PART

# 1

CHAPTER **1 General Regulations**

SECTION **1 General**

## **1.1 Background**

- 1.1.1 Asia Classification Society (hereinafter referred to as "ACS") was incorporated in 2005 as a private corporation registered in Kish Free Zone for: providing non-profit-making statutory services and certifications; faithful and accurate classification of merchant vessels, design approval, survey and issuing reports on merchant and non-merchant vessels, ships of special types (e.g., hovercrafts, hydrofoil boats, and multi-hull vessels), etc.; all within the scope of the classification described in the Rules.
- 1.1.2 This Chapter contains General Regulations which have been adopted by ACS for its governance.

## **1.2 Governance**

- 1.2.1 The management of the affairs of ACS are carried out under the direction and control of the Board of the Directors (hereinafter referred to as the 'Board'), in accordance with the provisions of its Memorandum and Articles of Association.
- 1.2.2 The Board of the Directors shall consist of representatives of the interests of various members of the company and those concerned with classification in general as under:
  - One Director representing IBS (Iransafineh Bureau of Shipping)
  - One Director representing Experts Group
  - One Director representing PMO (Ports and Maritime Organization) Holding Company
- 1.2.3 The composition of the Board as above is to be in accordance with the articles of association of ACS (as may be amended from time to time).
- 1.2.4 The Board shall elect one of its members to be Chairman of the Board.
- 1.2.5 The employees of ACS are to be appointed by the Managing Director.

## **1.3 Technical Committee**

- 1.3.1 The Board has appointed a Technical Committee (hereinafter referred to as the 'Committee') whose function is to consider technical issues connected with ships matters, including but not limited to:
  - Important technical issues concerning survey and certification of ships newbuildings and ships in service, development of checklists and procedures
  - Formulation of Technical Rules for Classification Surveys, building of ships, their machinery and equipment.

- Important alterations of Rules once framed as may be required from time to time.
- 1. 3. 2 All decisions of the Technical Committee including amendments and/ or additions to the Rules and procedures for classification surveys and building of ships' hull, their machinery and equipment are to be reported to the Board.
- 1. 3. 3 The Technical Committee to be constituted of members of ACS including Managing Director, Branches Division Manager, Advisor(s) to Managing Director, Marine Division Manager, Ships in Service Department Manager, Ships Newbuildings Department Manager, Industrial and Offshore Division Manager and Training Department Manager.
- 1. 3. 4 In addition to the foregoing, the Technical Committee may co-opt other members to the Committee among the high managerial positions in professional bodies representing technical disciplines relevant to the industry, including but not limited to: Ship Building, Marine Engineering, Naval Architecture, Marine Insurance, Steel Making, and etc. as appointed by the Managing Director (e.g., the full authorized representative of PMO, NITC, IRISL, ISOICO, IOEC, SADRA Ship Building Industries, Defense Marine Industries Group, Iranian Ship Owners' Association and Iran Supreme Council of Marine Industries) .
- 1. 3. 5 All nominations to be member of Technical Committee are subject to confirmation by the Managing Director.
- 1. 3. 6 The Technical Committees are empowered to:
  - a. appoint sub-Committees or panels; and
  - b. co-opt to the Technical Committee, or to its sub-Committees or panels, representatives of any organisation or industry or private individuals for the purpose of considering any particular problem or part of the Rules.
- 1. 3. 7 The Managing Director is the Chairman of the Technical Committee.
- 1. 3. 8 The members desiring to propose alterations in, or additions to the Rules for the classification, survey or building of ship (hull and machinery) shall give notice of such proposals to the Secretary of the Technical Committee. Every such meeting is to be convened by notice from the Secretary, if possible one month before the date of the meeting, and the Secretary will send the meeting agenda to the Committee members as soon as possible thereafter.
- 1. 3. 9 The Board reserves the right to alter, add to, or rescind any/or all of the above terms of reference including the dissolution of the Technical Committee.

## **1. 4 Applicability of Classification Rules and Disclosure of Information**

- 1. 4. 1 ACS has the power to adopt, and publish as deemed necessary, Rules relating to classification and has (in relation thereto) provided the following:
  - a. Except in the case of a special directive by the Committee, no new Regulation or alteration to any existing Regulation relating to classification or to class notations is to be applied to existing ships.
  - b. Except in the case of a special directive by the Committee, or where changes necessitated by mandatory implementation of International Conventions and Codes are concerned, no new Rule or alteration in any existing Rule is to be applied compulsorily after the date on which the contract between the ship builder and shipowner for construction of the ship has been signed, nor within six months of its adoption. The date of 'contract for construction' of a ship is the date on which the contract to build the ship is signed between the prospective shipowner and the ship builder. This date and the construction number (i.e. hull numbers) of all the vessels included in the contract are to be declared by the party applying for the assignment of class to a newbuilding. The date of 'contract for construction' of a series of sister ships, including specified optional ships for which the option is ultimately exercised, is the date on which the contract to build the series is signed between the prospective shipowner and the

ship builder. In this section a 'series of sister ships' is a series of ships built to the same approved plans for classification purposes, under a single contract for construction. The optional ships will be considered part of the same series of sister ships if the option is exercised not later than 1 year after the contract to build the series was signed. If a contract for construction is later amended to include additional ships or additional options, the date of 'contract for construction' for such ships is the date on which the amendment to the contract is signed between the prospective shipowner and the ship builder.

The amendment to the contract is to be considered as a 'new contract'. If a contract for construction is amended to change the ship type, the date of 'contract for construction' of this modified vessel, or vessels, is the date on which the revised contract or new contract is signed between the Owner(s) and the shipbuilder. Where it is desired to use existing approved ship or machinery plans for a new contract, written application is to be made to ACS. Sister ships may have minor design alterations provided that such alterations do not affect matters related to classification, or if the alterations are subject to classification requirements, these alterations are to comply with the classification requirements in effect on the date on which the alterations are contracted between the prospective owner and the ship builder or, in the absence of the alteration contract, comply with the classification requirements in effect on the date on which the alterations are submitted to ACS for approval. Recognising the long time period that may occur between the initial design contract and the contract for construction, the date determining effective classification requirements will be specially considered by ACS in such cases.

- c. All reports of survey are to be made by surveyors authorised by ACS to survey and report (hereinafter referred to as 'the Surveyors') according to the form prescribed, and submitted for the consideration of the Technical Committee.
- d. Information contained in the reports of classification and statutory surveys will be made available to the relevant owner, National Administration, Port State Administration, P&I Club, hull underwriter and, if authorised in writing by that owner, to any other person or organisation.
- e. Information relating to the status of classification and statutory surveys and suspensions/withdrawals of class together with any associated conditions of class will be made available as required by applicable legislation or court order.

## **1. 5 Ethics**

- 1. 5. 1 No ACS employee is permitted under any circumstances, to accept, directly or indirectly, from any person, firm or company, with whom the work of the employee brings the employee into contact, any present, bonus, entertainment or honorarium of any sort whatsoever which is of more than nominal value or which might be construed to exceed customary courtesy extended in accordance with accepted ethical business standards.

## **1. 6 Fees**

- 1. 6. 1 Fees, in accordance with normal ACS practice, will be charged for all services rendered by ACS. Expenses incurred by the Surveyors in connection with these services are normally charged in addition to the fees. However, in some special circumstances and at the discretion of the society these expenses may be included in the classification fees. Fees and expenses will be billed to the party requesting that particular service.
- 1. 6. 2 ACS has the power to withhold or, if already granted, to suspend or withdraw any ship from class (or to withhold any certificate or report in any other case), in the event of non-payment of any fee to ACS.

## **1. 7 Disagreement**

1. 7. 1 Any disagreement regarding either the proper interpretation of the Rules or translation of the Rules from the English language edition is to be referred to ACS for resolution.
1. 7. 2 In case of disagreement between the Owners or builders and the Surveyors regarding the material, workmanship, extent of repairs or application of the Rules relating to any vessel classed or proposed to be classed by ACS, an appeal may be made in writing to the Committee, who will order a special survey to be held. Should the opinion of the Surveyor be confirmed, the expense of this special survey is to be paid by the party appealing.

## **1. 8 Limitation of Liability**

1. 8. 1 Whilst ACS and its Board/ Committee use their best endeavors to ensure that the functions of ACS are properly carried out, in providing services, information or advice, neither ACS nor any of its servants or agents warrants the accuracy of any information or advice supplied. Except as set out herein, ACS nor any of its servants or agents (on behalf each of whom ACS has agreed this clause) shall be liable for any loss damage or expense whatever sustained by any person due to any act or omission or error of whatsoever nature and howsoever caused of ACS, its servants or agents or due to any inaccuracy of whatsoever nature and howsoever caused in any information or advice given in any way whatsoever by or on behalf of ACS, even if held to amount to a breach of warranty. Nevertheless, if any person uses services of ACS, or relies on any information or advice given by or on behalf of ACS and suffers loss, damage or expenses thereby which is proved to have been due to any negligent act omission or error of ACS, its servants or agents or any negligent inaccuracy in information or advice given by or on behalf of ACS, then ACS will pay compensation to such person for his proved loss up but not exceeding the amount of the fee charged by ACS for that particular services, information or advice.
1. 8. 2 Any notice of claim for loss, damage or expense as referred shall be made in writing to ACS Head Office within six months of the date when the service, information or advice was first provided, failing which all the rights to any such claim shall be forfeited and ACS shall be relieved and discharged from all liabilities.

## **1. 9 Hold Harmless**

1. 9. 1 The party requesting services hereunder, or his assignee or successor in interest, agrees to release ACS and to indemnify and hold harmless ACS from and against any and all claims, demands, lawsuits or actions for damages, including legal fees, to persons and/or property, tangible, intangible or otherwise which may be brought against ACS incidental to, arising out of or in connection with this Agreement, the work to be done, services to be performed or material to be furnished hereunder, except for those claims caused solely and completely by the negligence of ACS, its agents, employees, officers, directors or subcontractors. The parties agree that for the purposes of the Convention on Limitation of Liability for Maritime Claims, 1976, ACS is a person for whose acts the shipowner is responsible.
1. 9. 2 Any other individual, corporation, partnership or other entity who is a party hereto or who in any way participates in, is engaged in connection with or is a beneficiary of, any portion of the services described herein shall also release ACS and shall indemnify and hold ACS harmless from and against all claims, demands, lawsuits or actions for damages, including legal fees, to persons and/or property, tangible, intangible or otherwise, which may be brought against ACS by any person or entity as a result of the services performed pursuant to this Agreement, except for those claims caused solely and completely by the negligence of ACS, its agents, employees, officers, directors or subcontractors.

## **1. 10 Time Bar to Legal Action**

1. 10. 1 Any statutes of limitation notwithstanding, Owner's right to bring or to assert against ACS any and all claims, demands or proceedings whether in arbitration or otherwise shall be waived unless (a) notice is received by ACS within ninety (90) days after Owner had notice of or should reasonably have been expected to have had notice of the basis for such claims; and (b) arbitration or legal proceedings, if any, based on such claims or demands of whatever nature are commenced within six (6) months of the date of such notice to ACS.

## **1. 11 Arbitration**

1. 11. 1 Any and all differences and disputes of whatsoever nature arising out of services under these Rules shall be put to arbitration in Iran pursuant to the laws relating to arbitration there in force, before a board of three persons, consisting of one arbitrator to be appointed by ACS, one by the Client, and one by the two so chosen. The decision of any two of the three on any point or points shall be final. Until such time as the arbitrators finally close the hearings either party shall have the right by written notice served on the arbitrators and on an officer of the other party to specify further disputes or differences under these Rules for hearing and determination. The arbitration is to be conducted in accordance with the rules of the Society of Maritime Arbitrators, Inc. in the English language. The governing law shall be the law of the Islamic Republic of Iran (I.R.I). The arbitrators may grant any relief other than punitive damages which they, or a majority of them, deem within the scope of the agreement of the parties, including, but not limited to, specific performance. Awards made in pursuance to this clause may include costs including a reasonable allowance for attorney's fees and judgment may be entered upon any award made hereunder in any court having jurisdiction.

PART

# 1

CHAPTER **2 Classification Regulations**

SECTION **1 Conditions for classification**

## **1. 1 General**

1. 1. 1 Ships referred to in this Chapter are defined in [Pt 3 Ship Structures \(General\)](#), [Pt 4 Ship Structures \(Ship Types\)](#) and [Pt 7 Other Ship Types and Systems](#) of these Rules. Machinery referred to in this Chapter is defined in [Pt 5 Main and Auxiliary Machinery](#) and [Pt 6 Control, Electrical, Refrigeration and Fire](#) of these Rules. Systems referred to in this Chapter are defined in [Pt 7 Other Ship Types and Systems](#) of these Rules. Materials are referred to in the [Pt 2 Rules for the Manufacture, Testing and Certification of Materials](#).
1. 1. 2 Ships built in accordance with ACS Rules and Regulations, or in accordance with requirements equivalent thereto, will be assigned a class in the *Register Book* and will continue to be classed as long as they are found, upon examination at the prescribed surveys, to be maintained in accordance with the requirements of the Rules. Classification will be conditional upon compliance with ACS's requirements for both hull and machinery and with the Certification Requirements of [Pt 1, Ch 2, 1.1, General](#).
1. 1. 3 The Classification Committee, in addition to requiring compliance with ACS's Rules, may require to be satisfied that ships are suitable for the geographical or other limits or conditions of the service contemplated.
1. 1. 4 Loading conditions and any other preparations required to permit a ship with a class notation specifying some service limitation to undertake a sea-going voyage, either from port of building to service area or from one service area to another, are to be in accordance with arrangements agreed by ACS prior to the voyage.
1. 1. 5 Any damage, defect, breakdown, grounding, serious deficiency, detention or, arrest or refusal of access, which could invalidate the conditions for which a class has been assigned, is to be reported to ACS without delay.
1. 1. 6 The Rules are framed on the understanding that ships will be properly loaded and handled. They do not, unless stated or implied in the class notation, provide for special distributions or concentrations of loading. The Classification Committee may require additional strengthening to be fitted in any ship which, in their opinion, would otherwise be subjected to severe stresses due to particular features in the design, or where it is desired to make provision for exceptional loaded or ballast conditions. In such cases, particulars are to be submitted for consideration.
1. 1. 7 When longitudinal strength calculations have been required, loading guidance information is supplied to the Master by means of a Loading Manual and in addition, when required, by means of a loading instrument.
1. 1. 8 The Rules are framed on the understanding that ships will not be operated in environmental conditions more severe than those agreed for the design basis and approval, without the prior agreement of ACS.

1. 1. 9 The Classification Committee requires that ships comply with all requirements of the National Administration and all applicable mandatory international IMO and ILO Conventions and Codes (including Amendments thereto), including the following:

- *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988*
- *SOLAS - International Convention for the Safety of Life at Sea*
- *MARPOL - International Convention for the Prevention of Pollution from Ships*
- *AFS - International Convention on the Control of Harmful Anti-Fouling Systems on Ships, 2001*
- *Tonnage - International Convention on Tonnage Measurement of Ships, 1969*
- *IBC Code - International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk Amended by Resolution MEPC.225(64)*
- *2014 IGC Code - International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk*
- *IMSBC Code – International Maritime Solid Bulk Cargoes Code – Resolution MSC.268(85)*
- *Maritime Labour Convention.*

The Classification Committee requires the applicable Convention and Code Certificates to be issued by authorities as follows:

- Cargo Ship Radio Certificates, Safety Management Certificates, International Ship Security Certificates and Maritime Labour Certificates, if required, must have been issued by a recognised organisation authorised by the National Administration with which the ship is registered.
- all other mandatory statutory certificates must have been issued by ACS or by a National Administration or by an IACS Member when so authorised by the National Administration with which the ship is registered.

In the case of dual-classed ships, Convention Certificates may be issued by the other Classification Society with which the ship is classed, provided this is recognised in a formal Dual Class Agreement with ACS and provided the other Classification Society is also authorised by the National Administration.

In the event of a National Administration withdrawing any ship's Convention Certificate (referred to in this Section), then the Classification Committee may suspend the ship's class. If a ship is removed from the National Administration's Registry for the non-compliance with the Conventions or Classification Requirements referred to herein, then the Classification Committee will suspend the ship's class. In the event of *ISM Code - International Management Code and Revised Guidelines on Implementation of the ISM Code* certification being withdrawn from a ship or Operator, then the Classification Committee will suspend the ship's class.

1. 1. 10 Where an onboard computer system having longitudinal strength computation capability, which is required by the Rules, is provided on a new ship, or newly installed on an existing ship, then the system is to be certified in respect of longitudinal strength in accordance with ACS's document entitled *Approval of Longitudinal Strength and Stability Calculation Programs*, See also [Pt 3, Ch 4, 8 Loading guidance information](#)

1. 1. 11 Where an onboard computer system having stability computation capability is provided on a new ship, then the system is to be certified in respect of stability aspects in accordance with ACS's document entitled, *Approval of Longitudinal Strength and Stability Calculation Programs*. When

provided, an onboard computer system having stability computation capability is to carry out the calculations and checks necessary to assess compliance with all the stability requirements applicable to the ship on which it is installed.

1. 1. 12 Where a ship has been detained by Port State Control the Owner is to advise ACS immediately in order to arrange the attendance of a Surveyor.

## **1. 2 Advisory services**

1. 2. 1 The Rules do not cover certain technical characteristics, such as stability, trim, hull vibration, etc., but advice may be given on such matters without any assumption of responsibility for such advice.

## PART

# 1

## CHAPTER 2 Classification Regulations

### SECTION 2 Character of classification and class notations

#### 2. 1 Definitions

2. 1. 1 **Note** For the purpose of class notations, the definitions given in [Pt 1, Ch 2, 2.1 Definitions 2.1.2](#) to [Pt 1, Ch 2, 2.1 Definitions 2.1.12](#) will apply.
2. 1. 2 **Clear water.** Water having sufficient depth to permit the normal development of wind generated waves.
2. 1. 3 **Fetch.** The extent of clear water across which a wind has blown before reaching the ship.
2. 1. 4 **Sheltered water.** Water where the fetch is six nautical miles or less.
2. 1. 5 **Reasonable weather.** Wind strengths of force six or less in the Beaufort scale, associated with sea states sufficiently moderate to ensure that green water is taken on board the ship's deck at infrequent intervals only or not at all.
2. 1. 6 **Type notation.** A notation indicating that the ship has been arranged and constructed in compliance with particular Rules intended to apply to that type of ship. Type notations that may be assigned are listed in [Table 2. 2. 1: Type notations](#).

**Table 2. 2. 1: Type notations**

|                                  |                           |                                  |
|----------------------------------|---------------------------|----------------------------------|
| Dry cargo                        | Tanker                    | Passenger                        |
| Anchor handler                   | Chemical tanker           | Passenger ferry                  |
| AHTS (Anchor Handler Tug Supply) | Double hull oil tanker    | Passenger/vehicle ferry          |
| Barge                            | Liquefied gas carrier     | Passenger ship                   |
| Bulk carrier                     | Liquefied gas tanker      | Passenger yacht                  |
| Cable laying vessel              | Moored oil storage tanker | Roll on-Roll off passenger ferry |
| Container ship                   | Moored oil storage unit   | Roll on-Roll off passenger ship  |
| Diving support vessel            | Oil barge                 | Sailing passenger ship           |
| Dredger                          | Oil or bulk carrier       |                                  |
| Escort tug                       | Oil recovery ship         |                                  |
| Fire fighting                    | Oil tanker                |                                  |
| Fishing vessel                   | Ore or oil carrier        |                                  |
| Hopper barge                     |                           |                                  |

|                                |  |  |
|--------------------------------|--|--|
| Hopper dredger                 |  |  |
| Icebreaker                     |  |  |
| Icebreaker(+)                  |  |  |
| Launch                         |  |  |
| Livestock carrier              |  |  |
| Offshore support vessel        |  |  |
| Offshore supply vessel         |  |  |
| Offshore tug                   |  |  |
| Offshore well stimulation ship |  |  |
| Ore carrier                    |  |  |
| Pipe laying vessel             |  |  |
| Pontoon                        |  |  |
| Reclamation ship               |  |  |
| Refrigerated cargo ship        |  |  |
| Research                       |  |  |
| Roll on-Roll off cargo ship    |  |  |
| Seismographic support vessel   |  |  |
| Shipborne barge                |  |  |
| Subsea support vessel          |  |  |
| Standby vessel                 |  |  |
| Stern trawler                  |  |  |
| Split hopper barge             |  |  |
| Split hopper dredger           |  |  |
| Trawler                        |  |  |
| Tug                            |  |  |
| Vehicle carrier                |  |  |

2. 1. 7 **Cargo notation.** A notation indicating that the ship has been designed, modified or arranged to carry one or more particular cargoes, e.g. sulphuric acid. Ships with one or more particular cargo notations are not thereby prevented from carrying other cargoes for which they are suitable.
2. 1. 8 **Special duties notation.** A notation indicating that the ship has been designed, modified or arranged for special duties other than those implied by the type and cargo notations, e.g. research. Ships with special duties notations are not thereby prevented from performing any other duties for which they may be suitable.
2. 1. 9 **ACSPlus notation.** Where one or more of ACS notation procedures have been satisfactorily applied, then a notation showing the associated characters of the procedure(s) within brackets will, at the Owner's request, be entered in the *Register Book*, preceded by the word **ACSPlus**, See [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.17](#). Other ACSPlus procedures that have been satisfactorily

applied will similarly be shown as descriptive notes and will appear in the *Register Book*, See [Pt 1, Ch 2, 2.8 Descriptive notes 2.8.2](#).

2. 1. 10 **Special features notation.** A notation indicating that the ship incorporates special features which significantly affect the design, See [Table 2. 2. 2: Special features notations](#).

**Table 2. 2. 2: Special features notations**

| Special features notation  | Description   | See also  |
|--|---|---|
| <b>BC</b>  | Assigned to bulk carriers of length 150 m or above  | <a href="#">Pt 4, Ch 7, 1.4 Class notation for CSR bulk carriers 1.4.2</a>  |
| <b>Bottom Strengthened for (Operating Aground) (Loading and Unloading Aground)</b> | Assigned where the bottom structure has been additionally strengthened for loading and unloading aground  | <a href="#">Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground</a> and <a href="#">Pt 4, Ch 12, 1.3 Class notations 1.3.4</a> |
| <b>BLS</b>   | Bow Loading System. Assigned to tankers equipped with bow loading arrangements to facilitate the transfer of cargo oil from offshore loading terminals  | <a href="#">Pt 7, Ch 6, 1.2 Class notations 1.2.1</a>   |
| <b>BoxMax</b>  | Assigned to container vessels that have an approved onboard lashing program to calculate forces acting on a container and its container securing arrangements. The notation may be accompanied by one of the following supplementary letter sequences, <b>V</b> or <b>V,W</b> or <b>V,W,L</b> or <b>M</b> . These allow the Master to use weather dependent factors based on the environmental severity of the planned voyage to determine the forces acting on the container and the container securing arrangements, potentially increasing the flexibility of the carriage of containers onboard the ship.<br><br><b>V</b> (Voyage dependency) denotes that weather dependent factors based on an annual basis are available for selected specific voyages or routes.<br><br><b>W</b> (Weather dependency) denotes that weather dependent factors based on a seasonal basis are available for selected specific voyages or routes<br><br><b>L</b> (Limited duration voyage) denotes that weather dependent factors suitable for application to a limited duration voyage in coastal waters are available.<br><br><b>M</b> (Ship motion monitoring) denotes that the ship's Master shall select the weather dependent factors and that in-service maximum ship motion and environmental conditions will be recorded to demonstrate safe operation.<br><br>ACS will supply weather dependent factors applicable to the list of sea areas requested by the Owner, See also <a href="#">Table 14. 1. 1: BoxMax notation features</a> . | <a href="#">Pt 3, Ch 4 Longitudinal Strength</a> and <a href="#">Pt 3, Ch 14 Cargo Securing Arrangements</a>                                    |

| Special features notation  | Description   | See also  |
|--|---|---|
| <b>Cargo Loading on (Tank Top/ Tween/ Deck (s) Plating/ Hatch cover(s)) limited to .... tonnes/m<sup>2</sup></b> | Assigned where cargo loading on tank tops, decks and/or hatch covers are limited to a specified maximum value which is less than the normal Rule loading  | —   |
| <b>Carriage of Oils with a F.P. not exceeding 60°C</b>   | Assigned to non-oil tankers where the ship is suitably constructed and arranged for the carriage of oils with a flash point not exceeding 60°C (closed cup test)  | <a href="#">Pt 4, Ch 9 Double Hull Oil Tankers</a><br><a href="#">Pt 4, Ch 10 Single Hull Oil Tankers</a> |
| <b>Carriage of Oils with a F.P. exceeding 60°C</b>   | Assigned where only the carriage of oils having a flash point exceeding 60°C (closed cup test) is contemplated  | <a href="#">Pt 4, Ch 9, 1.1 General 1.1.5</a>   |
| <b>(Specified Cargo(es)) only</b>  | Assigned where arrangements have been approved for the carriage of a specific product(s)  | <a href="#">Pt 4, Ch 9, 1.1 General 1.1.7</a>   |
| <b>CC</b>  | Assigned where structures are fitted with an approved corrosion control system  | <a href="#">Pt 1, Ch 3 Periodical Survey Regulations</a>  |
| <b>CCSA</b>  | Certified Container Securing Arrangements. Assigned where freight container securing arrangements are fitted, and the design and construction of the system is in accordance with ACS Rules and loose fittings are supplied                 | <a href="#">Pt 3, Ch 14 Cargo Securing Arrangements</a>   |
| <b>CG</b>  | Cargo Gear. Assigned where cargo gear is included in class at the Owner's request   | <a href="#">Pt 3, Ch 9, 6 Lifting appliances and support arrangements</a>                                 |
| <b>CL</b>  | Cargo Lift(s). Assigned where cargo lift(s) are included in class at the Owner's request  | <a href="#">Pt 3, Ch 9, 6 Lifting appliances and support arrangements</a>                                 |
| <b>CR</b>  | Cargo Ramp(s). Assigned where cargo ramp(s) are included in class at the Owner's request  | <a href="#">Pt 3, Ch 9, 6 Lifting appliances and support arrangements</a>                                 |
| <b>CRC –/– –kW – %/–%</b>  | Carriage of refrigerated containers. The CRC notation may be applied to any ship which has the ability to carry refrigerated containers operating at their design condition with a 24-hour average external ambient air temperature of 35°C | <a href="#">Pt 7, Ch 10, 1.1 General</a>  |
|  | The following descriptive notations may be appended, giving details of electrical power and type of cargo:  |   |
|  | –/–   | No. of hold-stowed refrigerated containers/No. of deck-stowed refrigerated containers e.g. 230/140        |
|  | –kW   | Power generating capacity dedicated to supplying the container plug-in points, e.g. 2.800 kW              |

| Special features notation  | Description   | See also  |
|--|---|---|
|  | –%/–%<br>Stowage ratio of deep frozen and chilled cargoes, e.g. 60%/40%   |   |
| <b>Container Cargoes in ((all) Hold (No(s)))( and on Upper Deck)(( and on (all ) Hatch Cover( s) (No( s))...</b> | Assigned where general cargo ships carry container cargoes.   | <a href="#">Pt 3, Ch 4 Longitudinal Strength</a>  |
| <b>Deck No(s) ... Strengthened for Carriage of Roll on-Roll off Cargoes</b>                                      | Assigned where it is proposed either to stow wheeled vehicles on the deck or to use wheeled vehicles for cargo handling and the deck and supporting structure has been specially considered   | <a href="#">Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles</a>  |
| <b>DSPM4</b>   | Dual Single Point Mooring. Assigned to a ship provided with a dual mooring line arrangement at a single-point mooring   | <a href="#">Pt 3, Ch 13, 8 Anchor windlass design and testing</a>   |
| <b>DWA</b>   | Deep Water Anchoring. Assigned to a ship with a Rule length <i>L</i> not less than 135 m, subject to the Rules in <a href="#">Pt 3, Ch 13 Ship Control Systems</a> , which has increased equipment for anchoring in deep waters with a depth up to 120 m  | <a href="#">Pt 3, Ch 13, 10 Anchoring equipment in deep and unsheltered water</a>   |
| <b>ECL(1, 2, 3)</b>  | Assigned to vessels where work spaces, movement about the ship, fall protection and working arrangements on deck have been specially considered for performing container securing, inspection and other related tasks   | <i>Rules for Ergonomic Container Lashing</i>  |
| <b>ELD</b>   | Assigned when ergonomic lighting design has been applied  | <a href="#">Pt 6, Ch 2, 23 Ergonomic Lighting Design – ELD optional notation</a> and <a href="#">Pt 6, Ch 2, 22 Ergonomic Lighting Design – ELD optional notation</a> |
| <b>EWP</b>   | Enhanced Weather Protection. Assigned where a vessel, subject to the Rules in <a href="#">Pt 4, Ch 4 Offshore Support Vessels</a> , has increased scantlings for superstructure, windows and side scuttles.   | <a href="#">Pt 4, Ch 4, 9 Enhanced weather protection</a>   |
| <b>Fire-Fighting Ship 1, 2, 3, (with water spray) or E</b>   | Designed where fire protection and fire-fighting equipment is provided. Type 1, 2 or 3 signifies the capacity of the fire-fighting equipment. The total discharge capacity of the monitors in m <sup>3</sup> /h is shown in brackets. ‘With water spray’ signifies that a ship is provided with a water spray system which will provide an effective cooling spray of water<br><br>E, when the characteristics of the water fire-fighting system are not those required for the assignment of the additional service features 1, 2 or 3, and when the system is specially considered by the Society | <a href="#">Pt 7, Ch 3 Fire-fighting Ships</a>  |

| Special features notation   | Description  | See also   |
|---|--|--|
| <b>Hatch Covers omitted in Hold (No(s)) ...</b>                                   | Assigned where the omission of hatch covers have been specially considered based upon the model tests or alternative means to determine the quantity of water likely to ingress the cargo holds and the means by which it is effectively and safely discharged   | <a href="#">Pt 4, Ch 8, 11.4 Omission of hatch covers</a>  |
| <b>Heavy Deck Loads</b>   | Assigned where decks are strengthened for loading in excess of Rule basic minimum, e.g. 'Upper deck aft of Fr. 50 strengthened for load of 10 tonnes/m <sup>2</sup> '  | <a href="#">Pt 3, Ch 6 Aft End Structure</a>   |
| <b>Helideck</b>   | Assigned where a designated helicopter landing platform or other deck area with fire-fighting appliances and other equipment necessary for the safe operation of helicopters are provided.   | <a href="#">Pt 3, Ch 9, 5 Helicopter landing areas</a>   |
| <b>Occasional Helicopter Landing Area</b>   | Assigned where an area on a ship designated for occasional or emergency landing of helicopters is provided.  | <a href="#">Pt 3, Ch 9, 5 Helicopter landing areas</a>   |
| <b>Hold (No(s)) ... may be empty at draughts not (less than) (exceeding) ...m</b> | Assigned where particular loading arrangements have been specially considered  | <a href="#">Pt 4, Ch 7 Bulk Carriers</a>   |
| <b>Ice Class</b>  | Assigned where a ship is strengthened to navigate in specific ice conditions. Supplementary Ice Class notations are given in <a href="#">Table 2.2.3: Notations for ice and cold operations</a> .  | <a href="#">Pt 8, Ch 1 Application</a> and <a href="#">Pt 8, Ch 2 Ice Operations - Ice Class</a> |
| <b>Icebreaker</b>   | Assigned designed for icebreaking duties   | <a href="#">Pt 8, Ch 1 Application</a> and <a href="#">Pt 8, Ch 2 Ice Operations - Ice Class</a> |
| <b>LA</b>   | Mandatory Lifting Appliance(s). Assigned where the lifting appliance is considered to be an essential feature, e.g. cranes on crane barges, lifting arrangements for diving on diving support vessels, and is mandatory  | <a href="#">Pt 3, Ch 9, 6 Lifting appliances and support arrangements</a>                        |
| <b>LA</b>   | Mandatory Lifting Appliance(s). Assigned where the lifting appliance is considered to be an essential feature and has been classed by a recognised classification society other than ACS and later transferred into class with ACS. In such cases, a new Register of Ship's Lifting Appliances & Cargo Handling Gear (LA.1) will be issued in accordance with ACS's <i>Code for Lifting Appliances in a Marine Environment</i> . | <a href="#">Pt 3, Ch 9, 6 Lifting appliances and support arrangements</a>                        |
| <b>LFPL</b>   | Low flash point liquids. Assigned to offshore supply vessels intended for the carriage of liquids with flashpoint below 60°C (closed cup test) in bulk   | <a href="#">Pt 4, Ch 4 Offshore Support Vessels</a>  |

| Special features notation   | Description  | See also  |
|---|--|---|
| <b>For Liquefaction and Storage of (Methane, etc.) in Independent Gas Tanks (Type B, etc.), Maximum Vapour Pressure ( ) MPa, Minimum Temperature Minus ( ) °C</b> | Assigned where ships of Category 1B or 2 which have process plants installed solely for the purposes of the physical liquefaction of impure feedstock gases at low temperature and the storage of the purified liquefied gases (where the chemical treatment of the impurities is an incidental process) | <a href="#">Pt 7, Ch 2, 2.2 Additional notations</a>  |
| <b>Machinery on deck</b>  | Assigned where machinery other than lifting appliances, and anchoring and mooring equipment is installed on deck   | <a href="#">Pt 3, Ch 9, 9 Strengthening for machinery on deck</a>   |
| <b>Marpol 20.1.3</b>  | Assigned to double hull oil tankers not meeting the Rule minimum double side width requirements but which comply with MARPOL Annex 1, Regulation 20.1.3  | <a href="#">Pt 4, Ch 9, 1.4 Class notation and applicable Rules for non-CSR Double Hull Oil Tankers 1.4.3</a> |
| <b>Marpol 21.1.2</b>  | Assigned to double hull oil tankers of less than 5000 tonnes deadweight which have a complete double hull in accordance with MARPOL Annex 1, Regulation 21.1.2   | <a href="#">Pt 4, Ch 9, 1.4 Class notation and applicable Rules for non-CSR Double Hull Oil Tankers 1.4.4</a> |
| <b>Movable Decks</b>  | Assigned where all movable decks comply with ACS requirements. Movable decks other than those specifically indicated in ACS Rule requirements are not a classification item  | <a href="#">Pt 3, Ch 9, 4 Movable decks</a>   |
| <b>Oil Recovery</b>   | Assigned when a ship is equipped for oil recovery operations   | <a href="#">Pt 7, Ch 5, 2 Oil recovery</a>  |
| <b>Oil Recovery (F.P. &gt;60°C)</b>   | Assigned when a ship is equipped for oil recovery operations restricted to oils with a flash point greater than 60°C   | <a href="#">Pt 7, Ch 5, 2 Oil recovery</a>  |
| <b>Petrol in Hold (No(s))...</b>  | Assigned to ships that can carry motor vehicles with fuel in their tanks for self-propulsion, in specified locations. It does not apply to ships that are designed primarily for the carriage of motor vehicles Specific requirements will be advised upon request                                       | —   |
| <b>PL</b>   | Passenger Lift(s). Assigned where the passenger lift(s) are included in class at the Owner's request   | <a href="#">Pt 3, Ch 9, 6 Lifting appliances and support arrangements</a>                                     |
| <b>PM (T1) [or (T2) or (T3)]</b>  | For ships fitted with a positional mooring system (PM). The supplementary notation (T1) [or (T2) or (T3)] may be applied if the system is thruster-assisted. The encircled numeral defines the thruster allowance  | <a href="#">Pt 7, Ch 8, 1.2 Classification notations 1.2.1</a>  |

| Special features notation  | Description   | See also  |
|--|---|---|
| <b>PMC (T1) [or (T2) or (T3)]</b>  | For ships fitted with a positional mooring system for mooring in close proximity to other ships or installations (PMC). The supplementary notation <b>(T1)</b> [or <b>(T2)</b> or <b>(T3)</b> ] may be applied if the system is thruster-assisted. The encircled numeral defines the thruster allowance   | <a href="#">Pt 7, Ch 8, 1.2 Classification notations 1.2.1</a>  |
| <b>RD</b>  | Relative Density. Assigned where a ship has tanks appraised for a maximum permissible relative density greater than 1.025   | <a href="#">Pt 4, Ch 1 General Cargo Ships</a><br><a href="#">Pt 4, Ch 4 Offshore Support Vessels</a>   |
| <b>Self-Discharging (Unloading)</b>  | Assigned where a ship fitted with self-unloading equipment whose structural aspect has been specially approved  | <a href="#">Pt 4, Ch 12, 1 General</a>  |
| <b>SLS</b>   | Stern Loading System. Assigned to tankers equipped with stern loading arrangements to facilitate the transfer of cargo oil from offshore loading terminals  | <a href="#">Pt 7, Ch 6, 1 General</a>   |
| <b>Specialised for the Carriage of ...</b>                                 | Assigned to a vessel which has been designed for the carriage of specified cargo other than that applied by the type notation   | <a href="#">Pt 4, Ch 4, 1 General</a>   |
| <b>SPM4</b>  | Single Point Mooring. Assigned to a ship provided with a single mooring line arrangement at a single point mooring  | <a href="#">Pt 3, Ch 13, 8 Anchor windlass design and testing</a>                                       |
| <b>Strengthened to carry cargoes which may liquefy (IMSBC Group A)</b>     | Assigned to ore carriers which are to carry 'Group A cargo' and which have satisfied the ACS requirements for Classification as a specially constructed or fitted cargo ship for confining cargo shift, as stipulated in the IMSBC Code. In accordance with the IMSBC Code, vessels with this notation are eligible for the carriage of Group A cargo where the moisture content rises above the Transportable Moisture Limit (TML) after loading. This notation is assigned at the request of the Owner. | <a href="#">Pt 4, Ch 11, 1.3 Class notation 1.3.4</a>   |
| <b>Strengthened for Heavy Cargoes (any Hold (No(s) ..... may be empty)</b> | Assigned to a bulk carrier of less than 150 m in length or a ship designed for the carriage of heavy cargoes. If only certain holds are strengthened for heavy cargoes, they will be specified  | <a href="#">Pt 4, Ch 1 General Cargo Ships</a> and <a href="#">Pt 4, Ch 7, 1 General</a>                |
| <b>HNLS</b>  | Hazardous and noxious liquids system. Assigned to Offshore Support Vessels complying with the aspects relevant to classification of the <i>Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code)</i>   | <a href="#">Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk</a> |
| <b>Hold No(s) ... Strengthened for Regular Discharge by Heavy Grabs</b>    | Assigned to bulk carriers where cargoes are regularly discharged by heavy grabs and the thickness of the plating of the hold inner bottom, hopper and transverse bulkhead bottom stool is increased   | <a href="#">Pt 3, Ch 9, 7.1 Application</a>   |

| Special features notation  | Description   | See also   |
|--|---|--|
| <b>Submersible to a depth of ...m below Upper Deck in Harbour only</b> | Assigned to a ship that is designed so that it can be submersed to a specified depth in harbour only  | —  |
| <b>Timber Deck Cargoes</b>   | Assigned where a cargo of timber is carried on an uncovered part of the freeboard or superstructure deck (does not include wood pulp or similar cargo) and the requirements of the 1966 Load Line Convention concerning timber deck cargoes or other National Regulations are complied with | <a href="#">Pt 3, Ch 9, 2 Timber deck cargoes</a>  |
| <b>TLS</b>   | Submerged Turret Loading System. Assigned to tankers equipped with submerged turret loading systems to facilitate the transfer of cargo oil from offshore loading to terminals  | <a href="#">Pt 7, Ch 6, 1 General</a>  |
| <b>WDL(+)</b>  | Weather Deck Load. Assigned where the weather deck load scantlings have been approved for a loading greater than a design head of 3.5 m   | <a href="#">Pt 4, Ch 1 General Cargo Ships</a> and <a href="#">Pt 4, Ch 4 Offshore Support Vessels</a> |
| <b>W2W</b>   | Walk To Work. Assigned where a personnel transfer system is included in class at the Owner's request  | <a href="#">Pt 3, Ch 9, 6 Lifting appliances and support arrangements</a>                              |

**Table 2. 2. 3: Notations for ice and cold operations**

| Notation               | Description                               | Conditions  | Application     | See also   |
|------------------------|---|---|-----------------|--|
| <b>Ice Class 1E</b>    | For offshore supply vessels               | Light and very light ice conditions   | Hull, Machinery | <a href="#">Pt 8, Ch 2, 4 Hull requirements for light ice conditions – Ice Classes 1D and 1E</a> and <a href="#">Pt 8, Ch 2, 5 Machinery requirements for light ice conditions – Ice Classes 1D and 1E</a> |
| <b>Ice Class 1D</b>    | Hull strengthening in forward region only |   |                 |  |
| <b>Ice Class 1C FS</b> |   | Ice Class 1C; ships with such structure, engine output and other properties that they are capable of navigating in light ice conditions, with the assistance of icebreakers when necessary;   |                 |  |
| <b>Ice Class 1B FS</b> |   | Ice Class 1B; ships with such structure, engine output and other properties that they are capable of navigating in moderate ice conditions, with the assistance of icebreakers when necessary |                 |  |
| <b>Ice Class 1A FS</b> | Finnish Swedish Ice Class Rules           | Ice Class 1A; ships with such structure, engine output and other properties that they are capable of navigating in difficult ice conditions, with the   | Hull, Machinery | <a href="#">Pt 8, Ch 2, 6 Hull requirements for first-year ice conditions – Ice Classes 1A FS, 1A FS, 1B FS, 1C FS and</a>   |

|                            |   |  |                 |  |
|----------------------------|---|--|-----------------|--|
|                            |   | assistance of icebreakers when necessary   |                 | <a href="#">1D</a> and <a href="#">Pt 8, Ch 2, 7 Machinery requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS and 1C FS</a>   |
| <b>Ice Class 1AS FS</b>    |   | Ice Class 1A Super; ships with such structure, engine output and other properties that they are normally capable of navigating in difficult ice conditions without the assistance of icebreakers |                 |  |
| <b>Ice Class 1C FS(+)</b>  |   | Ice Class 1C; ships with such structure, engine output and other properties that they are capable of navigating in light ice conditions, with the assistance of icebreakers when necessary       |                 |  |
| <b>Ice Class 1B FS(+)</b>  | Finnish Swedish Ice Class Rules with enhanced engine power for icebreaking capability | Ice Class 1B; ships with such structure, engine output and other properties that they are capable of navigating in moderate ice conditions, with the assistance of icebreakers when necessary    | Hull, Machinery | <a href="#">Pt 8, Ch 2, 8 Hull requirements for first-year ice conditions – Ice classes 1AS FS(+), 1A FS(+), 1B FS(+) and 1C FS(+)</a> and <a href="#">Pt 8, Ch 2, 9 Machinery requirements for first-year ice conditions - Ice classes 1AS FS(+), 1A FS(+), 1B FS(+) and 1C FS(+)</a> |
| <b>Ice Class 1A FS(+)</b>  |   | Ice Class 1A; ships with such structure, engine output and other properties that they are capable of navigating in difficult ice conditions, with the assistance of icebreakers when necessary   |                 |  |
| <b>Ice Class 1AS FS(+)</b> |   | Ice Class 1A Super; ships with such structure, engine output and other properties that they are normally capable of navigating in difficult ice conditions without the assistance of icebreakers |                 |  |

2. 1. 11 **Service restriction notation.** A notation indicating that a ship has been classed on the understanding that it will be operated only in suitable areas or conditions which have been agreed by the Classification Committee, e.g. protected waters service.
2. 1. 12 **Linked** means connected, while in operation, to an attendant ship (which may be on shore, submerged or afloat) by a restraining line, suspension cable or umbilical cord.
2. 1. 13 **Laid-up notation.** A ship not under repair or not actively employed may be assigned the laid-up notation in order to maintain the ship in class subject to agreement by the Classification Committee. A general examination of the hull and machinery is to be carried out in lieu of the Annual Survey. An Underwater Examination (UWE) is to be carried out in lieu of the Special Survey. See [Pt 1, Ch 3, 1.1 Frequency of surveys 1.1.2](#), [Pt 1, Ch 3, 2.1 General 2.1.5](#), [Pt 1, Ch 3, 5.1 General 5.1.6](#) and [Pt 1, Ch 3, 11.1 Annual, Intermediate and Bottom Surveys 11.1.2](#).

## 2. 2 Character symbols

2. 2. 1 All ships, when classed, will be assigned one or more character symbols as applicable. For the majority of ships, the character assigned will be **100A1**, **✱100A1** or **✱ 100A1**.

2. 2. 2 A full list of character symbols for which ships may be eligible is as follows:

- ✠ = This distinguishing mark will be assigned, at the time of classing, to new ships constructed under ACS's Special Survey in compliance with the Rules, and to the satisfaction of the Classification Committee.
- ✡ = This distinguishing mark, will be assigned to ships built under supervision of an IACS member society and later assigned class with ACS. For such ships the class notations will be reviewed separately and equivalent notations will be assigned.
- 100 = This character figure will be assigned to all ships considered suitable for sea-going service.
- A = This character letter will be assigned to all ships which have been built or accepted into class in accordance with ACS's Rules and Regulations, and which are maintained in good and efficient condition.
- 1 = This character figure will be assigned to:
  - = (a) Ships having on board, in good and efficient condition, anchoring and/or mooring equipment in accordance with the Rules.
  - = (b) Ships classed for a special service, having on board, in good and efficient condition, anchoring and/or mooring equipment approved by the Classification Committee as suitable and sufficient for the particular service.
- N = This character letter will be assigned to ships on which the Classification Committee has agreed that anchoring and mooring equipment need not be fitted in view of their particular service.
- T = This character letter will be assigned to ships which are intended to perform their primary designed service function only while they are anchored, moored, towed or linked, and which have, in good and efficient condition, adequately attached anchoring, mooring, towing or linking equipment which has been approved by the Classification Committee as suitable and sufficient for the intended service.

2. 2. 3 For classification purposes, the character figure 1, or either of the character letters N or T, is to be assigned.

2. 2. 4 In cases where the anchoring and/or mooring equipment is found to be seriously deficient in quality or quantity, the class of the ship will be liable to be withheld.

## 2. 3 Class notations (hull)

2. 3. 1 When considered necessary by the Classification Committee, or when requested by an Owner and agreed by the Classification Committee, a class notation will be appended to the character of classification assigned to the ship. This class notation will consist of one of, or a combination of: a type notation, a cargo notation, a special duties notation, a special features notation and/or a service restriction notation, e.g. '✠ 100A1 Oil Tanker F.P. exceeding 60°C in No. 4 tanks ESP Baltic Service Ice Class 1B'.

2. 3. 2 Details of the ship types and particular cargoes for which special Rules apply are given in those Chapters of [Pt 3 Ship Structures \(General\)](#), [Pt 4 Ship Structures \(Ship Types\)](#) and [Pt 7 Other Ship Types and Systems](#) which apply to such ships and cargoes.

2. 3. 3 Details of the more common special features and the conditions relevant to the assignment of special features notations, together with the form of such notations, are incorporated in [Pt 3 Ship Structures \(General\)](#), [Pt 4 Ship Structures \(Ship Types\)](#) and [Pt 7 Other Ship Types and Systems](#) as applicable.

- 2.3.4 Service restriction notations will generally be assigned in one of the forms shown in [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.6](#) to [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.10](#), but this does not preclude Owners or Shipbuilders requesting special consideration for other forms in unusual cases.
- 2.3.5 Where a service notation is applicable, certain exemptions may be granted. Where these affect statutory requirements, such as Load Lines, the Owner or shipbuilder is to obtain the authorisation of the Flag State. Such exemptions are to be recorded on the Class certificate and any applicable statutory certificate.
- 2.3.6 **Protected waters service.** Service in sheltered water adjacent to sand banks, reefs, breakwaters or other coastal features, and in sheltered water between islands.
- 2.3.7 **Extended protected waters service.** Service in protected waters and also for short distances (generally less than 15 nautical miles) beyond protected waters in 'reasonable weather',—e.g. 'Extended Protected Waters Service from the Port of Bandar Abbas'.
- 2.3.8 **Specified coastal service.** Service along a coast, the geographical limits of which will be indicated in the Register Book, and for a distance out to sea generally not exceeding 21 nautical miles, unless some other distance is specified for 'coastal service' by the Administration with which the ship is registered, or by the Administration of the coast off which it is operating, as applicable, e.g. 'Indonesian coastal service'.
- 2.3.9 **Specified route service.** Service between two or more ports or other geographical features which will be indicated in the Register Book, e.g. 'Bandar Abbas to Dubai service'.
- 2.3.10 Specified operating area service. Service within one or more geographical area(s) which will be indicated in the Register Book, e.g. 'Pacific Tropical Zone service', 'Red Sea, Eastern Mediterranean and Black Sea service'.
- 2.3.11 **\*IWS.** This notation (In-water Survey) may be assigned to a ship where the applicable requirements of ACS's Rules and Regulations are complied with, See [Pt 1, Ch 3, 4.3 In-Water Surveys](#); [Pt 3, Ch 1, 5.2 Plans and supporting calculations](#) and [Pt 3, Ch 1, 5.3 Plans to be supplied to the ship](#); [Pt 3, Ch 2, 3.5 External hull protection](#); [Pt 3, Ch 13, 2.16 Pintles](#) and [Pt 5, Ch 6, 3.12 Sternbushes](#). The notation will be withdrawn for ESP ships upon reaching 15 years of age.
- 2.3.12 **ESP.** This notation (Enhanced Survey Programme) will be assigned to oil tankers, combination carriers, chemical tankers, bulk carriers and ore carriers, as defined in [Pt 1, Ch 3, 1.5 Definitions](#) which are subject to an enhanced survey programme as detailed in [Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements](#), [Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements](#), [Pt 1, Ch 3, 7 Special Survey - Oil tankers \(including ore/oil ships and ore/bulk/oil ships\) - Hull requirements](#) and [Pt 1, Ch 3, 8 Special Survey - Chemical Tankers - Hull requirements](#).
- 2.3.13 **CSR.** This notation will be assigned to bulk carriers and double hull oil tankers compliant with the *IACS Common Structural Rules for Bulk Carriers and Oil Tankers (CSR)*, See [Pt 4, Ch 7, 1.2 Application 1.2.1](#) and [Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.1](#). Additional mandatory and non-mandatory class notations for CSR bulk carriers are given in [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.14](#).
- 2.3.14 **Class notations for CSR bulk carriers.** In general, CSR bulk carriers less than 150 m in length are to comply with the requirements of [Pt 4, Ch 7, 1.4, Class notation for CSR bulk carriers](#) and the *IACS Common Structural Rules (CSR)* and will be eligible for one of the following mandatory class notations:

|        |       |   |
|--------|-------|---|
| {any   | holds | This class notation is normally assigned to a ship designed to carry dry bulk cargoes of cargo density 1.0 tonne/m <sup>3</sup> and above, with an approved arrangement of loaded holds such that any hold may be empty at the maximum draught. |
| may    | be    |   |
| empty} |       |   |

**{holds a, b, ... may be empty}** This class notation is normally assigned to a ship designed to carry dry bulk cargoes of cargo density 1.0 tonne/m<sup>3</sup> and above with specified holds empty at maximum draught.

In general, CSR bulk carriers equal to or greater than 150 m in length are to comply with the requirements of [Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers](#) and the IACS Common Structural Rules (CSR) and will be eligible for one of the following mandatory class notations:

**BC-A, {holds a, b, ... may be empty}** This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density 1.0 tonne/m<sup>3</sup> and above with specified holds empty at maximum draught.

**BC-B** This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density 1.0 tonne/m<sup>3</sup> and above with all cargo holds loaded.

**BC-C** This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density less than 1.0 tonne/m<sup>3</sup> with all cargo holds loaded.

The following additional notations and annotations are to be provided giving further detailed description of limitations to be observed during operation as a consequence of the design loading condition applied during the design:

**(maximum cargo density (in tonnes/m<sup>3</sup>))** For notations **BC-A** and **BC-B** if the maximum cargo density is less than 3.0 tonnes/m<sup>3</sup>

**(no MP)** For all notations when the vessel has not been designed for loading and unloading in multiple ports in accordance with the conditions specified in IACS Common Structural Rules (CSR), Pt 1, Ch 4, Sec 8, 4.2.2;

**GRAB [X]** Where the net thickness of plating of inner bottom, hopper tank sloping plate, transverse lower stool, transverse bulkhead plating and inner hull up to a height of 3.0 m above the lowest point of the inner bottom, excluding bilge wells comply with IACS Common Structural Rules (CSR), Pt 2, Ch 1, 6 for BC-A and BC-B, See IACS Common Structural Rules (CSR), Pt 1, Ch 1, Sec 1, 3.2.1;

**(allowed combination of specified empty holds)** Annotation for notation **BC-A**.

2. 3. 15 **ESN**. This notation (Enhanced Survivability Notation) will be assigned to non-CSR bulk carriers which are designed to withstand the individual flooding of all cargo holds, See [Pt 4, Ch 7, 1.3 General class notations 1.3.2](#).
2. 3. 16 **LI**. This notation will be assigned where an approved loading instrument has been installed as a classification requirement.
2. 3. 17 **ACSPlus( )**. Where one or more of ACS's ACSPlus procedures for the following have been satisfactorily applied, then a notation showing the associated characters of the procedure(s) within brackets will, at the Owner's request, preceded by the word **ACSPlus**, e.g. **ACSPlus(CM, SDA, FDA plus(25,NA))**. The requirements pertaining to these notations and the ACSPlus procedures are given in [Pt 3, Ch 16 ACSPlus Procedures for the Design, Construction and Lifetime Care of Ships](#).

