

## 8. 5 Arrangements for the closing, securing and supporting of doors

- 8. 5. 1 Bow doors are to be fitted with adequate means of closing, securing and supporting so as to be commensurate with the strength and stiffness of the surrounding structure. The hull supporting structure in way of the bow doors is to be suitable for the same design loads and design stresses as the securing and supporting devices. Where packing is required, the packing material is to be of a comparatively soft type, and the supporting forces are to be carried by the steel structure only. Maximum design clearance between securing and supporting devices is not to exceed 3 mm.
- 8. 5. 2 Securing devices are to be simple to operate and easily accessible. They are to be of a design approved by ACS for the intended purpose.
- 8. 5. 3 Securing devices are to be equipped with positive locking arrangements. Arrangements are to be such that the devices are retained in the closed position within design limits of inclination, vibration and other motion-induced loads and in the event of loss of any actuating power supply.
- 8. 5. 4 Systems for door opening/closing and securing/locking are to be interlocked in such a way that they can only operate in a proper sequence. Hydraulic systems are to comply with [Pt 5, Ch 14, 9 Hydraulic systems](#).
- 8. 5. 5 Means are to be provided to enable the bow doors to be mechanically fixed in the open position taking into account the self-weight of the door and a minimum wind pressure of 1.5 kN/m<sup>2</sup> (0.153 tonne-f/m<sup>2</sup>) acting on the maximum projected area in the open position.
- 8. 5. 6 The spacing for side and top cleats should not exceed 2.5 m and there should be cleats positioned as close to the corners as practicable. Alternative arrangements for ensuring weathertight sealing will be specially considered.
- 8. 5. 7 Control and monitoring arrangements are to comply with [Pt 6, Ch 2, 19 Ship safety systems](#).

## 8. 6 Design of securing and supporting devices

- 8. 6. 1 The external design forces for securing devices, supporting devices and surrounding structure are to be taken not less than  $P$ , taking the direction of the pressure into account:

$$P_x = A_x p_e$$

$$P_y = A_y p_e$$

$$P_{yz} = A_z p_e$$

Where

$p_e$  = external sea pressure, not to be taken less than:

a. For bow doors:

$$p_e = 0.8(0.15V + 0.6\sqrt{L})^2 \text{ kN/m}^2$$

or

$$p_e = 2.75\lambda C_H(0.22 + 0.15\tan \alpha)(0.4V\sin \beta + 0.6\sqrt{L})^2 \text{ kN/m}^2$$

whichever is the greater.

b. For inner doors:

$$p_e = 0.45L \text{ kN/m}^2$$

or

$$p_e = 10q \text{ kN/m}^2$$

whichever is the greater

The symbols are as defined in [Pt 4, Ch 2, 8.1 Symbols 8.1.1](#).

8. 6. 2 The inner door internal design pressure, considered for the scantlings of securing devices, is not to be less than 25 kN/m<sup>2</sup>.

8. 6. 3 For visor doors, the pivot arrangement is to be such that the visor is self-closing under external loads. The closing moment,  $M_c$ , is to be taken as:

$$M_c = P_x a + 10Wc - P_z b \text{ kNm}$$

but is not to be less than:

$$M_c = 10Wc + 0.1\sqrt{(a^2 + b^2)(p_x^2 + p_z^2)} \text{ kN m}$$

8. 6. 4 For visor doors, two securing devices are to be provided at the lower part of the door, each capable of providing the full reaction force required to prevent opening of the door within the permissible stresses given in [Pt 4, Ch 2, 8.6 Design of securing and supporting devices 8.6.7](#). The opening moment  $M_o$ , to be balanced by this reaction force, is to be taken as not less than:

$$M_o = 10Wd + 5A_x a \text{ kNm}$$

8. 6. 5 For visor type doors, the securing and supporting devices, excluding hinges, are to be capable of resisting the vertical design force ( $P_z - 10W$ ) kN, within the permissible stresses given in [Pt 4, Ch 2, 8.6 Design of securing and supporting devices 8.6.7](#).

8. 6. 6 For side-opening doors, securing devices are to be provided such that in the event of a failure of any single securing device the remainder are capable of providing the full reaction force required to prevent the opening of the door. The permissible stresses given in [Pt 4, Ch 2, 8.6 Design of securing and supporting devices 8.6.7](#) are not to be exceeded. The opening moment about the hinges to be balanced by this reaction force is not to be less than that calculated when the following loads are applied:

a. An internal pressure of 5 kN/m<sup>2</sup>.

b. A force of 10W kN acting forward at the centroid of mass.

8. 6. 7 Securing devices and supporting devices are to be designed to withstand the forces given above using the following permissible stresses:

$$\tau = \frac{80}{k} \text{ N/mm}^2$$

$$\sigma = \frac{120}{k} \text{ N/mm}^2$$

$$\sigma_e = \frac{150}{k} \text{ N/mm}^2$$

8. 6. 8 The arrangement of securing and supporting devices is to be such that threaded bolts are not to carry support forces. The maximum tensile stress in way of threads of bolts, not carrying support forces, is not to exceed:

$$\frac{125}{k} \text{ N/mm}^2$$

8. 6. 9 For steel to steel bearings in securing and supporting devices, the nominal bearing pressure is not to exceed  $0.8\sigma_y$ . For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification. The nominal bearing pressure is to be calculated by dividing the design force by the projected bearing area.
8. 6. 10 The reaction forces to be applied to the effective securing and supporting devices are to be determined from the combination of external loads defined in [Table 2. 8. 1: Combination of external loads](#).

**Table 2. 8. 1: Combination of external loads**

| Bow door type  | Combination of external loads                                   |  |
|--|---|--|
|  | Case 1<br>(Head seas)   | Case 2<br>(Quartering seas)  |
| Visor doors, <i>See</i> Notes 1 and 2  | $P_x$ and $P_z$<br><i>See</i> Note 3                            | $0.7P_y$ acting on each side separately, together with $0.7P_x$ and $0.7P_z$           |
| Side opening, <i>See</i> Notes 1 and 2   | $P_x$ , $P_y$ and $P_z$ acting on both doors, <i>See</i> Note 3 | $0.7P_x$ and $0.7P_z$ acting on both doors and $0.7P_y$ acting on each door separately |
| <p><b>Note 1.</b> <math>P_x</math>, <math>P_y</math> and <math>P_z</math> are defined in <a href="#">Pt 4, Ch 2, 8.6, Design of securing and supporting devices 8.6.1</a>. These forces are to be applied at the centroid of the projected areas.</p> <p><b>Note 2.</b> The self-weight of the door is to be included in the combination of external loads.</p> <p><b>Note 3.</b> The Case 1 forces are generally to give rise to a zero moment about the transverse axis through the centroid of area <math>A_x</math>, <i>See</i> <a href="#">Figure 2. 8. 1: Bow door (upward hinging)</a>.</p> |   |  |

8. 6. 11 The distribution of the reaction forces acting on the securing and supporting devices is to be supported by direct calculations taking into account the flexibility of the hull structure and the actual position and stiffness of the supports. Small and/or flexible devices, such as cleats, intended to provide load compression of the packing material are not to be included in these calculations.
8. 6. 12 The hinge or linking arms of a bow door and its supports are to be designed for the static and dynamic opening forces. A minimum wind pressure of  $1.5 \text{ kN/m}^2$ , acting on the transverse projected area of the door is to be taken into account.
8. 6. 13 For side-opening doors, supporting devices are to be provided in way of girder ends at the closing of the two doors to prevent one side shifting towards the other under the effect of asymmetrical pressure. A typical arrangement is shown in [Figure 2. 8. 3: Typical supporting device between doors](#).
8. 6. 14 Inner doors are to be gasketed and weathertight.

**Figure 2. 8. 3: Typical supporting device between doors**

- 8. 6. 15 Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included and considered to calculate the reaction forces acting on the devices.
- 8. 6. 16 The number of securing and supporting devices is to be the minimum practicable whilst complying with [Pt 4, Ch 2, 8.6 Design of securing and supporting devices 8.6.4](#) and [Pt 4, Ch 2, 8.6 Design of securing and supporting devices 8.6.17](#) and taking account of the available space for adequate support in the hull structure.
- 8. 6. 17 The arrangement of securing devices and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable of withstanding the reaction forces, resulting from the external loads defined in [Table 2. 8. 1: Combination of external loads](#), without exceeding, by more than 20 per cent, the permissible stresses as defined in [Pt 4, Ch 2, 8.6 Design of securing and supporting devices 8.6.7](#).

## **8. 7 Operating and Maintenance Manual**

- 8. 7. 1 An Operating and Maintenance Manual for the bow doors and inner doors is to be provided on board and is to contain the following information:
  - a. main particulars and design drawings,
    - special safety precautions;
    - details of vessel;
    - equipment and design loading for ramps;
    - key plan of equipment for doors and ramps;
    - manufacturers' recommended testing for equipment; and
    - a description of the equipment for:
      - bow doors;
      - inner bow doors;
      - bow ramp/doors;
      - side doors;
      - stern doors;
      - central power pack;
      - bridge panel;
      - ramps leading down from the main deck;
      - engine control room panel.
  - b. service conditions:
    - limiting heel and trim of the ship for loading/unloading;
    - limiting heel and trim for door operations;
    - operating instructions for doors and ramps; and

- emergency operating instructions for doors and ramps.
- c. maintenance:
  - schedule and extent of maintenance;
  - troubleshooting and acceptable clearances; and
  - manufacturers' maintenance procedures.
- d. register of inspections, including inspection of locking, securing and supporting devices, repairs and renewals.

This Manual is to be submitted for approval, and is to contain a note recommending that recorded inspections of the door supporting and securing devices be carried out by the ship's staff at monthly intervals or following incidents that could result in damage, including heavy weather or contact in the region of the doors. Any damages recorded during such inspections are to be reported to ACS.

8. 7. 2 Documented operating procedures for closing and securing the bow doors and inner doors are to be kept on board and posted at an appropriate place.

## CHAPTER 2 Ferries, Roll On-Roll Off Ships and Passenger Ships

### SECTION 9 Subdivision structure on vehicle deck

#### 9.1 General

- 9.1.1 The requirements of this Section cover subdivision structure fitted on the vehicle deck(s) of roll on-roll off passenger ships. Subdivision structure includes partition doors, bulkheads and longitudinal casings.
- 9.1.2 Where a ship is provided with subdivision structure that complies with the requirements of this Section, the ship will be eligible to be assigned the descriptive note **SSDS** (Subdivision Structure and Damage Stability).
- 9.1.3 The fitting of subdivision structure on the vehicle deck(s) forms one option to mitigate the stability-reducing effects of water on the vehicle deck(s) after damage. Such measures may be required by the National Administration with whom the ship is registered and/or by the National Administration within whose territorial jurisdiction the ship is intended to operate, for example *See The Stockholm Agreement*.

#### 9.2 Design loads

- 9.2.1 For calculation of the design loads, an equivalent depth of water on the first vehicle deck above the design waterline,  $d$ , in metres, is to be derived in accordance with the requirements of the National Administration, *See Pt 4, Ch 2, 9.1 General 9.1.3*
- 9.2.2 It is assumed that vehicles and cargo are effectively lashed and secured to prevent movement from the stowed position.
- 9.2.3 The design heads (*See Figure 2. 9. 1: Design heads for different locations in compartment*) are not to be taken less than the greater of 0.5 m and:
  - a. For transverse structure more than 1.5 m away from the longitudinal boundaries of the compartment:

$$h_T = 1.4\sqrt{L_c d K} \text{ in metres, for } z < 1$$

$$= 1.4\sqrt{L_c d K} \left(1 - \frac{(z-1)}{1.4\sqrt{L_c d K} - 1}\right) \text{ in metres, for } z \geq 1$$

Symbols are as defined in [Pt 4, Ch 2, 9.2 Design loads 9.2.4](#).

- b. For longitudinal structure more than  $L_c/6$  away from the transverse boundaries of the compartment:

$$h_L = \sqrt{B_c d} \text{ in metres, for } z < 1$$

$$= \sqrt{B_c d} \left( 1 - \frac{z-1}{(1.4\sqrt{B_c d}-1)} \right) \text{ in metres, for } z \geq 1$$

Symbols are as defined in [Pt 4, Ch 2, 9.2 Design loads 9.2.4](#).

c. For structure elsewhere:

$$h_c = \frac{L_c K}{2} + \sqrt{R} \text{ in metres, for } z < 1$$

$$= \left( \frac{L_c K}{2} + \sqrt{R} \right) \left( 1 - \frac{(z-1)}{1.4 \left( \frac{L_c K}{2} + R \right) - 1} \right) \text{ in metres, for } z \geq 1$$

Symbols are as defined in [Pt 4, Ch 2, 9.2 Design loads 9.2.4](#).

**Figure 2. 9. 1: Design heads for different locations in compartment**

9. 2. 4 Symbols, as used in [Pt 4, Ch 2, 9.2 Design loads 9.2.3](#), are defined as follows:

- $d$  = equivalent depth of water on the vehicle deck, in metres, in the upright condition taking into account the volume of flooded and accumulated water on the vehicle deck calculated in accordance with the requirements of the National Administration, *See* [Pt 4, Ch 2, 9.1 General 9.1.3](#) and [Pt 4, Ch 2, 9.2 Design loads 9.2.1](#)
- $z$  = vertical distance, between the point under consideration and the flooded vehicle deck, in metres. For plate panels the point under consideration is to be taken as one third of the panel height above its lower edge. For stiffeners the point under consideration is to be taken as the midspan of the effective length
- $B_c$  = breadth of compartment, in metres, *See* [Figure 2. 9. 1: Design heads for different locations in compartment](#)
- $K$  =  $0.21e(-0.0033 L_{pp})$  and need not exceed 0.14
- $L_c$  = length of compartment, in metres, *See* [Figure 2. 9. 1: Design heads for different locations in compartment](#)

$$R = B_c d - \frac{L_{2c} K_2}{12} \text{ and is not to be taken less than } 0$$

$e$  = base of natural logarithms, 2.7183

$L_{pp}$  = as defined in [Pt 3, Ch 1, 6 Definitions](#)

- 9.2.5 The design heads calculated in [Pt 4, Ch 2, 9.2 Design loads 9.2.3](#) are based on the ship being in the upright condition. Where the actual damaged floating position is specified, the design heads will be specially considered taking this into account.
- 9.2.6 The subdivision structure, and access doors within the subdivision structure, are to be capable of withstanding the design loading applied from the side of the compartment under consideration.
- 9.2.7 Consideration will be given to the use of design heads agreed by the National Administration.

### 9.3 Height of subdivision structure

- 9.3.1 The height of the subdivision structure,  $H_D$ , is not to be less than:
- 4m, or
  - $8d$ , but not less than 2.2 m, or
  - the height between the vehicle deck under consideration and the underside of the next watertight deck above,
- whichever is the lesser.
- $d$  = is defined in [Pt 4, Ch 2, 9.2 Design loads 9.2.4](#).
- 9.3.2 For special arrangements, such as hanging car decks or wide side casings, other subdivision structure heights may be accepted on the basis of detailed model tests in the flooded conditions under investigation by the National Administration.

### 9.4 Material

- 9.4.1 Where materials other than steel are used, the scantlings are to be specially considered.

### 9.5 Scantlings of subdivision structure other than doors

- 9.5.1 The minimum scantlings of subdivision bulkheads and casings are to be derived in accordance with [Table 1.9.1: Watertight and deep tank bulkhead scantlings](#) for watertight bulkheads, where  $h_4$  is to be substituted by either of  $h_T$ ,  $h_L$  or  $h_c$ , depending on the location under consideration.
- 9.5.2 Where a cut-out is made in the subdivision structure for the fitting of an access door, the strength and integrity of the subdivision structure are to be maintained.

### 9.6 Scantlings of subdivision doors

- 9.6.1 The plate thickness of subdivision doors of single plate construction is not to be less than the greater of:

$$t = 0.004sf(hk)^{0.5} \text{ mm, or}$$

$$t = 5.0 \text{ mm}$$

Where

$s, k$  = as defined in [Pt 4, Ch 2, 1.5 Symbols 1.5.1](#)

$f$  = as defined in [Table 1. 9. 1: Watertight and deep tank bulkhead scantlings](#) in [Pt 4, Ch 1 General Cargo Ships](#)

$h$  =  $h_T, h_L$  or  $h_c$  as defined in [Pt 4, Ch 2, 9.2 Design loads 9.2.3](#), as appropriate.

9. 6. 2 For subdivision doors of a double plate construction the plate thickness is to be specially considered.
9. 6. 3 The scantlings of primary and secondary stiffeners of subdivision doors are to be based on direct strength calculations.
9. 6. 4 The direct strength calculations are also to provide an assessment of the door, under the design load, to enable the leakage and hence the drainage requirements of [Pt 4, Ch 2, 9.9 Watertightness and drainage](#) to be assessed.
9. 6. 5 For the purpose of the direct strength calculations. the stresses induced in the subdivision door, determined using the design loads from [Pt 4, Ch 2, 9.2, Design loads](#), are not to exceed the permissible values given in [Table 2. 9. 1: Permissible stress values](#). Checks are also to be carried out to ensure that the door will not buckle under the design loads.

**Table 2. 9. 1: Permissible stress values**

| Stress type   | Permissible stress   |
|---|----------------------|
| Direct stress   | $\sigma_o$           |
| Shear stress  | $\frac{\sigma_o}{3}$ |
| Combined stress   | $\sigma_o$           |
| Symbols   |                      |
| $\sigma_o$ = specified minimum yield stress, in N/mm <sup>2</sup> |                      |

9. 6. 6 Where a cut-out is made within the subdivision door for the fitting of an access door, the strength of the subdivision door is to be maintained.

## 9. 7 Closing, securing and supporting of subdivision doors

9. 7. 1 The closing and securing devices of doors are to comply with the following requirements:
  - a. Securing devices are to be simple to operate and easily accessible. They are to be of a design approved by ACS for the intended purpose.
  - b. Securing devices and supporting devices are to be designed to withstand the design loads calculated in [Pt 4, Ch 2, 9.2 Design loads 9.2.1](#) in association with the permissible stresses shown in [Table 2. 9. 2: Permissible stress values](#).
  - c. The arrangement of securing and supporting devices is to be such that threaded bolts do not carry support forces. The maximum tensile stress in way of threads of bolts not carrying support forces is not to exceed  $0.5\sigma_o$ .
  - d. For steel to steel bearings in securing and supporting devices, the bearing pressure is not to exceed  $0.8\sigma_o$ . For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification. The bearing pressure is to be calculated by dividing the design force by the projected bearing area.
  - e. Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included when calculating the reaction forces acting on the devices.

- f. Securing devices are to be equipped with positive locking arrangements. Arrangements are to be such that the securing devices are retained in the closed position within design limits of inclination, vibration and other motion-induced loads and in the event of loss of any actuating power supply.
- g. Hydraulic systems are to comply with [Pt 5, Ch 14, 9 Hydraulic systems](#).
- h. Control and monitoring arrangements are to comply with [Pt 6, Ch 2, 19 Ship safety systems](#).

**Table 2. 9. 2: Permissible stress values**

| Stress type   | Permissible stress |
|---|--------------------|
| Direct stress   | $0.8\sigma_o$      |
| Shear stress  | $0.5\sigma_o$      |
| Combined stress   | $0.8\sigma_o$      |
| Symbols   |                    |
| $\sigma_o$ = specified minimum yield stress, in N/mm <sup>2</sup> |                    |

- 9. 7. 2 The reaction forces to be applied to the effective securing and supporting devices are to be determined using the applicable design loads calculated using the heads in [Pt 4, Ch 2, 9.2, Design loads](#) together with the weight of the door.

## 9. 8 Access doors

- 9. 8. 1 Access doors are permitted to be fitted in subdivision doors or bulkheads in order to provide access between compartments.
- 9. 8. 2 Access doors may be manually operated.
- 9. 8. 3 The strength of access doors is to be not less than that of the surrounding structure.
- 9. 8. 4 Means are to be provided to ensure that access doors are closed and secured when not in use after the ship has left the berth.
- 9. 8. 5 A notice is to be displayed on the access doors stating that the door is to be closed and secured at all times when not in use, when the ship is under way.
- 9. 8. 6 Means are to be provided on the navigation bridge to indicate whether the access doors are opened or closed.

## 9. 9 Watertightness and drainage

- 9. 9. 1 Subdivision doors and access doors are to be fitted with gaskets in order to minimise leakage. For access doors where down flooding could result, particular attention is to be paid to drainage requirements.
- 9. 9. 2 The gasket arrangement shall provide sufficient flexibility to absorb possible racking deformation.
- 9. 9. 3 Attention is drawn to the drainage requirements of [Pt 5, Ch 13, 3.1 General](#) with respect to the compartments created by subdivision structures.
- 9. 9. 4 The drainage arrangement for each compartment is to have sufficient capacity to handle leakage from any adjacent flooded compartment.

## 9. 10 Ventilation of vehicle deck spaces

9. 10. 1 Attention is drawn to the ventilation requirement of [Pt 6, Ch 2, 14.13 Special requirements for ships with spaces for carrying vehicles with fuel in their tanks, for their own propulsion 14.13.3](#), since subdivision structure could disrupt air flow.

## 9. 11 Operating and Maintenance Manual

9. 11. 1 An Operating and Maintenance Manual for the subdivision doors is to be provided on board and is to contain the following:
- main particulars and design drawings,
  - service conditions (e.g. service area restrictions),
  - maintenance and function testing,
  - register of inspections, repairs and renewals.
9. 11. 2 The Manual is to be submitted for approval. It is to contain a note recommending that recorded inspections of supporting and securing devices are to be carried out by the ship's staff at monthly intervals, or following incidents that could result in damage, including heavy weather or contact in the region of the subdivision doors. Any damages recorded during such inspections are to be reported to ACS.
9. 11. 3 Documented operating procedures for closing and securing the subdivision doors are to be kept on board and posted in an appropriate place.

## CHAPTER 2 Ferries, Roll On-Roll Off Ships and Passenger Ships

### SECTION 10 Masts and standing rigging

#### 10. 1 General

- 10. 1. 1 Masts are generally to be of tubular construction and may be either stayed or unstayed. Special consideration will be given to other forms of construction.
- 10. 1. 2 Masts are to be of sufficient strength to withstand the worst combination of loads from both the operational case with full sail, reduced sail configurations where applicable and survival conditions.
- 10. 1. 3 Masts are to be adequately supported using stays if necessary.
- 10. 1. 4 Drainage is to be provided to prevent the build-up of sea-water or condensation within the mast structure. Steel masts should, where possible, be coated internally with a suitable anti-corrosive preparation.
- 10. 1. 5 Openings in the masts for entry and exit of running rigging or cables should be adequately compensated with suitable insert plates or doublers.
- 10. 1. 6 Masts are to be efficiently integrated into the hull and in principle, carried through to the keel. Alternative arrangements of supporting masts will require to be specially considered.
- 10. 1. 7 Where ship response data are not available the values for roll, pitch and heave given in [Table 2. 10. 1: Ship motions](#) should be used.

#### 10. 2 Design loadings and allowable stresses

- 10. 2. 1 The mast and standing rigging design is to be considered with respect to the loads from the following conditions:
  - R1 - Operational case with full press of sails for the maximum operational apparent wind speed as specified by the designer.
  - R2 - Storm conditions with reduced sail.
  - R3 - Survival case with sails reefed/stowed/weathervaning with the environmental loads resulting from the combination of a maximum wind speed of 63 m/sec and the accelerations produced by ship motions.

**Table 2. 10. 1: Ship motions**

| Motion | Maximum single amplitude | Period, in seconds |
|--------|--------------------------|--------------------|
|--------|--------------------------|--------------------|

|   |   |                                |
|---|---|--------------------------------|
| Roll  | $\Phi = \sin^{-1}\theta$ degrees but need not exceed 30° and is not to be taken less than 22° | $T_r = \frac{0.7B}{\sqrt{GM}}$ |
| Pitch   | $\Psi = 12e^{-0.0033L_{pp}}$ degrees, but need not exceed 8°                                  | $T_p = 0.5\sqrt{L_{pp}}$       |
| Heave   | $\frac{L_p}{80}$ m  | $T_h = 0.5\sqrt{L_{pp}}$       |
| <b>where</b><br>$L_{pp}$ , $B$ as defined in <a href="#">Pt 3, Ch 1, 6 Definitions</a><br>$GM$ = transverse metacentric height of loaded ship, in metres<br>$\theta = \left(0.45 + 0.1\frac{L}{B}\right)\left(0.54 - \frac{L}{1270}\right)$ |   |                                |

10.2.2 The mast section is to be designed to have a margin against failure due to column buckling using the greatest combined design axial and bending stress in both the transverse and fore and aft directions.

10.2.3 For loadcases R1 and R2 described in [Pt 4, Ch 2, 10.2 Design loadings and allowable stresses 10.2.1](#), the following condition is to be satisfied:

$$\frac{\sigma_b}{\sigma_y} + \frac{\sigma_a}{\sigma_c} \leq 0.67$$

For loadcase R3 the following condition is to be satisfied:

$$\frac{\sigma_b}{\sigma_y} + \frac{\sigma_a}{\sigma_c} \leq 0.85$$

Where

$\sigma_b$  = is the bending stress in the mast section under consideration

$\sigma_y$  = is the tensile yield stress for the material

$\sigma_a$  = is the axial stress in the mast section under consideration

$\sigma_c$  = is the critical buckling stress for the mast section.

10.2.4 For thin walled masts, constructed from either flat or curved shells, calculations are to be submitted demonstrating adequate margin against local elastic instability.

## 10.3 Materials of mast construction

10.3.1 In general masts are to be constructed from either steel or aluminium alloy tubular members, extrusions and/or welded constructions, and are, generally, to comply with [Pt 2 Rules for the Manufacture, Testing and Certification of Materials](#), where appropriate.

10.3.2 Other materials will be specially considered.

## 10.4 Standing rigging

10.4.1 Standing rigging is to be so arranged such that it does not foul running rigging or interfere with the operation of the sails. Protection is to be provided against routine quay contacts.

10.4.2 Standing rigging is to be effectively attached to the masts, deck and hull structure and is to be so designed that it cannot become disconnected during operation.

10. 4. 3 Standing rigging is to be properly erected using tensioning devices to ensure that the correct pre-tension is applied as specified by the designer.
10. 4. 4 The initial pre-tension applied to standing rigging is to be measured and recorded.

## 10. 5 Design loadings

10. 5. 1 The forces in the standing rigging are to be obtained by direct calculation methods for the load conditions given in [Pt 4, Ch 2, 10.2 Design loadings and allowable stresses 10.2.1](#).
10. 5. 2 The minimum factors of safety on the breaking strength of shrouds and stays are as follows:
- |                      |     |
|----------------------|-----|
| Sail cases R1 and R2 | 3.5 |
| Survival case R3     | 2.0 |

## 10. 6 Shroud and stay attachment points

10. 6. 1 Standing rigging is to be effectively attached to the masts, ship's deck or bulwark structure. Chain plates, mast eyeplates and the structure in way are to be reinforced to withstand a load of 1.2 x breaking strength of the appropriate shroud or stay.
- Generally the hull structure in way of shroud/stay attachment should be capable of withstanding the wire breaking load without permanent deformation of the structure.
10. 6. 2 Increased mast wall thickness, or internal or external mast stiffening rings or diaphragms are to be arranged in way of the toes of shroud and stay eyeplates to resist mast wall punching shear loads. Where additional mast stiffening rings or diaphragms are not fitted, the mast wall is not to be less than:

$$t_{\text{wall}} = \frac{2(h_{\text{eye}} B_s k_{\text{mast}})}{(t_{\text{eye}} l_{\text{eye}})} (\text{mm})$$

Where

- $h_{\text{eye}}$  = eyeplate pin axis from mast wall, mm, See [Figure 2. 10. 1: Definition of heye and leye](#)
- $B_s$  = breaking strength, in kN, of attached rigging component
- $k_{\text{mast}}$  = mast material factor, k
- $t_{\text{eye}}$  = eyeplate thickness, mm, See [Figure 2. 10. 1: Definition of heye and leye](#)
- $l_{\text{eye}}$  = eyeplate length, mm, See [Figure 2. 10. 1: Definition of heye and leye](#)

10. 6. 3 The attachments of the stays and shrouds are to be efficiently integrated into the hull structure and due regard given to any attachments to the sheerstrake.

**Figure 2. 10. 1: Definition of  $h_{eye}$  and  $l_{eye}$**

10. 6. 4 Where it is intended to use mechanical attachments (bolting) of running rigging or other gear to the mast walls, the number of holes are to be kept to a minimum and are to be staggered in order to maintain the structural integrity of the mast. All details are to be submitted.

## 10. 7 Materials for rigging

10. 7. 1 In general, standing rigging is to be made from galvanised steel wire rope (GSRW) with galvanised steel rigging screws, shackles and terminations, and is to comply with the requirements of ACS. Special consideration will, however, be given to other rigging materials.
10. 7. 2 Alternatively, stainless steel wire rope or solid rod rigging may be used in place of GSRW.
10. 7. 3 The steel wire rope, solid rods and loose fittings used for standing rigging are to be manufactured to a recognised National or International Standard and at an ACS approved works.
10. 7. 4 Rigging components from other sources will be specially considered.
10. 7. 5 Where stainless steel rigging is employed, particular attention is to be given to the selection of the grade of material used as some stainless steels are prone to stress corrosion cracking and consequent fatigue failure, the onset of which is not readily observed.
10. 7. 6 Attention is drawn to the requirements of the Flag Administration for the vessel who may have requirements regarding the application of certain materials, systems or criteria.

## 10. 8 Testing and certification

10. 8. 1 All equipment items used for standing rigging, including loose items of gear such as shackles, bottle screws, sheaves, etc. are to be tested and surveyed in accordance with ACS requirements. For systems employing specialised devices or materials, individual consideration will be given to the testing and survey requirements.
10. 8. 2 For sailing passenger ships, the equipment requirement will be in accordance with the letter and numeral two grades higher than that corresponding to the calculated Equipment Numeral.

**CHAPTER 2 Ferries, Roll On-Roll Off Ships and Passenger Ships****SECTION 11 Miscellaneous openings****11. 1 General**

11. 1. 1 The requirements of [Pt 3, Ch 11, 6 Miscellaneous openings](#) are to be complied with.

**11. 2 Openings in main vehicle deck**

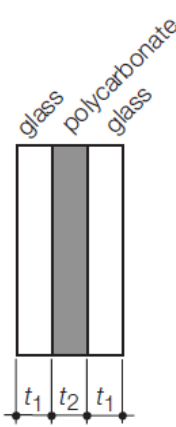

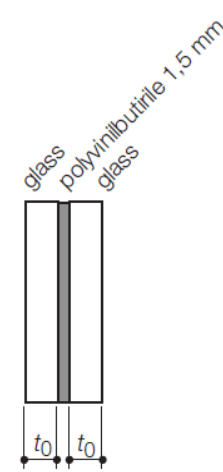

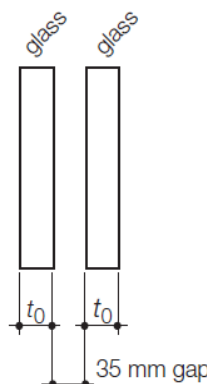

11. 2. 1 Where the main vehicle deck is enclosed, all companionways and openings in the deck which lead to spaces below are generally to be protected by steel doors or hatch covers. Approved fire doors may be accepted in lieu of steel doors. The sills or coamings are to be not less than 230 mm above the main vehicle deck, with the exception of those leading to machinery spaces which are to have sills or coamings not less than 380 mm. Exceptionally, when such openings are to be kept closed at sea, sills or coamings may be reduced in height, provided that the sealing arrangements are adequate. In such cases, the doors or hatch covers are to be secured weathertight by gaskets and a sufficient number of clamping devices. Such items as portable plates in the main vehicle deck arranged for the removal of machinery parts, etc. may be arranged flush with the deck, provided they are secured by gaskets and closely spaced bolts at a pitch not exceeding five diameters.
11. 2. 2 Scuppers from vehicle or cargo spaces above the bulkhead deck fitted with an approved fixed pressure water spray fire-extinguishing system are to be led directly overboard and are to be fitted with means of preventing water from passing inboard in accordance with [Pt 3, Ch 12, 4.2 Closing appliances](#).
11. 2. 3 Inboard draining scuppers do not require valves but are to be led to suitable drain tanks (not engine room or hold bilges) and the capacity of the tanks is to be sufficient to hold approximately 20 minutes of drenching water. The arrangements for emptying these tanks are to be approved and suitable high level alarms provided.
11. 2. 4 A drainage system is to be arranged in the area between bow door and ramp, or where no ramp is fitted, between the bow door and inner door. The system is to be equipped with an audible and visual alarm function to the navigation bridge being set off when the water levels in these areas exceed 0.5 m or the high water level alarm, whichever is the lesser.
11. 2. 5 The drainage arrangement for each area is to have sufficient capacity to prevent accumulation of water in case of leakage. Scuppers are to be provided on both sides of the ship with a diameter not less than 50 mm and in accordance with [Pt 3, Ch 12, 4 Scuppers and sanitary discharges](#). Alternatively, a bilge suction should be provided.
11. 2. 6 If the main vehicle deck is not totally enclosed, scuppers or freeing ports are to be provided consistent with the requirements of [Pt 3, Ch 8, 5.3 Freeing arrangements](#).

- 11.2.7 Air pipes from cofferdams or void spaces may terminate in the enclosed 'tween deck space on the main vehicle deck provided the space is adequately ventilated and the air pipes are provided with weathertight closing appliances.
- 11.2.8 Between the bow door and the inner door a television surveillance system is to be fitted with a monitor on the navigation bridge and in the engine control room. The system must monitor the position of doors and a sufficient number of their securing devices. Special consideration is to be given for lighting and contrasting colour of objects under surveillance, *See also* [Pt 4, Ch 2, 8.5 Arrangements for the closing, securing and supporting of doors 8.5.7](#).

### 11.3 Strength assessment of windows in large passenger ships

- 11.3.1 On windows in the second tier and higher above the freeboard deck, a glazing equivalent may be fitted in lieu of deadlights/storm covers. The thicknesses and arrangements are to be acceptable to the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the ship is intended to operate. For arrangements of glazing acceptable to ACS, *See* [Table 2.11.1: Acceptable arrangements of glazing in lieu of portable storm covers/deadlights](#). Alternative arrangement of glazing in lieu of deadlights/storm covers may be accepted provided details are submitted for consideration.
- 11.3.2 For passenger ships the design pressure,  $H_d$ , on windows is to be taken as given in [Table 2.11.2: Design pressure,  \$H\_d\$ , on windows](#), or an equivalent National or Internationally Recognised Standard.
- 11.3.3 The thickness,  $t_0$ , of toughened safety glass is to be taken as given in [Table 2.11.3: Thickness of toughened glass](#).
- 11.3.4 Toughened safety glass of laminated construction will also be accepted, provided the requirements of [Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights 6.5.29](#) are complied with.

**Table 2.11.1: Acceptable arrangements of glazing in lieu of portable storm covers/deadlights**

| In lieu of portable storm covers   | In lieu of deadlights and storm covers   |
|--|--|
|  $t_1^2 + (0,77t_2)^2 + t_1^2 = (1,2t_0)^2$ |  $t_0^2 + t_0^2 = (1,4t_0)^2$  <p>35 mm gap</p> |
| Symbols  |  |
| $t_0$ = minimum thickness of toughened glass as calculated in <a href="#">Table 2.11.3: Thickness of toughened glass</a>       |  |

**Table 2. 11. 2: Design pressure,  $H_d$ , on windows**

| Window location   | Design pressure head $H_d$ in metres   |
|---|--|
| Between the design waterline and a point $Z_{1.5}$ m above the waterline  | Per BS MA 25: 1973   |

| From the top of the navigation bridge to the uppermost deck, at sides and aft ends  | 0.25   |
| Symbols   |  |
| $f_w$ = 1.25 in way of sides and ends of superstructures<br>= 0.75 in way of house fronts<br>$Z_{1.5}$ = the vertical location in metres above the waterline at which the BS MA:25 pressure as given in Annex E of BS MA:25 (is 1973) 1.5t/m <sup>2</sup><br>$Z_{d1.5}$ = the vertical location in metres of the deck at which the pressure is 1.5 t/m <sup>2</sup> from <a href="#">Table 2. 11. 1: Acceptable arrangements of glazing in lieu of portable storm covers/deadlights</a><br>$Z_w$ = the vertical location in metres above the waterline to the point under consideration<br>$H_{t1}+H_{t2}$ = sum of the appropriate 'tween deck heights in metres |  |

**Table 2. 11. 3: Thickness of toughened glass**

| Window type   | Thickness, $t_o$ , in mm          |
|---------------|-----------------------------------|
| Rectangular   | $b \sqrt{\frac{H_d \beta}{4000}}$ |
| Circular      | $0.0175r \sqrt{H_d}$              |
| Semi-circular | $0.011r \sqrt{H_d}$               |
| Symbols       |                                   |

|         |   |
|---------|---|
| $b$     | = length of shorter side of window, in mm   |
| $H_d$   | = design pressure head, in metres, as calculated in <a href="#">Table 2. 11. 2: Design pressure, <math>H_d</math>, on windows</a> |
| $\beta$ | = $0.54 A_R - 0.078 A_R^2 - 0.17$ for $A_R \leq 3$<br>= 0.75 for $A_R > 3$  |
| $A_R$   | = aspect ratio of window, in mm<br>= $a/b$  |
| $a$     | = length of longer side of window, in mm  |
| $r$     | = the radius of the window, in mm   |

## 11. 4 Frame design and testing

11. 4. 1 **Application.** The testing requirements contained in this Section are for all exterior window and glass balustrade designs on all tiers for passenger ships regardless of length. The testing is to be carried out for characteristic window and balustrade sizes (largest, smallest) and forms (circular, semicircular and rectangular) for each passenger ship. Window and balustrade designs, which are not covered by Type Approval Certification, will require prototype testing in order to confirm structural integrity and weather or water tightness as required. Tests are to be carried out to the satisfaction of the Surveyor.
11. 4. 2 **Water tightness.** hydrostatic test is to be carried out in order to examine the water tightness of windows. This is carried out by applying the design pressure head  $H_d$ , as calculated in [Pt 4, Ch 2, 11.3, Strength assessment of windows in large passenger ships](#), to the external face of the window and maintained at this level for at least 15 minutes.
11. 4. 3 **Structural testing.** A hydrostatic test is to be carried out in order to examine the capability of the frame, mullions and the retaining arrangement for the glazing. This is carried out by applying a test pressure of  $4H_d$  ( $H_d$  as calculated in [Pt 4, Ch 2, 11.3, Strength assessment of windows in large passenger ships](#) for windows and [Pt 4, Ch 2, 12.3 Weather design loads](#) for balustrades) to the external face of the window, utilising an aluminium alloy plate of appropriate temper and thickness to simulate the flexural response in lieu of the glazing. A full-scale test with actual glazing in place may be acceptable provided that the stresses induced are within allowable limits. Details of the calculations made and testing procedures are to be submitted for review prior to the test. Alternative means of demonstrating adequacy of frame, mullions and the retaining arrangement for the glazing may be specially considered.
11. 4. 4 Equivalent proposals for testing will be considered. Where alternative testing procedures are proposed, these are to be agreed with ACS before commencement.
11. 4. 5 **Chemically toughened glass.**
- Chemically toughened glass may be used in lieu of thermally toughened glass provided it can be demonstrated the strength of the arrangement is at least equivalent in strength to that of thermally toughened glass.
  - The glazing system is to be of laminated construction.
  - Method of testing will be specially considered.
11. 4. 6 The overlap between glazing and the retaining frame is not to be less than 12 mm.