- AS()** This ACSPlus notation AS (Anti-Corrosion System) will be assigned when a specified area or areas of the ship have been protected against corrosion in accordance with the relevant ACSPlus procedures. The **AS()** notation with the extension of one or more of the following associated supplementary characters shown in brackets, detailing the specified protected area or areas, may be assigned;
- **B** for protective coating system of water ballast tanks;
  - D** for protective coating system of double-side skin spaces;
  - **C** for protective coating system of cargo oil tanks;
  - C\*** when corrosion resistant steel has been used in cargo oil tanks;
  - V** for protective coating system of void spaces.
- CM** This ACSPlus notation (Construction Monitoring), which complements the ACSPlus **SDA**, **FDA**, **FDA plus()**, **FDA ICE**, **FDA SPR**, and **WDA** notations, will be assigned when the controls in construction tolerances detailed in the relevant ACSPlus procedures have been applied and verified. The ACSPlus notation **CM** is mandatory upon application of any of the following ACSPlus notations: **SDA**, **FDA**, **FDA plus()**, **FDA ICE**, **FDA SPR** and **WDA**
- FDA** This ACSPlus notation (Fatigue Design Assessment) will be assigned when an appraisal has been made of the fatigue performance of the hull structure in accordance with the relevant ACSPlus procedures.
- FDA plus()** This ACSPlus notation (Fatigue Design Assessment plus) will be assigned when an appraisal has been made for a higher level of fatigue performance than that made for the assignment of **FDA**. The appraisal may be made based upon a specific trading pattern, which is to be expressed in terms of either a Worldwide trading route, as defined in the relevant ACSPlus procedures, or a North Atlantic trading route (that utilises the wave data from IACS Recommendation 34). The ACSPlus notation **FDA plus()** is to be followed by the number of years that the vessel has been assessed for the specific trading pattern shown in brackets, for either the Worldwide or North Atlantic trading routes, denoted by **WW** and **NA** respectively, e.g. **FDA plus (25, NA)**.
- FDA ICE** This ACSPlus notation (Fatigue Design Ice) will be assigned when an appraisal has been made for the fatigue performance of the hull structure when navigating through ice in accordance with the relevant ACSPlus procedures.
- FDA SPR** This ACSPlus notation (Springing Fatigue Assessment) will be assigned when an appraisal has been made of the fatigue performance of the hull structure taking into account the effects due to springing (the continuous vibrational response of the hull girder due to waves) in accordance with the relevant ACSPlus procedures.
- MP** This ACSPlus notation will be assigned to ore carriers where an assessment for multiple port loading and unloading has been carried out in accordance with the relevant ACSPlus procedures and the ACSPlus notation **SDA** has been assigned.
- SDA** This ACSPlus notation (Structural Design Assessment) will be assigned when direct calculations in accordance with the relevant ACSPlus procedures have been applied. The ACSPlus notation **SDA** is mandatory upon application of any of the following ACSPlus notations: **FDA**, **FDA plus()**, **FDA ICE**, **FDA SPR**, **WDA1** and **WDA2**.

**WDA1** This ACSPlus notation (Whipping Design Assessment Level 1) will be assigned when an appraisal has been made of the dynamic response of the hull structure due to wave impact loads (Whipping) in accordance with the relevant ACSPlus procedures.

**WDA2** This ACSPlus notation (Whipping Design Assessment Level 2) will be assigned when an appraisal has been made of the dynamic response of the hull structure due to wave impact loads (Whipping) in accordance with the relevant ACSPlus procedures.

2. 3. 18 When the ACSPlus notations **SDA**, **FDA**, **FDA plus()**, **FDA ICE**, **FDA SPR**, **WDA1**, and **WDA2** are assigned, the precise technical conditions of the appraisal will be made available to Owners.

2. 3. 19

2. 3. 20 The following notations may be assigned to ships that comply with standards for noise and vibration levels in different spaces at the time of delivery and during the ship's life if substantial changes to the machinery installation or interior arrangements are made.

**PAC** Passenger Accommodation Comfort. This notation indicates that the passenger accommodation meets the acceptance criteria.

**CAC** Crew Accommodation Comfort. This notation indicates that the crew accommodation and work areas meet the acceptance criteria.

**PCAC** Passenger and Crew Accommodation Comfort. This notation indicates that the passenger and crew spaces both meet the acceptance criteria.

Following the **PAC** or **CAC** notation, numerals 1, 2 or 3 will indicate the acceptance criteria to which the noise and vibration levels have been assessed. In the case of the **PCAC** notation, two numerals will be assigned. The first will indicate the acceptance criteria for passenger accommodation, whilst the second will indicate the crew comfort criteria. These notations are optional and are primarily intended to apply to passenger ships. Spaces that comply with the minimum Rule requirement for noise levels indicated in [Pt 7, Ch 12 Passenger and Crew Accommodation Comfort](#), will meet the requirements of section 4 of IMO *Resolution MSC.337(91) – Adoption of the Code on Noise Levels on Board Ships – (Adopted on 30 November 2012)* The Annex below is consolidated into *Resolution MSC.337(91)*, when measured in accordance with the requirements of *Chapters 2 and 3* of that Resolution

2. 3. 21 The notation **EPN** (escort performance numeral) may be assigned to escort tugs which carry out full-scale performance trials in accordance with the requirements of [Pt 4, Ch 3, 9.3 Performance numeral and trials](#). (**F,B,V,C**) may be appended to the notations where:

**F** Maximum steering force, in tonnes.

**B** Maximum braking force, in tonnes.

**V** Speed, in knots, at which F and B are determined.

**C** Time, in seconds, required for the escort tug in manoeuvring from maintained oblique position of the tug giving it a maximum steering force on one side of the assisted vessel to a mirror position on the other side.

2. 3. 22 The escort performance numerals in the **EPN** notation may be given the prefix **CFD**: where a Computational Fluid Dynamics prediction of the performance of the escort tug during escort operation in indirect towing mode is made in accordance with [Pt 4, Ch 3, 9.4 Computational Fluid Dynamics Predicted Performance](#), in lieu of full-scale performance trials.

2. 3. 23 Where escort performance numerals are predicted using computational fluid dynamics, the escort performance numeral “C” will be omitted.

## 2. 4 Class notations (machinery)

2. 4. 1 The following class notations are associated with the machinery construction and arrangement, and may be assigned as considered appropriate by the Classification Committee:

✕MC This notation will be assigned when the propelling and essential auxiliary machinery, *See [Pt 1, Ch 2, 2.9 Application notes 2.9.1](#)*, have been constructed, installed and tested under ACS's Special Survey and in accordance with ACS's Rules and Regulations for the Classification of Ships, *See [Pt 1, Ch 2, 3.2, New construction surveys](#)*.

[✕]MC This notation will be assigned when:

- the propelling arrangements for propellers, propulsion shafting and multiple input/output gearboxes, steering systems, pressure vessels and electrical equipment for essential systems have been constructed, installed and tested under ACS's Special Survey and are in accordance with ACS's Rules and Regulations, *See [Pt 1, Ch 2, 3.2, New construction surveys](#)*.
- other items of machinery and gearing arrangements for propulsion and electrical power generation and other auxiliary machinery for essential services are in compliance with ACS Rules and supplied with the Manufacturer's certificate. This notation is assigned subject to the conditions in [Pt 1, Ch 2, 2.9 Application notes 2.9.2](#) being complied with.
- the system arrangements of propelling and essential auxiliary machinery, *See [Pt 1, Ch 2, 2.9 Application notes 2.9.1](#)*, are appraised and found to be acceptable to ACS.

✕MC This notation will be assigned to existing ships in service that will be accepted or transferred into ACS class when:

- the propelling and essential auxiliary machinery, *See [Pt 1, Ch 2, 2.9 Application notes 2.9.1](#)*, have neither been constructed nor installed under ACS's Special Survey.
- the existing machinery installation and arrangement have been tested and found to be acceptable to ACS.

MCH This notation will be assigned when the:

- propelling and essential auxiliary machinery, *See [Pt 1, Ch 2, 2.9 Application notes 2.9.1](#)*, has been installed and tested under ACS's survey and found to be acceptable to ACS.
- propelling and essential auxiliary machinery has been supplied with a Manufacturer's certificate. This notation is assigned subject to the conditions in [Pt 1, Ch 2, 2.9, Application notes 2.9.3](#) being complied with.
- system arrangements of propelling and essential auxiliary machinery, *See [Pt 1, Ch 2, 2.9 Application notes 2.9.1](#)*, are appraised and found to be acceptable to ACS.

IGS This notation will be assigned when a ship intended for the carriage of oil in bulk, or for the carriage of liquid chemicals in bulk, is fitted with an approved system for producing gas for inerting the cargo tanks.

2. 4. 2 The following class notations are associated with the machinery control and automation, and may be assigned as considered appropriate by the Classification Committee:

UMS This notation may be assigned when the arrangements are such that the ship can be operated with the machinery spaces unattended. It denotes that the control engineering equipment has been arranged, installed and tested in accordance with ACS's Rules, or is equivalent thereto.

CCS This notation may be assigned when the arrangements are such that the machinery may be operated with continuous supervision from a centralised control station. It denotes that the control engineering equipment has been arranged, installed and tested in accordance with ACS's Rules, or is equivalent thereto.

**ICC** This notation may be assigned when the arrangements are such that the control and supervision of ship operational functions are computer based. It denotes that the control engineering equipment has been arranged, installed and tested in accordance with ACS's Rules, or is equivalent thereto.

**IP** This notation may be assigned to a ship classed with ACS when the arrangements of the machinery are such that the propulsion equipment and all the essential auxiliary machinery is integrated with the power unit for operation under all normal sea-going and manoeuvring conditions. The system is to be bridge controlled and the propulsion equipment is to incorporate an emergency means of propulsion in the event of failure in the prime mover. It also denotes that the machinery and control equipment have been arranged, installed and tested in accordance with ACS's Rules.

2. 4. 3 The following class notation is associated with vessels capable of being operated unmanned, and may be assigned as considered appropriate by the Classification Committee:

**Unmanned** Assigned when a vessel is designed and constructed such that it may be operated unmanned, i.e. without crew, passengers or other persons on board.

2. 4. 4 The following class notations are associated with dynamic positioning arrangements, and may be assigned as considered appropriate by the Classification Committee:

**DP(CM)** This notation may be assigned when a ship is fitted with centralised remote manual controls for position keeping and with position reference system(s) and environmental sensor(s). It denotes that the machinery and control engineering equipment has been arranged, installed and tested in accordance with ACS's Rules, or is equivalent thereto.

**DP(AM)** This notation may be assigned when a ship is fitted with automatic main and manual standby controls for position keeping and with position reference system(s) and environmental sensor(s). It denotes that the machinery and control engineering has been arranged, installed and tested in accordance with ACS's Rules, or is equivalent thereto.

**DP(AA)** This notation may be assigned when a ship is fitted with automatic main and automatic standby controls for position keeping and with position reference system(s) and environmental sensor(s). It denotes that the machinery and control engineering equipment has been arranged, installed and tested in accordance with ACS's Rules, or is equivalent thereto.

**DP(AAA)** This notation may be assigned when a ship is fitted with automatic main and automatic standby controls for position keeping, together with an additional/emergency automatic control unit located in a separate compartment and with position reference systems and environmental sensors. It denotes that the machinery and control engineering equipment has been arranged, installed and tested in accordance with ACS's Rules, or is equivalent thereto.

**PCR()** This rating supplements the DP() notation. This rating indicates the calculated percentage of time that a unit is capable of holding heading and position under a standard set of environmental conditions (North Sea).

Two rating numerals are calculated:

- The first numeral represents the percentage of time that the ship can remain on station when subjected to a set of standard environmental conditions (North Sea fully developed) with all thrusters operating.
- The second numeral represents the percentage of time that the ship can remain on station when subjected to a set of standard environmental conditions (North Sea fully developed) with the most effective thruster being inoperative.
- A typical rating might be (95),(70).

The foregoing dynamic positioning notations may be supplemented with a Performance Capability Rating (PCR). This rating indicates the calculated percentage of time that a ship is

capable of holding heading and position under a standard set of environmental conditions (North Sea), See [Pt 7, Ch 4 Dynamic Positioning Systems](#).

2. 4. 5 The following class notations are associated with navigation safety, and may be assigned as considered appropriate by the Classification Committee:

**NAV1** This notation will be assigned when the bridge layout and level of equipment are such that the ship is considered suitable for safe periodic operation under the supervision of a single watchkeeper on the bridge. It denotes that the navigational installation has been arranged, installed and tested in accordance with ACS's Rules, or is equivalent thereto.

**IBS** This additional notation will be assigned where an integrated bridge system is fitted to provide electronic chart display, track planning and automatic track following, centralised navigation information display, and bridge alarm management. It denotes that the integrated bridge system has been arranged, installed and tested in accordance with ACS's Rules, or is equivalent thereto. For assignment of this notation, in addition to satisfying ACS Rules, or equivalent thereto, for navigational function integration:

- the layout of the bridge and the equipment located on the bridge is to satisfy the requirements of a relevant International or National Ergonomic or Human-centred Design Standard, or an acceptable equivalent, to the satisfaction of ACS; or
- the notation **NAV1** is also to be assigned; or
- where the bridge is not intended to operate a periodic one man watch, the layout of the bridge and the equipment on the bridge are to satisfy the requirements for the assignment of the notation **NAV1** to the satisfaction of ACS with the exception of requirements identified by ACS Rules that may be relaxed in such cases.

2. 4. 6 Machinery class notations will not be assigned to ships the hulls of which are not classed or intended to be classed with ACS.

2. 4. 7 The notations **✕MC**, **[✕]MC**, **✕MC** and **MCH** will, in general, not be assigned to non-propelled craft, but individual cases will be considered on their merits.

**Table 2. 2. 4: Machinery Class Notations**

## 2. 5 Class notations (machinery special features)

2. 5. 1 The following class notation is associated with onshore power supply arrangements and may be assigned as considered appropriate by the Classification Committee, upon application from the Owners:

**OPS** Assigned when the machinery, electrical and control engineering arrangements installed on board to permit continued operation of services by connection to an external electrical power supply have been assessed.

2. 5. 2 The following class notations are associated with positional mooring systems, or thruster-assisted positional mooring systems, and may be assigned as considered appropriate by the Classification Committee:

**PM** Assigned when a positional mooring system is fitted. This notation can be supplemented by a Thrust-Assisted notation **(T1)** [or **(T2)** or **(T3)**].

**PMC** Assigned when a positional mooring system for mooring in close proximity to other vessels or installations is fitted. This notation can be supplemented by a Thrust-Assisted notation **(T1)** [or **(T2)** or **(T3)**].

**Note:** This notation is not intended to apply to vessels where station-keeping capabilities may be suspended for short periods during adverse weather conditions and a subsequent loss of position allowed.

2. 5. 3 The following class notations are associated with machinery redundancy and may be assigned as considered appropriate by the Classification Committee:

**PMR** This notation will be assigned where the main propulsion systems are arranged such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems. It also denotes that the installation has been arranged, installed and tested in accordance with ACS Rules.

**PMR\*** This notation will be assigned where the main propulsion systems are arranged such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and where the machinery is installed in separate compartments such that, in the event of the loss of one compartment, the ship will retain availability of propulsion power. It also denotes that the installation has been arranged, installed and tested in accordance with ACS Rules.

**SMR** This notation will be assigned where the steering systems for manoeuvring are arranged so that steering capability will continue to be available in the event of a single failure in the steering gear equipment or loss of power supply or control system for any steering system. It also denotes that the installation has been arranged, installed and tested in accordance with ACS's Rules.

**SMR\*** This notation will be assigned where the steering systems for manoeuvring are arranged so that steering capability will continue to be available in the event of a single failure in the steering gear equipment or loss of power supply or control system for any steering system and where the steering systems are installed in separate compartments such that, in the event of the loss of one compartment, steering capability will continue to be available. It also denotes that the installation has been arranged, installed and tested in accordance with ACS's Rules.

**PSMR** This notation will be assigned where the main propulsion and steering systems are configured such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and retain steering capability. It also denotes that the installation has been arranged, installed and tested in accordance with ACS's Rules.

**PSMR\*** This notation will be assigned where the main propulsion and steering systems are configured such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and retain steering capability. The propulsion and steering arrangements are to be installed in separate compartments such that, in the event of the loss of one compartment, the ship will retain availability of propulsion power and manoeuvring capability. It also denotes that the installation has been arranged, installed and tested in accordance with ACS's Rules.

The foregoing machinery redundancy notations may be supplemented with the additional **L** character which indicates a limited capability.

2. 5. 4 The following class notations are associated with comfort control and may be assigned as considered appropriate by the Classification Committee:

**CAC1** (or 2 or 3)

Assigned when noise and vibration levels in crew accommodation and work areas have been assessed. Numerals **1** or **2** or **3** indicate the acceptance criterion to which the noise and vibration levels have been assessed. Primarily intended to apply to passenger ships. If requested, however, any ship can be assessed for compliance.

**PAC1** (or 2 or 3)

Assigned when noise and vibration levels in passenger accommodation have been assessed. Numerals **1** or **2** or **3** indicate the acceptance criterion to which the noise and vibration levels have been assessed. Primarily intended to apply to passenger ships. If requested, however, any ship can be assessed for compliance.

**PCAC1** (or 2 or 3), (1 or 2 or 3)

Assigned when noise and vibration levels in passenger and crew spaces have been assessed. Numerals **1** or **2** or **3** indicate the acceptance criterion to which the noise and vibration levels have been assessed. Two numerals will be assigned, the first for the acceptance criteria for passenger accommodation, the second for crew comfort criteria. Primarily intended to apply to passenger ships. If requested, however, any ship can be assessed for compliance.

2. 5. 5 The following class notation is associated with low flashpoint fuelled vessels and may be assigned as considered appropriate by the Classification Committee:

**LFPF ( )** Assigned where the main propelling and/or auxiliary machinery is designed to operate using a low flashpoint fuel in accordance with the applicable ACS Rules and Regulations. As a minimum, the **LFPF( )** notation is to be appended by associated characters **GC** or **GF** and one two letter fuel identifier;

**GC** Assigned to liquefied gas carriers or tankers, where the main propelling and/or auxiliary machinery is designed to operate on a low flashpoint fuel. The notation also indicates that the gas-fuelled machinery has been constructed, arranged, installed and tested in accordance with the relevant requirements of *Use of Cargo as Fuel* of ACS's Rules for Ships for Liquefied Gases, or is equivalent thereto.

**GF** Assigned to ships other than liquefied gas carriers or tankers, where the main propelling and/or auxiliary machinery is designed to operate on a low flashpoint fuel, or a combination of low flashpoint fuel and standard marine oil fuel. The notation also indicates that the low flashpoint fuelled machinery has been constructed, arranged, installed and tested in accordance with the ACS Rules and Regulations applicable to the fuel(s) used.

The low flashpoint fuel (or fuels) that the ship is designed to use is (are) indicated in the notation using a two letter identifier:

**NG** Natural Gas

**EG** Ethane Gas

**LP** Liquid Petroleum Gas (LPG is considered to include pure propane or Butane or any mixture of the two)

**HG** Hydrogen Gas

**ML** Methanol

2. 5. 6 The following class notations are associated with Ballast Water Treatment Systems and may be assigned as considered appropriate by the Classification Committee:

**BWTS** Assigned to ships with a Ballast Water Treatment System (BWTS) which is approved and installed in accordance with ACS's Rules and Regulations.

**BWTS\*** Assigned to ships with a BWTS which is Type Approved in accordance with ACS's Type Approval procedures and approved and installed in accordance with ACS's Rules and Regulations.

2. 5. 7 The following notation associated with the equipment fitted for the abatement of combustion machinery SO<sub>x</sub> emissions may be assigned as considered appropriate by the Classification Committee:

**EGCS** This notation will be assigned where the SO<sub>x</sub> emissions abatement plant has been designed, constructed, arranged, installed and tested in accordance with ACS's Rules and Regulations. Application of the EGCS notation does not infer that the installation will meet the statutory requirements for emissions regulation. This notation is to be supplemented by one of the following associated notations depending on the type of emissions abatement plant that is installed ([See Pt 5, Ch 24, 1.2 Class notation and descriptive note 1.2.1](#) to [Pt 5, Ch 24, 1.2 Class notation and descriptive note 1.2.3](#) for more information):

- **(Open)** Open loop wet scrubber installed with no capacity to operate in zero discharge mode;
- **(Closed)** Closed loop wet scrubber installed only capable of operating in zero discharge mode;
- **(Hybrid)** The installed wet scrubber is able to operate in both open loop and closed loop modes; or

- (Dry) Dry scrubber installed.
2. 5. 8 The following notation associated with the equipment fitted for the abatement of combustion machinery NO<sub>x</sub> emissions may be assigned as considered appropriate by the Classification Committee:
- EGCN** This notation will be assigned where the NO<sub>x</sub> emissions abatement plant has been designed, constructed, arranged, installed and tested in accordance with ACS's Rules and Regulations. Application of the **EGCN** notation does not infer that the installation will meet the statutory requirements for emissions regulation. This notation is to be supplemented by the following associated notation(s) (See [Pt 5, Ch 24, 1.2 Class notation and descriptive note 1.2.4](#) to [Pt 5, Ch 24, 1.2 Class notation and descriptive note 1.2.7](#) for more information):
- (SCR) Selective catalytic reduction installed.
  - (EGR) Exhaust gas recirculation installed.
2. 5. 9 The following class notations are associated with hybrid electrical power systems and may be assigned as considered appropriate by the Classification Committee:
- Hybrid Power** Assigned to ships with an electrical power system utilising a combination of two or more different types of power source or utilising stored electrical energy to satisfy the ship's main power demand. The system and its component parts are in accordance with the existing applicable requirements of the Rules and the requirements of [Pt 6, Ch 2, 24 Hybrid electrical power systems](#).
- Hybrid Power (+)** Assigned to ships meeting the requirements for **Hybrid Power** and the additional optional requirements for **Hybrid Power (+)** specified within [Pt 6, Ch 2, 24 Hybrid electrical power systems](#). The additional optional requirements aim to provide for enhanced performance of the electrical power system achieved through the consideration of system simulation, system integration and the dependability of the electrical power system during normal or reasonably foreseeable abnormal operation.

## 2. 6 Class notations (refrigerated cargo installations (RMC), controlled atmosphere (CA) systems and carriage of refrigerated containers (CRC))

2. 6. 1 The following class notations may be assigned as considered appropriate by the Classification Committee, on application from the Owners:
- ✱**ACS's RMC** This notation will be assigned when a refrigerated cargo installation has been constructed, installed and tested under ACS's Special Survey and in accordance with the relevant requirements of the Rules.
- ACS's RMC** This notation will be assigned when the arrangements of the refrigerated cargo installation have been found to be equivalent to Rule requirements, and the installation has been tested in accordance with the relevant requirements of the Rules.
- ‡ This symbol will be assigned to installations considered suitable for the carriage of fruit. It indicates that the following parameters have been assessed and found satisfactory:
- a. The rate of air circulation and the air refreshing arrangements through the refrigerated spaces or chambers, or to containers.
  - b. The temperature controls and monitoring arrangements.
  - c. The installation's capability to cool down a complete cargo of fruit to its carrying temperature within a specified time. The symbol will also be assigned to fishing vessels that have the refrigerating capacity to freeze down their catch.
- ✱**ACS's RMC (LG)** This notation will be assigned to a classed liquefied gas carrier or tanker, in which reliquefaction or refrigeration equipment is approved and fitted for cargo temperature and

pressure control where the equipment has been constructed, installed and tested in accordance with the relevant requirements of the Rules.

**ACS's RMC (LG)** This notation will be assigned to a classed liquefied gas carrier or tanker, in which reliquefaction or refrigeration equipment is fitted for cargo temperature and pressure control, where the equipment has been found equivalent to Rule requirements and tested in accordance with the relevant requirements of the Rules.

**✕ACS's RMC (BC)** Assigned to a classed chemical tanker in which refrigeration equipment has been constructed, installed and tested, in accordance with the relevant requirements of the Rules.  
**ACS's RMC (BC)** Assigned to a classed chemical tanker where the equipment has been found equivalent to Rule requirements and tested in accordance with the relevant requirements of the Rules.

**TC** Assigned to a classed chemical tanker where the temperature control systems have been found equivalent to Rule requirements and tested in accordance with the relevant requirements of the Rules.

2. 6. 2 The following class notations are associated with controlled atmospheres and may be assigned as considered appropriate by the Classification Committee, on application from Owners, *See also* [Pt 7, Ch 1 Controlled Atmosphere System](#):

**(CA)** This notation may be assigned when a ship is fitted with arrangements for maintaining airtightness in CA zones and for the ready connection to a gas system in accordance with the relevant requirements of the Rules.

**CA (%O<sub>2</sub>, %CO<sub>2</sub>)** This notation may be assigned when a ship is provided with a CA system which will achieve and maintain specified ranges of oxygen and carbon dioxide levels in accordance with the relevant requirements of the Rules.

**RH** This notation may be assigned when a ship can maintain a specified relative humidity in the CA zones.

**RPA** Assigned to ships where the Refrigeration Machinery for Provision Stores and Air-conditioning comply with the applicable requirements of [Pt 7, Ch 15 Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations](#).

Before assignment of any of the above notations it is a prerequisite that the refrigeration installation is assigned an **RMC** class notation.

2. 6. 3 The following class notation is associated with the carriage of refrigerated cargo containers and may be assigned as considered appropriate by the Classification Committee, on application from Owners, *See also* [Pt 7, Ch 10 Carriage of Refrigerated Containers](#):

**✕CRC** This notation may be assigned when a ship is provided with a ventilation system which is approved, installed and tested in accordance with the relevant requirements of the Rules.

2. 6. 4 The class notation assigned will additionally specify the temperature conditions and other relevant characteristics for which the equipment has been approved, *See* [Pt 6, Ch 3 Refrigerated Cargo Installations](#).

2. 6. 5 The class notation assigned will be maintained as long as the installation is found, at the prescribed Periodical Surveys, to be in a fit and efficient condition, and in accordance with the requirements of the Rules.

2. 6. 6 The Classification Committee will give consideration to ships engaged on voyages of short duration, to installations of small capacity, or to other special circumstances. In such cases the class may include a service limitation or other restriction.

2. 6. 7 Refrigerating installations designed to supply refrigerated air to insulated containers in ships' holds aboard container ships, are eligible for classification. The installation is to include the refrigerating machinery, supply and return air ducting, and the flexible couplings between containers and the duct system. Where the arrangements are such that cell air conditioning is essential to the carriage

of the containers, the air conditioning equipment and/or insulation of the hold, deckheads, sides and tank tops are to be included in the classification.

2. 6. 8 Other methods of carrying refrigerated cargoes in containers aboard container ships will be considered for classification on application.

## 2. 7 Class notations (Environmental Protection)

2. 7. 1 The following class notations are associated with the design and operation of a ship and may be assigned as considered appropriate by the Classification Committee, on application from the Owners:

**ABN()** This notation will be assigned where a vessel has had its airborne noise measured and certified in accordance with ACS's *ACSPlus Additional Design and Construction Procedure for the determination of airborne noise emissions from marine vessels*, and the sound power and sound pressure are found to be less than the assessment criteria limits it contains. The parentheses are to contain the characters associated with the most stringent assessment criteria limits that the airborne noise of the vessel satisfies.

**ECO** This notation will be assigned when a ship is designed and operated in accordance with the relevant requirements of the Rules.

**ECO(TOC)** This notation will be assigned when the environmental protection arrangements are in accordance with the requirements of another recognised classification society and are essentially equivalent to Rule requirements and the ship is operated in accordance with the relevant requirements of the Rules.

**UWN-M** This notation will be assigned where a vessel has had its underwater radiated noise measured and certified in accordance with ACS's *ACSPlus Procedure Additional Design and Construction Procedure for the Determination of a Vessel's Underwater Radiated Noise*.

**UWN-L()** This notation will be assigned where a vessel has had its underwater radiated noise measured and certified in accordance with ACS's *ACSPlus Procedure Additional Design and Construction Procedure for the Determination of a Vessel's Underwater Radiated Noise* and the profile of the underwater radiated noise curve(s) are found to be less than the limits contained in the ACSPlus Procedure. The parentheses are to contain the limit set in accordance with the ACSPlus Procedure and listed therein.

## 2. 8 Descriptive notes

2. 8. 1 In addition to any class notations, an appropriate descriptive note may be entered in the *Register Book* indicating the type of ship in greater detail than is contained in the class notation, and/or providing additional information about the ship's design and construction. This descriptive note is not an ACS class notation and is provided solely for information.
2. 8. 2 **ACSPlus()**. Where one or more of ACS's ACSPlus procedures for the following have been satisfactorily applied, then a descriptive note showing the associated characters of the procedure(s) within brackets will, at the Owner's request, be entered in the *Register Book*, preceded by the word **ACSPlus**, e.g. **ACSPlus(IHM, SERS)**. The requirements pertaining to these descriptive notes and the ACSPlus procedures are given in [Pt 3, Ch 16 ACSPlus Procedures for the Design, Construction and Lifetime Care of Ships](#) and [Pt 5, Ch 21 Requirements for Condition Monitoring and Condition-Based Maintenance Systems](#), or directly within the relevant *ACSPlus Procedure* document.

- ShaftRight()** This ACSPlus descriptive note will be assigned when the main propulsion shafting alignment has been carried out in accordance with ACSPlus Procedure *ShaftRight: Main Propulsion Shafting Alignment Procedure*, which ACS considers to be best practice during design, construction and trials. The **ShaftRight()** descriptive note with the extension of one or more of the following associated supplementary characters shown in brackets, may be assigned:
- **E** Existing design. Applicable to vessels having main propulsion shafting and hull arrangements which have been previously implemented and, for which, proven satisfactory service experience is demonstrated;
  - **N** New design. Applicable to a new main propulsion shafting arrangement within a new, or previously implemented, hull design.
- BWMP()** This ACSPlus descriptive note (Ballast Water Management Plan) will be assigned, when the requirements in accordance with the relevant ACSPlus procedures have been complied with. The descriptive note **BWMP()** with the extension of one or more of the following associated supplementary characters shown in brackets, detailing the method(s) used, may be assigned:
- **S** sequential method;
  - **F** flow through method;
  - **D** dilution method;
  - **T** treatment method.
- DIST()** This ACSPlus descriptive note (Machinery suitable for operation on Distillate Fuels) will be assigned when specified machinery items are suitable for operation on distillate fuels, in accordance with the relevant ACSPlus procedures. The **DIST()** descriptive note with the extension of one or more of the following associated supplementary characters shown in brackets, detailing the specified machinery items, may be assigned:
- **M** main engine(s);
  - **AB** auxiliary engines and boiler;
  - **I** incinerator;
  - **IG** inert gas generator.
- E** This ACSPlus descriptive note (Evidence) will be assigned, where evidence exists that supporting calculations have been performed in accordance with hull structural finite element and fatigue analysis procedures of a recognised classification society. This descriptive note can be assigned to vessels transferring class or to new builds where the design has been appraised by another recognised classification society.
- ES()** This ACSPlus descriptive note (Enhanced Scantlings) will be assigned, where scantlings in excess of the approved Rule minimum are fitted at defined locations in accordance with the relevant ACSPlus procedures. The added thickness measurement in mm is to be shown with a description of the location(s) in brackets e.g. **ACSPlus(ES(+1 Strength Deck, +2 Bottom Shell))**.
- IHM** This ACSPlus descriptive note (Inventory of Hazardous Materials) will be assigned when the requirements in accordance with the relevant ACSPlus procedures have been complied with.

|                |  |
|----------------|--|
| <b>PCWBT()</b> | This ACSPlus descriptive note (Protection Coatings in Water Ballast Tanks) will be assigned, to indicate that all sea-water ballast spaces having boundaries formed by the hull envelope have a corrosion protection coating applied, and that the coating remains efficient and is maintained in good condition. The month and year that the coating is approved is to be appended to the descriptive note within brackets.   |
| <b>SEA()</b>   | <p>This descriptive note (Ship Event Analysis) will be assigned, where hull surveillance systems for monitoring of the ship's hull girder stresses and motions have been fitted and are in compliance with the relevant ACSPlus procedures. The ACSPlus descriptive note is to be appended by <b>HSS</b> followed by the number of strain gauges fitted shown in brackets. In addition the extension of one or more of the following associated supplementary characters may be shown e.g. <b>ACSPlus(SEA(HSS-2, VDR))</b>:</p> <ul style="list-style-type: none"> <li>• <b>L</b> The display of the relevant information in the cargo control area;</li> <li>• <b>M</b> The display and recording of the ship's motion;</li> <li>• <b>N</b> The facility to display and record navigational information;</li> <li>• <b>VDR</b> An interface with the ship's voyage data recorder system to enable the recording of hull stress, ship motion and hull pressure information.</li> </ul> |
| <b>SEA ICE</b> | This ACSPlus descriptive note (Ship Event Analysis Ice) will be assigned when the ship has been provided with a hull surveillance system that can display and record local ice load induced stresses from a series of strain gauges in the bow region.   |
| <b>SERS</b>    | This ACSPlus descriptive note (Ship Emergency Response Service) will be assigned when a Ship is registered with ACS's Ship Emergency Response Service.   |
| <b>SCM</b>     | This ACSPlus descriptive note (Screwshaft Condition Monitoring) will be assigned where an Owner adopts the requirements for monitoring of the screwshaft. The descriptive note will indicate that equipment and procedures are in place to determine the physical and operational condition of that equipment.   |
| <b>SRtP</b>    | This ACSPlus descriptive note (Safe Return to Port and Orderly Evacuation) is to be applied where the design appraisal and survey of the vessel has been performed in accordance with the relevant ACSPlus procedures for vessels required to comply with Safe Return to Port and Orderly Evacuation.  |
| <b>TCM</b>     | This ACSPlus descriptive note (Main Steam Turbine Condition Monitoring) will be assigned where an Owner adopts the requirements for monitoring of the main steam turbine. The descriptive note will indicate that equipment and procedures are in place to determine the physical and operational condition of that equipment. Further information is provided in the ACS document <i>ACSPlus Procedure Machinery Planned Maintenance and Condition Monitoring</i> .   |

**ThCM**

Thruster Condition Monitoring. This ACSPlus descriptive note (Thruster Condition Monitoring) will be assigned where an Owner adopts the requirements for monitoring of selected Thrusters and/or Podded Propulsors. The descriptive note will indicate that equipment and procedures are in place to determine the physical and operational condition of that equipment. Further information is provided in the ACS document *ACSPlus Procedure Machinery Planned Maintenance and Condition Monitoring*.

**Note** Not applicable where a single thruster, or podded propulsor, is solely responsible for the propulsion and/or steering of the vessel.

- MPMS()** This ACSPlus descriptive note (Machinery Planned Maintenance Scheme) will be assigned where an Owner operates, as part of the Continuous Survey Machinery (CSM) cycle, a Machinery Planned Maintenance Scheme which is approved in accordance with ACS's ACSPlus Procedures for Machinery Planned Maintenance and Condition Monitoring. The descriptive note will indicate that procedures and documentation are in place to control and record the inspection and maintenance routines of all machinery and equipment in the ship.
- **CM** This ACSPlus descriptive note (Condition Monitoring) will be assigned where an Owner operates, as part of the Continuous Survey Machinery (CSM) cycle, a Machinery Planned Maintenance Scheme which uses monitoring techniques and equipment are used to record the condition against agreed acceptable limits and the scheme is approved in accordance with ACS's ACSPlus Procedures for Machinery Planned Maintenance and Condition Monitoring. The descriptive note will indicate that equipment, procedures and documentation are in place to monitor, control and record the physical and operational condition of the equipment on the ship and control the maintenance routines accordingly. For the design and installation of machinery condition monitoring systems which form part of a Machinery Planned Maintenance Scheme approved by ACS for the assignment of the descriptive note, the requirements of [Pt 5, Ch 21 Requirements for Condition Monitoring and Condition-Based Maintenance Systems](#) are applicable.
  - **PT** This ACSPlus descriptive note (Predictive Techniques) will be assigned where an Owner operates, as part of the Continuous Survey of Machinery (CSM) cycle, a Machinery Planned Maintenance Scheme which uses the output from machine learning and complex algorithms to determine acceptability for continued service and maintenance requirements and the scheme is approved in accordance with ACS's ACSPlus Procedures for Machinery Planned Maintenance and Condition Monitoring. The descriptive note will indicate that equipment, procedures and documentation are in place to monitor, control and review the output from machinery maintenance systems using Predictive Techniques. The requirements of [Pt 5, Ch 21 Requirements for Condition Monitoring and Condition-Based Maintenance Systems](#) are applicable.
  - **RBM** This ACSPlus descriptive note (Risk Based Maintenance) will be assigned where an Owner operates, as part of the Continuous Survey Machinery (CSM) cycle, a Machinery Planned Maintenance Scheme based on the use of Risk Based Maintenance (RBM) which is approved in accordance with ACS's ACSPlus Procedures for Machinery Planned Maintenance and Condition Monitoring. The descriptive note will indicate that procedures and documentation are in place to control and record the inspection and maintenance routines of machinery and equipment based on the output from a Risk Based study. The Scheme is to be based on a risk assessment and an RBM In-Service Inspection Plan, both approved by ACS.
  - **RCM** This ACSPlus descriptive note (Reliability Centred Maintenance) will be assigned where an Owner operates, as part of the Continuous Survey Machinery (CSM) cycle, Machinery Planned Maintenance Scheme based on the use of Reliability Centred Maintenance which is approved in accordance with ACS's ACSPlus

Procedures for Machinery Planned Maintenance and Condition Monitoring. The descriptive note will indicate that procedures and documentation are in place to control and record the inspection and maintenance routines of all machinery and equipment in the ship, and that they are based on acceptable and applicable methodology.

**VECS** This ACSPlus descriptive note (Vapour Emission Control System) will be assigned to a ship that has a vapour emission control system fitted which has been designed and constructed in accordance with the requirements of USCG 46, CFR 39 or the IMO Standards for Vapour Emission Control Systems (MSC Circular 585).

**VECS-L** This ACSPlus descriptive note (Vapour Emission Control System – Lightering) will be assigned to a ship that has a vapour emission control system that complies with the requirements for the **VECS** Descriptive Note and which has also been designed and constructed to meet the requirements for vapour balancing in accordance with USCG 46, CFR 39.40 for service vessels. If a ship has been assigned the **ECO** notation then it will not be eligible for the **VECS-L** Descriptive Note. Instead, **VECS** for lightering will be referenced in the **ECO** notation, i.e. **ECO(VECS-L)**.

2. 8. 3 Where an approved loading instrument is provided as an Owner's requirement, a descriptive note **LI** may be entered in the *Register Book*, See also [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.16](#).
2. 8. 4 Where container securing arrangements are designed and constructed in accordance with [Pt 3, Ch 14 Cargo Securing Arrangements](#), but where the Initial and Periodical Survey requirements for loose fittings are not requested, the ship will be eligible to be assigned the descriptive note **CSA** (container securing arrangement) and for an entry to be made in the *Register Book*.
2. 8. 5 **EDD**. Vessel is eligible for the Owner/Operator to apply to the Flag Administration for the vessel to be placed on a pilot Extended Dry-Docking regime. The relevant Flag Administration may elect to impose requirements additional to those defined as per this descriptive note. Vessels are to comply with the ACS Guidance notes on Extended Dry- Dockings.
2. 8. 6 **STV**. Where a sailing vessel is used for the offshore training of cadets or trainee seamen, a sailing training vessel **STV** descriptive note may be entered in the *Register Book*.
2. 8. 7 **GR**. Assigned to ships other than LNG carriers, detailing the aspects of design and construction that are prepared for gas fuel operation in accordance with ACS's Rules and Regulations in force on the date of 'contract for construction'. If a ship has been assigned the **LFPF(GF, NG)** notation then it will not be eligible for the **GR** descriptive note. The descriptive note **GR**, with the extension of one or more of the following associated characters shown in brackets, may be entered in the *Register Book*.
  - A** The design of the gas fuel system has been approved in principle.
  - S** Enhanced structural reinforcement and appropriate materials have been fitted to support the proposed gas storage tank.
  - T** Fuel storage arrangements installed in accordance with an approved design.
  - P** Gas fuel piping arrangements installed in accordance with an approved design.
  - E** Engineering systems have been installed in accordance with an approved design. Additional letters will be assigned in brackets to identify which items may be gas-fuelled:

**M** = main engine(s)

**A** = auxiliary engines

**B** = boiler

**I** = incinerator

*See ACS's Rules and Regulations for the Classification of Ships using Gases or other Low-flashpoint Fuels, 2 General for further detail.*

2. 8. 8 **EGCS-R()**. Assigned to ships with the extension of one or more of the following associated characters shown in brackets, detailing the aspects of design and construction that are prepared for installation of SO<sub>x</sub> emissions abatement plant for combustion machinery in accordance with ACS's Rules and Regulations in force on the date of 'contract for construction' (See [Pt 5, Ch 24, 1.2 Class notation and descriptive note 1.2.1](#) to [Pt 5, Ch 24, 1.2 Class notation and descriptive note 1.2.3](#) for more information):

**A** Preliminary assessment of the proposed SO<sub>x</sub> emissions abatement plant including its arrangement on board has been completed satisfactorily;

**S** Enhanced structural reinforcement and structural modifications necessary for the function of the proposed SO<sub>x</sub> emissions abatement plant have been fitted under survey;

**T** The relevant tank(s) needed for operation of the proposed SO<sub>x</sub> emissions abatement plant (e.g. chemical and/or residue storage tanks as applicable) have been installed under survey.

2. 8. 9 **EGCN-R()**. Assigned to ships with the extension of one or more of the following associated characters shown in brackets, detailing the aspects of design and construction that are prepared for installation of NO<sub>x</sub> emissions abatement plant for combustion machinery in accordance with ACS's Rules and Regulations in force on the date of 'contract for construction' (See [Pt 5, Ch 24, 1.2 Class notation and descriptive note 1.2.4](#) to [Pt 5, Ch 24, 1.2 Class notation and descriptive note 1.2.6](#) for more information):

**A** Preliminary assessment of the proposed NO<sub>x</sub> emissions abatement plant including its arrangement on board has been completed satisfactorily;

**S** Enhanced structural reinforcement and structural modifications necessary for the function of the proposed NO<sub>x</sub> emissions abatement plant have been fitted under survey;

**T** The relevant tank(s) needed for operation of the proposed NO<sub>x</sub> emissions abatement plant (e.g. chemical tanks) have been installed under survey in accordance with approved design.

## 2. 9 Application notes

2. 9. 1 **Propelling and essential auxiliary machinery** includes machinery, equipment and systems installed for the ship to be under seagoing conditions and that are necessary for the following:
- Maintaining the watertight and weathertight integrity of the hull and spaces within the hull.
  - The safety of the ship, machinery and personnel on board.
  - The functioning and dependability of propulsion, steering and electrical systems.
  - The operation and functioning of control engineering systems for the monitoring and safety of propulsion and steering systems.
  - The operation and functioning of emergency machinery and equipment.
2. 9. 2 **Manufacturer's certificate** for assignment of the [✕] **MC** notation. Acceptance of the manufacturer's certificate for items of machinery for propulsion (including propulsion gearing with single input/output arrangements) and for electrical power generation and for other auxiliary machinery for essential services is subject to the following:
- The ship is a cargo ship of less than 500 gross tonnage or is a ship of 500 gross tonnage or greater and is not required to comply with international conventions applicable to a ship with unrestricted service.

- b. Propulsion power is provided by engines or gas turbines which have been type approved in accordance with ACS requirements for marine application.
- c. Electrical power is provided by generators driven by engines or gas turbines which have been type approved in accordance with ACS requirements for marine application.
- d. The design and manufacture standards for all machinery and associated engineering systems are the applicable ACS Rules.
- e. The machinery and equipment is manufactured under a recognised quality control system.
- f. Propellers, propulsion shafting and multiple input/output gearboxes are not included within the scope of propulsion arrangements for acceptance of a manufacturer's certificate.

2.9.3 **Manufacturer's certificate** for assignment of the **MCH** notation. Acceptance of the manufacturer's certificate for propelling and essential auxiliary machinery is subject to the following:

- a. The ship is a cargo ship of less than 500 gross tonnage or is a ship of 500 gross tonnage or greater and is not required to comply with the international conventions applicable to a ship with unrestricted service.
- b. Propulsion power is provided by engines or gas turbines which have been type approved in accordance with ACS requirements for marine application.
- c. Electrical power is provided by generators driven by engines or gas turbines which have been type approved in accordance with ACS requirements for marine application.
- d. The power of any prime mover is less than 2.250 kW and the cylinder bore or any engine is not greater than 300 mm.
- e. The design and manufacture standards for machinery and associated systems are the applicable ACS Rules or other marine standards acceptable to ACS.
- f. The machinery and equipment is manufactured under a recognised quality control system in accordance with the requirements of [Pt 5, Ch 1, 1.3 Alternative approach for product assurance](#).
- g. Individual components manufactured under [Pt 1, Ch 2, 2.9 Application notes 2.9.3.f](#) are to be delivered with a manufacturer's statement confirming that the scantlings comply with the applicable ACS Rule requirements.

PART

# 1

CHAPTER **2 Classification Regulations**

SECTION **3 Surveys – General**

### **3.1 Statutory surveys**

- 3.1.1 The Classification Committee will act, when authorised on behalf of Governments, in respect of National and International statutory safety and other requirements for passenger and cargo ships.
- 3.1.2 The Classification Committee will also act, when authorised, in respect of National Safety and other requirements relating to ships used for offshore mineral exploration and exploitation.

### **3.2 New construction surveys**

- 3.2.1 When it is intended to build a ship for classification with ACS, constructional plans and all necessary particulars relevant to the hull, equipment and machinery, as detailed in the Rules, are to be submitted for approval before the work is commenced. Proposals for any subsequent modifications or additions to the scantlings, arrangements or equipment shown on the approved plans are also to be submitted in writing and on plans for approval.
- 3.2.2 Where the proposed construction of any part of the hull or machinery is of novel design, or involves the use of unusual material, or where experience, in the opinion of the Classification Committee, has not sufficiently justified the principle or mode of application involved, special tests or examinations before and during service may be required. In such cases a suitable notation may be assigned.
- 3.2.3 The materials used in the construction of hulls and machinery intended for classification are to be of good quality and free from defects and are to be tested in accordance with the requirements of the [Pt 2 Rules for the Manufacture, Testing and Certification of Materials](#). The steel is to be manufactured by an approved process at an approved works. Alternatively, tests will be required to demonstrate the suitability of the steel.
- 3.2.4 New ships intended for classification are to be built under ACS's Special Survey. From the commencement of the work until the completion of the ship, the Surveyors are to be satisfied that the materials, workmanship and arrangements are satisfactory and in accordance with the Rules. Any items found not to be in accordance with the Rules or the approved plans, or any material, workmanship or arrangements found to be unsatisfactory, are to be rectified.
- 3.2.5 For compliance with [Pt 1, Ch 2, 3.2 New construction surveys 3.2.4](#), ACS is prepared to consider methods of survey and inspection for hull construction which formally include procedures involving the shipyard management, organisation and quality systems. The minimum requirements for the approval of any such proposed Quality Assurance methods are laid down in [Pt 3, Ch 15 Quality Assurance Scheme for the Hull Construction of Ships](#).
- 3.2.6 Each offshore supply ship, offshore tug/supply ship, dredger, hopper dredger, sand carrier, hopper barge or reclamation craft, proceeding to sea is to comply with the draught and stability requirements of the National Authority and is to have on board sufficient stability data to enable it to be properly loaded and handled, or, where appropriate, to be properly towed. This data is to

take full account of any intended special distribution or concentration of loading. In the case of an unmanned ship under tow, the data is to be made available to the tug master.

- 3. 2. 7 Copies of approved plans (showing the ship as built), essential certificates and records, required loading and other instruction manuals are to be readily available for use when required by the attending Surveyors, and may be required to be kept on board.
- 3. 2. 8 When the machinery is constructed under ACS's Special Survey, this survey is to relate to the period from the commencement of the work until the final test under working conditions. Any items found not to be in accordance with the Rules or the approved plans, or any material, workmanship or arrangements found to be unsatisfactory, are to be rectified.
- 3. 2. 9 When arrangements are such that essential machinery can be operated by remote and/or automatic control equipment, the control equipment is to be arranged, installed and tested in accordance with ACS's Rules and Regulations.
- 3. 2. 10 The date of completion of the Special Survey during construction of ships built under ACS's inspection will normally be taken as the date of build to be entered in the ACS *Publication Record*. If the period between launching and commissioning is, for any reason, unduly prolonged, the dates of launching and completion or commissioning may be separately indicated in the ACS *Publications*.
- 3. 2. 11 When a ship, upon completion, is not immediately commissioned but is laid-up for a period, the Classification Committee, upon application by the Owner, prior to the ship proceeding to sea, will direct an examination to be made by the Surveyors which may include a survey in dry-dock. If, as the result of such a survey, the hull and machinery be reported in all respects in accordance with applicable Rule requirements, the subsequent Special Survey and Complete Survey of the machinery will date from the time of such examination.

### 3. 3 Existing ships

- 3. 3. 1 **Classification of ships not built under survey.** The requirements of the Classification Committee for the classification of ships which have not been built under ACS's Survey are indicated in [Pt 1, Ch 3, 20 Classification of ships not built under survey](#). Special consideration will be given to ships transferring class to ACS from another recognised Classification Society.
- 3. 3. 2 **Reclassification.** When reclassification or class reinstatement is desired for a ship for which the class previously assigned by ACS has been withdrawn or suspended, the Classification Committee will direct that a survey, appropriate to the age of the ship and the circumstances of the case, be carried out by the Surveyors. If, at such a survey, the ship be found or placed in a condition in accordance with the requirements of the Rules and Regulations, the Classification Committee will be prepared to consider reinstatement of the original class or the assignment of such other class as may be deemed necessary.
- 3. 3. 3 A similar arrangement will apply in the case of reclassification of refrigerated cargo installations.
- 3. 3. 4 3.3.4 The Classification Committee reserves the right to decline an application for classification or reclassification where the prior history or condition of the ship indicates this to be appropriate.
- 3. 3. 5 **Unscheduled surveys.** Where the Classification Committee has concern about the condition of a ship and/or the equipment an unscheduled survey may be required at any time to determine the actual condition.

### 3. 4 Damages, repairs and alterations

- 3. 4. 1 All repairs to hull, equipment and machinery which may be required in order that a ship may retain her class (See [Pt 1, Ch 2, 1.1 General 1.1.5](#)), are to be carried out to the satisfaction of the Surveyors. When repairs are effected at a port, terminal or location where the services of a

Surveyor to ACS are not available, the repairs are to be surveyed by one of the Surveyors at the earliest opportunity thereafter.

3. 4. 2 When, at any survey, the Surveyors consider repairs to be immediately necessary, either as a result of damage, or wear and tear, they are to communicate their recommendations at once to the Owner, or his representative. When such recommendations are not complied with, immediate notification is to be given to the Classification Committee by the Surveyors.
3. 4. 3 Where repairs are to be carried out by a riding crew during a voyage then these must be planned in advance. A complete repair procedure, including the extent of proposed repair and the need for Surveyor's attendance during the voyage, is to be submitted reasonably in advance to the Surveyor for agreement. Failure to notify ACS in advance of the repairs may result in the class of the ship being specially considered by the Classification Committee. Where emergency repairs are effected immediately due to an extreme emergency circumstance, the repairs should be documented in the ship's log and submitted thereafter to ACS for use in determining further survey requirements.
3. 4. 4 When, at any survey, it is found that any damage, defect or breakdown (*See [Pt 1, Ch 2, 1.1 General 1.1.5](#)*) is of a nature that does not require immediate permanent repair, but is sufficiently serious to require rectification by a prescribed date in order to maintain class, a suitable condition of class is to be imposed by the Surveyors and recommended to the Classification Committee for consideration.
3. 4. 5 If a ship which is classed with ACS is to leave harbour limits or protected waters under tow, the Owner is to advise ACS of the circumstances prior to her departure.
3. 4. 6 If a ship which is classed with ACS is taken in tow whilst at sea, the Owner is to advise ACS of the circumstances at the first practicable opportunity.
3. 4. 7 Plans and particulars of any proposed alterations to the approved scantlings and arrangements of hull, equipment, or machinery are to be submitted for approval, and such alterations are to be carried out to the satisfaction of the Surveyors.
3. 4. 8 Where a complete replacement or addition of a major portion of the ship is involved, as defined in [Pt 1, Ch 2, 3.4 Damages, repairs and alterations 3.4.9](#), consideration may be given to assignment of a separate date of build for the new structure. The Survey requirements shall be based on the date of build associated with each major portion of the ship. Special Survey due dates may be aligned at the discretion of the Committee.
3. 4. 9 A major portion of the ship may include a complete forward or after section, a complete main cargo section (which may include a complete hold/tank of a cargo ship), a complete block of deck structure of a passenger ship or a structural modification of a single hull to a double hull ship.

### 3. 5 Existing ships – Periodical Surveys

3. 5. 1 Annual Surveys are to be held on all ships within three months, before or after each anniversary of the completion, commissioning or Special Survey in accordance with the requirements given in [Pt 1, Ch 3 Periodical Survey Regulations](#). The date of the last Annual Survey will be recorded on the Class website.
3. 5. 2 Intermediate Surveys are to be held on all ships instead of the second or third Annual Survey after completion, commissioning or Special Survey. The Intermediate Survey may be commenced at the second Annual Survey and progressed with completion at the third Annual Survey. The date of the last Intermediate Survey will be recorded on the Class website. The concurrent crediting of items towards both Intermediate Survey and Special Survey is not permitted.
3. 5. 3 The Owner should notify ACS whenever a ship can be examined in dry-dock or on a slipway. A minimum of two Bottom Surveys are to be held in each five-year Special Survey period and the maximum interval between successive Bottom Surveys is not to exceed three years. One of the two Bottom Surveys required in each five-year period is to coincide with the Special Survey. Consideration may be given in exceptional circumstances to an extension of the Bottom Survey,

not exceeding three months, provided the interval between successive surveys does not exceed 36 months. A definition of ‘exceptional circumstances’ is given in [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.9](#).

A Bottom Survey is an examination of the outside of the ship’s bottom and related items, and is normally to be carried out with the ship in dry-dock. However, the Classification Committee may give consideration to alternate examination while the ship is afloat as an In-Water Survey, subject to provisions of [Pt 1, Ch 3, 4.3 In-Water Surveys](#). An In-Water Survey shall not be permitted for ships of 15 years of age and over that are assigned the notation **ESP**.

For general dry cargo ships, for gas carriers and for ships with class notation **ESP**, the Bottom Survey in conjunction with the Special Survey must be carried out with the ship in dry-dock.

For ships over 15 years of age, with the class notation **ESP**, the Bottom Survey is to be held in dry-dock; in addition, a Bottom Survey in dry-dock is to be held as part of the Intermediate Survey.

Bottom Surveys are to be carried out in accordance with the requirements of [Pt 1, Ch 3, 4 Bottom Surveys – In Dry-Dock and In-Water - Hull and machinery requirements](#)

A Bottom Survey is considered to coincide with the Special Survey when held within the 15 months prior to the due date of the Special Survey.

Where the Special Survey of the hull is carried out on a Continuous Survey basis, as given in [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.14](#), the survey in Dry Dock may be held at any time within the five-year cycle.

3. 5. 4 The interval between Bottom Surveys for ships operating in fresh water and for certain non-self-propelled craft may be greater than that given in [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.3](#).
3. 5. 5 Attention is to be given to any relevant statutory requirements of the National Authority of the country in which the ship is registered.
3. 5. 6 The date of the last Bottom Survey will be recorded on the Class website.
3. 5. 7 As an alternative to Annual Surveys and Bottom Surveys, according to [Pt 1, Ch 2, 3.5, Existing ships – Periodical Surveys 3.5.1](#) and [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.3](#) respectively, ships classed ‘100A1 shipborne barge’ may be subjected to Intermediate Surveys. These surveys become due 30 months after the previous Special Survey. The survey is to be in accordance with the requirements given in [Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements](#), as applicable. Intermediate Surveys are to be completed within three months of the due date.
3. 5. 8 Survey requirements for In-Water Surveys are given in [Pt 1, Ch 3, 4.3 In-Water Surveys](#). The date of the last In-Water Survey will be recorded on the Class website.
3. 5. 9 All ships classed with ACS are also to be subjected to Special Surveys in accordance with the requirements given in [Pt 1, Ch 3 Periodical Survey Regulations](#). These Surveys become due at five-yearly intervals, the first one five years from the date of build or date of Special Survey for Classification as recorded in the *Register Book*, and thereafter five years from the date recorded for the previous Special Survey. Consideration may be given at the discretion of the Committee to any exceptional circumstances justifying an extension of the hull classification to a maximum of three months beyond the fifth year. If an extension is agreed the next period of hull classification will start from the due date of the Special Survey before the extension was granted. In this context ‘exceptional circumstances’ means unavailability of dry-docking facilities, repair facilities, essential materials, equipment or spare parts or delays incurred by action taken to avoid severe weather conditions.
3. 5. 10 Where, on shipborne barges, Intermediate Surveys are permitted as an alternative to Annual and Bottom Surveys, Special Surveys become due five years after the previous Special Survey.
3. 5. 11 Special Surveys may be commenced at the fourth Annual Survey after completion, commissioning, or previous Special Survey, and be progressed during the succeeding year with a view to completion by the due date of the Special Survey.

3. 5. 12 When Special Surveys are commenced prior to the fourth Annual Survey, the entire survey is to be completed within 15 months if such work is to be credited towards the Special Survey.
3. 5. 13 Ships which have satisfactorily passed a Special Survey will have a record entered in the *Register Book* indicating the date and the notation **ESP** if this is applicable See [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.12](#). Where the Special Survey is completed more than three months before the due date, the new record of Special Survey will be the final date of survey.
- In all other cases, with the exception of [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.13.b](#), the date recorded will be the fifth anniversary of the previous Special Survey.
  - For ships registered with Flag Administrations that have neither implemented the International Convention for the Safety of Life at Sea (SOLAS 1974) Harmonised System of Survey and Certification (HSSC) under the Protocol of 1988, nor adopted HSSC under *IMO Resolution A.883(21) – Global and Uniform Implementation of the Harmonized System of Survey and Certification (HSSC) – (Adopted on 25 November 1999)*, where the Special Survey is completed before the due date, the new record will be the final date of survey.
3. 5. 14 At the request of an Owner, it may be agreed that the Special Survey of the hull, for ships other than general dry cargo ships, bulk carriers, combination carriers, chemical tankers and oil tankers, be carried out on the Continuous Survey basis, all compartments of the hull being opened for survey and testing, in rotation, with an interval of five years between consecutive examinations of each part. In general, approximately one fifth of the Special Survey is to be completed each year and all the requirements of the particular hull Special Survey must be completed at the end of the five-year cycle. For examination of items listed in [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.25](#), [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.30](#) and [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.6](#), [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.7](#) and [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.9](#), the intervals for inspection will require to be specially agreed. For ships more than 10 years of age, an examination of the ballast tanks is to be carried out twice in each five year cycle, i.e. once within the scope of the Intermediate Survey and once within the scope of the Continuous Survey. Ships which have satisfactorily completed the cycle will have a record entered in the Class Direct indicating the date of completion which will not be later than five years from the last assigned date of Complete Survey of the hull. The agreement for surveys to be carried out on Continuous Survey basis may be withdrawn at the discretion of the Classification Committee.
3. 5. 15 In cases where the ship has been laid up or has been out of service for a considerable period because of a major repair or modification and the Owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the Special Survey. If the Owner elects to carry out the next due Special Survey, the period of class will start from the survey completion date.
3. 5. 16 Machinery is to be submitted to the surveys detailed in [Pt 1, Ch 3, 11 Machinery surveys - General requirements](#) to [Pt 1, Ch 3, 18 Screwshafts, tube shafts and propellers](#).
3. 5. 17 In cases where the ship has been laid-up, or has been out of service for a considerable period because of a major repair or modification and the Owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the last Complete Survey of machinery. If the Owner elects to carry out a Complete Survey, the period of class will start from the completion date of this survey.
3. 5. 18 Complete Surveys of machinery become due at five-yearly intervals, the first one five years from the date of build or date of first classification as recorded in Class Direct , and thereafter five years from the date recorded for the previous Complete Survey. Consideration can be given at the discretion of the Classification Committee to any exceptional circumstances justifying an extension of machinery class to a maximum of three months beyond the fifth year. If an extension is agreed, the next period of machinery class will start from the due date of Complete Survey of machinery before extension was granted. Surveys which are commenced prior to their due date are not to extend over a period greater than 15 months, except with the prior approval of the

Classification Committee. Where the survey is completed more than three months before the due date, the recorded date of completion will be the final date of survey.

- a. In all other cases, with the exception of [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.18.b](#), the date recorded will be the fifth anniversary of the previous Complete Survey of machinery.
  - b. For ships registered with Flag Administrations that have neither implemented the International Convention for the Safety of Life at Sea (SOLAS 1974) Harmonised System of Survey and Certification (HSSC) under the Protocol of 1988, nor adopted HSSC under *IMO Resolution A.883(21) – Global and Uniform Implementation of the Harmonized System of Survey and Certification (HSSC) – (Adopted on 25 November 1999)*, where the Survey is completed before the due date, the new record will be the final date of survey.
3. 5. 19 Upon application by an Owner, the Classification Committee may agree to an extension of the survey requirements for main engines, which, by the nature of the ship's normal service, do not attain the number of running hours recommended by the engines' manufacturer for major overhauls within the survey periods given in [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.18](#).
  3. 5. 20 If it is found desirable that any part of the machinery should be examined again before the due date of the next survey, a certificate for a limited period will be granted in accordance with the nature of the case.
  3. 5. 21 When, at the request of an Owner, it has been agreed by the Classification Committee that the Complete Survey of the machinery may be carried out on the Continuous Survey basis, the various items of machinery are to be opened for survey in rotation, as far as practicable, to ensure that the interval between consecutive examinations of each item will not exceed five years. In general, approximately one-fifth of the machinery is to be examined each year.
  3. 5. 22 If any examination during Continuous Survey reveals defects, further parts are to be opened up and examined as considered necessary by the Surveyor, and the defects are to be made good to his satisfaction.
  3. 5. 23 Upon application by an Owner, the Classification Committee may agree to an arrangement whereby, subject to certain conditions, some items of machinery may be examined by the Chief Engineer of the ship at ports where ACS is not represented, or, where practicable, at sea, followed by a limited confirmatory survey carried out at the next port of call where an Exclusive Surveyor is available. Particulars of this arrangement may be obtained from ACS. Where an approved planned maintenance scheme is in operation, the confirmatory surveys may be held at annual intervals, at which time the records will be checked and the operation of the scheme verified. Particulars of this arrangement may be obtained from any ACS Office.
  3. 5. 24 Where condition monitoring equipment is fitted, the Classification Committee, upon application by the Owner, will be prepared to amend applicable Periodical Survey requirements where details of the equipment are submitted and found satisfactory. Where machinery installations are accepted for this method of survey, it will be a requirement that an Annual Survey be held, at which time monitored records will be analysed and the machinery examined under working conditions. An acceptable lubricating oil trend analysis programme may be required as part of the condition monitoring procedures.
  3. 5. 25 Boiler Surveys, examination of steam pipes and Screwshaft Surveys are to be carried out as stated in [Pt 1, Ch 3, 15 Boilers](#) to [Pt 1, Ch 3, 18 Screwshafts, tube shafts and propellers](#).
  3. 5. 26 Where any inert gas system is fitted for the protection of cargo tanks on board a ship intended for the carriage of oil or liquid chemicals in bulk, the system is to be surveyed annually in accordance with the requirements of [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.33](#). In addition, on ships to which an IGS notation has been assigned, a Special Survey of the inert gas plant is to be carried out at intervals not exceeding five years, in accordance with the requirements of [Pt 1, Ch 3, 19 Inert gas systems](#).

- 3. 5. 27 Where the ship is fitted with a dynamic positioning system, the system is to be examined and tested annually in accordance with the requirements of [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.24](#). In addition, a Special Survey is to be carried out at intervals not exceeding five years in accordance with [Pt 1, Ch 3, 11.2 Complete Surveys 11.2.10](#).
- 3. 5. 28 Where the ship is fitted with a classed refrigerated cargo installation, the installation is to be surveyed annually in accordance with the requirements of [Pt 1, Ch 3, 21.1 Annual Surveys](#). In addition, a Special Survey is to be carried out at intervals not exceeding five years in accordance with the requirements of [Pt 1, Ch 3, 21.2 Special Surveys](#). At the request of the Owner, consideration will be given to the Survey of the installation being carried out on the Continuous Survey basis.
- 3. 5. 29 Where the ship is fitted with a classed refrigerated cargo installation, a Loading Port Survey, as detailed in [Pt 1, Ch 3, 21.4 Loading Port Surveys](#), may be carried out at the request of the Owner. On completion, a certificate will be issued recording, in addition to other details, the temperatures in the various refrigerated spaces at the time of the survey. The certificate issued by ACS is not in respect of the cargo to be loaded or the manner in which it is to be stowed. A Loading Port Survey is not mandatory for classification, but may be carried out concurrently with the Annual, Continuous or Special Surveys if so desired.
- 3. 5. 30 At the request of an Owner, the Classification Committee may give special consideration to the application of the periodical survey requirements given in [Pt 1, Ch 3 Periodical Survey Regulations](#) to military ships or commercial ships owned or chartered by Governments, which are utilised in support of military operation or service.
- 3. 5. 31 Where the ship has been assigned an OPS notation, the on-shore power supply arrangements are to be examined annually in accordance with the requirements of [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.27](#). In addition, a Special Survey is to be carried out at intervals not exceeding five years in accordance with [Pt 1, Ch 3, 14.2 Complete Surveys 14.2.15](#)
- 3. 5. 32 Where the Committee has agreed to an Owner's request to assign the notation 'laid-up', the ship may be retained in class provided a satisfactory general examination of the hull and machinery is carried out at the Annual Survey due date and an Underwater Examination (UWE) is carried out at the Special Survey due date. The general examination may be carried out within three months before or after the Annual Survey due date.

### **3. 6 Surveys for novel/complex systems, machinery and equipment**

- 3. 6. 1 Where novel/complex systems, machinery and equipment have been accepted by ACS and for which existing survey requirements are not considered to be suitable and sufficient then appropriate survey requirements are to be derived as part of the design approval process. In deriving these requirements ACS will consider, but not be limited to, the following:
  - a. Plan appraisal submissions;
  - b. Risk Assessment documentation where required by the Rules;
  - c. Equipment manufacturer recommendations;
  - d. Relevant recognised national or international standards.

### **3. 7 Certificates**

- 3. 7. 1 When the required reports, on completion of the survey of new or existing ships which have been submitted for classification, have been received from the Surveyors and classification has been agreed by the Classification Executive a Certificate of Classification may be issued by an authorised surveyor. After approval by the Classification Committee, a certificate of First Entry of Classification, signed by ACS's Chairman or the Chairman of the Classification Committee, will be issued to Builders or Owners.

- 3. 7. 2 A Certificate of Class valid for five years subject to endorsement for Annual and Intermediate Surveys will also be issued to the Owners.
- 3. 7. 3 ACS's Surveyors are permitted to issue provisional (interim) certificates to enable a ship classed with ACS to proceed on her voyage (or to continue her service in the case of a fixed or tethered ship) provided that in their opinion it is in a fit and efficient condition. Such certificates will embody the Surveyors' recommendations for continuance of class, but in all cases are subject to confirmation by the Classification Committee.
- 3. 7. 4 The full class notation and abbreviated descriptive notes shall be stated on the Certificate of Class and the provisional (interim) certificate.

### 3. 8 Notice of surveys

- 3. 8. 1 It is the responsibility of the Owners to ensure that all surveys necessary for the maintenance of class are carried out at the proper time and in accordance with the instructions of the Classification Committee. Information is available to Owners on the Class website.
- 3. 8. 2 ACS will make available to an Owner timely notice about forthcoming surveys by means of Quarterly Listing of Surveys, Conditions of Class and Memoranda. The omission of such notice, however, does not absolve the Owner from his responsibility to comply with ACS's survey requirements for maintenance of class, all of which are available to Owners on the Class website.

### 3. 9 Withdrawal/Suspension of class

- 3. 9. 1 When the class of a ship, for which the Regulations as regards surveys on hull, equipment and machinery have been complied with, is withdrawn by the Classification Committee in consequence of a request from the Owner the notation 'Class withdrawn at Owner's request' (with date) will be assigned.
- 3. 9. 2 When the Regulations as regards surveys on hull, equipment or machinery have not been complied with and the ship is thereby not entitled to retain class, the class will be suspended or withdrawn, at the discretion of the Classification Committee, and a corresponding notation will be assigned.
- 3. 9. 3 Class will be automatically suspended and the Certificate of Class will become invalid if the Annual or Intermediate Survey is not completed within three months of the due date of the survey.
- 3. 9. 4 Class will be automatically suspended from the expiry date of the Certificate of Class in the event that the Special Survey has not been completed by the due date and an extension has not been agreed (*See [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.9](#)*), or is not under attendance by the Surveyors with a view to completion prior to resuming trading.

Classification will be reinstated from suspension of class upon satisfactory completion of the surveys due. The surveys to be carried out are to be based upon the survey requirements at the original date due and not on the age of the ship when the survey is carried out. Such surveys are to be credited from the date originally due. However, the ship's Class remains suspended from the date of suspension until the date Class is reinstated.

- 3. 9. 5 When, in accordance with [Pt 1, Ch 2, 3.4 Damages, repairs and alterations 3.4.4](#) of the Regulations, a condition of class is imposed, this will be assigned a due date for completion and the ship's class may be suspended if the condition of class is not dealt with, or postponed by agreement, by the due date.
- 3. 9. 6 When it is found, from the reported condition of the hull equipment machinery or arrangements of a ship, that an Owner has failed to comply with [Pt 1, Ch 2, 1.1 General 1.1.5](#), [Pt 1, Ch 2, 1.1 General 1.1.9](#), [Pt 1, Ch 2, 3.4 Damages, repairs and alterations 3.4.1](#) or [Pt 1, Ch 2, 3.4 Damages, repairs and alterations 3.4.6](#), the class will be suspended or withdrawn, at the discretion of the Classification Committee, and a corresponding notation assigned. When it is considered that an Owner's failure to comply with these requirements is sufficiently serious, the suspension or

withdrawal of class may be extended to include other ships controlled by the same Owner, at the discretion of the Classification Committee.

3. 9. 7 When the Classification Committee is satisfied that a ship proceeded to sea with less freeboard than that approved by the Classification Committee, or that the freeboard marks are placed higher on the sides of the ship than the position assigned or approved by the Classification Committee, or, in cases of ships where freeboards are not assigned, the draught is greater than that approved by the Classification Committee, the ship's class will be withdrawn or suspended in relation to the above voyage(s) concerned.
3. 9. 8 When the Classification Committee is satisfied that a specialised ship has been operated in a manner contrary to that agreed at the time of classification, or is being operated in environmental conditions which are more onerous or in areas other than those agreed by the Classification Committee, the ship's class will be withdrawn or suspended in relation to those operations.
3. 9. 9 Where a ship has been
  - detained following a Flag State or Port State Control inspection on one or more occasions with serious deficiencies found, or
  - been subject to an unscheduled survey (See [Pt 1, Ch 2, 3.3 Existing ships 3.3.5](#)) with serious deficiencies found,

then class will be liable to be suspended or withdrawn, at the discretion of the Classification Committee, and a corresponding notation will be assigned. In these cases, a period of notice, but not exceeding 3 months, may be given prior to any suspension or withdrawal of class.
3. 9. 10 When a client fails to pay all undisputed portions of invoices for the services by the contractual due date then class will be liable to be suspended or withdrawn at the discretion of the Classification Committee and a corresponding notation will be assigned. In these cases, a period of notice not exceeding 3 months may be given, prior to any suspension or withdrawal of class.
3. 9. 11 In all instances of class withdrawal or suspension, the assigned notation, with date of application, will be published by ACS. In cases where class has been suspended by the Classification Committee and it becomes apparent that the Owners are no longer interested in retaining ACS's class it will be withdrawn.
3. 9. 12 When a ship is intended for a demolition voyage with any Periodical Survey overdue, the ship's class suspension may be held in abeyance and consideration may be given to allow the ship to proceed on a single direct ballast voyage from the lay up or final discharge port to the demolition yard, provided the attending Surveyor finds the ship in a satisfactory condition to proceed for the intended voyage, at the discretion of the Classification Committee.
3. 9. 13 When a ship is intended for a single voyage from 'laid-up' position to repair yard with any Periodical Survey overdue, the ship's class suspension may be held in abeyance and consideration may be given to allow the ship to proceed on a single direct ballast voyage from the site of lay up to the repair yard, upon agreement with the Flag Administration, at the discretion of the Classification Committee. This is provided the ship is found in a satisfactory condition by surveys, the extent of which are to be based on surveys overdue and duration of lay-up.
3. 9. 14 For reclassification and reinstatement of class, See [Pt 1, Ch 2, 3.3 Existing ships 3.3.2](#) and [Pt 1, Ch 2, 3.9 Withdrawal/Suspension of class 3.9.4](#).

### **3. 10 Appeal from Surveyors' recommendations**

3. 10. 1 If the recommendations of the Surveyors are considered in any case to be unnecessary or unreasonable, an appeal may be made to the Classification Committee, who may direct a Special Examination to be held.

### **3. 11 Force majeure**

3. 11. 1 If due to circumstances reasonably beyond the Owner's or ACS's control, as defined below, the ship is not in a port when surveys become overdue the Classification Committee may allow the ship to sail, in class, directly to an agreed discharge port and then, if necessary, in ballast to an agreed repair facility at which the survey can be completed. In this context, 'Force Majeure' means damage to the ship, unforeseen inability of Surveyors to attend the ship due to governmental restrictions on right of access or movement of personnel, unforeseen delays in port or inability to discharge cargo due to unusually lengthy periods of severe weather, strikes, civil strife, acts of war or other force majeure.

### **3. 12 Ownership details**

3. 12. 1 The Owner will ensure ACS is promptly informed in writing of any change to their contact details and, in the event of a vessel/asset transfer or sale, is to supply details of the new Owner in writing. The new Owner is to promptly inform ACS in writing of their contact details. If the new Owner fails to do so and if ACS cannot verify the ownership record, then the class of that vessel/asset will be specially considered by the Classification Committee.

CHAPTER **2 Classification Regulations**

SECTION **4 IACS Audits and Assessments**

## **4. 1 Audit of surveys**

- 4. 1. 1 The surveys required by the Regulations may be subject to audit or assessment in accordance with the requirements of the International Association of Classification Societies requirements.

PART

# 1

CHAPTER **2 Classification Regulations**

SECTION **5 Type Approval and Type Testing**

## **5.1 Type Approval — Marine Applications**

- 5.1.1 ACS Type Approval is an impartial certification system that provides independent third-party Type Approval Certificates attesting to a product's conformity with specific standards or specifications. It is based on design review and type testing or where testing is not appropriate, a design analysis.
- 5.1.2 The ACS Type Approval System is a process whereby a product is assessed in accordance with a specification, standard or code to check that it meets the stated requirements and through selective testing demonstrates compliance with specific performance requirements. The testing is carried out on a prototype or randomly selected product(s) which are representative of the manufactured product under approval. Thereafter, the manufacturer applying for ACS Type Approval certification is required to demonstrate the effective implementation of a quality assurance system. This will be assessed by ACS through a Production Quality Assurance (PQA) assessment as defined in the ACS Type Approval System Procedure TA14. The PQA assessment is specific to ACS Type Approval.
- 5.1.3 The selective testing required by [Pt 1, Ch 2, 5.1 ACS Type Approval — Marine Applications 5.1.2](#), is to include environmental testing applicable to the product's installation on board a ship classed or intended to be classed with ACS.
- 5.1.4 ACS Type Approval does not remove the requirements for inspection and survey procedures required by the Rules for equipment to be installed in ships classed or intended to be classed with ACS. Also, ACS Type Approval does not remove the requirement for plan appraisal of a system that incorporates Type Approved equipment where required by the Rules.
- 5.1.5 ACS Type Approval is subject to the understanding that the manufacturer's recommendations and instructions for the product and any relevant requirements of the ACS' [Rules and Regulations for the Classification of Ships](#) are fulfilled.
- 5.1.6 The manufacturer supplying equipment or components under the production quality assurance system (PQA), See [Pt 1, Ch 2, 5.1 ACS Type Approval — Marine Applications 5.1.2](#) is to have a recognised quality management system that is acceptable to ACS. The production quality assurance system (PQA) is to meet the requirements of ACS Type Approval System Procedure TA14.
- 5.1.7 Where equipment or components have been Type Approved in accordance with specifications and procedures other than ACS's, details of the product, certification and testing are to be submitted for consideration where appropriate.

## **5.2 Type testing**

- 5.2.1 Type testing is an impartial process that provides independent third-party verification that an item of machinery or equipment has satisfactorily undergone a functional type test.

- 5. 2. 2 Type testing is carried out against defined performance and test standards for a defined period of time with test conditions varying between minimum and maximum declared design conditions.
- 5. 2. 3 Type testing is carried out on a prototype or randomly selected product(s) which are representative of the manufactured product under assessment.
- 5. 2. 4 After type testing, mechanical equipment is to be opened out and inspected for damage or excessive wear.
- 5. 2. 5 On application from the manufacturer, type tests may be waived for equipment and machinery that has been proven to be reliable in marine service and where compliance with the current applicable standards can be demonstrated. Equipment and machinery that has been previously type tested with satisfactory testing evidence and certification need not have the type tests repeated where previous testing is in accordance with current testing standards.
- 5. 2. 6 The acceptance of type testing certification is subject to the understanding that the manufacturer's recommendations and instructions for the product and any relevant requirements of the applicable Rules are fulfilled.

PART

# 1

CHAPTER **2 Classification Regulations**

SECTION **6 Classification of machinery with [X] MC or MCH notation**

## **6. 1 General**

6. 1. 1 After delivery of machinery and equipment with the manufacturer's certificate to the shipyard, Survey at the Shipyard and Periodical Surveys are to be in accordance with the requirements for ships built or accepted into class with the **XMC** notation.

## **6. 2 Appraisal and records**

6. 2. 1 To facilitate survey and compilation of classification records, plans and information required for a ship being accepted into class with the **XMC** notation are to be submitted for appraisal and information. Plans are not required where machinery and equipment has previously been type approved; in these cases it is only necessary to submit details of the machinery and equipment together with details of previous approval.

## **6. 3 Survey and inspection**

6. 3. 1 The manufacturer's certificate for acceptance of machinery and equipment for assignment of the **[X]MC** or **MCH** notation is to be in the English language and include the following information:
- Design and manufacturing standard(s) used.
  - Materials used for construction of key components and their sources.
  - Details of the quality control system applied during design, manufacture and testing and of any software maintenance.
  - Details of any type approval or type testing.
  - Details of installation and testing recommendations for the machinery or equipment.
- The manufacturer is to have a recognized quality management system certified by an IACS member or a Notified Body.
6. 3. 2 The installation and testing of machinery and equipment at the build yard which has been supplied with a manufacturer's certificate is to be in accordance with the requirements applicable to a ship having the **XMC** notation.

| 7. 6             | Close-up Survey.....  | 130        |
| 7. 7             | Thickness measurement .....   | 135        |
| <b>SECTION 8</b> | <b>Special Survey - Chemical Tankers - Hull requirements .....</b>  | <b>144</b> |
| 8. 1             | General .....   | 144        |
| 8. 2             | Documentation .....   | 144        |
| 8. 3             | Planning for survey .....   | 145        |
| 8. 4             | Overall Survey.....   | 145        |
| 8. 5             | Testing .....   | 145        |
| 8. 6             | Close-up Survey.....  | 146        |
| 8. 7             | Thickness measurement .....   | 149        |
| 8. 8             | Ships over 10 years old.....  | 154        |
| <b>SECTION 9</b> | <b>Ships for liquefied gases .....</b>  | <b>155</b> |
| 9. 1             | General .....   | 155        |
| 9. 2             | Annual Surveys – Basic requirements.....  | 155        |
| 9. 3             | Annual Surveys – Reliquefaction/refrigeration equipment .....   | 157        |
| 9. 4             | Annual Surveys - Gas fuel burning equipment and other equipment components .....                              | 158        |
| 9. 5             | Annual Surveys – Cargo containment systems .....  | 158        |

|                   |  |            |
|-------------------|--|------------|
| 9. 6              | Intermediate Surveys .....   | 158        |
| 9. 7              | Special Survey I (ships five years old) – General requirements.....                        | 160        |
| 9. 8              | Special Survey I (ships five years old) – Reliquefaction/refrigeration equipment .....     | 162        |
| 9. 9              | Special Survey I (ships five years old) - Gas fuel burning equipment .....                 | 163        |
| 9. 10             | Special Survey II and Special Surveys thereafter (ships 10 years old and over).....        | 163        |
| 9. 11             | Special Survey III and Special Surveys thereafter (ships 15 years old and over).....       | 163        |
| 9. 12             | Close-up Survey.....   | 164        |
| 9. 13             | Thickness measurement .....  | 164        |
| <b>SECTION 10</b> | <b>Dredgers, hopper dredgers, sand carriers, hopper barges and reclamation craft .....</b> | <b>168</b> |
| 10. 1             | General .....  | 168        |
| 10. 2             | Special Surveys .....  | 168        |
| <b>SECTION 11</b> | <b>Machinery surveys - General requirements .....</b>                                      | <b>170</b> |
| 11. 1             | Annual, Intermediate and Bottom Surveys .....  | 170        |
| 11. 2             | Complete Surveys.....  | 170        |
| <b>SECTION 12</b> | <b>Turbines and steam engines - Detailed requirements .....</b>                            | <b>172</b> |
| 12. 1             | Complete Surveys.....  | 172        |
| <b>SECTION 13</b> | <b>Reciprocating internal combustion engines - Detailed requirements .....</b>             | <b>174</b> |
| 13. 1             | Scope.....   | 174        |
| 13. 2             | Complete Surveys.....  | 174        |
| <b>SECTION 14</b> | <b>Electrical equipment .....</b>  | <b>176</b> |
| 14. 1             | Annual and Intermediate Surveys .....  | 176        |
| 14. 2             | Complete Surveys.....  | 176        |
| 14. 3             | Bottom Surveys.....  | 178        |

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **1 General**

## 1. 1 Frequency of surveys

1. 1. 1 The requirements of this Chapter are applicable to the Periodical Surveys set out in [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys](#). Except as amended at the discretion of the Committee, the periods between such surveys are as follows:
  - a. Annual Surveys, as required by [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.1](#).
  - b. Intermediate Surveys, as required by [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.2](#).
  - c. Bottom Surveys, as required by [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.3](#) and [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.4](#).
  - d. When ships classed **100A1 shipborne barge** are subjected to Intermediate Surveys, those surveys become due 30 months after the previous Special Survey, *see* [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.7](#).
  - e. Special Surveys at five-yearly intervals, *see* [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.9](#). For alternative arrangements, *see also* [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.10](#), [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.11](#), [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.12](#) and [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.14](#).
  - f. Complete Surveys of machinery at five-yearly intervals, *see* [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.18](#).
1. 1. 2 For ships assigned the notation ‘laid-up’, in order to maintain the ship in class a general examination of the hull and machinery is to be carried out in lieu of the Annual Survey and an Underwater Examination (UWE) is to be carried out in lieu of the Special Survey, *see* [Pt 1, Ch 3, 2.1 General 2.1.5](#), [Pt 1, Ch 3, 5.1 General 5.1.6](#) and [Pt 1, Ch 3, 11.1 Annual, Intermediate and Bottom Surveys 11.1.2](#).
1. 1. 3 When it has been agreed that the complete survey of the hull and machinery may be carried out on the Continuous Survey basis, all compartments of the hull and all items of machinery are to be opened for survey in rotation to ensure that the interval between consecutive examinations of each part will not exceed five years, *see* [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.14](#) and [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.21](#).
1. 1. 4 For the frequency of surveys of boilers, steam pipes, screwshafts, tube shafts, propellers and inert gas systems, *see* [Pt 1, Ch 3, 15 Boilers](#) to [Pt 1, Ch 3, 19 Inert gas systems](#).
1. 1. 5 For the requirements for surveys of refrigerated cargo installations, *see* [Pt 6, Ch 3 Refrigerated Cargo Installations](#).
1. 1. 6 In general, the periodical survey requirements contained in [Pt 1, Ch 3 Periodical Survey Regulations](#) also apply to ships built in accordance with the *IACS Common Structural Rules for Bulk Carriers and Oil Tankers (CSR)*. Where a requirement does not apply to CSR ships, or where a specific requirement applies only to CSR ships, this will be clearly stated.

1. 1. 7 For ships which are classed as **100AT Moored Liquefied gas carrier for service at (place)**, **100AT Moored Liquefied gas tanker for service at (place)**, **100AT Moored Liquefied gas storage unit for service at (place)**, **100AT Moored Oil Storage Unit for service at (place)** or as **100AT Moored Oil Storage Tanker for service at (place)**, the frequency of the surveys will be considered on a case-by-case basis at the discretion of the Classification Committee.

## 1. 2 Surveys for damage or alterations

1. 2. 1 At any time when a ship is undergoing alterations or damage repairs, any exposed parts of the structure normally difficult to access are to be specially examined, e.g. if any part of the main or auxiliary machinery, including boilers, insulation or fittings, is removed for any reason, the steel structure in way is to be carefully examined by the Surveyor, or when cement in the bottom or covering on decks is removed, the plating in way is to be examined before the cement or covering is relaid.

## 1. 3 Unscheduled surveys

1. 3. 1 In the event that Asia Classification Society (hereinafter referred to as ACS) has cause to believe that its Rules and Regulations are not being complied with, ACS reserves the right to perform unscheduled surveys of the hull and machinery as well as the applicable statutory requirements whether or not the appropriate statutory certificate has been issued by ACS.
1. 3. 2 In the event of significant damage or defect affecting any ship, ACS reserves the right to perform unscheduled surveys of the hull or machinery of other similar ships classed by ACS and deemed to be vulnerable.

## 1. 4 Surveys for the issue of Convention certificates

1. 4. 1 Surveys are to be held by ACS when so appointed, or by the Exclusive Surveyors to a National Administration or by an IACS Member when so authorised by the National Authority, or, in the case of Cargo Ship Safety Radio Certificates or Safety Management Certificates, by any organisation authorised by the National Authority. In the case of dual classed ships, Convention Certificates may be issued by the other Society with which the ship is classed provided this is recognised in a formal Dual Class Agreement with ACS and provided the other Society is also authorised by the National Authority.

## 1. 5 Definitions

1. 5. 1 An **Oil Tanker** is a sea going self-propelled ship which is constructed generally with integral tanks and is intended primarily to carry oil in bulk and includes ship types such as combination carriers (ore/oil and ore/bulk/oil ships, etc.). Where referred to in this Chapter, it shall also include double hull oil tankers as well as tankers with alternative structural arrangements, e.g. mid-deck designs, except where specified. Single hull oil tankers and combination carriers are not covered by the IACS Common Structural Rules (CSR).
1. 5. 2 A **Double Hull Oil Tanker** is a sea going self-propelled ship which is constructed primarily for the carriage of oil in bulk, where the cargo tanks are protected by a double hull extending for the entire length of the cargo area, consisting of double side and double bottom spaces for the carriage of salt-water ballast.
1. 5. 3 A **Bulk Carrier** is a sea going self-propelled ship which is constructed generally with single deck, double bottom, topside tanks and hopper side tanks and with single side skin construction in the cargo length area, and is intended primarily to carry dry cargo in bulk and includes ship types such as ore carriers. Where referred to in this Chapter, it shall also include double skin bulk carriers and self-unloading bulk carriers except where specified.

1. 5. 4 A **Self-Unloading Bulk Carrier** is a sea going self-propelled ship which is constructed generally with single deck, double bottom, topside tanks and hopper side tanks and with single side skin or double side skin construction in the cargo length area, and is intended to carry and self-unload dry cargoes in bulk.
1. 5. 5 A **Double Skin Bulk Carrier** is a sea going self-propelled ship which is constructed generally with single deck, double bottom, topside tanks and hopper side tanks and with double side skin construction in the cargo length area (regardless of the width of the wing space) and is intended primarily to carry dry cargo in bulk and includes such types as ore carriers.
1. 5. 6 An **Ore Carrier** is a sea going self-propelled ship which is constructed generally with single deck, two longitudinal bulkheads and a double bottom throughout the cargo length area and intended primarily to carry ore cargoes in the centre holds only. Ore carriers are not covered by the IACS Common Structural Rules (CSR).
1. 5. 7 A **Chemical Tanker** is a sea going self-propelled ship constructed generally with integral tanks and being single or double hull construction, or having alternative structural arrangements, used primarily for the carriage in bulk of any liquid product listed in *Chapter 17 Summary of minimum requirements of the IBC Code - International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk, Amended by Resolution MEPC.225(64)* .
1. 5. 8 A **Gas Carrier or Gas Tanker** is a cargo ship constructed or adapted and used for the carriage in bulk of any liquefied gas or other products of flammable nature listed in Chapter 19 of the *International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk*.
1. 5. 9 A **Moored Liquefied gas carrier or Moored Liquefied gas tanker** is a Gas Carrier or Gas Tanker that is operated as a storage vessel at a fixed location, defined in the class notation, with the LMC notation either maintained or suspended. The character figure T will be assigned.
1. 5. 10 A **Moored Liquefied gas storage unit** is a Gas Carrier or Gas Tanker that is operated as a storage vessel at a fixed location, defined in the class notation, with the LMC notation withdrawn and the main propulsion machinery uncoupled and immobilised. The character figure T will be assigned.
1. 5. 11 A **Moored Oil Storage Unit** is an Oil Tanker or Double Hull Oil Tanker that is operated as a storage vessel at a fixed location, defined in the class notation, with the LMC notation withdrawn and the main propulsion machinery uncoupled and immobilised. The character figure T will be assigned.
1. 5. 12 A **Moored Oil Storage Tanker** is an Oil Tanker or Double Hull Oil Tanker that is operated as a storage vessel at a fixed location, defined in the class notation, with the LMC notation either maintained or suspended. The character figure T will be assigned.
1. 5. 13 A **Ballast Tank** is a tank which is used solely for the carriage of salt-water ballast. For bulk carriers, a space which is used for both cargo and salt-water ballast will be treated as a salt-water ballast tank when substantial corrosion has been found in that space. For double skin bulk carriers, the double side tank is to be considered as a separate tank even if it is connected to either the topside or hopper side tank. For oil tankers and chemical tankers, a combined tank which is used for both cargo and salt-water ballast as a routine part of the ship's operation will be treated as a ballast tank. A cargo tank which in exceptional cases may carry salt-water water ballast during severe weather conditions and is not designated as a combined cargo/ballast tank will be treated as a cargo tank.
1. 5. 14 **Spaces** are separate compartments such as holds, tanks, cofferdams and void spaces bounding cargo holds, decks and the outer hull.
1. 5. 15 **Enclosed space.** An enclosed space is any place of an enclosed nature where there is a risk of death or serious injury from hazardous substances or dangerous conditions. Examples include, but are not limited to: boilers, pressure vessels, cargo spaces (cargo holds or cargo tanks), cargo space stairways, ballast tanks, double bottoms, double hull spaces, fuel oil tanks, lube oil tanks, sewage-

tanks, pump-rooms, compressor rooms, cofferdams, void spaces, duct keels, inter-barrier spaces, engine crankcases, excavations and pits.

1. 5. 16 An **Overall Survey** is a survey intended to report on the overall condition of the hull structure and to determine the extent of additional Close-up Surveys.
1. 5. 17 A **Close-up Survey** is a survey where the details of structural components are within the close visual inspection range of the Surveyor, i.e. normally within reach of hand.
1. 5. 18 A **Remote Inspection Technique (RIT)** is a means of survey that enables examination of ship structure without the need for direct physical access of the Surveyor.
1. 5. 19 A **Transverse Section** includes all longitudinal members such as plating, longitudinals and girders at the deck, side, bottom, inner bottom, inner side, hopper side, top wing side and longitudinal bulkhead, where fitted. For transversely framed ships, a transverse section includes adjacent frames and their end connections in way of transverse sections.
1. 5. 20 **Representative Spaces** are those which are expected to reflect the condition of other spaces of similar type and service and with similar corrosion prevention systems. When selecting representative spaces, account is to be taken of the service and repair history on board and identifiable Critical Structural Areas.
1. 5. 21 **Critical Structural Areas** are locations which have been identified from calculations to require monitoring or from the service history of the subject ship or from similar ships or sister ships, if applicable, to be sensitive to cracking, buckling or corrosion which would impair the structural integrity of the ship.
1. 5. 22 **Substantial Corrosion** is wastage of individual plates and stiffeners in excess of 75 per cent of allowable margins, but within acceptable limits. For ships built in accordance with the IACS Common Structural Rules (CSR), substantial corrosion is an extent of corrosion such that the assessment of the corrosion pattern indicates a gauged (or measured) thickness between  $t_{ren} + 0.5 \text{ mm}$  and  $t_{ren}$ . Renewal thickness,  $t_{ren}$ , is the minimum allowable thickness, in mm, below which renewal of the structural members is to be carried out.
1. 5. 23 Steel renewal requirements have been separately determined according to date of contract for construction for:
  - a. cargo hold hatch covers and coamings under IACS UR S21 and UR S21A; and
  - b. bulk carriers' corrugated transverse watertight cargo hold bulkheads under IACS UR S18. *See [Pt 1, Ch 3, 5.6 Thickness measurement](#), [Pt 1, Ch 3, 6.7 Thickness measurement](#) and [Pt 1, Ch 3, 7.7 Thickness measurement](#).*  
 In these cases, the net thickness,  $t_{net}$ , is the minimum net thickness of the structural member, excluding any corrosion addition, and is defined in [Pt 4, Ch 7, 12.1 General 12.1.2](#) for Hatch Covers and [Pt 4, Ch 7, 10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions 10.4.10](#) for Transverse Bulkheads.
1. 5. 24 A **Corrosion Prevention System** is normally considered a full hard protective coating. This is usually to be an epoxy coating or equivalent. Other systems with the exception of soft and semi-hard coatings, may be considered acceptable as alternatives provided they are applied and properly maintained in compliance with the manufacturer's specification.
1. 5. 25 For the application of requirements outlined in Sections [Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements](#), [Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements](#), [Pt 1, Ch 3, 4 Bottom Surveys – In Dry-Dock and In-Water - Hull and machinery requirements](#) and [Pt 1, Ch 3, 5 Special Survey - General - Hull requirements](#), a **general dry cargo ship** is a self-propelled ship of 500 gross tonnes or above, constructed generally with a 'tween deck and intended to carry solid cargoes, other than:
  - bulk carriers;
  - ships dedicated to the carriage of containers;

- roll on-roll off ships;
- refrigerated cargo ships;
- dedicated wood chip carriers;
- dedicated cement carriers;
- livestock carriers;
- dock/deck cargo ships;
- general dry cargo ships of double side-skin construction, with double side-skin extending for the entire length of the cargo area, and for the entire height of the cargo hold to the upper deck.

For **general dry cargo ships** with hybrid cargo hold arrangements, e.g. with some cargo holds of single-side skin and others of double-side skin, the relevant survey requirements for **general dry cargo ships** are to be applied only to structure in way of the single-side skin cargo hold region.

1. 5. 26 **Coating Condition** is defined as follows

**GOOD:** Condition with only minor spot rusting.

**FAIR:** Condition with local breakdown of coating at edges of stiffeners and weld connections and/or light rusting over 20 per cent or more of areas under consideration, but less than as defined for POOR condition.

**POOR:** Condition with general breakdown of coating over 20 per cent or more of areas or hard scale at 10 per cent or more of areas under consideration.

These are further clarified as follows, in order to achieve a unified assessment of coating conditions, see [Table 3. 1. 1: Assessment of coating conditions](#):

**GOOD:** Condition with spot rusting on less than 3 per cent of the area under consideration without visible failure of the coating. Rusting at edges or welds should be on less than 20 per cent of edges or weld lines in the area under consideration.

**FAIR:** Condition with breakdown of coating or rust penetration on less than 20 per cent of the area under consideration. Hard rust scale should be less than 10 per cent of the area under consideration. Rusting at edges or welds should be on less than 50 per cent of edges or weld lines in the area under consideration.

**POOR:** Condition with breakdown of coating or rust penetration on more than 20 per cent or hard rust scale on more than 10 per cent of the area under consideration or local breakdown concentrated at edges or welds on more than 50 per cent of edges or weld lines in the area under consideration.

Further information on coating assessment can be found in the ACS document *Thickness Measurement and Close-Up Survey Guidance*.

**Table 3. 1. 1: Assessment of coating conditions**

|  | GOOD <sup>(3)</sup> | FAIR   | POOR  |
|--|---------------------|--------|-------|
| Breakdown of coating or area rusted <sup>(1)</sup>                       | < 3%                | 3–20%  | > 20% |
| Area of hard rust scale <sup>(1)</sup>                                   | —                   | 10%    | ≥ 10% |
| Local breakdown of coating or rust on edges or weld lines <sup>(2)</sup> | < 20%               | 20–50% | > 50% |

Note 1. % is the percentage calculated on basis of the area under consideration or of the 'critical structural area'.

Note 2. % is the percentage calculated on basis of edges or weld lines in the area under consideration or of the 'critical structural area'.

Note 3. Spot rusting, i.e. rusting in spot without visible failure of coating.

1. 5. 27 **Pitting Corrosion.** Pitting corrosion is defined as scattered corrosion spots/areas with local material reductions which are greater than the general corrosion in the surrounding area. Further information on pitting intensity can be found in the ACS document *Thickness Measurement and Close-Up Survey Guidance*.
1. 5. 28 **Edge Corrosion.** Edge corrosion is defined as local corrosion at the free edges of plates, stiffeners, primary support members and around openings. An example of edge corrosion can be found in the ACS document *Thickness Measurement and Close-Up Survey Guidance*.
1. 5. 29 **Grooving Corrosion.** Grooving corrosion is typically local material loss adjacent to weld joints along abutting stiffeners and at stiffener or plate butts or seams. An example of groove corrosion can be found in the ACS document *Thickness Measurement and Close-Up Survey Guidance*.
1. 5. 30 **A Prompt and Thorough Repair** is a permanent repair completed at the time of survey to the satisfaction of the Surveyor, therein removing the need for the imposition of any associated condition of class or recommendation.
1. 5. 31 Bulk carriers with hybrid cargo hold arrangements are to have single skin cargo holds surveyed in accordance with the requirements for single skin bulk carriers and the double skin cargo holds surveyed in accordance with the requirements for double skin bulk carriers.
1. 5. 32 **Special consideration** or **specially considered** (in connection with close-up surveys and thickness measurements) means sufficient close-up inspection and thickness measurements are to be taken to confirm the actual average condition of the structure under the coating.
1. 5. 33 **Air pipe heads** installed on the exposed decks are those extending above the freeboard deck or superstructure decks.
1. 5. 34 The **Cargo Area** or **Cargo Length Area** is that part of the ship which contains all cargo holds and adjacent areas including fuel tanks, cofferdams, ballast tanks and void spaces. For oil tankers and chemical tankers, the **Cargo Area** is that part of the ship which contains cargo tanks, slop tanks and cargo/ballast pump-rooms, cofferdams, ballast tanks and void spaces adjacent to cargo tanks and also deck areas throughout the entire length and breadth of the part of the ship over the above mentioned spaces.
1. 5. 35 A fuel installation using **gases or other low-flashpoint fuels** comprises the following: fuel bunkering, fuel storage, fuel processing and fuel delivery to gas fuelled consumers. The scope of such a fuel installation extends from the bunker manifold to the consumer and includes any re-liquefaction plant and compressors that are fitted to manage boil off. These installations may be on board any ship type referred to in this Chapter except gas carriers as defined in [Pt 1, Ch 3, 1.5 Definitions 1.5.8](#).

## 1. 6 Preparation for survey and means of access

1. 6. 1 In order to enable the attending Surveyor(s) to carry out surveys, provisions for safe access and for surveys are to be agreed between the Owner and ACS. Attention is drawn to the applicable recommendations in the IACS PR37 and/or IMO Recommendations For Entering Enclosed Spaces Aboard Ships, Resolution A.1050(27).
1. 6. 2 Means are to be provided to enable the Surveyor to examine the structure in a safe and practical way. Where the provisions of safety and required access are determined by the Surveyor not to be adequate, then the survey of the space(s) involved is not to proceed.

1. 6. 3 Spaces are to be made safe for access and survey and are to be sufficiently cleaned, illuminated and ventilated.
1. 6. 4 In preparation for survey, thickness measurements and to allow for a thorough examination, cleaning is to include removal from surfaces of all loose accumulated corrosion scale. Spaces are to be sufficiently clean and free from water, scale, dirt, and oil residues, etc. to reveal corrosion, deformation, fractures, damages or other structural deterioration, as well as the condition of the protective coating. However, those areas of structure whose renewal has already been decided by the Owner need only be cleaned and descaled to the extent necessary to determine the limits of renewed areas.
1. 6. 5 Where soft or semi-hard coatings have been applied, safe access is to be provided for the Surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft or semi-hard coating is to be removed.
1. 6. 6 Prior to entering an enclosed space, it is to be verified by a competent person using a calibrated multi gas meter that the atmosphere in that space is free from hazardous gas and contains sufficient oxygen.
1. 6. 7 Emergency equipment and personnel are to be available in case of an emergency or rescue operation.
1. 6. 8 Information on procedures, equipment-operating instructions and safety checklists is to be available.
1. 6. 9 During the survey, ventilation is to be ensured and periodic testing is to be carried out as necessary to verify that the atmosphere remains safe for access.
1. 6. 10 For surveys, including close-up survey where applicable, in cargo spaces and ballast tanks, one or more of the following means of access is to be provided:
  - a. Permanent staging and passages through structures.
  - b. Temporary staging and passages through structures.
  - c. Hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms.
  - d. Portable ladders, *see* Note.
  - e. Boats or rafts.
  - f. Other equivalent means.

Note Portable ladders may be used, at the discretion of the Surveyor, for survey of the hull structure of single skin bulk carriers, except for the close-up survey of cargo hold shell frames, *see* [Pt 1, Ch 3, 1.6 Preparation for survey and means of access 1.6.11](#) and [Pt 1, Ch 3, 1.6 Preparation for survey and means of access 1.6.12](#)
1. 6. 11 For close-up surveys of the cargo hold shell frames of single skin bulk carriers with a deadweight less than 100,000 tonnes, one or more of the following means of access is to be provided:
  - a. Permanent staging and passages through structures.
  - b. Temporary staging and passages through structures.
  - c. Portable ladder restricted to not more than 5 m in length may be accepted for surveys of the lower section of a shell frame including bracket.
  - d. Hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms.
  - e. Boats or rafts, provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water.
  - f. Other equivalent means.
1. 6. 12 For close-up surveys of the cargo hold shell frames of single skin bulk carriers with a deadweight equal to or greater than 100,000 tonnes, the use of portable ladders is not accepted and one or more of the following means of access is to be provided:

- a. At Annual Surveys, Intermediate Surveys held before the ship is 10 years old and Special Survey I:
    - i. Permanent staging and passages through structures.
    - ii. Temporary staging and passages through structures.
    - iii. Hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms.
    - iv. Boats or rafts, provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water.
    - v. Other equivalent means.
  - b. At Special Survey II and all subsequent Intermediate Surveys and Special surveys:
    - i. Either permanent or temporary staging and passage through structures for close-up survey of at least the upper part of hold frames.
    - ii. Hydraulic arm vehicles such as conventional cherry pickers for surveys of lower and middle part of shell frames as alternative to staging.
    - iii. Lifts and movable platforms.
    - iv. Boats or rafts, provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water.
    - v. Other equivalent means.
  - c. Notwithstanding the above requirements, the following apply:
    - i. At Annual Survey, for access to perform the close-up survey of the lower region of cargo hold shell frames, the use of a portable ladder fitted with a mechanical device to secure the upper end of the ladder is acceptable.
    - ii. The use of hydraulic arm vehicles such as conventional cherry pickers may be accepted by the attending Surveyor for the close-up survey of the upper part of side shell frames or other structures in all cases where the maximum working height is not more than 17 m.
1. 6. 13 For surveys of the hull structure/s conducted by use of a RIT, one or more of the following means for access, acceptable to the Surveyor, is to be provided:
- a. Unmanned robot arm.
  - b. Remote Operated Vehicles (ROV)
  - c. Unmanned Aerial Vehicles/Drones
  - d. Other means acceptable to ACS.
1. 6. 14 Survey at sea or anchorage may be undertaken when the Surveyor is fully satisfied with the necessary assistance from the personnel onboard and provided the foregoing preparations for survey, as applicable, have been met. In addition, the following conditions and limitations are to be applied:
- a. A communication system is to be arranged between the survey party in the tank and the responsible officer on deck. This system must include the personnel in charge of ballast pump handling if boats or rafts are to be used.
  - b. Surveys of tanks by means of boats or rafts are to be agreed with the attending Surveyor, who is to take into account the safety arrangements provided, including weather forecasting and ship response under foreseeable sea conditions and provide the expected rise of water within the tank does not exceed 0.25 m.
- Where it has been agreed to use boats or rafts when carrying out close-up survey, the following conditions are to be observed:
- i. Only rough duty, inflatable rafts or boats, having satisfactory residual buoyancy and stability even if one chamber is ruptured, are to be used.
  - ii. The boat or raft is to be tethered to the access ladder and an additional person is to be stationed down the access ladder with a clear view of the boat or raft.
  - iii. Appropriate lifejackets are to be available for all participants.
  - iv. The surface of water in the tank is to be calm and the water level stationary. On no account is the level of the water to be rising while the boat or raft is in use.

v. The tank or space must contain clean ballast water only. Even a thin sheen of oil on the water is not acceptable.

vi. At no time is the water level to be allowed to be within 1 m of the deepest under deck web face flat so that the survey team is not isolated from a direct escape route to the tank hatch. Filling to levels above the deck transverses is only to be contemplated if a deck access manhole is fitted and open in the bay being examined, so that an escape route for the survey party is available at all times. Other effective means of escape to the deck may be considered.

vii. If the tanks (or spaces) are connected by a common venting system, or Inert Gas system, the tank in which the boat or raft is to be used is to be isolated to prevent a transfer of gas from other tanks (or spaces).