## 11. 5 Strength of mullions

11. 5. 1 The section modulus of mullions is not to be less than:

$$Z = 10.78 H_d l A_m k 10^{-9} \text{ cm}^3$$

where

$a$  = See [Table 2. 11. 4: Mullion arrangements](#)

$b$  = See [Table 2. 11. 4: Mullion arrangements](#)

$r$  = See [Table 2. 11. 4: Mullion arrangements](#)

$l$  =  $a$  for rectangular windows

=  $2r$  for semi-circular windows

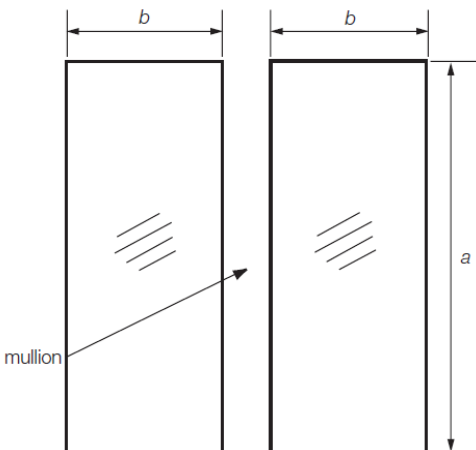

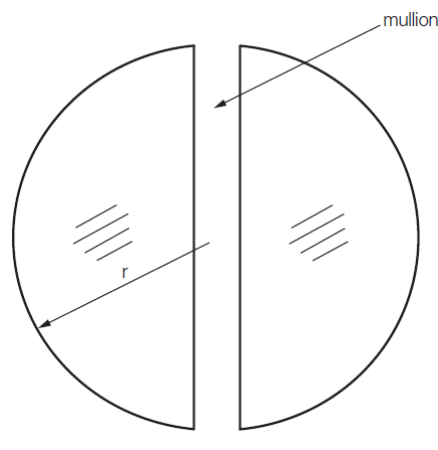

$H_d$  = design pressure head, in metres, as calculated in [Pt 4, Ch 2, 11.3 Strength assessment of windows in large passenger ships 11.3.2](#)

$A_m$  =  $ab$  for rectangular windows

=  $1.22r^2$  for semi-circular windows

$k$  = as defined in [Pt 4, Ch 2, 1.5 Symbols 1.5.1.](#)

**Table 2. 11. 4: Mullion arrangements**

| Rectangular windows  | Semi-circular windows   |
|--|---|
|    |  |
| <b>Symbols</b>   |   |
| $a$ = dimension parallel to mullion, in mm<br>$b$ = length of shorter side of window, in mm<br>$r$ = radius of the window, in mm |   |

## 11. 6 Bonded windows and side scuttles

11. 6. 1 A ‘bonded window’ or ‘bonded side scuttle’ is one in which the glazing material is secured in its frame from outside of the ship by glue or other adhesive material. No mechanical fixing is provided for the glazing. Bonded windows and side scuttles are to comply with the requirements of [Pt 4, Ch 2, 11 Miscellaneous openings](#). Proposals to secure glazing from the inside of the ship are to be specially considered using the requirements in this Section as a basis. It should be noted that bonding from the inside is not recommended and where it is proposed, further testing will be

required. Non-load bearing secondary bonded glazing, e.g. glazing to improve thermal insulation, is not required to comply with the requirements of this sub- Section.

11. 6. 2 The adhesive is to be flexible enough to support the glazing without holding it firm. The glue strip is to be elastic, with width and thickness designed to allow the glazing to move in both directions in the plane of the glazing without undue forces on the bonding or the substrate. The glass is to be free to settle under-load and not to be forced to follow deflections in the supporting structure. If substantial racking of the glazing opening under-load is expected, the bonding is to be designed to accommodate such deflections.
11. 6. 3 Bonded windows and side scuttles may be considered as acceptable, in general, depending on their position, size of vessel and applicable statutory requirements, noting the distinction between glazing and the frame, which may have different requirements.
11. 6. 4 Bonded windows are not permitted in galley areas, including glazing in galley doors (internal or external). They are not permitted on escape routes and evacuation routes where a fire rating is required. The fire integrity of bulkheads is not to be impaired.
11. 6. 5 Bonded windows and side scuttles are not acceptable on fire-fighting vessels, i.e. those with a fire-fighting notation.
11. 6. 6 The failure of laminated glass is considered to pose a lower risk to safety than that of single pane glass. In the event of breaking, laminated glass more readily holds together and tends not to break up into large sharp pieces. Therefore, in general, laminated glazing is preferred. When laminated glass is used, the sealant is to be compatible with the interlayer. Lamination thickness is to be in accordance with [Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights 6.5.29](#). Special consideration will be given to single pane toughened safety glass.
11. 6. 7 The durability of the adhesive and the sealant in the long term marine environment is to be considered in the approval process. Adhesive is to be approved in accordance with [Ch 14, 2.15 Adhesive and sealant materials of the Pt 2 Rules for the Manufacture, Testing and Certification of Materials](#) . The adhesive bead is to be resistant to or protected from UV radiation, either by an optically dense area at the edges of the glazing or by overlapping trim or UV shielding tape. The adhesive bead is to be resistant to or protected from fungal attack. Arrangements are to be in accordance with the adhesive manufacturer's published guidelines and relevant ACS Rules.
11. 6. 8 The edges of the bonding recess are to be rounded to facilitate the application of the sealant without air entrapment. The width of the gap between the flange and the glazing is to be large enough to accommodate the movement of the glazing as a result of hull deflection and thermal expansion, See [Figure 2. 11. 1: Gap width between flange and window, bonded from outside of the ship](#). Recommended gap widths for bonded windows are to be taken as:

| Gap width | Length of longest side of window |
|-----------|----------------------------------|
| 10–15 mm  | <1.5 m                           |
| 15–20 mm  | 1.5–3.0 m.                       |

**Figure 2. 11. 1: Gap width between flange and window, bonded from outside of the ship**

11.6.9 The minimum adhesive width and thickness are to be in accordance with the adhesive manufacturer's published guidelines.

CHAPTER 2 **Ferries, Roll On-Roll Off Ships and Passenger Ships**SECTION 12 **External glass balustrades****12. 1 General**

- 12. 1. 1 Attention is drawn to relevant requirements of National and International Standards concerning the construction of barriers using glass, as well as applicable statutory regulations for the Protection of Crew, *See the Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988* and its Protocol of 1988.
- 12. 1. 2 The requirements of this Section apply solely to external glass balustrades. External glass balustrades are barriers constructed with glass that are used on exposed decks.

**12. 2 Design considerations**

- 12. 2. 1 External glass balustrades should not be situated in areas deemed essential for the operation of the ship. Such areas include mooring decks, lifeboat decks, external muster stations and in the vicinity of davits. Where external glass balustrades are not to be used, more traditional bulwarks or guard rails are to be fitted in accordance with [Pt 3, Ch 8, 5 Bulwarks, guard rails and other means for the protection of crew](#).
- 12. 2. 2 External glass balustrades are to be designed to resist the most unfavourable anticipated loads within service, including weather loads or personnel loads without unacceptable deflection. Detailed plans and calculations are to be submitted clearly indicating the position, arrangement and the anticipated loads for all external glass balustrades.
- 12. 2. 3 External glass balustrades are to be not less than 1.0 m in height.
- 12. 2. 4 External glass balustrades are to provide water freeing areas in accordance with [Pt 3, Ch 8, 5.3 Freeing arrangements](#).
- 12. 2. 5 Laminated toughened safety glass is to be used for the glazing of all external glass balustrades.
- 12. 2. 6 In general openings should not be greater than 76 mm unless required for water freeing. Openings for water freeing are not to be greater than 230 mm.
- 12. 2. 7 Consideration should be given to minimising the possibility of surface deterioration of the balustrade glass infill panels in service by means of suitable edge protection or finishes.
- 12. 2. 8 The total horizontal deflection of external glass balustrades is not to exceed 25 mm when subject to the anticipated loads specified in [Pt 4, Ch 2, 12.3 Weather design loads](#) or [Pt 4, Ch 2, 12.4 Personnel design loads](#).
- 12. 2. 9 Special consideration may be given to external glass balustrades that are not constructed in accordance with this Section.

## 12. 3 Weather design loads

12. 3. 1 External glass balustrades are to be designed to resist the anticipated weather loadings dependent on their location specified in [Table 2. 11. 2: Design pressure, Hd, on windows](#). It is recommended that the equivalent monolithic thickness of the glass infill panels be derived through direct calculations using the design pressures given in [Table 2. 11. 2: Design pressure, Hd, on windows](#) and a safety factor of 2 on the characteristic failure strength of toughened safety glass. The equivalent laminated toughened safety glass thickness can then be obtained in accordance with [Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights 6.5.29](#).

## 12. 4 Personnel design loads

12. 4. 1 External glass balustrades are to be designed to resist the most unfavourable anticipated personnel loads, which are to be specified by the designer. The specified personnel loads are to be not less than 1.5 times the commensurate loads specified in *EN 1991-1-1:2002 Eurocode 1: Actions on structures – Part 1-1: General actions – Densities, self-weight, imposed loads for buildings*.

## 12. 5 Balustrade stanchions

12. 5. 1 External glass balustrades are to be fitted with fixed stanchions of adequate strength to resist the anticipated loads imposed between stanchions specified in [Pt 4, Ch 2, 12.3 Weather design loads](#) and [Pt 4, Ch 2, 12.4 Personnel design loads](#) using a bending stress coefficient not greater than 0.6.

## 12. 6 Balustrade top rail

12. 6. 1 External glass balustrades are to be fitted with a continuous top rail.
12. 6. 2 The top rail is to be sufficiently stiff so as not to permanently deflect when subject to the personnel loads specified in [Pt 4, Ch 2, 12.4 Personnel design loads](#).
12. 6. 3 The top rail is to be sufficiently stiff so as not to deflect more than  $L_b/96$  when subject to the personnel loads specified in [Pt 4, Ch 2, 12.4 Personnel design loads](#).

Where

$L_b$  = span of top rail between stanchions, in m.

12. 6. 4 The top rail minimum section modulus is to be greater than:

$$Z = \frac{141 \times q_k \times L_b^2}{f_\sigma \sigma_o} \text{ cm}^3$$

Where

$L_b$  = span of top rail between stanchions, in m.

$q_k$  = line load on top rail, in kN/m, in accordance with [Pt 4, Ch 2, 12.4 Personnel design loads](#) and to be taken not less than 1 kN/m

$\sigma_o$  = specified minimum yield stress in N/mm<sup>2</sup>.

$f_\sigma$  = bending stress coefficient not to be taken greater than 0.6.

## 12. 7 Impact Resistance and Containment

12. 7. 1 External glass balustrades are to be subject to a prototype pendulum impact test in accordance with *EN 13049:2003 Windows — Soft and heavy body impact — Test method, safety requirements and classification* or an equivalent National or International Standard utilising a drop height of not less than 1.5m. The test specimens including the retaining arrangements should be the same as the finished installation.

CHAPTER **2** **Ferries, Roll On-Roll Off Ships and Passenger Ships**

SECTION **13** **Direct calculation**

### **13. 1 Application**

- 13. 1. 1 Direct calculations are to be employed in derivation of scantlings where required by preceding Sections of this Chapter or by related provisions included in [Pt 3 Ship Structures \(General\)](#).
- 13. 1. 2 Direct calculation methods are also generally to be used where additional calculations are required by the Rules in respect of unusual structural arrangements.

### **13. 2 Procedures**

- 13. 2. 1 For details of ACS's direct calculation procedures, See [Pt 3, Ch 1, 2 Direct calculations](#). For requirements concerning use of other calculation procedures, See [Pt 3, Ch 1, 3 Equivalents](#).

CHAPTER **3 Tugs**

## LIST OF FIGURES

---

|   |      |
|---|------|
| Figure 3. 9. 1: Forces generated during a typical escort mode ..... | 1593 |
|---|------|

CHAPTER **3 Tugs**SECTION **1 General****1.1 Application**

- 1.1.1 Sections 1 to 8 of this Chapter apply to tugs.
- 1.1.2 [Pt 4, Ch 3, 9 Escort operation, performance numeral and trials](#) of this Chapter applies to tugs and offshore supply ships intended to provide escort operation.
- 1.1.3 The scantlings and arrangements are to be as required by [Pt 4, Ch 1 General Cargo Ships](#) except as otherwise specified. The draught,  $T$ , used for the determination of scantlings is to be not less than  $0.85D$ .

**1.2 Class notations**

- 1.2.1 Ships complying with relevant requirements will be assigned one or more of the class notations given in [Table 3.1.1: Class notations](#).
- 1.2.2 Tugs intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.6](#) to [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.10](#), will receive individual consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval. In particular, tugs complying with the requirements of this Chapter and [Pt 3, Ch 13, 7 Equipment](#) for the relevant reduced equipment requirements, will be eligible to be classed:
  - **A1 tug protected waters service;** or
  - **A1 escort tug protected waters service;** or
  - **A1 escort tug EPN (F,B,V,C) protected waters service;** or
  - **A1 escort tug EPN (CFD: F,B, V) protected waters service;** or
  - **100A1 tug with service restriction notation;** or
  - **100A1 escort tug with service restriction notation;** or
  - **100A1 escort tug EPN (F,B,V,C) with service restriction notation;** or
  - **100A1 escort tug EPN (CFD: F,B, V) with service restriction notation;**whichever is applicable.
- 1.2.3 The Regulations for classification and the assignment of class notations are given in [Pt 1, Ch 2 Classification Regulations](#) to which reference should be made.

**Table 3. 1. 1: Class notations**

| Class Notation  | Applicable Sections   |
|---|---|
| <b>100A1 tug</b>  | <a href="#">Pt 4, Ch 3, 1 General</a> to <a href="#">Pt 4, Ch 3, 8 Fenders</a>  |
| <b>100A1 escort tug</b>   | <a href="#">Pt 4, Ch 3, 1 General</a> to <a href="#">Pt 4, Ch 3, 9 Escort operation, performance numeral and trials</a> , except <a href="#">Pt 4, Ch 3, 9.3, Performance numeral and trials</a> and <a href="#">Pt 4, Ch 3, 9.4 Computational Fluid Dynamics Predicted Performance</a> |
| <b>100A1 escort tug EPN (F, B, V, C)</b>  | <a href="#">Pt 4, Ch 3, 1 General</a> to <a href="#">Pt 4, Ch 3, 9 Escort operation, performance numeral and trials</a> except <a href="#">Pt 4, Ch 3, 9.4 Computational Fluid Dynamics Predicted Performance</a>   |
| <b>100A1 escort tug EPN (CFD: F, B, V)</b>  | <a href="#">Pt 4, Ch 3, 1 General</a> to <a href="#">Pt 4, Ch 3, 9 Escort operation, performance numeral and trials</a> , except <a href="#">Pt 4, Ch 3, 9.3, Performance numeral and trials</a>  |
| <b>Note</b> Tugs which comply with the anchor handler requirements in <a href="#">Pt 4, Ch 4, 1 General</a> to <a href="#">Pt 4, Ch 3, 8 Fenders</a> will be eligible for the additional notation <b>anchor handler</b> . |   |

## 1. 3 Information required

1. 3. 1 In addition to the information and plans required by [Pt 3, Ch 1, 5 Information required](#), plans covering the following items are to be submitted for approval where applicable:
  - Support structure and foundations of towing equipment.
  - Skegs, propeller guards and other structures which support the weight of the vessel during dry-docking.
1. 3. 2 The following supporting documents are to be submitted for information:
  - Towing arrangements, including lines of action, magnitudes and corresponding points of application of towline pulls on towing equipment.
  - Details of the breaking strength of the components of the towline system, together with maximum pull and brake holding load, or equivalent, of towing winches where applicable.

PART

# 4

CHAPTER **3 Tugs**

SECTION **2 Longitudinal strength**

## **2. 1 General**

- 2. 1. 1 The longitudinal strength standard is to comply with the relevant requirements of [Pt 3, Ch 4 Longitudinal Strength](#).
- 2. 1. 2 The requirements of [Pt 3, Ch 4, 8.3 Loading instrument](#) regarding loading instruments are not applicable to tugs.

PART

# 4

CHAPTER **3 Tugs**

SECTION **3 Floors in single bottoms**

## **3. 1 Floors**

3. 1. 1 Single bottom floors are to be in accordance with the requirements of [Pt 4, Ch 1. 7 Single bottom structure](#), except that floors clear of the machinery space may be flanged in lieu of a face plate being fitted.

PART

# 4

CHAPTER **3 Tugs**

SECTION **4 Panting and strengthening of bottom forward**

## **4. 1 Panting region reinforcement**

- 4. 1. 1 The arrangements to resist panting required by [Pt 3, Ch 5 Fore End Structure](#) do not apply to tugs less than 46 m in length. In tugs 46 m or more in length, additional stiffening is also to be fitted in the 'tween decks throughout the panting region.

## **4. 2 Strengthening of bottom forward**

- 4. 2. 1 The requirements for strengthening of bottom forward detailed in [Pt 3, Ch 5 Fore End Structure](#) do not apply to tugs.

PART

# 4

CHAPTER **3 Tugs**

SECTION **5 Machinery casings**

## **5. 1 Escape hatches**

- 5. 1. 1 Any emergency exit from the machinery room to the deck is to be capable of being used at extreme angles of heel, and should be positioned as high as possible above the waterline and on or near the ship's centreline. Covers to escape hatches are to have hinges arranged athwartships. Coaming heights are to be at least 600 mm above the upper surface of the deck.

PART

# 4

CHAPTER **3 Tugs**

SECTION **6 Freeing arrangements**

## **6. 1 General**

6. 1. 1 If the only means of access to the wheelhouse is external, then stormboards, or an equivalent, are to be fitted between the deckhouse and the ship's sides forward of any deckhouse doors up to the height of the bulwark rail. A gap is to be left between the deck and the bottom board for freeing purposes.

**7.1 Towing equipment**

- 7.1.1 For tugs which normally tow over the stern with the main towline connection to the hull ahead of the propellers, the position of towline connection is normally to be five to 10 per cent of the ship's length abaft amidships, but in no circumstances is it to be sited forward of a position, five per cent of the ship's Rule length abaft the longitudinal centre of gravity of the tug in any anticipated condition of loading.
- 7.1.2 The attachment of the towline to the tug is to be located as low as practicable in order to minimise heeling moments arising from working conditions. Reliable slip arrangements which facilitate towline release regardless of the angle of the towline are to be provided.
- 7.1.3 It is recommended that the slip arrangements should also be operable from the bridge. The arrangements should be tested to the Surveyor's satisfaction. The breaking strength of the hook, or its equivalent, should generally be 50 per cent in excess of that of the towline, See [Pt 3, Ch 13, 7 Equipment](#).
- 7.1.4 The emergency release systems provided on towing winches that are used for towing ships within close quarters, ports or terminals, are also to comply with the requirements specified in [Pt 7, Ch 16 Towing Winch Emergency Release Systems](#).

**7.2 Towing equipment foundations**

- 7.2.1 Direct support for towing equipment by means of pillars and/or pillar bulkheads is to be arranged as far as this is practicable.
- 7.2.2 The design load to be considered for the strength assessment of the towing equipment and the associated supporting structures is to be as given in [Table 3. 7. 1: Tug towing equipment design loads](#), unless a higher design load is specified by the designer/owner.

**Table 3. 7. 1: Tug towing equipment design loads**

| Class Notation               | Design Force or Bollard Pull as appropriate (kN) | Design Load (kN)                                       |
|------------------------------|--|--|
| tug protected waters service | $T_{BP} \leq 200$                                | $2 \cdot T_{BP}$                                       |
|                              | $200 < T_{BP} < 800$                             | $\left(\frac{2600 - T_{BP}}{1200}\right) \cdot T_{BP}$ |
|                              | $T_{BP} \geq 800$                                | $1.5 \cdot T_{BP}$                                     |
| tug                          | $T_{BP} \leq 400$                                | $2.5 \cdot T_{BP}$                                     |

|  |                       |  |
|--|-----------------------|--|
|  | $400 < T_{BP} < 1000$ | $\left(\frac{3400 - T_{BP}}{1200}\right) \cdot T_{BP}$ |
|  | $T_{BP} \geq 1000$    | $2 \cdot T_{BP}$                                       |
| escort tug<br>protected waters<br>service  | $T_{DF} \leq 500$     | $2.4 \cdot T_{DF}$                                     |
|  | $500 < T_{DF} < 1000$ | $\left(\frac{2000 - T_{DF}}{625}\right) \cdot T_{DF}$  |
|  | $T_{DF} \geq 1000$    | $1.6 \cdot T_{DF}$                                     |
| escort tug   | $T_{DF} \leq 500$     | $3 \cdot T_{DF}$                                       |
|  | $500 < T_{DF} < 1000$ | $\left(\frac{2000 - T_{DF}}{500}\right) \cdot T_{DF}$  |
|  | $T_{DF} \geq 1000$    | $2 \cdot T_{DF}$                                       |
| <p><b>Where</b></p> <p><math>T_{BP}</math> = Bollard pull of the tug as submitted by the designer and represents the towline maximum continuous force (also called quasi-static towline force).</p> <p><math>T_{DF}</math> = Design force as submitted by the designer and represents the towline maximum continuous force for escort operations (also called quasi-static towline force).</p> |                       |  |
| <b>Note 1</b> The Design loads shown in this table include dynamic effects.  |                       |  |

- 7.2.3 Scantlings of pillars and pillar bulkheads are to be in accordance with [Pt 4, Ch 1, 4.4, Deck supporting structure](#).
- 7.2.4 The scantling requirements for towing arrangements are detailed in the following subsections:
- Towing winches [Pt 4, Ch 3, 7.3 Towing winches](#)
  - Towline guiding fittings [Pt 4, Ch 3, 7.4 Towline guiding fittings](#)
  - Towing hooks: [Pt 4, Ch 3, 7.5 Towing hooks](#)
  - Towing equipment supporting structure: [Pt 4, Ch 3, 7.6, Supporting Structure](#)
- 7.2.5 Generally, the foundations of towing fairleads are to be carried through the deck and integrated into suitable underdeck structure.
- 7.2.6 On tugs which utilise an indirect method of towing, attention is drawn to the increased out-of-plane forces that occur in towing fairleads.

## 7.3 Towing winches

- 7.3.1 The scantlings of towing winches (including winch drums, drum shafts, brakes, support frames and connections to the hull structure) are to be determined by direct calculations using the Design Loads given in [Pt 4, Ch 3, 7.2 Towing equipment foundations 7.2.2](#) and are to be able to sustain the following:
- The Design Loads (in the most unfavourable anticipated position of the towline) without permanent deformation i.e.  $\sigma_e \leq 1 \cdot \sigma_y$ .
  - The winch BHL (in the most unfavourable anticipated position of the towline), without exceeding  $\sigma_e \leq 0.80 \sigma_y$ .
  - The anticipated maximum RP (in the most unfavourable anticipated position of the towline), without exceeding  $\sigma_e \leq 0.40 \sigma_y$ .

Where

BHL is the brake holding load, i.e. the maximum towline force the towing winch can withstand without slipping of the (activated) brake, considering the towline at the first inner layer.

RP is the rated pull, i.e. the winch maximum hauling-in load considering the towline at the first inner layer.

$\sigma_e$  = equivalent stress, in N/mm<sup>2</sup>

$\sigma_y$  = specified minimum tensile yield stress of the material, in N/mm<sup>2</sup>

## 7.4 Towline guiding fittings

- 7.4.1 Towline guiding fittings, such as fairleads, staples, towing pins, stern rollers and equivalent components which guide the towline, shall be able to sustain the force exerted by the towline loaded under a tension equal to the design load as specified in [Table 3. 7. 1: Tug towing equipment design loads](#), in the most unfavourable anticipated position of the towline. The fittings shall not exceed the following permissible stress levels:

- $\sigma \leq 0.75_{\text{ref}}$ ;
- $\tau \leq 0.47_{\text{ref}}$ ;
- $\sigma_e \leq 0.85_{\text{ref}}$

Where

$\sigma$  = normal stress, in N/mm<sup>2</sup>

$\tau$  = shear stress, in N/mm<sup>2</sup>

$\sigma_e$  = equivalent stress, in N/mm<sup>2</sup>

$\sigma_{\text{ref}} = \frac{235}{k_L}$  = Reference stress of the material in N/mm<sup>2</sup>, but may be taken as  $\sigma_y$  for fittings not made of welded construction

$k_L$  = as defined in [Pt 3 Ship Structures \(General\), Table 2. 1. 1: Values of  \$k\_L\$](#)

- 7.4.2 Towline guiding fittings used for guiding the towline when towing on a towing winch shall be able to sustain the force exerted by the towline loaded under a tension equal to the winch BHL (with the most unfavourable anticipated position of the towline) without exceeding the specified permissible stress criteria.
- 7.4.3 Where a towline guiding fitting has been designed for a specific Safe Working Load (SWL), defined as the maximum static working load, the fitting shall be able to sustain a force equal to 2 times the SWL without exceeding the above-specified permissible stress criteria.

## 7.5 Towing hooks

- 7.5.1 The scantlings of towing hooks, their load carrying attachments (transferring load from the hook to the hull structure) are to be determined by direct calculations using the Design Loads given in [Pt 4, Ch 3, 7.2 Towing equipment foundations 7.2.2](#) and are to be able to sustain the Design Load (in the most unfavourable anticipated position), without exceeding  $\sigma_e \leq 0.80\sigma_y$ .

## 7. 6 Supporting Structure

7. 6. 1 The scantlings of the supporting structures of towing equipment shall be such that they able to sustain the force exerted upon them with the towing equipment under the action of the towline (with the most unfavourable anticipated position) loaded under a tension equal to the DL as specified in [Table 3. 7. 1: Tug towing equipment design loads](#), without exceeding the following permissible stress levels:
- $\sigma \leq 0.75_{\text{ref}}$ ,
  - $\tau \leq 0.47_{\text{ref}}$ ,
  - $\sigma_e \leq 0.85_{\text{ref}}$

Where

$\sigma$  = normal stress, in N/mm<sup>2</sup>

$\tau$  = shear stress, in N/mm<sup>2</sup>

$\sigma_e$  = equivalent stress, in N/mm<sup>2</sup>

$\sigma_{\text{ref}} = \frac{235}{k_L}$  = Reference stress of the material in N/mm<sup>2</sup>,

$k_L$  = as defined in [Pt 3 Ship Structures \(General\), Table 2. 1. 1: Values of  \$k\_L\$](#)

7. 6. 2 In addition, supporting structures of towing equipment used for escort or towing on a winch services shall be such that they able to sustain the force exerted upon them with the towing equipment under the action of the towline (with the most unfavourable anticipated position) loaded under a tension equal to the BHL of the associated winch without exceeding the permissible stress criteria in [Pt 4, Ch 3, 7.6 Supporting Structure 7.6.1](#).
7. 6. 3 Where a towline guiding fitting has been designed for a specific Safe Working Load (SWL), defined as the maximum static working load, the supporting structure shall be able to sustain a force equal to 2 times the SWL without exceeding the permissible stress criteria in [Pt 4, Ch 3, 7.6 Supporting Structure 7.6.1](#).

PART

# 4

CHAPTER **3 Tugs**

SECTION **8 Fenders**

## **8. 1 Ship's side fenders**

8. 1. 1 An efficient fender is to be fitted to the ship's side at deck level extending all fore and aft.

**9. 1 General**

- 9. 1. 1 An escort tug is a tug intended for escort operation. Escort operation is an operation in which the tug closely follows the assisted ship providing control by steering and braking, as necessary.
- 9. 1. 2 Escort tugs are to be capable of utilising methods of towing through which steering and braking forces are generated by a combination of propulsive and hydrodynamic forces developed by the tug, acting on the towline to the attended ship, *See example in [Figure 3. 9. 1: Forces generated during a typical escort mode](#).*
- 9. 1. 3 The intact stability of the tug during escort operation is to comply with a Standard recognised by the National Administration with whom the ship is registered and/or by the National Administration within whose territorial jurisdiction the tug is intended to operate, as applicable. Attention is drawn to the inherent problems relating to the quick release of the towline and the sudden loss of propulsion power during the escort operation in addition to the maximum steering and braking forces.

**9. 2 Towing arrangements**

- 9. 2. 1 The specified breaking strength of the towline is to be at least 2.5 x maximum design towline force.
- 9. 2. 2 The towing winch is to include a system of continuous load monitoring, with a bridge readout display and an overload prevention system, which is to be operational during escort duties. The overload prevention system is to be designed with the capability to pay out the towline in a controlled manner when the load reaches the maximum design towline force, and is to be capable of alerting the Master and crew.

**Figure 3. 9. 1: Forces generated during a typical escort mode**

### 9. 3 Performance numeral and trials

9. 3. 1 Escort tugs which carry out full scale performance trials in accordance with the requirements of this Section will be eligible to have the escort performance numeral **EPN (F,B,V,C)** appended to the **escort tug** notations, See [Pt 4, Ch 3, 1.2 Class notations 1.2.1](#) and [Pt 4, Ch 3, 1.2 Class notations 1.2.2](#) and [Pt 4, Ch 4, 1.2 Class notations 1.2.2](#),

Where

- F** is the maximum steering force ( $F_s$ ), in tonnes, See [Figure 3. 9. 1: Forces generated during a typical escort mode](#) and [Pt 4, Ch 3, 9.3 Performance numeral and trials 9.3.6](#).
  - B** is the maximum braking force ( $F_b$ ), in tonnes, See [Figure 3. 9. 1: Forces generated during a typical escort mode](#) and [Pt 4, Ch 3, 9.3 Performance numeral and trials 9.3.6](#).
  - V** is the speed, in knots, at which **F** and **B** are determined.
  - C** is the time, in seconds (s), required for the escort tug in manoeuvring from maintained oblique position of tug giving maximum steering force  $F_s$  on one side of assisted vessel to mirror position on the other side, See [Pt 4, Ch 3, 9.3 Performance numeral and trials 9.3.6](#). The towline angle,  $\alpha$ , need not be taken less than  $30^\circ$ , See [Figure 3. 9. 1: Forces generated during a typical escort mode](#).
9. 3. 2 The performance numeral may be determined with speed **V** equal to either 8 knots or 10 knots. If both sets of numerals are determined at the trials then the class notation will include them all.
9. 3. 3 A trials plan, which includes the estimated forces, is to be submitted and approved prior to trials being undertaken.

- 9.3.4 The trials of the escort tug are to be performed using a ship capable of maintaining almost constant heading and speed when subjected to the steering and braking forces from the escort tug.
- 9.3.5 The following trials are to be carried out in calm weather conditions and in the presence of a Lloyd's Register Surveyor:
- Steering and braking force capability test, See [Pt 4, Ch 3, 9.3 Performance numeral and trials 9.3.6](#).
  - Bollard pull test, See [Pt 4, Ch 3, 9.3 Performance numeral and trials 9.3.8](#).
- A record of the results is to be kept on board the escort tug.
- 9.3.6 Prior to commencing a trial, the following data are to be recorded:
- Wind speed and direction.
  - Sea state.
  - Current speed and direction.
  - Water depth.
  - The main particulars and the loading condition of the assisted ship.
  - Loading condition of the escort tug.
- 9.3.7 **Steering and braking force capability test** is a test by which the steering force,  $F_s$ , and braking force,  $F_b$ , are determined when utilising the method, shown in [Figure 3.9.1: Forces generated during a typical escort mode](#), of towing at a range of towline angles,  $\alpha$ , from 0 to 90 degrees and for a range of operating speeds up to and including the maximum escort speed. The following parameters are to be continuously recorded during the test:
- Position, speed and heading of the assisted ship and the escort tug.
  - Towline force,  $F_t$ .
  - Angle of towline,  $\alpha$ .
  - Heel angle of the escort tug.
  - Direction of thrust and power absorbed by all propellers and thrusters of the tug.
  - Rudder angles of the tug.
- 9.3.8 The length of the towline is to represent a typical operating condition and is to be recorded prior to and at the completion of the test. The steering and braking forces for a given speed and angle can be calculated by using the average values of the recorded towline force.
- 9.3.9 **9.3.9 Bollard pull test** is to be carried out in accordance with ACS *Guide for Certification of Bollard Pull*.

## 9.4 Computational Fluid Dynamics Predicted Performance

- 9.4.1 Where the performance of the escort tug during escort operation in indirect towing mode has been predicted and reported using computational fluid dynamics in accordance with the requirements of this Section and in lieu of full-scale performance trials, the vessel will be eligible to have **EPN (CFD: F,B,V)** appended to the **escort tug** notation, See [Pt 4, Ch 3, 1.2 Class notations 1.2.1](#), [Pt 4, Ch 3, 1.2 Class notations 1.2.2](#) and [Pt 4, Ch 4, 1.2 Class notations 1.2.2](#).
- 9.4.2 The computational fluid dynamics investigation is to include escort performance prediction with an escort speed equal to 8 knots and/or 10 knots.

- 9. 4. 3 A computational fluid dynamics report is to be submitted to ACS for consideration. The performance prediction simulating the trials detailed in [Pt 4, Ch 3, 9.3, Performance numeral and trials](#) is to be carried out in accordance with ACSPlus Guidelines titled *Guidelines for CFD Escort Tug Performance*.
- 9. 4. 4 The length of the towline in the computational fluid dynamics simulation is to represent a typical operating condition.
- 9. 4. 5 The report or a summary of the results obtained therein is to be kept on board the vessel and made available prior to the commencement of any full-scale performance trials.

CHAPTER **4 Offshore Support Vessels**

SECTION **1 General**

## 1. 1 Application

1. 1. 1 This Chapter applies to sea-going ships specially designed and constructed to support the operations of offshore installations, including the carriage of specialised stores and cargoes to such facilities. These may be defined as:
- a. **AHTS:** Assigned to vessels designed for anchor handling, towing and supply of specialised stores and cargo.
  - b. **Anchor handler:** Assigned to vessels specially designed, constructed and equipped for handling anchors used to secure floating offshore installations.
  - c. **Cable laying vessel:** Assigned where special consideration has been given to operations for laying/maintaining underwater cables.
  - d. **Diving support vessel:** Assigned where a diving system has been installed and where special consideration has been given to the launch and recovery systems for diving operations, including the strength and continuity in way of moon pools, large hatches, heavy loads, etc.
  - e. **Offshore supply vessel:** Assigned to vessels designed for the carriage of specialised stores and cargoes to fixed or floating offshore installations.
  - f. **Offshore support vessel:** Assigned to vessels designed for the provision of support services to fixed or floating offshore installations.
  - g. **Offshore well stimulation ship:** Assigned where a plant has been installed and where special consideration has been given to operations associated with the stimulation of wells for offshore oil/gas production.
  - h. **Pipe laying vessel:** Assigned where special consideration has been given to operations for laying/maintaining pipes associated with offshore oil/gas production.
  - i. **Seismographic support vessel:** Assigned where special consideration has been given to operations associated with seismographic research and survey.
  - j. **Standby vessel:** Assigned to vessels designed to provide rescue assistance and afford safe refuge in the event of an emergency on or near an offshore installation.
  - k. **Subsea support vessel:** Assigned where special consideration has been given to operations associated with subsea construction and installation support, inspection, repair and maintenance.
1. 1. 2 Where appropriate, ACS may request direct calculations or additional requirements to be complied with, for novel or additional features pertinent to a given Ship Type listed within this Chapter, *See also [Pt 3, Ch 1, 2.1 General 2.1.1](#)*.
1. 1. 3 The scantlings and arrangements are to be as required by [Pt 4, Ch 1 General Cargo Ships](#), except as otherwise specified in this Chapter.
1. 1. 4 Attention is drawn to the need for Masters to be able to assess the stability of their ships quickly and accurately in all service conditions, *See [Pt 1, Ch 2, 3 Surveys - General](#)*.

1. 1. 5 Where towing equipment is fitted, the requirements of [Pt 4, Ch 3, 7 Towing arrangements](#) are to be applied.
1. 1. 6 Attention is drawn to the National and International standards applicable to vessels in this chapter as required by the Flag Administration

## 1. 2 Class notations

1. 2. 1 In general, ships complying with the requirements of this Chapter and relevant additional requirements will be eligible for one or a combination of the notations indicated in [Table 4. 1. 1: Type notations applicable to offshore support vessels](#).

**Table 4. 1. 1: Type notations applicable to offshore support vessels**

| Class Notation  | Requirements  |
|---|---|
| Offshore support vessel   | <a href="#">Pt 4, Ch 4, 1 General</a> to <a href="#">Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk</a>  |
| Offshore supply vessel  | <a href="#">Pt 4, Ch 4, 1 General</a> to <a href="#">Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk</a>  |
| Cable laying vessel<br>Pipe laying vessel<br>Diving support vessel<br>Subsea support vessel<br>Seismographic support vessel   | <a href="#">Pt 4, Ch 4, 1 General</a> , <a href="#">Pt 4, Ch 4, 2 Longitudinal strength</a> , <a href="#">Pt 4, Ch 4, 7 Engine exhaust outlets</a> and <a href="#">Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk</a> , See Note 2 |
| Standby vessel  | <a href="#">Pt 4, Ch 4, 1 General</a> to <a href="#">Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk</a>  |
| Anchor handler  | <a href="#">Pt 4, Ch 4, 1 General</a> to <a href="#">Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk</a>  |
| Offshore Tug  | <a href="#">Pt 4, Ch 3, 1 General</a> to <a href="#">Pt 4, Ch 3, 8 Fenders</a> and <a href="#">Pt 4, Ch 4, 1 General</a> to <a href="#">Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk</a>   |
| AHTS (Anchor Handler Tug Supply)  | <a href="#">Pt 4, Ch 3, 1 General</a> to <a href="#">Pt 4, Ch 3, 8 Fenders</a> ; and <a href="#">Pt 4, Ch 4, 1 General</a> to <a href="#">Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk</a>                                       |
| <p><b>Note 1.</b> A ship designed to fulfil more than one function can be assigned a combination of the notations listed above, e.g.:</p> <ul style="list-style-type: none"> <li>• 100A1 Offshore supply vessel/Standby vessel</li> <li>• 100A1 Offshore supply vessel /Anchor handler</li> <li>• 100A1 Offshore supply vessel /Standby vessel/Oil Recovery</li> <li>• Any combination of the requirements listed in this Table.</li> </ul> <p><b>Note 2.</b> ACS may request direct calculations or additional requirements to be complied with, See <a href="#">Pt 4, Ch 4, 1.1 Application 1.1.2</a></p> |   |

1. 2. 2 The following additional special features may be requested:

- **EWP** (Enhanced Weather Protection):

The notation **EWP** may be added if the vessel complies with requirements in [Pt 4, Ch 4, 9 Enhanced weather protection](#), e.g. **Offshore supply vessel EWP**. The notation is mandatory for vessels that are intended for unrestricted worldwide service and that are required to stay on station in adverse weather conditions. The enhanced features provide additional protection in harsh weather.

- **Oil Recovery:**

A vessel complying with the requirements of [Pt 7, Ch 5 Ships Equipped for Oil Recovery Operations](#) will be eligible for the notation **Oil Recovery**.

- **WDL(+)** (Weather deck load):

If the weather deck scantlings have been approved for a loading greater than a design head of 3.5 m, the notation **WDL(+)** may be added. If requested, the maximum permissible weather deck load and extent can be identified in the notation, e.g. **WDL(5.0 t/m<sup>2</sup> from Aft to Fr. 26)**.

- **RD** (Relative density):

Where a ship has tanks appraised for a maximum permissible relative density greater than 1.025, the notation **RD(specified tank names, density)** may be added, See [Pt 4, Ch 1 General Cargo Ships](#).

- **LFPL** (Low flashpoint liquids):

Ships intended for the carriage of liquids with flash point below 60°C (closed-cup test) in bulk are to be built and equipped in accordance with the relevant requirements of [Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk](#) and will be given the class notation **LFPL**. If requested, the concerned cargo, flash point (closed-cup test) and tank can be identified in the notation, e.g. **LFPL(methanol, 12°C, No. 7 centre tank)**.

1. 2. 3 The Regulations for classification and the assignment of class notations are given in [Pt 1, Ch 2 Classification Regulations](#), to which reference should be made.

## 1. 3 Information required

1. 3. 1 In addition to the information and plans required by [Pt 3, Ch 1, 5 Information required](#), plans covering the following items are to be submitted where applicable:
  - Independent cargo tanks.
  - Cargo tank foundations and securing arrangements.
  - Towing arrangements, including supports and foundations of towing winches.
  - Arrangements for the stowage of deck cargoes (cargo containment) and details of any associated racks or other similar structures and their supports/foundations together with information to indicate design loads.
  - Movable decks, including the stowing arrangements for portable components.
  - Freeing arrangements.
1. 3. 2 In addition to the information and plans required by [Pt 4, Ch 4, 1.3 Information required 1.3.1](#), details of local strengthening for the following items are to be submitted where applicable:
  - The arrangement and integration into the hull of equipment, tanks, supports, foundations, etc. in conjunction with their mass, working load and holding capability information.
  - For unusual structural arrangement and equipment, calculations are to be submitted showing acceptable structural strength.

- Supports and foundations for anchor handling and laying arrangements for anchors carried as cargo.
- Supports for towing arrangements.
- The arrangement for fast rescue craft.

## 1. 4 Symbols

1. 4. 1 The symbols are as defined in [Pt 4, Ch 1, 1.5, Symbols and definitions](#).

PART

# 4

CHAPTER **4 Offshore Support Vessels**

SECTION **2 Longitudinal strength**

## **2. 1 General**

- 2. 1. 1 The longitudinal strength standard is to comply with the relevant requirements of [Pt 3, Ch 4 Longitudinal Strength](#).
- 2. 1. 2 The requirements of [Pt 3, Ch 4, 8.3 Loading instrument](#) regarding loading instruments are generally not applicable to offshore supply ships.

## CHAPTER 4 Offshore Support Vessels

## SECTION 3 Hull envelope plating

## 3.1 Hull envelope plating

- 3.1.1 Anchor handling activities often give rise to areas of high local loads and/or frequent impacts, such as in way of stern rollers and immediately adjacent to high duty bollards. The shell in way of high loads and/or frequent impacts is to be suitably reinforced by increasing shell plate thickness, additional stiffening support or other appropriate means.

## 3.2 Side shell

- 3.2.1 The thickness of side shell is to be that required by [Pt 4, Ch 1, 5.4 Side shell](#) but is not to be less than given by [Table 4.3.1: Minimum side shell thickness](#)
- 3.2.2 As an alternative, where over the length of a vessel, portions of the sheerstrake that are not protected by an efficient fender, the sheerstrake is to be increased by a minimum of 5 mm thickness. The increased thickness shall extend from the deck level to not less than 600 mm below the deck level.

Table 4.3.1: Minimum side shell thickness

| Ship type             | Minimum thickness, mm |
|-----------------------|-----------------------|
| Offshore supply ships | 9                     |
| Standby vessels       | 8                     |
| Anchor handler        | 9                     |

## 3.3 Weather decks

- 3.3.1 Where cargo is to be carried on weather decks, the scantlings are to be suitable for the specified loadings. The thickness,  $t$ , of deck plating is to be not less than the greater of:

a.

$$t = 0.025L + 4.5 + t_a \text{ mm}$$

b.

$$t = 0.1 f_m^s \sqrt{\frac{P F_D}{f_y \sigma}} t_a \text{ mm}$$

Where

$$P = \text{specified design load for weather deck, in tonnef/m}^2$$

$$= \frac{h}{1.39}$$

$h$  = equivalent design head, in metres, not to be taken less than 3.5 m

$s$  = spacing of secondary stiffeners, in mm

$\sigma$  = yield stress of plating, in N/mm<sup>2</sup>

$F_D$  = as defined in [Pt 3, Ch 4, 5.7 Local reduction factors](#)

$f_m$  = 0.75

$f_y$  = 0.67

$t_a$  = 2.5 mm, in general

= 1.0 mm, for ships with dedicated class notation **standby vessel**.

- 3.3.2 Scantlings are to be increased locally where specialised cargoes are likely to induce concentrated loads that exceed the specified design load. Acceptable stress levels are given in [Pt 4, Ch 3, 7.2 Towing equipment foundations 7.2.4](#).
- 3.3.3 Deck areas, where there are arrangements for the collection and handling of anchors and associated equipment, are to be protected by wooden sheathing. Alternatively, this can be omitted if the plate thickness is increased by 2.5 mm.

### 3.4 Cargo containment

- 3.4.1 Means are to be provided to enable deck cargoes to be adequately secured and protected. In general, suitable inner bulwarks, rails, bins or storage racks of substantial construction are to be provided and properly secured to adequately strengthened parts of the hull structure. Properly designed locking equipment or efficient means of lashing containers are to be fitted where appropriate. Small hatches (including escape hatches), valve controls, ventilators, air pipes, etc. are to be situated clear of the cargo containment areas.

CHAPTER **4 Offshore Support Vessels**

SECTION **4 Hull envelope framing**

## 4. 1 General

4. 1. 1 The section moduli of side longitudinals, the main and 'tween deck frames are to be not less than  $kZ$ , cm<sup>3</sup>

Where

$$k = 1.25 \text{ in general}$$

$$= 1.10 \text{ for ships with dedicated class notation **standby vessel**}$$

$$Z = \text{as required by [Pt 4, Ch 1, 6 Shell envelope framing](#), [Pt 3, Ch 5, 4 Shell envelope framing](#) and [Pt 3, Ch 6, 4 Shell envelope framing](#) for the appropriate location.}$$

4. 1. 2 Frames are not to be scalloped.
4. 1. 3 The scantlings of deck secondary stiffeners are to be in accordance with the requirements of [Table 1. 4. 4: Cargo and accommodation deck longitudinals](#) (1) or [Table 1. 4. 5: Strength/weather, cargo and accommodation deck beams](#) (2) in [Pt 4, Ch 1 General Cargo Ships](#), where  $h_2$  is to be taken as the specified design loading and not less than a design head of 3.5 m.

CHAPTER 4 Offshore Support Vessels

SECTION 5 Lifting appliances, equipment integration and foundations

5. 1 Lifting appliances

5. 1. 1 Where the vessel has fitted onboard lifting appliances, which are considered by ACS to be essential for the vessel to fulfil its primary operational role, and if there are no alternative means of operation, it is a requirement that the lifting appliance(s) is classed in accordance with the requirements of the LA or LA notation, See [Pt 3, Ch 9, 6 Lifting appliances and support arrangements](#).
- Where the LA notation is assigned, the lifting appliance(s) are to be designed, built and surveyed in accordance with ACS Guideline for Lifting Appliances in a Marine Environment.
  - Where the LA notation is assigned, the lifting appliance(s) have been classed by a recognised classification society other than ACS and later transferred into class with ACS. From the time the LA notation is assigned, the subject appliance(s) is to be tested and surveyed in accordance with ACS Guideline for Lifting Appliances in a Marine Environment.
- A lifting appliance forms an essential feature of a vessel if the purpose of the vessel is predominantly to support the appliance, and the purpose of the floating structure is impaired if the appliance is not functioning.
5. 1. 2 For non-classed lifting appliances, generally it is a requirement of National Authorities that lifting appliances are approved, examined, tested and certified by a competent person or organisation. It is ACS's interpretation of the intention of current National Regulations that every lifting appliance is to be certified. See also [Pt 3, Ch 9, 6 Lifting appliances and support arrangements](#).

5. 2 Equipment foundation loads and permissible stresses

5. 2. 1 When considering the loads, all expected directions of operation are to be taken into account. The supporting arrangements for equipment which are not considered to be lifting appliances are to be loaded in accordance with [Pt 4, Ch 4, 5.2 Equipment foundation loads and permissible stresses 5.2.1](#).

Table 4. 5. 1: Loading conditions

|                    |       |
|--------------------|-------|
| Loading/conditions | Loads |
|--------------------|-------|

|                |  |
|----------------|--|
| Transit/Stowed | Gravity loads;<br>Environmental loads such as wind and waves as applicable; and<br>inertia forces generated by ship motions, <i>See also ACS Guideline for Lifting Appliances in a Marine Environment, Ch 4, 2.11 Forces due to ship motion.</i> |
| Operation      | Equipment operational load   |

5. 2. 2 Permissible stress values used for equipment integration and foundations are to be in accordance with the *ACS Guideline for Lifting Appliances in a Marine Environment, Ch 4, 5 Pedestals and foundation*

### 5. 3 Equipment supporting arrangements loads and permissible stresses

5. 3. 1 Support arrangements for lifting appliances which are part of the hull or main support structure are classification items and are to be in accordance with [Pt 3, Ch 9, 6 Lifting appliances and support arrangements](#). For supporting structure that is not part of the hull or main support, reference is made to ACS Guideline for Lifting Appliances in a Marine Environment, [Ch 4, 5 Pedestals and foundation](#).

### 5. 4 Support arrangements for towing equipment

5. 4. 1 Direct support for towing and deck equipment, if applicable, is to be in accordance with [Pt 4, Ch 3, 7.2, Towing equipment foundations](#).

## CHAPTER 4 Offshore Support Vessels

### SECTION 6 Miscellaneous openings

#### 6.1 General

- 6.1.1 For offshore supply ships the requirements of [Pt 3, Ch 11, 6 Miscellaneous openings](#) are to be complied with.

#### 6.2 Access from freeboard deck

- 6.2.1 There is to be no direct access from the freeboard deck to machinery or other spaces below the freeboard deck. Indirect access may be arranged via a space or passageway fitted with an outer door having a sill not less than 600 mm high and an inner door having a sill not less than 380 mm high. The inner door is to be self-closing and gastight. The space or passageway between the two doors is to be adequately drained. It is desirable, however, that access to spaces below the freeboard deck is arranged from a position above the superstructure deck. Where it is necessary to provide an emergency escape trunk which cannot terminate within a superstructure space, the arrangements for maintaining the integrity of the hatch or outlet are to be approved by ACS.

#### 6.3 Windows and side scuttles

- 6.3.1 Requirements for windows and side scuttles are to be determined in accordance with [Pt 3, Ch 11, 6.5, Side scuttles, windows and skylights](#).

PART

# 4

CHAPTER **4 Offshore Support Vessels**

SECTION **7 Engine exhaust outlets**

## **7.1 Location**

- 7.1.1 Engine exhaust outlets are to be located as high as is practicable above the deck and are to be fitted with spark arresters.

## CHAPTER 4 Offshore Support Vessels

## SECTION 8 Transport and handling of hazardous and noxious liquid substances in bulk

## 8.1 Scope

- 8.1.1 This Section applies to the arrangement and scantling of sea-going ships as defined in [Pt 4, Ch 4, 1.1., Application](#) and intended for the carriage of hazardous and noxious substances, i.e.;
- Products which are listed in chapter 17 or chapter 18 of the IBC Code and the latest edition of the MEPC.2/Circular (Provisional categorization of liquid substances in accordance with MARPOL Annex II and the IBC Code) and their related references to chapter 15 and chapter 19; or
  - Oil-based/water-based mud containing mixtures of products listed in 1(a); or
  - Liquid carbon dioxide (high purity and reclaimed quality) and liquid nitrogen; or
  - Contaminated backloads.
- 8.1.2 The requirements of this Section are non-mandatory and need not be complied with for classification with ACS, although compliance may be insisted upon, in part or in full, by the Flag Administration.
- 8.1.3 Ships complying with the requirements of this Section will be eligible for the optional special feature notation **HNLS**.
- 8.1.4 Carriage of products not listed in [Pt 4, Ch 4, 8.1 Scope 8.1.1](#) may be permitted in accordance with the *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels* (OSV Chemical Code) 1.1 Application 1.1.10.
- 8.1.5 Compliance with the *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels* (OSV Chemical Code) will warrant the issuance of a certificate of fitness in line with the Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels 1.4 Surveys and certification 1.4.1.
- 8.1.6 This Section is to be considered as additional to the requirements listed in Pt 4, Ch 4, Sections 1 to 7 in these Rules.

## 8.2 Definitions and equivalents

- 8.2.1 The definitions applicable to this Section are as per the *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels* (OSV Chemical Code) 1.2 Definitions.
- 8.2.2 Equivalents to the requirements of this Section will be considered in accordance with the *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels* (OSV Chemical Code) 1.3 Equivalents.

## 8. 3 Design

8. 3. 1 The goals of this sub-Section are:
  - a. To ensure that the cargo tanks are located in protected location(s) in the event of minor hull damage.
  - b. To ensure that the cargo containment and handling systems are located so that the consequences of any release of cargo will be minimised, and to provide safe access for operation and inspection.
8. 3. 2 The vessel is to be designed in accordance with the following:
  - a. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 2.3 Non-cargo discharges below the freeboard deck*.
  - b. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 2.9 Location of cargo tanks*.
  - c. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 3 Vessel design*.
  - d. Segregation of cargo tanks from spaces which are intended to be non-hazardous, where diagonal or corner to corner situations occur, will be specially considered. *See also [Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.9](#) of these Rules.*
  - e. With respect to access to spaces in the cargo area, spaces which are of confined or cellular construction adjacent to cargo or slop tanks, such as double bottom tanks and cofferdams, are to have dual access from the upper deck, spaced as widely apart as possible. Pipe tunnels and duct keels to which access is normally required for operational purposes are to be provided with means of access not more than 60 m apart. In all cases, however, access is to be provided at each end of the tunnel or duct keel.

## 8. 4 Special requirements for products with a flashpoint not exceeding 60°C, toxic products and acid

8. 4. 1 The goal of this sub-Section is to ensure that the consequences of any release of liquid cargo with severe safety hazards, from compliant vessels, will be minimised; and to provide protection to the vessel and crew from fire, toxic vapour and corrosive substances.
8. 4. 2 Where the vessel is designed to carry cargoes with a flashpoint not exceeding 60°C, toxic products or acid, it shall comply with the following:
  - a. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 4 Special requirements for products with a flashpoint not exceeding 60°C, toxic products and acid*.
  - b. With respect to toxic products, vapour return lines are to be fitted with shut-off valves and blank flanges.
  - c. With respect to internal cargo tanks for the carriage of acids, the surface is to be smooth and free of obstruction, and the arrangements at corners are to be appropriate to the intended lining arrangements.
  - d. With respect to tank or piping surfaces to be exposed to acid cargoes, the corrosion protection lining is to be applied in a solid state.
  - e. Linings approved for use with acids are considered to be an acid-resistant material that is applied to the tank or piping system in a solid state with a defined elasticity property, which is to be greater than the elasticity of the structural steel.

## 8. 5 Cargo containment

- 8. 5. 1 The goal of this sub-Section is to ensure the safe containment of cargo under all foreseeable design and operating conditions having regard to the nature of the cargo carried.
- 8. 5. 2 The cargo containment arrangements of the vessel shall comply with the following:
  - a. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 5 Cargo containment*.
  - b. Cargo tanks are to be as required by the ACS Rules as applicable for the intended cargo.
  - c. Integral cargo tank scantlings and arrangements are to be in accordance with the ACS Rules as applicable.
  - d. With respect to independent cargo tank scantlings and arrangements, these are to be considered on the basis of the standards contained in the classification Rules taking account of the cargo relative densities, and giving due consideration to the maximum pressure which will be encountered in service and the dynamic loading which will be experienced by the tanks, supports and keys. Calculations are to be submitted to enable the appraisal of the proposed arrangements.
  - e. Where it is intended that vessels are to carry high temperature cargoes in independent cargo tanks, the tanks are to be supported and keyed so as to permit free expansion in all directions and to eliminate heat bridges which can transmit thermal stresses to the hull of the ship.
  - f. All openings in independent cargo tanks are to be in the top of the tank and extended above the deck (alternative arrangements will be specially considered). Access is to be from the open deck direct, with arrangements for maintaining watertightness at the joint between the hatch coaming and the deck.

## 8. 6 Materials of construction

- 8. 6. 1 The goal of this sub-Section is to ensure that the materials used in the construction of the vessel, piping, pumps, valves, vents, and their jointing materials are of suitable quality and traceability, and shall be suitable for the temperature and pressure for their intended function in accordance with appropriate standards.
- 8. 6. 2 OSVs intended for the transport and handling of hazardous and noxious liquid substances in bulk shall comply with the ACS Rules as applicable.

## 8. 7 Cargo transfer

- 8. 7. 1 The goal of this sub-Section is to ensure the safe handling of all cargoes, under all normal operating conditions and foreseeable emergency conditions, to minimise the risk to the vessel, its crew and the environment, having regard to the nature of the products involved through ensuring the integrity of integral liquid product tanks, piping systems and cargo hoses, preventing the uncontrolled transfer of cargo, and ensuring reliable means to fill and empty cargo tanks.
- 8. 7. 2 OSVs intended for the transport and handling of hazardous and noxious liquid substances in bulk shall comply with the following cargo transfer requirements:
  - a. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 6 Cargo Transfer*.
  - b. The nominal thickness of steel pipes is to be not less than shown in [Pt 5 Main and Auxiliary Machinery Table 12. 2. 4: Minimum thickness for steel pipes](#) in these Rules.
  - c. The use of and scantlings of stainless steel pipes will be specially considered.
  - d. Welding, post-heat treatment and non-destructive examination for piping fabrication and jointing details is also to be in accordance with the requirements of [Ch 13 Requirements for Welded Construction](#) of Pt 2.

- e. Standby means for pumping out each cargo tank are to be provided. See [Pt 5, Ch 15, 3.1 General 3.1.2](#) of Pt 2.
- f. Details of ship's cargo hoses are to be submitted together with a type test certificate issued by a recognised authority.
- g. The extreme service temperature for ship's cargo hoses is to be taken as the highest and/or lowest service temperature for which the hose is intended.

## 8. 8 Cargo tank venting

- 8. 8. 1 The goal of this sub-Section is to protect cargo containment systems from harmful over-pressure or under-pressure at all times.
- 8. 8. 2 The cargo tank venting arrangements for the vessel shall comply with the following:
  - a. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 7 Cargo Tank venting*.
  - b. The system for guarding against liquid rising to a height which would exceed the design head of the cargo tanks is to be independent of the gauging devices.
  - c. With respect to cargo tank venting, attention is drawn to the need to comply with any more onerous filling height restrictions imposed by the carriage of high relative density cargoes (i.e. above 1.025 t/m<sup>3</sup>).

## 8. 9 Electrical installations

- 8. 9. 1 The goal of this sub-Section is to ensure that electrical installations are designed so as to minimise the risk of fire and explosion from flammable products; and ensure availability of electrical generation and distribution systems relating to the safe carriage, handling and conditioning of cargoes.
- 8. 9. 2 The electrical installations aboard the vessel are to comply with the following:
  - a. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 8 Electrical installations*.
  - b. [Pt 6, Ch 2 Electrical Engineering](#) of these Rules.
  - c. Where electrical equipment is to be of a 'safe type' in order to comply with *IEC 60092: Electrical installations in ships - Part 502: Tankers - Special features*, such equipment is to be certified for the gases/vapours involved. The construction and type testing are to be in accordance with IEC Publication 60079: *Electrical Apparatus for Explosive Gas Atmospheres*, or an equivalent National Standard.
  - d. For electrical installations for systems or tanks which are to carry chlorosulphonic acid, hydrochloric acid, nitric acid, oleum, phosphoric acid, sulphuric acid or trimethylacetic acid, the hazardous areas identified in *IEC 60092 Electrical installations in ships - Part 502: Tankers - Special features, 4.5 Tankers carrying cargoes (for example acids) reacting with other products/materials to evolve flammable gases* are applicable. The relevant gas group and temperature class are IIC T1.
  - e. For electrical installations for systems or tanks which are to carry sulphur liquid, the hazardous areas identified in *IEC 60092 Electrical installations in ships - Part 502: Tankers - Special features, 4.3 Tankers carrying flammable liquids having a flashpoint exceeding 60° C*, are applicable.

## 8. 10 Mechanical ventilation in the cargo area

- 8. 10. 1 The goal of this sub-Section is to ensure that arrangements are provided for enclosed spaces in the cargo area to control the accumulation of flammable and/or toxic vapours.

8. 10. 2 Mechanical ventilation arrangements in the cargo area are to comply with the following:
- The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code)* 10 Mechanical ventilation in the cargo area.
  - With respect to ventilation of spaces not normally entered, the particulars of the type and number of portable fans, their arrangement and means of attachment are to be submitted to ACS for consideration in relation to the internal and external arrangement of the space concerned;
    - increased ventilation will be required for spaces which contain gas-freeing systems, unless these systems are totally enclosed; and
    - ventilation systems are to be capable of use prior to entry and during occupation.

## **8. 11 Instrumentation and automation systems**

8. 11. 1 The goal of this sub-Section is to ensure that any instruments and automation systems provide for the safe carriage and handling of cargoes.
8. 11. 2 Instrumentation and automation systems on board the vessel shall comply with the *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code)* 11 instrumentation and automation systems.

## **8. 12 Pollution prevention requirements**

8. 12. 1 The goal of this sub-Section is to ensure control of pollution from noxious liquid substances from offshore support vessels.
8. 12. 2 The vessel shall comply with the *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code)* 12 pollution prevention requirements.

## **8. 13 Carriage of liquefied gases**

8. 13. 1 The goal of this sub-Section is to ensure that the vessel's design, arrangement and operational procedures are such as to minimise the risk to the vessel, its crew and the environment, when carrying liquefied gases in bulk.
8. 13. 2 Where the vessel is to carry liquefied gases as a cargo it shall comply with the following:
  - Cargo tanks are to be as required by the ACS Rules as applicable for the intended cargo.
  - The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code)* 18.1 General, noting that, in the context of the application of this Chapter of the code, deviation from specific requirements of the IGC code must first be agreed with the relevant Flag Administration and latterly presented to ACS for special consideration.
  - The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code)* 18.2 Accommodation, service and machinery spaces and control stations.
  - The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code)* 18.3 Cargo containment.
  - The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code)* 18.4 Materials of construction.
  - The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code)* 18.5 Vent system for cargo containment.

| <b>PART</b>    | <b>4</b> | <b>Ship Structures (Ship Types)</b>  |
| <b>CHAPTER</b> | <b>4</b> | <b>Offshore Support Vessels</b>  |
| <b>SECTION</b> | <b>8</b> | <b>Transport and handling of hazardous and noxious liquid substances in bulk</b> |

---

- g. The Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 18.6 Cargo transfer.
- h. The Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 18.7 Vapour detection.
- i. The Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 18.8 Gauging and level detection.
- j. The Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 18.9 Emergency shutdown system.
- k. *The Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 18.12 Carriage of other liquefied gases listed in chapter 19 of the IGC Code* noting that, where a vessel is intended for carriage of liquefied gases listed in chapter 19 of the IGC Code, other than liquid carbon dioxide (high purity and reclaimed quality) or liquid nitrogen, then agreement on the relevant aspects of the IGC Code and any additional requirements are to be agreed during multi-party discussions to include the Flag Administration and ACS.

## CHAPTER 4 Offshore Support Vessels

## SECTION 9 Enhanced weather protection

## 9.1 Applicability

- 9.1.1 Where the requirements in this Section are complied with, the special features notation **EWP** may be assigned.

## 9.2 Superstructure scantlings

- 9.2.1 The scantlings of deckhouses situated on the forecastle deck and above are to comply with the requirements of [Table 4.9.1: Superstructures and deckhouses on forecastle deck](#).
- 9.2.2 The scantlings of forecastle end bulkheads are to be not less than those required by [Table 4.9.1: Superstructures and deckhouses on forecastle deck](#) for aft ends of deckhouses or less than those required by [Pt 3, Ch 8, 2 Scantlings of erections other than forecastles](#) for an exposed machinery casing.

Table 4.9.1: Superstructures and deckhouses on forecastle deck

| Position   | Thickness of plating, in mm        | Modulus of stiffeners, in cm <sup>3</sup> | Depth of stiffeners, in mm |
|--|------------------------------------|---|----------------------------|
| Fronts   | The greater of $t = 0.012s$ or 8.0 | $Z = 0.034sl_e^2$                         | Not less than 100          |
| Sides  | The greater of $t = 0.01s$ or 6.5  | $Z = 0.027sl_e^2$                         | Not less than 75           |
| Aft ends   | The greater of $t = 0.008s$ or 6.5 | $Z = 0.027sl_e^2$                         | Not less than 65           |
| <b>Note</b> The ends of stiffeners are to be connected on all tiers. |                                    |   |                            |

## 9.3 Windows and side scuttles

- 9.3.1 The requirements of this Section are to be applied in conjunction with [Pt 3, Ch 11, 6.5, Side scuttles, windows and skylights](#).
- 9.3.2 Windows may only be fitted in the following locations:
- Second tier and higher above the freeboard deck:
    - in the after end bulkhead of deckhouses and superstructures,
    - in the sides of deckhouses and superstructures which are not part of the shell plating.
  - Third tier and higher above the freeboard deck:
    - in the forward facing bulkheads of deckhouse and superstructures, except that in the first tier of the front bulkhead above the weather deck, only side scuttles will be accepted.

- 9.3.3 In locations not specified in [Pt 4, Ch 4, 9.3 Windows and side scuttles 9.3.2](#), only side scuttles will be accepted.
- 9.3.4 Permanently attached deadlights are to be provided as follows:
- Side scuttles:
    - in the side shell plating,
    - in the forward facing bulkheads of superstructures and deckhouses,
    - in the sides of deckhouses and superstructures up to and including the third tier above the freeboard deck,
    - in the after end bulkheads of superstructures, deckhouses, casings and companionways in the first and second tiers above the freeboard deck.
  - Windows in locations permitted in [Pt 4, Ch 4, 9.3 Windows and side scuttles 9.3.2](#):
    - in the sides of deckhouses and superstructures in the second and third tiers above the freeboard deck.
    - in the after end bulkheads of superstructures, deckhouses, casings and companionways in the second tier above the freeboard deck.
- 9.3.5 On windows in the second tier and higher above the freeboard deck, hinged storm covers may be fitted in lieu of deadlights, provided there is safe access for closing.
- 9.3.6 Windows in the wheelhouse front are to have deadlights or storm covers. For storm covers, an arrangement for easy and safe access is to be provided, (e.g. gangway with railing). However, for practical purposes, the deadlights or storm covers may be portable if stowed adjacent to the window for quick fitting. At least two of the deadlights or storm covers are to have the means of providing a clear view.
- 9.3.7 Deadlights for side scuttles, and for windows not mentioned in [Pt 4, Ch 4, 9.3 Windows and side scuttles 9.3.5](#) and [Pt 4, Ch 4, 9.3 Windows and side scuttles 9.3.6](#), are to be internally hinged.
- 9.3.8 Side scuttles are to comply with [ISO Standard 1751](#), as follows:
- Type A side scuttles in the shell plating, in the sides of superstructures and in the forward facing bulkheads of superstructures and deckhouses on the weather deck;
  - Type B side scuttles in the after ends of superstructures and in the sides and ends of deckhouses; or
  - An equivalent National Standard.
- 9.3.9 For the location of windows and side scuttles, See [Figure 4. 9. 1: Location of windows and side scuttles](#).
- 9.3.10 The thickness of the toughened safety glass for windows is to be not less than the greater of:

a.

$$t = 10 \text{ mm}$$

b.

$$t = b \sqrt{\frac{H_d \beta}{4000}} \text{ mm}$$

where

$H_d$  = design pressure head, in metres, as obtained from [Table 4. 9. 2: Design pressure head,  \$H\_d\$ , on windows](#)

$b$  = length of shorter side of window, in mm

$$\beta = 0.54A_R - 0.078A_R^2 - 0.17 \text{ for } A_R < 3$$

$$= 0.75 \text{ for } A_R > 3$$

$A_R$  = aspect ratio of window

$$= a/b$$

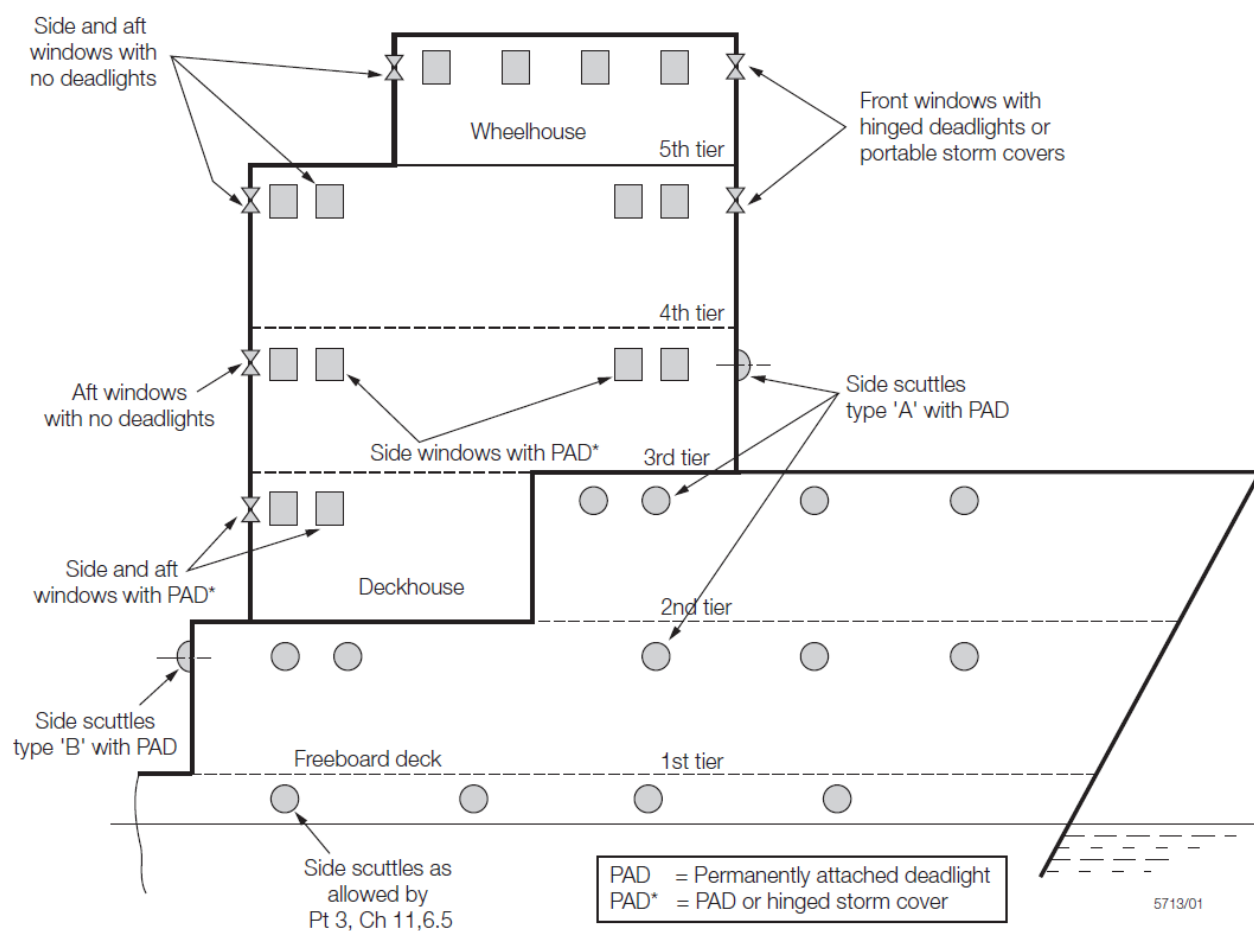

$a$  = length of longer side of window, in mm.

9. 3. 11 Proposals for alternative materials will be specially considered.

**Table 4. 9. 2: Design pressure head,  $H_d$ , on windows**

|                    | Design pressure head, in metres     |                                |
|--------------------|-------------------------------------|--------------------------------|
|                    | Windows in front and side bulkheads | Windows in after end bulkheads |
| 6th tier and above | 3.0                                 | 2.5                            |
| 5th tier           | 5.0                                 | 2.5                            |
| 4th tier           | 8.0                                 | 2.5                            |
| 3rd tier           | 12.5                                | 6.25                           |
| 2nd tier           | 14.0                                | 8.0                            |

CHAPTER **5 Barges and Pontoons**

SECTION **1 General**

## 1. 1 Application

1. 1. 1 This Chapter applies, in general, to manned or unmanned non-self-propelled ships defined as follows:
- Barges for the carriage of general dry cargoes in cargo holds.
  - Barges for the carriage of liquid cargoes in bulk.
  - Pontoons designed specifically for the carriage of non-perishable cargo on deck.
  - Shipborne barges for the carriage of general dry cargo in cargo holds and intended to operate afloat only within specified geographical limits, and suitable for regular carriage on board a larger ship.
1. 1. 2 Manned or unmanned barges for the carriage of liquid chemicals in bulk and barges for the carriage of liquefied gases will receive individual consideration on the basis of the Rules, *See [Table 5. 1. 1: Applicable Rules](#)*.

**Table 5. 1. 1: Applicable Rules**

| Type of barge  | Applicable Rules  |
|--|---|
| Barge for the carriage of general dry cargo in cargo hold                      | <a href="#">Pt 4, Ch 1 General Cargo Ships</a>  |
| Barge for the carriage of liquid cargo in bulk                                 | <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a>   |
| Pontoon designed specifically for the carriage of non-perishable cargo on deck | <a href="#">Pt 4, Ch 1 General Cargo Ships</a>  |
| Shipborne barges for the carriage of general dry cargo in cargo holds          | <a href="#">Pt 4, Ch 1 General Cargo Ships</a> and this Chapter for 'extended protected water service' barges |

1. 1. 3 The scantlings and arrangements, except where otherwise specified in this Chapter, are to comply with the Rules as indicated in [Table 5. 1. 1: Applicable Rules](#).
1. 1. 4 The Rules assume that the structural arrangements of barges carrying cargo in holds will generally approximate to normal ship shape and construction. Barges of this type not doing so will receive individual consideration on the basis of the Rules.
1. 1. 5 The Rules also assume that barges and pontoons are homogeneously loaded. Barges or pontoons with other types of loading, e.g. crane pontoon, will receive individual consideration.

1. 1. 6 All barges and pontoons are to be fitted with adequate arrangements for towing. In general, such arrangements are to consist of, or be equivalent to, not less than two sets of bollards, each of which shall be suitable for accepting a towline of suitable breaking strength.

## 1. 2 Class notations

1. 2. 1 In general, ships complying with the requirements of this Chapter will be eligible for one of the following classes:
- 100A1 barge.** This class will be assigned to non-self-propelled sea-going ships as defined in [Pt 4, Ch 5, 1.1, Application 1.1.1.](#)
  - 100A1 oil barge.** This class will be assigned to non-self-propelled sea-going ships as defined in [Pt 4, Ch 5, 1.1 Application 1.1.1.b.](#)
  - 100A1 pontoon.** This class will be assigned to non-self-propelled sea-going ships as defined in [Pt 4, Ch 5, 1.1 Application 1.1.1.c.](#)
1. 2. 2 Barges and pontoons intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.6](#) to [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.10](#), will receive individual consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval. In particular, shipborne barges as defined in [Pt 4, Ch 5, 1.1 Application 1.1.1.d](#) complying with the requirements of this Chapter will be eligible to be classed **100A1 shipborne barge extended protected water service**.
1. 2. 3 The Regulations for classification and the assignment of class notations are given in [Pt 1, Ch 2 Classification Regulations](#), to which reference should be made.

## 1. 3 Information required

1. 3. 1 In addition to the information and plans required by [Pt 3, Ch 1, 5 Information required](#), the following are to be submitted:
- Details of structure and fittings to which deck cargo securing lashings, etc. are attached.
  - Details of the bollards and their supporting structure.
  - Where pusher tugs or integral tug/barge systems are proposed, full details and data of the attachment and support arrangements.
  - Details of the intended service areas required for barges or pontoons designed to operate within specified geographical limits.
  - Longitudinal strength and lifting arrangements for ship-borne barges.

## 1. 4 Symbols and definitions

1. 4. 1 The Rule length,  $L$ , for vessels with swim ends is to be measured as shown in [Figure 5. 1. 1: Definition of Rule length](#). Where a swim end is arranged aft but no rudder is fitted,  $L$  need not exceed 97 per cent of the extreme length on the summer load waterline. For tugs and barge units having rigid connections, the length,  $L$ , is to be taken as the combined length of the tug and barge.

**Figure 5. 1. 1: Definition of Rule length**

## CHAPTER 5 Barges and Pontoons

## SECTION 2 Longitudinal strength

## 2. 1 General

2. 1. 1 Longitudinal strength calculations are to be made in accordance with the requirements given in [Pt 3, Ch 4 Longitudinal Strength](#), and the ship service factor,  $f_1$ , is given in [Table 5. 2. 1: Ship service factor  \$f\_1\$](#) .

Table 5. 2. 1: Ship service factor  $f_1$ 

|   | $f_1$   |  |
|---|---------|--|
| Type of ship  | '100A1' | '100A1 extended protected water service' |
| Barge for the carriage of general cargo in holds and for the carriage of liquid cargoes in bulk | 1.0     | 0.80                                     |
| Pontoons for the carriage of non-perishable cargoes on deck                                     |         |  |
| Shipborne barges for the carriage of general cargo in holds and unmanned                        | —       | 0.70                                     |

2. 1. 2 The requirements of [Pt 3, Ch 4, 8.3 Loading instrument](#) regarding loading instruments are not applicable to barges and pontoons.
2. 1. 3 For shipborne barges, where it is the intention to lift the barge on board ship by crane, a condition 'fully loaded barge suspended by crane' is to be submitted. For this condition the following stresses are permissible:
- Bending stress  $\sigma_b = 147.2 \text{ N/mm}^2$
  - Shear stress  $\tau = 98.1 \text{ N/mm}^2$

## CHAPTER 5 Barges and Pontoons

### SECTION 3 Hull envelope plating

#### 3.1 Shell and deck plating

- 3.1.1 The thickness of shell and deck plating is to be as necessary to give the hull section modulus required by [Pt 4, Ch 5, 2.1 General](#) and to satisfy the requirements listed in [Table 5.3.1: Shell and deck plating](#).

**Table 5.3.1: Shell and deck plating**

| Item of plating |  | Thickness for ships classed 100A1   | Thickness for ships having extended protected water service notation   |
|-----------------|--|---|--|
| (a)             | Keel   | The separate requirements of <a href="#">Pt 4, Ch 1 General Cargo Ships</a> or <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> , whichever is applicable, for keel width and thickness need not be applied, except where $L > 100$ m and the bottom has a rise of floor |  |
| (b)             | Bottom shell and bilge                               | In accordance with the requirements of <a href="#">Pt 4, Ch 1 General Cargo Ships</a> or <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> , whichever is applicable  | In accordance with the requirements of <a href="#">Pt 4, Ch 1 General Cargo Ships</a> or <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> , whichever is applicable, reduced by 12.5 per cent, but is to be not less than required by (c) below   |
|                 |  | For chines, See <a href="#">Pt 4, Ch 5, 3.1 Shell and deck plating 3.1.2</a>  |  |
| (c)             | Side shell from upper turn of bilge or chine to deck | The greater of the values obtained from <a href="#">Pt 4, Ch 1 General Cargo Ships</a> or <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> , whichever is applicable, for the appropriate framing arrangement  |  |
| (d)             | Deck   | In accordance with the requirements of <a href="#">Pt 4, Ch 1 General Cargo Ships</a> or <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> , whichever is applicable  | In accordance with the requirements of <a href="#">Pt 4, Ch 1 General Cargo Ships</a> or <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> , whichever is applicable, reduced by 2 mm, but is to be not less than the deck basic end thickness as required by <a href="#">Pt 3, Ch 5 Fore End Structure</a> and <a href="#">Pt 3, Ch 6 Aft End Structure</a> |
|                 |  | In pontoon barges with deck cargoes the deck thickness derived from (d) may be required to be increased   |  |
| (e)             | Swim ends  | The bottom shell plating thickness is to be maintained up to the summer load waterline for the rake plating. Above this point the thickness may be tapered to that of the side shell requirements from a point not less than 1 m above the load waterline                   |  |

- 3.1.2 On ships with two chines each side, the bilge plating should generally be calculated from the bottom plating formulae. On hard chine ships, flanged chines will not, in general, be approved, but where a chine is formed by knuckling the shell plating, the radius of curvature, measured on the inside of the plate, is to be not less than 10 times the plate thickness. Where a solid round chine bar is fitted, the bar diameter is to be not less than three times the thickness of the thickest abutting

plate. Where welded chines are used, the welding is to be built up as necessary to ensure that the shell plating thickness is maintained across the weld.