- c. Rafts or boats may be permitted for the survey of the under deck areas of tanks or spaces, if the depth of the under deck web plating is 1.5 m or less. If the depth of the under deck web plating is greater than 1.5 m, then rafts or boats may be permitted only when the coating of the under deck structure is in GOOD condition and there is no evidence of wastage or if a permanent means of access is provided in each bay to allow safe entry and exit. A permanent means of access is considered to mean:

i. Access direct from the deck via a vertical ladder and a small platform fitted approximately 2 m below the deck in each bay or,

ii. Access to deck from a longitudinal permanent platform having ladders to the deck at each end of the tank. The platform shall be arranged over the full length of the tank and level with, or above, the maximum water level needed for rafting of the under deck structure. For this purpose, the ullage corresponding to the maximum water level is to be assumed not more than 3 m from the deck plate measured at the midspan of deck transverses and at the mid point of the tank's length.

If neither of the above conditions are met, then staging or another equivalent means is to be provided for the survey of the under deck areas.

1. 6. 15 Rescue and emergency response equipment: if breathing apparatus and/or other equipment is used as 'rescue and emergency response equipment', it is recommended that the equipment be suitable for the configuration of the space being surveyed.

1. 6. 16 For ships assigned the notation **ESP**, the Owner is to respond to a Survey Planning Questionnaire and to prepare a Survey Programme, *see* [Pt 1, Ch 3, 6.3 Planning for survey](#), [Pt 1, Ch 3, 7.3 Planning for survey](#) and [Pt 1, Ch 3, 8.3 Planning for survey](#). In such cases, the following requirements are applicable:

- a. The Survey Planning Questionnaire is to be submitted to ACS prior to the preparation of a Survey Programme. The response to the Questionnaire is to include information on access provisions for close-up Surveys and thickness measurements; cargo history; the results of inspections carried out by the Owner; a list of reports of Port State Control Inspection containing hull structural deficiencies; a list of Safety Management System non-conformities related to hull maintenance and details of the thickness measurement company.

- b. The Survey Programme is to be submitted prior to the commencement of any part of the Intermediate Survey on ships over 10 years of age and Special Survey. This is to be in a written format and submitted to ACS at least six months in advance of the survey. The Survey Programme at Intermediate Survey may consist of the Survey Programme agreed for the previous Special Survey supplemented by the Executive Hull Summary of that Special Survey and later relevant survey reports. The survey will not commence until a Survey Programme has been agreed.

- c. The Survey Programme is to be worked out taking into account any amendments to the survey requirements implemented after the previous Special Survey.

- d. Further information on the Survey Planning Questionnaire and Survey Programme can be found in the *ESP guidance booklets* that have been prepared by ACS and are available on the Class Direct website.

- e. Prior to the commencement of any part of the Intermediate Survey and Special Survey, a survey planning meeting is to be held between the attending Surveyor(s), the Owner's representative in attendance, the thickness measurement company operator representative (as applicable) and the Master of the ship or an appropriately qualified representative appointed by the Master or Owner for the purpose of ascertaining that all the arrangements envisaged in the Survey Programme are in place, so as to ensure the safe and efficient conduct of the survey to be carried out. The following is an indicative list of items that are to be addressed in the meeting:
  - i. Schedule of the ship (i.e. the voyage, docking and undocking manoeuvres, periods alongside, cargo and ballast operations, etc.).
  - ii. Provisions and arrangements for thickness measurements (i.e. access, cleaning/de-scaling, illumination, ventilation, personal safety).
  - iii. Extent of the thickness measurements.
  - iv. Permissible diminution levels.
  - v. Extent of close-up survey and thickness measurement considering the coating condition and suspect areas/areas of substantial corrosion.
  - vi. Execution of thickness measurements.
  - vii. Taking representative readings in general and where uneven corrosion/pitting is found.
  - viii. Mapping of areas of substantial corrosion.
  - ix. Communication between attending surveyor(s), the thickness measurement company operator(s) and Owner's representative(s) concerning findings.
- f. Proper preparation and close co-operation between the attending Surveyor(s) and the Owner's representative on board prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly.

1. 6. 17 For a fuel installation using **gases or other low-flashpoint fuels** see also [Pt 1, Ch 3, 24.1 General](#)

## 1. 7 Remote Inspection Technique (RIT)

Consideration may be given by ACS to allow the use of a RIT as a means to carry out a close-up survey. Surveys conducted using a RIT are to be completed to the satisfaction of the attending Surveyor. The following requirements are applicable:

- a. The RIT is to provide the information normally obtained by a Surveyor when using traditional means of access to perform the survey.
- b. Surveys performed with the use of a RIT are to be carried out in accordance with the requirements given in *IACS Recommendation 42 'Guidelines for Use of Remote Inspection Techniques for surveys'*. These considerations are to be included in the proposals for use of a RIT which are to be submitted in advance of the survey so that satisfactory arrangements can be agreed with ACS.
- c. The equipment and procedure for observing and reporting the survey using a RIT are to be discussed and agreed prior to the survey using a RIT.
- d. Time is to be allowed to set up, calibrate and test all equipment beforehand.
- e. When using a RIT as a means to carry out a close-up survey, if not carried out by ACS itself, it is to be conducted by a firm approved as a service supplier and is to be witnessed by the attending Surveyor.
- f. The structure to be examined using a RIT is to be sufficiently clean and visibility is to be sufficient to allow a meaningful examination. ACS is to be satisfied with the methods of orientation on the structure.

- g. The Surveyor is to be satisfied with the method of data presentation including pictorial representation, and a good two-way communication between the Surveyor and the RIT operator is to be provided.
- h. When a RIT is used as a means to carry out a close-up survey, means of access for the corresponding thickness measurements are to be provided unless the RIT is also able to carry out the required thickness measurements.
- i. If the RIT reveals damage or deterioration that requires attention, the Surveyor may require a further close-up survey to be undertaken without the use of a RIT.

## 1. 8 Thickness measurement at surveys

- 1. 8. 1 This Section is applicable to the thickness measurement of the hull structure where required by Sections [Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements](#), [Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements](#), [Pt 1, Ch 3, 5 Special Survey - General - Hull requirements](#), [Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements](#), [Pt 1, Ch 3, 7 Special Survey - Oil tankers \(including ore/oil ships and ore/bulk/oil ships\) - Hull requirements](#), [Pt 1, Ch 3, 8 Special Survey - Chemical Tankers - Hull requirements](#) and [Pt 1, Ch 3, 9 Ships for liquefied gases](#).
- 1. 8. 2 Prior to the commencement of the Intermediate Survey and Special Survey, a meeting is to be held between the attending Surveyor(s), the Owner's representative in attendance, the thickness measurement company representative and the Master of the ship or an appropriately qualified representative appointed by the Master or Owner, so as to ensure the safe and efficient conduct of the survey and thickness measurements to be carried out.
- 1. 8. 3 Thickness measurements are normally to be taken by means of ultrasonic test equipment and are to be carried out by a firm approved in accordance with ACS's *Approval for Thickness Measurement of Hull Structure*. For non-ESP ships less than 500 gross tons and all fishing vessels, a suitably qualified exclusive Surveyor (where available) may carry out thickness measurements. On all other occasions, an approved firm is to carry out the thickness measurements.
- 1. 8. 4 The Surveyor may require to measure the thickness of the material in any portion of the structure where signs of wastage are evident or wastage is normally found. Any parts of the structure which are found defective or excessively reduced in scantlings are to be made good by materials of the approved scantlings and quality. Attention is to be given to the structure in way of discontinuities. If a corrosion control CC special features notation, as defined in the *Register Book*, is assigned, then surfaces are to be re-coated as necessary.
- 1. 8. 5 Thickness measurements are to be witnessed by the Surveyor. This requires the Surveyor to be on board, while the measurements are carried out, to the extent necessary to control the process. This also applies to thickness measurements carried out while the ship is at sea.
- 1. 8. 6 The Surveyor may extend the scope of thickness measurement if deemed necessary.
- 1. 8. 7 Where it is required as part of the survey to carry out thickness measurements for the structural areas subject to Close-up Survey, then these measurements are to be carried out simultaneously with the Close-up Survey.
- 1. 8. 8 Thickness measurements are to be taken in the forward and aft areas of all plates. Where plates cross ballast/cargo tank boundaries separate measurements for the area of plating in way of each type of tank are to be reported. In all cases the measurements are to represent the average of multiple measurements taken on each plate and/or stiffener. Where measured plates are renewed, the thicknesses of adjacent plates in the same strake are to be reported.
- 1. 8. 9 The acceptance criteria for thickness measurements are according to the ACS document *Thickness Measurement and Close-Up Survey Guidance*.
- 1. 8. 10 A report is to be prepared by the approved firm or Surveyor carrying out the thickness measurements. The report is to give the location of measurement, the thickness measured as well

as the corresponding original thickness. The report is to give the date when measurement was carried out, the type of measuring equipment, names of personnel and their qualifications and is to be signed by the operator.

1. 8. 11 The thickness measurement report is to be verified and signed by the Surveyor and countersigned by an authorising Surveyor.
1. 8. 12 In all cases the extent of the thickness measurements is to be sufficient to represent the actual average condition.

## 1. 9 Repairs

1. 9. 1 Any damage in association with wastage over the allowable limit (including buckling, grooving, detachment or fracture), or extensive areas of wastage over the allowable limits, which affects or, in the opinion of the Surveyor, will affect the ship's structural, watertight or weathertight integrity, is to be promptly and thoroughly repaired. Areas to be considered include, (where fitted):
  - side shell frames, their end attachments and adjacent shell plating;
  - deck structure and deck plating;
  - bottom structure and bottom plating;
  - side structure and side plating;
  - inner bottom structure and inner bottom plating;
  - inner side structure and inner side plating;
  - watertight or oil-tight bulkheads;
  - hatch covers and hatch coamings;
  - the weld connection between air pipes and deck plating;
  - air pipe heads installed on the exposed decks;
  - ventilators, including closing devices.

For locations where adequate repair facilities are not available, consideration may be given to allow the ship to proceed directly to a repair facility. This may require discharging the cargo and/or temporary repairs for the intended voyage.

1. 9. 2 Additionally, when a survey results in the identification of structural defects or corrosion, either of which, in the opinion of the Surveyor, will impair the ship's fitness for continued service, remedial measures are to be implemented before the ship continues in service.
1. 9. 3 Where the damage found on structure mentioned in [Pt 1, Ch 3, 1.9 Repairs 1.9.1](#) is isolated and of a localised nature which does not affect the ship's structural integrity (as, for example, a localised, isolated and very minor hole in a cross-deck strip), consideration may be given by the Surveyor to allow an appropriate temporary repair to restore watertight or weathertight integrity after careful evaluation of the surrounding structure and impose an associated Condition of Class with a specific short-term time limit in order to complete the repair and retain classification.

## 1. 10 Documentation

1. 10. 1 For oil tankers and bulk carriers, the Owner is to obtain, supply and maintain documentation on board as follows:
  - a. A survey file comprising reports of structural surveys, thickness measurement and executive hull summary in accordance with the *2011 ESP Code – International Code on the Enhanced*

*Programme of Inspections During Surveys of Bulk Carriers and Oil Tankers, 2011 – Resolution A.1049(27).*

- b. Supporting documentation consisting of:
  - i. Main structural plans of cargo holds and ballast tanks (for ships built in accordance with the IACS Common Structural Rules (CSR), these plans are to include for each structural element, both the as-built and the renewal thickness. Any thickness for voluntary addition is also to be clearly indicated on the plans. The midship section plan to be supplied on board the ship is to include the minimum allowable hull girder sectional properties for the hold transverse section in all cargo holds).
  - ii. Previous repair history.
  - iii. Cargo and ballast history.
  - iv. Records of inspections by ship's personnel with reference to structural deterioration in general, leakages in bulkheads and piping and the condition of the corrosion prevention systems, if any.
  - v. Any other information that may help to identify critical structural areas and/or suspect areas requiring inspection.
  - vi. Survey Programme as required by [Pt 1, Ch 3, 6.3 Planning for survey](#) and [Pt 1, Ch 3, 7.3 Planning for survey](#).
1. 10. 2 In addition to the above, for CSR oil tankers and CSR bulk carriers subject to *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations Part A-1 - Structure of ships Regulation 3-10 – Goal-based ship construction standards for bulk carriers and oil tankers*, a Goal Based Standard (GBS) Ship Construction File (SCF) is to be provided in accordance with the requirements of [Pt 4, Ch 7, 1.6 Information required for CSR bulk carriers 1.6.4](#) and [Pt 4, Ch 9, 1.6 Information required for CSR Double Hull Oil Tankers 1.6.4](#). Certain important GBS SCF information must be retained aboard the ship. The remainder may be kept ashore as a 'GBS SCF' Supplement Ashore in an on-shore Archive Centre.
1. 10. 3 For CSR oil tankers and CSR bulk carriers subject to *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations Part A-1 - Structure of ships Regulation 3-10 – Goal-based ship construction standards for bulk carriers and oil tankers*, the Owner is to arrange the updating of the SCF throughout the ship's life information contained in the GBS SCF throughout the ship's life at any major event, including, but not limited to, substantial repair, conversion or modification to the ship structure. Documented procedures for updating the GBS SCF are to be included within the Safety Management System.
1. 10. 4 The applicable documentation is to be kept on board for the lifetime of the ship and is to be readily available for the Surveyor.

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **2 Annual Surveys - Hull and machinery requirements**

## **2. 1 General**

- 2. 1. 1 Annual Surveys are to be held concurrently with statutory annual or other relevant statutory surveys, wherever practicable.
- 2. 1. 2 At Annual Surveys, the Surveyor is to examine the ship and machinery, so far as necessary and practicable, in order to be satisfied as to their general condition.
- 2. 1. 3 For additional requirements for ships for liquefied gases, see [Pt 1, Ch 3, 9 Ships for liquefied gases](#).
- 2. 1. 4 For ships which are required by International Convention to comply with the *ISM Code - International Management Code and Revised Guidelines on Implementation of the ISM Code* (ISM Code), the Surveyor is to review the overall effectiveness of the Code onboard ship. This is to be undertaken regardless of the organisation issuing the Safety Management Certificate (SMC).
- 2. 1. 5 For ships assigned the notation 'laid-up', in lieu of the normal Annual Survey requirements a general examination of the hull and machinery is to be carried out.

## **2. 2 Annual Surveys**

- 2. 2. 1 The survey is to include:
  - a. An examination for the purpose of ensuring, as far as practicable, that the hull, hatch covers, hatch coamings, closing appliances, equipment and related piping are maintained in a satisfactory condition and shall take into account the service history, condition and extent of the corrosion prevention system of ballast tanks and areas identified in the ship's classification records.
  - b. Examination of weather decks, ship side plating above the waterline, hatch cover and coamings.
  - c. Examination of watertight penetrations as far as practicable.
  - d. Examination of the weld connection between air pipes, ventilators and deck plating.
  - e. External examination of all air pipe heads installed on exposed decks.
  - f. Examination of flame screens on air pipes to all bunker tanks.
  - g. Examination of ventilators including closing devices, if any.
  - h. The Surveyor is to be satisfied regarding the efficient condition of:
    - i. exposed casings, skylights, flush deck scuttles, deckhouses and companionways, superstructure bulkheads, side, bow and stern doors, side scuttles and deadlights, chutes and other openings, together with all closing appliances.

- ii. scuppers and sanitary discharges (so far as practicable); valves on discharge lines (so far as practicable) and their controls; guard rails and bulwarks; freeing ports, gangways and life-lines; fittings and appliances for timber deck cargoes.
- iii. bilge level detection and alarm systems on ships assigned a **UMS** notation.

2. 2. 2 The following requirements for hatch covers and coamings are applicable:

- a. The Surveyor is to obtain confirmation that no unapproved changes have been made to the hatch covers, hatch coamings and their securing and sealing devices since the previous survey.
- b. Where mechanically operated steel hatch covers are fitted, Surveyors are to confirm the satisfactory condition of:
  - i. hatch covers;
  - ii. tightness devices of longitudinal, transverse and intermediate cross junctions (gaskets, gasket lips, compression bars, drainage channels);
  - iii. clamping devices, retaining bars, cleating;
  - iv. chain or rope pulleys;
  - v. guides;
  - vi. guide rails and track wheels;
  - vii. stoppers, etc;
  - viii. wires, chains, gypsies, tensioning devices;
  - ix. hydraulic system essential to closing and securing;
  - x. safety locks and retaining devices.
- c. Where portable hatch covers, wooden or steel pontoons are fitted, Surveyors are to confirm the satisfactory condition of:
  - i. wooden covers and portable beams, carriers or sockets for the portable beam, and their securing devices;
  - ii. steel pontoons;
  - iii. tarpaulins;
  - iv. cleats, battens and wedges;
  - v. hatch securing bars and their securing devices;
  - vi. loading pads/bars and the side plate edge;
  - vii. guide plates and chocks;
  - viii. compression bars, drainage channels and drain pipes (if any).
- d. The Surveyor is to confirm the satisfactory condition of hatch coaming plating and their stiffeners, where applicable.
- e. The Surveyor is to carry out random checking of the satisfactory operation of mechanically operated hatch covers including:
  - i. stowage and securing in open condition,
  - ii. proper fit and efficiency of sealing in closed condition,
  - iii. operational testing of hydraulic and power components, wires, chains and link drives.
- f. Where considered necessary by the Surveyor, the effectiveness of sealing arrangements may be proved by hose or chalk testing supplemented by dimensional measurements of seal compressing components.
- g. For **general dry cargo ships** the survey is to include a close-up survey of the hatch covers, hatch coaming and stiffeners.
- h. For **bulk carriers** the following requirements are also applicable:
  - i. The survey is to include a close-up survey of the hatch covers, hatch coaming and stiffeners.
  - ii. A thorough survey of cargo hatch covers and coamings is only possible by their examination in an open and closed position, including verification of the proper opening and closing operation. As such, the hatch cover sets located in the forward 25 per cent of the ship's length and at least one other additional set are to be surveyed open, closed and in operation to the full extent on each direction in accordance with ([Pt 1, Ch 3, 2.2 Annual Surveys 2.2.2.\(e\)](#)) above. When selecting hatch cover sets it should be ensured that all sets are subject to survey

at least once in every five-year Special Survey period. The closing of the covers is to include the fastening of all peripheral and cross joint cleats or other securing devices, with particular attention to be paid to the condition of the hatch covers located in the forward 25 per cent of the ship's length, where sea loads are normally greatest.

iii. If there are indications of difficulty in operating and securing hatch covers, then additional sets are to be tested in operation at the discretion of the Surveyor.

iv. Where the cargo hatch securing system does not function properly, repairs are to be carried out under the supervision of the Surveyor. Where hatch covers or coamings undergo substantial repairs, the strength of securing devices shall be upgraded to comply with [Pt 4, Ch 7, 12.3 Closing arrangements](#).

v. Surveyors are to survey the sealing arrangements of perimeter and cross joints (gaskets for condition of permanent deformation, flexible seals on combination carriers, gasket lips, compression bars, drainage channels and non-return valves).

2. 2. 3 The Surveyor is to confirm that, where required, an approved loading instrument together with its operation manual are available on board, see [Pt 3, Ch 4, 8 Loading guidance information](#). The operation of the loading instrument is to be verified in accordance with ACS's certification procedure.
2. 2. 4 The anchoring and mooring equipment is to be examined so far as practicable.
2. 2. 5 The watertight doors in watertight bulkheads, their indicators and alarms, are to be examined and tested (locally and remotely), together with an examination of watertight bulkhead penetrations, so far as practicable.
2. 2. 6 If a rig is fitted that is used for propulsion by wind force, then a general examination of the mast(s), standing rigging, sail/wind propulsion system and associated structure and equipment is to be carried out. The examination may be undertaken by a Surveyor and/or by a firm approved by ACS.
2. 2. 7 The Surveyor is to examine and test in operation all main and auxiliary steering arrangements including their associated equipment and control systems, and verify that log book entries have been made in accordance with statutory requirements where applicable.
2. 2. 8 The Surveyor is to be satisfied regarding the freeboard marks on the ship's side.
2. 2. 9 The Surveyor is to generally inspect the machinery and boiler spaces, with particular attention being given to the propulsion system, auxiliary machinery and to the existence of any fire and explosion hazards. Emergency escape routes are to be checked to ensure that they are free of obstruction.
2. 2. 10 The means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the alternative steering position, if fitted, are to be tested.
2. 2. 11 The bilge pumping systems for each watertight compartment, including bilge wells, extended spindles, self-closing drain cocks, valves fitted with rod gearing or other remote operation, pumps and level alarms, where fitted, are to be examined and operated as far as practicable and all confirmed to be satisfactory. Any hand pumps provided are to be included.
2. 2. 12 Piping systems containing fuel oil, lubricating oil or other flammable liquids are to be generally examined and operated as far as practicable, with particular attention being paid to tightness, fire precaution arrangements, flexible hoses and sounding arrangements.
2. 2. 13 The Surveyor is to be satisfied regarding the condition of non-metallic joints in piping systems which penetrate the hull, where both the penetration and the non-metallic joint are below the deepest load waterline.
2. 2. 14 The main propulsion, essential auxiliary and emergency generators including safety arrangements, controls and foundations are to be generally examined. Surveyors are to confirm that Periodical Surveys of engines have been carried out as required by the Rules and that safety devices have been tested.

- 2. 2. 15 The boilers, other pressure vessels and their appurtenances, including foundations, controls, high pressure and waste steam piping and insulation and gauges, are to be generally examined. Surveyors should confirm that Periodical Surveys of boilers and other pressure vessels have been carried out as required by the Rules.
- 2. 2. 16 For boilers, the safety devices are to be tested, and the safety valves are to be operated using the relieving devices. For exhaust gas heated economisers/boilers, the safety valves are to be tested at sea by the Chief Engineer and details recorded in the log book.
- 2. 2. 17 The operation and maintenance records, repair history and feed water chemistry records of boilers are to be examined.
- 2. 2. 18 For other pressure vessels, the safety devices are to be examined.
- 2. 2. 19 The electrical equipment and cabling forming the main and emergency electrical installations are to be generally examined under operating conditions so far as practicable. The satisfactory operation of the main and emergency sources of power and electrical services essential for safety in an emergency is to be verified; where the sources of power are automatically controlled they should be tested in the automatic mode. Bonding straps for the control of static electricity and earthing arrangements are to be examined where fitted.
- 2. 2. 20 Where lithium battery system installations are used as a power source for essential or emergency systems, testing is to be conducted in accordance with the trials requirements in [Pt 6 Control, Electrical, Refrigeration and Fire, Table 2. 21. 3: Test requirements on lithium battery systems](#). Additionally the following aspects of the battery space are to be inspected, as applicable to the installation:
  - a. structural fire protection;
  - b. fixed fire detection;
  - c. HVAC, ventilation, cooling, smoke extraction, fire damper systems;
  - d. fixed and portable extinguishing; and
  - e. escape and EEBD (emergency escape breathing device).
- 2. 2. 21 The electrical installation in areas which may contain flammable gas or vapour and/or combustible dust is to be examined in order to verify that it is in good condition and has been properly maintained.
- 2. 2. 22 For main propulsion, essential auxiliary and emergency machinery control engineering systems, a general examination of the equipment and arrangements is to be carried out. Records of modifications are to be made available for review by the attending Surveyor. The documentation required by [Pt 6, Ch 1 Control Engineering Systems](#), including configuration management, are to be reviewed following system modifications to confirm compliance with applicable Rules. Satisfactory operation of the safety devices and control systems is to be verified. For ships having **UMS** or **CCS** notation, a general examination of the control engineering equipment required for these notations is also to be carried out.
- 2. 2. 23 For ships fitted with an electronically controlled engine for main propulsion, essential auxiliary or emergency power purposes the following is to be carried out to the satisfaction of the Surveyor:
  - a. Verification of evidence of satisfactory operation of the engine and where possible this is to include a running test under load.
  - b. Verification of satisfactory operation of the safety devices and control, alarm and monitoring systems.
  - c. Verification that any changes to the software or control, alarm, monitoring and safety systems that affect the operation of the engine have been assessed by ACS and are under configuration management control.
- 2. 2. 24 Dead ship starting arrangements for bringing machinery into operation without external aid are to be tested to the Surveyor's satisfaction.

2. 2. 25 On ships fitted with a dynamic positioning system, the control system and associated machinery items are to be generally examined and tested to demonstrate that they are in good working order. For ships classed with **DP (AA)** or **DP (AAA)** notations Surveyors are to review records of the annual testing to confirm the ship's ability to keep position after single failures of any component or system and, in addition, Surveyors are to witness testing conducted alongside as far as is practicable.
2. 2. 26 For ships to which a **PM** or **PMC** notation has been assigned in accordance with [Pt 7, Ch 8, 1.2 Classification notations 1.2.1.\(b\)](#), the thruster assisted positional mooring system, control system and associated machinery items are to be generally examined and tested under operating conditions to an approved Test Schedule.
2. 2. 27 For ships fitted with positional mooring equipment in accordance with [Pt 7, Ch 8 Positional Mooring and Thruster-Assisted Positional Mooring Systems](#), a schedule or rota of moorings to be examined at Annual Survey should be agreed for component parts of the positional moorings.
2. 2. 28 For ships having an **OPS** notation assigned, a General Examination of on-shore power supply arrangements is to be carried out in accordance with [Pt 7, Ch 13 On-shore Power Supplies](#).
2. 2. 29 For ships to which [Pt 6, Ch 4 Fire Protection, Detection and Extinction Requirements](#) applies, the arrangements for fire protection, detection and extinction are to be examined and are to include:
- Verification, so far as practicable, that no significant changes have been made to the arrangement of structural fire protection.
  - Verification of the operation of manual and/or automatic doors where fitted.
  - Verification that fire-control plans are properly posted.
  - Examination, so far as possible, and testing as feasible, of the fire and/or smoke detection and alarm system(s).
  - Examination of fire main system, and confirmation that each fire pump, including the emergency fire pump can be operated separately so that the two required powerful jets of water can be produced simultaneously from different hydrants.
  - Verification that fire-hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations.
  - Examination of fixed fire-fighting systems controls, piping, instructions and marking, checking for evidence of proper maintenance and servicing, including date of last systems tests.
  - Verification that all portable and semi-portable fire-extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random checks for evidence of discharged containers.
  - Verification, so far as practicable, that the remote control for stopping fans and machinery and shutting-off fuel supplies in machinery spaces and, where fitted, the remote controls for stopping fans in accommodation spaces and the means of cutting off power to the gallery are in good working order.
  - Examination of the closing arrangements of ventilators, funnel annular spaces, skylights, doorways and tunnels, where applicable.
  - Verification that the firemen's outfits are complete and in good condition.
2. 2. 30 The examination of salt-water ballast tanks is to be carried out as follows:
- Salt-water ballast tanks, other than double bottom ballast tanks, on all ships (excluding oil tankers and chemical tankers) where it has been identified at a previous Special Survey or Intermediate Survey that:
    - A hard protective coating has not been applied from the time of construction; or
    - A soft or semi-hard coating has been applied; or
    - A hard protective coating is found to be in POOR condition, as defined in 1.5, and the hard protective coating is not repaired to the satisfaction of the Surveyor.

If the conditions listed above are applicable to double bottom ballast tanks, then these tanks may be subject to examination at the Annual Survey at the discretion of the Surveyor.

- b. Salt-water ballast tanks on oil tankers (including ore/oil and ore/bulk/oil ships) and chemical tankers where it has been identified at a previous Special Survey or Intermediate Survey that:
  - i. A hard protective coating has not been applied from the time of construction; or
  - ii. A soft or semi-hard coating has been applied; or
  - iii. The hard protective coating is found to be in less than GOOD condition, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), and the hard protective coating is not repaired to the satisfaction of the Surveyor.
- c. The examination of the salt-water ballast tanks, in accordance with the above, is to include thickness measurements to confirm the condition of the hull structure.

2. 2. 31 The Surveyor is to carry out an examination and thickness measurement of structure identified at the previous Special Survey or Intermediate Survey as having substantial corrosion, as defined in [Pt 1, Ch 3, 1.5 Definitions](#). This requirement does not apply to cargo tanks of oil tankers and chemical tankers. The extent of thickness measurements is to be in accordance with the appropriate Tables in Sections [Pt 1, Ch 3, 5 Special Survey - General - Hull requirements](#), [Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements](#), [Pt 1, Ch 3, 7 Special Survey - Oil tankers \(including ore/oil ships and ore/bulk/oil ships\) - Hull requirements](#) or [Pt 1, Ch 3, 8 Special Survey - Chemical Tankers - Hull requirements](#), as applicable, to determine the full extent of the corrosion pattern. The survey will not be considered complete until these additional thickness measurements have been carried out. For cargo holds and ballast tanks of bulk carriers built in accordance with the IACS Common Structural Rules (CSR), the annual thickness measurement may be dispensed with where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in good condition. Steel renewal requirements have been separately determined according to date of contract for construction for:

- a. cargo hold hatch covers and coamings under IACS UR S21 and UR S21A; and
- b. bulk carriers' corrugated transverse watertight hold bulkheads under IACS UR S18.

Where the gauged thickness is within the range  $t_{net} + 0.5$  mm and  $t_{net} + 1.0$  mm, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. See [Pt 1, Ch 3, 5.6 Thickness measurement 5.6.7](#), [Pt 1, Ch 3, 6.7 Thickness measurement 6.7.5](#) and [Pt 1, Ch 3, 7.7 Thickness measurement 7.7.4](#).

2. 2. 32 For **oil tankers** (including ore/bulk/oil ships and ore/oil ships), in addition to the applicable requirements of [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.1](#) to [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.10](#), the following are to be dealt with where applicable:
- a. Examination of cargo tank openings including gaskets, covers, coamings and screens.
  - b. Examination of cargo tank venting arrangements including secondary means of venting, or over/under pressure alarms where fitted, with associated pressure/vacuum valves and flame screens.
  - c. Examination of flame screens on vents to all bunker, oily ballast and oily slop tanks and void spaces, so far as practicable.
  - d. Examination of cargo, crude oil washing, bunker, ballast and vent piping systems together with flame arresters and pressure/vacuum valves, as applicable above the upper deck within the cargo tank area, including vent masts and headers.
  - e. Verification that no potential sources of ignition such as loose gear, excessive products in the bilges, excessive vapours, combustible materials, etc. are present in or near the cargo pump room and that access ladders are in good condition.
  - f. Examination of cargo pump rooms and pipe tunnels (where fitted) and examination of all pump room bulkheads for signs of leakage or fractures and, in particular, the sealing arrangements of all penetrations in these bulkheads.

- g. Verification that the pump room ventilation system is operational, ducting intact, dampers operational and screens are clean.
  - h. For ships to which [Pt 6, Ch 4 Fire Protection, Detection and Extinction Requirements](#) applies, the external examination of the piping and cut-out valves of cargo tank and cargo pump room fixed fire-fighting system.
  - i. For ships to which [Pt 6, Ch 4 Fire Protection, Detection and Extinction Requirements](#) applies, verification that the deck foam system and deck sprinkler system are in good operating condition.
  - j. Examination of the condition of all piping systems in the cargo pump room so far as practicable.
  - k. Examination, so far as practicable, of cargo, bilge, ballast and stripping pumps for excessive gland seal leakage, verification of proper operation of electrical and mechanical remote operating and shutdown devices and operation of pump room bilge system, and checking that pump foundations are intact.
  - l. Verification that installed pressure gauges on cargo discharge lines and level indicator systems are operational.
  - m. Verification that at least one portable instrument for measuring flammable vapour concentrations is available, together with a sufficient set of spares and a suitable means of calibration.
  - n. Examination of any inert gas system, see [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.34](#).
  - o. For ballast tanks, in areas where substantial corrosion, as defined in 1.5, has been noted then additional measurements are to be carried out in accordance with [Table 3. 7. 7: Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Bottom structure with substantial corrosion](#) to [Table 3. 7. 15: Thickness measurement - Double hull oil tankers - Transverse watertight and swash bulkhead structure in cargo tanks with substantial corrosion](#), as applicable. The survey will not be considered complete until these additional thickness measurements have been carried out.
  - p. Verification that any special arrangements made for bow or stern loading and unloading are in good condition.
2. 2. 33 For **chemical tankers**, in addition to the applicable requirements of [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.1](#) to [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.32](#), the following are to be dealt with, where applicable:
- a. Examination of gauging devices, high level alarms and valves associated with overflow control.
  - b. Verification that any devices provided for measuring the temperature of the cargo and any associated alarms are satisfactory.
  - c. Examination of the cargo heating/cooling system sampling arrangements where fitted.
  - d. Verification that wheelhouse doors and windows, side scuttles and windows in superstructure and deckhouse ends facing the cargo area are in good condition.
  - e. Verification that pump discharge pressure gauges fitted outside the cargo pump rooms are satisfactory.
  - f. Verification that pumps, valves and pipelines are identified and distinctively marked.
  - g. Verification that the remote operation of the cargo pump room bilge system is satisfactory.
  - h. Verification that cargo pump room rescue arrangements are in order.
  - i. Verification that removable pipe lengths or other approved equipment necessary for cargo separation are available, and satisfactory.
  - j. Verification that the ventilation system including portable equipment, if any, of all spaces in the cargo area is operational.
  - k. Verification that arrangements are made for sufficient inert/padding/drying gas to be carried to compensate for normal losses and that means are provided for monitoring of ullage spaces.
  - l. Verification that arrangements are made for sufficient medium to be carried where drying agents are used on air inlets to cargo tanks.

- m. Verification that suitable protective clothing is available for crew engaged in loading and discharging operations and that suitable storage is maintained.
  - n. Verification that the requisite safety equipment and associated breathing apparatus with requisite air supplies and emergency escape respiratory and eye protection, if required, are in good condition and are properly stowed.
  - o. Verification that medical first aid equipment including stretchers and oxygen resuscitation is in good condition and that satisfactory arrangements are made for antidotes for cargoes actually carried to be on board.
  - p. Verification that decontamination arrangements are operational.
  - q. Verification that the requisite gas detection instruments are on board and that satisfactory arrangements are made for the supply of any required vapour detection tubes.
  - r. Verification that the cargo sample stowage arrangements are in good condition.
  - s. Verification that, if applicable, the provisions made for chemicals which have special requirements listed in Chapter 17 of the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk* are in order.
  - t. For ballast tanks, in areas where substantial corrosion, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), has been noted then additional measurements are to be carried out in accordance with [Table 3. 8. 5: Thickness measurement - Single and double hull chemical tankers - Bottom, inner bottom and hopper structure with substantial corrosion](#), [Table 3. 8. 6: Thickness measurement - Single and double hull chemical tankers - Deck structure with substantial corrosion](#), [Table 3. 8. 7: Thickness measurement - Single and double hull chemical tankers - Side shell and longitudinal bulkheads with substantial corrosion](#) and [Table 3. 8. 8: Thickness measurement - Single and double hull chemical tankers - Transverse watertight bulkheads and swash bulkheads with substantial corrosion](#). The survey will not be considered complete until these additional thickness measurements have been carried out.
2. 2. 34 For **inert gas systems**, where fitted, the following are to be dealt with:
- a. External examination of the condition of piping including vent piping above the upper deck in the cargo tank area and overboard discharges through the shell so far as practicable, together with components for signs of corrosion or gas leakage/effluent leakage.
  - b. Verification of the proper operation of both inert gas blowers.
  - c. Checking the scrubber room ventilation system.
  - d. Checking, so far as practicable, of the deck water seal for automatic filling and draining and checking for presence of water carry-over. Checking the operation of the non-return valve.
  - e. Testing of all remotely operated or automatically controlled valves including the flue gas isolating valve(s).
  - f. Checking the interlocking features of soot blowers.
  - g. Checking that the gas pressure regulating valve automatically closes when the inert gas blowers are secured.
  - h. Checking, so far as practicable, the following alarms and safety devices of the inert gas system using simulated conditions where necessary:
    - i. high oxygen content of gas in the inert gas main;
    - ii. low gas pressure in the inert gas main;
    - iii. low pressure in the supply to the deck water seal;
    - iv. high temperature of gas in the inert gas main;
    - v. low water pressure to the scrubber;
    - vi. accuracy of portable and fixed oxygen measuring equipment by means of calibration gas.
2. 2. 35 For **bulk carriers**, in addition to the applicable requirements of [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.1](#) to [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.31](#), the following are to be dealt with, where applicable:
- a. Examination of cargo holds in accordance with [Table 3. 2. 1: Bulk carriers - Annual Surveys](#) is required.

- b. Where substantial corrosion, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), has been noted then additional measurements are to be carried out in accordance with [Table 3. 6. 5: Thickness measurement - Single skin bulk carriers - Shell plating and stiffening, with substantial corrosion](#), [Table 3. 6. 6: Thickness measurement - Single skin bulk carriers - Double bottom and hopper structure, with substantial corrosion](#), [Table 3. 6. 7: Thickness measurement - Single and double skin bulk carriers - Transverse bulkheads in cargo holds, with substantial corrosion](#), [Table 3. 6. 8: Thickness measurement - Single skin and double skin bulk carriers - Deck structure\\* with substantial corrosion](#), [Table 3. 6. 9: Thickness measurement - Double skin bulk carriers - Double side space structure \(including wing void spaces of ore carriers\), with substantial corrosion](#) and [Table 3. 6. 10: Thickness measurement - Double skin bulk carriers - Double side space structure \(including wing void spaces of ore carriers\), with substantial corrosion](#). The survey will not be considered complete until these additional thickness measurements have been carried out.

For cargo holds and ballast tanks of bulk carriers built in accordance with the IACS Common Structural Rules (CSR), the annual thickness measurement may be dispensed with where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in good condition. Steel renewal requirements have been separately determined according to date of contract for construction for:

- c. cargo hold hatch covers and coamings under IACS UR S21; and
- d. corrugated transverse watertight hold bulkheads under IACS UR S18.

Where the gauged thickness is within the range  $t_{net} + 0.5$  mm and  $t_{net} + 1.0$  mm, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. See [Pt 1, Ch 3, 5.6 Thickness measurement 5.6.7](#) and [Pt 1, Ch 3, 6.7 Thickness measurement 6.7.5](#).

- e. For ships fitted with water level detectors in cargo holds, ballast tanks forward of the collision bulkhead and any dry or void space which extends forward of the foremost cargo hold, an examination and a test, at random, of the water ingress detection systems and of their alarms is to be carried out.
- f. For ships fitted with a means for draining and pumping ballast tanks forward of the collision bulkhead and the bilges of dry spaces, any part of which extends forward of the foremost cargo hold, an examination and a test of the draining and pumping systems, including their controls, is to be carried out.
- g. Examination of bunker and vent piping systems, including ventilators.

2. 2. 36 For **general dry cargo ships**, in addition to the applicable requirements of [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.1](#), the following are required for ships over 10 years of age:

- a. Overall survey of one forward and one after cargo hold and their associated 'tween deck spaces.
- b. When considered necessary by the Surveyor, thickness measurement is to be carried out. If the results of thickness measurement indicate substantial corrosion, the extent of thickness measurement is to be in accordance with [Pt 1, Ch 3, 5 Special Survey - General - Hull requirements](#), [Table 3. 5. 6: Thickness measurement - Additional requirements in way of structure identified with substantial corrosion](#). The survey will not be considered complete until these additional thickness measurements have been carried out. Steel renewal requirements have been separately determined according to date of contract for construction for cargo hold hatch covers and coamings under IACS UR S21A. Where the gauged thickness is within the range  $t_{net} + 0.5$  mm and  $t_{net} + 1.0$  mm, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. See [Pt 1, Ch 3, 5.6 Thickness measurement 5.6.7](#).

**Table 3. 2. 1: Bulk carriers - Annual Surveys**

| Ships between 10 and 15 years old  | Ships greater than 15 years old  |
|--|--|
| <ul style="list-style-type: none"> <li>a. Overall Survey of <ul style="list-style-type: none"> <li>i. all cargo holds on single skin ships.</li> <li>ii. two selected cargo holds on double skin ships.</li> </ul> </li> <li>a. Close-up Survey of at least 25 per cent of the cargo hold side shell frames, their lower end attachments and adjacent shell plating in the forward cargo hold on single skin ships</li> <li>b. Examination of all piping and penetrations in cargo holds including overboard piping.</li> </ul> <p>See Notes 1, 2, 3, and 4</p>  | <ul style="list-style-type: none"> <li>a. Overall Survey of all cargo holds</li> <li>b. Close-up Survey of at least 25 per cent of the cargo hold side shell frames, their lower end attachments and adjacent shell plating in the forward cargo hold and one other selected cargo hold on single skin ships</li> <li>c. Examination of all piping and penetrations in cargo holds including overboard piping</li> </ul> <p>See Notes 1, 2, 3, and 4</p> |
| <p>Note The requirements in this Table apply to both single skin and double skin ships, unless stated otherwise.</p>   |  |
| <p>Note 1. Close-up Survey is required within the area of the lower one-third of the length of the cargo hold side shell frames.</p>   |  |
| <p>Note 2. Where the Survey reveals the need for remedial measures, the Survey is to be extended to include a Close-up Survey of all of the cargo hold side shell frames and adjacent shell plating of that cargo hold, as well as a Close-up Survey of sufficient extent of all remaining cargo holds.</p>  |  |
| <p>Note 3. When considered necessary by the Surveyor, thickness measurement is to be carried out. If the results of thickness measurement indicate substantial corrosion, the extent of thickness measurement is to be in accordance with Section 6, <a href="#">Table 3. 6. 5: Thickness measurement - Single skin bulk carriers - Shell plating and stiffening, with substantial corrosion</a>, <a href="#">Table 3. 6. 6: Thickness measurement - Single skin bulk carriers - Double bottom and hopper structure, with substantial corrosion</a>, <a href="#">Table 3. 6. 7: Thickness measurement - Single and double skin bulk carriers - Transverse bulkheads in cargo holds, with substantial corrosion</a>, <a href="#">Table 3. 6. 8: Thickness measurement - Single skin and double skin bulk carriers - Deck structure* with substantial corrosion</a>, <a href="#">Table 3. 6. 9: Thickness measurement - Double skin bulk carriers - Double side space structure (including wing void spaces of ore carriers), with substantial corrosion</a> and <a href="#">Table 3. 6. 10: Thickness measurement - Double skin bulk carriers - Double side space structure (including wing void spaces of ore carriers), with substantial corrosion</a> as applicable. The survey will not be considered complete until these additional thickness measurements have been carried out.</p> |  |
| <p>Note 4. Where protective coatings are found in GOOD condition, as defined in <a href="#">Pt 1, Ch 3, 1.5 Definitions</a>, the extent of the Close-up Survey may be specially considered. When considered necessary by the Surveyor, thickness measurement is to be carried out. However, prior to any coating or recoating of cargo holds, scantlings are to be confirmed by thickness measurement with the Surveyor in attendance.</p>   |  |

2. 2. 37 For **general dry cargo ships**, in addition to the applicable requirements of [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.1](#), the following are required for ships over 15 years of age:
- a. Overall survey of all cargo holds and 'tween deck spaces.
  - b. Close-up Survey of at least 25 per cent of shell frames, including their end attachments and adjacent shell plating in a forward lower cargo hold and one other selected lower cargo hold. Close-up Survey is to include the lower one third length of the shell frames.
  - c. Where the survey reveals the need for remedial measures, then the survey is to be extended to include the Close-up Survey of all shell frames and adjacent shell plating in those cargo holds

and associated tween deck spaces, as well as a Close-up Survey of sufficient extent of all remaining cargo holds and tween deck spaces.

- d. Where the protective coatings in cargo holds are found in GOOD condition, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), the extent of Close-up Survey may be specially considered.
  - e. When considered necessary by the Surveyor, thickness measurement is to be carried out. If the results of thickness measurement indicate substantial corrosion, the extent of thickness measurement is to be in accordance with [Table 3. 5. 6: Thickness measurement - Additional requirements in way of structure identified with substantial corrosion](#) in [Pt 1, Ch 3, 5 Special Survey - General - Hull requirements](#). The survey will not be considered complete until these additional thickness measurements have been carried out. Steel renewal requirements have been separately determined according to date of contract for construction for cargo hold hatch covers and coamings under IACS UR S21A. Where the gauged thickness is within the range  $t_{net} + 0.5 \text{ mm}$  and  $t_{net} + 1.0 \text{ mm}$ , a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. See [Pt 1, Ch 3, 5.6 Thickness measurement 5.6.7](#).
2. 2. 38 For **ship-borne barges** where surveys are permitted in accordance with [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.7](#), see [Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements](#).
  2. 2. 39 For **roll on-roll off ships** (i.e. those that utilise a loading ramp which enables wheeled vehicles to be rolled on and rolled off the ship), in addition to the requirements of [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.1](#), the requirements of [Pt 1, Ch 3, 23 Bow, inner, side shell and stern doors on Ro-Ro ships](#) are to be complied with, as applicable. For ships other than roll on-roll off ships, fitted with bow doors, inner doors, side doors and stern doors, in addition to the requirements of [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.1](#), the following are to be satisfactorily dealt with, as applicable:
    - a. Verification of the freedom of movement of doors, and operation of their power units.
    - b. Examination of the door structure and surrounding ship structure.
    - c. Examination of the door sealing arrangements including gaskets and retaining bars.
    - d. Examination of the door cleating, locking and securing arrangements.
    - e. Examination of the door hinging arrangements.
    - f. Verification of the local and/or remote control of the securing devices/cleats.
    - g. Examination of all equipment associated with the opening, closing and securing of the door, e.g. wire ropes, chains, sheaves, rollers, guides, shackles, etc.
    - h. Verification of the tightness of the doors.
    - i. Examination and testing of remote control panels and associated indicator lights, closed circuit television systems, water leakage indicator lights and alarm systems.
    - j. Examination of the required notice boards and verification of log entries.
    - k. Verification of the satisfactory testing of the bilge systems for the space between the inner and outer bow doors and of the vehicle deck.
    - l. Verification that the approved Operation and Maintenance Manual is on board and satisfactorily maintained.
  2. 2. 40 For **navigational arrangements for periodic one man watch and integrated bridge systems**, Annual Surveys are to be carried out in accordance with the approved test schedule as required by [Pt 7, Ch 9, 1.2 Information and plans required to be submitted 1.2.1](#) to ascertain that the equipment and arrangements required for the applicable class notation(s) are being maintained in good working order. At the time of the survey, relevant statutory certificates may be accepted as evidence of satisfactory operation.
  2. 2. 41 For **liquefied gas ships**, see also [Pt 1, Ch 3, 9 Ships for liquefied gases](#).
  2. 2. 42 The Surveyor is to examine the fixed cargo securing fittings as far as necessary and practicable in order to be satisfied as to their general condition, see [Pt 3, Ch 14, 10 Surveys](#).

2. 2. 43 Where the special features notation **CCSA** (certified container securing arrangements) is assigned, the Surveyor is to examine the securing arrangements including loose fittings so far as necessary and practicable in order to be satisfied as to their general condition, *see* [Pt 3, Ch 14, 10 Surveys](#).
2. 2. 44 It is the responsibility of the onboard personnel to examine, maintain or renew cargo securing devices and maintain the appropriate certification. Records of inspections, maintenance and renewals, as well as the procedures for accepting, maintaining and repairing or rejecting cargo securing devices are to be kept onboard and made available to the attending Surveyor on request.
2. 2. 45 The Surveyor is to confirm that, for container ships which have the special features notation **BoxMax**, the onboard lashing program, together with its operation manual, is available on board, *see* [Pt 3, Ch 4, 8 Loading guidance information](#). The operation of the program is to be verified in accordance with ACS's certification procedure.
2. 2. 46 For single hold general dry cargo ships, other than bulk carriers, fitted with water level detectors in the cargo hold, an examination and a test, at random, of the water ingress detection system and alarms are to be carried out.
2. 2. 47 For a fuel installation using **gases or other low-flashpoint fuels** *see also* [Pt 1, Ch 3, 24.3 Annual Surveys - General Requirements for Fuel Systems](#) to [Pt 1, Ch 3, 24.6 Annual Survey - Fuel Bunkering System](#).
2. 2. 48 Where a Ballast Water Treatment System (BWTS) is installed, a general examination is to be carried out to ascertain that the BWTS is being maintained in good working order. This is to include examination and testing of safety/protective devices, the fixed fire detection and alarm system(s) and, where fitted, the gas detection and alarm system(s) and associated BWTS emergency shutdown devices. The ventilation arrangements of the space in which Ballast Water Treatment System (BWTS) is fitted are to be examined under operating conditions as far as practicable. At the time of the Annual Survey the operational and maintenance records are to be made available to the attending Surveyor to verify the satisfactory operation of the BWTS and associated safety devices/systems.
2. 2. 49 Where emissions abatement plant for combustion machinery is installed, the plant, supporting structure and associated systems are to be generally examined. This is to include the examination and testing of alarms, controls and safeguards and where fitted:
- isolation, by-pass, back pressure, backflow and carryover prevention arrangements;
  - gas detection and alarm system(s);
  - ventilation arrangements of the space in which the emissions abatement plant is fitted; and
  - personal protective equipment.

Operational and maintenance records are to be made available to the attending Surveyor to verify satisfactory operation of the emissions abatement plant and associated safety devices/systems.

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **3 Intermediate Surveys - Hull and machinery requirements**

### 3. 1 General

- 3. 1. 1 Intermediate Surveys are to be held concurrently with statutory annual or other relevant statutory surveys wherever practicable.

### 3. 2 Review of documentation on board

- 3. 2. 1 Prior to survey, the Surveyor is to examine the completeness of the documentation onboard as detailed in [Pt 1, Ch 3, 1.10 Documentation](#), and its contents as a basis for the survey.
- 3. 2. 2 For CSR oil tankers and CSR bulk carriers subject to *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations Part A-1 - Structure of ships Regulation 3-10 – Goal-based ship construction standards for bulk carriers and oil tankers*, the Surveyor is to examine the information held in the Goal Based Standard (GBS) Ship Construction File (SCF) stored on board the ship. On completion of the survey, in the case of any major event, including, but not limited to, substantial repair, conversion or any modification to the ship structure, the Surveyor is to verify that the information stored on board of the ship has been updated, and is to verify any addition and/or renewal of materials used for the construction of the hull structure are documented within the GBS SCF list of materials.
- 3. 2. 3 For CSR oil tankers and CSR bulk carriers subject to *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations Part A-1 - Structure of ships Regulation 3-10 – Goal-based ship construction standards for bulk carriers and oil tankers*, for the GBS SCF Supplement Ashore, the Surveyor is to verify the information stored in the Archive Centre by examining the list of information included in the Supplement Ashore. In addition, the Surveyor is to confirm that the service contract with the Archive Centre remains valid. In the case of any major event, including, but not limited to, substantial repair, conversion or modification to the ship's structure, the Surveyor is to verify that the information stored in the Archive Centre has been updated by examining the list of updated information included in the Supplement Ashore.

### 3. 3 Intermediate Surveys

- 3. 3. 1 The requirements of [Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements](#) are to be complied with so far as applicable.
- 3. 3. 2 A general examination of salt water ballast tanks is to be carried out as required by [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.6](#) and [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.7](#). For ships other than oil tankers and chemical tankers, if such examinations reveal no visible structural defects then the

examination may be limited to a verification that the protective coating remains in GOOD or FAIR condition as defined in [Pt 1, Ch 3, 1.5 Definitions](#).