## CHAPTER 5 Barges and Pontoons

## SECTION 4 Hull envelope framing

## 4. 1 Symbols

4. 1. 1 The symbols used in this Section are defined as follows:

- $h$  = head or load height, in metres, and is to be taken as:
  - = for bottom longitudinals, frames, girders and transverses: the depth  $D$
  - = for side longitudinals: the distance of the longitudinal below the deck at side, but not less than  $0.01L + 0.7$
  - = for side transverses: the distance from the mid-point of span to the deck at side, but not less than  $0.01L + 0.7$
  - = for deck longitudinals and transverses: the head equivalent to cargo carried at a stowage rate of  $1.39 \text{ m}^3/\text{tonne}$ , but is not to be taken less than  $0.01L + 0.7$
  - = for side frames: the distance from the midpoint of span to the deck at the side
  - = for deck beams and girders: the head equivalent to cargo carried at a stowage rate of  $1.39 \text{ m}^3/\text{tonne}$ , but is not to be taken less than required by [Table 3. 5. 1: Design heads and permissible cargo loadings](#)
- $l_e$  = effective length of stiffening member, in metres, See [Pt 3, Ch 3, 3 Structural idealisation](#)
- $s$  = spacing of frames, beams or longitudinals, in mm
- $S$  = spacing or mean spacing of girders, transverses or floors, in metres
- $Z$  = section modulus of stiffening member, in  $\text{cm}^3$ , See [Pt 3, Ch 3, 3 Structural idealisation](#).

## 4. 2 General

- 4. 2. 1 Bottom, side and deck transverses are to be connected in such a manner as to ensure continuity of the transverse ring system, and longitudinals are to be attached to transverses. In way of deck and bottom transverses, a deep web frame is to be fitted.
- 4. 2. 2 End connections of longitudinals at bulkheads are to provide adequate fixity and direct continuity of longitudinal strength.
- 4. 2. 3 Brackets at the top and bottom of side frames are to extend to the adjacent deck or bottom longitudinal to which they are to be attached.
- 4. 2. 4 pontoons where truss arrangements, comprising top and bottom girders in association with pillars and diagonal bracing, are used in the support of the deck loads, the diagonal members are generally

to have angles of inclination with the horizontal of about 45° and cross-sectional area of approximately 50 per cent of the adjacent pillar in accordance with [Pt 4, Ch 1, 4.4, Deck supporting structure](#), with a head in accordance with Pt 4, [Ch 1, 4.1 General](#) 4.1.1.

4. 2. 5 Adequate support must be provided on the centreline for the loads imposed on the structure when the ship is in dry dock.

### 4. 3 Longitudinal framing

4. 3. 1 The scantlings of bottom, side and deck longitudinals are to comply with the requirements of [Table 5. 4. 1: Longitudinal framing](#).

**Table 5. 4. 1: Longitudinal framing**

| Position of longitudinals  | Modulus, in cm <sup>3</sup>   |
|--|---|
| Bottom   | $* Z = 11.0 l_e^2 s h \times 10^{-3}$   |
| Side shell   | $* Z = 8.0 l_e^2 s h \times 10^{-3}$  |
| Deck   | $* Z = 5.5 l_e^2 s h \times 10^{-3}$  |
|  | * For the requirements for barges carrying liquid cargoes in bulk See <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> |
| <b>Note</b> The scantlings derived from above need not exceed the scantling requirements of <a href="#">Pt 4, Ch 1 General Cargo Ships</a> or <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> , whichever is applicable. |   |

### 4. 4 Transverse framing

4. 4. 1 The scantlings of bottom and side frames and deck beams are to comply with the requirements of [Table 5. 4. 2: Transverse framing](#).

**Table 5. 4. 2: Transverse framing**

| Position of member   | Modulus, in cm <sup>3</sup>   |
|--|---|
| Bottom and side frames   | $* Z = 9.5 l_e^2 s h \times 10^{-3}$  |
| Deck beams   | $* Z = 4.5 l_e^2 s h \times 10^{-3}$  |
|  | * For the requirements for barges carrying liquid cargoes in bulk See <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> |
| <b>Note</b> The scantlings derived from above need not exceed the scantling requirements of <a href="#">Pt 4, Ch 1 General Cargo Ships</a> or <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> , whichever is applicable. |   |

## 4. 5 Primary supporting structure

4. 5. 1 Primary supporting members are to comply with the requirements of [Table 5. 4. 3: Primary supporting structure](#).

**Table 5. 4. 3: Primary supporting structure**

| Position of member  | Modulus, in $\text{cm}^3$   |
|---|---|
| Bottom transverse   | $* Z = 11.0 l_e^2 S h$  |
| Side transverse   | $* Z = 8.0 l_e^2 S h$<br>(may be reduced by 5 per cent for vessels classed '100A1 extended protected water service')      |
| Deck transverse   | $* Z = 5.5 l_e^2 S h$   |
| Bottom girder   | $* Z = 9.5 l_e^2 S h$   |
| Deck longitudinal girder  | $* Z = 5.0 l_e^2 S h$   |
|   | * For the requirements for barges carrying liquid cargoes in bulk See <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> |
| <b>Note</b> The scantlings derived from above need not exceed the scantling requirements of <a href="#">Pt 4, Ch 1 General Cargo Ships</a> or <a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> , whichever is applicable |   |

# 4

CHAPTER **5 Barges and Pontoons**

SECTION **5 Strengthening of bottom forward**

## **5. 1 Application**

- 5. 1. 1 The requirements for strengthening of bottom forward detailed in [Pt 3, Ch 5 Fore End Structure](#) do not apply to barges or pontoons less than 50 m in length.

PART

# 4

CHAPTER **5 Barges and Pontoons**

SECTION **6 Bottom strengthening for loading and unloading aground**

## **6. 1 Application**

6. 1. 1 For barges or pontoons intended to load or unload while aground, *See [Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground](#)*.

CHAPTER **5 Barges and Pontoons**SECTION **7 Watertight bulkheads****7.1 Collision bulkheads**

- 7.1.1 Barges and pontoons are to have a collision bulkhead extending intact to the strength/weather deck and, in general, this is to be positioned as detailed in [Table 5.7.1: Collision bulkhead position](#).

**Table 5.7.1: Collision bulkhead position**

| Length $L$ ,<br>in metres | Distance of collision bulkhead aft of fore end of $L$ , in metres,<br>See <a href="#">Figure 5.1.1: Definition of Rule length</a> |               |
|---------------------------|---|---------------|
|                           | Minimum   | Maximum       |
| $\leq 150$                | $0.05L$   | $0.05L + 4.5$ |
| $> 150$                   | The lesser of:<br>$0.05L$ or 10   | $0.08L$       |

## CHAPTER 5 Barges and Pontoons

## SECTION 8 Towing fittings

## 8.1 Smit-Type towing brackets and closed fairleads

- 8.1.1 This sub-Section applies to the typical Smit-Type towing brackets and closed fairleads installed on board manned or unmanned non-self-propelled ships which are part of the envisaged towing arrangement.
- 8.1.2 The design load for Smit-Type brackets and closed fairleads shall be no less than 1.3 times the minimum breaking strength of the provided towline or of the weakest component in the envisaged towing arrangement if that is lower, applied at all possible angles of tow.

Figure 5. 8. 1: Illustration of apex angle in a towing arrangement

- 8.1.3 When towed using a bridle arrangement, the angle at the apex of the bridle shall normally be between 45° and 60° as shown in [Figure 5. 8. 1: Illustration of apex angle in a towing arrangement](#). If it exceeds 60°, then the design load for Smit-Type brackets and closed fairleads specified in [Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.2](#) shall be increased to account for the increased resolved load in the bridle.
- 8.1.4 The Smit-Type brackets and closed fairleads shall be selected from an industry standard accepted by ACS based on the design load specified in [Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.2](#) or [Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.3](#) as appropriate, applied at all possible angles of tow.
- 8.1.5 When the Smit-Type brackets or the closed fairleads are not selected from an industry standard accepted by the society, the strength of fittings is to be adequate for the design load specified in [Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.2](#) or [Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.3](#) as appropriate, applied at all possible angles of tow. Under the design load and with net scantlings, the stresses are not to exceed those given in [Table 5. 8. 1: Permissible Stress Values](#). Non-linear analysis is considered acceptable subject to special consideration.

**Table 5. 8. 1: Permissible Stress Values**

|   | Permissible stress<br>N/mm <sup>2</sup> |
|---|---|
| Normal stress   | $\sigma_0$                              |
| Shear stress  | $\frac{\sigma_0}{\sqrt{3}}$             |
| Combined stress   | $\sigma_0$                              |
| Symbols   |   |
| $\sigma_0$ = specified minimum yield stress, in N/mm <sup>2</sup><br><b>Note</b> Normal stress is defined as the sum of bending and axial stresses, with the corresponding shearing stress acting perpendicular to the normal stress. |   |

8. 1. 6 Prototype testing will be required to confirm the strength unless the Smit-Type bracket or the closed fairlead is selected from a recognised National or International Standard. The fitting shall be tensioned to its design load as specified in [Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.2](#) or [Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.3](#) as appropriate, accounting for all possible angles of tow. After the test, the prototype needs to be examined for any failures including unacceptable deformations. The prototype which was strength-tested shall not be installed on board.
8. 1. 7 The weld between the fittings and the deck shall be capable of resisting the design load specified in [Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.2](#) or [Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.3](#) as appropriate.
8. 1. 8 The deck and the supporting structure in way of the fittings are to be suitably reinforced to resist a design load specified in [Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.2](#) or [Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.3](#) as appropriate, applied at all possible angles of tow. Stresses induced in the supporting structure, determined using the design load and with net scantlings are not to exceed the permissible values given in [Table 5. 8. 1: Permissible Stress Values](#). The capability of the structure to withstand buckling is also to be assessed, and an appropriate insert plate needs to be provided where necessary.
8. 1. 9 An allowance for corrosion is to be added to the net thickness derived as indicated below:
- For the supporting deck structure, a corrosion addition of 2 mm is to be added to the net thickness derived.
  - For fittings not selected from an accepted industry standard, 2 mm is to be added to the net thickness derived.
8. 1. 10 In addition to the corrosion requirements specified in [Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.9](#), the wear allowance for the shipboard fittings not selected from an accepted industry standard is not to be less than 1.0 mm, added to the surfaces which are intended to be in regular contact with the towline.

PART

# 4

CHAPTER **5 Barges and Pontoons**

SECTION **9 Void spaces**

## **9. 1 Void spaces on unmanned pontoons not fitted with auxiliary machinery**

- 9. 1. 1 Drainage arrangements and air pipes are to be provided in accordance with [Pt 5, Ch 13, 10 Drainage arrangements for ships not fitted with propelling machinery](#) and [Pt 5, Ch 13, 12.4 Air pipes 12.4.4](#) respectively.
- 9. 1. 2 Deck openings to allow drainage in accordance with [Pt 5, Ch 13, 10.1 Pumps 10.1.3](#) are to be as small as practicable and closed by watertight gasketed covers of steel or equivalent material.

## CHAPTER 6 Trawlers and Fishing Vessels

### SECTION 1 General

#### 1.1 Application

- 1.1.1 This Chapter applies to sea-going steel trawlers, stern trawlers and fishing vessels.
- 1.1.2 For the purpose of this Chapter, a fishing vessel is a ship used for fishing operations, but not equipped for trawling.
- 1.1.3 The scantlings and arrangements are to be as required by [Pt 4, Ch 1 General Cargo Ships](#) except as otherwise specified in this Chapter. Consideration will be given to proposals for modified scantlings on vessels where  $L$  is less than 24 m.

#### 1.2 Assignment of load lines

- 1.2.1 The *International Convention on Load Lines, 1966* does not apply to trawlers and fishing vessels, but certain National Authorities may request the assignment of load lines for ships registered in their countries.
- 1.2.2 The Rules affecting the protection of openings and protection of crew, and particularly those contained in [Pt 3, Ch 11 Closing Arrangements for Shell, Deck and Bulkheads](#) and [Pt 3, Ch 12 Ventilators, Air Pipes and Discharges](#), may be modified to take account of National Regulations or practicabilities related to fishing operations.

#### 1.3 Class notations

- 1.3.1 In general, ships complying with the requirements of this Chapter will be eligible for one of the following classes:
  - a. **100A1 trawler**. This class will be assigned to side fishing trawlers.
  - b. **100A1 stern trawler**. This class will be assigned to stern fishing trawlers.
  - c. **100A1 fishing vessel**. This class will be assigned to fishing vessels, See [Pt 4, Ch 6, 1.1 Application 1.1.2](#).
- 1.3.2 The Regulations for classification and the assignment of class notations are given in [Pt 1, Ch 2 Classification Regulations](#) to which reference should be made.

#### 1.4 Information required

- 1.4.1 In addition to the information required by [Pt 3, Ch 1, 5 Information required](#), the position and arrangement of trawl gear and deck machinery and location of insulated compartments are to be indicated.

## 1. 5 Symbols and definitions

1. 5. 1 The Rule length,  $L$ , is the distance, in metres, on the classification waterline from the fore side of the stem to the after side of the rudder post, or to the centre of the rudder stock if there is no rudder post.  $L$  is to be not less than 96 per cent, and need not be greater than 97 per cent, of the extreme length on the classification waterline.
1. 5. 2 Breadth  $B$ , is the greatest moulded breadth, in metres.
1. 5. 3 Depth  $D$ , is measured, in metres, at the middle of the length,  $L$  from the base line to top of the deck beam at side on the uppermost continuous deck.
1. 5. 4 The classification waterline in single deck ships is the waterline taken perpendicular to the plane of the transverse bulkheads located at  $0.85D$  from the base line amidships, or at the maximum operational draught amidships, whichever is the greater. In two-deck ships, it is the waterline located at the maximum operational draught, but if this is unknown, it may be taken at 50 mm below the lower deck. If a load line is required by a National Authority, the classification waterline is the summer load waterline.
1. 5. 5 Keel line is the line parallel to the slope of the keel intersecting the top of the keel at amidships, or the line of intersection of the inside of shell plating with the keel where a bar keel is fitted.
1. 5. 6 Base line is a line parallel to the classification waterline and intersecting the keel line at amidships.
1. 5. 7 Draught  $T$ , is the distance in metres, between the classification waterline and the base line amidships.
1. 5. 8 The block coefficient  $C_b$  is to be taken at the classification waterline.
1. 5. 9 The following symbols are also applicable to this Chapter:
 

|       |   |   |
|-------|---|---|
| $k$   | = | material factor, See <a href="#">Pt 4, Ch 1, 1.5, Symbols and definitions</a>   |
| $l_e$ | = | effective length of stiffening member, in metres, See <a href="#">Pt 3, Ch 3, 3 Structural idealisation</a>   |
| $s$   | = | spacing of stiffeners, in mm  |
| $s_b$ | = | $470 + \frac{L}{0.6}$ with minimum limitation at ends as defined in Pt 3, Ch 5, <a href="#">Table 5. 3. 1: Shell and deck plating</a> for fore end structure and <a href="#">Pt 3, Ch 6 Aft End Structure, Table 6. 3. 1: Shell plating aft</a> for aft end structure |
| $s_1$ | = | $s$ , but not less than $s_b$   |
| $t$   | = | thickness of plating, in mm   |
| $Z$   | = | section modulus of stiffening member, in $\text{cm}^3$ , See <a href="#">Pt 3, Ch 3, 3 Structural idealisation</a>  |

### **2. 1 Protection of steelwork**

- 2. 1. 1 Where wood sheathing is fitted, the material is to be of good quality, well seasoned and free from sapwood, and the thickness is to be not less than 65 mm. The plank widths should not normally exceed 150 mm. Thwartship planks are to be laid at the ends of deckhouses and at break of deck. Fastenings are to be sunk below the surface of the planking and covered with turned dowels, and the whole to be thoroughly bedded in a suitable composition. All weather decks are to be caulked and payed.
- 2. 1. 2 Where gutter waterways are fitted, the bar forming the inner edge of the waterway is to be not less than 7.5 mm thick.
- 2. 1. 3 Welded studs are to be not less than 9.5 mm diameter, and are to be coated with suitable composition before the planking is laid. Bolts used instead of studs may be 12.5 mm diameter galvanised. If the steel deck is penetrated for bolts, the deck is to be hose tested in accordance with [Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks](#).

### **2. 2 Protection of cargo**

- 2. 2. 1 When a fuel oil bunker or double bottom carrying fuel oil, or a lubricating oil tank, is adjacent to a fish hold, the relevant requirements of [Pt 4, Ch 3, 4 Panting and strengthening of bottom forward](#) are to be complied with.
- 2. 2. 2 Compartments used for the processing of fish, or for temporary storage during or while awaiting processing, need not comply with the requirements of [Pt 4, Ch 6, 2.2 Protection of cargo 2.2.1](#), but the construction of the bulkheads, decks and insulation, if any, should be such as to minimise the risk of oil leakage.

PART

# 4

CHAPTER **6 Trawlers and Fishing Vessels**

SECTION **3 Longitudinal strength**

## **3. 1 General**

- 3. 1. 1 The longitudinal strength standard is to comply with the relevant requirements of [Pt 3, Ch 4 Longitudinal Strength](#).
- 3. 1. 2 The requirements of [Pt 3, Ch 4, 8.3 Loading instrument](#) regarding loading instruments are not applicable to trawlers and fishing vessels.

## CHAPTER 6 Trawlers and Fishing Vessels

### SECTION 4 Deck structure

#### 4. 1 Deck plating

4. 1. 1 The thickness of deck plating is to be not less than that required by [Pt 4, Ch 1, 4 Deck structure](#). Under the trawl winch, windlass, mast, centre and side bollards and gallows, the plating thickness is to be not less than:

$$t = (0.04L + 7.5) \text{ mm}$$

where  $L$  is to be taken not less than 30 m.

4. 1. 2 When a raised deck is fitted, adequate scarfing is to be arranged at the step.

#### 4. 2 Factory deck beams

4. 2. 1 The section modulus of the beams of factory decks under fish handling spaces is to be not less than that required by [Table 1. 4. 5: Strength/weather, cargo and accommodation deck beams](#) in [Pt 4, Ch 1 General Cargo Ships](#), with  $h_2$  equal to 2 m, but extra strengthening may be required in way of heavy items of machinery or equipment.

CHAPTER **6 Trawlers and Fishing Vessels**SECTION **5 Shell envelope plating****5. 1 Shell plating**

5. 1. 1 The thickness of shell plating is to be not less than that required by [Pt 4, Ch 1, 5 Shell envelope plating](#) but in no case is it to be less than the following:

$$\text{For } L > 70m \ t = (5.5 + 0.033L) \sqrt{\frac{ks_1}{s_b}} mm$$

$$\text{For } L > 70m \ t = (6.5 + 0.033L) \sqrt{\frac{ks_1}{s_b}} mm$$

5. 1. 2 For single deck side trawlers the thickness derived from the formulae in [Pt 4, Ch 6, 5.1 Shell plating 5.1.1](#) is to be increased by 10 per cent.
5. 1. 3 When nets or control wires are in contact with the ship's side, such as below the gallows in a side trawler, the side shell plating is to be increased by 40 per cent.
5. 1. 4 Where a bar keel is fitted, the breadth of the garboard strake is to be not less than 760 mm, and the thickness is to be 10 per cent greater than the bottom shell.
5. 1. 5 The thickness of the bottom shell plating is to be increased by 10 per cent where intercostal girders are not fitted.
5. 1. 6 For increase to sheerstrake at the break of a raised deck, See [Pt 4, Ch 1, 5 Shell envelope plating](#).
5. 1. 7 Cope irons are to be fitted under gallows or any other area where excessive wear could occur.

CHAPTER **6 Trawlers and Fishing Vessels**

SECTION **6 Shell envelope framing**

**6. 1 Transverse side framing**

- 6. 1. 1 The section modulus of the side frames of single deck trawlers and fishing vessels need not be greater than 80 per cent of the modulus required by [Pt 4, Ch 1, 6 Shell envelope framing](#), but in no case is the depth of the frame to be less than 60 mm. Where not specified the draught is to be taken as not less than  $0.85D$ .
- 6. 1. 2 For two deck trawlers and two deck fishing vessels and all vessels requiring a load line, the requirements of [Pt 4, Ch 1, 6 Shell envelope framing](#) are to be complied with.
- 6. 1. 3 The section modulus of frames in the fore peak is to be the greater of the following:
  - a. 10 per cent greater than that required by [Pt 3, Ch 5, 4 Shell envelope framing](#).
  - b.  $Z=(45D-212) \text{ cm}^3$ .
- 6. 1. 4 The section modulus of frames in the aft end region is to be not less than that required by [Pt 3, Ch 6, 3 Shell envelope plating](#).
- 6. 1. 5 Where frames are stopped at watertight flats they are to be bracketed.

PART

# 4

CHAPTER **6 Trawlers and Fishing Vessels**

SECTION **7 Watertight bulkheads**

## **7. 1 Collision bulkheads**

- 7. 1. 1 Consideration will be given to proposals for the collision bulkhead to be positioned further aft than  $0.08L$  from the fore end of the classification waterline, provided that bow damage will not result in excessive trim forward.

CHAPTER **6 Trawlers and Fishing Vessels**

SECTION **8 Stern ramp, and cruiser and transom sterns**

**8. 1 Stern ramp**

8. 1. 1 The thickness of plating of the stern ramp is to be not less than:

$$t = 0.025s \text{ mm or } 10 \text{ mm, whichever is the greater.}$$

8. 1. 2 The section modulus of stiffeners is to be not less than:

$$Z = 0.019sl_e^2 \text{ cm}^3$$

**8. 2 Cruiser and transom sterns**

8. 2. 1 Cruiser and transom sterns are to have frames of the size required for peaks, and are to be additionally stiffened by web frames when required. The depth of plate floors is to be not less than that given in [Pt 4, Ch 1, 7 Single bottom structure](#), and the floors are to be associated with a suitable system of girders.

CHAPTER **6 Trawlers and Fishing Vessels**

SECTION **9 Strengthening of bottom forward**

**9. 1 General**

9. 1. 1 The requirements of [Pt 3, Ch 5, 1 General](#) are to be applied except when the forward draught contemplated for any sea-going condition is equal to or greater than  $0.03L$  in which case the bottom shell plating in the region to be strengthened may be taken as:

$$t = 0.00818sfL^{1/4}k^{1/2}$$

where the symbols are as defined in [Table 5. 1. 1: Additional strengthening of bottom forward](#) in [Pt 4, Ch 5 Barges and Pontoons](#).

This thickness derivation may be adopted for both longitudinal and transverse framing.

CHAPTER **7 Bulk Carriers**SECTION **1 General****1.1 General**

- 1.1.1 This Chapter applies to sea-going self propelled ships, constructed generally with single deck, double bottom, hopper side tanks and topside tanks and with single or double side skin construction in the cargo length area, and intended primarily for the carriage of bulk dry cargoes.
- 1.1.2 A 'bulk carrier of single side skin construction' is defined as a bulk carrier where one or more cargo holds are bound by the side shell only, or by two watertight boundaries, one of which is the side shell, which are less than 1000 mm apart.
- 1.1.3 The term 'bulk carrier of double side skin construction' is defined as a bulk carrier where all cargo holds are bound by two watertight boundaries, one of which is the side shell, which are greater than or equal to 1000 mm apart at any location within the hold length.
- 1.1.4 The ACSPlus Guidelines for the hull construction of ships are detailed in [Pt 3, Ch 16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships](#) and the classification notations and descriptive notes associated with these procedures are given in [Pt 1, Ch 2, 3 Surveys - General](#).
- 1.1.5 The attention of Owners, Masters and Cargo Shippers is drawn to the IMO Code of Safe Practice for Solid Bulk Cargoes when shipping these cargoes. Attention is also drawn to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered, and any special requirements of the Port Authorities at the ports of loading and discharge.
- 1.1.6 The Regulations for classification and the assignment of class notations are given in [Pt 1, Ch 2 Classification Regulations](#) to which reference should be made.

**1.2 Application**

- 1.2.1 Single skin and double skin bulk carriers with length,  $L$ , greater than or equal to 90 m with structural configuration as shown in [Figure 7. 1. 1: CSR-BC Applicability](#) are defined as 'CSR Bulk Carriers' and are to comply with [Pt 4, Ch 7, 1.4, Class notation for CSR bulk carriers](#).

**Figure 7. 1. 1: CSR-BC Applicability**

1. 2. 2 Single skin and double skin bulk carriers other than those described in [Pt 4, Ch 7, 1.2 Application 1.2.1](#) are defined as ‘Non- CSR Bulk Carriers’ and are to comply with [Pt 4, Ch 7, 1.5, Class notation for non-CSR bulk carriers](#).

### 1. 3 General class notations

1. 3. 1 Class notations applicable to CSR bulk carriers are defined as follows:

- **CSR**

Identifies the bulk carrier as being compliant with the *IACS Common Structural Rules for Bulk Carriers and Oil Tankers (CSR)*;

- **ESP**

Identifies the bulk carrier as being subject to an Enhanced Survey Programme as detailed in [Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements](#) and [Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements](#), See also [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.12](#).

1. 3. 2 Class notations applicable to non-CSR bulk carriers are defined as follows:

- **Strengthened for heavy cargoes**

For bulk carriers with scantlings complying with [Pt 4, Ch 7, 8.2, Carriage of heavy cargoes](#);

- **ESN**

Identifies the bulk carrier as being subject to an Enhanced Survey Programme as detailed in [Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements](#) and [Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements](#), See also [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.12](#);

- **ESN**

Identifies the bulk carrier as having been assessed for enhanced survivability with respect to flooding. Scantlings and arrangements are to comply with [Pt 4, Ch 7, 3.1 General 3.1.2](#), [Pt 4, Ch 7, 8.8, Allowable hold loading in the flooded condition](#) and [Pt 4, Ch 7, 10.4, Vertically corrugated transverse watertight bulkheads – Application and definitions](#).

## 1. 4 Class notation for CSR bulk carriers

1. 4. 1 In general, CSR bulk carriers less than 150 m in length are to comply with the requirements of [Pt 4, Ch 7, 1.6 Information required for CSR bulk carriers](#), [Pt 3, Ch 2 Materials](#) and the *IACS Common Structural Rules* (CSR) and will be eligible for one of the following mandatory class notations:
  - a. **100A1 bulk carrier, CSR, any holds may be empty, ESP.** This class notation is normally assigned to a ship designed to carry dry bulk cargoes of cargo density 1.0 tonne/m<sup>3</sup> and above, with an approved arrangement of loaded holds such that any hold may be empty at the full loaded draught.
  - b. **100A1 bulk carrier, CSR, hold, nos. 1, 2 ... may be empty, ESP.** This class notation is normally assigned to a ship designed to carry dry bulk cargoes of cargo density 1.0 tonne/m<sup>3</sup> and above with specified holds empty at maximum draught.
  - c. **100A1 bulk carrier, CSR, ESP.** This class notation will be assigned to a ship designed to carry dry bulk cargoes of cargo density less than 1.0 tonne/m<sup>3</sup>.
1. 4. 2 In general, CSR bulk carriers equal to or greater than 150 m in length are to comply with the requirements of [Pt 4, Ch 7, 1.6 Information required for CSR bulk carriers](#), [Pt 3, Ch 2 Materials](#) and the *IACS Common Structural Rules* (CSR) and will be eligible for one of the following mandatory class notations:
  - a. **100A1 bulk carrier, CSR, BC-A, hold, nos. 1, 2 ... may be empty, GRAB [X] ESP.** This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density 1.0 tonne/m<sup>3</sup> and above with specified holds empty at maximum draught.
  - b. **100A1 bulk carrier, CSR, BC-B, GRAB [X], ESP.** This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density 1.0 tonne/m<sup>3</sup> and above with all cargo holds loaded.
  - c. **100A1 bulk carrier, CSR, BC-C, ESP.** This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density less than 1.0 tonne/m<sup>3</sup> with all cargo holds loaded.
1. 4. 3 The following additional notations and annotations are to be provided giving further detailed description of limitations to be observed during operation as a consequence of the design loading condition applied during the design.
  - **Notations:**
    - a. **(maximum cargo density (in tonnes/m<sup>3</sup>))** For notations **BC-A** and **BC-B** if the maximum cargo density is less than 3.0 tonnes/m<sup>3</sup>,  
**(no MP)** For all notations when the vessel has not been designed for loading and unloading in multiple ports in accordance with the conditions specified in *IACS Common Structural Rules* (CSR), Pt 1, Ch 4, Sec 8, 4.2.2:  
**GRAB [X]** where the net thickness of inner bottom, lower strake of hopper tank sloping plate and transverse lower stool plating comply with *IACS Common Structural Rules* (CSR), Pt 2, Ch 1, 6 for **BC-A** and **BC-B**, See *IACS Common Structural Rules* (CSR), Pt 1, Ch 1, Sec 1, 3.2.1;
  - **Annotations:**  
 (allowed combination of specified empty holds). For notation **BC-A**.
1. 4. 4 The ACSPlus notation **CM** is mandatory for CSR bulk carriers greater than 150 m in length, See [Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.7](#).
1. 4. 5 Optional notations indicating compliance with specific requirements of [Pt 4, Ch 7, 3 Longitudinal strength](#) to [Pt 4, Ch 7, 14 Forecastles](#) on a voluntary basis may also be assigned.

## 1. 5 Class notation for non-CSR bulk carriers

1. 5. 1 In general, non-CSR Bulk Carriers are to comply with the requirements of [Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.2](#) to [Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.10](#) and will be eligible for one of the following mandatory class notations:
  - a. **100A1 bulk carrier, ESP.**
  - b. **100A1 bulk carrier, strengthened for heavy cargoes, ESP.** This class notation will be assigned to a ship when the double bottom structure has been specially strengthened in accordance with the requirements of [Table 7. 8. 1: Strengthening for heavy cargo requirements](#).
  - c. **100A1 bulk carrier, strengthened for heavy cargoes, hold, nos. 1, 2 ... may be empty, ESP.** This class notation is normally assigned to a ship which has been specially strengthened for heavy cargoes, See [Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.1.b](#), so as to enable the ship to be fully loaded with an approved arrangement of empty holds, See also [Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.10](#) and [Pt 4, Ch 7, 1.4 Class notation for CSR bulk carriers 1.4.3](#).
  - d. **100A1 bulk carrier, strengthened for heavy cargoes, any holds may be empty, ESP.** This class notation is normally assigned to a ship which has been specially strengthened for heavy and ore cargoes, with an approved arrangement of loaded holds such that any hold may be empty at the full loaded draught.
1. 5. 2 Plans and information are to be submitted in accordance with [Pt 4, Ch 7, 1.7, Information required for non-CSR bulk carriers](#).
1. 5. 3 Requirements are also given for special strengthening for heavy cargoes, See [Pt 4, Ch 7, 8.2, Carriage of heavy cargoes](#).
1. 5. 4 The scantlings and arrangements of the cargo region are to be as specified in this Chapter in [Pt 4, Ch 7, 2 Materials and protection](#) to [Pt 4, Ch 7, 14 Forecastles](#). The requirements are intended to cover the midship region, but also apply, with suitable modification, to the taper regions forward and aft in way of cargo spaces.
1. 5. 5 The ACSPlus notation **CM** is mandatory for non-CSR bulk carriers greater than 150 m in length, See [Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.7](#).
1. 5. 6 Where the length of the ship is greater than 190 m, or where the structural arrangements are considered such as to necessitate it, the scantlings of the primary supporting structure are to be assessed by direct calculation and the ACSPlus notations **SDA**, **FDA** and **CM** are mandatory, See [Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.7](#) and [Pt 4, Ch 7, 11 Direct calculation](#).
1. 5. 7 The 'ACSPlus Guidelines' for the hull construction of ships are detailed in [Pt 3, Ch 16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships](#) and the classification notations and descriptive notes associated with these procedures are given in [Pt 1, Ch 2, 2 Character of classification and class notations](#).
1. 5. 8 The 'Structural Design Assessment' (**SDA**), 'Fatigue Design Assessment' (**FDA**) and 'Construction Monitoring' (**CM**) Guidelines detailed in the *ACSPlus Guidelines Manual*, published by ACS, are mandatory for non-CSR bulk carriers greater than 190 m in length and for other non-CSR bulk carriers of abnormal hull form, or of unusual structural configuration or complexity See [Pt 4, Ch 7, 1.1 General 1.1.5](#) and [Pt 4, Ch 7, 11 Direct calculation](#).
1. 5. 9 Where the class notation referred to in [Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.1.d](#) is assigned such that any hold may be empty at the full draught the following items are to be considered and the corresponding requirements complied with:
  - a. Longitudinal strength calculations are to be carried out for all the operational fully loaded, non-homogeneous, part loaded, heavy cargo conditions, and these conditions included in the approved Loading Manual, See [Pt 4, Ch 7, 3 Longitudinal strength](#). Envelopes of the still

water bending moments and the shear forces covering these conditions are also to be submitted.

- b. The double bottom structure in each hold is to satisfy the requirements of [Pt 4, Ch 7, 8.4 Ships to be classed '100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP'](#).
  - c. The arrangement and scantlings of cross-deck structure between the upper deck cargo hatchways, *See* [Pt 4, Ch 7, 4.1 General 4.1.2](#).
  - d. Transverse bulkheads in holds, *See* [Pt 4, Ch 7, 10.1 General 10.1.4](#).
  - e. For main cargo hatchway openings the requirements of [Pt 4, Ch 7, 4.3 Main cargo hatchway openings 4.3.1](#) are to be complied with.
1. 5. 10 Where appropriate, other cargoes or particular loading arrangements will be included in the class notation. When the class notation referred to in [Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.1.c](#) is to be assigned for other combinations of empty and loaded holds, for example where it is the intention to load fully any two adjoining holds with adjacent holds empty in sea-going or short voyage conditions, the longitudinal and local strength aspects will be specially considered, *See also* [Pt 4, Ch 7, 4.1 General 4.1.2](#). In addition, permissible weights of cargo in each hold or pair of adjacent holds, plotted against ship's draught likely to be incurred, are to be included in the ship's approved Loading Manual.
  1. 5. 11 The scantlings of structural items may be determined by direct calculation.
  1. 5. 12 The additional requirements for bulk carriers for the alternate carriage of oil cargo and dry bulk cargo are given in [Pt 4, Ch 9, 11 Ships for alternate carriage of oil cargo and dry bulk cargo](#). When complying with the requirements of this Chapter, such ships may be excluded from all requirements and notations pertaining to vessels with length, *L*, greater than or equal to 150 m. The requirements of [Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.8](#) are however to be complied with.

## 1. 6 Information required for CSR bulk carriers

1. 6. 1 Plans and supporting documents/calculations are to be submitted for approval in accordance with the requirements of the CSR.
1. 6. 2 In addition, where not already required by the CSR, plans and supporting documents/calculations are to be submitted for approval as required by [Pt 3, Ch 1, 5.2 Plans and supporting calculations](#).
1. 6. 3 A Ship Construction File (SCF) is to be provided on board of the ship containing information to facilitate inspection/survey, repair and maintenance. As a minimum it is to include documentation and plans in accordance with the requirements of the CSR.
1. 6. 4 For CSR bulk carriers subject to *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations Part A-1 - Structure of ships Regulation 3-10 – Goal-based ship construction standards for bulk carriers and oil tankers*, the SCF is to be provided instead in accordance with the requirements specified therein in SOLAS and for these goal-based standard ships an SCF contents list is to be prepared and submitted for approval.
1. 6. 5 These SCFs are also to include the documentation and plans as listed in [Pt 3, Ch 1, 5.3 Plans to be supplied to the ship](#), where not already required by the CSR or *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations Part A-1 - Structure of ships Regulation 3-10 – Goal-based ship construction standards for bulk carriers and oil tankers*.
1. 6. 6 In all cases, as required by the CSR, *Pt 1, Ch 13 Ship in Operation - Renewal Criteria*, the mid-ship section plan to be supplied on board the ship is to include the minimum required hull girder sectional properties. Sectional properties are to be provided for transverse sections within the cargo length, i.e. each cargo hold, and are to include:

- sectional properties as defined in CSR, *Pt 1, Ch 5, 1 Strength Characteristics of Hull Girder Transverse Sections*;
- the defined section modulus at Deck and at Bottom calculated with the gross offered thickness;
- the sectional area of the defined Deck and Bottom Zones calculated with the gross offered thickness; and
- the sectional area of the defined Neutral Axis Zone calculated with the gross offered thickness minus 0.5  $t_c$ .

## 1. 7 Information required for non-CSR bulk carriers

1. 7. 1 In addition to the information and plans required by [Pt 3, Ch 1, 5 Information required](#), the following are to be submitted:
  - Cargo loadings on decks, hatchways and inner bottom if these are to be in excess of Rule, *See Pt 3, Ch 3, 5 Design loading*.
  - The maximum pressure head in service on tanks, also details of any double bottom tanks interconnected with hopper and topside tanks.
  - Details of the proposed depths of any partial fillings where water ballast or liquid cargo is intended to be carried in the holds.
  - Details of loading arrangements where combinations of empty and loaded holds are envisaged, and where it is the intention to load fully any two adjoining holds with adjacent holds empty in sea-going or short voyage conditions.
1. 7. 2 Additional information required for bulk carriers of length,  $L$ , 150 m or above:
  - The bulk cargo density to be used in the design homogeneous loading condition at scantling draught with all holds, including hatchways, being 100 per cent full.
  - The maximum bulk cargo density the ship is designed to carry.
  - The maximum bulk cargo weight to be carried in each hold.
  - Tables or curves indicating the change of cargo hold volume as a function of height above moulded baseline.

## 1. 8 Symbols and definitions

1. 8. 1 The following symbols and definitions are applicable to this chapter unless otherwise stated:  $L$ ,  $B$ ,  $D$ ,  $T$  as defined in [Pt 3, Ch 1, 6 Definitions](#)
  - $k_L, k$  = higher tensile steel factor, *See Pt 3, Ch 2, 1 Materials of construction*
  - $l$  = overall length of stiffening member, in metres, *See Pt 3, Ch 3, 3 Structural idealisation*
  - $l_e$  = effective length of stiffening member, in metres, *See Pt 3, Ch 3, 3 Structural idealisation*
  - $s$  = spacing of secondary stiffeners, in mm
  - $t$  = thickness of plating, in mm

- $C$  = stowage rate, in m<sup>3</sup>/tonne, as defined in [Pt 3, Ch 3, 5 Design loading](#)  
 $I$  = inertia of stiffening member, in cm<sup>4</sup>, See [Pt 3, Ch 3, 3 Structural idealisation](#)  
 $M_H$  = the actual cargo mass in a cargo hold corresponding to a homogenously loaded condition at maximum draught  
 $M_{Full}$  = the cargo mass in a cargo hold corresponding to cargo with virtual density (homogenous mass/hold cubic capacity, minimum 1.0 tonne/m<sup>3</sup>) filled to the top of the hatch coaming.  $M_{Full}$  is in no case to be less than  $M_H$   
 $M_{HD}$  = the maximum cargo mass allowed to be carried in a cargo hold according to design Loading conditions with specified holds empty at maximum draught  
 $R$  =  $\sin \theta$   
 $S$  = spacing, or mean spacing, of primary members, in metres  
 $Z$  = section modulus of stiffening member, in cm<sup>3</sup>, See [Pt 3, Ch 3, 3 Structural idealisation](#)  
 $\rho$  = relative density (specific gravity) of liquid carried in a tank, and is not to be taken less than 1.025  
 $\theta$  = roll angle, in degrees  
 $\sin \theta$  =  $\left(0.45 + 0.1 \frac{L}{B}\right) \left(0.54 - \frac{L}{1270}\right)$

## **2. 1 Materials and grades of steel**

2. 1. 1 Materials and grades of steel are to comply with the requirements of [Pt 3, Ch 2 Materials](#).

## **2. 2 Protection of steelwork**

2. 2. 1 For the protection of steelwork, in addition to the requirements specified in [Pt 4, Ch 1, 2 Materials and protection](#) and [Pt 3, Ch 2, 3 Corrosion protection](#) the requirements of [Pt 4, Ch 7, 2.2 Protection of steelwork 2.2.2](#) are to be complied with.
2. 2. 2 All internal and external surfaces of hatch coamings and hatch covers, and all internal surfaces of the cargo holds, except where excluded below, are to have an efficient protective coating (epoxy coating or equivalent) applied in accordance with the manufacturer's recommendations. In the selection of coating, due consideration is to be given to the intended cargo conditions in service. Areas which may remain uncoated are:
- The inner bottom plating.
  - The hopper tank sloping plating between the intersection with the inner bottom plating and a line approximately 300 mm below the toe of the side shell frame end brackets.
2. 2. 3 For the notation '**strengthened for regular discharge by heavy grabs**', See [Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground](#).

## CHAPTER 7 Bulk Carriers

## SECTION 3 Longitudinal strength

## 3.1 General

- 3.1.1 Longitudinal strength calculations are to be made in accordance with the requirements given in [Pt 3, Ch 4 Longitudinal Strength](#) and [Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.9](#) and [Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.10](#) where appropriate.
- 3.1.2 Longitudinal strength calculations for the flooded conditions defined in [Pt 4, Ch 7, 3.2, Hull vertical bending stresses for flooded conditions](#) to [Pt 4, Ch 7, 3.4 Flooded conditions](#) are to be applied for bulk carriers which satisfy all of the following criteria:
- Single skin construction, or double skin construction where any part of the longitudinal bulkhead is located within  $B/5$  or 11.5 m, whichever is less, inboard from the ship's side at right angles to the centreline at the assigned summer load line.
  - Length,  $L$ , of 150 m or above.
  - Intended for the carriage of cargoes having bulk densities of 1.0 tonne/m<sup>3</sup> or above.

## 3.2 Hull vertical bending stresses for flooded conditions

- 3.2.1 The maximum hull vertical bending stresses in the flooded condition at deck,  $\sigma_{Df}$ , and keel,  $\sigma_{Bf}$ , for use in [Pt 3, Ch 4 Longitudinal Strength](#) are given by the following, using the appropriate combination of bending moments to give sagging and hogging stresses:

$$\sigma_{Df} = \frac{|M_{sf} + 0.8M_w| \times 10^{-3}}{Z_D} \text{ N/mm}^2$$

$$\sigma_{Bf} = \frac{|M_{sf} + 0.8M_w| \times 10^{-3}}{Z_B} \text{ N/mm}^2$$

Where

- $M_{sf}$  = maximum still water bending moment in the flooded condition, in kN m, at the section under consideration, See [Pt 4, Ch 7, 3.4 Flooded conditions](#)
- $M_w$  = design hull vertical wave bending moment, in kN m, as defined in [Pt 3, Ch 4, 5 Hull bending strength](#) at the section under consideration
- $Z_D$ ,  $Z_B$  = actual hull section moduli, in m<sup>3</sup>, at strength deck and keel respectively, at the section under consideration.

- 3.2.2 The maximum values of  $\sigma_{Df}$  and  $\sigma_{Bf}$  are to be used in [Pt 3, Ch 4 Longitudinal Strength](#).

### 3.3 Shear stresses for flooded conditions

- 3.3.1 The shear stress,  $\tau_{Af}$ , in the flooded condition to be used in [Pt 3, Ch 4, 6 Hull shear strength](#), is to be taken as:

$$\tau_{Af} = 100Az \frac{|Q_{sf}| + 0.8Q_w}{I\delta_i} \text{ N/mm}^2$$

Where

- $Az$  = the first moment, in  $\text{cm}^3$ , about the neutral axis, of the area of the effective longitudinal members between the vertical level under consideration and the vertical extremity of the effective longitudinal members, taken at the section under consideration
- $Q_{sf}$  = maximum hull still water shear force, in kN, in the flooded condition at the section under consideration
- $Q_w$  = design hull wave shear force, in kN, as defined in [Pt 3, Ch 4, 6.3 Design wave shear force](#) at the section under consideration
- $I$  = moment of inertia of the hull about the horizontal neutral axis, in  $\text{cm}^4$ , at the longitudinal section under consideration
- $\delta_i$  = defined in [Pt 3, Ch 4, 6.5 Permissible still water shear force](#).

### 3.4 Flooded conditions

- 3.4.1 For the relevant loading conditions specified in [Pt 3, Ch 4, 5.3, Design still water bending moments](#) and [Pt 3, Ch 4, 5.4, Minimum hull section modulus](#), each cargo hold is to be considered individually flooded up to the equilibrium waterline. The shear forces and still water bending moments are to be calculated for the most severe flooded conditions which will significantly load the ship's structure. Harbour conditions, docking conditions afloat, loading and unloading transitory conditions in port and loading conditions encountered during ballast water exchange need not be considered.
- 3.4.2 In calculating the weight of ingressed water into the cargo hold under consideration, the permeabilities and bulk densities given in [Table 7.3.1: Permeability and bulk density factors](#) are to be used.

**Table 7.3.1: Permeability and bulk density factors**

| Hold condition                                     | Permeability<br>(See Note 1) | Bulk density<br>(tonne/m <sup>3</sup> ) |
|--|------------------------------|---|
| Empty cargo space                                  | 0.95                         | -                                       |
| Volume left in loaded cargo spaces above any cargo | 0.95                         | -                                       |
| Iron ore cargo                                     | 0.3(See Note 2)              | 3.0                                     |
| Cement   | 0.3(See Note 2)              | 1.3                                     |

**Note 1.** Bulk cargo permeability is defined as the ratio of the voids within the cargo mass to the volume occupied by the cargo.

**Note 2.** More specific information relating to the bulk cargo may be used where available, but permeabilities are not to be less than those given above.

**Note 3.** For packed cargo, the actual density of the cargo is to be used with a permeability of zero.

3. 4. 3 In calculating the strength of the ship's structure in the flooded condition it is to be assumed that the ship's structure will remain fully effective in resisting the applied loads.

**4. 1 General**

- 4. 1. 1 Longitudinal framing is, in general, to be adopted outside line of openings. The arrangement of structure between hatches is to be such as to ensure continuity of the main deck structure to resist athwartship forces, and transverse stiffening is to be arranged. For and aft knuckles in cross deck strip plating between hatches should be arranged close to longitudinal girders or supported by brackets.
- 4. 1. 2 In the case of large bulk carriers with narrow deck strips between hatchways, or where it is the intention to load any two adjoining holds with adjacent holds fully empty for a sea-going condition or for bulk carriers to be classed 'any hold may be empty', the cross deck scantlings will be specially considered.
- 4. 1. 3 The requirements of [Pt 4, Ch 1, 4 Deck structure](#) are to be applied, together with the requirements of this Section.
- 4. 1. 4 The *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG), indicates recommended structural design configurations in critical areas, for the deck structure outside the line of openings and between hatches.

**4. 2 Deck plating**

- 4. 2. 1 Where the difference between the thickness of plating inside and outside the line of main hatches exceeds 12 mm, a transitional plate of thickness equivalent to the mean of the adjacent plate thicknesses is to be fitted. The plate thickness outside the line of hatches is to be continued inboard between hatches beyond the end of the hatch corner curvature, to ensure that the chamfered plating is clear of the corner tangent point.

**4. 3 Main cargo hatchway openings**

- 4. 3. 1 The following requirements apply to bulk carriers with vertically corrugated transverse bulkheads in cargo holds having one or more of the following characteristics:

$$a. \quad B \geq 40 \text{ m}$$

$$b. \quad \frac{b}{w} \geq 2.2$$

$b$  = breadth of deck opening

$w$  = width of cross deck strip

$B$  = moulded breadth of ship

- c. A structural arrangement where the hatch side coaming and deck opening are arranged inboard of the topside tank.
  - d. All bulk carriers to be classed **100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP**.
- 4. 3. 2 The corners of main cargo hatchways in the strength deck are to be rounded with a radius not less than  $\frac{1}{20}$  of the breadth of the opening, with a maximum radius of 1000 mm.
- 4. 3. 3 Insert plates are to be fitted at the corners having a thickness not less than 25 per cent greater than the adjacent deck thickness outside the line of openings, with a minimum increase of 5 mm, *See also [Pt 4, Ch 7, 4.3 Main cargo hatchway openings 4.3.4](#)*.  
The corner inserts are to be extended transversely into the cross deck plating for a minimum distance equal to  $0.075b$ , where  $b$ , is the breadth of deck opening.
- 4. 3. 4 For the extreme corners of the end hatchways of the cargo region furthest from amidships the thickness of the corner insert plates is to be not less than 60 per cent greater than the adjacent deck thickness outside the line of openings.

## 4. 4 Deck supporting structure

- 4. 4. 1 For the scantlings of deck longitudinals and transverses in way of topside tanks, *See [Pt 4, Ch 7, 7.4 Shell and deck structure](#) and [Pt 4, Ch 7, 7.5 Primary supporting structure](#)*, respectively.

# 4

## CHAPTER 7 Bulk Carriers

### SECTION 5 Shell envelope plating

#### 5.1 General

- 5.1.1 Longitudinal framing is, in general, to be adopted at the bottom, but special consideration will be given to proposals for transverse framing in this region. The side shell may be longitudinally or transversely framed.
- 5.1.2 The requirements of [Pt 4, Ch 1, 5 Shell envelope plating](#) are to be applied together with the requirements of this Section.

#### 5.2 Bottom shell

- 5.2.1 The thickness of the bottom shell plating below loaded holds may be required to be increased for local strength considerations.

#### 5.3 Side shell

- 5.3.1 The thickness of the side shell plating may be required to be increased for shear forces to satisfy the requirements of [Pt 4, Ch 7, 3.2 Hull vertical bending stresses for flooded conditions 3.2.1](#).
- 5.3.2 The thickness of the side shell plating located between the hopper and topside tanks of single skin bulk carriers is to be not less than:

$$t = \sqrt{L} \text{ mm}$$

**6.1 Longitudinal stiffening**

- 6.1.1 Side frames of all single skin bulk carriers with a hopper are to comply with [Pt 4, Ch 7, 6.2, Transverse stiffening](#) and [Pt 4, Ch 7, 6.3 Primary supporting structure](#).
- 6.1.2 Side frames and end brackets of all double skin bulk carriers are to comply with [Pt 4, Ch 1, 6 Shell envelope framing](#).
- 6.1.3 Side frames and end brackets of other structural configurations will be specially considered.
- 6.1.4 The end connections for the longitudinal stiffening are to satisfy the requirements of [Pt 3, Ch 10, 3 Secondary member end connections](#), *See also* [Pt 4, Ch 7, 7.6 Structural details 7.6.1](#) and [Pt 4, Ch 7, 9.7 Structural details 9.7.1](#).
- 6.1.5 The arrangements at the intersections of continuous secondary and primary members are to satisfy the requirements of [Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members](#) and [Pt 4, Ch 1, 6.2, Longitudinal stiffening](#).

**6.2 Transverse stiffening**

- 6.2.1 The modulus and inertia of main and topside tank frames in the midship region are to comply with the requirements given in [Table 7. 6. 1: Shell framing](#). Arrangements of main frames in holds in association with web frames are not recommended in view of the vulnerability to cargo handling damage. Where such web frames are proposed the arrangements and scantlings will be specially considered.
- 6.2.2 Main frames in the cargo and ballast holds are to have a web thickness not less than:
  - a. In general:
 
$$t_{\min} = 7 + 0.03L \text{ mm,}$$
 or 13 mm whichever is the lesser
  - b. In the foremost hold:
 
$$t_{\min} = 1.15(7 + 0.03L) \text{ mm,}$$
 or 15 mm whichever is the lesser
 where  $L$  is the Rule length, in metres.
- 6.2.3 The web depth to thickness ratio of the frames is not to be greater than:
 
$$60\sqrt{k}, \text{ for symmetric sections}$$

$$50\sqrt{k}, \text{ for asymmetric sections}$$
 The breadth to thickness ratio of the flange outstand is not to be greater than:
 
$$10\sqrt{k}$$

6.2.4 The upper and lower end brackets of the main frames in the cargo and ballast holds are to satisfy the requirements of [Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.5](#) to [Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.14](#) inclusive, based on the mild steel section modulus  $Z$  in  $\text{cm}^3$ , derived from [Table 7.6.1: Shell framing](#), or the equivalent mild steel section modulus for higher tensile steel frames.

6.2.5 The lengths of the arms of the brackets, measured as shown in [Figure 7.6.1: Diagrammatic arrangement of end brackets](#), are not to be less than:

a. Frame connection to hopper tank.

Athwartship arm:

$$\text{Dry cargo hold } l_a = 32.43\sqrt{Z} \text{ mm}$$

$$\text{Ballast hold } l_a = 32.43(\sqrt{Z} - 7.5) \text{ mm}$$

Vertical arm:

$$\text{Dry cargo hold } l_v = 27.6\sqrt{Z} \text{ mm}$$

$$\text{Ballast hold } l_v = 27.6(\sqrt{Z} - 9.0) \text{ mm}$$

b. Frame connection to topside tank

Athwartship arm:

$$\text{Dry cargo hold } l_a = 30.0\sqrt{Z} \text{ mm}$$

$$\text{Ballast hold } l_a = 30.0(\sqrt{Z} - 9.0) \text{ mm}$$

Vertical arm:

$$\text{Dry cargo hold } l_v = 26.85\sqrt{Z} \text{ mm}$$

$$\text{Ballast hold } l_v = 26.85(\sqrt{Z} - 11.0) \text{ mm}$$

In no case are the bracket arm lengths to be taken less than  $0.125H$ , where  $H$  is as defined in [Table 7.6.1: Shell framing](#).

**Table 7.6.1: Shell framing**

| Location  | Modulus, in $\text{cm}^3$   | Inertia, in $\text{cm}^4$ |
|---|---|---------------------------|
| (1) Main frames in dry cargo holds                    | $Z = 3.50skh_T H^2 \times 10^{-3}$  | $I = \frac{3.2}{k} HZ$    |
| (2) Main frames in cargo holds used for water ballast | The greater of the following:<br><br>(a) $Z = 1.15 \times$ modulus given in (1)<br><br>(b) $Z = 6.7skh_4 H^2 \times 10^{-3}$  | $I = \frac{3.2}{k} HZ$    |
| (3) Transverse frames in topside wing tanks           | The greater of the following:<br><br>(a) $1.15 \times Z$ as given in location (1) of <a href="#">Table 1.6.3: Shell framing (transverse)</a><br><br>(b) As required by <a href="#">Pt 4, Ch 7, 7.3 Bulkhead stiffeners 7.3.1</a> for the sloped bulkhead stiffeners | $I = \frac{3.2}{k} HZ$    |

| Symbols   |
|---|
| $D, T, s, k$ = as defined in <a href="#">Pt 4, Ch 7, 1.7 Information required for non-CSR bulk carriers 1.7.1</a>   |
| $h_{T1}$ = head, in metres, at middle of $H$<br>$= C_W \left(1 - \frac{h_6}{D-T}\right) F_\lambda$ in metres, for frames where the mid-length of frame is above the summer load waterline,<br>$= \left(1 - \frac{h_6}{D-T}\right)$ is not to be taken less than 0.7<br>$= (h_6 + C_W \left(1 - \frac{h_6}{2T}\right))' (F_\lambda)$ in metres, where the mid-length of frame is below the summer load waterline |
| $h_4$ = head, in metres, measured from the middle of $H$ to the deck at side, or half the distance from the middle of $H$ to the top of the overflow, whichever is greater.   |
| $h_6$ = vertical distance in metres, from the summer load waterline at draught $T$ to the mid-length of $H$   |
| $C_w$ = a wave head, in metres<br>$= 7.71 \times 10^{-2} e^{-0.0044L}$<br>= where $e$ = base of natural logarithms 2.7183   |
| $F_\lambda$ = 1.0 for $L \leq 200$ m<br>$= (1.0 + 0.0023(L - 200))$ for $L > 200$ m   |
| $H$ = length overall of frame, in metres, but is to be taken not less than 2.5 m  |

6. 2. 6 The section modulus of the frame and bracket or integral bracket, and associated shell plating at the location marked  $Z_a$  in [Figure 7. 6. 1: Diagrammatic arrangement of end brackets](#) is to be not less than  $2.0Z$ .

In addition, the minimum depth of the frame and bracket or integral bracket at the location indicated in [Figure 7. 6. 1: Diagrammatic arrangement of end brackets](#) is to be not less than  $1.5d$ .

6. 2. 7 The upper and lower integral or separate brackets are to have a web thickness not less than the as built web thickness of the side frame. In addition, the lower bracket thickness is to be not less than:

$$t = t_{\min} + 2 \text{ mm, where } t_{\min} \text{ is derived from } \text{Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.2}$$

The toes of the brackets are to be designed to avoid notch effects by making the upper and lower toes concave or otherwise tapering them off, *See also* [Pt 3, Ch 10, 5.1 Continuity and alignment 5.1.7](#).

6. 2. 8 Except as indicated in [Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.9](#), frames are to be fabricated symmetrical sections with integral upper and lower brackets.

The side frame face plate is to be curved (not knuckled) at the connection with the end brackets. The radius of curvature,  $r$ , is to be not less than:

$$r = \frac{0.4b_{2f}}{t_f} \text{ mm}$$

Where

$$b_f = \text{breadth of the bracket face plate, in mm}$$

$t_f$  = thickness of the bracket face plate, in mm

The brackets are to be arranged with soft toes and the frame section face bar tapered symmetrically to the toes with a taper rate not exceeding 1 in 3. Where the free edge of the bracket is hollowed out, it is to be stiffened or increased in size to ensure that the section modulus of the bracket through the throat is not less than that of the required straight edged bracket.

6. 2. 9 In ships of length,  $L$ , less than 190 m, mild steel fabricated frames may be asymmetric and fitted with separate brackets. Brackets are to be arranged with soft toes. The free edges of the brackets are to be stiffened as follows:
- a. Where a flange is fitted, its breadth,  $b_f$ , is to be not less than:

$$b_f = 40 \left( 1 + \frac{Z}{1000} \right) \text{ mm}$$

or 50 mm, whichever is the greater

The flange is to be tapered at the ends with a taper rate not exceeding 1 in 3.

- b. Where the edge is stiffened by a welded face flat, the cross-sectional area of the face flat is to be not less than:
- $0.009b_ft$  cm<sup>2</sup> for offset edge stiffening
  - $0.014b_ft$  cm<sup>2</sup> for symmetrically placed stiffening

Where

$t$  = web thickness of bracket, in mm

- c. The face plate is to be tapered at the ends with a taper rate not exceeding 1 in 3.
6. 2. 10 For mild steel construction with separate brackets where the frames are lapped on to the bracket, the length of the overlap is to be adequate to provide for the required area of welding to achieve equivalent strength.
6. 2. 11 Double continuous welding is to be adopted for the connections of frames and brackets to side shell, hopper and topside tank plating and web to face plates. For this purpose, the following weld factors are to be adopted:
- 0.44 in Zone 'a' and
  - 0.40 in Zone 'b', See [Figure 7. 6. 1: Diagrammatic arrangement of end brackets](#).

Where the hull form is such that an effective fillet weld cannot be made, edge preparation of the web of the frame and bracket may be required, in order to ensure the required efficiency of the weld connection.

Figure 7. 6. 1: Diagrammatic arrangement of end brackets

6. 2. 12 Continuity of the frames is to be maintained by supporting brackets, See [Figure 7. 6. 2: Supporting brackets in topside and hopper tanks](#), in the topside and hopper tanks. The design of end connections and their supporting structure is to be such as to provide adequate resistance to rotation and displacement of the joint. For this purpose, in the hopper and topside tanks, the thickness of the supporting brackets (which must align with the hold main frame brackets) is to be not less than the following:
- Lower brackets (in hopper tank):
 
$$t = t_{\min} + 0.5 \text{ mm, where } t_{\min} \text{ is derived from } \text{Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.2 or}$$

$$t = 9.0 \text{ mm}$$

whichever is the greater.

b. Upper brackets (in topside tank):

$t = t_{\min}$ , where  $t_{\min}$  is derived from [Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.2](#) or

$t = 9.0 \text{ mm}$

whichever is the greater.

The size and arrangement of stiffening of the supporting brackets will be specially considered. Where the toe of the hold frame bracket is situated on or in close proximity to the first longitudinal from the shell of the hopper or topside tank sloped bulkheads, the supporting brackets are to be extended to the next longitudinal. This extension is to be achieved by enlarging the supporting bracket or by fitting an intercostal flat bar stiffener the same depth as the longitudinal and connected to the webs of the longitudinals.

**Figure 7. 6. 2: Supporting brackets in topside and hopper tanks**

6. 2. 13 The requirements are to be maintained throughout the cargo hold region. However, in the forward and aft cargo holds where the shape becomes finer because of the ship form, increased requirements may be necessary and each case will be specially considered.
6. 2. 14 In way of the foremost hold, side frames of asymmetric section are to be effectively supported by intercostal brackets, See [Figure 7. 6. 3: Typical arrangement of intercostal brackets supporting asymmetric side shell frames in No. 1 hold.](#)

**Figure 7. 6. 3: Typical arrangement of intercostal brackets supporting asymmetric side shell frames in No. 1 hold**

6. 2. 15 The hold side shell frame adjacent to the collision bulkhead is to be suitably strengthened. As an alternative, at least two supporting structures are to be fitted which align with the forepeak stringers or flats, See [Figure 7. 6. 4: Hold frame supporting structures at fore end of No. 1 cargo hold](#). The supporting structures are to have adequate cross-sectional shear resisting area at their connections to the hold frame.
6. 2. 16 Detail design guidelines for connection of side shell frames to hopper and topside tank plating are shown in the *ACSPlus FDA Guideline, Structural Detail Design Guide (SDDG)*.

### 6. 3 Primary supporting structure

6. 3. 1 For the requirements for primary supporting structure, See [Pt 4, Ch 7, 7.5 Primary supporting structure](#) and [Pt 4, Ch 7, 9.6 Primary supporting structure](#).

**Figure 7. 6. 4: Hold frame supporting structures at fore end of No. 1 cargo hold**

## CHAPTER 7 Bulk Carriers

## SECTION 7 Topside tank structure

## 7.1 General

- 7.1.1 Requirements are given in this Section for longitudinal or transverse framing in the topside tank, but, in general, the deck is to be longitudinally framed. The sloped bulkhead is to be of plane construction with the associated stiffening arranged inside or outside the tank.
- 7.1.2 The buckling requirements of [Pt 3, Ch 4, 7 Hull buckling strength](#) are also to be satisfied.
- 7.1.3 Recommended examples of structural design configurations around the transverse ring web of the topside tank can be Seen in the *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG).

## 7.2 Bulkhead plating

- 7.2.1 The thickness of the sloped bulkhead, tank end bulkhead, and diaphragm, if fitted, is to be the greater of the following:
  - a. For watertight bulkheads, the thickness,  $t$ , as derived from in [Pt 4, Ch 1 General Cargo Ships](#) for a deep tank bulkhead using a head,  $h_4$ , in metres, determined as follows:

$$h_4 = h_0 \cos \theta + R b_1 \text{ or}$$

= the greater of the distance from a point one-third of the height of the plate above its lower edge to the top of the tank, or half the distance to the top of the overflow

whichever is the greater, or

- b.  $t = 7.5\text{mm}$

In no case, however, is the thickness of the sloped bulkhead and diaphragm to be taken less than:

- i.  $t = 0.012s$  mm, or

$$t = 0.012s \sqrt{\frac{F_D}{k_D}} \text{ mm}$$

whichever is the greater

Where

$k_D$  = the higher tensile steel factor equal to  $k_L$  value for deck material

$F_D$  = as defined in [Pt 3, Ch 4, 5.7 Local reduction factors](#)

$R$  = as defined in [Pt 4, Ch 7, 1.8 Symbols and definitions 1.8.1](#)

$h_0$  = the vertical distance, in metres, from a point one third of the height of the plate from the lower edge to the highest point of the tank excluding hatchway

$b_1$  = the larger horizontal distance, in metres, from the tank corner at top of tank either side to point of plate under consideration.

- 7.2.2 The thickness of the top strake of the sloped bulkhead, including the vertical plate attached to deck, may be required to be increased to form an effective girder below the deck. In general, this plate is to be not less in thickness than 60 per cent of the thickness of the deck plate outside the line of openings nor less than:

a.  $t = 0.018s$  mm, or

b.  $t = 0.018s \sqrt{\frac{F_0}{k_D}}$  mm

whichever is the greater.

- 7.2.3 The thickness of the transverse wash bulkhead, where fitted, is to be not less than:

$t = 0.012s$  mm or 7.5 mm

= whichever is the greater.

### 7.3 Bulkhead stiffeners

- 7.3.1 The section modulus of longitudinal or transverse stiffeners on the sloped bulkhead or watertight diaphragms, if fitted, is to be not less than:

$$Z = 0.01skh_4l_e^2 \text{ cm}^3$$

Where

$$h_4 = h_0 \cos \theta + Rb_1$$

= the greater of the distance, in metres, from the middle of the effective length to the top of the tank, or half the distance to the top of the overflow, or

= 1.5 m

= whichever is the greatest

$R$  = as defined in [Pt 4, Ch 7, 1.7 Information required for non-CSR bulk carriers 1.7.1](#)

$h_0$  = the vertical distance, in metres, from the mid-point of span of the stiffener to the highest point of the tank excluding hatchway

$b_1$  = the larger horizontal distance, in metres, from the tank corner at top of tank, either side to midpoint of span.

- 7.3.2 Where the bulkhead stiffening is fitted on the hold side of the sloped bulkhead, suitable arrangements are to be made to prevent tripping.
- 7.3.3 The scantlings of stiffeners on tank end bulkheads are to be not less than those given in [Table 1.9.1: Watertight and deep tank bulkhead scantlings](#) of [Pt 4, Ch 1 General Cargo Ships](#) for deep tanks, using  $h$  as defined in [Pt 4, Ch 7, 7.3 Bulkhead stiffeners 7.3.1](#).
- 7.3.4 The section modulus of stiffeners of non-watertight fore and aft diaphragms, or transverse wash bulkheads is to be not less than 50 per cent of that required by [Pt 4, Ch 7, 7.3 Bulkhead stiffeners 7.3.3](#). The stiffeners are to be bracketed at both ends.
- 7.3.5 Tank end bulkheads are generally to be in line with the main hold bulkheads.

## 7.4 Shell and deck structure

- 7.4.1 The scantlings of shell and deck longitudinals are to comply with [Pt 4, Ch 7, 7.3 Bulkhead stiffeners 7.3.1](#). The scantlings must also satisfy the requirements of [Pt 4, Ch 1 General Cargo Ships](#), *See also* [Pt 4, Ch 7, 7.6 Structural details 7.6.1](#).
- 7.4.2 The scantlings of side shell frames are to comply with [Pt 4, Ch 7, 6.2, Transverse stiffening](#).

## 7.5 Primary supporting structure

- 7.5.1 The section modulus and inertia of deck, shell and bulkhead transverses or stringers are to be not less than:

$$Z = 7.5kShl_e^2 \text{ cm}^3$$

$$I = \frac{2.5}{k} l_e Z \text{ cm}^4$$

using  $h$  as defined in [Pt 4, Ch 7, 7.3 Bulkhead stiffeners 7.3.1](#). The scantlings of shell and deck members must also satisfy the requirements of [Pt 4, Ch 1 General Cargo Ships](#) for dry cargo holds.

- 7.5.2 Primary transverse members are, in general, to be spaced not more than 3.8 m apart where the length,  $L$ , is 100 m or less, and  $(0.006L + 3.2)$  m apart for lengths greater than 100 m.
- 7.5.3 Transverses are to be arranged in line with the primary structure at ends of hatchways, or equivalent scarfing arranged. Where the sloped bulkhead or side shell is transversely framed, arrangements are to be made to ensure effective continuity at the ends of the deck transverse.
- 7.5.4 Where non-watertight transverse diaphragms are arranged instead of open transverses, the thickness of plating is to be in accordance with [Pt 4, Ch 7, 7.2 Bulkhead plating 7.2.3](#). The diaphragms are to be efficiently stiffened.

## 7.6 Structural details

- 7.6.1 Bracket/diaphragm connections at the bottom of the topside tank are to be of sufficient size and thickness to provide effective rigidity, and care is to be taken to ensure alignment with brackets at the heads of the side frames in the holds, *See also* [Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.12](#). The shell and sloped bulkhead longitudinals supporting the diaphragms are to be derived using the span taken between transverses.
- 7.6.2 For ships where  $L \geq 300$  m a fore and aft diaphragm extending vertically from the deck to the sloping plating of the topside tank is to be arranged at about the half-width of the tank.
- 7.6.3 Where longitudinal framing is fitted to the side shell, a bracket may be required in way of a rounded gunwale, approximately halfway between transverses and extending to the adjacent shell and deck longitudinal.

## CHAPTER 7 Bulk Carriers

## SECTION 8 Double bottom structure

## 8.1 General

- 8.1.1 The double bottom is, in general, to be longitudinally framed, but special consideration will be given to proposals for a transverse framing system.
- 8.1.2 The requirements of [Pt 4, Ch 1, 8 Double bottom structure](#) are to be applied, together with the requirements of this Section, *See also* [Pt 4, Ch 7, 2.2 Protection of steelwork 2.2.3](#).
- 8.1.3 Where the double bottom tanks are interconnected with double skin side tanks or combined hopper and top-side tanks, the double bottom scantlings are also to satisfy the requirements of [Table 7.8.1: Strengthening for heavy cargo requirements](#) (3)(c), (3)(d), (4)(c) and (4)(d) for ballast holds and (3)(c) and (4)(c) in way of dry cargo holds, *See also* [Pt 4, Ch 1, 6.2, Longitudinal stiffening](#).
- 8.1.4 The requirements given in [Pt 4, Ch 7, 8.8, Allowable hold loading in the flooded condition](#) are to be applied to bulk carriers which satisfy the following criteria:
- Single skin construction, or double skin construction where any part of the longitudinal bulkhead is located within B/5 or 11.5 m, whichever is less, inboard from the ship's side at right angles to the centreline at the assigned summer load line.
  - Length,  $L$ , of 150 m or above.
  - Intended for the carriage of cargoes having bulk densities of 1.0 tonne/m<sup>3</sup> or above.
- 8.1.5 For all bulk carriers where bulk cargoes are discharged by grabs the maximum recommended unladen weight of the grab corresponding to the approved inner bottom plating thickness is to be calculated using the following formulae:

$$P = \left(\frac{s}{k}\right)^2 \frac{10^d}{1.775} \text{ tonnes}$$

Where

$$d = \frac{40.875(t - 1.5)\sqrt{k} + 344.5}{s} - 5.7633$$

$P$  = unladen grab weight, in tonnes

$s$  = spacing of inner bottom longitudinal, in mm

$k$  = higher tensile steel factor as defined in [Pt 4, Ch 7, 1.8 Symbols and definitions 1.8.1](#)

$t$  = thickness of inner bottom plating, in mm

The maximum recommended unladen weight of the grab rounded up to the next tonne above, is to be recorded in the Loading Manual (*See also Pt 3, Ch 4, 8.2 Loading Manual 8.2.4.e*), and does not preclude the use of heavier grabs. It is intended as an indication to the Builders, Owners and operators of the increased risk of local damage and the possibility of accelerated diminution of the plating thickness if grabs heavier than this are used regularly to discharge cargo.

- 8.1.6 Detail design guidelines for stiffeners connecting inner bottom and bottom longitudinals are shown in the *ACSPlus FDA Guideline, Structural Detail Design Guide (SDDG)*.

**Table 7. 8. 1: Strengthening for heavy cargo requirements**

| Symbols   | Item                                 | Requirement  |
|---|--------------------------------------|--|
| $L, l_e, D, T, s, S, k, Z$ and $\lambda$ as defined in <a href="#">Pt 4, Ch 7, 1.8 Symbols and definitions 1.8.1</a><br>$C_1$ = a factor varying from 1.0 at $\frac{D}{2}$ to $\frac{75}{225-150F_B}$ at base line of ship  | (1) Double bottom plating            | The spacing of floors, generally, is not to exceed 2.5 m. Scantlings are to comply with the requirements of <a href="#">Pt 4, Ch 1, 8.5, Floors</a>  |
| $C$ = stowage rate, in m <sup>3</sup> /tonne, and is defined as the volume of the hold excluding the volume contained within the depth of the cargo hatchway divided by the weight of cargo stowed in the hold. The value is not to be taken greater than 0.865   | (2) Double bottom side girder        | The spacing of side girders, generally, is not to exceed 3.7 m. Scantlings are to comply with the requirements of <a href="#">Pt 4, Ch 1, 8.3., Girders</a>  |
| $F_B$ as defined in <a href="#">Pt 3, Ch 4, 1.8.1 Local reduction factors</a><br>$R$ and $\theta$ as defined in <a href="#">Pt 4, Ch 7, 1.8.1 Symbols and definitions 1.8.1</a><br>$H$ = height from tank top, position under consideration, to deck at side amidships, in metres   | (3) Inner bottom plating             | <p>The thickness of the inner bottom plating in the holds is to be not less than required by the greatest of the following:</p> <p>(a) <math>t = 0.00136(s + 660)\sqrt{k^2LT} + 5\text{mm}</math></p> <p>(b) <math>t = 0.00455s\sqrt{\frac{Hk}{c}}</math> mm, or</p> <p>(c) Where the double bottom tanks are interconnected with double skin side tanks or combined hopper and topside tanks the scantlings are also to satisfy the requirements for deep tanks in <a href="#">Table 1. 9. 1: Watertight and deep tank bulkhead scantlings</a> in Chapter 1, with the load head <math>h = h_0 \cos \theta + Rb_1</math> m</p> |
| $Y_1$ = distance from $\frac{D}{2}$ to tank top, in metres<br>$h_0$ = for plating and stiffeners the vertical distance, in metres, from the inner bottom to the highest point of the tank excluding hatchway<br>$b_1$ = the larger horizontal distance, in metres, from the tank corner at top of tank either side to the point of plate or stiffener under consideration | (4) In way of ballast holds the tank | <p>In way of ballast holds the scantlings are to satisfy the requirements for deep tanks in <a href="#">Table 1. 9. 1: Watertight and deep tank bulkhead scantlings</a> in <a href="#">Pt 4, Ch 1 General Cargo Ships</a>, with the load head <math>h</math> in metres, measured to the deck at centre. <i>See also Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground</i> if protection against heavy grabs is desired.</p>   |

|   |   |  |
|---|---|--|
|   | (4)<br>Inner<br>botto<br>m<br>longit<br>udina<br>ls<br><br>See<br>Notes<br>1 and<br>2 | <p>The section modulus of inner bottom longitudinals is to be not less than the greatest of the following:</p> <p>(a) <math>Z = 85</math> per cent of the Rule value for bottom longitudinals as given in <a href="#">Pt 4, Ch 1 General Cargo Ships</a>, or</p> <p>(b) <math>Z = \frac{0.0083s l_0^2 H C_1 k}{(1 - 0.233 \frac{Y_1}{D}) C} \text{ cm}^3</math> or</p> <p>(c) Where the double bottom tanks are interconnected with double skin side tanks or combined hopper and topside tanks <math>Z = 0.0073 s k h_4 l_c^2 \text{ cm}^3</math> where <math>h_4 = h_0 \cos \theta + R b_1</math> m. <math>Z</math> is not to be less than the requirements for deep tanks in <a href="#">Table 1.9.1: Watertight and deep tank bulkhead scantlings</a> in <a href="#">Pt 4, Ch 1 General Cargo Ships</a>, with the load head <math>h_4</math>, in metres, measured to the highest point of the topside tank, or side tank, or</p> <p>(d) In way of ballast holds the section modulus of the longitudinals is to be not less than required for deep tanks in <a href="#">Table 1.9.1: Watertight and deep tank bulkhead scantlings</a> in <a href="#">Pt 4, Ch 1 General Cargo Ships</a>, with the load head <math>h_4</math>, in metres, measured to the deck at centre</p> |
| <p><b>Note 1.</b> If plate girders are fitted alternatively with built or rolled sections, the section modulus as given in (4)(b) may be reduced by 10 per cent.</p> <p><b>Note 2.</b> Consideration will be given to the fitting of struts in way of double bottom tanks in ships with homogeneous loading. The arrangement and scantlings are, in general, to be confirmed by direct calculation.</p> <p><b>Note 3.</b> See also <a href="#">Pt 4, Ch 7, 8.1 General 8.1.5</a> for the maximum recommended unladen weight of the grab corresponding to the approved inner bottom plating thickness.</p> |   |  |

## 8.2 Carriage of heavy cargoes

- 8.2.1 When the notation 'strengthened for heavy cargoes' is to be assigned, the requirements of [Table 7.8.1: Strengthening for heavy cargo requirements](#) are to be complied with.

## 8.3 Carriage of heavy cargoes with specified or alternate holds empty

- 8.3.1 For ships strengthened for heavy cargoes and having a class notation permitting specified or alternate holds to be empty, the requirements of [Pt 4, Ch 7, 8.2 Carriage of heavy cargoes 8.2.1](#) are to be complied with. In addition the scantlings and arrangements of the primary structure are to be confirmed by additional calculations, See [Pt 4, Ch 7, 11.1 Application](#).

## 8.4 Ships to be classed '100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP'

- 8.4.1 For ships to be classed '100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP', the requirements of [Pt 4, Ch 7, 8.2 Carriage of heavy cargoes 8.2.1](#) and [Pt 4, Ch 7, 8.3 Carriage of heavy cargoes with specified or alternate holds empty 8.3.1](#) are to be complied

with. In addition the value for  $C$ , the stowage rate in  $\text{m}^3/\text{tonne}$ , as defined in [Table 7. 8. 1: Strengthening for heavy cargo requirements](#), is not be taken greater than 0.60 for each hold.

## 8. 5 Ballast ducts

8. 5. 1 Where ballast ducts are arranged in lieu of suction and/or filling pipes, the scantlings will be approved as suitable for a specified equivalent static head of water. This head must not be exceeded in service, and details of methods to ensure this are to be submitted. The continuity of the floors is to be maintained in way of the ducts.

## 8. 6 Structural details in way of double bottom tank and hopper tank knuckle

8. 6. 1 In all dry holds where the double bottom tank and hopper tank knuckle is of radiused construction and the floor spacing is 2.5 m or greater brackets shown as in [Figure 7. 8. 1: Intermediate brackets at knuckle](#) are to be arranged mid-length between floors in way of the intersection. The brackets are to be attached to the adjacent inner bottom and hopper longitudinals. The thickness of the brackets is to be in accordance with [Pt 4, Ch 1, 8.5 Floors 8.5.3](#) but need not exceed 15 mm. This requirement does not apply where the double bottom tank and hopper tank knuckle is of welded construction.

**Figure 7. 8. 1: Intermediate brackets at knuckle**

8. 6. 2 In way of floodable holds, two intermediate bracket arrangements, as shown in [Figure 7. 8. 1: Intermediate brackets at knuckle](#), are to be provided in all cases where the hopper to double bottom knuckle is radiused and are, in general, to be located at each frame space. Where the double bottom tank and hopper tank knuckle is of welded construction, a single intermediate bracket arrangement, as shown in [Figure 7. 8. 1: Intermediate brackets at knuckle](#), is to be provided only when the floor spacing is greater than 2.5 m.
8. 6. 3 The connections at the intersection are to be as follows:
- Where of welded construction the corner scallops in floors and transverses are to be omitted, or closed by welded collars where arranged for purposes of construction. In such cases to ensure satisfactory welding of the collars the radius of the scallops should not be less than 150 mm, See [Figure 7. 8. 2: Connection at intersection of double bottom and hopper](#). Alternatively the scallop may be retained on the hopper tank side provided gusset plates are arranged in line with the inner bottom plating, See [Figure 7. 8. 2: Connection at intersection of double bottom and hopper](#).

- b. Where of radiused construction the corner scallops are to be omitted, and full penetration welding is to be arranged locally for the connection to the inner bottom plating. The centre of the flange is not to be greater than 70 mm from the side girder, See [Figure 7. 8. 2: Connection at intersection of double bottom and hopper](#)
  - 8. 6. 4 Detail design guidelines for the connection of hopper tank sloping plating to inner bottom plating are shown in the *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG).