- 3.3.3 In application of [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.11](#), [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.13](#) and [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.15](#) respectively for **oil tankers** (including ore/oil and ore/bulk/oil ships), **chemical tankers** and **bulk carriers** over 15 years of age a survey in dry-dock is to be a part of the Intermediate Survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of cargo tanks/holds and water ballast tanks are to be surveyed in accordance with the applicable requirements for Intermediate Surveys, if not already surveyed.
- 3.3.4 For **oil tankers** (including ore/oil and ore/bulk/oil ships) and **chemical tankers**, the condition of the corrosion prevention system identified during the Survey may result in the salt-water ballast tanks being subject to further examination at Annual Surveys, in accordance with [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.30](#).
- 3.3.5 For salt-water ballast tanks on those ships not listed in [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.4](#), the condition of the corrosion prevention system identified during the Survey may result in the tanks being subject to further examination at Annual Surveys, in accordance with [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.30](#). For double bottom ballast tanks, the examination at Annual Surveys will be at the discretion of the Surveyor.
- 3.3.6 For ships over 5 years of age and up to 10 years of age, representative salt-water ballast tanks are to be examined. In addition to this, the following requirements are applicable:
  - a. For **general dry cargo ships**, an Overall Survey of representative salt-water ballast tanks, as selected by the Surveyor is to be carried out.
  - b. For **bulk carriers**, an Overall Survey of representative salt-water ballast tanks, as selected by the Surveyor is to be carried out. The selected tanks are to include the fore peak tank, aft peak tank and a number of other tanks, taking into account the total number and type of ballast tanks.
  - c. For **single hull oil tankers** (including ore/oil and ore/bulk/oil ships), an examination of all salt-water ballast tanks is to be carried out. Where considered necessary by the Surveyor, thickness measurement and testing are to be carried out to ensure the structural integrity remains effective.
  - d. For **double hull oil tankers** and **chemical tankers**, an Overall Survey of representative salt-water ballast tanks, as selected by the Surveyor is to be carried out. If the survey reveals no visible defects, the examination may be limited to a verification that the hard protective coating remains in GOOD condition, as defined in [Pt 1, Ch 3, 1.5 Definitions](#).
  - e. Where a hard protective coating is found to be in POOR condition, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), where a soft or semi-hard coating has been applied, where a protective coating was not applied from the time of construction or other defects are found, the survey is to be extended to other ballast tanks of the same type.
- 3.3.7 For all ships over 10 years of age, the following are required:
  - a. All salt-water ballast tanks are to be examined.
  - b. The anchors are to be partially lowered and raised using the windlass.
- 3.3.8 The Surveyor is to carry out an examination and thickness measurement of structure identified at the previous Special Survey as having substantial corrosion, *see also* [Pt 1, Ch 3, 5 Special Survey - General - Hull requirements](#), [Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements](#), [Pt 1, Ch 3, 7 Special Survey - Oil tankers \(including ore/oil ships and ore/bulk/oil ships\) - Hull requirements](#) and [Pt 1, Ch 3, 8 Special Survey - Chemical Tankers - Hull requirements](#). In addition, for double hull oil tankers built in accordance with the IACS Common Structural Rules (CSR), the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out in accordance with [Table 3. 7. 11: Thickness measurement - Double hull oil tankers - Bottom, inner bottom and hopper structure with substantial corrosion](#) to

[Table 3. 7. 15: Thickness measurement - Double hull oil tankers - Transverse watertight and swash bulkhead structure in cargo tanks with substantial corrosion.](#)

3. 3. 9 For all ships, the electrical generating sets are to be examined under working conditions to verify compliance with [Pt 6, Ch 2, 2.2 Number and rating of generators and converting equipment](#).
3. 3. 10 In addition to the foregoing, in the case of all **oil tankers** (including ore/oil and ore/bulk/oil ships) the following are to be dealt with where applicable:
  - a. An examination of cargo, crude oil washing, bunker, ballast, steam and vent piping on the weather decks, as well as vent masts and headers. If upon examination there is any doubt as to the condition of the piping, the piping may be required to be pressure tested, gauged, or both.
  - b. A general examination within the zones and spaces deemed as hazardous, such as cargo pump rooms and spaces adjacent to and zones above cargo tanks, for defective and non-certified safe-type electrical equipment, improperly installed, defective and dead-end wiring. An electrical insulation resistance test of the circuits terminating in, or passing through, the hazardous zones and spaces is to be carried out. If the ship is not in a gas free condition the results of previously recorded test readings may be accepted.
3. 3. 11 For **oil tankers** (including ore/oil and ore/bulk/oil ships), in addition to [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.10](#), the following are required for ships over 10 years of age:
  - a. A survey to the same extent as the previous Special Survey (applicable only to ESP surveys, see [Pt 1, Ch 3, 7.1 General 7.1.2](#)).
  - b. Pressure testing of cargo and ballast tanks and the requirements for the longitudinal strength evaluation (see [Pt 1, Ch 3, 7.7 Thickness measurement 7.7.3](#)) are to be carried out if deemed necessary by the attending Surveyor.
3. 3. 12 For **chemical tankers**, in addition to the applicable requirements of [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.1](#) to [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.9](#) the following are to be dealt with where applicable:
  - a. Examination of vent line drainage arrangements.
  - b. Verification that the cargo heating/cooling system is in good condition.
  - c. Verification that the ship's cargo hoses are approved and in good condition.
  - d. Verification that where applicable, pipelines and independent cargo tanks are electrically bonded to the hull.
  - e. An examination of cargo, cargo washing, bunker, ballast, steam and vent piping on the weather decks, as well as vent masts and headers. If upon examination there is any doubt as to the condition of the piping, the piping may require to be pressure tested, gauged or both.
  - f. A General Examination within the zones and spaces deemed as hazardous, such as cargo pump rooms and spaces adjacent to and zones above cargo tanks, for defective and non-certified safe-type electrical equipment, improperly installed, defective and dead-end wiring. An electrical insulation resistance test of the circuits terminating in, or passing through, the hazardous zones and spaces is to be carried out. If the ship is not in a gas free condition the results of previously recorded test readings may be accepted.
3. 3. 13 For **chemical tankers**, in addition to [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.12](#), the following are required for ships over 10 years of age:
  - a. A survey to the same extent as the previous Special Survey (applicable only to ESP surveys, see [Pt 1, Ch 3, 8.1 General 8.1.2](#)).
  - b. Pressure testing of cargo and ballast tanks is to be carried out if deemed necessary by the attending Surveyor.
3. 3. 14 For **bulk carriers**, in addition to the applicable requirements of [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.1](#) to [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.9](#), the following are to be dealt with on ships over five years of age:

- a. Overall Survey, Close-up Survey and thickness measurements of cargo holds in accordance with [Table 3. 3. 1: Bulk carriers - Intermediate Surveys](#).
  - b. Steel renewal requirements have been separately determined according to date of contract for construction for:
    - i. cargo hold hatch covers and coamings under IACS UR S21; and
    - ii. corrugated transverse watertight hold bulkheads under IACS UR S18.

Where the gauged thickness is within the range  $t_{net} + 0.5$  mm and  $t_{net} + 1.0$  mm, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. See [Pt 1, Ch 3, 5.6 Thickness measurement 5.6.7](#) and [Pt 1, Ch 3, 6.7 Thickness measurement 6.7.5](#).
  - c. For bulk carriers built in accordance with the IACS Common Structural Rules (CSR), the areas identified with substantial corrosion in cargo holds and ballast tanks may be either:
    - i. protected by coating applied in accordance with the coating manufacturer's requirements and examined at Annual Surveys to confirm the coating in way is still in GOOD condition, or alternatively;
    - ii. subject to thickness measurement at Annual Surveys.
3. 3. 15 For **bulk carriers**, in addition to the applicable requirements of [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.1](#) to [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.9](#), the following is required for ships over 10 years of age:
- a. A survey to the same extent as the previous special Survey (applicable to ESP surveys, see [Pt 1, Ch 3, 6.1 General 6.1.2](#)).
  - b. Pressure testing of all tanks and the internal examination of fuel oil tanks are to be carried out if deemed necessary by the Surveyor.
3. 3. 16 For ships over 10 years old of age (other than dry cargo ships, general dry cargo ships, ships assigned ESP Notation and ships for liquefied gases), in addition to the applicable requirements of [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.1](#) to [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.8](#), an Overall Survey of selected cargo spaces is to be carried out.
3. 3. 17 For **dry cargo ships** over 15 years old (other than bulk carriers and general dry cargo ships), in addition to the applicable requirements of [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.1](#) to [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.8](#), an Overall Survey of selected cargo holds is to be carried out.
3. 3. 18 For **general dry cargo ships**, in addition to the applicable requirements of [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.1](#) to [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.9](#), the following is required for ships over 5 years of age:
- An overall survey of one forward and one after cargo hold and their associated 'tween deck spaces.
3. 3. 19 For **general dry cargo ships**, in addition to the applicable requirements of [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.1](#), the following are required for ships over 10 years of age:
- a. An overall survey of all cargo holds and 'tween deck spaces.
  - b. Where considered necessary by the Surveyor, thickness measurement is to be carried out. If the results of thickness measurement indicate substantial corrosion, the extent of thickness measurement is to be in accordance with [Table 3. 5. 6: Thickness measurement - Additional requirements in way of structure identified with substantial corrosion](#) in Section 5. The survey will not be considered complete until these additional thickness measurements have been carried out. Steel renewal requirements have been separately determined according to date of contract for construction for cargo hold hatch covers and coamings under IACS UR S21A. Where the gauged thickness is within the range  $t_{net} + 0.5$  mm and  $t_{net} + 1.0$  mm, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. See [Pt 1, Ch 3, 5.6 Thickness measurement 5.6.7](#).

- 3.3.20 For **general dry cargo ships**, in addition to the applicable requirements of [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.1](#), the following are required for ships over 15 years of age:
- A survey to the same extent as the previous special Survey (applicable only to surveys of the hull structure and piping systems in way of the cargo holds, cofferdams, pipe tunnels and void spaces within the cargo area and all salt water ballast tanks).
  - Tank testing, survey of automatic air pipe heads and internal examination of fuel oil, lubricating oil and fresh water tanks are to be carried out if deemed necessary by the Surveyor.
- 3.3.21 For **ship-borne barges**, where Intermediate Surveys are permitted as an alternative to Annual Surveys and Bottom Surveys, all the hatch covers are to be hose tested at every survey. The external surfaces of the barges are to be surveyed at these surveys.
- 3.3.22 For **liquefied gas ships**, see [Pt 1, Ch 3, 9 Ships for liquefied gases](#).
- 3.3.23 For a fuel installation using **gases or other low-flashpoint fuels** see also [Pt 1, Ch 3, 24.7 Intermediate Surveys](#).

**Table 3.3. 1: Bulk carriers - Intermediate Surveys**

| Ships between 5 and 10 years old   | Ships between 10 and 15 years old  | Ships greater than 15 years old  |
|--|--|--|
| <ol style="list-style-type: none"> <li>Overall Survey of all cargo holds, see Notes 1, 2, 3 and 4</li> <li>Close-up Survey to establish the condition of at least 25 per cent of the cargo hold side shell frames including their upper and lower end attachments, adjacent shell plating and the transverse bulkheads in the forward cargo hold and one other selected cargo hold on single skin ships, see Notes 1, 3 and 4.</li> </ol>  | <p>A survey to the same extent as the previous Special Survey (applicable only to ESP surveys, see <a href="#">Pt 1, Ch 3, 6.1 General 6.1.2</a>), see Note 3.</p> | <p>A survey to the same extent as the previous Special Survey (applicable only to ESP surveys, see <a href="#">Pt 1, Ch 3, 6.1 General 6.1.2</a>), see Note 3.</p> |
| <p>Note The requirements in this Table apply to both single skin and double skin ships, unless stated otherwise.</p>   |  |  |
| <p>Note 1. For single skin ships, where considered necessary by the Surveyor as a result of the Overall and Close-up Survey, the Survey is to be extended to include a Close-up Survey of all of the side shell frames and adjacent shell plating of that cargo hold, as well as a Close-up Survey of sufficient extent of all remaining cargo holds.</p>  |  |  |
| <p>Note 2. For double skin ships, where considered necessary by the Surveyor as a result of the Overall Survey, the Survey is to be extended to include a Close-up Survey of those areas of structure in cargo holds selected by the Surveyor.</p>   |  |  |
| <p>Note 3. Thickness measurement is to be carried out of sufficient extent to determine the level of corrosion of those areas subject to Close-up Survey. If the results of thickness measurement indicate substantial corrosion, the extent of thickness measurement is to be in accordance with Section 6, Table 3. 6. 5: Thickness measurement - Single skin bulk carriers - Shell plating and stiffening, with substantial corrosion to <a href="#">Table 3. 6. 10: Thickness measurement - Double skin bulk carriers - Double side space structure (including wing void spaces of ore carriers), with substantial corrosion</a>, as applicable. The survey will not be considered complete until these additional thickness measurements have been carried out.</p> |  |  |
| <p>Note 4. For ships between 5 and 10 years old where hard protective coatings in cargo holds are found to be in GOOD condition, as defined in <a href="#">Pt 1, Ch 3, 1.5 Definitions</a>, the extent of Close-up Survey and thickness measurement may be specially considered but not dispensed with in its entirety. Prior to any coating or recoating of cargo holds, scantlings are to be confirmed by thickness measurement with the Surveyor in attendance.</p>   |  |  |

CHAPTER 3 **Periodical Survey Regulations**SECTION 4 **Bottom Surveys – In Dry-Dock and In-Water - Hull and machinery requirements****4. 1 General**

4. 1. 1 At Bottom Surveys the Surveyor is to examine the ship and machinery, so far as necessary and practicable, in order to be satisfied as to the general condition.

**4. 2 Bottom Surveys in Dry-Dock**

4. 2. 1 Where a ship is in dry-dock or on a slipway it is to be placed on blocks of sufficient height, and proper staging is to be erected as may be necessary, for the examination of the shell including bottom and bow plating, keel, stern, sternframe and rudder.
4. 2. 2 The shell plating is to be examined for excessive corrosion, deterioration due to chafing or contact with the ground and for undue unfairness or buckling. Special attention is to be given to the connection between the bilge strakes and the bilge keels.
4. 2. 3 Visible parts of the rudder, rudder pintles, rudder stocks and couplings and stern frame are to be examined. The pintles are to be examined either by removal of the inspection plates, or if considered necessary by the Surveyor, the rudder is to be lifted to enable examination. The clearances in the rudder bearings are to be measured. Where applicable, pressure testing of the rudder may be required if deemed necessary by the Surveyor.
4. 2. 4 The sea chests, sea connections, scuppers and sanitary discharges, their attachments to the hull and the gratings at the sea inlets are to be examined.
4. 2. 5 Visible parts of the propeller(s) and sternbush(es) are to be examined. The clearance in the sternbush and the efficiency of the oil gland, if fitted, are to be ascertained and recorded. For controllable pitch propellers, the Surveyor is to be satisfied with the fastenings and tightness of hub and blade sealing.
4. 2. 6 Visible parts of side thrusters are to be examined. Other propulsion systems which also have manoeuvring characteristics (such as directional propellers, vertical axis propellers, water jet units) are to be examined externally with focus on the condition of gear housing, propeller blades, bolt locking and other fastening arrangements. Sealing arrangements of propeller blades, propeller shaft and steering column are to be verified.
4. 2. 7 When chain cables are ranged, the anchors and cables are to be examined by the Surveyor, *see also* [Pt 1, Ch 3, 5.3 Examination and testing 5.3.15](#), [Pt 1, Ch 3, 5.3 Examination and testing 5.3.16](#), [Pt 1, Ch 3, 5.3 Examination and testing 5.3.18](#) and [Table 3. 5. 1: Survey preparation](#).
4. 2. 8 Where the anti-fouling system is changed completely, or partial repair is carried out affecting 25 per cent or more of the antifouling system, the coating specification and anti-fouling system is to be examined by the Surveyor in accordance with the *AFS - International Convention on the*

|                |          |  |
|----------------|----------|--|
| <b>PART</b>    | <b>1</b> | <b>Regulations</b>   |
| <b>CHAPTER</b> | <b>3</b> | <b>Periodical Survey Regulations</b>   |
| <b>SECTION</b> | <b>4</b> | <b>Bottom Surveys – In Dry-Dock and In-Water - Hull and machinery requirements</b> |

---

*Control of Harmful Anti-Fouling Systems on Ships, 2001* (AFS 2001) and [Ch 15 Corrosion Prevention of the Rules for Materials](#).

4. 2. 9 To maintain an \*IWS notation, at completion of each dry-docking the condition of the high resistance paint is to be confirmed and, as applicable, satisfactory access arrangements to take the sternbush clearance and rudder pintle/bearing clearances are to be verified.

### **4. 3 In-Water Surveys**

4. 3. 1 The Committee will accept an In-Water Survey at alternate Bottom Surveys on ships other than those covered in [Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys 3.5.3](#) and where an \*IWS notation is assigned, *see* [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.11](#).
4. 3. 2 The Committee may accept an In-Water Survey at alternate Bottom Surveys on ships where suitable protection is applied to the underwater portion of the hull. If requested, an \*IWS notation may be assigned on satisfactory completion of the Survey, provided that the applicable requirements of ACS's Rules and Regulations are complied with, *see also* [Pt 1, Ch 2, 2.3 Class notations \(hull\) 2.3.11](#).
4. 3. 3 The In-Water Survey is to provide the information normally obtained from the Bottom Survey in dry-dock. However, for oil lubricated sternbush arrangements, the clearance in the sternbush is not required to be ascertained subject to the Surveyor confirming satisfactory operating history and condition data records (lubricating oil analysis, bearing temperature, lubricating oil consumption) and verifying satisfactory operation of the screwshaft.
4. 3. 4 When there is no access, special consideration shall be given to ascertaining rudder bearing clearances and sternbush clearances of water lubricated bearings based on a review of the operating history, on board testing and stern bearing condition data. These considerations are to be included in the proposals for In-Water Surveys which are to be submitted in advance of the survey being required, so that satisfactory arrangements can be agreed with ACS.
4. 3. 5 The In-Water Survey is to be carried out at an agreed geographical location under the surveillance of a Surveyor to ACS, with the ship at a suitable draught in sheltered waters and with weak tidal streams and currents. The in-water visibility and the cleanliness of the hull below the waterline is to be clear enough to permit a meaningful examination which allows the Surveyor and diver to determine the condition of the plating, appendages and the welding. The Surveyor is to be satisfied with the methods of orientation of the divers on the plating, which should make use where necessary of permanent markings on the plating at selected points.
4. 3. 6 Prior to commencing the In-Water Survey, the equipment and procedures for both observing and reporting the survey are to be agreed between the Owners, the Surveyor and the diving firm.
4. 3. 7 The In-Water Survey is to be carried out by a qualified diver employed by a firm approved by ACS. In addition, for certain aspects of the In-Water Survey, consideration may be given to the use of a Remotely Operated Vehicle (ROV) operated by the ACS approved firm.
4. 3. 8 The Surveyor is to be satisfied that the method of pictorial presentation is satisfactory. There is to be good two-way communication between the Surveyor and the diver.
4. 3. 9 If the In-Water Survey reveals damage or deterioration that requires early attention, the Surveyor may require that the ship be dry-docked in order that a fuller survey can be undertaken and the necessary work carried out.

CHAPTER **3 Periodical Survey Regulations**

SECTION **5 Special Survey - General - Hull requirements**

## 5.1 General

- 5.1.1 The survey is to be of sufficient extent to ensure that the hull and related piping are in satisfactory condition and are fit for the intended purpose for the new period of class of five years to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out as required by the Regulations.
- 5.1.2 The requirements of [Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements](#) are to be complied with as applicable for all ships.
- 5.1.3 Additional requirements for **general dry cargo ships** are given in this Section; **dry bulk cargo ships bulk carriers** in [Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements](#); **oil tankers** (including ore/oil ships and ore/bulk/oil ships) in [Pt 1, Ch 3, 7 Special Survey - Oil tankers \(including ore/oil ships and ore/bulk/oil ships\) - Hull requirements](#); **chemical tankers** in [Pt 1, Ch 3, 8 Special Survey - Chemical Tankers - Hull requirements](#); **ships for liquefied gases** in [Pt 1, Ch 3, 9 Ships for liquefied gases](#).
- 5.1.4 A Bottom Survey in accordance with the requirements of [Pt 1, Ch 3, 4 Bottom Surveys – In Dry-Dock and In-Water - Hull and machinery requirements](#) is to be carried out as part of the Special Survey.
- 5.1.5 During the Bottom Survey, for general dry cargo ships, oil tankers (including ore/oil ships and ore/bulk/oil ships), chemical tankers and bulk carriers, the overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo spaces and ballast tanks are to be carried out as required, if not already surveyed.
- 5.1.6 For ships assigned the notation ‘laid-up’, an Underwater Examination (UWE) and general examination of hull and machinery is to be carried out in lieu of the normal Special Survey requirements.
- 5.1.7 For roll on-roll off ships (i.e. those fitted with a loading ramp which enables wheeled vehicles to be rolled on and rolled off the ship), in addition to the requirements of this Section, the requirements of [Pt 1, Ch 3, 23 Bow, inner, side shell and stern doors on Ro-Ro ships](#) are to be complied with, as applicable.

## 5.2 Preparation

- 5.2.1 The ship is to be prepared for Overall Survey in accordance with the requirements of [Table 3.5.1: Survey preparation](#). The preparation should be of sufficient extent to facilitate an examination to ascertain any significant corrosion, deformation, fractures, damages and other structural deterioration.

**Table 3. 5. 1: Survey preparation**

| Special Survey<br>(Ships 5 years old) I   | Special Survey<br>(Ships 10 years old) II   | Special Survey<br>(Ships 15 years old) III   |
|---|---|--|
| Special Survey<br>(Ships 5 years old) I   | Special Survey<br>(Ships 10 years old) II   | Special Survey<br>(Ships 15 years old) III   |
| <p>(1) The holds, 'tween decks, peaks, deep tanks, engine and boiler spaces, and other spaces, are to be cleared and cleaned as necessary, and the bilges and limbers all fore and aft are to be cleaned and prepared for examination. Platform plates in engine and boiler spaces are to be lifted as may be necessary for the examination of the structure below. Where necessary, close and spar ceiling, lining and pipe casings are to be removed for examination of the structure</p> <p>(2) In ships having a single bottom, a sufficient amount of close ceiling is to be lifted all fore and aft on each side from the bottom and bilges to permit the structure below to be examined</p> <p>(3) In ships having a double bottom, a sufficient amount of ceiling is to be removed from the bilges and inner bottom to enable the condition of the plating to be ascertained. If it is found that the plating is clean and in good condition, and free from rust, the removal of the remainder of ceiling may be dispensed with. The Surveyor may waive the removal of heavy reinforced compositions if there is no evidence of leakages, cracking or other faults in the composition</p> | <p>In addition to the requirements for Special Survey I, the following are to be complied with:</p> <p>(1) A sufficient amount of ceiling in the holds and other spaces is to be removed from the bilges and inner bottom to enable the condition of the structure in the bilges, the inner bottom plating, pillar feet, and the bottom plating of bulkheads and tunnel sides to be examined. If the Surveyor deems it necessary, the whole of the ceiling is to be removed</p> <p>(2) In ships having a single bottom, the limber boards and ceiling equal to not less than three strakes, all fore and aft on each side are to be removed, one such strake being taken from the bilges. Where the ceiling is fitted in hatches, the whole of the hatches and at least one strake of ceiling in the bilges are to be removed. If the Surveyor deems it necessary the whole of the ceiling and limber boards are to be removed</p> <p>(3) The chain locker is to be cleaned internally. The chain cables are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection</p> | <p>In addition to the requirements for Special Survey II the following are to be complied with:</p> <p>(1) Ceiling in holds is to be removed in order to ascertain that the steelwork is in good condition, free from rust and coated. If the Surveyor is satisfied, after removal of portions of the ceiling then it need not all be removed</p> <p>(2) Portions of wood sheathing, or other covering, on steel decks are to be removed, as considered necessary by the Surveyor, in order to ascertain the condition of the plating</p> <p>All subsequent Special Surveys</p> <p>In addition to the requirements for Special Survey III the following are to be complied with:</p> |

|  |  |
|--|--|
| <p>(4) Casings, ceilings or linings and loose insulation, where fitted, are to be removed for examination of plating and framing, as required by the Surveyor. Compositions on plating are to be examined and sounded, but need not be disturbed if found to be adhering satisfactorily to the plating. Where structural defects are identified, any applied composition is to be locally removed to enable further examination of the plating and adjacent frames, as required by the Surveyor</p> <p>(5) The steelwork is to be exposed and cleaned and rust removed as may be required for its proper examination by the Surveyor</p> <p>(6) All tanks are to be cleaned as necessary to permit examination, where this is required by <a href="#">Table 3. 5. 2: Tank internal examination requirements</a></p> <p>(7) Casings or covers of air, sounding, steam and other pipes, spar ceiling and lining in way of the side scuttles are to be removed, as required by the Surveyor</p> <p>(8) The masts and the sail/wind propulsion system are to be unshipped for survey. The whole of the standing rigging, including rigging screws, bolts, pins and fittings, is to be fully or partly disassembled as considered necessary by the Surveyor.</p> <p>Note This requirement may be waived at alternate Special Surveys or when the construction does not allow disassembly, provided that the masts and rigging are thoroughly examined <i>in situ</i>.</p> | <p>(1) In refrigerated cargo spaces, sufficient insulation is to be removed in each of the chambers to enable the Surveyor to be satisfied as to the condition of the steel structure, and to enable the thickness of the structure to be ascertained as required by <a href="#">Pt 1, Ch 3, 5.6 Thickness measurement</a></p> |
| <p>Note 'unshipped' means removed from its fixed or regular position and laid down, providing access for Close-up Survey.</p> <p>'disassembled' means to dismantle and lay out all lines, tackles and other removable parts to the extent necessary to establish the condition of the rigging components.</p>  |  |

‘disassembled’ means to dismantle and lay out all lines, tackles and other removable parts to the extent necessary to establish the condition of the rigging components.

### 5.3 Examination and testing

- 5.3.1 All spaces within the hull and superstructure are to be examined unless specified otherwise by this Section.
- 5.3.2 At Special Survey III and subsequent special surveys, structural downflooding ducts and structural ventilation ducts are to be internally examined.
- 5.3.3 The requirements for tank internal examination are given in [Table 3. 5. 2: Tank internal examination requirements](#).

**Table 3. 5. 2: Tank internal examination requirements**

| Tank  |  | Special Survey I<br>(Ships 5 years old) | Special Survey II<br>(Ships 10 years old) | Special Survey III<br>(Ships 15 years old) | Special Survey IV and subsequent<br>(Ships 20 years old and over) |
|---|--|---|---|--|---|
| (1)   | Peaks  | All tanks                               | All tanks                                 | All tanks                                  | All tanks   |
| (2)   | Salt water ballast, <i>see</i> Note 5  | All tanks                               | All tanks                                 | All tanks                                  | All tanks   |
| (3)   | Lubricating oil  | None                                    | None                                      | None                                       | One tank  |
| (4)   | Fresh water  | None                                    | One tank                                  | All tanks                                  | All tanks   |
| (5)   | Fuel oil   |   |   |  |   |
|   | (i) In way of engine room  | None                                    | None                                      | One tank                                   | One tank  |
|   | (ii) In way of cargo area  | None                                    | One tank                                  | Two tanks, <i>see</i> Note 3               | 50% of tanks - <i>see</i> Notes 3 and 4.                          |
|   | (iii) If no tanks in cargo length area, additional fuel tank(s) outside of engine room (if fitted) | None                                    | One tank                                  | One tank                                   | Two tanks   |
| <p>Note 1. The above requirements apply to integral tanks only.</p> <p>Note 2. Where a selected number of tanks are examined, then different tanks are to be examined at each Special Survey on a rotational basis.</p> <p>Note 3. To include one deep tank, if any.</p> <p>Note 4. Where 50% of tanks are to be examined, a minimum of two tanks are required to be examined depending upon the overall number of tanks.</p> <p>Note 5. The requirements for Salt-water ballast tanks are applicable to Bilge water, Sewage and Grey water tanks</p> |  |   |   |  |   |

- 5.3.4 For **oil tankers** (including ore/oil and ore/bulk/oil ships) and **chemical tankers**, the condition of the corrosion prevention system, where provided, is to be examined in cargo tanks and salt-water ballast tanks. When considered necessary by the Surveyor, thickness measurements are to be carried out. The condition of the corrosion prevention system identified during the Survey may result in the salt-water ballast tanks being subject to further examination at Annual Surveys, in accordance with [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.30](#).
- 5.3.5 For those ships not listed in [Pt 1, Ch 3, 5.3 Examination and testing 5.3.4](#), the condition of the corrosion prevention system, where provided, in salt-water ballast tanks is to be examined. When

considered necessary by the Surveyor, thickness measurements are to be carried out. The condition of the corrosion prevention system identified during the Survey may result in the salt-water ballast tanks being subject to further examination at Annual Surveys, in accordance with [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.30](#). For double bottom ballast tanks, the examination at Annual Surveys will be at the discretion of the Surveyor.

- 5.3.6 Double bottom, deep, ballast, peak and other tanks, including cargo holds assigned also for the carriage of salt water ballast, are to be tested with a head of liquid to the top of air pipes or to near the top of hatches for ballast/cargo holds. Boundaries of fuel oil, lubricating oil and fresh water tanks are to be tested with a head of liquid to the highest point that liquid will rise to under service conditions. Tank testing of fuel oil, lubricating oil and fresh water tanks may be specially considered based upon a satisfactory external examination of the tank boundaries, and a confirmation from the Master stating that the pressure testing has been carried out according to the requirements with satisfactory results. Surveyors may extend the testing as deemed necessary. For **oil tankers** (including ore/oil and ore/bulk/oil ships) and **chemical tankers**, the minimum requirements for cargo tank testing are to be in accordance with Sections [Pt 1, Ch 3, 7.5 Testing](#) and [Pt 1, Ch 3, 8.5 Testing](#), as applicable.
- 5.3.7 Where repairs are effected to the shell plating or bulkheads, any tanks in way are to be tested to the Surveyor's satisfaction on completion of these repairs.
- 5.3.8 On ship-borne barges, in lieu of water testing, tanks and cofferdams may be air tested.
- 5.3.9 In cases where the inner surface of the bottom plating is covered with cement, asphalt, or other composition, the removal of this covering may be dispensed with, provided that it is inspected, tested by beating or chipping, and found sound and adhering satisfactorily to the steel.
- 5.3.10 All decks, casings and superstructures are to be examined.
- 5.3.11 Wood decks or sheathing are to be examined. If decay or rot is found or the wood is excessively worn, the wood is to be renewed. When a wood deck, laid on stringers and ties, has worn by 15 mm or more, it is to be renewed. Attention is to be given to the condition of the plating under wood decks, sheathing or other deck covering. If it is found that such coverings are broken, or are not adhering closely to the plating, sections are to be removed as necessary to ascertain the condition of the plating, *see also* [Pt 1, Ch 3, 1.2 Surveys for damage or alterations 1.2.1](#).
- 5.3.12 Mechanically-operated hatch covers are to be tested to confirm satisfactory operation including stowage; and securing in open condition; proper fit and efficiency of sealing in closed conditions; operational testing of hydraulic and power components, wires, chains and link drives. The effectiveness of sealing arrangements of all hatch covers is to be checked by carrying out hose testing or equivalent.
- 5.3.13 Rigs used for propulsion using wind force, associated structure and equipment, where fitted, are to be examined, *see* [Table 3. 5. 1: Survey preparation](#). The examination may be undertaken by a Surveyor and/or by a firm approved by ACS.
- 5.3.14 The masts and standing rigging are to be examined.
- 5.3.15 The anchors are to be examined. If the chain cables are ranged they are to be examined. If any length of chain cable is found to be reduced in mean diameter at its most worn part by 12 per cent or more from its nominal diameter, it is to be renewed. The windlass is to be examined. For equipment forming part of a positional mooring system, *see* [Pt 1, Ch 3, 5.3 Examination and testing 5.3.18](#).
- 5.3.16 The chain cables are to be ranged and examined on all ships over five years old.
- 5.3.17 The Surveyor is to be satisfied that there are suitable mooring ropes when these are a Rule requirement.
- 5.3.18 On ships fitted with positional mooring equipment in accordance with [Pt 7, Ch 8 Positional Mooring and Thruster-Assisted Positional Mooring Systems](#), or wire rope anchor cables in accordance with [Pt 3, Ch 13, 7 Equipment](#), the anchors are to be cleaned and examined. Wire rope

anchor cables are to be examined. If cables are found to contain broken, badly corroded or birdcaging wires they are to be renewed. Chain cables are to be ranged and examined. If any length of chain cable is found to be reduced in mean diameter at its most worn part by 12 per cent or more from its nominal diameter it is to be renewed. The windlass(es) or winches are to be examined.

- 5.3.19 The hand pumps, suction, watertight doors, air and sounding pipes are to be examined. In addition, the Surveyor is to internally and externally examine air pipe heads in accordance with the requirements of [Table 3.5.7: Air pipe head internal examination requirements \(applicable for automatic air pipe heads installed on exposed decks of all ships except passenger ships\)](#).
- 5.3.20 The Surveyor is to be satisfied as to the efficient condition of the following:
  - a. For ships to which [Pt 6, Ch 4 Fire Protection, Detection and Extinction Requirements](#) applies, means of escape from crew and passenger spaces, and spaces in which crew are normally employed.
  - b. Helm indicator, protection of aft steering wheel and gear.
- 5.3.21 Where the special features notation **CCSA** (certified container securing arrangements) is assigned, the Surveyor is to be satisfied as to the efficient condition of:
  - a. Cell guide structure including the connections between vertical cell guides and cross ties.
  - b. Cell guide entry devices.
  - c. Portable frameworks or other forms of structural restraints.
  - d. Fittings attached to the ship structure, with special attention to any signs of leakage in way of tanks or deck and shell plating.
  - e. End connecting pieces for lashings, twist locks and other loose fittings, which are to be examined and verified with the Register, *see* [Pt 3, Ch 14, 10 Surveys](#).
  - f. Lashings, rods, wire ropes, and chains together with turn buckles and other tightening devices are to be examined and verified with the Register as far as necessary and practicable in order to be satisfied as to their general condition, *see* [Pt 3, Ch 14, 10 Surveys](#).
  - g. Lashing wire ropes, which are to be renewed where more than five per cent of the wires are broken, worn or corroded in any length of 10 diameters of the wire rope.
  - h. Chains, which are to be renewed where worn or damaged.

Where renewals are required, the new item is to be of approved type and manufacture. Where test certificates are not available, the item is to be tested in accordance with [Pt 3, Ch 14, 3 Loose container securing fittings, materials and testing](#).
- 5.3.22 It is the responsibility of the onboard personnel to examine, maintain or renew cargo securing devices and maintain the appropriate certification. Records of inspections, maintenance and renewals, as well as the procedures for accepting, maintaining and repairing or rejecting cargo securing devices are to be kept onboard and made available to the attending Surveyor on request.
- 5.3.23 All bilge and ballast piping systems are to be examined and operationally tested to working pressure, to the satisfaction of the Surveyor, to ensure that tightness and condition remain satisfactory.
- 5.3.24 Ship side valves (i.e. sea connections, scuppers and sanitary discharges) are to be tested once reassembled.
- 5.3.25 For engine room and machinery space fire dampers the following is applicable:
  - a. At Special Survey I, Surveyors are to select and internally examine one engine room fire damper and one machinery space fire damper. Where considered necessary by the Surveyor as a result of the examinations, the extent of examinations may be extended to include other fire dampers.
  - b. At each subsequent Special Survey, all engine room and machinery space fire dampers are to be internally examined by the Surveyor.

Note The examination of fire dampers may be specially considered by the Surveyor where there is satisfactory documented evidence of their replacement within the previous five years.

5. 3. 26 In refrigerated cargo spaces, the condition of the coating and structure behind the insulation is to be examined at representative locations. Surveyors may limit the examination to the verification that the protective coating remains effective and that there are no visible structural defects. Where POOR coating condition is found, or structural defects are identified, then sufficient insulation is to be removed in each of the chambers in order to assess the condition of the remaining structure, as deemed necessary by the Surveyor. Additionally, where indents, scratches or other defects are identified during the survey of the shell plating from the outside, insulations in way are to be removed to enable further examination of the plating and adjacent frames, as required by the Surveyor.

## 5. 4 Overall Survey

5. 4. 1 The following requirements are applicable to **general dry cargo ships**.
5. 4. 2 All cargo holds, salt-water ballast tanks including double bottom tanks, pipe tunnels, cofferdams and void spaces bounding cargo holds, decks and outer hull are to be examined, and this is to be supplemented by Close-up Survey, thickness measurement and testing as deemed necessary, to ensure that the structural integrity remains effective.
5. 4. 3 The examination is to be sufficient to ascertain substantial corrosion, significant deformation, fractures, damages or other structural deterioration and, if deemed necessary by the Surveyor, suitable non-destructive examination may be required.
5. 4. 4 All piping systems within the tanks and spaces indicated in [Pt 1, Ch 3, 5.4 Overall Survey 5.4.2](#) are to be examined and operationally tested to working pressure to the satisfaction of the Surveyor, to ensure that conditions remain satisfactory.
5. 4. 5 Where the salt-water ballast tanks have been converted to void spaces, the survey extent is to be specially considered based upon salt-water ballast tank requirements.
5. 4. 6 For single hold general dry cargo ships, other than bulk carriers, fitted with water level detectors in the cargo hold, an examination and a test of the water ingress detection system and alarms are to be carried out.

## 5. 5 Close-up Survey

5. 5. 1 The following requirements are applicable to **general dry cargo ships**.
5. 5. 2 The minimum requirements for Close-up Survey are given in [Table 3. 5. 4: Minimum requirements for Close-up Survey - General dry cargo ships](#). The Close-up Survey may be extended, as deemed necessary by the Surveyor, after taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.
5. 5. 3 For areas in tanks and cargo holds where coatings are found to be in GOOD condition, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), the extent of Close-up Surveys may be specially considered.

## 5. 6 Thickness measurement

5. 6. 1 The general minimum requirements for thickness measurement are given in [Table 3. 5. 3: Minimum requirements for thickness measurements - General](#). For **general dry cargo ships**, the minimum requirements for thickness measurement are given in [Table 3. 5. 5: Minimum requirements for Thickness measurement - General dry cargo ships](#). The Surveyor may extend the thickness measurements as deemed necessary.

**Table 3. 5. 3: Minimum requirements for thickness measurements - General**

| Special Survey<br>(Ships 5 years old)   | I Special Survey<br>(Ships 15 years old)  | III Special Survey IV and subsequent<br>(Ships 20 years old and over)   |
|---|---|---|
| (1) Suspect areas, as required by the Surveyor. <i>See</i> Note 8.  | (1) Within 0.5 <i>L</i> amidships; 2 transverse sections in way of two different cargo spaces. <i>See</i> Notes 2, 4(a), 5 and 7. | (1) Within 0.5 <i>L</i> amidships; a minimum of 3 transverse sections in way of cargo spaces. <i>see</i> Notes 2, 4(b) and 7.                             |
| <b>Special Survey<br/>(Ships 10 years old)</b>  | <b>II</b>   |   |
| (1) Within 0.5 <i>L</i> amidships; 1 transverse section of deck plating in way of a cargo space, <i>See</i> Notes 2 and 7.  | (2) All cargo hold hatch covers and coamings (plating and stiffeners). <i>See</i> Note 9.   | (2) All cargo hold hatch covers and coamings (plating and stiffeners). <i>See</i> Note 9.   |
| (2) Suspect areas, as required by the Surveyor. <i>See</i> Note 8.  | (3) Internals and the transverse bulkhead complete in the fore peak ballast tank and aft peak ballast tank. <i>See</i> Note 6.    | (3) All exposed main deck plating over full length of ship.   |
|   | (4) Suspect areas, as required by the Surveyor. <i>See</i> Note 8.  | (4) All wind and water strakes over the full length of the ship, port and starboard.  |
|   |   | (5) Representative exposed superstructure deck plating (i.e. poop, bridge and forecastle deck).   |
|   |   | (6) Lowest strake and strakes in way of 'tween deck of all transverse bulkheads in cargo spaces together with internals in way. <i>See</i> Notes 6 and 7. |
|   |   | (7) Internals and the transverse bulkhead complete in the fore peak ballast tank and aft peak ballast tank. <i>See</i> Note 6.                            |
|   |   | (8) All keel plates over the full length of the ship. Also additional bottom plates in way of cofferdams, machinery space and aft end of tanks.           |
|   |   | (9) Plating of sea chests. Also side shell plating in way of overboard discharges, as considered necessary by the Surveyor.                               |
|   |   | (10) Suspect areas, as required by the Surveyor. <i>See</i> Note 8.   |
| <p>Note 1. Thickness measurement locations are to be selected to provide the best representative sampling of areas likely to be most exposed to corrosion, considering cargo and ballast history and arrangement, and condition of protective coatings.</p> <p>Note 2. A transverse section is to include all longitudinal members such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom, hopper side and longitudinal bulkheads, where fitted. For transversely framed vessels, a transverse section includes adjacent frames and their end connections in way of transverse sections.</p> |   |   |

Note 3. Where the protective coating is in GOOD condition, then the extent of thickness measurements of internals may be specially considered, but not dispensed with in its entirety, at the discretion of the Surveyor.

4. For ships having length  $L$  less than 100 m:

the number of transverse sections required at Special Survey III may be reduced to one;

the number of transverse sections required at Special Survey IV and subsequent surveys may be reduced to two.

Note 5. For ships having length  $L$  more than 100m, at Special Survey III, thickness measurements of exposed deck plating within  $0.5L$  amidships may be required.

Note 6. Transverse bulkhead complete including stiffening system.

Note 7. For vessels without defined cargo spaces, thickness measurements are to be taken at the appropriate, most onerous locations selected to provide the best representative sampling of areas likely to be exposed to corrosion the most.

Note 8. Suspect Areas are locations showing substantial corrosion and/or are considered by the Surveyor to be prone to rapid wastage.

Note 9. Subject to cargo hold hatch covers of approved design which structurally have no access to the internals close-up survey/thickness measurement shall be done of accessible parts of hatch cover structures.

**Table 3. 5. 4: Minimum requirements for Close-up Survey - General dry cargo ships**

| Special Survey I<br>(Ships 5 years old)  | Special Survey II<br>(Ships 10 years old)  | Special Survey III<br>(Ships 15 years old)  | Special Survey IV and subsequent<br>(Ships 20 years old and over)   |
|--|--|---|---|
| (1) Selected shell frames in one forward and one aft cargo hold and associated 'tween deck spaces. | (1) Selected shell frames in all cargo holds and 'tween deck spaces.                           | (1) All shell frames in the forward lower cargo hold and 25% of shell frames in each remaining cargo hold and 'tween deck spaces, including their upper and lower end attachments and adjacent shell plating. | (1) All shell frames in all cargo holds and 'tween deck spaces, including their upper and lower end attachments and adjacent shell plating. |
| (2) One selected cargo hold transverse bulkhead.   | (2) One transverse bulkhead in each cargo hold, including stiffening system.                   | (2) All cargo hold transverse bulkheads, including stiffening system.   | (2) All cargo hold transverse bulkheads, including stiffening system.   |
| (3) All cargo hold hatch covers and coamings (plating and stiffeners). <i>See</i> Note 2.          | (3) Forward and aft transverse bulkhead in one side ballast tank, including stiffening system. | (3) All transverse bulkheads in ballast tanks, including stiffening system.   | (3) All transverse bulkheads in ballast tanks, including stiffening system.   |

|--|---|---|---|
|  | <p>(4) One transverse web with associated plating and framing in two representative water ballast tanks of each type (i.e. topside, hopper side, side tank, peak tank or double bottom tank).</p> <p>(5) All cargo hold hatch covers and coamings (plating and stiffeners). <i>See</i> Note 2.</p> <p>(6) Selected areas of all deck plating and underdeck structure inside the line of hatch openings between cargo hold hatches.</p> <p>(7) Selected areas of inner bottom plating.</p> | <p>(4) All transverse webs with associated plating and framing in each water ballast tank.</p> <p>(5) All cargo hold hatch covers and coamings (plating and stiffeners). <i>See</i> Note 2.</p> <p>(6) All deck plating and underdeck structure and inside the line of hatch openings between cargo hold hatches.</p> <p>(7) All areas of inner bottom plating.</p> | <p>(4) All transverse webs with associated plating and framing in each water ballast tank.</p> <p>(5) All cargo hold hatch covers and coamings (plating and stiffeners). <i>See</i> Note 2.</p> <p>(6) All deck plating and underdeck structure inside the line of hatch openings between cargo hold hatches.</p> <p>(7) All areas of inner bottom plating.</p> |
|--|---|---|---|

Note 1. Close-up survey of cargo hold transverse bulkheads to be carried out at the following areas:

- Immediately above the inner bottom and immediately above the 'tween decks, as applicable.
- Mid-height of the bulkhead for the holds without 'tween decks.
- Immediately below the main deck plating and 'tween deck plating.

Note 2. Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey/thickness measurement shall be done of accessible parts of hatch covers structures.

**Table 3. 5. 5: Minimum requirements for Thickness measurement - General dry cargo ships**

| <p>(1) Suspect areas, as required by the Surveyor. <i>See</i> Note 3.</p>   | <p>(1) Within 0.5 <math>L</math> amidships; 2 transverse sections in way of two different cargo spaces. <i>See</i> Notes 2, and 4(a).</p>   | <p>(1) Within the cargo length area:</p> <p>(i) A minimum of three transverse sections within the amidships 0.5 <math>L</math>. <i>See</i> Notes 2 &amp; 4(b).</p> <p>(ii) Each deck plate outside the line of cargo hatch openings. <i>See</i> Note 6.</p> <p>(iii) Each bottom plate, including lower turn of bilge.</p> <p>(iv) Duct keel or pipe tunnel plating and internals.</p> |
| <p><b>Special Survey II</b><br/>(Ships 10 years old)</p>  | <p>(2) Measurements for the general assessment and recording of corrosion pattern of those structural members subject to Close-up Survey in accordance with <a href="#">Table 3. 5. 4: Minimum requirements for Close-up Survey - General dry cargo ships</a></p> | <p>(2) Measurements for the general assessment and recording of corrosion pattern of those structural members subject to Close-up Survey in accordance with <a href="#">Table 3. 5. 4: Minimum requirements for Close-up Survey - General dry cargo ships</a>.</p>   |
| <p>(1) Within 0.5<math>L</math> amidships; 1 transverse section of deck plating in way of a cargo space. <i>See</i> Note 2.</p>   | <p>(3) Within the cargo length area; each deck plate outside line of cargo hatch openings. <i>See</i> Note 6.</p>   | <p>(3) All wind and water strakes over the full length of the ship, port and starboard.</p>  |
| <p>(2) Measurements for the general assessment and recording of corrosion pattern of those structural members subject to Close-up Survey in accordance with <a href="#">Table 3. 5. 4: Minimum requirements for Close-up Survey - General dry cargo ships</a></p> | <p>(4) All wind and water strakes within cargo length area.</p> <p>(5) Selected wind and water strakes outside the cargo length area.</p>   | <p>(4) Remaining exposed main deck plates not considered in item (3) and representative exposed superstructure deck plating (i.e. poop, bridge and forecastle deck).</p> <p>(5) Lowest strake and strakes in way of 'tween deck of all transverse bulkheads in cargo spaces together with internals in way.</p>  |

|  |  |  |
|--|--|--|
| (3) Suspect areas, as required by the Surveyor. <i>See</i> Note 3.   | (6) Suspect areas, as required by the Surveyor. <i>See</i> Note 3. | (6) All keel plates over the full length of the ship. Also additional bottom plates in way of cofferdams, machinery spaces and aft end of tanks.<br><br>(7) Plating of sea chests. Also side shell plating in way of overboard discharges, as considered necessary by the Surveyor.<br><br>(8) Suspect areas, as required by the Surveyor. <i>See</i> Note 3 |
| <p>Note 1. Thickness measurement locations are to be selected to provide the best representative sampling of areas likely to be most exposed to corrosion, considering cargo and ballast history and arrangement, and condition of protective coatings.</p> <p>Note 2. A transverse section is to include all longitudinal members such as plating, longitudinals and girders at deck, sides, bottom, inner bottom and hopper side plating, longitudinal bulkheads and bottom plating in top wing tanks, where fitted. For transversely framed vessels, a transverse section includes adjacent frames and their end connections in way of transverse sections.</p> <p>Note 3. Suspect areas are locations showing substantial corrosion and/or are considered by the Surveyor to be prone to rapid wastage.</p> <p>4. For ships having length <i>L</i> less than 100 m:</p> <ol style="list-style-type: none"> <li>the number of transverse sections required at Special Survey III may be reduced to one.</li> <li>the number of transverse sections required at Special Survey IV and subsequent surveys may be reduced to two.</li> </ol> <p>Note 5. For areas in spaces (Cargo Holds and Water Ballast Tanks) where coatings are found to be in GOOD condition, as defined in <a href="#">Pt 1, Ch 3, 1.5 Definitions 1.5.26</a>, the extent of thickness measurement may be specially considered, but not dispensed with in its entirety.</p> <p>Note 6. Deck plating outside line of cargo hatch openings is deck plating between the ship sides and hatch coamings in the transverse section concerned.</p> |  |  |

5. 6. 2 Thickness measurements may be carried out in association with the fourth Annual Survey.
5. 6. 3 In areas where substantial corrosion, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), has been noted, then additional measurements are to be carried out, as applicable, in accordance with [Table 3. 5. 6: Thickness measurement - Additional requirements in way of structure identified with substantial corrosion](#) to determine the full extent of the corrosion pattern. The survey will not be considered complete until these additional thickness measurements have been carried out.

**Table 3. 5. 6: Thickness measurement - Additional requirements in way of structure identified with substantial corrosion**

| Structural member | Extent of measurement             | Pattern of measurement                            |
|-------------------|-----------------------------------|---|
| Plating           | Suspect areas and adjacent plates | 5 point pattern over 1m <sup>2</sup>              |
| Stiffeners        | Suspect areas                     | 3 measurements each in line across web and flange |

**Table 3. 5. 7: Air pipe head internal examination requirements (applicable for automatic air pipe heads installed on exposed decks of all ships except passenger ships)**

| Special Survey I<br>(Ships 5 years old)   |   | Special Survey II<br>(Ships 10 years old) |  | Special Survey III<br>(Ships 15 years old) and<br>subsequent |
|---|---|---|--|--|
| (1)   | Two air pipe heads (one port and one starboard) on exposed decks in the forward 0.25 <i>L</i> . <i>See</i> Notes 1 to 5             | (1)                                       | All air pipe heads on exposed decks in the forward 0.25 <i>L</i> . <i>See</i> Notes 1 to 5                     | All air pipe heads on exposed decks. <i>See</i> Notes 1 to 6 |
| (2)   | Two air pipe heads (one port and one starboard) on the exposed decks, serving spaces aft of 0.25 <i>L</i> . <i>See</i> Notes 1 to 5 | (2)                                       | At least 20% of air pipe heads on exposed decks, serving spaces aft of 0.25 <i>L</i> . <i>See</i> Notes 1 to 5 |  |
| <p>Note 1. Air pipe heads serving ballast tanks are to be selected where available.</p> <p>Note 2. The Surveyor is to select which air pipe heads are to be examined.</p> <p>Note 3. Where considered necessary by the Surveyor as a result of the examinations, the extent of examinations may be extended to include other air pipe heads on exposed decks.</p> <p>Note 4. Where the inner parts of air pipe head cannot be properly examined due to its design, it is to be removed in order to allow an internal examination.</p> <p>Note 5. Particular attention is to be given to the condition of the zinc coating in heads constructed from galvanised steel.</p> <p>Note 6. Exemption may be considered for air pipe heads where there is documented evidence of their replacement within the previous five years.</p> |   |   |  |  |

5. 6. 4 Where substantial corrosion is identified and not rectified, this will be subject to examination and thickness measurement at Annual and Intermediate Surveys.
5. 6. 5 Where considered necessary by the Surveyor, thickness measurements are to be carried out in way of critical areas. These include areas considered prone to rapid wastage.
5. 6. 6 Where required by ACS, a check of the buckling capacity of the upper deck is to be carried out for tankers having a length greater than 90 m.
5. 6. 7 Steel evaluation of hatch covers on exposed decks and hatch coamings and closing arrangements of cargo holds on ships with contract for construction on or after 1 July 2012 is to be in accordance with IACS UR S21A. Further information is provided in the ACS document *Thickness Measurement and Close-Up Survey Guidance*.

Steel renewal is required where the gauged thickness is less than  $t_{net} + 0.5$  mm. For definition of  $t_{net}$ , see [Pt 4, Ch 7, 12.1 General 12.1.2](#).

Where the gauged thickness is within the range  $t_{net} + 0.5$  mm and  $t_{net} + 1.0$  mm, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal.

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **6 Special Survey - Bulk carriers - Hull requirements**

## **6. 1 General**

- 6. 1. 1 The requirements of [Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements](#), [Pt 1, Ch 3, 4 Bottom Surveys – In Dry-Dock and In-Water - Hull and machinery requirements](#) and [Pt 1, Ch 3, 5 Special Survey - General - Hull requirements](#) are to be complied with as applicable.
- 6. 1. 2 In order to maintain and/or assign the **ESP** notation, the following requirements apply to the surveys of the hull structure and piping systems in way of the cargo holds, cofferdam, pipe tunnels, void spaces, topside tanks and double bottom tanks in way of the cargo hold area and all salt-water ballast tanks.