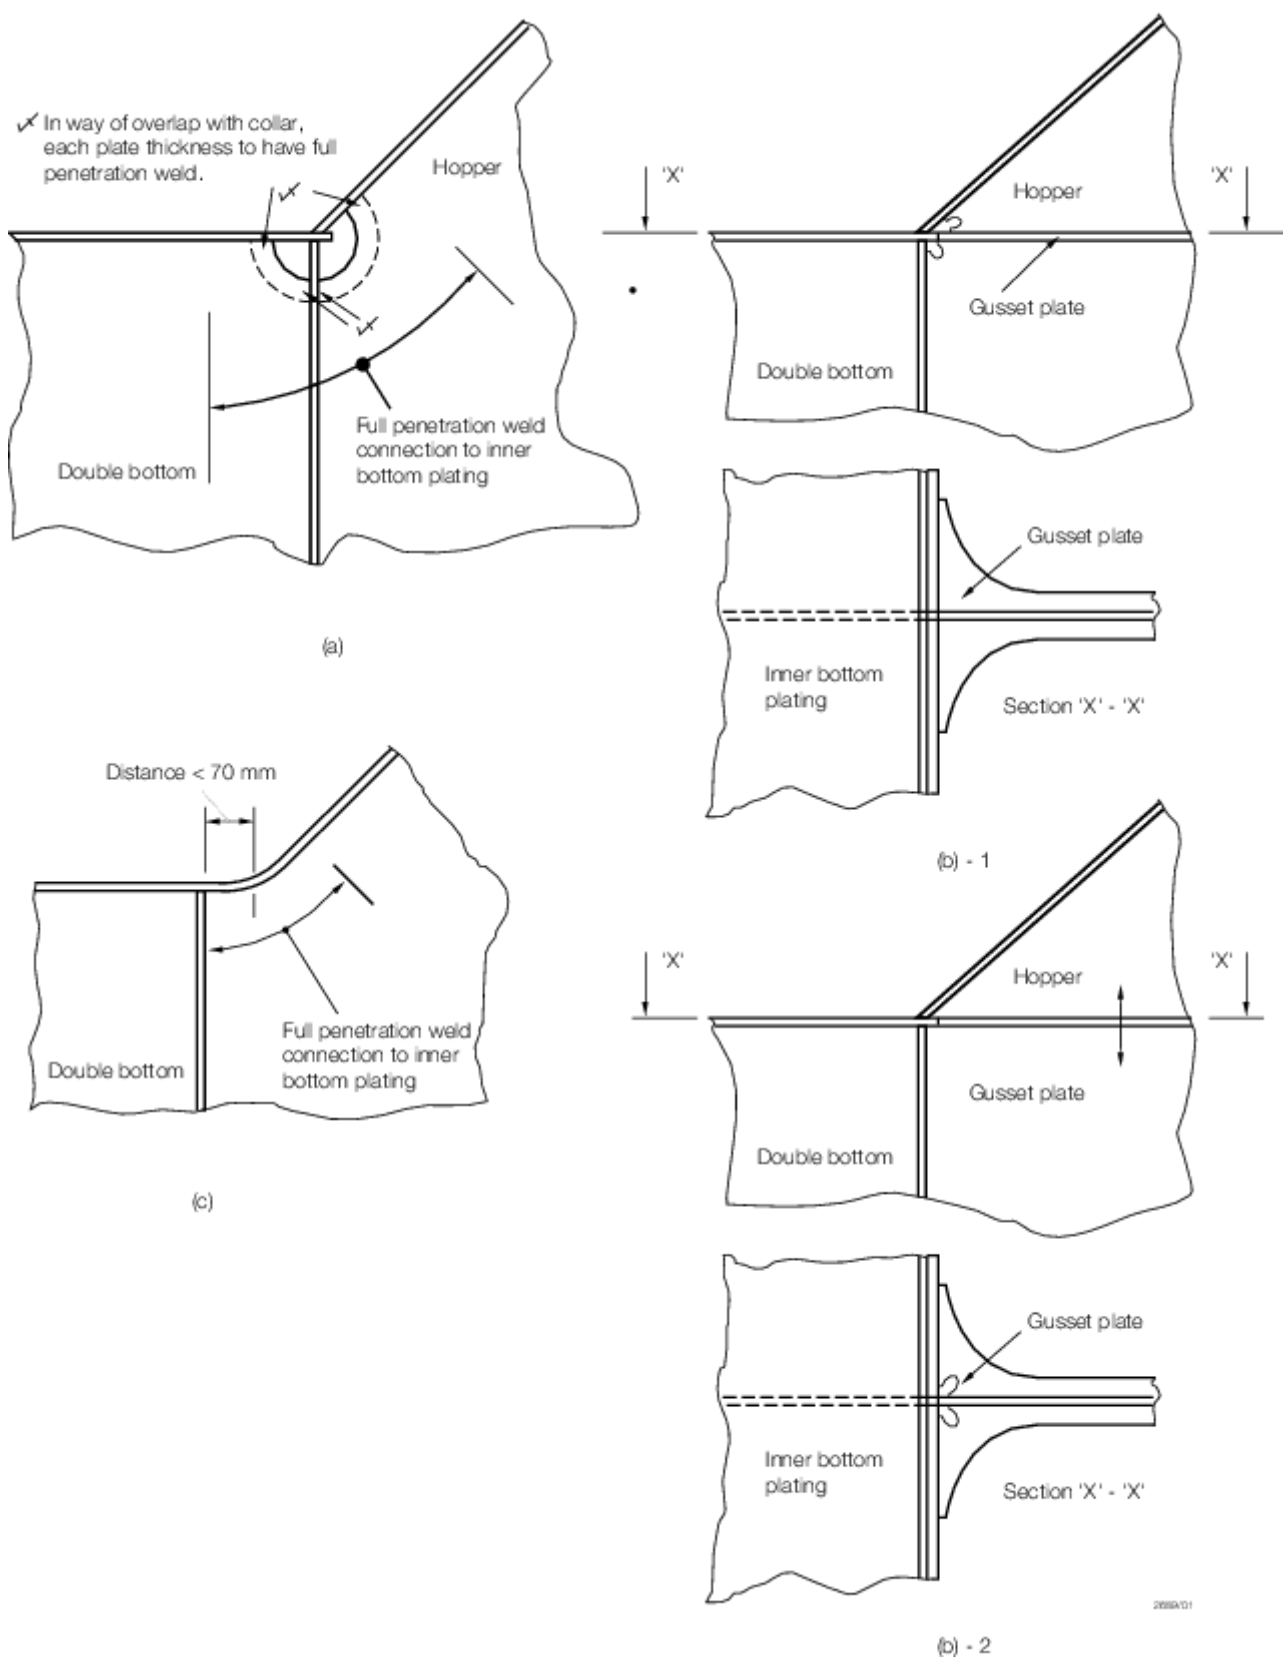

## 8. 7 Combined double bottom/hopper tank and topside tank

- 8. 7. 1 Where a double bottom/hopper tank is interconnected with a topside tank the dimensions of the connecting trunks or pipes, and the air/overflow pipe(s) and the type of closing appliance are to comply with the requirements of [Pt 5, Ch 13, 12 Air, overflow and sounding pipes](#).

## 8. 8 Allowable hold loading in the flooded condition

- 8. 8. 1 The requirements of this sub-Section are to be applied as defined in [Pt 4, Ch 7, 8.1 General 8.1.4](#).
- 8. 8. 2 The maximum load which may be carried in each cargo hold in combination with flood water is to be determined for the most severe homogeneous, non-homogeneous and packed cargo conditions contained in the Loading Manual. The maximum density of cargo intended to be carried in each condition is to be used.

**Figure 7. 8. 2: Connection at intersection of double bottom and hopper**

8. 8. 3 The ship is to be assumed immersed to the draught,  $T_F$ , in metres, in way of the flooded cargo hold under consideration. The flooding head,  $h_f$ , See [Figure 7. 8. 3: Loading](#), is to be taken as the distance, in metres, measured vertically with the ship in the upright position, from the inner bottom to position,  $d_f$ , in metres, from the baseline given by:
- In general:
    - $d_f = D$  for the foremost hold
  - $d_f = 0.9D$  for other holds
  - For ships less than 50 000 tonnes deadweight with Type B freeboard:
    - $d_f = 0.95D$  for the foremost hold
    - $d_f = 0.85D$  for other holds

Where

$D$  = distance, in metres, from the baseline to the freeboard deck at side amidships.

**Figure 7. 8. 3: Loading**

8. 8. 4 For this application, the double bottom is defined as the structure bounded by the transverse bulkhead lower stools (or bulkhead plating if no lower stools are fitted) and the hopper sides. The floors and girders immediately in way of these structures are excluded.
8. 8. 5 The determination of shear strength required for the permissible load assessment in [Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.9](#), is to be performed using the net plate thickness,  $t_{net}$ , for the floors and girders:

$$t_{net} = t - t_c$$

Where

$t$  = as built thickness, in mm

$t_c$  = thickness deduction for corrosion, in mm, generally to be taken as 2.5 mm.

8. 8. 6 Shear capacity of the double bottom is defined as the sum of the shear strengths for:
- all the floors adjacent to both hoppers, less one half the strength of the floors adjacent to each lower stool (or transverse bulkhead if no lower stool is fitted), See [Figure 7. 8. 4: Double bottom structure](#), and
  - all the girders adjacent to the lower stools (or transverse bulkheads if no lower stool is fitted). Where a girder or floor terminates without direct attachment to the boundary stool or hopper side girder, its shear capacity is to include only that for the effectively connected end.

8. 8. 7 The shear strengths,  $S_{f1}$ , of floors adjacent to hoppers, and  $S_{f2}$ , of floors in way of openings in bays nearest to the hoppers, are as follows:

$$S_{f1} = 0.001 A_f \tau_p / \eta_1 \text{ kN}$$

$$S_{f2} = 0.001 A_{fh} \tau_p / \eta_2 \text{ kN}$$

Where

$A_f$  = net sectional area, in  $\text{mm}^2$ , of floor panel adjacent to hopper

$A_{fh}$  = net sectional area, in  $\text{mm}^2$ , of floor panel in way of opening in the bay closest to hopper

$\eta_1$  = 1.10

$\eta_2$  = 1.20 generally

= 1.10 where appropriate reinforcement is fitted in way of the opening

$\sigma_0$  = specified minimum yield stress, in  $\text{N/mm}^2$

$\tau_p$  = permissible shear stress, to be taken equal to the lesser of:

$\tau_0 = \frac{\sigma_0}{\sqrt{3}} \text{ N/mm}^2$  and

$\tau_c = \frac{162\sigma_0 0.6_0}{(s_1/t_{\text{net}})0.8} \text{ N/mm}^2$

Where

$s_1$  = spacing of stiffening members, in mm, for the panel under consideration

$t_{\text{net}}$  = net thickness, in mm, of the panel under consideration.

For floors adjacent to the stools (or bulkhead plating if no lower stools are fitted),  $\tau_p$  may be taken as  $\frac{\sigma_0}{\sqrt{3}} \text{ N/mm}^2$ .

8. 8. 8 The shear strengths  $S_{g1}$ , of girders adjacent to transverse bulkhead lower stools (or transverse bulkheads if no lower stools are fitted), and  $S_{g2}$ , of girders in way of the largest openings in bays nearest to the lower stools (or transverse bulkheads if no lower stools are fitted), are as follows:

$$S_{g1} = 0.001 A_g \tau_p / \eta_1 \text{ kN}$$

$$S_{g2} = 0.001 A_{gh} \tau_p / \eta_2 \text{ kN}$$

Where

$A_g$  = net sectional area, in  $\text{mm}^2$ , of the girder adjacent to transverse bulkhead lower stool (or transverse bulkhead, if no lower stool is fitted)

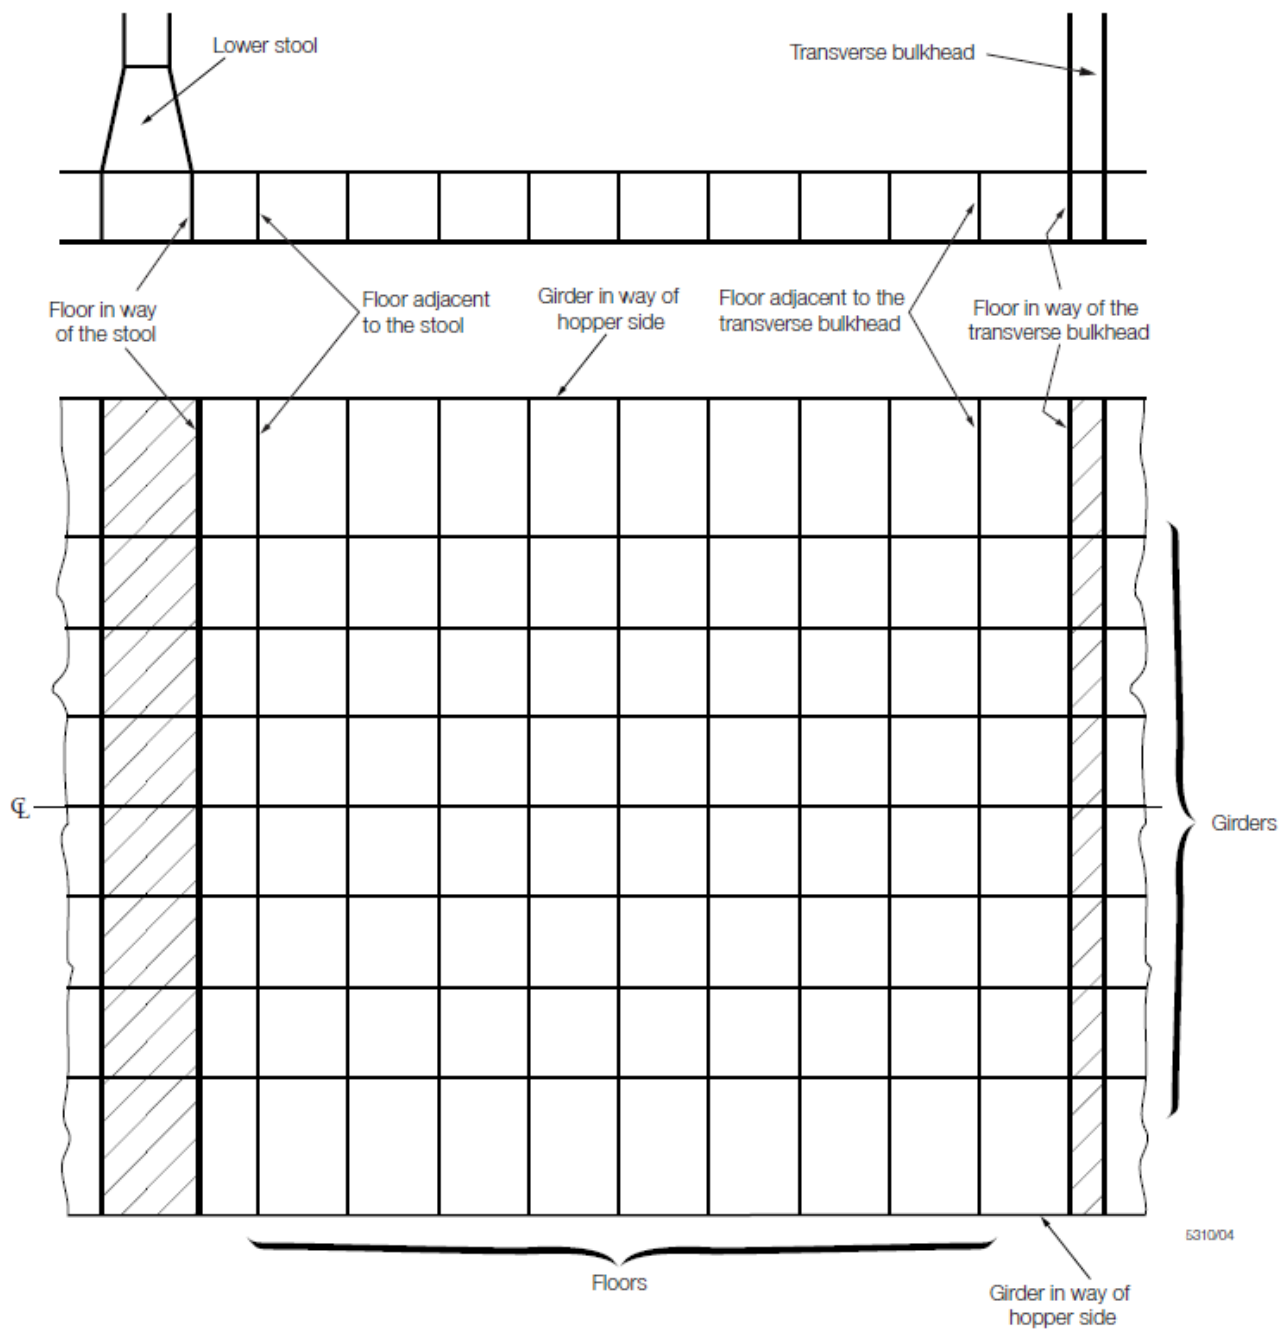

$A_{gh}$  = net sectional area, in  $\text{mm}^2$ , of the girder in way of the largest openings in the bays closest to the transverse bulkhead lower stool (or transverse bulkhead if no lower stool is fitted)

$\eta_1$  = 1.10

$\eta_2$  = 1.15 generally

= 1.10 where appropriate reinforcement is fitted in way of the opening.

Figure 7. 8. 4: Double bottom structure

8. 8. 9 The permissible cargo hold loading,  $W_p$ , is given by:

$$W_p = g \rho_c V / F_c \text{ kN}$$

Where

$d_f, D$  = as defined in [Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.3](#)

$g$  = gravitational constant,  $9.81 \text{ m/sec}^2$

Where

- $h_f$  = flooding head, in metres, as defined in [Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.3](#)
- $h_1$  =  $\frac{X}{\rho_c g}$  where  $X$  is in kN/m<sup>2</sup>
- $n$  = number of floors between transverse bulkhead lower stools or transverse bulkheads, if no lower stools are fitted
- $s$  = spacing, in metres, of double bottom longitudinals adjacent to hoppers
- $A_{DB,e}$  =  $\left[ \sum_{i=1}^n \right] S_i (B_{DB} - s)$
- $A_{DB,h}$  =  $\left[ \sum_{i=1}^n \right] S_i B_{DB,i}$
- $B_{DB}$  = breadth of double bottom, in metres, between hoppers See [Figure 7. 8. 5: Double bottom breadth](#)
- $B_{DB,h}$  = distance, in metres, between openings See [Figure 7. 8. 5: Double bottom breadth](#)
- $B_{DB,i}$  =  $(B_{DB}-s)$  for floors where shear strength is given by  $S_{f1}$   
=  $B_{DB,h}$  for floors where shear strength is given by  $S_{f2}$
- $C_e$  = shear capacity of the double bottom, in kN (tonne- f), as defined in [Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.6](#), considering for each floor, the shear strength  $S_{f1}$ , See [Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.7](#), and for each girder, the lesser of the shear strengths  $S_{g1}$  and  $S_{g2}$ , See [Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.8](#)
- $C_h$  = shear capacity of the double bottom, in kN (tonne- f), as defined in [Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.6](#), considering for each floor, the lesser of the shear strengths  $S_{f1}$  and  $S_{f2}$ , See [Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.7](#), and for each girder, the lesser of the shear strengths  $S_{g1}$  and  $S_{g2}$ , See [Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.8](#)
- $F_c$  = 1.1 in general  
= 1.05 for steel mill products
- $S_i$  = spacing of  $i$ th floor, in metres
- $T_F$  =  $d_f - 0.1D$
- $V$  = volume, in m<sup>3</sup>, occupied by cargo at a level  $h_1$
- $X$  = the lesser of  $X_1$  and  $X_2$  for bulk cargoes and  
 $X$  =  $X_1$  for steel mill products

Where

$$X_1 = \frac{Y + \rho g (T_F - h_f)}{1 + \left(\frac{\rho}{\rho_c}\right)(\mu - 1)} \text{ where } Y \text{ is in kN/m}^2$$

$$X_2 = Y + \rho g (T_F - h_f \mu) \text{ where } Y \text{ is in kN/m}^2$$

$Y$  = the lesser of  $Y_1$  and  $Y_2$  given by:

$$Y_1 = \frac{C_b}{A_{DB,h}}$$

Where

$$Y_2 = \frac{C_e}{A_{DB,e}}$$

$\mu$  = permeability of cargo but need not exceed 0.3

= 0.0 for steel mill products

$\rho$  = density of sea water, 1.025 tonne/m<sup>3</sup>

$\rho_c$  = cargo density, in tonne/m<sup>3</sup> (bulk density for bulk cargoes and actual cargo density for steel mill products).

**Figure 7. 8. 5: Double bottom breadth**

CHAPTER **7 Bulk Carriers**SECTION **9 Hopper side tank structure****9.1 General**

- 9.1.1 Provision is made in this Section for longitudinal framing of the hopper side tank, but proposals for transverse framing will be specially considered.
- 9.1.2 Where oil cargoes are carried the scantlings of the sloped bulkhead are to comply with the requirements of [Pt 4, Ch 7, 10.2 Bulkheads supported by stools](#).
- 9.1.3 For ships to be classed '**100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP**', the requirements of [Pt 4, Ch 7, 9.2, Sloped bulkhead plating](#), [Pt 4, Ch 7, 9.3 Sloped bulkhead stiffeners](#) and [Pt 4, Ch 7, 9.6 Primary supporting structure](#) are to be complied with. In addition the value for  $C$ , the stowage rate in m<sup>3</sup>/tonne, as defined in [Table 7.8.1: Strengthening for heavy cargo requirements](#), is not be taken greater than 0.60 for each hold.
- 9.1.4 The buckling requirements of [Pt 3, Ch 4, 7 Hull buckling strength](#) are also to be satisfied.
- 9.1.5 The *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG), indicates recommended details of structural design configurations around the transverse ring web of the hopper tank.

**9.2 Sloped bulkhead plating**

- 9.2.1 The thickness of the sloped bulkhead plating is to be as required by [Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening 8.4.1](#) but based on actual spacing of sloped bulkhead stiffeners.
- 9.2.2 Where the ship is regularly discharged by grabs and the optional notation for heavy grabs is not desired (See [Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground](#)), the increase in thickness, as required by [Pt 4, Ch 1, 2.2, Protection of steelwork](#), is to be tapered from the inner bottom knuckle to nil at the top corner of the tank.
- 9.2.3 Where a 'strengthened for heavy cargo notation' is desired, in addition to [Pt 4, Ch 7, 9.2 Sloped bulkhead plating 9.2.2](#) the thickness of the sloped bulkhead plating is also to comply with the requirements of [Table 7.8.1: Strengthening for heavy cargo requirements](#) (3)(b) using the actual spacing of stiffeners and with  $H$ , in metres, measured vertically from a point one third of each plate width from its lower edge to the upper deck at side.
- 9.2.4 Where the hopper tanks are interconnected with the topside tanks, or in way of ballast holds, the plating is also to comply with the requirements of [Table 7.8.1: Strengthening for heavy cargo requirements](#) (3)(c) and (3)(d), whichever is appropriate.

**9.3 Sloped bulkhead stiffeners**

- 9.3.1 The scantlings of sloped bulkhead stiffeners are to be as required for inner bottom longitudinals, See [Pt 4, Ch 7, 8 Double bottom structure](#). In ships strengthened for heavy cargoes, the scantlings of the stiffeners are to be derived from [Table 7.8.1: Strengthening for heavy cargo requirements](#)

using a head for heavy cargo measured vertically from the mid-point of the effective length to the underside of the topside tank sloped bulkhead. Where the hopper tanks are interconnected with the topside tanks, or in way of ballast holds, the scantlings of the stiffeners are also to comply with the requirements of [Table 7. 8. 1: Strengthening for heavy cargo requirements](#)(4)(c) and (4)(d), whichever is appropriate. For higher tensile steel longitudinals the requirements of [Pt 4, Ch 1, 6.2 Longitudinal stiffening 6.2.3](#) are to be complied with where applicable, *See also* [Pt 4, Ch 7, 9.7 Structural details 9.7.1](#).

## 9. 4 Shell and bilge stiffeners

9. 4. 1 The scantlings of the shell and bilge longitudinals are to comply with the requirements of [Pt 4, Ch 1, 6 Shell envelope framing](#).

## 9. 5 Tank end bulkheads

9. 5. 1 The scantlings of tank end bulkheads are to comply with the requirements for deep tanks in [Table 1. 9. 1: Watertight and deep tank bulkhead scantlings](#). Where the hopper tanks are interconnected with the topside tanks, the scantlings are to be derived, using the load head  $h_4$ , in metres, from [Table 7. 8. 1: Strengthening for heavy cargo requirements](#) (3)(c) and (4)(c), as appropriate.

## 9. 6 Primary supporting structure

9. 6. 1 Transverses supporting longitudinal stiffening are to comply with the requirements of , and are to be in line with the double bottom floors.

## 9. 7 Structural details

9. 7. 1 Bracket/diaphragms at the top of the hopper tank are to be of sufficient size and thickness to provide effective rigidity, and care is to be taken to ensure alignment with brackets at the bottom of the side frames in the holds. The shell and sloped bulkhead longitudinals supporting the diaphragms are to be derived using the span taken between transverses, *See also* [Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.11](#).

**Table 7. 9. 1: Hopper tank primary structure**

| Item                                  | Modulus, in $\text{cm}^3$  | Inertia, in $\text{cm}^4$                               |
|---------------------------------------|--|---|
| (1) Bottom and side shell transverses | $Z = 11.71\rho kSh_1l_e^2$   | $I = \frac{2.5}{k}l_eZ$                                 |
| (2) Sloped bulkhead transverses       | The greater of:<br>(a) $Z = 11.71\rho kSh_1l_e^2$<br>(b) $Z = 6.6\frac{kSH_Hl_e^2}{c}\tan$ | $I = \frac{2.5}{k}l_eZ$<br><br>$I = \frac{1.85}{k}l_eZ$ |
| Symbols                               |  |   |

$S, k, l_e, Z, I, \rho$  = as defined in [Pt 4, Ch 7, 1.7 Information required for non-CSR bulk carriers 1.7.1](#)

$h$  = distance, in metres, from the mid-point of the effective length to the upper deck at side

$h_1$  = the greater of the distance, in metres, from the midpoint of the effective length to the top of the tank or half the distance, in metres, to the top of the overflow, or in way of cargo oil or ballast holds: the distance from the tank top to the deck at centre, or where the hopper tank is interconnected with the topside tank: the load head  $h_4$ , as derived from [Table 7. 8. 1: Strengthening for heavy cargo requirements](#) (4)(c), whichever is the greatest

$C$  = stowage rate, in m<sup>3</sup>/tonne, as defined in [Table 7. 8. 1: Strengthening for heavy cargo requirements](#). For bulk carriers without the notation 'strengthened for heavy cargoes', the value to be used is 1.39 m<sup>3</sup>/tonne. For bulk carriers with the notation 'strengthened for heavy cargoes', the actual stowage rate is to be used, but the value is not to be taken greater than 0.865 m<sup>3</sup>/tonne.

$H_H$  = distance, in metres, measured vertically from the mid-point of the effective length to the underside of the topside tank sloped bulkhead

CHAPTER **7 Bulk Carriers**SECTION **10 Bulkheads****10. 1 General**

10. 1. 1 The requirements of [Pt 4, Ch 1, 9 Bulkheads](#) are to be applied, together with the requirements of this Section.
10. 1. 2 Where vertically corrugated transverse watertight bulkheads are fitted, the scantlings and arrangements are also to satisfy the requirements of [Pt 4, Ch 7, 10.4, Vertically corrugated transverse watertight bulkheads – Application and definitions](#). Other transverse watertight bulkhead types will be specially considered.
10. 1. 3 In way of ballast holds, the scantlings are to satisfy the requirements of [Table 1. 9. 1: Watertight and deep tank bulkhead scantlings](#) in [Pt 4, Ch 1 General Cargo Ships](#) for deep tanks with the load head,  $h_4$ , in metres, taken to the deck at centre. This includes the scantlings of vertically corrugated and double plate transverse bulkheads supported by stools. In addition, the thickness of corrugations is to be not less than given by [Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.8](#) for watertight corrugated bulkheads. Alternatively, the scantlings may be based on direct calculations which are to be submitted.
10. 1. 4 All bulk carriers to be classed ‘**100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP**’ are to be arranged with top and bottom stools. The requirements of [Pt 4, Ch 7, 10.2 Bulkheads supported by stools](#) are to be complied with as appropriate.

**10. 2 Bulkheads supported by stools**

10. 2. 1 The stools are to be reinforced with plate diaphragms or deep webs, and in bottom stools the diaphragms are to be aligned with double bottom side girders. Continuity is also to be maintained between the diaphragms and the bulkhead corrugations for 90° corrugations.
10. 2. 2 The sloping plate of bottom stools is to be aligned with double bottom floors. Particular attention is to be given to the through thickness properties of the inner bottom plating and continuity at the connection to the inner bottom, and to the through thickness properties of the bottom stool shelf plate, See [Ch 3, 8 Plates with specified through thickness properties of the Pt 2 Rules for the Manufacture, Testing and Certification of Materials](#) regarding requirements for plates with specified through thickness properties.
10. 2. 3 An efficient system of reinforcement is to be arranged in line with the hold transverse bulkheads or bulkhead stools at the intersection with the sloped plating of the hopper and topside tanks. The reinforcement fitted in the tanks is to consist of girders or intercostal bulb plate or equivalent stiffeners fitted between, and connected to, the sloped bulkhead longitudinals.
10. 2. 4 The shelf plates of the bulkhead stools are to be arranged to align with the longitudinals in the hopper and topside tanks. Where sloping shelf plates are fitted to stools, suitable scarfing is to be arranged in way of the connections of the stools to the adjoining structures.

10. 2. 5 The *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG), indicates recommended structural design configurations in the critical areas of the lower stool and of the upper boundaries.

### 10. 3 Structural details in way of holds confined to dry cargoes

10. 3. 1 In dry cargo holds where transverse bulkheads are arranged without bottom stools, the stiffeners and brackets of plane bulkheads, and rectangular corrugations of corrugated bulkheads, are to be aligned with floors and inner bottom longitudinals. In the case of non-rectangular corrugations, the flanges are to be aligned with floors, but consideration will be given to the fitting of a substantial transverse girder in place of one of the floors.
10. 3. 2 Where transverse corrugated bulkheads are arranged without top stools, transverse beams are to be arranged under the deck in way.

### 10. 4 Vertically corrugated transverse watertight bulkheads – Application and definitions

10. 4. 1 Where corrugated transverse watertight bulkheads are fitted, the scantlings are to be determined in accordance with the following requirements.
10. 4. 2 For ships of length,  $L$ , 190 m or above, the vertically corrugated transverse bulkheads are to be fitted with a bottom stool and, generally, with a top stool below the deck. The requirements of [Pt 4, Ch 7, 10.6 Vertically corrugated transverse bulkheads – Support structure at ends](#) are to be complied with as appropriate.
10. 4. 3 The loads to be considered as acting on the bulkheads are those given by the combination of cargo loads with those induced by the flooding of one hold adjacent to the bulkhead under consideration. The most severe combinations of cargo induced loads and flooding loads are to be used for the determination of the scantlings of each bulkhead, depending on the specified design loading conditions:
- homogeneous loading conditions,
  - non-homogeneous loading conditions (excluding part loading conditions associated with multi-port loading and unloading),
  - packed cargo conditions (such as steel mill products).
- The individual flooding of loaded and empty holds is to be considered, but the pressure used in the assessment is not to be less than that obtained for flood water alone. Holds containing packed cargo are to be treated as empty holds.
10. 4. 4 The cargo surface is to be taken as horizontal and at a distance  $d_1$ , in metres, from the base line, See [Figure 7. 10. 1: Cargo hold dimensions](#), where  $d_1$  is calculated taking into account the cargo properties and the hold dimensions. Unless the ship is designed to carry only cargo of bulk density greater than or equal to 1.78 tonne/m<sup>3</sup> in non-homogeneous loading conditions, the maximum mass of cargo which may be carried in the hold is to be taken as filling that hold to the upper deck level at centreline. A permeability,  $\mu$ , of 0.3 and angle of repose,  $\psi$ , of 35° is to be assumed for this application.

Figure 7. 10. 1: Cargo hold dimensions

10. 4. 5 An homogeneous load condition is defined as one where the ratio between the highest and the lowest filling levels,  $d_1$ , in adjacent holds does not exceed 1.20. For this purpose, where a loading condition includes cargoes of different densities, equivalent filling levels are to be calculated for all holds on the basis of a single reference value of cargo density, which can be the minimum to be carried.
10. 4. 6 The permeability,  $\mu$ , may be taken as 0.3 for ore, coal and cement cargoes. The bulk density and angle of repose,  $\psi$ , may generally be taken as 3.0 tonne/m<sup>3</sup> and 35° respectively for iron ore and 1.3 tonne/m<sup>3</sup> and 25° respectively for cement.
10. 4. 7 The flooding head,  $h_f$ , See [Figure 7. 10. 1: Cargo hold dimensions](#), is the distance, in metres, measured vertically with the ship in the upright position, from the location  $P$ , under consideration, to a position  $d_f$ , in metres, from the base line as given in [Table 7. 10. 1: Flooding head](#).
10. 4. 8 In considering a flooded hold, the total load is to be taken as that of the cargo and flood water at the appropriate permeability. Where there is empty volume above the top of the cargo, this is to be taken as flooded to the level of the flooding head.
10. 4. 9 Corrugations may be constructed of flanged plates or fabricated from separate flange and web plates, which may be of different thicknesses. The corrugation angle is to be not less than 55°, See [Figure 7. 10. 2: Dimensions of bulkhead corrugation angles](#).
10. 4. 10 The term net plate thickness is used to describe the calculated minimum thickness of plating of the web,  $t_w$ , or flange,  $t_f$ . The plate thickness to be fitted is the net plate thickness plus a corrosion addition of 3.5 mm.

## 10. 5 Vertically corrugated transverse watertight bulkheads – Scantling assessment

10. 5. 1 The bending moment  $M$ , in kNm, for the bulkhead corrugations is given by:

$$M = \frac{Fl}{8}$$

Where

- $l$  = span of the corrugation, in metres, to be measured between the internal ends of the bulkhead upper and lower stools in way of the neutral axis of the corrugations or, where no stools are fitted, from inner bottom to deck, See [Figure 7. 10. 2: Dimensions of bulkhead corrugation angles](#) and [Figure 7. 10. 3: Scantling assessment](#). The lower end of the upper stool is not to be taken greater than a distance from the deck at the centreline equal to:
- = 3 times the depth of the corrugation, in general, or
  - = 2 times the depth of the corrugation, for rectangular stools
- $F$  = resultant force, in kN, See [Table 7. 10. 3: Resultant pressure and force](#).

**Figure 7. 10. 2: Dimensions of bulkhead corrugation angles**

10. 5. 2 The shear force,  $Q$ , in kN at the lower end of the bulkhead corrugation is given by:

$$Q = 0.8F$$

where  $F$  is defined in [Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.1](#).

**Table 7. 10. 1: Flooding head**

| Item  | Bulkhead location     | Bulk carriers with Type B freeboard and deadweight < 50 000 tonnes | Other bulk carriers |
|---|-----------------------|--|---------------------|
| <b>I</b> <sup>(1)</sup>   | Between holds 1 and 2 | $d_f = 0.95D$  | $d_f = D$           |
|   | Elsewhere             | $d_f = 0.85D$  | $d_f = 0.9D$        |
| <b>II</b> <sup>(1)</sup>  | Between holds 1 and 2 | $d_f = 0.9D$   | $d_f = 0.95D$       |
|   | Elsewhere             | $d_f = 0.8D$   | $d_f = 0.85D$       |
| <p><b>Note 1.</b> Item <b>II</b> is to be used for non-homogeneous loading conditions where the bulk cargo density is less than 1.78 tonne/m<sup>3</sup>.<br/>Otherwise, Item <b>I</b> is to be used.</p> <p><b>Note 2.</b> <math>D</math> = distance, in metres, from the base line to the freeboard deck at side amidships, See Fig 7.10.1.</p> |                       |  |                     |

**Figure 7. 10. 3: Scantling assessment**

10. 5. 3 The section modulus of the corrugations is to be calculated using net plate thicknesses. At the lower end, the following requirements apply:
- An effective width of compression flange,  $b_{ef}$ , not greater than given in [Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.7](#), is to be used.
  - Where corrugation webs are not supported by local brackets below the shelf plate (or below the inner bottom if no lower stool is fitted), they are to be assumed 30 per cent effective in bending. Otherwise, the full area of web plates may be used, See also [Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.3.e](#).

- c. Where effective shedder plates are fitted, See [Figure 7. 10. 4: Symmetric shedder plates](#) and [Figure 7. 10. 5: Asymmetric shedder plates](#), the net area of the corrugation flange plates, in cm<sup>2</sup>, may be increased by the lesser of:

$$2.5b\sqrt{(t_f t_{sh})} \text{ and } 2.5bt_f$$

Where

$b$  = width of corrugation flange, in metres, See [Figure 7. 10. 2: Dimensions of bulkhead corrugation angles](#)

$t_f$  = net flange plate thickness, in mm

$t_{sh}$  = net shedder plate thickness, in mm

A shedder plate is considered effective when it:

- is not knuckled; and
- is welded to the corrugations and the lower stool shelf plate by one-side penetration welds or equivalent; and
- has a minimum slope of 45° and lower edges in line with the stool side plating; and
- has a thickness not less than 0.75 times the thickness of the corrugation flanges; and
- has material properties at least equal to those of the corrugation flanges.

- d. Where effective gusset plates are fitted, See [Figure 7. 10. 6: Symmetric gusset/shedder plates](#) and [Figure 7. 10. 7: Asymmetric gusset/shedder plates](#) the net area of the corrugation flange plates, in cm<sup>2</sup>, may be increased by:

$$7h_g t_f$$

Where

$h_g$  = height of the gusset plate, in metres, but is not to be taken greater than  $\frac{10}{7} s_{gu}$

$t_f$  = net flange plate thickness, in mm

$s_{gu}$  = width of the gusset plate, in metres

A gusset plate is considered effective when it:

- is fitted in combination with an effective shedder plate as defined in [Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.3.c](#); and
- has height not less than half the flange plate width; and
- is fitted in line with the stool side plating; and
- has thickness and material properties at least equal to those of the flanges; and
- is welded to the top of the lower stool by full penetration welds and to the corrugations and shedder plates by one-side penetration welds or equivalent.

- e. Where the corrugation is welded to a sloping stool shelf plate, set at an angle of not less than 45° to the horizontal, the corrugation webs may be taken as fully effective in bending. Where the slope is less than 45°, the effectiveness is to be assessed by linear interpolation between fully effective at 45° and the appropriate value from [Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.3.b](#) at 0°. Where effective gusset plates are also fitted, the area of the flange plates may be increased in accordance with [Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight](#)

[bulkheads – Scantling assessment 10.5.3.d](#). No increase is permitted in the case where shedder plates are fitted without gussets.

**Table 7. 10. 2: Bulkhead pressure and force**

| Item  | Pressure, kN/m <sup>2</sup> (tonne-f/m <sup>2</sup> )  | Force, kN (tonne-f)  |
|---|--|--|
| (1) In non-flooded bulk cargo holds   | $p_c = g\rho_c h_1 \tan^2 \theta$<br>$(p_c = g\rho_c h_1 \tan^2 \theta)$   | $F_c = 0.5\rho_c g s_1 (d_1 - h_{DB} - h_{LS})^2 \tan^2 \theta$<br>$(F_c = 0.5\rho_c s_1 (d_1 - h_{DB} - h_{LS})^2 \tan^2 \theta)$   |
| (2) In flooded bulk cargo holds, when $d_f \geq d_1$<br><br>(a) For positions between $d_1$ and $d_f$ from base line<br><br>(b) For positions at a distance lower than $d_f$ from base line | $p_{cf} = g\rho h_f$<br>$(p_{cf} = \rho h_f)$<br><br>$p_{cf} = g(\rho h_f + (\rho_c - \rho(1 - \mu))h_c \tan^2 \theta)$<br>$(p_{cf} = (\rho h_f + (\rho_c - \rho(1 - \mu))h_1 \tan^2 \theta))$   | $F_{cf} = 0.5s_1(\rho g(d_f - d_1)^2 + (\rho g(d_f - d_1) + p_{le})(d_1 - h_{DB} - h_{LS}))$<br><br>$(F_{cf} = 0.5s_1(\rho(d_f - d_1)^2 + (\rho(d_f - d_1) + p_{le})(d_1 - h_{DB} - h_{LS})))$   |

| Flood water alone (adjacent holds empty)   | $p_r = p_f$                             | $F = F_f$             |
| <b>Note</b> For symbols, See <a href="#">Table 7. 10. 2: Bulkhead pressure and force</a> . |   |                       |

10. 5. 4 The section modulus of corrugations at cross-sections other than the lower end is to be calculated with fully effective webs and an effective compression flange width,  $b_{ef}$  not greater than given in [Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.7](#).