## **6. 2 Review of documentation on board**

- 6. 2. 1 Prior to survey, the Surveyor is to examine the completeness of the documentation onboard as detailed in [Pt 1, Ch 3, 1.10 Documentation](#), and its contents as a basis for the survey.
- 6. 2. 2 For CSR bulk carriers subject to *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations Part A-1 - Structure of ships Regulation 3-10 – Goal-based ship construction standards for bulk carriers and oil tankers*, the Surveyor is to examine the information held in the Goal Based Standard (GBS) Ship Construction File (SCF) stored on board the ship. On completion of the survey, in the case of any major event, including, but not limited to, substantial repair, conversion or any modification to the ship structure, the Surveyor is to verify that the information stored on board of the ship has been updated, and is to verify any addition and/or renewal of materials used for the construction of the hull structure are documented within the GBS SCF list of materials.
- 6. 2. 3 For CSR bulk carriers subject to *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations Part A-1 - Structure of ships Regulation 3-10 – Goal-based ship construction standards for bulk carriers and oil tankers*, for the GBS SCF Supplement Ashore, the Surveyor is to verify the information stored in the Archive Centre by examining the list of information included in the Supplement Ashore. In addition, the Surveyor is to confirm that the service contract with the Archive Centre remains valid. In the case of any major event, including, but not limited to, substantial repair, conversion or modification to the ship's structure, the Surveyor is to verify that the information stored in the Archive Centre has been updated by examining the list of updated information included in the Supplement Ashore.

## **6. 3 Planning for survey**

- 6. 3. 1 A Survey Programme is to be submitted by the Owner and is to include the proposals for survey, including the means of providing access for Close-up Survey, thickness measurement and tank

testing and should take account of the information detailed in [Pt 1, Ch 3, 6.2 Review of documentation on board 6.2.1](#).

- 6.3.2 Prior to the development of the Survey Programme, a Survey Planning Questionnaire is to be completed and submitted by the Owner, see [Pt 1, Ch 3, 1.6 Preparation for survey and means of access 1.6.16](#).

## 6.4 Overall survey

- 6.4.1 All cargo holds, salt-water ballast tanks including double bottom tanks, pipe tunnels, cofferdams and void spaces bounding cargo holds, decks and outer hull are to be examined, and this examination is to be supplemented by Close-up Survey, thickness measurement and testing as applicable, to ensure that the structural integrity remains effective.
- 6.4.2 The examination is to be sufficient to ascertain substantial corrosion, significant deformation, fractures, damages or other structural deterioration and, if deemed necessary by the Surveyor, suitable non-destructive examination may be required.
- 6.4.3 Where substantial corrosion, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), is identified and is not rectified, this will be subject to re-examination at Annual and Intermediate Surveys.
- 6.4.4 All piping systems within the tanks and spaces indicated in [Pt 1, Ch 3, 6.4 Overall survey 6.4.1](#) are to be examined and tested under working conditions to ensure that the conditions remain satisfactory.
- 6.4.5 The extent of survey of combined salt-water ballast cargo holds is to be evaluated based on the records of ballast history, the extent and condition of the corrosion protection system provided, and the extent of structural diminution (corrosion).
- 6.4.6 Where salt-water ballast tanks have been converted to void spaces the survey extent is to be based upon salt-water ballast tank requirements.
- 6.4.7 Where provided, in association with a corrosion control CC special features notation, as defined in the *Register Book*, the condition of the protective coating or corrosion prevention system of cargo holds is to be examined.
- 6.4.8 For ships fitted with water level detectors in cargo holds, ballast tanks forward of the collision bulkhead and any dry or void space which extends forward of the foremost cargo hold, an examination and a test of the water ingress detection systems and of their alarms is to be carried out.
- 6.4.9 For ships fitted with a means for draining and pumping ballast tanks forward of the collision bulkhead and the bilges of dry spaces, any part of which extends forward of the foremost cargo hold, an examination and a test of the draining and pumping systems including their controls is to be carried out.

## 6.5 Testing

- 6.5.1 The minimum requirements for tank testing, as applicable, are given in [Pt 1, Ch 3, 5.3 Examination and testing 5.3.6](#). Where required, the Surveyor may extend the tank testing if deemed necessary.

## 6.6 Close-up Survey

- 6.6.1 The minimum requirements for Close-up Survey are given in [Table 3. 6. 1: Minimum requirements for Close-up Survey - Single skin bulk carriers](#), [Table 3. 6. 2: Minimum requirements for Close-up Survey - Double skin bulk carriers \(excluding ore carriers\)](#) and [Table 3. 6. 3: Minimum requirements for Close-up Survey - Ore carriers](#) as applicable.

6. 6. 2 The Close-up Survey may be extended, as deemed necessary by the Surveyor, after taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.
6. 6. 3 For areas in tanks and cargo holds where coatings are found to be in GOOD condition, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), the extent of Close-up Surveys may be specially considered.

**Table 3. 6. 1: Minimum requirements for Close-up Survey - Single skin bulk carriers**

| Special Survey I<br>(Ships 5 years old)   | Special Survey II<br>(Ships 10 years old)  | Special Survey III<br>(Ships 15 years old)   | Special Survey IV<br>(Ships 20 years old and over)  |
|---|--|--|---|
| <p>(1) 25% of shell frames and their end attachments in the forward cargo hold at representative positions.</p> <p>(2) Selected shell frames and their end attachments in remaining cargo holds.</p> <p>(3) 1 transverse web with associated plating and longitudinals in 2 representative water ballast tanks of each type (i.e. topside, peak, double bottom and hopper side tank).</p> <p>(4) 2 selected cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted. This is to include the aft bulkhead of the forward hold. <i>See Note 1.</i></p> <p>(5) All cargo hold hatch covers and coamings (plating and stiffeners). <i>See Note 2.</i></p> | <p>(1a) For bulk carriers with a deadweight less than 100,000 tonnes, all shell frames in the forward cargo hold and 25% of frames in each of the remaining cargo holds, including their upper and lower end attachments and adjacent shell plating.</p> <p>(1b) For bulk carriers with a deadweight equal to or greater than 100,000 tonnes, all shell frames in the forward cargo hold and 50% of frames in each of the remaining cargo holds, including their upper and lower end attachments and adjacent shell plating.</p> <p>(2) 1 transverse web with associated plating and longitudinals in each water ballast tank.</p> <p>(3) Forward and aft transverse bulkhead in 1 side ballast tank, including stiffening system.</p> <p>(4) All cargo hold transverse bulkheads including internal structure of upper and lower stools, where fitted. <i>See Note 1.</i></p> <p>(5) All cargo hold hatch covers and coamings, (plating and stiffeners). <i>See Note 2.</i></p> <p>(6) All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches.</p> | <p>(1) All shell frames in the forward and one other selected cargo hold and 50% of frames in each of the remaining cargo holds, including their upper and lower end attachments and adjacent shell plating.</p> <p>(2) All transverse webs with associated plating and longitudinals in each water ballast tank.</p> <p>(3) All transverse bulkheads in ballast tanks, including stiffening system.</p> <p>(4) All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted. <i>See Note 1.</i></p> <p>(5) All cargo hold hatch covers and coamings (plating and stiffeners). <i>See Note 2.</i></p> <p>(6) All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches.</p> | <p>(1) All shell frames in all cargo holds, including their end attachments and adjacent shell plating.</p> <p>(2) All transverse webs with associated plating and longitudinals in each water ballast tank.</p> <p>(3) All transverse bulkheads in ballast tanks, including stiffening system.</p> <p>(4) All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted. <i>See Note 1.</i></p> <p>(5) All cargo hold hatch covers and coamings (plating and stiffeners). <i>See Note 2.</i></p> <p>(6) All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches.</p> |

Note 1. Close-up Survey of transverse bulkheads to be carried out at four levels:

- Level (a) Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.
- Level (b) Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools), and immediately above the line of the shedder plates.
- Level (c) About mid-height of the bulkhead.
- Level (d) Immediately below the upper deck plating and immediately adjacent to the upper wing tank and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.

Note 2. Subject to cargo hold hatch covers of approved design (which structurally have no access to the internals), close-up survey/thickness measurement shall be done of accessible parts of hatch covers structures.

**Table 3. 6. 2: Minimum requirements for Close-up Survey - Double skin bulk carriers (excluding ore carriers)**

| Special Survey I<br>(Ships 5 years old)  | Special Survey II<br>(Ships 10 years old)  | Special Survey III<br>(Ships 15 years old)   | Special Survey IV<br>(Ships 20 years old and over)   |
|--|--|--|--|
| <p>(1) 1 transverse web with associated plating and longitudinals in 2 representative water ballast tanks of each type. This is to include the foremost topside and double side tanks; peak tanks and double bottom tanks.</p> <p>(2) 2 selected cargo hold transverse bulkheads including internal structure of upper and lower stools, where fitted. <i>See</i> Note 1.</p> <p>(3) All cargo hold hatch covers and coamings (plating and stiffeners). <i>See</i> Note 2.</p> | <p>(1) 1 transverse web with associated plating and longitudinals in each water ballast tank.</p> <p>(2) Forward and aft transverse bulkheads, including stiffening system, in one complete double side ballast tank on one side of the ship (i.e. port or starboard), <i>see</i> Note 3.</p> <p>(3) 25% of ordinary transverse frames for transverse framing system or 25% of longitudinals for longitudinal framing system on side shell and inner side plating at forward, middle and aft parts, in the foremost double side tanks.</p> <p>(4) One transverse bulkhead in each cargo hold including internal structure of upper and lower stools, where fitted. <i>See</i> Note 1.</p> <p>(5) All cargo hold hatch covers and coamings (plating and stiffeners). <i>See</i> Note 2.</p> <p>(6) All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches.</p> | <p>(1) All transverse webs with associated plating and longitudinals in each water ballast tank.</p> <p>(2) All transverse bulkheads in ballast tanks, including stiffening system.</p> <p>(3) 25% of ordinary transverse frames for transverse framing system or 25% of longitudinals for longitudinal framing system on side shell and inner side plating at forward, middle and aft parts, in all double side tanks.</p> <p>(4) All cargo hold transverse bulkheads including internal structure of upper and lower stools, where fitted. <i>See</i> Note 1.</p> <p>(5) All cargo hold hatch covers and coamings (plating and stiffeners). <i>See</i> Note 2.</p> <p>(6) All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches.</p> | <p>(1) All transverse webs with associated plating and longitudinals in each water ballast tank.</p> <p>(2) All transverse bulkheads in ballast tanks, including stiffening system.</p> <p>(3) All ordinary transverse frames for transverse framing system or all longitudinals for longitudinal framing system on side shell and inner side plating at forward, middle and aft parts, in all double side tanks.</p> <p>(4) All cargo hold transverse bulkheads including internal structure of upper and lower stools, where fitted. <i>See</i> Note 1.</p> <p>(5) All cargo hold hatch covers and coamings (plating and stiffeners). <i>See</i> Note 2.</p> <p>(6) All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches.</p> |

Note 1. Close-up survey of transverse bulkheads to be carried out at four levels:

- Level (a) Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.
- Level (b) Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools), and immediately above the line of the shedder plates.
- Level (c) About mid-height of the bulkhead.
- Level (d) Immediately below the upper deck plating and immediately adjacent to the upper wing tank and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.

Note 2. Subject to cargo hold hatch covers of approved design (which structurally have no access to the internals), close-up survey/thickness measurement shall be done of accessible parts of hatch covers structures.

Note 3. Complete ballast tank means topside tank, hopper tank, double bottom tank and double side tank, even if these are separate.

Note 1. Close-up Survey of transverse bulkheads to be carried out at four levels:

- Level (a) Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.
- Level (b) Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools), and immediately above the line of the shedder plates.
- Level (c) About mid-height of the bulkhead.
- Level (d) Immediately below the upper deck plating and immediately adjacent to the upper wing tank and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.

Note 2. Subject to cargo hold hatch covers of approved design (which structurally have no access to the internals), close-up survey/thickness measurement shall be done of accessible parts of hatch covers structures.

## 6. 7 Thickness measurement

6. 7. 1 The minimum requirements for thickness measurements are given in [Table 3. 6. 4: Minimum requirements for thickness measurement - Single skin and double skin bulk carriers](#), see also [Pt 1, Ch 3, 5.6 Thickness measurement](#). For ships built in accordance with the IACS Common Structural Rules (CSR), refer to the ACS document *Thickness Measurement and Close-Up Survey Guidance*.
6. 7. 2 In areas where substantial corrosion, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), has been noted then additional measurements are to be carried out, as applicable, in accordance with [Table 3. 6. 5: Thickness measurement - Single skin bulk carriers - Shell plating and stiffening, with substantial corrosion](#), [Table 3. 6. 6: Thickness measurement - Single skin bulk carriers - Double bottom and hopper structure, with substantial corrosion](#), [Table 3. 6. 7: Thickness measurement - Single and double skin bulk carriers - Transverse bulkheads in cargo holds, with substantial corrosion](#), [Table 3. 6. 8: Thickness measurement - Single skin and double skin bulk carriers - Deck structure\\* with substantial corrosion](#), [Table 3. 6. 9: Thickness measurement - Double skin bulk carriers - Double side space structure \(including wing void spaces of ore carriers\), with substantial corrosion](#) and [Table 3. 6. 10: Thickness measurement - Double skin bulk carriers - Double side space structure \(including wing void spaces of ore carriers\), with substantial corrosion](#) to determine the full extent of the corrosion pattern. The survey will not be considered complete until these additional thickness measurements have been carried out. For bulk carriers built in accordance with the IACS Common Structural Rules (CSR), the areas identified with substantial corrosion may be either:
  - a. protected by coating applied in accordance with the coating manufacturer's requirements and examined at Annual Surveys to confirm the coating in way is still in GOOD condition, or alternatively;
  - b. subject to thickness measurement at Annual Surveys.
6. 7. 3 Thickness measurement is required to determine both general and local levels of corrosion in salt water ballast tanks and in the shell frames and their end attachments in all cargo holds. Thickness measurements are also to be carried out to determine the corrosion levels on the transverse bulkhead plating.
6. 7. 4 Single skin bulk carriers contracted for construction prior to 1 July 1998 are to undergo a re-assessment and evaluation of their cargo hold shell frames. The number of shell frames to be measured is equivalent to number of shell frames subject to Close-Up Survey (see [Table 3. 6. 1: Minimum requirements for Close-up Survey - Single skin bulk carriers](#)), with representative measurements to be taken at specific areas for each frame. The extent of thickness measurement may be specially considered, but not dispensed with in its entirety, by the Surveyor, provided the structural members indicate no thickness diminution with respect to the Rule thickness and the coating is found in 'as-new' condition (i.e. without breakdown or rusting). Repairs to shell frames are to be based upon the minimum thickness values shown in the evaluation records.

6. 7. 5 For bulk carriers built in accordance with the IACS Common Structural Rules (CSR), the ship's longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced, as appropriate, during the Special Surveys carried out after the ship reaches 15 years of age (or during the Special Survey No. 3, if this is carried out before the ship reaches 15 years) in accordance with the criteria for longitudinal strength of the ship's hull girder for CSR bulk carriers specified in Chapter 13 of CSR. For further details refer to the ACS document *Thickness Measurement and Close-Up Survey Guidance*.
6. 7. 6 Steel renewal evaluation of corrugated transverse watertight bulkheads on bulk carriers of 150 m in length and above, intending to carry solid bulk cargoes having a density of 1.0 t/m<sup>3</sup> with contract for construction on or after 1 July 1998 is to be in accordance with IACS UR S18. These requirements are not applicable to bulk carriers with class notation ESN Hold 1 and ESN – All Holds, or ships built in accordance with the IACS Common Structural Rules (CSR). Further information is provided in the ACS document *Thickness Measurement and Close-Up Survey Guidance*.
6. 7. 7 Steel renewal is required where the gauged thickness is less than  $t_{net} + 0.5$  mm. For definition of  $t_{net}$ , see [Pt 4, Ch 7, 10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions 10.4.10](#).
6. 7. 8 Where the gauged thickness is within the range  $t_{net} + 0.5$  mm and  $t_{net} + 1.0$  mm, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal.
6. 7. 9 Hatch covers of cargo holds' steel renewal evaluation of bulk carriers with contract for construction on or after 1 July 1998 is to be in accordance with IACS UR S21. These requirements are not applicable to ships built in accordance with the IACS Common Structural Rules (CSR). Further information is provided in the ACS document *Thickness Measurement and Close-Up Survey Guidance*.
6. 7. 10 Steel renewal is required where the gauged thickness is less than  $t_{net} + 0.5$  mm. For definition of  $t_{net}$ , see [Pt 4, Ch 7, 12.1 General 12.1.2](#).
6. 7. 11 Where the gauged thickness is within the range  $t_{net} + 0.5$  mm and  $t_{net} + 1.0$  mm, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal.
6. 7. 12 Steel renewal evaluation of hatch covers and hatch coamings of cargo holds on bulk carriers and ore carriers with contract for construction on or after 1 January 2004 is to be in accordance with IACS UR S21. These requirements are not applicable to ships built in accordance with the IACS Common Structural Rules (CSR). Further information is provided in the ACS document *Thickness Measurement and Close-Up Survey Guidance*.
6. 7. 13 Steel renewal is required where the gauged thickness is less than  $t_{net} + 0.5$  mm. For definition of  $t_{net}$ , see [Pt 4, Ch 7, 12.1 General 12.1.2](#).
6. 7. 14 Where the gauged thickness is within the range  $t_{net} + 0.5$  mm and  $t_{net} + 1.0$  mm, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal.

**Table 3. 6. 4: Minimum requirements for thickness measurement - Single skin and double skin bulk carriers**

| Special Survey I<br>(Ships 5 years old) | Special Survey III<br>(Ships 15 years old) | Special Survey IV and subsequent<br>(Ships 20 years old and over) |

| <p><b>Special Survey II (Ships 10 years old)</b></p> <p>(1) Within the cargo length area:</p> <p>(a) 2 transverse sections of deck plating outside line of cargo hatch openings. See Note 7.</p> <p>(2) Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey in accordance with <a href="#">Table 3. 6. 1: Minimum requirements for Close-up Survey - Single skin bulk carriers</a>, <a href="#">Table 3. 6. 2: Minimum requirements for Close-up Survey - Double skin bulk carriers (excluding ore carriers)</a> or <a href="#">Table 3. 6. 3: Minimum requirements for Close-up Survey - Ore carriers</a>. See notes 3 and 4.</p> <p>(3) Wind and water strakes in way of the transverse sections considered in item (1).</p> <p>(4) Selected wind and water strakes outside the cargo length area.</p> | <p>(2) Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey in accordance with <a href="#">Table 3. 6. 1: Minimum requirements for Close-up Survey - Single skin bulk carriers</a>, <a href="#">Table 3. 6. 2: Minimum requirements for Close-up Survey - Double skin bulk carriers (excluding ore carriers)</a> or <a href="#">Table 3. 6. 3: Minimum requirements for Close-up Survey - Ore carriers</a>. See Notes 3 and 4.</p> <p>(3) All wind and water strakes within the cargo length area.</p> <p>(4) Selected wind and water strakes outside the cargo length area.</p> <p>(5) Suspect areas, as required by the Surveyor. See Note 5.</p> | <p>(2) Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey in accordance with <a href="#">Table 3. 6. 1: Minimum requirements for Close-up Survey - Single skin bulk carriers</a>, <a href="#">Table 3. 6. 2: Minimum requirements for Close-up Survey - Double skin bulk carriers (excluding ore carriers)</a> or <a href="#">Table 3. 6. 3: Minimum requirements for Close-up Survey - Ore carriers</a>. See Notes 3 and 4.</p> <p>(3) All wind and water strakes over the full length of the ship, port and starboard.</p> <p>(4) Remaining exposed main deck plates not considered in item (1) and representative exposed superstructure deck plating (i.e. poop, bridge and forecastle deck).</p> <p>(5) All keel plates outside the cargo length area. Also additional bottom plates in way of cofferdams. Machinery space and aft end of tanks.</p> |

|  |  |   |
|--|--|---|
| (5) Suspect areas, as required by the Surveyor. <i>See Note 5.</i>   |  | (6) Plating of sea chests. Also side shell plating in way of overboard discharges, as considered necessary by the Surveyor.<br><br>(7) Suspect areas, as required by the Surveyor. <i>See Note 5.</i> |
| <p>Note The requirements in this table apply to both single skin and double skin ships unless stated otherwise.</p> <p>Note 1. For areas in spaces (cargo holds and water ballast tanks) where coatings are found to be in GOOD condition, as defined in <a href="#">Pt 1, Ch 3, 1.5 Definitions</a>, the extent of thickness measurement may be specially considered, but not dispensed with in its entirety.</p> <p>Note 2. Transverse sections should be chosen where the largest scantling diminution is likely to occur, or as revealed by deck or bottom plating measurement.</p> <p>Note 3. For ships assigned the notations <b>ESN Hold No1</b> and <b>ESN All Holds</b>, the corrugated part of the aft transverse bulkhead of the forward cargo hold is to be subject to thickness measurement. This is to include each vertical corrugation at its lower and middle level including shedder plates and gusset plates, where applicable.</p> <p>Note 4. Single skin bulk carriers contracted for construction prior to 1 July 1998 are to undergo a re-assessment of their cargo hold shell frames. The number of shell frames to be measured is equivalent to the number of shell frames subject to Close-up survey (<i>see Table 3. 6. 1: Minimum requirements for Close-up Survey - Single skin bulk carriers</i>), with representative measurements to be taken at specific areas for each frame.</p> <p>Note 5. Suspect Areas are locations showing substantial corrosion and/or are considered by the surveyor to be prone to rapid wastage.</p> <p>Note 6. A transverse section includes all continuous longitudinal members such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom, hopper sides, longitudinal bulkheads, inner sides, top wing inner sides and bottom of top wing tanks. For transversely framed vessels, a transverse section includes adjacent frames and their end connections in way of transverse sections.</p> <p>Note 7. Deck Plating outside line of cargo hatch openings is deck plating between the ship sides and hatch coamings in the transverse section concerned.</p> |  |   |

**Table 3. 6. 5: Thickness measurement - Single skin bulk carriers - Shell plating and stiffening, with substantial corrosion**

| Structural member                   | Extent of measurement                                  | Pattern of measurement   |
|-------------------------------------|--|--|
| (1) Bottom and side shell plating   | Suspect plate plus four adjacent plates                | 5 point pattern for each panel between longitudinals   |
| (2) Bottom/side shell longitudinals | Minimum of three longitudinals in way of suspect areas | 3 measurements in line across web and 3 measurements on flange   |
| (3) Side shell frames               | Suspect frame and each adjacent                        | At each end and mid-span:<br><br>(a) 5 point pattern on both web and flange<br><br>(b) 5 point pattern within 25 mm of welded attachment to both side shell and hopper sloping plate |

**Table 3. 6. 6: Thickness measurement - Single skin bulk carriers - Double bottom and hopper structure, with substantial corrosion**

| Structural member                              | Extent of measurement                              | Pattern of measurement  |
|--|--|---|
| (1) Inner bottom plating                       | Suspect plate plus all immediately adjacent plates | 5 point pattern for each panel between longitudinals over 1 m length  |
| (2) Inner bottom longitudinals                 | Three longitudinals in way of plates measured      | 3 measurements in line across web and 3 measurements on flange        |
| (3) Transverse floors and longitudinal girders | Suspect plates                                     | 5 point pattern over approximately 1 m <sup>2</sup> of plating        |
| (4) Watertight floors and girders              | (a) lower 1/3 of tank                              | (a) 5 point pattern over 1 m <sup>2</sup> of plating                  |
|  | (b) upper 2/3 of tank                              | (b) 5 point pattern alternate plates over 1 m <sup>2</sup> of plating |
| (5) Transverse web frames                      | Suspect plate                                      | 5 point pattern over 1 m <sup>2</sup> of plating                      |

**Table 3. 6. 7: Thickness measurement - Single and double skin bulk carriers - Transverse bulkheads in cargo holds, with substantial corrosion**

| Structural member       | Extent of measurement  | Pattern of measurement                                 |
|-------------------------|--|--|
| (1) Lower stool         | (a) Transverse band within 25 mm of welded connection to inner-bottom  | (a) 5 point pattern between stiffeners over 1 m length |
|                         | (b) Transverse band within 25 mm of welded connection to shelf plate   | (b) as above   |
| (2) Transverse bulkhead | (a) Transverse band immediately above lower stool shelf plate  | (a) 5 point pattern over 1 m length                    |
|                         | (b) Transverse band at approximately mid-height  | (b) 5 point pattern over 1 m <sup>2</sup> of plating   |
|                         | (c) Transverse band at part of bulkhead adjacent to upper deck or below upper stool shelf plate (for those ships fitted with upper stools) | (c) 5 point pattern over 1 m <sup>2</sup> of plating   |

**Table 3. 6. 8: Thickness measurement - Single skin and double skin bulk carriers - Deck structure\* with substantial corrosion**

| Structural member        | Extent of measurement  | Pattern of measurement                                       |
|--------------------------|--|--|
| (1) Cross deck plating   | Suspect cross deck strip plating   | 5 point pattern between underdeck stiffeners over 1 m length |
| (2) Underdeck stiffeners | (a) Transverse members   | (a) 5 point pattern at each end and mid-span                 |
|                          | (b) Longitudinal member  | (b) 5 point pattern on both web and flange                   |
| (3) Hatch covers         | (a) Each side and end plate 3 locations  | (a) 5 point pattern at each location                         |
|                          | (b) Hatch cover top plate, 3 longitudinal bands - 2 on outboard strakes and 1 on centreline strake | (b) 5 point measurement at each band                         |
| (4) Hatch coamings       | Each side and end of coaming, one upper and one lower band   | 5 point measurement at each band                             |

|  |  |  |
|--|--|--|
| (5) Topside salt water ballast tanks   | (a) Watertight transverse bulkheads                    | (i) 5 point pattern over 1 m <sup>2</sup> of plating   |
|  | (i) lower 1/3 of bulkhead                              | (ii) 5 point pattern over 1 m <sup>2</sup> of plating  |
|  | (ii) upper 2/3 of bulkhead                             | (iii) 5 point pattern over 1 m length                  |
|  | (iii) stiffeners                                       |  |
|  | (b) Swash transverse bulkheads                         | (i) 5 point pattern over 1 m <sup>2</sup> of plating   |
|  | (i) lower 1/3 of bulkhead                              | (ii) 5 point pattern over 1 m <sup>2</sup> of plating  |
|  | (ii) upper 2/3 of bulkhead                             | (iii) 5 point pattern over 1 m length                  |
|  | (iii) stiffeners                                       |  |
|  | (c) 3 representative bays of the topside sloping plate | (i) 5 point pattern over 1 m <sup>2</sup> of plating   |
|  | (i) lower 1/3 of tank                                  | (ii) 5 point pattern over 1 m <sup>2</sup> of plating  |
| (6) Main deck plating  | (ii) upper 2/3 of tank                                 |  |
|  | (d) suspect longitudinals and adjacent plates          | 5 point pattern both web and flange over 1 m length    |
| (7) Main deck longitudinals  | Suspect plates and 4 immediately adjacent plates       | 5 point pattern over 1 m <sup>2</sup> of plating       |
| (8) Web frames/transverses   | Minimum of 3 longitudinals where plating measured      | 5 point pattern on both web and flange over 1 m length |
|  | Suspect plates   | 5 point pattern over 1 m <sup>2</sup> of plating       |
| * including cross strips, main cargo hatchways, hatch covers, coamings and topside tanks |  |  |

**Table 3. 6. 9: Thickness measurement - Double skin bulk carriers - Double side space structure (including wing void spaces of ore carriers), with substantial corrosion**

| Structural member   | Extent of measurement   | Pattern of measurement   |
|---|---|--|
| (1) Bottom, inner bottom and hopper structure plating       | (a) Minimum of 3 bays across double bottom tank, including aft bay<br>(b) Measurements around and under all suction bell mouths | 5 point pattern for each panel between longitudinals and floors  |
| (2) Bottom, inner bottom and hopper structure longitudinals | Minimum of 3 longitudinals in each bay where bottom plating measured  | 3 measurements in line across flange and<br>3 measurements on the vertical web   |
| (3) Bottom girders, including watertight girders            | At fore and aft watertight floors and in centre of tanks  | Vertical line of single measurements on girder plating with 1 measurement between each panel stiffener, or a minimum of 3 measurements |
| (4) Bottom floors, including watertight floors              | 3 floors in the bays where bottom plating measured, with measurements at both ends and middle                                   | 5 point pattern over 2 m <sup>2</sup> area   |
| (5) Hopper structure web frame ring                         | 3 floors in bays where bottom plating measured  | 5 point pattern over 1 m <sup>2</sup> of plating and single measurements on flange   |

|   |   |  |
|---|---|--|
| (6) Hopper structure transverse watertight bulkhead or swash bulkhead | (a) lower 1/3 of bulkhead<br>(b) upper 2/3 of bulkhead<br>(c) stiffeners (minimum of 3) | (a) 5 point pattern over 1 m <sup>2</sup> of plating<br>(b) 5 point pattern over 2 m <sup>2</sup> of plating<br>(c) For web, 5 point pattern over span (2 measurements across web at each end and 1 at centre of span). For flange, single measurements at each end and centre of span |
| (7) Panel stiffening  | Where applicable  | Single measurements  |

**Table 3. 6. 10: Thickness measurement - Double skin bulk carriers - Double side space structure (including wing void spaces of ore carriers), with substantial corrosion**

| Structural member   | Extent of measurement  | Pattern of measurement   |
|---|--|--|
| (1) Side shell and inner plating:                                 | (i) Plating between each pair of transverse frames/longitudinals in a minimum of 3 bays along the tank | (i) Single measurement   |
| (i) Upper strake and strakes in way of horizontal girders         | (ii) Plating between every third pair of longitudinals in same 3 bays                                  | (ii) Single measurement  |
| (ii) All other strakes  |  |  |
| (2) Side shell and inner side transverse frames/longitudinals on: | (i) Each transverse frame/longitudinal in same 3 bays  | (i) 3 measurements across web and 1 measurement on flange          |
| (i) Upper strake  | (ii) Every third transverse frame/longitudinal in same 3 bays  | (ii) 3 measurements across web and 1 measurement on flange         |
| (ii) All other strakes  |  |  |
| (3) Transverse frames/longitudinals - brackets                    | Minimum of 3 at top, middle and bottom of tank in same 3 bays  | 5 point pattern over area of bracket                               |
| (4) Vertical web and transverse bulkheads:                        | (i) Minimum of 2 webs and both transverse bulkheads  | (i) 5 point pattern over approx. 2 m <sup>2</sup> area             |
| (i) Strakes in way of horizontal girders                          | (ii) Minimum of 2 webs and both transverse bulkheads   | (ii) 2 measurements between each pair of vertical stiffeners       |
| (ii) Other strakes  |  |  |
| (5) Horizontal girders  | Plating on each girder in a minimum of 3 bays  | 2 measurements between each pair of longitudinal girder stiffeners |
| (6) Panel stiffening  | Where applicable   | Single measurements  |

6. 7. 15 Prior to any coating or recoating of cargo holds, scantlings are to be confirmed by a thickness measurement, with the Surveyor in attendance.

CHAPTER **3 Periodical Survey Regulations**SECTION **7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements****7.1 General**

- 7.1.1 The requirements of [Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements](#), [Pt 1, Ch 3, 4 Bottom Surveys – In Dry-Dock and In-Water - Hull and machinery requirements](#) and [Pt 1, Ch 3, 5 Special Survey - General - Hull requirements](#) are to be complied with as applicable.
- 7.1.2 In order to maintain and/or assign the **ESP** notation, the following requirements apply to the surveys of the hull structure and piping systems in way of the cargo tanks/cargo holds, pump rooms, cofferdam, pipe tunnels, void spaces, double bottom tanks, etc. in way of the cargo tank area and all salt-water ballast tanks.

**7.2 Review of documentation on board**

- 7.2.1 Prior to survey, the Surveyor is to examine the completeness of the documentation on board as detailed in [Pt 1, Ch 3, 1.10 Documentation](#) and its contents as a basis for the survey.
- 7.2.2 For CSR oil tankers subject to *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations Part A-1 - Structure of ships Regulation 3-10 – Goal-based ship construction standards for bulk carriers and oil tankers* the Surveyor is to examine the information held in the Goal Based Standard (GBS) Ship Construction File (SCF) stored on board the ship. On completion of the survey, in the case of any major event, including, but not limited to, substantial repair, conversion or any modification to the ship structure, the Surveyor is to verify that the information stored on board of the ship has been updated and is to verify any addition and/or renewal of materials used for the construction of the hull structure are documented within the GBS SCF list of materials.
- 7.2.3 For CSR oil tankers subject to *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations Part A-1 - Structure of ships Regulation 3-10 – Goal-based ship construction standards for bulk carriers and oil tankers* for the GBS SCF Supplement Ashore, the Surveyor is to verify the information stored in the Archive Centre by examining the list of information included in the Supplement Ashore. In addition, the Surveyor is to confirm that the service contract with the Archive Centre remains valid. In the case of any major event, including, but not limited to, substantial repair, conversion or modification to the ship's structure, the Surveyor is to verify that the information stored in the Archive Centre has been updated by examining the list of updated information included in the Supplement Ashore.

| SECTION | 7 | Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements |

---

### 7.3 Planning for survey

- 7.3.1 A Survey Programme is to be submitted by the Owner and is to include the proposals for survey, including the means of providing access for Close-up Survey, thickness measurement and tank testing and should take account of the information detailed in [Pt 1, Ch 3, 7.2 Review of documentation on board 7.2.1](#).
- 7.3.2 Prior to the development of the Survey Programme a Survey Planning Questionnaire is to be completed and submitted by the Owner, see [Pt 1, Ch 3, 1.6 Preparation for survey and means of access 1.6.16](#).

### 7.4 Overall Survey

- 7.4.1 All cargo tanks/cargo holds, and salt-water ballast tanks including double bottom tanks, pump rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks/cargo holds, deck and outer hull are to be examined, and this examination is to be supplemented by Close-up Survey, thickness measurement and testing as applicable, to ensure that the structural integrity remains effective.
- 7.4.2 The examination is to be sufficient to ascertain substantial corrosion, significant deformation, fractures, damages or other structural deterioration and, if deemed necessary by the Surveyor, suitable non-destructive examination may be required.
- 7.4.3 Where substantial corrosion, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), is identified and is not rectified, this will be subject to re-examination at Annual and/or Intermediate Surveys. In the case of salt-water ballast tanks and combined tanks for the carriage of salt-water ballast and cargo oil, the examination will be required at Annual Survey and Intermediate Survey. In the case of cargo oil tanks the examination will be required at Intermediate Surveys.
- 7.4.4 All cargo piping on deck, including Crude Oil Washing (COW) piping, and cargo and ballast piping within those spaces indicated in [Pt 1, Ch 3, 7.4 Overall Survey 7.4.1](#) are to be examined and tested under working conditions to ensure that tightness and condition remain satisfactory. Special attention is to be given to ballast piping in cargo tanks and any cargo piping in ballast tanks and void spaces. The Surveyor should be advised on all occasions when this piping, including valves and fittings, is open and degasified during repair periods and may be examined internally.
- 7.4.5 Where salt-water ballast tanks have been converted to void spaces the survey extent is to be based upon salt-water ballast tank requirements.
- 7.4.6 Where provided, in association with a corrosion control CC special features notation, as defined in the *Register Book*, the condition of the protective coating or corrosion prevention system of cargo tanks is to be examined.
- 7.4.7 The attachment to the structure and condition of anodes in tanks is to be examined.
- 7.4.8 Where fitted, the strums of the cargo suction pipes are to be removed or lifted to facilitate examination of the shell plating and bulkheads in the vicinity, unless other means for visual inspection of these parts are provided.

### 7.5 Testing

- 7.5.1 The minimum ballast tank testing requirements are given in [Table 3. 7. 1: Tank testing requirements - Single hull and double hull oil tankers, ore/oil ships and ore/bulk/oil ships](#) and, where required, the Surveyor may extend the tank testing if deemed necessary. The remaining requirements for tank testing, as applicable, are given in [Pt 1, Ch 3, 5.3 Examination and testing 5.3.6](#).

|                |          |  |
|----------------|----------|--|
| <b>PART</b>    | <b>1</b> | <b>Regulations</b>   |
| <b>CHAPTER</b> | <b>3</b> | <b>Periodical Survey Regulations</b>   |
| <b>SECTION</b> | <b>7</b> | <b>Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements</b> |

7. 5. 2 The minimum cargo tank testing requirements are given in [Table 3. 7. 1: Tank testing requirements - Single hull and double hull oil tankers, ore/oil ships and ore/bulk/oil ships](#); boundaries of cargo tanks are to be tested to the highest point that liquid will rise to under service conditions. Cargo tank testing carried out by the ship's crew under the direction of the Master may be accepted by the Surveyor provided the following conditions are complied with:
- A tank testing procedure specifying fill heights, tanks being filled and bulkheads being tested has been submitted by the Owner and reviewed by ACS prior to the testing being carried out.
  - There is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank.
  - The tank testing has been satisfactorily carried out within the special survey window not more than 3 months prior to the date of the survey on which the overall or close-up survey is completed.
  - The satisfactory results of the testing are recorded in the ship's logbook.
  - The internal and external condition of the tanks and associated structure is found satisfactory by the Surveyor at the time of the overall and close-up survey.

**Table 3. 7. 1: Tank testing requirements - Single hull and double hull oil tankers, ore/oil ships and ore/bulk/oil ships**

| Special Survey I (Ships 5 years old)  | Special Survey II and subsequent (Ships 10 years old and over) |
|---|--|
| All ballast tank boundaries   | All ballast tank boundaries                                    |
| Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump rooms or cofferdams | All cargo tank bulkheads                                       |

7. 5. 3 Notwithstanding the provisions of [Pt 1, Ch 3, 7.5 Testing 7.5.2](#), permitting cargo tank testing to be carried out by the ship's crew under the direction of the Master, the testing of water ballast tanks is to be witnessed by an attending Surveyor, during which the attending Surveyor is to examine all boundaries, including the boundaries facing the cargo oil tanks.
7. 5. 4 Where the outcome of cargo tank testing reveals structural damage or leakage, the Owner is to advise ACS immediately in order to arrange the attendance of a Surveyor.

## 7. 6 Close-up Survey

7. 6. 1 The minimum requirements for Close-up Survey are given in [Table 3. 7. 2: Minimum requirements for Close-up Survey - Single hull oil tankers](#) (Single hull oil tankers), [Table 3. 7. 3: Minimum requirements for Close-up Survey - Double hull oil tankers](#) (Double hull oil tankers), [Table 3. 7. 4: Minimum requirements for Close-up Survey - Ore/oil ships](#) (Ore/oil ships) and [Table 3. 7. 5: Minimum requirements for Close-up Survey - Ore/bulk/oil ships](#) (Ore/bulk/oil ships).

| PART    | 1 | Regulations   |
| CHAPTER | 3 | Periodical Survey Regulations   |
| SECTION | 7 | Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements |

7. 6. 2 The Surveyor may extend the Close-up Survey, if deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system, and the following:
- Structural arrangements or details which have suffered defects in similar spaces or on similar ships.
  - Spaces which have structures approved with reduced scantlings in association with an approved corrosion control system.
7. 6. 3 For areas in tanks where coatings are found to be in GOOD condition, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), the extent of Close-up Surveys may be specially considered.

## 7. 7 Thickness measurement

7. 7. 1 The minimum requirements for thickness measurements are given in [Table 3. 7. 6: Minimum requirements for thickness measurement - Single hull and double hull oil tankers, ore/oil ships and ore/bulk/oil ships](#) (Single and double hull oil tankers, including ore/oil ships and ore/bulk/oil ships), *see also* [Pt 1, Ch 3, 5.6 Thickness measurement](#). For ships built in accordance with the IACS Common Structural Rules (CSR), refer to the ACS document *Thickness Measurement and Close-Up Survey Guidance*.

Also side shell plating in way of overboard discharges, as considered necessary by the Surveyor.</p> <p>(7) Suspect areas, as required by the Surveyor. <i>See</i> Note 7.</p> |
| <p>Note 1. For areas in tanks where coatings are found to be in GOOD condition, as defined in <a href="#">Pt 1, Ch 3, 1.5 Definitions</a>, the extent of thickness measurements may be specially considered, but not dispensed with in its entirety.</p> <p>Note 2. Transverse sections should be chosen where the largest reductions are likely to occur, or as revealed by deck plating measurement.</p> <p>Note 3. Where two or three transverse sections are required to be measured, at least one is to include a ballast tank within 0.5L amidships.</p> <p>Note 4. All cargo hold hatch covers and coamings, where fitted, are to be measured on ore/oil and ore/bulk/oil ships.</p> <p>Note 5. For oil tankers (including ore/oil and ore/bulk/oil ships), with length <math>\geq 130</math> m and over 10 years of age, the longitudinal strength is to be evaluated. In such cases, a minimum of three transverse sections are to be measured within 0.5L amidships.</p> <p>Note 6. A transverse section includes all longitudinal members such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom and longitudinal bulkheads. For transversely framed vessels, a transverse section includes adjacent frames and their end connections in way of transverse sections.</p> |  |  |

Note 7. Suspect areas are locations showing substantial corrosion and/or are considered by the Surveyor to be prone to rapid wastage.

7. 7. 2 In areas where substantial corrosion, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), has been noted then additional measurements are to be carried out, as applicable, in accordance with [Table 3. 7. 7: Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Bottom structure with substantial corrosion](#), [Table 3. 7. 8: Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Deck structure with substantial corrosion](#), [Table 3. 7. 9: Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Shell and longitudinal bulkheads with substantial corrosion](#), [Table 3. 7. 10: Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Transverse bulkheads and swash bulkheads with substantial corrosion](#), [Table 3. 7. 11: Thickness measurement - Double hull oil tankers - Bottom, inner bottom and hopper structure with substantial corrosion](#), [Table 3. 7. 12: Thickness measurement - Double hull oil tankers - Deck structure with substantial corrosion](#), [Table 3. 7. 13: Thickness measurement - Double hull oil tankers - Wing ballast tank structure with substantial corrosion](#), [Table 3. 7. 14: Thickness measurement - Double hull oil tankers - Longitudinal bulkhead structure in cargo tanks with substantial corrosion](#) and [Table 3. 7. 15: Thickness measurement - Double hull oil tankers - Transverse watertight and swash bulkhead structure in cargo tanks with substantial corrosion](#) to determine the full extent of the corrosion pattern. The survey will not be considered complete until these additional thickness measurements have been carried out. For double hull oil tankers built in accordance with the IACS Common Structural Rules (CSR), the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out at Annual and Intermediate Surveys.
7. 7. 3 For **oil tankers** (including ore/oil and ore/bulk/oil ships) of 130 m in length and upwards (as defined by the *International Convention on Load Lines* in force), the ship's longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced as appropriate, during the Special Surveys carried out after the ship reaches 10 years of age.
7. 7. 4 Steel renewal evaluation of hatch covers and hatch coamings of cargo holds on combination carriers with contract for construction on or after 1 January 2004 is to be in accordance with IACS UR S21. These requirements are not applicable to ships built in accordance with the IACS Common Structural Rules (CSR). Further information is provided in the ACS document *Thickness Measurement and Close-Up Survey Guidance*.
7. 7. 5 Steel renewal is required where the gauged thickness is less than  $t_{net} + 0.5$  mm. For definition of  $t_{net}$ , see [Pt 4, Ch 7, 12.1 General 12.1.2](#).
7. 7. 6 Where the gauged thickness is within the range  $t_{net} + 0.5$  mm and  $t_{net} + 1.0$  mm, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal.

**Table 3. 7. 7: Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Bottom structure with substantial corrosion**

| Structural member        | Extent of measurement   | Pattern of measurement   |
|--------------------------|---|--|
| (1) Bottom plating       | Minimum of 3 bays across tank, including aft bay<br>Measurement around and under all suction strums | 5 point pattern for each panel between longitudinals and webs              |
| (2) Bottom longitudinals | Minimum of 3 longitudinals in each bay where bottom plating measured                                | 3 measurements in line across flange and<br>3 measurements on vertical web |

|                                 |   |   |
|---------------------------------|---|---|
| (3) Bottom girders and brackets | At fore and aft transverse bulkhead, bracket toes and in centre of tanks                | Vertical line of single measurements on web plating with 1 measurement between each panel stiffener, or a minimum of 3 measurements. 2 measurements across face flat. 5 point pattern on girder/bulkhead brackets |
| (4) Bottom transverse webs      | 3 webs in bays where bottom plating measured, with measurements at middle and both ends | 5 point pattern over 2 m <sup>2</sup> area. Single measurements on face flat  |
| (5) Panel stiffening            | Where applicable  | Single measurements   |

**Table 3. 7. 8: Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Deck structure with substantial corrosion**

| Structural member             | Extent of measurement  | Pattern of measurement  |
|-------------------------------|--|---|
| (1) Deck plating              | 2 bands across tank  | Minimum of 3 measurements per plate per band  |
| (2) Deck longitudinals        | Minimum of 3 longitudinals in each of 2 bays                             | 3 measurements in line vertically on webs and 2 measurements on flange (if fitted)  |
| (3) Deck girders and brackets | At fore and aft transverse bulkhead, bracket toes and in centre of tanks | Vertical line of single measurements on web plating with 1 measurement between each panel stiffener, or a minimum of 3 measurements. 2 measurements across face flat. 5 point pattern on girder/bulkhead brackets |
| (4) Deck transverse webs      | Minimum of 2 webs with measurement at both ends and middle of span       | 5 point pattern over 2 m <sup>2</sup> area. Single measurements on face flat  |
| (5) Panel stiffening          | Where applicable   | Single measurements   |

**Table 3. 7. 9: Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Shell and longitudinal bulkheads with substantial corrosion**

| Structural member  | Extent of measurement   | Pattern of measurement   |
|--|---|--|
| (1) Deckhead and bottom strakes and strakes in way of stringer platforms | Plating between each pair of longitudinals in a minimum of 3 bays                         | Single measurement   |
| (2) All other strakes  | Plating between every 3rd pair of longitudinals in same 3 bays                            | Single measurement   |
| (3) Longitudinals – deckhead and bottom strakes                          | Each longitudinal in same 3 bays  | 3 measurements across web and 1 measurement on flange  |
| (4) Longitudinals – all others   | Every third longitudinal in same 3 bays   | 3 measurements across web and 1 measurement on flange  |
| (5) Longitudinals – bracket  | Minimum of 3 at top, middle and bottom of tank in same 3 bays                             | 5 point pattern over area of bracket   |
| (6) Web frames and cross ties  | 3 webs with minimum of 3 locations on each web, including in way of cross tie connections | 5 point pattern over 2 m <sup>2</sup> area, plus single measurements on web frame and cross tie face flats |

**Table 3. 7. 10: Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Transverse bulkheads and swash bulkheads with substantial corrosion**

| Structural member  | Extent of measurement  | Pattern of measurement   |
|--|--|--|
| (1) Deckhead and bottom strakes in way of stringer platforms | Plating between pair of stiffeners at 3 locations: approx. 1/4, 1/2 and 3/4 width of tank      | 5 point pattern between stiffeners over 1 m length   |
| (2) All other strakes  | Plating between pair of stiffeners at middle location  | Single measurement   |
| (3) Strakes in corrugated bulkheads                          | Plating for each change of scantling at centre of panel and at flange or fabricated connection | 5 point pattern over 1 m <sup>2</sup> of plating   |
| (4) Stiffeners   | Minimum of 3 typical stiffeners  | For web, 5 point pattern over span between bracket connections (2 measurements across web at each bracket connection and one at centre of span). For flange, single measurements at each bracket toe and at centre of span |
| (5) Brackets   | Minimum of 3 at top, middle and bottom of tank   | 5 point pattern over area of bracket   |
| (6) Deep webs and girders                                    | Measurements at toe of bracket and at centre of span   | For web, 5 point pattern over 1 m <sup>2</sup> area. 3 measurements across face flat   |
| (7) Stringer platforms                                       | All stringers with measurements at middle and both ends  | 5 point pattern over 1 m <sup>2</sup> area plus single measurements near bracket toes and on face flats  |

**Table 3. 7. 11: Thickness measurement - Double hull oil tankers - Bottom, inner bottom and hopper structure with substantial corrosion**

| Structural member                                 | Extent of measurement   | Pattern of measurement   |
|---|---|--|
| (1) Bottom, inner bottom and hopper plating       | Minimum of 3 bays across double bottom tank, including aft bay. Measurement around and under all suction strums | 5 point pattern for each panel between longitudinals and floors  |
| (2) Bottom, inner bottom and hopper longitudinals | Minimum of 3 longitudinals in each bay where bottom plating measured  | 3 measurements in line across flange and 3 measurements on vertical web  |
| (3) Bottom girders, including watertight girders  | At the fore and aft watertight floors and in centre of tanks  | Vertical line of single measurements on girder plating with 1 measurement between each panel stiffener, or a minimum of 3 measurements |
| (4) Bottom floors, including watertight floors    | 3 floors in bays where bottom plating measured, with measurements at both ends and middle                       | 5 point pattern over 2 m <sup>2</sup> area   |
| (5) Hopper web frame ring                         | 3 floors in bays where bottom plating measured  | 5 point pattern over 1 m <sup>2</sup> of plating. Single measurements on flange  |

|   |                                      |  |
|---|--------------------------------------|--|
| (6) Hopper transverse watertight bulkhead or swash bulkhead | (i) Lower $\frac{1}{3}$ of bulkhead  | (i) 5 point pattern over 1 m <sup>2</sup> of plating.  |
|   | (ii) Upper $\frac{2}{3}$ of bulkhead | (ii) 5 point pattern over 2 m <sup>2</sup> of plating.   |
|   | (iii) Stiffeners (minimum of 3)      | (iii) For web, 5 point pattern over span (2 measurements across web at each end and 1 at centre of span). For flange, single measurement at each end and centre of span. |
| (7) Panel stiffening  | Where applicable                     | Single measurements  |

**Table 3. 7. 12: Thickness measurement - Double hull oil tankers - Deck structure with substantial corrosion**

| Structural member  | Extent of measurement  | Pattern of measurement   |
|--|--|--|
| (1) Deck plating   | 2 transverse bands across tank   | Minimum of 3 measurements per plate per band   |
| (2) Deck longitudinals   | Every 3rd longitudinal in each of 2 bands with a minimum of 1 longitudinal   | 3 measurements in line vertically on webs and 2 measurements on flange (if fitted)   |
| (3) Deck girders and brackets (usually in cargo tanks only)                          | At the fore and aft transverse bulkhead, bracket toes and in centre of tanks | Vertical line of single measurements on web plating with 1 measurement between each panel stiffener, or a minimum of 3 measurements. 2 measurements across flange. 5 point pattern on girder / bulkhead brackets |
| (4) Deck transverse webs   | Minimum of 2 webs, with measurements at both ends and middle of span         | 5 point pattern over 1 m <sup>2</sup> area. Single measurements on the flange  |
| (5) Vertical web and transverse bulkhead in wing ballast tank (two metres from deck) | Minimum of 2 webs, and both transverse bulkheads                             | 5 point pattern over 1 m <sup>2</sup> area   |
| (6) Panel stiffening   | Where applicable   | Single measurements  |

**Table 3. 7. 13: Thickness measurement - Double hull oil tankers - Wing ballast tank structure with substantial corrosion**

| Structural member  | Extent of measurement  | Pattern of measurement                                     |
|--|--|--|
| (1) Side shell and longitudinal bulkhead plating:          | (i) Plating between each pair of longitudinals in a minimum of 3 bays (along the tank) | (i) Single measurements                                    |
| (i) Upper strake and strakes in way of horizontal girders  | (ii) Plating between every 3rd pair of longitudinals on same 3 bays                    | (ii) Single measurements                                   |
| (ii) All other strakes                                     |  |  |
| (2) Side shell and longitudinal bulkhead longitudinals on: | (i) Each longitudinal in same 3 bays   | (i) 3 measurements across web and 1 measurement on flange  |
| (i) Upper strake   | (ii) Every 3rd longitudinal in same 3 bays   | (ii) 3 measurements across web and 1 measurement on flange |
| (ii) All other strakes                                     |  |  |
| (3) Longitudinals – brackets                               | Minimum of 3 at top, middle and bottom of tank in same 3 bays                          | 5 point pattern over area of bracket                       |

|  |  |  |
|--|--|--|
| (4) Vertical web and transverse bulkheads (excluding deckhead area): | (i) Minimum of 2 webs and both transverse bulkheads  | (i) 5 point pattern over approximately 2 m <sup>2</sup> area       |
| (i) Strakes in way of horizontal girders                             | (ii) Minimum of 2 webs and both transverse bulkheads | (ii) 2 measurements between each pair of vertical stiffeners       |
| (ii) Other strakes   |  |  |
| (5) Horizontal girders   | Plating on each girder in a minimum of 3 bays        | 2 measurements between each pair of longitudinal girder stiffeners |
| (6) Panel stiffening   | Where applicable                                     | Single measurements  |

**Table 3. 7. 14: Thickness measurement - Double hull oil tankers - Longitudinal bulkhead structure in cargo tanks with substantial corrosion**

| Structural member   | Extent of measurement   | Pattern of measurement   |
|---|---|--|
| (1) Deckhead and bottom strakes, and strakes in way of horizontal stringers on transverse bulkheads | Plating between each pair of longitudinals in a minimum of 3 bays                         | Single measurement   |
| (2) All other strakes   | Plating between every 3rd pair of longitudinals in same 3 bays                            | Single measurement   |
| (3) Longitudinals on deckhead and bottom strakes  | Each longitudinal in same 3 bays  | 3 measurements across web and 1 measurements on flange   |
| (4) All other longitudinals   | Every 3rd longitudinal in same 3 bays   | 3 measurements across web and 1 measurements on flange   |
| (5) Longitudinals – brackets  | Minimum of 3 at top, middle and bottom of tank in same 3 bays                             | 5 point pattern over area of bracket   |
| (6) Web frames and cross ties   | 3 webs with minimum of 3 locations on each web, including in way of cross tie connections | 5 point pattern over approximately 2 m <sup>2</sup> area of webs, plus single measurements on flanges of web frames and cross ties |
| (7) Lower end brackets (opposite side of web frame)   | Minimum of 3 brackets   | 5 point pattern over approximately 2 m <sup>2</sup> area of brackets, plus single measurements on bracket flanges                  |

**Table 3. 7. 15: Thickness measurement - Double hull oil tankers - Transverse watertight and swash bulkhead structure in cargo tanks with substantial corrosion**

| Structural member   | Extent of measurement   | Pattern of measurements  |
|---|---|--|
| (1) Upper and lower stool, where fitted                                     | Transverse band within 25 mm of welded connection to inner bottom/deck plating Transverse band within 25 mm of welded connection to shelf plate | 5 point pattern between stiffeners over 1 m length             |
| (2) Deckhead and bottom strakes, and strakes in way of horizontal stringers | Plating between pair of stiffeners at 3 locations; approximately ¼, ½ and ¾ width of tank.  | 5 point pattern between stiffeners over 1 m length             |
| (3) All other strakes   | Plating between pair of stiffeners at middle location   | Single measurement   |
| (4) Strakes in corrugated bulkheads   | Plating for each change of scantling at centre of panel and at flange of fabricated connection  | 5 point pattern over approximately 1 m <sup>2</sup> of plating |

|                          |   |  |
|--------------------------|---|--|
| (5) Stiffeners           | Minimum of 3 typical stiffeners                         | For web, 5 point pattern over span between bracket connections (2 measurements across web at each bracket connection and 1 at centre of span). For flange, single measurement at bracket toe and at centre of span |
| (6) Brackets             | Minimum of 3 at top, middle and bottom of tank          | 5 point pattern over area of bracket   |
| (7) Horizontal stringers | All stringers with measurements at both ends and middle | 5 point pattern over 1 m <sup>2</sup> area, plus single measurements near bracket toes and on flanges  |

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **8 Special Survey - Chemical Tankers - Hull requirements**

## 8. 1 General

- 8. 1. 1 The requirements of [Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements](#), [Pt 1, Ch 3, 4 Bottom Surveys – In Dry-Dock and In-Water - Hull and machinery requirements](#) and [Pt 1, Ch 3, 5 Special Survey - General - Hull requirements](#) are to be complied with as applicable.
- 8. 1. 2 In order to maintain and/or assign the **ESP** notation, the following requirements apply to the surveys of the hull structure and piping systems in way of the cargo tanks, pump rooms, cofferdam, pipe tunnels, void spaces, double bottom tanks, etc. in way of the cargo tank area and all salt-water ballast tanks.