Figure 7. 10. 4: Symmetric shedder plates

Figure 7. 10. 5: Asymmetric shedder plates

**Figure 7. 10. 6: Symmetric gusset/shedder plates**

10. 5. 5 The bending capacity of the bulkhead corrugations is to comply with the following relationship:

$$\frac{1000M}{0.5Z_{le}\sigma_{p,le} + Z_m\sigma_{p,m}} \leq 0.95$$

Where

$M$  = bending moment, in kNm, See [Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.1](#)

$Z_{le}$  = section modulus at the lower end of the corrugations, in  $\text{cm}^3$

$Z_m$  = section modulus at mid-span of the corrugations, in  $\text{cm}^3$

$\sigma_{p,le}$  = permissible bending stress at the lower end of the corrugations, in  $\text{N/mm}^2$

$\sigma_{p,m}$  = permissible bending stress at mid-span of the corrugations, in  $\text{N/mm}^2$

In the above expression  $Z_{le}$ , in  $\text{cm}^3$ , is not to be taken greater than  $Z'_{le}$  where

$$Z'_{le} = Z_g + \left( \frac{1000Qh_g - 0.5h_g^2s_1p_g}{\sigma_{p,le}} \right)$$

and  $Z_m$  is not to exceed the lesser of  $1.15Z_{le}$  and  $1.15Z'_{le}$

Where

$h_g$  = height of the gusset plate, in metres

$p_g$  = resultant pressure calculated in way of the middle of the shedder or gusset plates as appropriate, in  $\text{kN/m}^2$

$s_1$  = spacing of the corrugations, in metres

$Q$  = shear force, in kN, See [Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.2](#)

Where

$Z_g$  = section modulus of the corrugations in way of the upper end of shedder or gusset plates as appropriate, in  $\text{cm}^3$ .

**Figure 7. 10. 7: Asymmetric gusset/shedder plates**

10. 5. 6 The applied shear stress, in  $\text{N/mm}^2$ , is determined by dividing the shear force derived from [Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.2](#) by the shear area of the corrugation, calculated using the net plate thickness. The shear area is to be reduced to account for non- perpendicularity between the corrugation webs and flanges. In general, the reduced area may be obtained by multiplying the web sectional area by  $\sin \phi$ , where  $\phi$  is the angle between the web and the flange, See [Figure 7. 10. 2: Dimensions of bulkhead corrugation angles](#). The applied shear stress is not to exceed the permissible shear stress or the shear buckling stress given in [Table 7. 10. 4: Permissible shear and buckling stresses](#).

**Table 7. 10. 4: Permissible shear and buckling stresses**

|                             |                           |                                    |
|-----------------------------|---------------------------|------------------------------------|
| Bending,<br>$\text{N/mm}^2$ | Shear,<br>$\text{N/mm}^2$ | Shear buckling,<br>$\text{N/mm}^2$ |
|-----------------------------|---------------------------|------------------------------------|

|   |                        |  |
|---|------------------------|--|
| $\sigma_p = \sigma_0$   | $\tau_p = 0.5\sigma_0$ | $\tau_{cr} = \tau_E$<br>when $\tau_E \leq \frac{\tau_0}{2}$<br>$= \tau_0 \left(1 - \frac{\tau_0}{4\tau_E}\right)$<br>when $\tau_E \leq \frac{\tau_0}{2}$ |
| Symbols   |                        |  |
| $b$ = width of corrugation flange, in metres, See <a href="#">Figure 7. 10. 2: Dimensions of bulkhead corrugation angles</a><br>$c$ = width of corrugation web, in metres, See <a href="#">Figure 7. 10. 2: Dimensions of bulkhead corrugation angles</a><br><hr/> $t_f$ = net flange plate thickness, in mm<br>$t_w$ = web plate net thickness, in mm<br>$E$ = modulus of elasticity<br>= 206 000 N/mm <sup>2</sup><br>$\sigma_0$ = specified minimum yield stress, in N/mm <sup>2</sup><br>$\tau_E = 5.706E(t_w/1000c)^2$ N/mm <sup>2</sup><br>$\tau_0 = \frac{\sigma_0}{\sqrt{3}}$ N/mm <sup>2</sup> |                        |  |

10. 5. 7 The width of the compression flange, in metres, to be used for calculating the effective modulus is:

$$b_{ef} = C_{ef}b$$

Where

$$C_{ef} = \frac{2.25}{\beta} - \frac{1.25}{\beta^2} \text{ for } \beta > 1.25$$

$$C_{ef} = 1.0 \text{ for } \beta \leq 1.25$$

$$\beta = 10^3 \left( \frac{b}{t_f} \right) \sqrt{\frac{\sigma_0}{E}}$$

Other symbols are as defined in [Table 7. 10. 4: Permissible shear and buckling stresses](#).

10. 5. 8 The corrugation flange and web local net plate thickness are not to be less than:

$$t = 14.9s_w \sqrt{1.05 \frac{p_r}{\sigma_0}} \text{ mm}$$

Where

$s_w$  = plate width, in metres, to be taken equal to the width of the corrugation flange or web, whichever is the greater

$p_r$  = resultant pressure, in kN/m<sup>2</sup>, as defined in [Table 7. 10. 3: Resultant pressure and force](#), at the lower edge of each strake of plating. The net thickness of the lowest strake is to be determined using the resultant pressure at the top of the lower stool, (or at the inner bottom, if no lower stool is fitted), or at the top of the shedders, if effective shedder or gusset and shedder plates are fitted

$\sigma_0$  = specified minimum yield stress of the material, in N/mm<sup>2</sup>.

10. 5. 9 For built-up corrugations, where the thickness of the flange and of the web are different, the net thickness of the narrower plating is to be not less than:

$$t_n = 14.9s_n \sqrt{1.05 \frac{p_r}{\sigma_0}} \text{ mm}$$

Where

$s_n$  = width of the narrower plating, in metres.

The net thickness, in mm, of the wider plating is not to be taken less than the greater of:

$$t_{wp} = 14.9s_w \sqrt{1.05 \frac{p_r}{\sigma_0}} \text{ mm or}$$

$$t_{wp} = \sqrt{\frac{462s_w^2 p_r}{\sigma_0} - t_{np}^2} \text{ mm}$$

Where

$t_{np} \leq$  actual net thickness of the narrower plating but not greater than:.

$$14.9s_w \sqrt{1.05 \frac{p_r}{\sigma_0}} \text{ mm}$$

10. 5. 10 The required thickness of plating is the net thickness plus the corrosion addition given in [Pt 4, Ch 7, 10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions 10.4.10](#).
10. 5. 11 Scantlings required to meet the bending and shear strength requirements at the lower end of the bulkhead corrugation are to be maintained for a distance of  $0.15l$  from the lower end, where  $l$  is as defined in [Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.1](#). Scantlings required to meet the bending requirements at mid-height are to be maintained to a location no greater than  $0.3l$  from the top of the corrugation. The section modulus of the remaining upper part of the corrugation is to be not less than 0.75 times that required for the middle part, corrected for differences in yield stress.

## 10. 6 Vertically corrugated transverse bulkheads – Support structure at ends

10. 6. 1 The requirements of [Pt 4, Ch 7, 10.2 Bulkheads supported by stools](#) are to be complied with as applicable, together with the following.
10. 6. 2 **Lower stool:**
- The height of the lower stool is generally to be not less than three times the depth of the corrugations.
  - The thickness and steel grade of the stool shelf plate are to be not less than those required for the bulkhead plating above.

- c. The thickness and steel grade of the upper portion of vertical or sloping stool side plating, within the depth equal to the corrugation flange width from the stool top, are to be not less than the flange plate thickness and steel grade needed to meet the bulkhead requirements at the lower end of the corrugation.
- d. The thickness of the stool side plating and the section modulus of the stool side stiffeners are to be not less than those required by [Pt 4, Ch 1, 9 Bulkheads](#) for a plane transverse bulkhead and stiffeners using the greater of the pressures determined from the head,  $h_4$ , in [Table 1. 9. 1: Watertight and deep tank bulkhead scantlings](#) and the expressions given in [Table 7. 10. 2: Bulkhead pressure and force](#).
- e. The ends of stool side vertical stiffeners are to be attached to brackets at the upper and lower ends of the stool.
- f. The width of the shelf plate is to be in accordance with [Figure 7. 10. 8: Width of shelf plate](#).
- g. The stool bottom is to have a width not less than 2.5 times the mean depth of the corrugation.
- h. Scallop in the brackets and diaphragms in way of connections to the stool shelf plate are to be avoided.
- i. Where corrugations are terminated on the bottom stool, corrugations are to be connected to the stool top plate by full penetration welds. The stool side plating is to be connected to the stool top plate and the inner bottom plating by either full penetration or partial penetration welds, See [Figure 7. 10. 9: Partial penetration welding](#). The supporting floors are to be connected to the inner bottom by either full penetration or partial penetration welds.

**Figure 7. 10. 8: Width of shelf plate**

#### 10. 6. 3 Upper stool:

- a. The upper stool, where fitted, is to have a height generally between two and three times the depth of corrugations.
- b. Rectangular stools are to have a height generally equal to twice the depth of corrugations, measured from the deck level and at hatch side girder.
- c. The upper stool is to be properly supported by girders or deep brackets between the adjacent hatch-end beams.
- d. The width of the shelf plate is generally to be the same as that of the lower stool shelf plate.
- e. The upper end of a non-rectangular stool is to have a width not less than twice the depth of corrugations.

- f. The thickness and steel grade of the shelf plate are to be the same as those of the bulkhead plating below.
- g. The thickness of the lower portion of stool side plating is to be not less than 80 per cent of that required for the upper part of the bulkhead plating where the same materials are used.
- h. The thickness of the stool side plating and the section modulus of the stool side stiffeners are to be not less than those required by Ch 1.9 for plane transverse bulkheads and stiffeners using the greater of the pressures determined from the head,  $h_4$ , in [Table 1.9.1: Watertight and deep tank bulkhead scantlings](#) and the expressions given in [Table 7.10.2: Bulkhead pressure and force](#).
- i. Where vertical stiffening is fitted, the ends of stool side stiffeners are to be attached to brackets at the upper and lower end of the stool.
- j. Diaphragms are to be fitted inside the stool, in line with, and effectively attached to, longitudinal deck girders extending to the hatch end coaming girders for effective support of the corrugated bulkhead.
- k. Scallops in the brackets and diaphragms in way of the connection to the stool shelf plate are to be avoided.

**Figure 7. 10. 9: Partial penetration welding**

Root face  $f = 3 \text{ mm to } T/3 \text{ mm}$   
 Groove angle  $\alpha = 40 \text{ to } 60$   
 Throat thickness = } See Pt 3, Ch 10  
 Leg length = }

10. 6. 4 If no upper stool is fitted, two transverse reinforced beams are to be fitted in line with the corrugation flanges.
10. 6. 5 If no bottom stool is fitted, the corrugation flanges are to be in line with the supporting floors. Corrugations are to be connected to the inner bottom plating by full penetration welds. The thickness and steel grades of the supporting floors are to be at least equal to those provided for the corrugation flanges. The plating of supporting floors is to be connected to the inner bottom by either full penetration or deep penetration welds, *See* . The cut-outs for connections of the inner bottom longitudinals to double bottom floors are to be closed by collar plates. The supporting floors are to be connected to each other by suitably designed shear plates.
10. 6. 6 Stool side plating is to align with the corrugation flanges. Stool side vertical stiffeners and their brackets in the lower stool are to align with the inner bottom longitudinals to provide appropriate load transmission between these stiffening members. The lower stool side plating is not to be knuckled.
10. 6. 7 The design of local details is to take into account the transfer of the bulkhead forces and moments to the boundary structures and particularly to the double bottom and cross-deck structures.

PART

# 4

CHAPTER **7 Bulk Carriers**

SECTION **11 Direct calculation**

## **11. 1 Application**

- 11. 1. 1 Direct calculations are to be employed in derivation of scantlings where required by the preceding Sections of this Chapter or by related provisions included in [Pt 3 Ship Structures \(General\)](#).
- 11. 1. 2 Direct calculation methods are also generally to be used where additional calculations are required by the Rules in respect of unusual structural arrangements.

## **11. 2 Procedures**

- 11. 2. 1 For details of ACS's direct calculation procedures See [Pt 3, Ch 1, 2 Direct calculations](#). For requirements concerning use of other calculation procedures, See [Pt 3, Ch 1, 3 Equivalents](#).

## CHAPTER 7 Bulk Carriers

## SECTION 12 Steel hatch covers

## 12. 1 General

12. 1. 1 These requirements apply to hatch covers on exposed decks in Position 1, *See* [Pt 3, Ch 1, 6.6 Position 1](#) and [Position 2 6.6.1](#), and are in addition to the following requirements:
- [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.14](#), [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.16](#), [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.17](#), [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.25](#), [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.27](#), and [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.29](#).
  - [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.5](#) for the vertical weather pressure load case and cargo load, if carried on the hatch covers.  
**Note** When cargo is carried on the hatch covers, [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.8](#) to [Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.10](#) are also to be complied with. Cargo loads are to be in accordance with [Pt 3, Ch 11, 2.3 Load model 2.3.4](#) and [Pt 3, Ch 11, 2.3 Load model 2.3.5](#). [Pt 4, Ch 8, 11.2, Direct calculations](#) is to be considered for compliance with [Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1](#), [Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.2](#), [Pt 3, Ch 11, 2.5 Local net plate thickness 2.5.1](#), [Pt 3, Ch 11, 2.8 Net scantling of secondary stiffeners 2.8.1](#), [Pt 3, Ch 11, 2.8 Net scantling of secondary stiffeners 2.8.4](#), [Pt 3, Ch 11, 2.8 Net scantling of secondary stiffeners 2.8.5](#), [Pt 3, Ch 11, 2.9 Net scantling of primary supporting members 2.9.1](#) and [Pt 3, Ch 11, 2.9 Net scantling of primary supporting members 2.9.2](#). The vertical weather design load needs not to be combined with the cargo load.
  - For hatch covers subject to wheel loading or helicopter landing, [Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles](#) and [Pt 3, Ch 9, 5 Helicopter landing areas](#) are to be complied with.
12. 1. 2 The net plate thickness,  $t_{\text{net}}$ , is the calculated minimum thickness of the plating and stiffeners. The required thickness is the net thickness plus a corrosion addition,  $t_c$ , given in [Table 7. 12. 1: Corrosion addition  \$t\_c\$](#) .

**Table 7. 12. 1: Corrosion addition  $t_c$** 

| Hatch cover type                   | $t_c$ , in mm |
|------------------------------------|---------------|
| (a) Single skin                    | 2.0           |
| (b) Pontoon (double skin)          |               |
| (i) for the top and bottom plating | 2.0           |
| (ii) for the internal structures   | 1.5           |

12. 1. 3 Material for the hatch covers is to be steel according to the requirements for ship's hull.

## 12. 2 Stiffener arrangement

12. 2. 1 The secondary stiffeners and primary supporting members of the hatch covers are to be continuous over the breadth and length of the hatch covers, as far as practical. When this is impractical, sniped end connections are not to be used and appropriate arrangements are to be adopted to ensure sufficient load carrying capacity.
12. 2. 2 The spacing of primary supporting members parallel to the direction of secondary stiffeners is not to exceed  $\frac{1}{3}$  of the span of primary supporting members.

## 12. 3 Closing arrangements

12. 3. 1 Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced alongside the coamings and between cover elements.
12. 3. 2 Arrangement and spacing are to be determined with due attention to the effectiveness for weather-tightness, depending upon the type and the size of the hatch cover, as well as on the stiffness of the cover edges between the securing devices.
12. 3. 3 The net sectional area of each securing device is not to be less than:

$$A = 1.4a/f \text{ cm}^2$$

Where

$a$  = spacing in m of securing devices, not being taken less than 2 m

$f$  =  $(\sigma_Y/235)^e$

$\sigma_Y$  = specified minimum upper yield stress in N/mm<sup>2</sup> of the steel used for fabrication, not to be taken greater than 70 per cent of the ultimate tensile strength

$e$  = 0.75 for  $\sigma_Y > 235$   
 = 1.0 for  $\sigma_Y \leq 235$

12. 3. 4 Rods or bolts are to have a net diameter not less than 19 mm for hatchways exceeding 5 m<sup>2</sup> in area.
12. 3. 5 Between cover and coaming and at cross-joints, a packing line force sufficient to obtain weathertightness is to be maintained by the securing devices. For packing line forces exceeding 5 N/mm, the cross section area is to be increased in direct proportion. The packing line force is to be specified.
12. 3. 6 The cover edge stiffness is to be sufficient to maintain adequate sealing pressure between securing devices. The moment of inertia,  $I$ , of edge elements is not to be less than:

$$I = 6pa^4 \text{ cm}^4$$

Where

$p$  = packing line pressure in N/mm, minimum 5 N/mm

$a$  = spacing in m of securing devices.

12. 3. 7 Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or covers. Individual securing devices on each cover are to have approximately the same stiffness characteristics.

12. 3. 8 Where rod cleats are fitted, resilient washers or cushions are to be incorporated.
12. 3. 9 Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.
12. 3. 10 Hatch covers are to be effectively secured, by means of stoppers, against transverse and longitudinal forces (acting on the forward end) arising from a pressure of 175 kN/m<sup>2</sup>.
12. 3. 11 The equivalent stress:
- in stoppers and their supporting structures; and
  - calculated in the throat of the stopper welds; is not to exceed the allowable value of 0.8σ<sub>y</sub>.

## 12. 4 Load model

12. 4. 1 The pressure,  $p$ , in kN/m<sup>2</sup>, acting on the hatch covers is given by:
- a. For ships of length 100 m or greater, for hatchways located on the freeboard deck,  $p$  is to be the greater of 34.3 or the following:

$$p = 34.3 + \frac{p_{FP} - 34.3}{0.25} \left( 0.25 - \frac{x}{L} \right)$$

Where a hatchway is located in position 1 and at least one superstructure standard height higher than the freeboard deck, the pressure  $p$  may be 34.3 kN/m<sup>2</sup>.

- b. For ships less than 100 m in length, for hatchways located at the freeboard deck,  $p$  is to be the greater of  $0.195L + 14.9$  or the following:

$$p = 15.8 + \frac{L}{3} \left( 1 - \frac{5x}{3L} \right) - 3.6 \frac{x}{L}$$

Where two or more panels are connected by hinges, each individual panel is to be considered separately.

$p_{FP}$  = pressure at the forward perpendicular

Where

$$= 49.1 + (L - 100)a$$

$$a = 0.0726 \text{ for type B freeboard ships}$$

$$= 0.356 \text{ for ships with reduced freeboard}$$

$L$  = Freeboard length, in metres, as defined in *Regulation 3 - Definitions of terms used in the Annexes* of Annex I to the 1966 Load Line Convention as modified by the Protocol of 1988, to be taken not greater than 340 m

$x$  = distance, in metres, of the mid length of the hatch cover under examination from the forward end of  $L$ .

- c. For weather deck covers for holds which may be flooded and used as ballast tanks and holds in OBO, ore or oil and similar types of ship, the pressure  $p$ , in kN/m<sup>2</sup>, due to the internal load for a member and position under consideration is to be taken as:

$$p = 5.53Y \sin q \text{ kN/m}^2$$

Where

$$\sin q = \left( 0.45 + \frac{L}{10B} \right) \left( 0.54 - \frac{L}{1270} \right)$$

$q$  = roll angle, in degrees, but need not exceed  $25^\circ$  and is not to be taken as less than  $22^\circ$

$Y$  = transverse distance, in metres, from the side coaming at the coaming top to the member and position under consideration. Both sides of roll are to be considered.

In way of holds for oil cargo, a load equivalent to the inert gas pressure is to be applied over the full breadth of the cover and added to the load corresponding to the liquid pressure. However, where the rolling angle has been determined by direct calculations, the load may be derived accordingly.

## 12. 5 Allowable stress

12. 5. 1 The normal and shear stresses calculated for the net section hatch cover structures are not to exceed the values given in [Table 7. 12. 2: Permissible stresses](#).

**Table 7. 12. 2: Permissible stresses**

| Failure mode | Permissible stress, in N/mm <sup>2</sup> |  |                  |
|--------------|--|--|------------------|
| Bending      | $\sigma_a$                               | =  | $. 0.80\sigma_F$ |
| Shear        | $\tau_a$                                 | =  | $0.46\sigma_F$   |
| Symbols      |  |  |                  |
| $\sigma_F$   |  | = minimum upper yield stress, in N/mm <sup>2</sup> |                  |

12. 5. 2 The normal stress in compression of the attached flange of primary supporting members is not to exceed 0.8 times the critical buckling stress of the structure according to the buckling check as given in [Pt 4, Ch 7, 12.10 Hatch cover plating](#), [Pt 4, Ch 7, 12.11 Hatch cover secondary stiffeners](#) and [Pt 4, Ch 7, 12.12 Web panels of hatch cover primary supporting members](#).
12. 5. 3 The stresses in hatch covers that are designed as a grillage of longitudinal and transverse primary supporting members are to be determined by a grillage or a FE analysis. When such an analysis is used the secondary stiffeners are not to be included in the attached flange area of the primary members.
12. 5. 4 When calculating the stresses  $\sigma$  and  $\tau$  as defined in [Table 7. 12. 2: Permissible stresses](#), the net scantlings are to be used.

## 12. 6 Effective cross-sectional area of panel flanges for primary supporting members

12. 6. 1 The effective flange area,  $A_f$ , in cm<sup>2</sup>, of the attached plating, to be considered for the yielding and buckling checks of primary supporting members, when calculated by means of a beam or grillage model, is obtained as the sum of the effective flange areas of each side of the girder web as appropriate:

$$A_f = \sum_{nf} (10b_{ef}t)$$

Where

$nf$  = 2 if attached plate flange extends on both sides of girder web

- $=$  1 if attached plate flange extends on one side of girder web only
- $t$  = net thickness of considered attached plate, in mm
- $b_{ef}$  = effective breadth of attached plate flange on each side of girder web, in metres
- $= b_p$ , but not to be taken greater than  $0.165\lambda$
- $b_p$  = half distance between the considered primary supporting member and the adjacent one, in metres
- $l$  = span of primary supporting members, in metres.

## 12. 7 Local net plate thickness

12. 7. 1 The local net plate thickness of the hatch cover top plating is to be not less than:

$$t = F_p 15.8s \sqrt{\frac{p}{0.95\sigma_F}}$$

or 1 per cent of the spacing of the stiffeners or 6 mm, whichever is greater

Where

- $F_p$  = factor for combined membrane and bending response
- $=$  1.50 in general
- $= 1.90\sigma/\sigma_a$ , where  $\sigma/\sigma_a \geq 0.8$ , for the attached plate flange of primary supporting members
- $s$  = stiffener spacing, in metres
- $p$  = pressure, in kN/m<sup>2</sup>, as defined in [Pt 4, Ch 7, 12.4 Load model](#)
- $\sigma$  = as defined in [Pt 4, Ch 7, 12.9 Net scantlings of primary supporting members](#)
- $\sigma_a$  = as defined in [Pt 4, Ch 7, 12.5 Allowable stress](#).

12. 7. 2 For double skin hatch covers, when the lower plating is taken into account as a strength member of the hatch cover, the local net plate thickness of the hatch cover bottom plating is to be not less than:

- $t$  = 6.5s mm, or
- $t$  = 5.0 mm, whichever is the greater

Where

- $s$  = stiffener spacing, in metres.

## 12. 8 Net scantlings of secondary stiffeners

12. 8. 1 The required minimum section modulus,  $Z$ , in cm<sup>3</sup>, of secondary stiffeners of the hatch cover top plate, based on stiffener net member thickness, is given by:

$$Z = \frac{1000l^2sp}{12\sigma_a}$$

Where

- $l$  = secondary stiffener span, in metres, to be taken as the spacing, in metres, of primary supporting members or the distance between a primary supporting member and the edge support, as applicable. When brackets are fitted at both ends of all secondary stiffener spans, the secondary stiffener span may be reduced by an amount equal to  $\frac{2}{3}$  of the minimum bracket arm length, but not greater than 10 per cent of the gross span, for each bracket
- $s$  = secondary stiffener spacing, in metres
- $p$  = pressure, in kN/m<sup>2</sup>, as defined in [Pt 4, Ch 7, 12.4 Load model](#)
- $\sigma_a$  = as defined in [Pt 4, Ch 7, 12.5 Allowable stress](#).

12. 8. 2 The net section modulus of the secondary stiffeners is to be determined based on an attached plate width assumed equal to the stiffener spacing.

## 12. 9 Net scantlings of primary supporting members

12. 9. 1 The section modulus and web thickness of primary supporting members, based on member net thickness, are to be such that the normal stress  $\sigma$  in both flanges and the shear stress  $\tau$ , in the web, do not exceed the allowable values  $\sigma_a$  and  $\tau_a$ , respectively, defined in [Pt 4, Ch 7, 12.5 Allowable stress](#).
12. 9. 2 The breadth of the primary supporting member flange is to be not less than 40 per cent of their depth for laterally unsupported spans greater than 3.0 m. Tripping brackets attached to the flange may be considered as a lateral support for primary supporting members.
12. 9. 3 The flange outstand is not to exceed 15 times the flange thickness.

## 12. 10 Hatch cover plating

12. 10. 1 The compressive stress,  $\sigma$ , in N/mm<sup>2</sup>, in the hatch cover plate panels, induced by the bending of primary supporting members parallel to the direction of secondary stiffeners, is not to exceed 0.8 times the critical buckling stress  $\sigma_{C1}$ , to be evaluated as defined below:

$$\begin{aligned}\sigma_{C1} &= \sigma_{E1} && \text{when } \sigma_{E1} \leq \sigma_F/2 \\ &= \sigma_F[1 - \sigma_F/(4\sigma_{E1})] && \text{when } \sigma_{E1} > \sigma_F/2\end{aligned}$$

Where

- $\sigma_F$  = minimum upper yield stress, in N/mm<sup>2</sup>, of the material
- $\sigma_{E1} = 3.6E \left( \frac{t}{1000_s} \right)^2$
- $E$  = modulus of elasticity, in N/mm<sup>2</sup>  
=  $2.06 \times 10^5$  for steel
- $t$  = net thickness, in mm, of plate panel

$s$  = spacing of secondary stiffeners, in metres

12. 10. 2 The mean compressive stress  $\sigma$  in each of the hatch cover plate panels, induced by the bending of primary supporting members perpendicular to the direction of secondary stiffeners, is not to exceed 0.8 times the critical buckling stress  $\sigma_{C2}$ , to be evaluated as defined below:

$$\begin{aligned}\sigma_{C2} &= \sigma_{E2} && \text{when } \sigma_{E2} \leq \sigma_F/2 \\ &= \sigma_F \left[ 1 - \sigma_F / (4\sigma_{E2}) \right] && \text{when } \sigma_{E2} > \sigma_F/2\end{aligned}$$

Where

|               |   |  |
|---------------|---|--|
| $\sigma_F$    | = | minimum upper yield stress, in N/mm <sup>2</sup> , of the material               |
| $\sigma_{E2}$ | = | $0.9mE \left( \frac{t}{1000s_s} \right)^2$                                       |
| $m$           | = | $c \left[ 1 + \left( \frac{s_s}{l_s} \right)^2 \right]^2 \frac{2.1}{\psi + 1.1}$ |
| $E$           | = | modulus of elasticity, in N/mm <sup>2</sup>                                      |
|               | = | 2.06x10 <sup>5</sup> for steel   |
| $t$           | = | net thickness of plate panel, in mm  |
| $s_s$         | = | length of the shorter side of the plate panel, in metres                         |
| $l_s$         | = | length of the longer side of the plate panel, in metres                          |
| $\Psi$        | = | ratio between smallest and largest compressive stress                            |
| $c$           | = | 1.3 when plating is stiffened by primary supporting members                      |
|               | = | 1.21 when plating is stiffened by secondary stiffeners of angle or T type        |
|               | = | 1.1 when plating is stiffened by secondary stiffeners of bulb type               |
|               | = | 1.05 when plating is stiffened by flat bar.                                      |

12. 10. 3 The biaxial compressive stress in the hatch cover panels, when calculated by means of FEM shell element model, is to comply with [Pt 3, Ch 11, 2.11 Buckling strength of hatch cover structures 2.11.2](#), using  $S=1.25$ .

## 12. 11 Hatch cover secondary stiffeners

12. 11. 1 The compressive stress  $\sigma$ , in N/mm<sup>2</sup>, in the top flange of secondary stiffeners, induced by the bending of primary supporting members parallel to the direction of secondary stiffeners, is not to exceed 0.8 times the critical buckling stress  $\sigma_{CS}$ , to be evaluated as defined below:

$$\sigma_{CS} = \sigma_{ES} \quad \text{when } \sigma_{ES} \leq \sigma_F/2$$

$$= \frac{\sigma_F [1 - \sigma_F / (4\sigma_{ES})]}{\sigma_F} \quad \text{when } \sigma_{ES} > \sigma_F / 2$$

Where

|               |   |  |
|---------------|---|--|
| $\sigma_F$    | = | minimum upper yield stress, in N/mm <sup>2</sup> , of the material   |
| $\sigma_{ES}$ | = | ideal elastic buckling stress, in N/mm <sup>2</sup> , of the secondary stiffener   |
|               | = | minimum between $\sigma_{E3}$ and $\sigma_{E4}$  |
| $\sigma_{E3}$ | = | $0.001EI_a/(Al^2)$   |
| $E$           | = | modulus of elasticity, in N/mm <sup>2</sup>  |
|               | = | $2.06 \times 10^5$ for steel   |
| $I_a$         | = | moment of inertia of the secondary stiffener, including a top flange equal to the spacing of secondary stiffeners, in cm <sup>4</sup>    |
| $A$           | = | cross-sectional area of the secondary stiffener, including a top flange equal to the spacing of secondary stiffeners, in cm <sup>2</sup> |
| $l$           | = | span of the secondary stiffener, in metres   |
| $\sigma_{E4}$ | = | $\frac{\pi^2 EI_w}{10^4 I_p l^2} \left( m^2 + \frac{K}{m^2} \right) + 0.385 E \frac{I_t}{I_p}$   |
| $K$           | = | $\frac{Cl^4}{\pi^4 EI_w} 10^6 \text{ m}$   |
| $m$           | = | number of half waves, given in <a href="#">Table 7. 12. 3: Number of half waves</a>  |
| $I_w$         | = | sectorial moment of inertia (warping constant) of the secondary stiffener about its connection with the plating, in cm <sup>6</sup>      |
|               | = | $\frac{h_w^3 t_w^3}{36} 10^{-6}$ for flat bar secondary stiffeners   |
|               | = | $\frac{t_f b_f^3 h_w^2}{12} 10^{-6}$ 'Tee' secondary stiffeners  |
|               | = | $\frac{b_f h^2 w^3}{12 (b_f + h_w)^2} [t_f (b_f^2 + 2b_f h_w + 4h_w^2) + 3t_w b_f h_w] 10^{-6}$  |
|               | = | for angles and bulb secondary stiffeners   |
| $I_p$         | = | polar moment of inertia of the secondary stiffener about its connection with the plating, in cm <sup>4</sup>                             |
|               | = | $\frac{h_w^3 t_w}{3} 10^{-4}$ for flat bar secondary stiffeners  |
|               | = | $\left( \frac{h_w^3 t_w}{3} + h_w^2 b_f t_f \right) 10^{-4}$   |

|               |   |  |
|---------------|---|--|
|               | = | for flanged secondary stiffeners   |
| $I_t$         | = | St.Venant's moment of inertia of the secondary stiffener without top flange, in cm <sup>4</sup>                      |
|               | = | $\frac{h_w^3 t_w}{3} 10^{-4}$ for flat secondary stiffeners  |
|               | = | $\frac{1}{3} \left[ h_w t_w^3 + b_f t_f^3 \left( 1 - 0.63 \frac{t_f}{b_f} \right) \right] 10^{-4}$                   |
|               | = | for flanged secondary stiffeners   |
| $h_w, t_w$    | = | height and net thickness of the secondary stiffener, respectively, in mm   |
| $b_f, t_f$    | = | width and net thickness of the secondary stiffener bottom flange, respectively, in mm                                |
| $s$           | = | spacing of secondary stiffeners, in metres   |
| $C$           | = | spring stiffness exerted by the hatch cover top plating  |
|               | = | $\frac{k_p E t_p^3}{3s \left[ 1 + \frac{1.33 k_p h_w t_p^3}{1000 s t_w^3} \right]} 10^{-3}$                          |
| $k_p$         | = | $1 - \eta_p$ to be taken not less than zero; for flanged secondary stiffeners, $k_p$ need not be taken less than 0.1 |
| $\eta_p$      | = | $\frac{\sigma}{\sigma_{E1}}$   |
| $\sigma$      | = | as defined in <a href="#">Pt 4, Ch 7, 12.9 Net scantlings of primary supporting members</a>                          |
| $\sigma_{E1}$ | = | as defined in <a href="#">Pt 4, Ch 7, 12.10 Hatch cover plating</a>  |
| $t_p$         | = | net thickness of the hatch cover plate panel, in mm.   |

**Table 7. 12. 3: Number of half waves**

|  |   |
|--|---|
| $K$                                    | m |
| $0 < K < 4$                            | 1 |
| $4 < K < 36$                           | 2 |
| $36 < K < 144$                         | 3 |
| $(m - 1)^2 m^2 < K \leq m^2 (m + 1)^2$ | m |

12. 11. 2 For flat bar secondary stiffeners and buckling stiffeners, the ratio  $h/t_w$  is to be not greater than  $15k^{0.5}$

$h, t_w$  = height and net thickness of the stiffener, respectively

$k$  =  $235/\sigma_F$

$\sigma_F$  = minimum upper yield stress, in N/mm<sup>2</sup>, of the material.

## 12. 12 Web panels of hatch cover primary supporting members

12. 12. 1 This check is to be carried out for the web panels of primary supporting members formed by web stiffeners or by the crossing with other primary supporting members, the face plate (or the bottom cover plate) or the attached top cover plate.
12. 12. 2 The shear stress  $\tau$  in the hatch cover primary supporting members web panels is not to exceed 0.8 times the critical buckling stress  $\tau_C$ , to be evaluated as defined below:

$$\begin{aligned}\tau_C &= \tau_E && \text{when } \tau_E \leq \tau_F/2 \\ &= \tau_F [1 - \tau_F/(4\tau_E)] && \text{when } \tau_E > \tau_F/2\end{aligned}$$

Where

$$\begin{aligned}\sigma_F &= \text{minimum upper yield stress of the material, in N/mm}^2 \\ \tau_F &= \frac{\sigma_F}{\sqrt{3}} \\ \tau_E &= 0.9k_tE \left( \frac{t_{pr,n}}{1000d} \right)^2 \\ E &= \text{modulus of elasticity, in N/mm}^2 \\ &= 2.06 \times 10^5 \text{ for steel} \\ t_{pr,n} &= \text{net thickness of primary supporting member, in mm} \\ k_t &= 5.35 + 4.0/(a/d)^2 \\ a &= \text{greater dimension of web panel of primary supporting member, in metres} \\ d &= \text{smaller dimension of web panel of primary supporting member, in metres.}\end{aligned}$$

12. 12. 3 For primary supporting members parallel to the direction of secondary stiffeners, the actual dimensions of the panels are to be considered.
12. 12. 4 For primary supporting members perpendicular to the direction of secondary stiffeners or for hatch covers built without secondary stiffeners, a presumed square panel of dimension  $d$  is to be taken for the determination of the stress  $\tau_C$ . In such a case, the average shear stress  $\tau$  between the values calculated at the ends of this panel is to be considered.

## 12. 13 Deflection limit and connections between hatch cover panel

12. 13. 1 Load bearing connections between the hatch cover panels are to be fitted with the purpose of restricting the relative vertical displacements.
12. 13. 2 The vertical deflection of primary supporting members is to be not more than  $0.0056l$ , where  $l$  is the greatest span of primary supporting members.

**13. 1 General**

13. 1. 1 The height and construction of forward and side hatch coamings are to comply with the following requirements. All hatch coamings are to comply with the requirements of [Pt 3, Ch 11, 5.1 General 5.1.1](#), [Pt 3, Ch 11, 5.1 General 5.1.4](#), [Pt 3, Ch 11, 5.2, Construction 5.2.1](#), [Pt 3, Ch 11, 5.2 Construction 5.2.2](#), [Pt 3, Ch 11, 5.2 Construction 5.2.4](#) to [Pt 3, Ch 11, 5.2 Construction 5.2.12](#), [Pt 3, Ch 11, 5.2 Construction 5.2.16](#) to [Pt 3, Ch 11, 5.2 Construction 5.2.18](#) and [Pt 3, Ch 11, 5.4 Rest bars in hatchways 5.4.1](#).
13. 1. 2 For the structure of hatch coamings and coaming stays, the corrosion addition  $t_c$  is to be 1.5 mm.
13. 1. 3 Material for the hatch coamings is to be steel according to the requirements for the ship's hull.
13. 1. 4 The secondary stiffeners of the hatch coamings are to be continuous over the breadth and length of the hatch coamings.

**13. 2 Load model**

13. 2. 1 The pressure  $p_{\text{coam}}$ , on hatch coamings is to be taken as 220 kN/m<sup>2</sup>.

**13. 3 Local net plate thickness**

13. 3. 1 The local net plate thickness,  $t$ , in mm, of the hatch coaming plating is to be the greater of 9.5 mm or the following:

$$t = 14.9s \sqrt{\frac{p_{\text{coam}}}{\sigma_{a, \text{coam}}}} S_{\text{coam}}$$

Where

$s$  = secondary stiffener spacing, in metres

$P_{\text{coam}}$  = pressure, in kN/m<sup>2</sup>, as defined in [Pt 4, Ch 7, 13.2 Load model 13.2.1](#)

$S_{\text{coam}}$  = safety factor to be taken equal to 1.15

$\sigma_{a, \text{coam}}$  =  $0.95\sigma_F$ .

$\sigma_F$  = minimum upper yield stress, in N/mm<sup>2</sup>, of the material.

## 13. 4 Net scantlings of longitudinal and transverse secondary stiffeners

13. 4. 1 The required section modulus,  $Z$ , in  $\text{cm}^3$ , of the longitudinal or transverse secondary stiffeners of the hatch coamings, based on net member thickness, is given by:

$$Z = \frac{1000S_{\text{coam}}l^2sp_{\text{coam}}}{mc_p\sigma_{a,\text{coam}}}$$

Where

- |                          |   |   |
|--------------------------|---|---|
| $m$                      | = | 16 in general   |
|                          | = | 12 for the end spans of stiffeners sniped at the coaming corners  |
| $S_{\text{coam}}$        | = | safety factor to be taken equal to 1.15   |
| $l$                      | = | span of secondary stiffeners, in metres   |
| $s$                      | = | spacing of secondary stiffeners, in metres  |
| $p_{\text{coam}}$        | = | pressure in $\text{kN/m}^2$ as defined in <a href="#">Pt 4, Ch 7, 13.2 Load model 13.2.1</a>  |
| $c_p$                    | = | ratio of the plastic section modulus to the elastic section modulus of the secondary stiffeners with an attached plate breadth equal to $40t$ , where $t$ is the plate net thickness, in mm |
|                          | = | 1.16 in the absence of more precise evaluation  |
| $\sigma_{a,\text{coam}}$ | = | $0.95\sigma_F$  |
| $\sigma_F$               | = | minimum upper yield stress, in $\text{N/mm}^2$ , of the material.   |

## 13. 5 Net scantlings of coaming stays

13. 5. 1 The required minimum section modulus,  $Z$ , in  $\text{cm}^3$ , and web thickness,  $t_w$ , in mm of coaming stays designed as beams with flange connected to the deck or sniped and fitted with a bracket (See [Figure 7. 13. 1: Typical coaming stays](#), Type A and B) at their connection with the deck, based on member net thickness, are given by:

$$Z = \frac{1000H_c^2sp_{\text{coam}}}{2\sigma_{a,\text{coam}}}$$

$$t_w = \frac{1000H_c^sp_{\text{coam}}}{h\tau_{a,\text{coam}}}$$

Where

- |                          |   |   |
|--------------------------|---|---|
| $H_c$                    | = | stay height, in metres  |
| $s$                      | = | stay spacing, in metres   |
| $h$                      | = | stay depth at the connection with the deck, in mm   |
| $p_{\text{coam}}$        | = | pressure, in $\text{kN/m}^2$ , as defined in <a href="#">Pt 4, Ch 7, 13.2 Load model 13.2.1</a> |
| $\sigma_{a,\text{coam}}$ | = | $0.95\sigma_F$  |
| $t_{a,\text{coam}}$      | = | $0.5\sigma_F$   |

$\sigma_F$  = minimum upper yield stress, in N/mm<sup>2</sup>, of the material.

**Figure 7. 13. 1: Typical coaming stays**

13. 5. 2 For calculating the section modulus of coaming stays, their face plate area is to be taken into account only when it is welded with full penetration welds to the deck plating and adequate underdeck structure is fitted to support the stresses transmitted by it.
13. 5. 3 For other designs of coaming stays, such as those shown in [Figure 7. 13. 1: Typical coaming stays](#) Type C and D, the stress levels in 12.5 apply and are to be checked at the highest stressed locations.

## 13. 6 Local details

13. 6. 1 The design of local details is to comply with [Pt 3, Ch 11, 5 Hatch coamings](#) for the purpose of transferring the pressures on the hatch covers to the hatch coamings and, through them, to the deck structures below. Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions.
13. 6. 2 Underdeck structures are to be checked against the load transmitted by the stays, adopting the same allowable stresses specified in [Pt 4, Ch 7, 13.5 Net scantlings of coaming stays 13.5.1](#).
13. 6. 3 Double continuous welding is to be adopted for the connections of stay webs with deck plating and the weld throat is to be not less than  $0.44t_w$ , where  $t_w$  is the gross thickness of the stay web.
13. 6. 4 Toes of stay webs are to be connected to the deck plating with deep penetration double bevel welds extending over a distance not less than 15 per cent of the stay width.

**14. 1 Arrangement**

14. 1. 1 An enclosed forecastle is to be fitted on the freeboard deck.
14. 1. 2 The aft bulkhead of the forecastle is to be fitted in way or aft of the forward bulkhead in the foremost cargo hold. See [Figure 7. 14. 1: Forecastle arrangement](#). However, if this requirement hinders hatch cover operation, the aft bulkhead of the forecastle may be fitted forward of the forward bulkhead of the foremost cargo hold provided the forecastle length is not less than 7 per cent of ship length abaft the forward perpendicular where the ship length and forward perpendicular are defined in the *International Convention on Load Lines 1966* and its Protocol of 1988.

**Figure 7. 14. 1: Forecastle arrangement**

14. 1. 3 The forecastle height  $H_F$ , in metres, above the main deck is to be not less than the greater of:
- the standard height of a superstructure as specified in the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988* ; or
  - $H_C + 0.5$  m
14. 1. 4 All points of the aft edge of the forecastle deck are to be located at a distance:

$$l_f < 5\sqrt{(H_F - H_C)}$$

from the hatch coaming, See [Figure 7. 14. 1: Forecastle arrangement](#).

14. 1. 5 A breakwater is not to be fitted on the forecastle deck with the purpose of protecting the hatch coaming or hatch covers. If fitted for other purposes, it is to be located such that its upper edge at centre line is not less than:

$$H_B / \tan 20^\circ$$

forward of the aft edge of the forecastle deck.

Where

$H_B$  = the height, in metres, of the breakwater above the forecastle, See [Figure 7. 14. 1: Forecastle arrangement](#).

## 14. 2 Construction

14. 2. 1 The construction of the forecastle is to comply with the requirements of [Pt 3, Ch 8, 4 Forecastles](#).

**CHAPTER 8 Container Ships****SECTION 1 General****1.1 Application and definitions**

- 1.1.1 A **container ship** is defined as a ship designed exclusively for the carriage of containers in holds and on deck. Containers in holds are normally stowed within cellular guide systems.
- 1.1.2 The term 'narrow side structures' applies where the breadth of hatch opening exceeds 90 per cent of the breadth of the ship.
- 1.1.3 Other terms used to describe the various structural components of container ships are generally indicated in *ACSPlus FDA Guideline, Structural Detail Design Guide*.
- 1.1.4 Scantlings and arrangements of container ships are to be as required by [Pt 4, Ch 1 General Cargo Ships](#), except as otherwise indicated in this Chapter.

**Figure 8. 1. 1: Structural configuration**

## 1.2 Structural configuration

- 1.2.1 [Figure 8. 1. 1: Structural configuration](#) shows the typical structural configuration of a container ship covered by the requirements of this Chapter. The typical configuration includes:
  - a. An efficient torsion box girder or equivalent structure at the topsides comprising strength deck, side shell, inner skin and a second deck. The space within the torsion box is often utilised as an underdeck access passageway.
  - b. Single or double skin side construction with or without bilge box.
  - c. Double bottom.
  - d. Continuous or discontinuous hatch coamings.
  - e. Optional continuous deck girders to support hatch covers.
- 1.2.2 For container ships which do not conform to the above configuration, the application of this Chapter will be specially considered

## 1.3 Class notations

- 1.3.1 In general, ships complying with the requirements of this Chapter will be eligible to be classed **100A1 Container Ship**.
- 1.3.2 ‘ACSPlus Guidelines’ for the hull construction of ships are detailed in [Pt 3, Ch 16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships](#) and the associated notations and descriptive notes are given in [Pt 1, Ch 2, 2.2 Character symbols](#).
- 1.3.3 The ACSPlus notations **SDA** (Structural Design Assessment) and subsequently **CM** (Construction Monitoring) are mandatory for container ships with a beam greater than 32 m or a length greater than 150 m or where the type, size and structural configuration demand, including container ships with narrow side structures, abnormal hull form or unusual structural configuration or complexity.
- 1.3.4 For large container ships, the effects of whipping and springing on the structural integrity are to be addressed. The ACSPlus notations **WDA** (Whipping Design Assessment) and **FDA SPR** (Springing Fatigue Assessment) are mandatory for ships that meet the application criteria specified in [Pt 4, Ch 8, 14.3, Procedures for verification of structural response due to whipping, springing and fatigue](#), See also [Table 8. 14. 1: Summary of direct calculation analysis requirements for container ships](#).
- 1.3.5 The ACSPlus notations **SDA**, **FDA**, **FDA SPR**, **WDA** may be applied on a voluntary basis. In which case all the requirements of the relevant procedures and supporting procedures are to be applied.

## 1.4 Information required

- 1.4.1 In addition to the information and plans required by [Pt 3, Ch 1, 5 Information required](#), the following are to be submitted:
  - a. Details of overlap arrangement of steps in decks and longitudinal bulkheads.
  - b. Details of outline stowage arrangement of containers.
  - c. Details of design container stack weights.
  - d. Details of cell guides and supporting structure indicating the position of guides relative to hatch corners, and attachment to structural members.
  - e. Details of reinforcement to structure in way of container corners/supports.
  - f. Details of reinforcement to structure in way of lashing bridges where fitted.
  - g. Details showing the location of all openings in decks within the cargo holds.
  - h. Details of longitudinal girders supporting hatch coamings where fitted.
  - i. Detailed arrangements for crack arrest design, See [Pt 4, Ch 8, 2.3, Requirements for use of thick steel plates](#).

## 1. 5 Symbols and definitions

1. 5. 1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

$L, L_{pp}, B, D, T, V, C_b$  as defined in [Pt 3, Ch 1, 6 Definitions](#)

$e$  = base of natural logarithms, 2.7183

$k_L, k$  = higher tensile steel factor, See [Pt 3, Ch 2, 1 Materials of construction](#)

$s$  = spacing of secondary stiffeners, in mm

$s_I$  = spacing of secondary stiffeners, but is not to be taken less than  $470 + 1.67L$  mm

$t$  = thickness of plating, in mm

$L_I$  =  $L$  but need not be taken greater than 190 m.

CHAPTER **8** **Container Ships**SECTION **2** **Materials****2. 1 Materials**

- 2. 1. 1 Materials are to comply with [Pt 3, Ch 2 Materials](#).
- 2. 1. 2 Attention is drawn to the specific requirements for container ship hatch corners in [Table 2. 2. 1: Buckling factors of safety,  \$\lambda\$](#) , Note 1 in [Pt 3, Ch 2 Materials](#).

**2. 2 Protection of steelwork**

- 2. 2. 1 In addition to the requirements of [Pt 3, Ch 2, 3 Corrosion protection](#) the requirements of [Pt 4, Ch 1, 2.2 Protection of steelwork 2.2.3](#) may also be applied.

**2. 3 Requirements for use of thick steel plates**

- 2. 3. 1 This Section provides the requirements for crack arrest design to reduce the risk of brittle fractures in container ships where thick steel plates are applied for longitudinal structural members within the cargo hold region.
- 2. 3. 2 This Section is to be applied to container ships where the steel plates for longitudinal structural members exceed a thickness of 50 mm but are not greater than 100 mm. Special consideration is required for plates with a thickness exceeding 100 mm.
- 2. 3. 3 This Section applies to plates having specified minimum yield strength of 355, 390 and 460 N/mm<sup>2</sup>. Steels and weldments are to comply with the toughness requirements of [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#), [Ch 11 Approval of Welding Consumables](#) and [Ch 12 Welding Qualifications of Pt 2 Rules for the Manufacture, Testing and Certification of Materials](#).
- 2. 3. 4 The approach in this Section generally applies to the erection block-to-block joints. Appropriate measures are to be considered to prevent large scale fracture of the hull girder in anticipation of the following:
  - a. Crack initiation in the block-to-block butt weld joint in either the hatch side coaming or upper deck. Crack propagates along the butt weld joint without deviation.
  - b. Crack initiation in the block-to-block butt weld joint in either the hatch side coaming or upper deck. Crack propagates away from the butt weld joint running into base metal.
  - c. Crack initiation in any welded joint, for example in way of attachment welds, and deviates away from the butt weld joint running into base metal.
- 2. 3. 5 The detailed arrangements for crack arrest design are to be submitted for approval.
- 2. 3. 6 A number of measures are given in [Table 8. 2. 1: Preventative measures to be used in design and construction for thick steel plates](#) which are considered to be acceptable means of addressing the cases given in [Pt 4, Ch 8, 2.3., Requirements for use of thick steel plates 2.3.4](#). A range of thicknesses is shown for the different strength grades of steel. Where the maximum as-built

thickness of the hatch coaming top plate and side plate falls within this range, measures are to be selected as shown in the Table. If the as-built thickness of the hatch coaming top plate and side plate is below the values contained in the Table, then additional measures are not necessary regardless of the thickness and yield strength of the upper deck plating. The application of these measures is described in [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.7](#) to [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.11](#).

- 2.3.7 Where Measure 1 is required in [Table 8.2.1: Preventative measures to be used in design and construction for thick steel plates](#), 100 per cent ultrasonic testing in accordance with [Ch 13, 2.12 Non-destructive examination of welds of Pt 2 Rules for the Manufacture, Testing and Certification of Materials](#), both application and acceptance criteria, is to be carried out on all block-to-block butt joints of all upper flange longitudinal structural members in the cargo hold region. Upper flange longitudinal structural members include the topmost strakes of the inner hull/bulkhead, the sheer strake, main deck, coaming plate, coaming top plate, and all attached longitudinal stiffeners. These members are defined in [Figure 8.2.1: Upper flange longitudinal structural members](#).

**Table 8.2.1: Preventative measures to be used in design and construction for thick steel plates**

| Nominal yield strength (N/mm <sup>2</sup> )   | Thickness of hatch coaming plating See Note 3 (mm) | Measure, See Note 1 |              |              |              |              |
|---|--|---------------------|--------------|--------------|--------------|--------------|
|   |  | 1                   | 2            | 3            | 4 See Note 2 | 5 See Note 2 |
| 355   | 50 < t ≤ 85  | Not required        | Not required | Not required | Not required | Not required |
|   | 85 < t ≤ 100                                       | Required            | Not required | Not required | Not required | Not required |
| 390   | 50 < t ≤ 85  | Required            | Not required | Not required | Not required | Not required |
|   | 85 < t ≤ 100                                       | Required            | Required     | Required     | Not required | Not required |
| 460   | 50 < t ≤ 85  | Required            | Required     | Required     | Not required | Not required |
|   | 85 < t ≤ 100                                       | Required            | Required     | Required     | Not required | Not required |
| Key to measures:  |  |                     |              |              |              |              |
| Measure 1: NDE during construction on all upper flange longitudinal members, See <a href="#">Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.7</a>               |  |                     |              |              |              |              |
| Measure 2: Block shift, crack arrest insert plates, crack arrest holes and enhanced NDE, See <a href="#">Pt 4, Ch 8, 2.3., Requirements for use of thick steel plates 2.3.8</a> |  |                     |              |              |              |              |
| Measure 3: Crack arrest steel for the upper deck, See <a href="#">Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.9</a>  |  |                     |              |              |              |              |
| Measure 4: Periodic in-service NDE, See <a href="#">Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.10</a>   |  |                     |              |              |              |              |
| Measure 5: Tough welds, See <a href="#">Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.11</a>   |  |                     |              |              |              |              |

**Note 1.** Measures are to be applied where 'Required' is shown.

**Note 2.** Measures 4 and 5 are only required where enhanced NDE during construction has been applied as part of Measure 2

**Note 3.** Hatch coaming plating includes side plating and top plating

**Figure 8. 2. 1: Upper flange longitudinal structural members**

2. 3. 8 Where Measure 2 is required in [Table 8. 2. 1: Preventative measures to be used in design and construction for thick steel plates](#), the following are considered to be acceptable examples of brittle crack arrest design for the case given in [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.4.a](#):
- Where the block-to-block butt welds of the hatch side coaming plate and those of the upper deck are staggered, this offset is to be greater than or equal to 300 mm. This offset distance is defined in [Figure 8. 2. 2: Minimum offset between block-to-block butt welds of the hatch side coaming and those of the upper deck staggered](#). Brittle crack arrest steel, as defined in [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.12](#), is to be provided for the hatch side coaming plate.
  - Where crack arrest holes are provided in way of the block-to-block butt welds at the region where the hatch side coaming weld meets the deck weld, See [Figure 8. 2. 3: Crack arrest hole in way of the block-to-block butt weld at the region where hatch side coaming weld meets the deck weld](#), the corners of the crack arrest holes located where the hatch side coaming joints meet the deck weld are to be specially assessed for fatigue strength. The fatigue strength is also to be assessed at the location where the block-to-block butt weld intersects the crack arrest hole. Brittle crack arrest steel, as defined in [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.12](#), is to be provided for the hatch side coaming plate.
  - Where higher crack arrest steel insert plates such as SUF (Surface Layer with Ultras-Fine grain) steel or equivalent, or weld metal inserts with high crack arrest toughness properties

are provided in way of the block-to-block butt welds at the region where hatch side coaming weld meets the deck weld. Brittle crack arrest steel, as defined in [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.12](#), is to be provided for the hatch side coaming plate.

- d. As an alternative to the provision of crack arrest steel for the hatch coaming side plate stipulated in [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.8.a](#), [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.8.b](#) and [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.8.c](#), enhanced non-destructive examination can be carried out in association with stricter acceptance criteria. The acceptance criteria are to be determined through the means of an engineering critical assessment (ECA) to be carried out in accordance with Chapter 2 of the *ACSPlus Guidelines for the Use of Enhanced NDE in Container Ships*, and the enhanced NDE is to be carried out in accordance with Chapter 3 of the *ACSPlus Guideline for the Use of Enhanced NDE in Container Ships*. Other mechanical means of crack arrest such as block shift, crack arrest insert plates and crack arrest holes are still to be fitted. This approach also requires a programme of non-destructive testing during the lifetime of the ship, See [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.10](#). The weld toughness of the block to block butt welds of the hatch coaming side plate, hatch coaming top plate and upper deck is to be as required by [Pt 4, Ch 8, 2.3., Requirements for use of thick steel plates 2.3.8](#) and EGW welding is not permitted.

**Figure 8. 2. 2: Minimum offset between block-to-block butt welds of the hatch side coaming and those of the upper deck staggered**

**Figure 8. 2. 3: Crack arrest hole in way of the block-to-block butt weld at the region where hatch side coaming weld meets the deck weld**

- 2. 3. 9 Where Measure 3 is required in [Table 8. 2. 1: Preventative measures to be used in design and construction for thick steel plates](#) for the cases given in [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.4.b](#) and [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.4.c](#), the use of brittle crack arrest steel, as defined in [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.12](#), for the upper deck along the cargo hold region is considered to be an acceptable means to arrest a brittle crack initiating from the coaming side and top plate and propagating into the structure below.
- 2. 3. 10 Where Measure 4 is required in [Table 8. 2. 1: Preventative measures to be used in design and construction for thick steel plates](#), periodic NDE during service is to be carried out in accordance with Chapter 3 of the *ACSPlus Guideline for the Use of Enhanced NDE in Container Ships*.
- 2. 3. 11 Where Measure 5 is required in [Table 8. 2. 1: Preventative measures to be used in design and construction for thick steel plates](#), the block to block butt welds of the hatch coaming side plate, hatch coaming top plate and upper deck are to have a minimum crack tip opening displacement (CTOD) value of 0.18 mm. The CTOD tests to confirm the CTOD value are to be carried out to the satisfaction of ACS.
- 2. 3. 12 Brittle crack arrest steel is to be in accordance with [Pt 2 Rules for the Manufacture, Testing and Certification of Materials, Ch 3, 3 Higher strength steels for ship and other structural applications](#).
- 2. 3. 13 Where higher crack arrest steel or weld inserts are proposed, as given in [Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.8.c](#), the specific properties or grades of material are to be agreed with ACS.

CHAPTER **8** **Container Ships**SECTION **3** **Longitudinal strength****3.1 General**

- 3.1.1 Longitudinal strength calculations are to be carried out in accordance with [Pt 4, Ch 8, 3.2 Longitudinal strength](#) and [Pt 4, Ch 8, 3.3 Combined longitudinal and torsional strength 3.3.1](#)
- 3.1.2 Alternatively the values and distributions of wave induced loads may be derived by direct calculation in accordance with *ACSPlus Guidance Notes on the Assessment of Global Design Loads of Large Container Ships and Other Ships Prone to Whipping and Springing*.
- 3.1.3 For ships of abnormal hull form, or for ships of unusual structural configuration or complexity, the values and distributions of wave induced loads are to be agreed with ACS. ACS may decide to mandate the application of the ACSPlus notations; **SDA**, **FDA**, **FDA SPR** or **WDA**.

**3.2 Longitudinal strength**

- 3.2.1 Longitudinal strength calculations are to be made in accordance with the requirements of [Pt 4, Ch 8, 16 Longitudinal strength calculations](#) and the additional notes contained in this Section and [Pt 4, Ch 8, 14 Direct calculation](#).
- 3.2.2 The wave vertical bending moments and shear forces given in [Pt 4, Ch 8, 16 Longitudinal strength calculations](#) apply to mono-hull displacement ships in unrestricted service and are limited to ships meeting the following criteria:
  - a.  $65 \text{ m} \leq L \leq 500 \text{ m}$
  - b.  $5 \leq L/B \leq 9$
  - c.  $2 \leq B/T \leq 6$
  - d.  $0.55 \leq C_B \leq 0.9$
 For ships which do not meet the above criteria, the wave vertical bending moments and shear forces are to be specially considered.
- 3.2.3 In order to determine the local reduction factors,  $F_D$  and  $F_B$ , longitudinal strength calculations are to be made in accordance with the requirements of [Pt 3, Ch 4 Longitudinal Strength](#) where  $M_w$  is to be calculated in accordance with [Pt 4, Ch 8, 16.6, Design vertical wave bending moments](#).
- 3.2.4 For operation in sheltered water or short voyages, See [Pt 3, Ch 4, 5.2 Design vertical wave bending moments 5.2.3](#) and [Pt 3, Ch 4, 5.4 Minimum hull section modulus 5.4.3](#) where  $M_w$  is to be calculated in accordance with [Pt 4, Ch 8, 16.6, Design vertical wave bending moments](#).

**3.3 Combined longitudinal and torsional strength**

- 3.3.1 The strength of the ship to resist a combination of longitudinal and torsional loads is to be determined in accordance with [Pt 4, Ch 8, 15.1 Application](#).

CHAPTER 8 **Container Ships**SECTION 4 **Deck structure****4. 1 General**

- 4. 1. 1 The requirements of [Pt 4, Ch 1, 4 Deck structure](#) are to be complied with as modified by this Section.
- 4. 1. 2 The strength deck is to be longitudinally framed throughout the region of container holds for ships where  $L \geq 100\text{m}$ .
- 4. 1. 3 Lower decks/side stringers are to be efficiently scarfed into the machinery space, and the fore end and aft end structure.
- 4. 1. 4 The *ACSPlus FDA Guideline, Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of deck structures.

**4. 2 Primary supporting structure**

- 4. 2. 1 Where decks form part of the primary support structures described in [Pt 4, Ch 8, 6.2 Side shell primary supporting structure](#) and [Pt 4, Ch 8, 9.2 Transverse watertight/non-watertight bulkhead primary supporting structure](#) the scantlings of the decks are to be verified by direct calculation procedures in accordance with [Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings](#).

**4. 3 Deck plating and stiffeners**

- 4. 3. 1 Strength/weather deck scantlings outside the line of hatch openings are to satisfy the requirements of [Pt 4, Ch 8, 3 Longitudinal strength](#) and [Pt 4, Ch 8, 4.2 Primary supporting structure](#), and are to be not less than required by [Pt 4, Ch 1, 4.2 Deck plating](#) and [Pt 4, Ch 1, 4.3 Deck stiffening](#).
- 4. 3. 2 Within the cargo holds, strength/weather/second deck scantlings inside the line of hatch openings are to satisfy the requirements of [Pt 4, Ch 8, 3 Longitudinal strength](#), [Pt 4, Ch 8, 4.2 Primary supporting structure](#) and [Pt 4, Ch 8, 4.4, Cross decks](#).
- 4. 3. 3 Other deck scantlings are to satisfy the requirements of [Pt 4, Ch 8, 3 Longitudinal strength](#), [Pt 4, Ch 8, 4.2 Primary supporting structure](#) and [Pt 4, Ch 1, 4 Deck structure](#) as appropriate.

**4. 4 Cross decks**

- 4. 4. 1 The width and scantlings of cross-deck strips are to satisfy the requirements of [Pt 4, Ch 8, 4.2 Primary supporting structure](#). The thickness,  $t$ , of cross-deck strips is to comply with the requirements of [Table 8. 4. 1: Cross deck plating](#).

**Table 8. 4. 1: Cross deck plating**

| Location   | Minimum thickness, in mm   |
|--|--|
| At strength deck   | The greater of the following:<br>(a) $t = 0.012 s_1$<br>(b) $t = 10 + 0.01L_1$               |
| At second deck   | The greater of the following:<br>(a) $t = 0.012 s_1$ but need not exceed 12<br>(b) $t = 8.0$ |
| Symbols  |  |
| $s_1$ and $L_1$ as defined in <a href="#">Pt 4, Ch 8, 1.5 Symbols and definitions 1.5.1.</a> |  |

4. 4. 2 The thickness may require to be increased locally in way of access openings.
4. 4. 3 Where the difference between the thickness of plating inside and outside the line of main hatchway openings exceeds 25 mm, a single transition plate is to be fitted at the end of the cross deck strip. The thickness of the transition plate is to be equal to the mean of the adjacent plate thicknesses.
4. 4. 4 The scantlings of cross-deck stiffeners are to comply with [Pt 4, Ch 1, 4 Deck structure.](#)
4. 4. 5 For initial design purposes the width of the cross deck strips,  $w$ , forming a transverse bulkhead top box (or equivalent) can be estimated according to the following formula:

$$w = 32.5B + 400, \text{ or } 1000\text{mm, whichever is the greater}$$

where  $B$  is given in [Pt 4, Ch 8, 1.5 Symbols and definitions 1.5.1.](#)

## 4. 5 Deck openings

4. 5. 1 The corners of main hatchway openings are generally to be rounded. However, corners with negative radii, or parabolic or elliptic profiles will be specially considered.
4. 5. 2 The design of hold corners including deck thickness and corner profile is to comply with either [Pt 4, Ch 8, 4.5 Deck openings 4.5.3](#) or [Pt 4, Ch 8, 4.5 Deck openings 4.5.4.](#)
4. 5. 3 The design of hatch corners is to be verified by direct calculations, See [Pt 4, Ch 8, 14.1 Procedures for calculation of combined longitudinal and torsional strength 14.1.1.](#)
4. 5. 4 Alternatively, where the design of hatch corners has not been verified by direct calculations:
- The outboard radius of main hatchway openings at strength deck level is, in general, to be not less than 35 per cent of the width of the cross-deck strip indicated in [Pt 4, Ch 8, 4.4 Cross decks 4.4.5](#) with a minimum of 300 mm.
  - The radius of the hatch corners of the main hatchway openings adjacent to the engine room is to be made as large as practicable, with a radius of approximately  $40B$  mm.
  - Insert plates at main hatch corners are to have an increased thickness above the adjacent plating outside the line of hatchways of 15 per cent in way of the container holds, and 25 per cent in container holds at engine room bulkheads. The minimum increase is to be not less than 4.0 mm, nor need exceed 7.0 mm, and the minimum fore and aft extent is to be 1.0 m from the edge of the openings.

## 4. 6 Local reinforcement

4. 6. 1 Attention is to be paid to structural continuity, and abrupt changes of shape, section or plate thickness are to be avoided, particularly in highly stressed areas. Arrangements in way of openings are to be such as to minimise the creation of stress concentrations.

- 4. 6. 2 In general, large access openings are not to be arranged in the strength deck outside the line of main hatchways in the region of container holds.
- 4. 6. 3 Small openings, such as those for ventilation pipes or scuppers, are to be kept clear of hold corners, ends of longitudinal hatch coamings, ends of cross-deck strips and other critical locations.

## 4. 7 Support for container corner seats

- 4. 7. 1 In general, local stiffening is to be fitted under seats for container supports.
- 4. 7. 2 The design of attachments to the strength deck is to minimise the effects of stress concentration, and consideration is to be given to the strength and grade of welding consumable used, *See, [Ch 13, 2.2 Welding consumables 2.2.2 of Pt 2 Rules for the Manufacture, Testing and Certification of Materials.](#)*
- 4. 7. 3 The strength of support arrangements is to be verified in accordance with [Pt 3, Ch 14, 4 Ship structure.](#)
- 4. 7. 4 Doubler plates are not to be utilised in connections subject to tensile loads.

## **5. 1 General**

- 5. 1. 1 The requirements of [Pt 4, Ch 1, 5 Shell envelope plating](#) are to be applied, together with the requirements of this Section.
- 5. 1. 2 The bottom shell is, in general, to be longitudinally framed for ships where  $L \geq 100$  m.
- 5. 1. 3 The side shell may be longitudinal or transversely framed, except in way of the topside torsion box which is, in general, to be longitudinally framed.

## **5. 2 Bottom shell and bilge**

- 5. 2. 1 The thickness of the bottom shell plating is to satisfy the requirements of [Pt 4, Ch 8, 3 Longitudinal strength](#) and [Pt 4, Ch 8, 7.2 Double bottom primary supporting structure](#) and is to be not less than required by [Pt 4, Ch 1, 5.3 Bottom shell and bilge](#).
- 5. 2. 2 In regions where transverse framing is adopted, particularly towards the end of the ship, the buckling stability of the plating will be specially considered.

## **5. 3 Side shell and sheerstrake**

- 5. 3. 1 The thickness of the side shell and sheerstrake plating is to satisfy the requirements of [Pt 4, Ch 8, 3 Longitudinal strength](#) and [Pt 4, Ch 8, 6.2 Side shell primary supporting structure](#) and is to be not less than required by [Pt 4, Ch 1, 5.4 Side shell](#).
- 5. 3. 2 At positions where high shear forces are present, local increases in thickness may be required.
- 5. 3. 3 The difference in thickness between the sheerstrake and shell plating below is not to exceed 25 mm.

CHAPTER **8** **Container Ships**SECTION **6** **Shell envelope framing****6. 1 General**

- 6. 1. 1 The requirements of [Pt 4, Ch 1, 6 Shell envelope framing](#) are to be applied, together with the requirements of this Section.
- 6. 1. 2 The *ACSPlus FDA Guideline, Structural Detail Design Guide (SDDG)* indicates recommended examples of configurations for end connections of shell envelope longitudinals.

**6. 2 Side shell primary supporting structure**

- 6. 2. 1 A primary supporting structure for side shell envelope framing is to be provided of either single or double skin construction. This normally consists of a combination of vertical transverse webs and horizontal side stringers/decks.
- 6. 2. 2 Transverse webs supporting side shell envelope framing are to be arranged in line with the floors in the double bottom to ensure continuity of transverse strength.
- 6. 2. 3 The scantlings of double skin primary structure, including thickness of side shell envelope plating, are to be verified by direct calculations in accordance with [Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings](#).
- 6. 2. 4 The scantlings of single skin primary structure are to comply with [Pt 4, Ch 1, 6.4 Primary supporting structure](#). Alternatively the scantlings are to be verified by direct calculations in accordance with [Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings](#).

**6. 3 Side stringers in double skin construction**

- 6. 3. 1 The scantlings of side stringers are to satisfy the requirements of [Pt 4, Ch 8, 3 Longitudinal strength](#), [Pt 4, Ch 8, 6.2 Side shell primary supporting structure](#) and [Pt 4, Ch 8, 6.5 Minimum thickness of transverse webs/side stringers in double skin construction](#).
- 6. 3. 2 In addition, the scantlings of watertight side stringers are to satisfy the requirements of [Pt 4, Ch 1, 9 Bulkheads](#).

**6. 4 Transverse webs in double skin construction**

- 6. 4. 1 The scantlings of transverse webs are to satisfy the requirements of [Pt 4, Ch 8, 6.2 Side shell primary supporting structure](#) and [Pt 4, Ch 8, 6.5 Minimum thickness of transverse webs/side stringers in double skin construction](#).
- 6. 4. 2 Transverse webs are to be efficiently stiffened, and the thickness increased locally where necessary on account of high shear stress.

6. 4. 3 Where, towards the end of the ship, the width of transverse webs reduces from that assumed in the direct calculations, the thickness may require to be increased locally.

## **6. 5 Minimum thickness of transverse webs/side stringers in double skin construction**

6. 5. 1 Transverse webs and side stringers are to have a thickness,  $t$ , not less than:

$$t = 7.5 + 0.015L \text{ or } 9 \text{ mm, whichever is the lesser.}$$

CHAPTER **8** **Container Ships**SECTION **7** **Double bottom structure****7.1 General**

- 7.1.1 The double bottom is, in general, to be longitudinally framed for ships where  $L \geq 100$  m.
- 7.1.2 Longitudinally framed double bottoms are to comply with [Pt 4, Ch 1, 8.2, General](#) and the contents of this Section.
- 7.1.3 Transversely framed double bottoms are to comply with [Pt 4, Ch 1, 8 Double bottom structure](#).
- 7.1.4 The *ACSPlus FDA Guideline, Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of the double bottom.

**7.2 Double bottom primary supporting structure**

- 7.2.1 The primary supporting structure formed by the double bottom comprises inner bottom plating, floors, longitudinal girders and bottom shell plating.
- 7.2.2 The scantlings of this primary structure are to be verified by direct calculations in accordance with [Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings](#).
- 7.2.3 Where, towards the end of the ship, the depth of double bottom structure webs is reduced from that assumed in the direct calculations, the thickness may require to be increased locally.
- 7.2.4 Where mid-hold or quarter-length-of-hold supports for the double bottom structure are arranged, these are to take the form of an efficiently stiffened transverse box or open section structure, *See* [Pt 4, Ch 8, 9.4 Transverse non-watertight mid-hold bulkheads](#).

**7.3 Inner bottom plating and stiffening**

- 7.3.1 The scantlings of the inner bottom are to satisfy the requirements of [Pt 4, Ch 8, 3 Longitudinal strength](#) and [Pt 4, Ch 8, 7.2 Double bottom primary supporting structure](#) and are to be not less than required by [Pt 4, Ch 1, 8.4, Inner bottom plating and stiffening](#) as modified by this sub-Section.
- 7.3.2 The requirements of [Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening 8.4.2](#) need not be applied to container ships.
- 7.3.3 In applying [Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening 8.4.5](#), the Rule value of bottom longitudinals may be calculated assuming  $F_{sb} = 1.05$ .

**7.4 Girders**

- 7.4.1 Girders are, in general, to be arranged under container corner seatings.

7. 4. 2 The scantlings of watertight centreline/side girders are to satisfy the requirements of [Pt 4, Ch 8, 3 Longitudinal strength](#) and [Pt 4, Ch 8, 7.2 Double bottom primary supporting structure](#) and are to be not less than required by [Pt 4, Ch 1, 8.3., Girders](#).
7. 4. 3 The scantlings of non-watertight centreline/side girders are to satisfy the requirements of [Pt 4, Ch 8, 3 Longitudinal strength](#) and [Pt 4, Ch 8, 7.2 Double bottom primary supporting structure](#).
7. 4. 4 For double bottoms having a depth greater than 1.6 m, additional longitudinal stiffening may have to be introduced in order to ensure the buckling stability of the girders.

## 7. 5 Floors

7. 5. 1 Plate floors are to be fitted under watertight bulkheads, non-watertight bulkheads/mid-hold supports, under container corners at hold quarter length locations and at other locations to ensure that the maximum spacing does not, in general, exceed 3.8 m. Proposals for floor spacings greater than 3.8 m are to be supported by direct calculations agreed with ACS.
7. 5. 2 The scantlings of watertight floors are to satisfy the requirements of [Pt 4, Ch 8, 7.2 Double bottom primary supporting structure](#) and are to be not less than required by [Pt 4, Ch 1, 8.5, Floors](#).
7. 5. 3 The thickness,  $t$ , of non-watertight floors is to satisfy the requirements of 7.2 and is to be not less than:
- $$t = 6 + 0.03L \text{ or } 12 \text{ mm, whichever is the lesser.}$$
7. 5. 4 Non-watertight floor stiffeners are to be fitted at approximately the same spacing as the bottom longitudinals. The scantlings are to satisfy the requirements of [Pt 3, Ch 10 Welding and Structural Details](#).
7. 5. 5 Docking brackets, or equivalent, are to be fitted in accordance with [Pt 4, Ch 1, 8.5 Floors 8.5.3](#).

## 7. 6 Support for containers

7. 6. 1 In general, local stiffening is to be fitted to double bottom floors or girders under container corner seatings in order to ensure the effective transmission of load.
7. 6. 2 Such stiffening normally takes the form of additional brackets with suitable extensions to adjacent stiffening members. The scantlings of the adjacent stiffening members may require to be increased depending on the arrangements proposed.
7. 6. 3 Attention is drawn to the benefit of direct support in order to minimise the effect of eccentric loading on the support brackets.
7. 6. 4 The scantlings of these arrangements may be determined utilising simple beam models to verify the shear and bending strength. Based on static container loads, the stresses induced in the structure are not to exceed the permissible values stated in [Table 8. 7. 1: Permissible stress values](#). Alternative more complex assessment methods are to be agreed with ACS.
7. 6. 5 In general, doubling members or equivalent structures are to be attached to the inner bottom to distribute the load from container corners into the supporting structure. Doubler plates are to have well-rounded corners.

**Table 8. 7. 1: Permissible stress values**

|   | Permissible stress, N/mm <sup>2</sup> |
|---|---------------------------------------|
| Normal stress (bending, tension, compression) | $0.67\sigma_o$                        |
| Shear stress                                  | $0.4\sigma_o$                         |

|   |                |
|---|----------------|
| Combined stress   | $0.86\sigma_0$ |
| Symbols   |                |
| $\sigma_0$ = specified minimum yield stress, in N/mm <sup>2</sup> |                |

CHAPTER **8** **Container Ships**SECTION **8** **Longitudinal bulkheads****8. 1 General**

- 8. 1. 1 The requirements of [Pt 4, Ch 1, 9 Bulkheads](#) are to be applied, together with the requirements of this Section.
- 8. 1. 2 Longitudinal bulkheads may be transversely or longitudinally framed, except in way of the topside torsion box which is, in general, to be longitudinally framed.
- 8. 1. 3 Longitudinal bulkheads are to be maintained continuous in way of the machinery space where this is situated between container holds and as far forward and aft as practicable.
- 8. 1. 4 The scarfing arrangements in way of the steps are to be sufficient to ensure an efficient overlap of the inner skin bulkheads.
- 8. 1. 5 The *ACSPlus FDA Guideline, Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of the double side skin structures.

**8. 2 Side shell primary supporting structure**

- 8. 2. 1 Where the longitudinal bulkhead forms the inner skin of the side shell primary supporting structure the thickness of longitudinal bulkhead plating is to be verified by direct calculations as described in [Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings](#).

**8. 3 Plating and stiffeners**

- 8. 3. 1 The scantlings of longitudinal bulkheads are to satisfy the requirements of [Pt 4, Ch 8, 3 Longitudinal strength](#) and [Pt 4, Ch 8, 8.2 Side shell primary supporting structure](#) and are to be not less than required by [Pt 4, Ch 1, 9 Bulkheads](#).
- 8. 3. 2 Openings in the upper parts of longitudinal bulkheads are to have shapes which minimise stress concentrations and are to be framed to ensure adequate buckling stability.
- 8. 3. 3 The difference in thickness between the top strake and the bulkhead plating below is not to exceed 25 mm.

**8. 4 Support for container corner seats**

- 8. 4. 1 Where direct support for 20 ft containers by the longitudinal bulkhead is required at the mid length of a cell arranged for 40 ft containers, adequate stiffening is to be fitted in order to ensure the effective transmission of load.
- 8. 4. 2 The strength of these arrangements is to be verified in accordance with [Pt 3, Ch 14, 4 Ship structure](#).

CHAPTER **8** **Container Ships**SECTION **9** **Transverse bulkheads****9.1 General**

- 9.1.1 The requirements of [Pt 4, Ch 1, 9 Bulkheads](#) are to be applied, together with the requirements of this Section.
- 9.1.2 Watertight transverse bulkheads may be vertically or horizontally framed.
- 9.1.3 The *ACSPlus FDA Guideline, Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of transverse bulkhead structures.

**9.2 Transverse watertight/non-watertight bulkhead primary supporting structure**

- 9.2.1 The primary supporting structure of transverse bulkheads normally comprises a grillage of vertical webs and horizontal stringers/decks.
- 9.2.2 Vertical webs are to be fitted in line with double bottom girders.
- 9.2.3 The scantlings of transverse bulkhead primary structure including bulkhead plating are to be verified by direct calculations as described in [Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings](#).
- 9.2.4 The scantlings are to be adequate for the static and dynamic loads imposed on the structure by the container stowage arrangements.

**9.3 Transverse watertight bulkheads**

- 9.3.1 The thickness of the transverse bulkhead plating is to satisfy the requirements of [Pt 4, Ch 8, 9.2 Transverse watertight/non-watertight bulkhead primary supporting structure](#) and is to be not less than required by [Pt 4, Ch 1, 9.2, Watertight and deep tank bulkheads](#) for watertight bulkheads.
- 9.3.2 In general, a transverse box structure or equivalent is to be arranged at upper deck level.
- 9.3.3 In certain cases, a transverse box structure at the inner bottom may also be required.

**9.4 Transverse non-watertight mid-hold bulkheads**

- 9.4.1 Where non-watertight bulkheads are arranged in conjunction with the double bottom mid-hold support, a transverse box is to be arranged at strength deck level.
- 9.4.2 Non-watertight bulkhead scantlings are to satisfy the requirements of [Pt 4, Ch 8, 9.2 Transverse watertight/non-watertight bulkhead primary supporting structure](#) and [Pt 4, Ch 1, 4.4, Deck supporting structure](#) for a non-watertight pillar bulkhead.

CHAPTER **8** **Container Ships**SECTION **10** **Hatch coamings and support for hatch covers****10. 1 Hatch coamings**

- 10. 1. 1 Scantlings of hatch coamings are to comply with [Pt 3, Ch 11, 5 Hatch coamings](#) in addition to the requirements of this Section.
- 10. 1. 2 Continuous side coamings are to be effectively scarfed into the deckhouse structure or gradually tapered at ends, as applicable. The scantlings are also to satisfy the requirements of [Pt 4, Ch 8, 3 Longitudinal strength](#).
- 10. 1. 3 The scantlings of transverse hatch coamings forming part of a transverse bulkhead top box are also to satisfy the requirements of [Pt 4, Ch 8, 9.2 Transverse watertight/non-watertight bulkhead primary supporting structure](#).
- 10. 1. 4 The *ACSPlus FDA Guideline, Structural Detail Design Guide (SDDG)*, indicates examples of recommended structural design configurations in critical areas of the hatch side coamings.

**10. 2 Support for inboard edges of hatch covers by girders**