## 8. 2 Documentation

- 8. 2. 1 The Owner is to obtain, supply and maintain documentation on board as follows:
  - a. A survey file comprising reports of structural surveys, thickness measurement and executive hull summary in accordance with the *2011 ESP Code – International Code on the Enhanced Programme of Inspections During Surveys of Bulk Carriers and Oil Tankers, 2011 – Resolution A.1049(27)*.
  - b. Supporting documentation consisting of:
    - i. Main structural plans of cargo tanks and ballast tanks.
    - ii. Previous repair history.
    - iii. Cargo and ballast history.
    - iv. Records of inspections by ship's personnel with reference to structural deterioration in general, leakages in bulkheads and piping and the condition of the corrosion prevention systems, if any.
    - v. Extent of use of inert gas plant and tank cleaning procedures.
    - vi. Any other information that may help to identify critical structural areas and/or suspect areas requiring inspection.
    - vii. Survey Programme as required by [Pt 1, Ch 3, 8.3 Planning for survey](#).

The complete documentation in [Pt 1, Ch 3, 8.2 Documentation 8.2.1](#) is to be readily available for examination by the Surveyor and should be used as a basis for survey.
- 8. 2. 2 The documentation is to be kept on board for the lifetime of the ship.

### 8.3 Planning for survey

- 8.3.1 A Survey Programme is to be submitted by the Owner and is to include the proposals for survey, including the means of providing access for Close-up Survey, thickness measurement, tank testing and should take account of the information detailed in [Pt 1, Ch 3, 8.2 Documentation 8.2.1](#).
- 8.3.2 Prior to the development of the Survey Programme a Survey Planning Questionnaire is to be completed and submitted by the Owner, see [Pt 1, Ch 3, 1.6 Preparation for survey and means of access 1.6.16](#).

### 8.4 Overall Survey

- 8.4.1 All cargo tanks and salt-water ballast tanks including double bottom tanks, pump rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks, deck and outer hull are to be examined, and this examination is to be supplemented by Close-up Survey, thickness measurement and testing as applicable, to ensure that the structural integrity remains effective.
- 8.4.2 The examination is to be sufficient to ascertain substantial corrosion, significant deformation, fractures, damages or other structural deterioration and, if deemed necessary by the Surveyor, suitable non-destructive examination may be required.
- 8.4.3 Where substantial corrosion, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), is identified and is not rectified, this will be subject to re-examination at Annual and/or Intermediate Surveys. In the case of salt-water ballast tanks the examination will be required at Annual Survey and Intermediate Survey. In the case of cargo tanks the examination will be required at Intermediate Surveys.
- 8.4.4 All cargo piping on deck, and cargo and ballast piping, within those spaces indicated in [Pt 1, Ch 3, 8.4 Overall Survey 8.4.1](#) are to be examined and tested under working conditions to ensure that tightness and condition remain satisfactory. Special attention is to be given to ballast piping in cargo tanks and any cargo piping in ballast tanks and void spaces.
- 8.4.5 The survey of stainless steel tanks may be carried out as an Overall Survey supplemented by Close-up Survey as deemed necessary by the Surveyor.
- 8.4.6 Where salt-water ballast tanks have been converted to void spaces the survey extent is to be based upon salt-water ballast tank requirements.
- 8.4.7 Where provided, in association with a corrosion control CC special features notation, as defined in the *Register Book*, the condition of the protective coating or corrosion prevention system of cargo tanks is to be examined.
- 8.4.8 The attachment to the structure and condition of anodes in tanks is to be examined.
- 8.4.9 Where fitted, the strums of the cargo suction pipes are to be removed or lifted to facilitate examination of the shell plating and bulkheads in the vicinity, unless other means for visual inspection of these parts are provided.

### 8.5 Testing

- 8.5.1 The minimum ballast tank testing requirements are given in [Table 3.8.1: Tank testing requirements - Chemical tankers](#) and, where required, the Surveyor may extend the tank testing if deemed necessary. Other arrangements for cargo tank testing will be considered on application. The remaining requirements for tank testing, as applicable, are given in [Pt 1, Ch 3, 5.3 Examination and testing 5.3.6](#).
- 8.5.2 The minimum cargo tank testing requirements are given in [Table 3.8.1: Tank testing requirements - Chemical tankers](#), boundaries of cargo tanks are to be tested to the highest point that liquid will rise to under service conditions. Other arrangements for cargo tank testing will be considered on application.

Cargo tank testing carried out by the ship's crew under the direction of the Master may be accepted by the Surveyor provided the following conditions are complied with:

- A tank testing procedure specifying fill heights, tanks being filled and bulkheads being tested has been submitted by the Owner and reviewed by ACS prior to the testing being carried out.
- There is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank.
- The tank testing has been satisfactorily carried out within the special survey window not more than 3 months prior to the date of the survey on which the overall or close-up survey is completed.
- The satisfactory results of the testing are recorded in the ship's logbook.
- The internal and external condition of the tanks and associated structure is found satisfactory by the Surveyor at the time of the overall and close-up survey.

**Table 3. 8. 1: Tank testing requirements - Chemical tankers**

| Special Survey I<br>(Ships 5 years old)   | Special Survey II and subsequent<br>(Ships 10 years old and over) |
|---|---|
| All ballast tank boundaries   | All ballast tank boundaries                                       |
| Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump rooms or cofferdams | All cargo tank bulkheads  |

## 8. 6 Close-up Survey

8. 6. 1 The minimum requirements for Close-up Survey are given in [Table 3. 8. 2: Minimum requirements for Close-up Survey - Single hull chemical tankers](#) (Single hull chemical tankers) and [Table 3. 8. 3: Minimum requirements for Close-up Survey - Double hull chemical tankers](#) (Double hull chemical tankers).

**Table 3. 8. 2: Minimum requirements for Close-up Survey - Single hull chemical tankers**

| Special Survey I<br>(Ships 5 years old)                                  | Special Survey II<br>(Ships 10 years old)   | Special Survey III<br>(Ships 15 years old)                              | Special Survey IV<br>(Ships 20 years old and over)                   |
|--|---|---|--|
| (1) One web frame ring in a ballast wing tank. <i>See</i> Notes 1 and 6. | (1) All web frame rings in a ballast wing tank or double bottom ballast tank. <i>See</i> Notes 1 and 6. | (1) All web frame rings in all ballast tanks. <i>See</i> Notes 1 and 6. | (1) As Special Survey III.   |
| (2) One deck transverse in a cargo tank or on deck. <i>See</i> Note 2.   | (2) One deck transverse in each remaining ballast tank or on deck. <i>See</i> Note 2.                   | (2) All web frame rings in a cargo wing tank. <i>See</i> Notes 1 and 6. | (2) Additional transverse areas if deemed necessary by the Surveyor. |
| (3) One transverse bulkhead in a ballast tank. <i>See</i> Note 3.        | (3) One deck transverse in a cargo wing tank or on deck. <i>See</i> Note 2.                             | (3) One web frame ring in each remaining cargo tank. <i>See</i> Note 6. |  |

| <p>Note 1. Ballast double hull tank means double bottom tank, double side tank or double deck tank, as applicable, even if these tanks are separate.</p> <p>Note 2. Deck transverse including adjacent deck structural members (or external structure on deck in way of the tank).</p> <p>Note 3. Transverse bulkhead lower part including girder system and adjacent structural members.</p> <p>Note 4. Transverse bulkhead complete, including girder system and adjacent members, and adjacent longitudinal bulkhead structure.</p> <p>Note 5. Where there are no centre tanks, the transverse bulkheads in wing tanks are to be subject to Close-up Survey. Where there are no wing tanks, the transverse bulkheads in centre tanks are to be subject to Close-up Survey.</p> <p>Note 6. Complete transverse web frame ring including adjacent structural members.</p> |  |   |  |

**Table 3. 8. 3: Minimum requirements for Close-up Survey - Double hull chemical tankers**

| <b>Special Survey I<br/>(Ships 5 years old)</b>                                 | <b>Special Survey II<br/>(Ships 10 years old)</b>   | <b>Special Survey III<br/>(Ships 15 years old)</b>               | <b>Special Survey IV<br/>(Ships 20 years old and over)</b> |
|---|---|--|--|
| (1) One web frame ring in a ballast double hull tank. <i>See</i> Notes 1 and 9. | (1) All web frame rings in a ballast wing tank or ballast double hull tank. <i>See</i> Notes 1 and 9. | (1) All web frame rings in all ballast tanks. <i>See</i> Note 1. | (1) As Special Survey III.                                 |

|   |  |  |  |
|---|--|--|--|
| (2) One deck transverse in a cargo tank or on deck. <i>See</i> Note 2.  | (2) The knuckle area and the upper part (approx. 3 m) of one web frame ring in each remaining ballast tank. <i>See</i> Note 6. | (2) All web frame rings in a cargo wing tank. <i>See</i> Note 7.                         | (2) Additional transverse areas if deemed necessary by the Surveyor. |
| (3) One transverse bulkhead in a ballast tank. <i>See</i> Note 5.   | (3) One deck transverse in two cargo tanks. <i>See</i> Note 2.   | (3) One web frame ring in each remaining cargo tank. <i>See</i> Note 7.                  |  |
| (4) One transverse bulkhead in a cargo wing tank. <i>See</i> Notes 3 and 8.   | (4) One transverse bulkhead in each ballast tank. <i>See</i> Note 5.   | (4) All transverse bulkheads – in all cargo and ballast tanks. <i>See</i> Notes 4 and 5. |  |
| (5) One transverse bulkhead in a cargo centre tank. <i>See</i> Notes 3 and 8.   | (5) One transverse bulkhead in a cargo wing tank. <i>See</i> Note 3.   |  |  |
|   | (6) One transverse bulkhead in two cargo centre tanks. <i>See</i> Notes 3 and 8.   |  |  |
| <p>Note 1. Web frame ring in a ballast tank includes the vertical web in side tank, hopper web in hopper tank, floor in double bottom tank and deck transverse in a double deck tank (where fitted) and adjacent structural members. In peak tanks, a web frame means a complete transverse web frame ring, including adjacent structural members.</p> <p>Note 2. Deck transverse including adjacent deck structural members (or external structure on deck in way of the tank), where applicable.</p> <p>Note 3. Transverse bulkhead lower part in cargo tanks, including girder system and adjacent structural members (including longitudinal bulkheads) and internal structure of lower stools, where fitted.</p> <p>Note 4. Transverse bulkhead complete in cargo tanks, including girder system, adjacent structural members (including longitudinal bulkheads) and internal structure of lower and upper stools, where fitted.</p> <p>Note 5. Transverse bulkhead complete in ballast tanks, including girder system and adjacent structural members including longitudinal bulkheads, girders in double bottom tanks, inner bottom plating, hopper side, connecting brackets.</p> <p>Note 6. The knuckle area and the upper part (approximately 3 m), including adjacent structural members. Knuckle area is the area of the web frame around the connections of the sloping hopper plating to the inner hull bulkhead and the inner bottom plating, up to 2 m from the corners both on the bulkhead and the double bottom.</p> <p>Note 7. Web frame ring in a cargo tank includes deck transverse, longitudinal bulkhead structural elements and cross ties, where fitted, and adjacent structural members.</p> <p>Note 8. Where there are no centre tanks, the transverse bulkheads in wing tanks are to be subject to Close-up Survey. Where there are no wing tanks, the transverse bulkheads in centre tanks are to be subject to Close-up Survey.</p> <p>Note 9. Ballast double hull tank includes double bottom tank, double side tank and double deck tank even though these tanks may be separate.</p> |  |  |  |

8. 6. 2 The Surveyor may extend the Close-up Survey, if deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system, and the following:
- Structural arrangements or details which have suffered defects in similar spaces or on similar ships.
  - Spaces which have structures approved with reduced scantlings in association with an approved corrosion control system.
8. 6. 3 For areas in tanks where coatings are found to be in GOOD condition, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), the extent of Close-up Surveys may be specially considered.

## 8. 7 Thickness measurement

8. 7. 1 The minimum requirements for thickness measurements are given in [Table 3. 8. 4: Minimum requirements for thickness measurement - Single and double hull chemical tankers](#), see also [Pt 1, Ch 3, 5.6 Thickness measurement](#).

**Table 3. 8. 4: Minimum requirements for thickness measurement - Single and double hull chemical tankers**

| Special Survey I<br>(Ships 5 years old)   | Special Survey III<br>(Ships 15 years old)   | Special Survey IV<br>(Ships 20 years old and over)  |
|---|--|---|
| <p>(1) 1 section of deck plating for the full beam of the ship within 0.5L amidships (in way of a ballast tank, if any).</p> <p>(2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to Close-up Survey in accordance with <a href="#">Table 3. 8. 2: Minimum requirements for Close-up Survey - Single hull chemical tankers</a> and <a href="#">Table 3. 8. 3: Minimum requirements for Close-up Survey - Double hull chemical tankers</a>. See Note 4</p> <p>(3) Suspect areas, as required by the Surveyor. See Note 6.</p> | <p>(1) Within the cargo area:</p> <ol style="list-style-type: none"> <li>Each deck plate.</li> <li>2 transverse sections. See Notes 2, 3 and 5.</li> </ol> <p>(2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to Close-up Survey in accordance with <a href="#">Table 3. 8. 2: Minimum requirements for Close-up Survey - Single hull chemical tankers</a> and <a href="#">Table 3. 8. 3: Minimum requirements for Close-up Survey - Double hull chemical tankers</a>. See Note 4.</p> <p>(3) Selected wind and water strakes outside the cargo area.</p> | <p>(1) Within the cargo area:</p> <ol style="list-style-type: none"> <li>Each deck plate.</li> <li>3 transverse sections. See Notes 2, 3 and 5.</li> <li>Each bottom plate.</li> </ol> <p>(2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to Close-up Survey in accordance with <a href="#">Table 3. 8. 2: Minimum requirements for Close-up Survey - Single hull chemical tankers</a> and <a href="#">Table 3. 8. 3: Minimum requirements for Close-up Survey - Double hull chemical tankers</a>. See Note 4.</p> |
| Special Survey II<br>(Ships 10 years old)   | (4) All wind and water strakes within the cargo area.  | (3) All wind and water strakes over the full length of the ship, port and starboard.  |

|  |   |   |
|--|---|---|
| <p>(1) Within the cargo area:</p> <p>(a) Each deck plate.</p> <p>(b) 1 transverse section. <i>See</i> Notes 2, 3 and 5.</p> <p>(2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to Close-up Survey in accordance with <a href="#">Table 3. 8. 2: Minimum requirements for Close-up Survey - Single hull chemical tankers</a> and <a href="#">Table 3. 8. 3: Minimum requirements for Close-up Survey - Double hull chemical tankers</a>. <i>See</i> Note 4</p> <p>(3) Selected wind and water strakes outside the cargo area.</p> <p>(4) Suspect areas, as required by the Surveyor. <i>See</i> Note 6.</p>  | <p>(5) Suspect areas, as required by the Surveyor. <i>See</i> Note 6.</p> | <p>(4) Remaining exposed main deck plating not considered in item (1) and representative exposed superstructure deck plating (i.e. poop, bridge and forecastle deck).</p> <p>(5) All keel plates outside the cargo tank length. Also additional bottom plates in way of cofferdams, machinery space and aft end of tanks.</p> <p>(6) Plating of seachests. Also side shell plating in way of overboard discharges, as considered necessary by the Surveyor.</p> <p>(7) Suspect areas, as required by the Surveyor. <i>See</i> Note 6.</p> |
| <p>Note 1. For areas in tanks where coatings are found to be in GOOD condition, as defined in <a href="#">Pt 1, Ch 3, 1.5 Definitions</a>, the extent of thickness measurements may be specially considered, but not dispensed with in its entirety.</p> <p>Note 2. Transverse sections should be chosen where the largest reductions are likely to occur, or as revealed by deck plating measurements.</p> <p>Note 3. Where two or three transverse sections are required to be measured, at least one is to include a ballast tank within 0.5L amidships.</p> <p>Note 4. Transverse bulkhead complete including stiffening system.</p> <p>Note 5. A transverse section includes all continuous longitudinal members such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom and longitudinal bulkheads. For transversely framed vessels, a transverse section includes adjacent frames and their end connections in way of transverse sections.</p> <p>Note 6. Suspect areas are locations showing substantial corrosion and/or are considered by the Surveyor to be prone to rapid wastage.</p> |   |   |

8. 7. 2 In areas where substantial corrosion, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), has been noted, then additional measurements are to be carried out, as applicable, in accordance with [Table 3. 8. 5: Thickness measurement - Single and double hull chemical tankers - Bottom, inner bottom and hopper structure with substantial corrosion](#), [Table 3. 8. 6: Thickness measurement - Single and double hull chemical tankers - Deck structure with substantial corrosion](#), [Table 3. 8. 7: Thickness measurement - Single and double hull chemical tankers - Side shell and longitudinal bulkheads with substantial corrosion](#) and [Table 3. 8. 8: Thickness measurement - Single and double hull chemical tankers - Transverse watertight bulkheads and swash bulkheads with substantial corrosion](#) to determine the full extent of the corrosion pattern. The survey will not be considered complete until these additional thickness measurements have been carried out.

**Table 3. 8. 5: Thickness measurement - Single and double hull chemical tankers - Bottom, inner bottom and hopper structure with substantial corrosion**

| Structural member   | Extent of measurement   | Pattern of measurement   |
|---|---|--|
| (1) Bottom, inner bottom and hopper plating.                | Minimum of 3 bays across double bottom tank, including aft bay. Measurement around and under all suction strums | 5 point pattern for each panel between longitudinals and floors.   |
| (2) Bottom, inner bottom and hopper longitudinals.          | Minimum of 3 longitudinals in each bay where bottom plating measured.   | 3 measurements in line across flange and 3 measurements on vertical web.   |
| (3) Bottom girders, including watertight girders.           | At the fore and aft watertight floors and in centre of tanks.   | Vertical line of single measurements on girder plating with 1 measurement between each panel stiffener, or a minimum of 3 measurements. 2 measurements across face flat (if fitted). |
| (4) Bottom floors, including watertight floors.             | 3 floors in bays where bottom plating measured, with measurements at both ends and middle.                      | 5 point pattern over 2 m <sup>2</sup> area.  |
| (5) Hopper web frame ring                                   | 3 floors in bays where bottom plating measured  | 5 point pattern over 1 m <sup>2</sup> of plating. Single measurements on flange  |
| (6) Hopper transverse watertight bulkhead or swash bulkhead | (i) Lower $\frac{1}{3}$ of bulkhead   | (i) 5 point pattern over 1 m <sup>2</sup> of plating   |
|   | (ii) Upper $\frac{2}{3}$ of bulkhead  | (ii) 5 point pattern over 2 m <sup>2</sup> of plating  |
|   | (iii) Stiffeners (minimum of 3)   | (iii) For web, 5 point pattern over span (2 measurements across web at each end and 1 at centre of span). For flange, single measurement at each end and centre of span              |
| (7) Panel stiffening  | Where applicable  | Single measurements  |

**Table 3. 8. 6: Thickness measurement - Single and double hull chemical tankers - Deck structure with substantial corrosion**

| Structural member             | Extent of measurement  | Pattern of measurement   |
|-------------------------------|--|--|
| (1) Deck plating              | 2 transverse bands across tank   | Minimum of 3 measurements per plate per band   |
| (2) Deck longitudinals        | Every 3rd longitudinal in each of 2 bands with a minimum of 1 longitudinal   | 3 measurements in line vertically on webs and 2 measurements on flange (if fitted)   |
| (3) Deck girders and brackets | At the fore and aft transverse bulkhead, bracket toes and in centre of tanks | Vertical line of single measurements on web plating with 1 measurement between each panel stiffener, or a minimum of 3 measurements. 2 measurements across flange. 5 point pattern on girder/bulkhead brackets |

|  |  |   |
|--|--|---|
| (4) Deck transverse webs   | Minimum of 2 webs, with measurements at both ends and middle of span | 5 point pattern over 1 m <sup>2</sup> area. Single measurements on the flange |
| (5) Vertical web and transverse bulkhead in wing ballast tank (2 m from deck) – for double hull chemical tankers | Minimum of 2 webs, and both transverse bulkheads                     | 5 point pattern over 1 m <sup>2</sup> area                                    |
| (6) Panel stiffening   | Where applicable   | Single measurements   |

**Table 3. 8. 7: Thickness measurement - Single and double hull chemical tankers - Side shell and longitudinal bulkheads with substantial corrosion**

| Structural member   | Extent of measurement  | Pattern of measurement                                       |
|---|--|--|
| (1) Side shell and longitudinal bulkhead plating:   |  |  |
| (i) Top and bottom strakes, and strakes in way of horizontal girders                      | (i) Plating between each pair of longitudinals in a minimum of 3 bays (along the tank) | (i) Single measurements                                      |
| (ii) All other strakes  | (ii) Plating between every 3rd pair of longitudinals on same 3 bays                    | (ii) Single measurements                                     |
| (2) Side shell and longitudinal bulkhead longitudinals on:                                |  |  |
| (i) Top and bottom strakes  | (i) Each longitudinal in same 3 bays   | (i) 3 measurements across web and 1 measurement on flange    |
| (ii) All other strakes  | (ii) Every 3rd longitudinal in same 3 bays   | (ii) 3 measurements across web and 1 measurement on flange   |
| (3) Longitudinals – brackets  | Minimum of 3 at top, middle and bottom of tank in same 3 bays                          | 5 point pattern over area of bracket                         |
| (4) Vertical web and transverse bulkheads of double side tanks (excluding deckhead area): |  |  |
| (i) Strakes in way of horizontal girders  | (i) Minimum of 2 webs and both transverse bulkheads                                    | (i) 5 point pattern over approximately 2 m <sup>2</sup> area |
| (ii) Other strakes  | (ii) Minimum of 2 webs and both transverse bulkheads                                   | (ii) 2 measurements between each pair of vertical stiffeners |

|  |   |   |
|--|---|---|
| (5) Web frames and cross ties for other tanks than double side tanks | 3 webs with minimum of 3 locations on each web, including in way of cross tie connections and lower end bracket | 5 point pattern over approximately 2 m <sup>2</sup> area of webs, plus single measurements on flanges of web frame and cross ties |
| (6) Horizontal girders   | Plating on each girder in a minimum of 3 bays   | 2 measurements between each pair of longitudinal girder stiffeners  |
| (7) Panel stiffening   | Where applicable  | Single measurements   |

**Table 3. 8. 8: Thickness measurement - Single and double hull chemical tankers - Transverse watertight bulkheads and swash bulkheads with substantial corrosion**

| Structural member  | Extent of measurement  | Pattern of measurement   |
|--|--|--|
| (1) Upper and lower stool, where fitted                                | Transverse band within 25 mm of welded connection to inner bottom/deck plating<br>Transverse band within 25 mm of welded connection to shelf plate | 5 point pattern between stiffeners over 1 m length   |
| (2) Top and bottom strakes, and strakes in way of horizontal stringers | Plating between pair of stiffeners at<br><br>3 locations; approximately $\frac{1}{4}$ , $\frac{1}{2}$ , and $\frac{3}{4}$ width of tank            | 5 point pattern between stiffeners over 1 m length   |
| (3) All other strakes  | Plating between pair of stiffeners at middle location  | Single measurement   |
| (4) Strakes in corrugated bulkheads                                    | Plating for each change of scantling at centre of panel and at flange of fabricated connection   | 5 point pattern over approximately 1 m <sup>2</sup> of plating   |
| (5) Stiffeners   | Minimum of 3 typical stiffeners  | For web, 5 point pattern over span between bracket connections (2 measurements across web at each bracket connection and 1 at centre of span). For flange, single measurement at bracket toe and at centre of span |
| (6) Brackets   | Minimum of 3 at top, middle and bottom of tank   | 5 point pattern over area of bracket   |
| (7) Horizontal stringers   | All stringers with measurements at both ends and middle  | 5 point pattern over 1 m <sup>2</sup> area, plus single measurements near bracket toes and on flanges  |
| (8) Deep webs and girders  | Measurements at toe of bracket and centre of span  | For webs, 5 point pattern over 1 m <sup>2</sup> area. 3 measurements across face flat  |

## **8. 8 Ships over 10 years old**

8. 8. 1 Selected steel cargo pipes outside cargo tanks and ballast pipes passing through cargo tanks are to be:
- Thickness measured at random or selected pipe lengths to be opened for internal inspection.
  - Pressure tested to the maximum working pressure.
- Note Special attention is to be given to cargo/slop discharge piping through ballast tanks and void spaces.

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **9 Ships for liquefied gases**

## 9. 1 General

- 9. 1. 1 The requirements of [Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements](#) to [Pt 1, Ch 3, 7 Special Survey - Oil tankers \(including ore/oil ships and ore/bulk/oil ships\) - Hull requirements](#) are to be complied with, as applicable.
- 9. 1. 2 Prior to the inspection of cargo tanks, surrounding spaces, associated piping, fittings and equipment, etc. the respective items are to be cleaned and thoroughly cleared of gas. Every precaution is to be taken to ensure safety during inspection.
- 9. 1. 3 The following documentation, as applicable, is to be available on board the ship:
  - a. Relevant instruction and information material such as cargo handling plans, filling limit information, cooling down procedures, etc.
  - b. A copy of the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk*.
  - c. Test records of secondary barrier.
  - d. Loading and stability information, including damage stability.
  - e. A document specifying the maximum allowable loading limits for each cargo tank and product, at each applicable loading temperature and maximum reference temperature approved by the Administration. The pressures at which the pressure relief valves (PRVs) have been set shall also be stated in the document.
  - f. The cargo system operation manuals approved by the Administration.
- 9. 1. 4 For requirements of Special Survey for electrical equipment, see [Pt 1, Ch 3, 14 Electrical equipment](#).
- 9. 1. 5 The survey requirements of [Pt 1, Ch 3, 9.2 Annual Surveys – Basic requirements](#) to [Pt 1, Ch 3, 9.11 Special Survey III and Special Surveys thereafter \(ships 15 years old and over\)](#) shall additionally be applied to gas fuel tanks and their associated systems, as applicable.

## 9. 2 Annual Surveys – Basic requirements

- 9. 2. 1 The Annual Survey is preferably to be carried out during a loading or discharging operation. Access to cargo tanks or inerted hold spaces, necessitating gasfreeing/ aerating will normally not be necessary unless required by the Regulations.
- 9. 2. 2 The ship's log and operational records for the cargo containment system covering the period from the previous survey are to be examined. Any malfunction of the system entered in the log is to be investigated, the cause ascertained, and that part of the system at fault is to be found or placed in good order.
- 9. 2. 3 Instrumentation and safety systems are to be surveyed as follows:

- a. The instrumentation of the cargo installations with regard to pressure, temperature and liquid level is to be verified in good working order by one or more of the following methods:
    - i. Visual external examination.
    - ii. Comparing of read outs from different indicators.
    - iii. Consideration of read outs with regard to the actual cargo and/or actual conditions.
    - iv. Examination of maintenance records with reference to cargo plant instrumentation maintenance manual.
    - v. Verification of calibration status of the measuring instruments.
  - b. The low level, high level, and overfill alarms are to be examined and tested to ascertain that they are in working order.
  - c. The alarms associated with the following are to be tested as applicable:
    - i. Cargo tank high and low pressure.
    - ii. Cargo tank temperature.
    - iii. Cargo hold pressure.
    - iv. Interbarrier space pressure.
    - v. Inner hull temperature.
    - vi. Secondary barrier temperature.
    - vii. Cargo Hold or Interbarrier bilge level detection.
  - d. Control devices for the cargo containment systems and cargo handling equipment, together with any associated shutdown and/or interlock, are to be checked under simulated working conditions and, if necessary, recalibrated. Such safety systems include but are not limited to:
    - i. Cargo tank overfill protection including cargo pump, compressor and other cargo machinery automatic shutdown.
    - ii. Cargo pump, compressor and other cargo machinery shutdown on low cargo tank pressure or cargo tank and interbarrier/hold space differential pressure.
    - iii. Cargo pump automatic shutdown on low level or current;
  - e. The emergency shutdown system is to be tested, without flow in the pipe lines, to verify that the system will cause the cargo pumps, compressors and other cargo machinery, as applicable, to stop.
  - f. Consideration will be given to the acceptance of simulated tests, provided that they are carried out at the cargo temperature, or comprehensive maintenance records, including details of tests held, in accordance with the cargo plant instrumentation maintenance manual.
- 9. 2. 4 Cargo gas leakage detection systems are to be examined and tested to ascertain that they are in working order and calibrated using sample gas.
  - 9. 2. 5 Inert gas/dry air installations including the means for prevention of backflow of cargo vapour to gas-safe spaces are to be verified as being in satisfactory operating condition.
  - 9. 2. 6 Ventilation systems and air locks in working spaces are to be checked for satisfactory operation.
  - 9. 2. 7 Cargo pipeline, valves and fittings are to be generally examined, with special reference to expansion bellows, supports and vapour seals on insulated pipes. It is to be verified that all accessible cargo piping systems are electrically bonded to the hull.
  - 9. 2. 8 Portable and/or fixed drip trays, or insulation for deck protection in the event of cargo leakage, are to be examined for condition.
  - 9. 2. 9 The means for accomplishing gas tightness of the wheelhouse doors and windows is to be examined. All windows and side-scuttles within the area required to be of the fixed type (non-opening) are to be examined for gas tightness. The closing devices for all air intakes and openings into accommodation spaces, service spaces, machinery spaces, control stations and approved openings in superstructures and deckhouses facing the cargo area or bow and stern loading/unloading arrangements are to be examined. For ships carrying toxic gases such devices should be capable of being operated from inside the space.

- 9. 2. 10 Venting systems, including protection screens if provided, for the cargo tanks, inter-barrier spaces and hold spaces are to be visually examined externally. It is to be verified that the cargo tank relief valves are sealed and that the certificate for the relief valves opening/closing pressures is on board the ship.
- 9. 2. 11 Mechanical ventilation fans in gas hazardous zones and spaces are to be visually examined. Adequate spare parts should be carried for each type of fan installed.
- 9. 2. 12 Electrical equipment, cables and supports in gas hazardous zones and spaces shall be examined as far as practicable. Alarms and safety systems associated with pressurised lighting systems and any safety device associated with nonsafe type electrical equipment that is protected by air-locks are to be verified.
- 9. 2. 13 Heating arrangements, if fitted, for cofferdams and other spaces shall be verified in good working order.
- 9. 2. 14 All accessible gas-tight bulkhead penetrations including gas-tight shaft sealings are to be visually examined.
- 9. 2. 15 The sealing arrangements for tanks or tank domes penetrating decks or tank covers are to be externally examined.
- 9. 2. 16 The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull and piping are maintained in a satisfactory condition.
  - a. The examination of the hull and piping is to include the following:
    - i. hull plating and closing appliances as far as can be seen
    - ii. watertight penetrations as far as practicable
    - iii. weather decks
    - iv. flame screens on vents to all bunker tanks
    - v. bunker and vent piping systems
  - b. The examination of the cargo pump rooms and compressor rooms and, as far as practicable, pipe tunnels if fitted is to include the following:
    - i. all pump room and compressor room bulkheads for signs of leakage or fractures and, in particular, the sealing arrangements of all penetrations of pump room and compressor room bulkheads
    - ii. condition of all piping systems (for cargo piping systems, see [Pt 1, Ch 3, 9.2 Annual Surveys – Basic requirements 9.2.7](#)).
- 9. 2. 17 The Surveyor is to carry out an examination and thickness measurement of structure identified at the previous Special Survey or Intermediate Survey as having substantial corrosion, as defined in [Pt 1, Ch 3, 1.5 Definitions](#). The extent of thickness measurements is to be increased in accordance with [Table 3. 9. 4: Thickness measurement - Ships for liquefied gases - Structural areas with substantial corrosion](#) to determine the full extent of the corrosion pattern. The survey will not be considered complete until these additional thickness measurements have been carried out.

### **9. 3 Annual Surveys – Reliquefaction/refrigeration equipment**

- 9. 3. 1 Where reliquefaction or refrigeration equipment for cargo temperature and pressure control is fitted, the following are to be examined, so far as practicable:
  - a. The machinery under working conditions.
  - b. The shells of all pressure vessels in the system, externally. Insulation need not be removed for this examination, but any deterioration of insulation or evidence of dampness which could lead to external corrosion of the vessels or their connections, is to be investigated.
  - c. Primary refrigerant gas and liquid pipes, cargo vapour and liquid condensate pipes and condenser cooling water pipes. Insulation need not be removed, but any deterioration or evidence of dampness is to be investigated.

d. The reliquefaction/refrigeration plant spare gear.

9. 3. 2 Reference should be made to the Special Survey requirements for guidance on Continuous Survey arrangements.

## 9. 4 Annual Surveys - Gas fuel burning equipment and other equipment components

9. 4. 1 The following components are to be generally examined externally. If insulation is fitted, this need not be removed, but any deterioration of insulation, or evidence of dampness which could lead to external corrosion of the vessels or their connections, is to be investigated:
- Heat exchangers and pressure vessels for use with gas fuel burning in boilers or machinery.
  - Cargo heaters, vaporisers, masthead heaters and other miscellaneous pressure vessels.
9. 4. 2 Controls and interlocks are to be checked.
9. 4. 3 Alarm systems are to be checked to ascertain that they are in working order.
9. 4. 4 Exhaust fans and/or pressurising system for gas trunking are to be tested.
9. 4. 5 Ventilation systems are to be checked for satisfactory operation, if separate from the cargo venting arrangements.
9. 4. 6 Fuel tanks and relief valves are to be externally examined, where applicable.

## 9. 5 Annual Surveys – Cargo containment systems

9. 5. 1 Where the insulation arrangement is such that the insulation cannot be examined, the surrounding structures of wing tanks, double bottom tanks and cofferdams are to be examined for cold spots, prior to the survey. This examination is to be held at a convenient cargo discharge operation with the cargo tanks loaded at approximately the minimum notation temperature.
9. 5. 2 On application by the Owner, consideration will be given to the cold spot examination, where applicable, being carried out by the ship's staff.
9. 5. 3 When tests are required after repairs, independent cargo tanks, other than independent tanks type C, are to be tested by hydraulic or hydropneumatic means as appropriate. Test heads and pressures should be as defined in *Part E - Tank Types* of the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk*. Cargo tanks of the membrane or semi-membrane type are to be tested by means of a detectable gas in the inter-barrier spaces and discolouring paint on the weld seams of the cargo tanks wall, or other suitable means. Independent cargo tanks of type C are to be tested hydraulically at 1.25 times the approved maximum vapour pressure.
9. 5. 4 For membrane containment systems, the Surveyor is to receive confirmation from the Master that the nitrogen control system for insulation and inter-barrier spaces is operating normally.

## 9. 6 Intermediate Surveys

9. 6. 1 The Intermediate Survey intends to supplement the Annual Survey by testing cargo handling installations with related automatic control, alarm and safety systems for correct functioning. The Intermediate Survey is preferably to be carried out with the ship in a gas-free condition. The extent of the testing required for the Intermediate Survey will normally be such that the survey cannot be carried out during a loading or discharging operation.
9. 6. 2 In addition to the requirements for Annual Survey and the requirements of [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.1](#) to [Pt 1, Ch 3, 3.3 Intermediate Surveys 3.3.9](#), the following are to be dealt with as applicable:

- a. Examination of means for draining the vent piping system.
  - b. Verification that pipelines and cargo tanks are electrically bonded to the hull.
  - c. Verification that the heating arrangements, if any, for steel structures are satisfactory.
  - d. Where required by the manufacturer's maintenance instructions, cargo tank and inter-barrier space pressure and vacuum relief valve settings are to be checked and adjusted as required. Cargo tank pressure relief valve harbour settings are also to be checked, if applicable. Cargo tank pressure relief valves are to lift at a pressure not more than the percentage given below, above the maximum vapour pressure for which the tanks have been approved.
    - i. For 0 to 0.15 MPa, 10 per cent.
    - ii. For 0.15 to 0.3 MPa, 6 per cent.
    - iii. For pressures exceeding 0.3 MPa, 3 per cent.
    - iv. Valves may be removed from the tanks for the purpose of checking.
  - e. A General Examination within the zones and spaces deemed as hazardous, such as cargo compressor rooms and spaces adjacent to and zones above cargo areas, for defective and non-certified safe-type electrical equipment, improperly installed, defective and dead wiring. An electrical insulation resistance test of the circuits terminating in, or passing through the hazardous zones and spaces, is to be carried out. If the ship is not in a gas free condition the results of previously recorded test readings may be accepted.
9. 6. 3 For ships over 5 years of age and up to 10 years of age, an overall survey of representative ballast tanks is to be carried out. Where a hard protective coating is found to be in POOR condition, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), where a soft or semi-hard coating has been applied or where a protective coating was not applied from the time of construction, the survey is to be extended to other ballast tanks of the same type.
9. 6. 4 For ships over 10 years of age, an overall survey of all ballast tanks is to be carried out.
- a. If such examinations reveal no visible structural defects, the examination may be limited to verification that the corrosion prevention system remains in GOOD or FAIR condition.
  - b. The condition of the corrosion prevention system identified during the Survey may result in the tanks being subject to further examination at Annual Surveys, in accordance with [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.30](#). For independent double bottom ballast tanks, the examination at Annual Surveys will be at the discretion of the Surveyor.
9. 6. 5 The minimum requirements for Close-up Survey are given in [Table 3. 9. 1: Ships for liquefied gases - Intermediate Surveys](#).

**Table 3. 9. 1: Ships for liquefied gases - Intermediate Surveys**

| Ships between 10 and 15 years old   | Ships greater than 15 years old  |
|---|--|
| (1) Close-up survey of all web frames and both transverse bulkheads in a representative ballast tank. <i>See Notes 1, 2, 3, 4, 5 and 6.</i> | (1) Close-up survey of all web frames and both transverse bulkheads in a two representative ballast tanks. <i>See Notes 1, 2, 3, 4, 5 and 6.</i> |
| (2) Close-up survey of the upper part of one web frame in one other representative ballast tank. <i>See Notes 1, 2, 3, 4, 5 and 6.</i>      |  |
| (3) Close-up survey of one transverse bulkhead in one other representative ballast tank. <i>See Notes 1, 3, 4, 5 and 6.</i>                 |  |

- Note 1. Ballast tanks include topside, double hull side, double bottom, hopper side, or any combined arrangement of the aforementioned, and peak tanks where fitted.
- Note 2. Complete transverse web frame including adjacent structural members.
- Note 3. Transverse bulkhead complete, including girder system and adjacent structural members and adjacent longitudinal bulkhead structure.
- Note 4. For areas in cargo tanks and salt-water ballast tanks subject to Close-up Survey, the Close-up Survey may be specially considered but not dispensed with in its entirety, provided the Surveyor is satisfied with the Close-up Survey that there is no structural diminution and the overall tank protective coating remains in GOOD condition.
- Note 5. The Surveyor may extend the Close-up Survey, if deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system, the structural arrangements or details which have suffered defects in similar spaces or on similar ships and tanks having structures approved with reduced scantlings.
- Note 6. For ships having independent cargo tanks of Type C, with a midship section similar to that of a general cargo ship, the extent of Close-up Survey may be specially considered.

## 9. 7 Special Survey I (ships five years old) – General requirements

9. 7. 1 The requirements of [Pt 1, Ch 3, 9.1 General](#) to [Pt 1, Ch 3, 9.6 Intermediate Surveys](#) are to be complied with.
9. 7. 2 The requirements for Close-up Survey and thickness measurement are given in [Pt 1, Ch 3, 9.12 Close-up Survey](#) and [Pt 1, Ch 3, 9.13 Thickness measurement](#).
9. 7. 3 All cargo tanks are to be examined internally, also externally so far as practicable, particular attention being paid to the plating in way of supports of securing arrangements, tower structures, seatings and pipe connections, also to sealing arrangements in way of the deck penetrations. Provided that the structural examination is satisfactory, that the gas leakage monitoring systems have been found to be operating satisfactorily and that the voyage records have not shown any abnormal operation, cargo tanks do not require to be hydraulically tested. The primary membranes of 'Gas Transport' design should be examined with the primary insulation space under a vacuum of at least -500 mbar gauge. For 'Moss Type' LNG cargo tanks, the Structural Transition Joints (STJ) are to be examined at the port, starboard, forward and aft locations. Insulation is to be removed as required. Non-destructive testing may be required where considered necessary. For membrane containment systems with corrugated primary barriers, in view of the sloshing loads experienced in service, measurements should, if required, be taken inside the cargo tanks of deformations of the primary barrier corrugations in order to assess the condition of the containment system in accordance with the system designer's procedures as approved by ACS.
9. 7. 4 The non-destructive testing of cargo tanks is to be carried out as follows:
- Non-destructive testing is to supplement cargo tank inspection with special attention to be given to the integrity of the main structural members, tank shell and highly stressed parts, including welded connections as deemed necessary by the Surveyor. The following items are, inter alia, considered as highly stressed parts:
    - Cargo tanks supports and anti-rolling/antipitching devices;
    - Web frames or stiffening rings;
    - Swash bulkhead boundaries;
    - Dome and stump connections to tank shell;
    - Foundations for pumps, towers, ladders, etc.;
    - Pipe connections.
  - For independent tanks of Type B, the extent of non-destructive testing shall be as given in the programme specially prepared for the cargo tank design.

- c. Independent cargo tanks of Type C are to be subjected to non-destructive testing of the plating in way of supports and also at selected lengths of welds. Where such testing raises doubt as to the structural integrity, a hydraulic test should be carried out at 1.25 times the approved maximum vapour pressure. Alternatively, consideration will be given to pneumatic testing under special circumstances, provided full details are submitted for approval.
- d. At each alternate Special Survey (i.e. SSII, SSIV and so on), all independent cargo tanks of Type C are to be either:
  - i. Hydraulically or hydro-pneumatically tested to 1.25 times MARVS, followed by non-destructive testing in accordance with paragraph [Pt 1, Ch 3, 9.7 Special Survey I \(ships five years old\) – General requirements 9.7.4](#) above, or,
  - ii. Subjected to a thorough, planned, non-destructive testing. This testing is to be carried out in accordance with a programme specially prepared for the tank design. If a special programme does not exist, the following applies:
    - cargo tank supports and anti-rolling/anti-pitching devices;
    - stiffening rings;
    - Y-connections between tank shell and a longitudinal bulkhead of bi-lobe tanks;
    - swash bulkhead boundaries;
    - dome and sump connections to the tank shell;
    - foundations for pumps, towers, ladders etc.;
    - pipe connections.

At least 10 per cent of the length of the welded connections in each of the above mentioned areas is to be tested. This testing is to be carried out internally and externally as applicable. Insulation is to be removed as necessary for the required non-destructive testing.

- 9. 7. 5 Deck mounted cargo storage tanks are to be examined in the same manner as main cargo tanks.
- 9. 7. 6 For membrane containment systems, a tightness test of the primary and secondary barrier shall be carried out in accordance with the system designer's procedures and acceptance criteria as approved by ACS. Low differential pressure tests may be used for monitoring the cargo containment system performance, but are not considered an acceptable test for the tightness of the secondary barrier. For membrane containment systems with glued secondary barriers, if the designer's threshold values are exceeded, an investigation is to be undertaken and additional testing such as thermographic or acoustic emissions testing should be carried out.
- 9. 7. 7 Where a cargo tank or the hull structure is insulated and the insulation is accessible, the insulation should be examined externally, together with any vapour or protective barrier, and sections removed for examination, if considered necessary by the Surveyor. Special attention should be given to insulation in way of chocks, supports and keys. Portions of the insulation are also to be removed, if required by the Surveyor, to enable the condition of the plating to be ascertained. Where the insulation is not accessible, see [Pt 1, Ch 3, 9.5 Annual Surveys – Cargo containment systems 9.5.1](#).
- 9. 7. 8 Cargo tank internal pipes and fittings are to be examined, and all valves and cocks in direct communication with the interiors of the tanks are to be opened out for inspection and the connection pipes are to be examined internally, so far as practicable.
- 9. 7. 9 Relief valves are to be surveyed as follows:
  - a. The pressure relief valves for the cargo tanks are to be opened for examination, adjusted, function tested, and sealed. If the cargo tanks are equipped with relief valves with non-metallic membranes in the main or pilot valves, such non-metallic membranes are to be replaced.

- b. Pressure relief valves are subsequently to be adjusted to lift at a pressure in accordance with [Pt 1, Ch 3, 9.6 Intermediate Surveys 9.6.2.\(d\)](#). Relief valve harbour settings are to be checked, if applicable. Valves may be removed from the shell for the purpose of making this adjustment under pressure of air or other suitable gas.
  - c. Where a proper record of continuous overhaul and retesting of individually identifiable relief valves is maintained, consideration will be given to acceptance on the basis of opening, internal examination, and testing of a representative sampling of valves, including each size and type of liquefied gas or vapour relief valve in use, provided there is logbook evidence that the remaining valves have been overhauled and tested since crediting of the previous Special Survey.
  - d. Relief valves on cargo gas and liquid pipelines are to have their pressure settings checked. The valves may be removed from the pipelines for this purpose. At the Surveyor's discretion a sample of each size and type of valve may be opened for examination and testing.
9. 7. 10 All cargo pumps, cargo booster pumps and cargo vapour pumps are to be opened out for examination. If requested by the Owner, these items may be examined on a Continuous Survey basis, provided the interval between examination of each item does not exceed five years. Pumping systems for inter-barrier spaces are to be checked and verified to be in good working order.
9. 7. 11 Piping for cargo and process systems including valves, actuators and compensators are to be opened for examination. Insulation may need to be removed, as deemed necessary, to ascertain the condition of the piping. If any doubt exists regarding the integrity of the piping based upon visual examination then, where deemed necessary by the Surveyor, a pressure test at 1.25 times MARVS for the pipeline is to be carried out. The complete piping systems are to be tested for leaks after re-assembly.
9. 7. 12 Equipment for the production of inert gas is to be examined and shown to be operating satisfactorily within the gas specification limits. Pipelines, valves, etc. for the distribution of the inert gas are to be generally examined. Pressure vessels for the storage of inert gas are to be examined internally and externally and the securing arrangements are to be specially examined. Pressure relief valves are to be demonstrated to be in good working order. Liquid nitrogen storage vessels are to be examined, so far as practicable, and all control equipment, alarms and safety devices are to be verified as operational.
9. 7. 13 Gastight bulkhead shaft seals are to be opened out so that the sealing arrangements may be checked.
9. 7. 14 Sea connections associated with the cargo handling equipment are to be opened out when the ship is in dry-dock.
9. 7. 15 The arrangements for discharging the cargo overboard in an emergency are to be checked.

## 9. 8 Special Survey I (ships five years old) – Reliquefaction/refrigeration equipment

- 9. 8. 1 Each reciprocating compressor is to be opened out. Cylinder bores, pistons, piston rods, connecting rods, valves and seats, glands, relief devices, suction filters and lubricating arrangements are to be examined. Crankshafts are to be examined, but crankcase glands and the lower half of main bearings need not be exposed if the Surveyor is satisfied with the alignment and wear.
- 9. 8. 2 Where other than reciprocating-type compressors are fitted, or where there is a program of replacement instead of surveys on board, alternative survey arrangements will be considered. Each case will be given individual consideration.
- 9. 8. 3 The water end covers of condensers are to be removed for examination of the tubes, tubeplates and covers.

- 9. 8. 4 Refrigerant condenser cooling water pumps, including standby pump(s) which may be used on other services, are to be opened out for examination.
- 9. 8. 5 Where a pressure vessel is insulated, sufficient insulation is to be removed, especially in way of connections and supports, to enable the vessel's condition to be ascertained.
- 9. 8. 6 Insulated pipes are to have sufficient insulation removed to enable their condition to be ascertained. Vapour seals are to be specially examined for their condition.
- 9. 8. 7 The Surveyor is to satisfy himself that all pressure relief valves and/or safety discs throughout the system are in good order. No attempt, however, is to be made to test primary refrigerant pressure relief valves on board ship.
- 9. 8. 8 The items covered by [Pt 1, Ch 3, 9.8 Special Survey I \(ships five years old\) – Reliquefaction/refrigeration equipment 9.8.1](#) to [Pt 1, Ch 3, 9.8 Special Survey I \(ships five years old\) – Reliquefaction/refrigeration equipment 9.8.4](#) may, at the request of the Owner, be examined on a Continuous Survey basis provided the interval between examination of each item does not exceed five years.

## **9. 9 Special Survey I (ships five years old) - Gas fuel burning equipment**

- 9. 9. 1 Where gas fuel is used for main propulsion purposes, the associated compressors and heat exchangers are to be opened out and examined as for reliquefaction/refrigeration equipment. The glycol/water or steam side of the heaters is to be hydraulically tested to 1.5 times the design pressure.
- 9. 9. 2 Gas fuel pipe trunks or casings are to be generally examined and the exhaust or inerting arrangements for these trunks are to be verified.
- 9. 9. 3 All alarms associated with the gas fuel burning systems are to be verified.

## **9. 10 Special Survey II and Special Surveys thereafter (ships 10 years old and over)**

- 9. 10. 1 The requirements of [Pt 1, Ch 3, 9.1 General](#) to [Pt 1, Ch 3, 9.9 Special Survey I \(ships five years old\) - Gas fuel burning equipment](#) are to be complied with.
- 9. 10. 2 Water cooled condensers in which the primary refrigerant is in contact with the shell are to have the end covers removed and the shell pneumatically tested to a pressure equal to the designed working pressure.
- 9. 10. 3 All other pressure vessels in the reliquefaction/refrigeration system, gas fuel burning system and other handling systems are to be pneumatically tested to a pressure equal to the designed working pressure.
- 9. 10. 4 The requirements for Close-up Survey and thickness measurement are given in [Pt 1, Ch 3, 9.12 Close-up Survey](#) and [Pt 1, Ch 3, 9.13 Thickness measurement](#).

## **9. 11 Special Survey III and Special Surveys thereafter (ships 15 years old and over)**

- 9. 11. 1 The requirements of [Pt 1, Ch 3, 9.1 General](#) to [Pt 1, Ch 3, 9.10 Special Survey II and Special Surveys thereafter \(ships 10 years old and over\)](#) are to be complied with.
- 9. 11. 2 For independent tanks of Type B, the Owner is to submit proposals for the extent of non-destructive testing of the cargo tanks well in advance of the Special Survey.

## 9. 12 Close-up Survey

9. 12. 1 The minimum requirements for Close-up Survey are given [Table 3. 9. 2: Minimum requirements for Close-up Survey - Ships for liquefied gases](#).
9. 12. 2 The Surveyor may extend the Close-up Survey, if deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and the structural arrangements or details which have suffered defects in similar spaces or on similar ships and tanks having structures approved with reduced scantlings.
9. 12. 3 For areas in tanks where coatings are found to be in GOOD condition, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), the extent of Close-up Survey may be specially considered.

**Table 3. 9. 2: Minimum requirements for Close-up Survey - Ships for liquefied gases**

| Special Survey I<br>(Ships 5 years old)   | Special Survey II<br>(Ships 10 years old)  | Special Survey III<br>(Ships 15 years old)  | Special Survey IV<br>(Ships 20 years old and over)  |
|---|--|---|---|
| <p>(1) One web frame in:</p> <p>(a) a topside ballast tank</p> <p>(b) a hopper side ballast tank</p> <p>(c) a double hull side ballast tank</p> <p>See Notes 1, 2, 5 and 6.</p> <p>(2) One transverse bulkhead in a ballast tank. See Notes 1, 3, 4, 5 and 6.</p>   | <p>(1) All web frames in either a topside ballast tank or a double hull side ballast tank. If such tanks are not fitted, another ballast tank is to be selected. See Notes 1, 2, 5 and 6.</p> <p>(2) One web frame in each remaining ballast tank. See Notes 1, 2, 5 and 6.</p> <p>(3) One transverse bulkhead in each ballast tank. See Notes 1, 3, 5 and 6</p> | <p>(1) All web frames in all ballast tanks. See Notes 1, 2, 5 and 6.</p> <p>(2) All transverse bulkheads in all ballast tanks. See Notes 1, 3, 5 and 6.</p> | <p>(1) All web frames in all ballast tanks. See Notes 1, 2, 5 and 6.</p> <p>(2) All transverse bulkheads in all ballast tanks. See Notes 1, 3, 5 and 6.</p> |
| <p>Note 1. Ballast tanks include topside, double hull side, double bottom, hopper side, or any combined arrangement of the aforementioned, and peak tanks where fitted.</p> <p>Note 2. Complete transverse web frame ring including adjacent structural members.</p> <p>Note 3. Transverse bulkhead complete, including girder system and adjacent structural members and adjacent longitudinal bulkhead structure.</p> <p>Note 4. Transverse bulkhead lower part including girder system and adjacent structural members.</p> <p>Note 5. For ships having independent cargo tanks of Type C, with a midship section similar to that of a general cargo ship, the extent of Close-up Survey may be specially considered.</p> <p>Note 6. The Surveyor may extend the Close-up Survey, if deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system, the structural arrangements or details which have suffered defects in similar spaces or on similar ships and tanks having structures approved with reduced scantlings.</p> |  |   |   |

## 9. 13 Thickness measurement

9. 13. 1 The minimum requirements for thickness measurement are given in [Table 3. 9. 3: Minimum requirements for thickness measurement - Ships for liquefied gases](#).
9. 13. 2 In areas where substantial corrosion, as defined in [Pt 1, Ch 3, 1.5 Definitions](#), has been noted, then additional measurements are to be carried out in accordance with [Table 3. 9. 4: Thickness measurement - Ships for liquefied gases - Structural areas with substantial corrosion](#) to determine

the full extent of the corrosion pattern. The survey will not be considered complete until these additional thickness measurements have been carried out.

**Table 3. 9. 3: Minimum requirements for thickness measurement - Ships for liquefied gases**

| Special Survey I<br>(Ships 5 years old)   | Special Survey III<br>(Ships 15 years old)   | Special Survey IV and subsequent<br>(Ships 20 years old and over)   |

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **10 Dredgers, hopper dredgers, sand carriers, hopper barges and reclamation craft**

## **10. 1 General**

10. 1. 1 The requirements of this Section are to be complied with, as applicable, in addition to the survey requirements of [Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements](#), [Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements](#), [Pt 1, Ch 3, 4 Bottom Surveys – In Dry-Dock and In-Water - Hull and machinery requirements](#) and [Pt 1, Ch 3, 5 Special Survey - General - Hull requirements](#). Where surveys are required on dredging or hopper equipment such as gantries, bottom doors and their operating gear, positioning spuds and suction pipe attachments or split hull devices such as actuating and locking devices, these will be limited to the extent considered necessary by the Surveyor to satisfy himself that their condition or malfunction will not adversely affect the ship's structure.
10. 1. 2 Where applicable, the Bottom Survey is to include the examination of hopper doors and their fittings, and of hopper valves.

## **10. 2 Special Surveys**

10. 2. 1 On ships up to 10 years old (Special Survey I and II):
- Hoppers are to be cleared and cleaned as necessary and examined.
  - Where applicable, hopper doors or valves are to be opened and closed, so far as practicable, but keel blocks need not normally be moved specially to permit this to be done.
  - The integrity of hopper overflows and diluting water inlet and distribution structures is to be confirmed. Weir valves and sluices are to be tested to ensure proper operation, particular attention being paid to the lower weir when weirs are fitted at more than one level.
  - Attention is to be given to shell plating in way of hopper overflows.
  - The attachment to the ship's structure of all main items of dredging equipment, including gantries, 'A' frames, spud controlgear supports and items provided to facilitate separation of split hulls including hinge pin gudgeons, anchorages for rams and locking devices, is to be carefully examined to ensure that no fracture is present.
10. 2. 2 On ships 15 years old and over (Special Survey III and subsequent Special Surveys):
- Attention is to be given by the Surveyor to the structure in way of dredging pumps.
  - Hopper doors, valves and items provided to facilitate separation of split hulls are to be checked for proper operation, and their hinges, controlgear and other fittings are to be examined for wear or distortion. All seals and wear-down strips are to be replaced if necessary, but a watertight seal is not normally required. Attention is to be paid to areas likely to be suffering from excessive erosion.

---

- c. Those items of dredging gear and equipment whose efficiency is not part of classification but whose failure or malfunctioning is, nevertheless, likely to adversely affect the ship's structure, are to be examined to ensure that the structural integrity of the ship is maintained.

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **11 Machinery surveys - General requirements**

## **11. 1 Annual, Intermediate and Bottom Surveys**

- 11. 1. 1 For Annual, Intermediate and Docking Surveys, *see* [Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements](#), [Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements](#) and [Pt 1, Ch 3, 4 Bottom Surveys – In Dry-Dock and In-Water - Hull and machinery requirements](#).
- 11. 1. 2 For ships assigned the notation ‘laid-up’, a general examination of the machinery is to be carried out in lieu of the normal Annual Survey requirements.

## **11. 2 Complete Surveys**

- 11. 2. 1 While the ship is in dry-dock, all openings to the sea in the machinery spaces and pump-rooms, together with the valves, cocks and the fastenings with which these are connected to the hull, are to be examined.
- 11. 2. 2 All shafts (except screwshafts and tube shafts, for which special arrangements are detailed in [Pt 1, Ch 3, 18 Screwshafts, tube shafts and propellers](#)), thrust block and all bearings are to be examined. The lower halves of bearings need not be exposed if alignment and wear are found to be acceptable.
- 11. 2. 3 An examination is to be made of all reduction gears complete with all wheels, pinions, shafts, bearings and gear teeth, thrust bearings and incorporated clutch arrangements.
- 11. 2. 4 The following auxiliaries and components are also to be examined:
  - a. Auxiliary engines, auxiliary air compressors with their intercoolers, filters and/or oil separators and safety devices, and all pumps and components used for essential services.
  - b. Steering machinery.
  - c. Windlass and associated driving equipment, where fitted.
  - d. Evaporators (other than those of vacuum type) and their safety valves, which should be seen in operation under steam.
  - e. The holding down bolts and chocks of main and auxiliary engines, gearcases, thrust blocks and intermediate shaft bearings.
  - f. Where Thrusters and/or Podded Propulsors are fitted and have been assigned the ACSPlus descriptive note **ThCM**, the degree of inspection required whilst in dock will be determined by the analysis of Condition Monitoring records. Refer to *ACSPlus Procedure Machinery Planned Maintenance and Condition Monitoring*, Section 8.
- 11. 2. 5 All air receivers for essential services, together with their mountings, valves and safety devices, are to be cleaned internally and examined internally and externally. If internal examination of the air receivers is not practicable, they are to be tested hydraulically to 1.3 times the working pressure.
- 11. 2. 6 The valves, cocks and strainers of the bilge system, including bilge injection, are to be opened up as considered necessary by the Surveyor and, together with pipes, are to be examined and tested

under working conditions. The fuel oil, feed, lubricating oil and cooling water systems, emissions abatement plant for combustion machinery where installed, as well as the Ballast Water Treatment System (BWTS) where installed, ballast connections and blanking arrangements to deep tanks which may carry liquid or dry cargoes, together with all pressure filters, heaters and coolers used for essential services, are to be opened up and examined or tested, as considered necessary by the Surveyor. All safety devices for the foregoing items are to be examined.

11. 2. 7 Water ingress detection arrangements fitted on single hold cargo ships having length less than 80 m and bulk carriers and flooding detection systems fitted on passenger ships are to be tested to demonstrate that they are in good working order. Alternatively, this testing may be conducted during the required hull Special Survey space examinations, *see also* [Pt 1, Ch 3, 5.3 Examination and testing](#).
11. 2. 8 Fuel tanks which do not form part of the ship's structure are to be examined and, if considered necessary by the Surveyor, they are to be tested to the pressure specified for new tanks. The tanks need not be examined internally at the first survey if they are found satisfactory on external inspection. The mountings, fittings and remote controls of all fuel oil tanks are to be examined, so far as practicable.
11. 2. 9 Where remote and/or automatic controls are fitted for essential machinery, they are to be tested to demonstrate that they are in good working order.
11. 2. 10 For ships fitted with a dynamic positioning system, the control system and associated machinery items are to be examined and tested under operating conditions to an approved Test Schedule.
11. 2. 11 In addition to the above, detailed requirements for steam and gas turbines and steam engines, engines, electrical installations and boilers are given in [Pt 1, Ch 3, 12 Turbines and steam engines - Detailed requirements](#), [Pt 1, Ch 3, 13 Reciprocating internal combustion engines - Detailed requirements](#), [Pt 1, Ch 3, 14 Electrical equipment](#) and [Pt 1, Ch 3, 15 Boilers](#) respectively. In certain instances, upon application by the Owner or where indicated by the maker's servicing recommendations, the Committee will give consideration to the circumstances where deviation from these detailed requirements is warranted, taking account of design, appropriate indicating equipment (e.g. vibration indicators) and operational records.
11. 2. 12 For a fuel installation using **gases or other low-flashpoint fuels** *see also* [Pt 1, Ch 3, 24.8 Complete Surveys - General requirements](#) and [Pt 1, Ch 3, 24.9 Complete Surveys - Consumers and other equipment](#).

CHAPTER **3 Periodical Survey Regulations**

SECTION **12 Turbines and steam engines - Detailed requirements**

**12. 1 Complete Surveys**

- 12. 1. 1 The requirements of [Pt 1, Ch 3, 11 Machinery surveys - General requirements](#) are to be complied with.
- 12. 1. 2 The working parts of the main engine and attached pumps, and of auxiliary machinery used for essential services, are to be opened out and examined, including:
  - a. For reciprocating engines:
    - i. Bulkhead stop valves and manoeuvring valves.
    - ii. Cylinders.
    - iii. Pistons, piston rods, connecting rods, crossheads and guides.
    - iv. Valves and valve gear.
    - v. Crankshaft.
  - b. For turbine machinery:
    - i. Blading and rotors.
    - ii. Flexible couplings.
    - iii. Casings.
- 12. 1. 3 In gas turbines and free piston gas generators, the following parts, also, are to be opened out and examined:
  - Impellers or blading.
  - Rotors and casings of the air compressors.
  - Combustion chambers and burners.
  - Intercoolers and heat exchangers.
  - Gas and air piping, and fittings.
  - Starting and reversing arrangements.
- 12. 1. 4 Where gas turbines operate in conjunction with free piston gas generators, the following parts of the latter are to be opened out and examined:
  - Gas and air compressor cylinders and pistons.
  - Compressor end covers.
  - Valves and valve gear.
  - Fuel pumps and fittings.

- Synchronizing and controlgear.
  - Cooling system.
  - Explosion relief devices.
  - Gas and air piping.
  - Receivers and valves, including by-pass arrangements.
12. 1. 5 Condensers, steam reheaters, desuperheaters which are not incorporated in the boilers, and any other appliances used for essential services, are to be examined to the satisfaction of the Surveyor and, if it is considered necessary, they are to be tested.
12. 1. 6 The manoeuvring of the engines is to be tested under working conditions.
12. 1. 7 Exhaust steam turbines supplying power for main propulsion purposes in conjunction with reciprocating engines together with their gearing and appliances, steam compressors or electrical machinery, are to be examined, so far as practicable. Where cone connections to internal gear shafts are fitted, the coned ends are to be examined, so far as practicable.
12. 1. 8 In ships having essential auxiliary machinery driven by engines, the prime movers of these auxiliaries are to be examined as detailed in [Pt 1, Ch 3, 13 Reciprocating internal combustion engines - Detailed requirements](#).

CHAPTER **3 Periodical Survey Regulations**

SECTION **13 Reciprocating internal combustion engines - Detailed requirements**

**13. 1 Scope**

13. 1. 1 The requirements of this Section are applicable to reciprocating internal combustion engines, operating on liquid, gas or dual fuel, providing power for services essential to the safety of the vessel.

**13. 2 Complete Surveys**

13. 2. 1 The requirements of [Pt 1, Ch 3, 11 Machinery surveys - General requirements](#) are to be complied with.
13. 2. 2 The following parts are to be opened out and examined:
- Cylinders and covers.
  - Pistons, piston rods, connecting rods, crossheads and guides.
  - Valves and valve gear.
  - Crankshafts and all bearings.
  - Crankcases, bedplates and entablatures.
  - Crankcase door fastenings, explosion relief devices and scavenge relief devices.
  - Scavenge pumps, scavenge blowers, superchargers and their associated coolers.
  - Air compressors and their intercoolers.
  - Filters and/or separators and safety devices.
  - Fuel pumps and fittings.
  - Camshaft drives and balancer units.
  - Vibration dampers or detuners.
  - Flexible couplings and clutches.
  - Reverse gears.
  - Attached pumps and cooling arrangements.
13. 2. 3 Selected pipes in the starting air system are to be removed for internal examination and are to be hammer tested. If any appreciable amount of lubricating oil is found in the pipes, the starting air

system is to be thoroughly cleaned internally by steaming out, or other suitable means. Some of the pipes selected are to be those adjacent to the starting air valves at the cylinders and to the discharges from the air compressors.

- 13. 2. 4 The electric ignition system, if fitted, is to be examined and tested.
- 13. 2. 5 The manoeuvring of engines is to be tested under working conditions. Initial starting arrangements are to be tested.
- 13. 2. 6 Where steam is used for essential purposes, the condensing plant, feed pumps and fuel oil burning plant are to be examined and the steam pipes examined and tested as detailed in [Pt 1, Ch 3, 16 Steam pipes](#).

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **14 Electrical equipment**

## **14. 1 Annual and Intermediate Surveys**

- 14. 1. 1 The electrical contacts of air circuit-breakers are to be visually inspected and maintained in accordance with the manufacturer's recommendations by suitably qualified and trained personnel. Appropriate maintenance records are to be made available to the attending Surveyor on request.
- 14. 1. 2 Where harmonic filters are fitted, the harmonic distortion level is to be measured annually and after any modification to the electrical distribution system or associated consumers. As a minimum, harmonic distortion measurements are to be taken at the main busbar under seagoing conditions, as close to the annual survey as possible, and readings are to be recorded when the greatest amount of distortion is indicated, by suitably qualified and trained personnel. Records are to include which equipment was running including the load on it and the filters that were in service. These records are to be made available to the attending Surveyor on request.
- 14. 1. 3 The requirements of [Pt 1, Ch 3, 2.2 Annual Surveys](#) and [Pt 1, Ch 3, 3.3 Intermediate Surveys](#) are to be complied with as far as applicable.

## **14. 2 Complete Surveys**

- 14. 2. 1 An electrical insulation resistance test is to be made on the electrical equipment and cables. The installation may be sub-divided, or equipment which may be damaged disconnected, for the purpose of this test.
- 14. 2. 2 The fittings on the main and emergency switchboard, section boards and distribution boards are to be examined and over-current protective devices and fuses inspected to verify that they provide suitable protection for their respective circuits.
- 14. 2. 3 Generator circuit-breakers are to be tested, so far as practicable, to verify that protective devices including preference tripping relays, if fitted, operate satisfactorily.
- 14. 2. 4 Air circuit-breakers for essential or emergency services and rated at 800 A and above are to be surveyed to ensure that the manufacturer's recommended number of switching options has not been exceeded. See [Pt 6, Ch 2, 7.3 Circuit-breakers 7.3.6](#). Where a breaker is not fitted with an automatic counter, a written record is to be kept.
- 14. 2. 5 The electric cables are to be examined, so far as practicable, without undue disturbance of fixtures or casings, unless opening up is considered necessary as a result of observation or of the tests required by [Pt 1, Ch 3, 14.2 Complete Surveys 14.2.1](#).
- 14. 2. 6 The generator prime movers are to be surveyed as required by [Pt 1, Ch 3, 12 Turbines and steam engines - Detailed requirements](#) and [Pt 1, Ch 3, 13 Reciprocating internal combustion engines - Detailed requirements](#) and the governing of the engines tested. The motors concerned with essential services together with associated control and switch gear are to be examined and, if considered necessary, are to be operated, so far as practicable, under working conditions. All

generators and steering gear motors are to be examined and are to be operated under working conditions, though not necessarily under full load or simultaneously.

14. 2. 7 Where transformers associated with supplies to essential services are liquid-immersed, the Owner is to arrange for samples of the liquid to be taken and tested for dissolved gases, breakdown voltage, acidity and moisture by a competent testing authority, in accordance with the equipment manufacturer's requirements, and a certificate giving the test results is to be made available to the Surveyor on request.
14. 2. 8 Navigation light indicators are to be tried under working conditions, and correct operation on the failure of supply or failure of navigation lights is to be verified.
14. 2. 9 The emergency sources of electrical power, their automatic arrangements and associated circuits are to be tested.
14. 2. 10 Emergency lighting, transitional emergency lighting, supplementary emergency lighting, general emergency alarm and public address systems are to be tested as far as practicable.
14. 2. 11 Where the ship is electrically propelled, the propulsion motors, generators, propulsion transformers, propulsion conversion equipment, cables, harmonic filters, neutral earthing resistors, dynamic braking resistors and all ancillary electrical equipment that forms part of the propulsion drive and control system, exciters and ventilating plant (including coolers) associated therewith are to be surveyed, and the insulation resistance to earth is to be tested. Special attention is to be given to windings, commutators and slip-rings. Where practicable, the low voltage and high voltage windings of cast resin propulsion transformers are to be subjected to boroscopic inspection, to assess the physical condition of their insulation and for signs of mechanical and thermal damage. The operation of protective gear and alarm devices is to be checked, so far as practicable. Insulating oil, if used, is to be tested in accordance with [Pt 1, Ch 3, 14.2 Complete Surveys 14.2.7](#). Interlocks intended to prevent unsafe operations or unauthorised access are to be checked to verify that they are functioning correctly. Emergency overspeed governors are to be tested.
14. 2. 12 Where the ship has high voltage electrical equipment and associated cables used for essential services, the Surveyor is to visually examine the condition of their insulation systems for signs of deterioration, including partial discharge activity. Where deemed necessary by the Surveyor, boroscopic and/or endoscopic inspections are to be conducted. Areas to be considered for examination are to include, but are not limited to:
  - winding ends of all high voltage electrical machines;
  - electrical motor core laminations; stator wedges; stator bars; space blocks; and connection rings;
  - terminal connections of high voltage equipment; and
  - high voltage cable connections.
14. 2. 13 Where on-line partial discharge monitoring equipment has been fitted to high voltage equipment used for the provision of essential services, the Surveyor is to review the test reports for signs of deteriorating performance of the insulation system, see [Pt 6, Ch 2, 21.4 On-line partial discharge testing of high voltage rotating machines for essential services](#).
14. 2. 14 A General Examination of the electrical equipment in areas which may contain flammable gas or vapour and/or combustible dust is to be made to ensure that the integrity of the safe-type electrical equipment has not been impaired owing to corrosion, missing bolts, etc. and that there is not an excessive build-up of dust on or in dust protected electrical equipment. Cable runs are to be examined for sheath and armouring defects, where practicable, and to ensure that the means of supporting the cables are in good order. Tests are to be carried out to demonstrate the effectiveness of bonding straps for the control of static electricity. Alarms and interlocks associated with pressurized equipment or spaces are to be tested for correct operation.

14. 2. 15 For ships having an **OPS** notation assigned, the onshore power supply arrangements are to be examined and functionally tested whilst connected to an external electrical power supply in accordance with approved test schedules (see [Pt 7, Ch 13 On-shore Power Supplies](#)) during the Complete Surveys of machinery or, where it is not practical to provide the facilities and operations for testing during the required Surveys of other machinery items, within 12 months of the due date of the Complete Surveys of machinery.

### **14. 3 Bottom Surveys**

14. 3. 1 For tankers five years old and over, [Pt 1, Ch 3, 14.2 Complete Surveys 14.2.14](#) is to be complied with. In addition, an electrical insulation resistance test of the circuits terminating in, or passing through, the hazardous zones and spaces is to be carried out.

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **15 Boilers**

## **15. 1 Frequency of surveys**

- 15. 1. 1 All boilers, economizers, steam receivers, steam heated steam generators, thermal oil and hot water units intended for essential services, together with boilers used exclusively for non-essential services having a working pressure exceeding 0.35 MPa and a heating surface exceeding 4.5 m<sup>2</sup> are to be surveyed internally. There is to be a minimum of two internal examinations during each five-year Special Survey cycle. The interval between any two such examinations is not to exceed 36 months. A general external examination is to be carried out at the time of the Annual Survey.
- 15. 1. 2 Consideration may be given in exceptional circumstances to an extension of the internal examination of the boiler not exceeding three months beyond the due date. The extension may be granted after the following is satisfactorily carried out:
  - a. External examination of the boiler.
  - b. Examination and operational test of the boiler safety valve relieving gear (easing gear).
  - c. Operational tests of the boiler protective devices.
  - d. Review of the following records since the previous boiler survey:
    - i. Operation
    - ii. Maintenance
    - iii. Repair history
    - iv. Feedwater chemistry.In this context 'exceptional circumstances' means unavailability of repair facilities, essential materials, equipment or spare parts, or delays incurred by action taken to avoid severe weather conditions.
- 15. 1. 3 An external survey of boilers including tests of safety and protective devices, and tests of safety valves using their relieving gear, is to be carried out annually within the range dates of the Annual Survey of the ship. For exhaust gas heated economizers, the safety valves are to be tested by the Chief Engineer at sea within the range dates of the Annual Survey. This test is to be recorded in the log book and reviewed by the attending Surveyor prior to crediting the Annual Survey.

## **15. 2 Scope of surveys**

- 15. 2. 1 At the surveys described in [Pt 1, Ch 3, 15.1 Frequency of surveys](#), the boilers, superheaters, economizers and air heaters are to be examined internally on the water-steam side and the fire side. Where considered necessary, the pressure parts are to be tested by hydraulic pressure and the thicknesses of plates and tubes and sizes of stays are to be ascertained to determine a safe working pressure. The safety valves and principal mountings on boilers, superheaters and economizers are to be examined and opened up as necessary by the Surveyor. The adjustment of safety valves is to be verified during each boiler internal survey. Boiler safety valves and their relieving gear are to be examined and tested to verify their satisfactory operation. Safety valves are to be set under steam to a pressure not greater than the approved design pressures of the respective parts. As a

working tolerance, the setting is acceptable, provided that the valves lift at not more than 103 per cent of the approved design pressure. However, for exhaust gas heated economizers, if steam cannot be raised in port, the safety valves may be set by the Chief Engineer at sea, and the results recorded in the log book and reviewed by the attending Surveyor. The following records since the previous Boiler Survey are to be reviewed as part of the survey:

- Operation
- Maintenance
- Repair history
- Feedwater chemistry.

The remaining mountings are to be examined externally and, if considered necessary by the Surveyor, are to be opened up for internal examination. Collision chocks, rolling stays and boiler stools are to be examined and maintained in an efficient condition.

15. 2. 2 In addition to the foregoing, in exhaust gas heated economizers of the shell type, all accessible welded joints are to be subjected to a visual examination in order to identify any evidence of cracking. Non-destructive testing may be required for this purpose and may be requested by the Surveyor.
15. 2. 3 In fired boilers employing forced circulation, the pumps used for this service are to be opened and examined at each Boiler Survey.
15. 2. 4 The fuel oil burning system is to be examined under working conditions and a General Examination made of fuel tank valves, pipes, deck controlgear and oil discharge pipes between pumps and burners.
15. 2. 5 At each survey of a cylindrical boiler which is fitted with smoke tube superheaters, the saturated steam pipes are to be examined as detailed in Section 16.
15. 2. 6 At the annual General Examination referred to in [Pt 1, Ch 3, 15.1 Frequency of surveys 15.1.1](#) the requirements of [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.15](#) to [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.17](#) are to be complied with.

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **16 Steam pipes**

## **16. 1 Frequency of surveys**

- 16. 1. 1 Saturated steam pipes, as well as superheated steam pipes where the temperature of the steam at the superheater outlet is not over 450°C, are to be surveyed 10 years from the date of build (or installation) and thereafter at five-yearly intervals.
- 16. 1. 2 Superheated steam pipes where the temperature of the steam at the superheater outlet is over 450°C are to be surveyed five years from the date of build (or installation) and thereafter at five-yearly intervals.
- 16. 1. 3 At 10 years from the date of build (or installation) and thereafter at five-yearly intervals, all copper or copper alloy steam pipes over 76 mm external diameter supplying steam for essential services at sea, are to be hydraulically tested to twice the working pressure.

## **16. 2 Scope of surveys**

- 16. 2. 1 At each survey, a selected number of main steam pipes, also of auxiliary steam pipes, which:
  - a. are over 76 mm external diameter,
  - b. supply steam for essential services at sea, and
  - c. have bolted joints,are to be removed for internal examination and are to be hydraulically tested to 1.5 times the working pressure. If these selected pipes are found satisfactory in all respects, the remainder need not be tested. So far as practicable, the pipes are to be selected for examination and hydraulic test in rotation, so that in the course of surveys all sections of the pipeline will be tested.
- 16. 2. 2 Where main and/or auxiliary steam pipes of the category described in [Pt 1, Ch 3, 16.2 Scope of surveys 16.2.1](#) and [Pt 1, Ch 3, 16.2 Scope of surveys 16.2.1.\(b\)](#) have welded joints between the lengths of pipe and/or between pipes and valves, the lagging in way of the welds is to be removed, and the welds examined and, if considered necessary by the Surveyor, crack detected. Pipe ranges having welded joints are to be hydraulically tested to 1.5 times the working pressure. Where lengths having ordinary bolted joints are fitted in such pipe ranges and can be readily disconnected, they are to be removed for internal examination and hydraulically tested to 1.5 times the working pressure.
- 16. 2. 3 Where, on cylindrical boilers having smoke tube superheaters, the saturated steam pipes adjoining the saturated steam headers are situated partly in the boiler smoke boxes, all such pipes adjoining and cross-connecting these headers in the smoke boxes are, at the surveys required by [Pt 1, Ch 3, 16.1 Frequency of surveys](#), to be included in the pipes selected for examination and testing, as defined in [Pt 1, Ch 3, 16.2 Scope of surveys 16.2.1](#). Where the saturated steam pipes inside the smoke boxes consist of steel castings of substantial construction, these requirements need only be applied to a sample casting. Where steel castings are not fitted, the Surveyor is to satisfy himself

of the condition of the ends of the saturated steam pipes in the smoke boxes at each Boiler Survey and, if he considers it necessary, a sample pipe is to be removed for examination.

16. 2. 4 At the surveys specified in [Pt 1, Ch 3, 16.1 Frequency of surveys 16.1.3](#), any of the copper or copper alloy pipes, such as those having expansion or other bends, which may be subject to bending and/or vibration, also closing lengths adjacent to steam-driven machinery, are to be annealed before being tested.
16. 2. 5 Where it is inconvenient for the Owner to fulfill all the requirements of a Steam Pipe Survey at its due date, the Committee will be prepared to consider postponement of the survey, either wholly or in part.

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **17 Screwshafts, tube shafts and propellers**

## 17. 1 Applicability

- 17. 1. 1 The requirements of this Section are applicable as follows:
  - a. to ships delivered on or after 1 January 2016; and
  - b. after the first screwshaft survey scheduled on or after 1 January 2016 for ships delivered before 1 January 2016.
- 17. 1. 2 For ships delivered before 1 January 2016, the first screwshaft survey held on or after 1 January 2016 is to be held in accordance with the requirements of [Pt 1, Ch 3, 18 Screwshafts, tube shafts and propellers](#).

## 17. 2 Definitions

- 17. 2. 1 **Adequate means for protection against corrosion.** An adequate means for protection against corrosion is an approved means for full protection of the shaft against sea water intrusion and subsequent corrosion attack. Such means are used for the protection of common steel material against corrosion particularly in combination with water lubricated bearings. Typical means are to be for example:
  - a. continuous metallic, corrosion-resistant liners ([Pt 5, Ch 6, 3.9 Bronze or gunmetal liners on shafts](#)),
  - b. continuous cladding,
  - c. multiple layer synthetic coating,
  - d. multiple layers of fiberglass,
  - e. combinations of above mentioned,
  - f. rubber/elastomer covering coating.The means for protection against corrosion are to be installed/applied according to ACS approved procedures.
- 17. 2. 2 **Fresh Water sample test.** At the Screwshaft Survey, a sample of the fresh water in a closed loop fresh water lubricated shaft is to be taken in the presence of a Surveyor. The requirements for Fresh Water sample tests are given in the *ACSPlus Procedure Machinery Planned Maintenance and Condition Monitoring*.
- 17. 2. 3 **Lubricating oil analysis.** Lubricating oil analysis is to be carried out at regular intervals not exceeding six months. The documentation on lubricating oil analysis is to be available on board. Oil samples, to be submitted for the analysis, are to be taken under service conditions.
- 17. 2. 4 **Oil sample examination.** An oil sample examination is a visual examination of the sterntube lubricating oil taken in the presence of a Surveyor, with a focus on water contamination.
- 17. 2. 5 **Service records.** Service records are regularly recorded data showing in-service conditions of the shaft(s) and are to include:

- a. For Oil Lubricated Stern Bearings: lubricating oil temperature, bearing temperature and oil consumption records.
  - b. For Closed Loop System Fresh Water Lubricated Bearings: water flow, water temperature, salinity, pH, make-up water and water pressure (depending on design).
- 17.2.6 **Survey methods on closed systems.** Oil Lubricated Shafts or Closed Loop System Fresh Water Lubricated Shafts:
- a. **TS Method 1** – Survey of screwshaft, tube shaft and propeller in accordance with the requirements of TS Method 1, see [Table 3. 17. 3: Shaft survey methods](#). Primarily the shaft is withdrawn and the propeller is removed.
  - b. **TS Method 2** – Survey of screwshaft, tube shaft and propeller in accordance with the requirements of TS Method 2, see [Table 3. 17. 3: Shaft survey methods](#). Primarily records are reviewed, the propeller is removed but the shaft is not withdrawn.
  - c. **TS Method 3** – Survey of screwshaft, tube shaft and propeller in accordance with the requirements of TS Method 3, see [Table 3. 17. 3: Shaft survey methods](#). Primarily records are reviewed, the shaft is not withdrawn and the propeller is not removed.
- 17.2.7 **Survey Methods on Open Systems.** Water Lubricated Shafts:
- a. **TS Method 4** – Survey of screwshaft, tube shaft and propeller in accordance with the requirements of TS Method 4, see [Table 3. 17. 3: Shaft survey methods](#). Primarily the shaft is withdrawn and the propeller is removed.
- 17.2.8 **Tube shaft** is a shaft placed between the intermediate shaft and propeller shaft, normally arranged within a sterntube or running in open water. It may also be called a sterntube shaft.

### **17.3 Closed systems – Oil lubricated shafts or closed loop system fresh water lubricated shafts: Frequency of surveys**

- 17.3.1 Oil lubricated shafts fitted with approved oil glands and closed loop system fresh water lubricated shafts fitted with approved adequate means of protection against corrosion or fabricated from corrosion-resistant material are to be surveyed in accordance with [Pt 1, Ch 3, 17.3 Closed systems – Oil lubricated shafts or closed loop system fresh water lubricated shafts: Frequency of surveys 17.3.2 to Pt 1, Ch 3, 17.3 Closed systems – Oil lubricated shafts or closed loop system fresh water lubricated shafts: Frequency of surveys 17.3.5](#).
- 17.3.2 Shafts with a keyless propeller connection or a flanged propeller connection (including controllable pitch propellers for main propulsion purposes) are to be surveyed at intervals of five years in accordance with TS Method 1, 2 or 3.
- 17.3.3 Shafts with a keyed propeller connection with a keyway that complies fully with the present Rules are to be surveyed at intervals of five years in accordance with TS Method 1 or 2; TS Method 3 is not permitted.
- 17.3.4 For oil lubricated keyless shafts, the maximum interval between two surveys carried out according to TS Method 1 or TS Method 2 shall not exceed 15 years, except in the case when one extension for no more than three months is agreed.
- 17.3.5 Closed loop system fresh water lubricated shafts may be surveyed in accordance with TS Method 2 or for keyless shafts TS Method 3, only if the descriptive note **ACSPlus SCM** is assigned. Notwithstanding this, the maximum interval between two surveys carried out according to TS Method 1 shall not exceed 15 years, except in the case when one extension for no more than three months is agreed.
- 17.3.6 Shaft configurations other than those listed in [Pt 1, Ch 3, 17.3 Closed systems – Oil lubricated shafts or closed loop system fresh water lubricated shafts: Frequency of surveys 17.3.1 to Pt 1, Ch 3, 17.3 Closed systems – Oil lubricated shafts or closed loop system fresh water lubricated shafts:](#)

[Frequency of surveys 17.3.5](#) above are to be surveyed at intervals of three years in accordance with TS Method 1.

- 17.3.7 TS Method 2 and TS Method 3 are only permitted where the prerequisite service records and data specified for those methods are to be provided. If at the time of survey the attending Surveyor is not satisfied with the service records and data presented, then the shaft may be required to be withdrawn. The service records and data are to be retained onboard and audited by ACS at the Annual Survey.
- 17.3.8 For oil lubricated arrangements, the descriptive note **ACSPlus SCM** is not a prerequisite in order to hold TS Method 2 and TS Method 3.
- 17.3.9 In order to assign and maintain the descriptive note **ACSPlus SCM**, the requirements of [Pt 5, Ch 6, 4 Control and Monitoring](#) and *ACSPlus Procedure Machinery Planned Maintenance and Condition Monitoring, Section 4*, are to be complied with, including the requirements therein for onboard maintenance of records and review of them by the attending Surveyor at Annual Survey.
- 17.3.10 For surveys completed within three months before the Shaft Survey due date, the next period will start from the Shaft Survey due date.
- 17.3.11 See Summary of Survey Intervals and Extensions for closed systems in [Table 3. 17. 1: Summary of survey intervals and extensions – Closed systems](#).

## 17.4 Open Systems – Water Lubricated Shafts: Frequency of surveys

- 17.4.1 Survey in accordance with TS Method 4 at intervals of five years is applicable to any of the following:
  - a. Single shaft operating in fresh water only,
  - b. Single shaft provided with approved adequate means of protection against corrosion or fabricated from corrosion-resistant material,
  - c. Multiple shaft arrangements.
- 17.4.2 Single shaft configurations other than listed above are to be surveyed every three years in accordance with TS Method 4.
- 17.4.3 For shafts subject to five-yearly surveys with keyless connections, at the Surveyor's discretion removal of the propeller and NDE of the shaft taper, as required by TS Method 4, need only be carried out every 15 years, subject to a satisfactory visual inspection of all accessible parts of the shafting system at the intervening surveys.
- 17.4.4 For surveys completed within three months before the Shaft Survey due date, the next survey period will start from the Shaft Survey due date.
- 17.4.5 At the discretion of the Classification Committee, consideration may be given to accept special arrangements to monitor the condition of the screwshaft, bearings, sealing devices and the sterntube lubricant system so as to allow an extension to the interval between withdrawals of the Screwshaft required by TS Method 4. This is subject to the shaft being provided with approved adequate means of protection against corrosion or being fabricated from corrosion-resistant material.
- 17.4.6 See Summary of Survey Intervals and Extensions for open systems in [Table 3. 17. 2: Summary of survey intervals and extensions – Open systems](#).

## 17.5 Survey extensions

- 17.5.1 For all types of propeller connections, consideration can be given at the discretion of the Classification Committee to an extension of the interval between two consecutive surveys after the execution of an extension survey as follows:

- a. Extension up to a maximum of two and a half years: Only permitted for closed systems. No more than one extension can be considered. No further extension, of other type, can be considered.
  - b. Extension up to a maximum of one year: Two consecutive 'one year extensions' can be considered. Where an additional extension is agreed the requirements of the 'two and a half year extension' are to be carried out and the Shaft Survey due date, prior to the previous extension(s), is extended for a maximum of two and a half years.
  - c. Extension up to a maximum of three months: One 'three month extension' can be considered. In the event an additional extension is agreed the requirements of the "one year extension" or 'two and a half years extension' are to be carried out and the Shaft Survey due date, prior to the previous extension, is extended for a maximum of one year or two and a half years.
17. 5. 2 If the extension survey is carried out within one month of the shaft survey due date then the extension will take effect from the Shaft Survey due date.
17. 5. 3 If the extension survey is carried out more than one month prior to the Shaft Survey due date, then the period of extension will take effect from the date on which the extension survey was completed.

**Table 3. 17. 1: Summary of survey intervals and extensions – Closed systems**

| Oil Lubricated   |                             |                             |  |
|--|-----------------------------|-----------------------------|--|
|  | Flanged Propeller Coupling  | Keyless Propeller Coupling  | Keyed Propeller Coupling<br>(see Note b) |
| Every 5 years (see Note a)   | TS Method 1 or              | TS Method 1 or              | TS Method 1 or                           |
|  | TS Method 2 or              | TS Method 2 or              | TS Method 2                              |
|  | TS Method 3                 | TS Method 3 (see Note c)    |  |
| Extension 2.5 years  | Yes (see Note d)            | Yes (see Note d)            | Yes (see Note d)                         |
| Extension 1 year   | Yes (see Note e)            | Yes (see Note e)            | Yes (see Note e)                         |
| Extension 3 months   | Yes (see Note f)            | Yes (see Note f)            | Yes (see Note f)                         |
| Closed Loop System Fresh Water Lubricated  |                             |                             |  |
|  | Flanged Propeller Coupling  | Keyless Propeller Coupling  | Keyed Propeller Coupling<br>(see Note b) |
| Every 5 years (see Note a)   | TS Method 1 (see Note g) or | TS Method 1 (see Note g) or | TS Method 1 (see Note g) or              |
|  | TS Method 2 or              | TS Method 2 or              | TS Method 2                              |
|  | TS Method 3                 | TS Method 3                 |  |
| Extension 2.5 years  | Yes (see Note d)            | Yes (see Note d)            | Yes (see Note d)                         |
| Extension 1 year   | Yes (see Note e)            | Yes (see Note e)            | Yes (see Note e)                         |
| Extension 3 months   | Yes (see Note f)            | Yes (see Note f)            | Yes (see Note f)                         |
| General notes:   |                             |                             |  |
| For surveys (TS Method 1, or TS Method 2, or TS Method 3) completed within 3 months before the Shaft Survey due date, the next period will start from the shaft survey due date.   |                             |                             |  |
| If the extension survey is carried out within 1 month of the shaft survey due date then the extension will take effect from the shaft survey due date. If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension counts from the date when the extension survey was completed. |                             |                             |  |

**Notes:**

Note a. Unless an Extension (Extension 2.5 years, Extension one year, Extension three months) is applied in between.

Note b. TS Method 3 not allowed.

Note c. The maximum interval between two surveys carried out according to TS Method 1 or TS Method 2 shall not exceed 15 years, except in the case when one extension for no more than 3 months is agreed.

Note d. No more than one extension can be considered. No further extension of other type can be considered.

Note e. Two consecutive extensions can be considered. Where an additional extension is agreed the requirements of the '2.5 year extension' are to be carried out and the shaft survey due date, prior to the previous extension(s), is extended for a maximum of 2.5 years.

Note f. Extension up to a maximum of 3 months: One "3 month extension" can be considered. In the event an additional extension is agreed the requirements of the 'one year extension' or '2.5 years extension' are to be carried out and the shaft survey due date, prior to the previous extension, is extended for a maximum of one year or 2.5 years.

Note g. The maximum interval between two surveys carried out according to TS Method 1 shall not be more than 15 years, except in the case when one extension for no more than 3 months is agreed.

**Table 3. 17. 2: Summary of survey intervals and extensions – Open systems**

|   |  |                                    |  |

## 17. 6 Shaft Survey Methods

17. 6. 1 For the survey methods see [Table 3. 17. 3: Shaft survey methods](#) below.

**Table 3. 17. 3: Shaft survey methods**

|   | TS METHOD 1 | TS METHOD 2 | TS METHOD 3 | TS METHOD 4 |
|---|-------------|-------------|-------------|-------------|
| <b>GENERAL</b>  |             |             |             |             |
| Drawing the shaft and examining the entire shaft (including liners, corrosion protection system and stress reducing features, where provided), sealing system and bearings  | X           |             |             | X           |
| <b>SHAFT</b>  |             |             |             |             |
| Visual examination of all accessible parts of the shafting system <i>in situ</i>  |             | X           | X           |             |
| For keyed and keyless propeller connections, removing the propeller to expose the forward end of the taper  | X           | X           |             | X           |
| For keyed and keyless propeller connections, perform a non-destructive examination (NDE) by an approved surface crack-detection method around the after end of the cylindrical part of the shaft and the forward one-third of the shaft cone, including the keyway with the key removed (if fitted); for shafts provided with liners the NDE shall be extended to the after edge of the liner | X           | X           |             | X           |
| For flanged connections, whenever the coupling bolts of any type of flange-connected shaft are removed or the flange radius is made accessible in connection with overhaul, repairs or when deemed necessary by the Surveyor, the coupling bolts and flange radius are to be examined by means of an approved surface crack detection method  | X           | X           | X           | X           |
| Visual examination of all accessible parts of the shafting system following re-installation of the shaft  | X           |             |             | X           |
| <b>PROPELLER</b>  |             |             |             |             |
| Examination of the propeller  | X           | X           | X           | X           |
| Controllable pitch propellers, where fitted, are to be opened up and the working parts examined, together with the control gear. Propeller to be examined upon reassembly   | X           | X           |             | X           |

|   |   |   |   |   |
|---|---|---|---|---|
| Where a controllable pitch propeller is fitted, at least one of the blades is to be dismantled completely for examination of the working parts and the control gear. Propeller to be examined upon reassembly |   |   | X |   |
| Examination of the propeller following re-installation  | X | X |   | X |
| <b>BEARING CLEARANCES</b>   |   |   |   |   |
| Checking, recording and verification of bearing clearances  | X |   |   | X |
| Recording the bearing wear down measurements after re-installation, if applicable   | X |   |   |   |
| Checking and recording the bearing wear down measurements   |   | X | X |   |
| <b>SEALING SYSTEM</b>   |   |   |   |   |
| Examine the inboard and outboard seals with shaft removed and following the re-installation of the shaft and propeller  | X |   |   | X |
| Examine the inboard and outboard seals  |   | X | X |   |
| Examination of seal liner   |   | X | X |   |
| <b>OTHERS</b>   |   |   |   |   |
| Stationary supporting structure and any erosion protection inserts or doublers are to be examined in way of any propulsion devices  | X | X | X | X |
| Verification of no unapproved repairs by grinding or welding of shaft and/or propeller  | X | X | X | X |
| <b>SERVICE RECORDS</b>  |   |   |   |   |
| Review of service records   |   | X | X |   |
| Review of test records of Lubricating Oil Analysis (for oil lubricated shafts), or Fresh Water Sample Test (for closed system fresh water lubricated shafts)  |   | X | X |   |
| Oil Sample Examination (for oil lubricated shafts), or Fresh Water Sample Test (for closed system fresh water lubricated).  |   | X | X |   |

## 17. 7 Other systems

17. 7. 1 Directional propeller and podded propulsion units for main propulsion purposes, inclusive of the propellers, shafts, gearing, control gear and the primary electrical components including any control and protection devices, are to be surveyed at intervals not exceeding five years. They are to be dismantled if considered necessary and generally examined as far as practicable. Non-destructive examination is to be carried out as considered necessary by the Surveyor on blade/fin

roots. Consideration may be given to condition monitoring schemes for determining the condition of the unit.

- 17. 7. 2 Podded propulsion unit screwshaft roller bearings are to be renewed when the calculated life at the maximum continuous rating no longer exceeds the survey interval, *see* [Pt 5, Ch 9, 5.3 Propulsion shafting 5.3.7](#).
- 17. 7. 3 Dynamic positioning and/or thruster-assisted mooring and athwartship thrust propellers and shaftings are to be surveyed at intervals not exceeding five years. They are to be generally examined so far as possible in dry dock and tested under working conditions afloat for satisfactory operation. All accessible parts, including sealing, locking and bearing faces, and any other moving parts are to be examined. Non-destructive examination is to be carried out as considered necessary by the Surveyor on blade/fin roots. Consideration may be given to condition monitoring schemes for determining the condition of the unit.
- 17. 7. 4 Water jet units for main propulsion purposes, including the impeller, casing, shaft, shaft seal, shaft bearing, inlet and outlet channels, steering nozzle, reversing arrangements, and control gear are to be surveyed at intervals not exceeding five years, provided the impeller shafts are made of approved corrosion-resistant material or have approved equivalent arrangements. They are to be generally examined so far as practicable.
- 17. 7. 5 Stationary supporting structure and any erosion protection inserts or doublers are to be examined in way of any propulsion devices.

## 17. 8 Alternative arrangements

- 17. 8. 1 The Classification Committee will be prepared to give consideration to the circumstances of any special case upon application by the Owner, where the level of safety achieved is equivalent to that obtained by the survey methods described in this section.

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **18 Screwshafts, tube shafts and propellers**

## **18. 1 Applicability**

- 18. 1. 1 The requirements of this Section are only applicable to the first screwshaft survey scheduled on or after 1 January 2016 for ships delivered before 1 January 2016. For subsequent screwshaft surveys, see [Pt 1, Ch 3, 17 Screwshafts, tube shafts and propellers](#).
- 18. 1. 2 For screwshaft survey requirements on ships delivered on or after 1 January 2016, see [Pt 1, Ch 3, 17 Screwshafts, tube shafts and propellers](#).

## **18. 2 Frequency of surveys**

- 18. 2. 1 Shafts with keyed propeller attachments and fitted with continuous liners or approved oil glands, or made of approved corrosion resistant materials, are to be surveyed at intervals of five years when the keyway complies fully with the present Rules.
- 18. 2. 2 Shafts having keyless-type propeller attachments are to be surveyed at intervals of five years, provided they are fitted with approved oil glands or are made of approved corrosion resistant materials.
- 18. 2. 3 Shafts having solid coupling flanges at the after end are to be surveyed at intervals of five years, provided they are fitted with approved oil glands or are made of approved corrosion resistant materials.
- 18. 2. 4 All other shafts not covered by [Pt 1, Ch 3, 18.2 Frequency of surveys 18.2.1](#) to [Pt 1, Ch 3, 18.2 Frequency of surveys 18.2.3](#) are to be surveyed at intervals of 2<sup>1</sup>/<sub>2</sub> years.
- 18. 2. 5 Controllable pitch propellers for main propulsion purposes are to be surveyed at the same intervals as the screwshaft.
- 18. 2. 6 Directional propeller and podded propulsion units for main propulsion purposes are to be surveyed at intervals not exceeding five years.
- 18. 2. 7 Water jet units for main propulsion purposes are to be surveyed at intervals not exceeding five years, provided the impeller shafts are made of approved corrosion resistant material or have approved equivalent arrangements.
- 18. 2. 8 Dynamic positioning and/or thruster-assisted mooring and athwartship thrust propellers and shaftings are to be surveyed at intervals not exceeding five years.

## **18. 3 Normal surveys**

- 18. 3. 1 All screwshafts are to be withdrawn for examination by ACS's Surveyors at the intervals prescribed in [Pt 1, Ch 3, 18.2 Frequency of surveys 18.2.1](#) to [Pt 1, Ch 3, 18.2 Frequency of surveys 18.2.4](#). The after end of the cylindrical part of the shaft and the forward one-third of the shaft cone,

or fillet of the flange, are to be examined by a magnetic particle crack detection method. In the case of a keyed propeller attachment, at least the forward one-third of the shaft cone is to be examined with the key removed. Wear down is to be measured and the stern tube bearings, oil glands, propellers and fastenings are to be examined. Controllable pitch propellers where fitted are to be opened up and the working parts examined, together with the control gear.

- 18.3.2 Directional propeller and podded propulsion units, inclusive of the propellers, shafts, gearing, control gear and the primary electrical components including any control and protection devices, are to be dismantled if considered necessary and generally examined as far as practicable.
- 18.3.3 Water jet units, including the impeller, casing, shaft, shaft seal, shaft bearing, inlet and outlet channels, steering nozzle, reversing arrangements, and control gear are to be generally examined so far as practicable.
- 18.3.4 Dynamic positioning and/or thruster-assisted mooring and athwartship thrust propellers are to be generally examined so far as possible in dry dock and tested under working conditions afloat for satisfactory operation. All accessible parts, including sealing, locking and bearing faces, and any other moving parts are to be examined. Non-destructive examination is to be carried out as considered necessary by the Surveyor on blade/fin roots. Consideration may be given to condition monitoring schemes for determining the condition of the unit.
- 18.3.5 Podded propulsion unit screwshaft roller bearings are to be renewed when the calculated life at the maximum continuous rating no longer exceeds the survey interval. *See [Pt 5, Ch 9, 5.3 Propulsion shafting 5.3.7](#).*
- 18.3.6 Stationary supporting structure and any erosion protection inserts or doublers are to be examined in way of any propulsion devices.

## **18.4 Screwshaft Condition Monitoring (SCM)**

- 18.4.1 Monitoring records are to be reviewed at annual survey for all vessels assigned the ACSPlus descriptive note SCM (Screwshaft Condition Monitoring). The records that are to be maintained for oil and water lubricated bearings are detailed in the following Sections.
- 18.4.2 Oil lubricated bearing records are to be available on board that include the following:
  - a. Lubricating oil analysis to be carried out regularly at intervals not exceeding six months. Each analysis is to include the following minimum parameters:
    - i. water content,
    - ii. chloride content,
    - iii. bearing material and metal particles content,
    - iv. oil ageing (resistance to oxidation), minimum testing to include Viscosity and Total Acid Number (TAN).

Note Oil samples are to be taken under service conditions and are to be representative of the oil within the stern tube.
  - b. Oil consumption.
  - c. Bearing temperatures.
- 18.4.3 Further information is provided in the ACS document ACSPlus Procedure Machinery Planned Maintenance and Condition Monitoring.
- 18.4.4 Water lubricated bearing records are to be available on board that include the following:
  - a. A record of variations in the flow rate of lubricating water.
  - b. A record of variations in the shaft power transmission.
  - c. Wear monitoring records for the stern bush.
  - d. For open loop systems the records from equipment for continuous monitoring of water sediment or alternatively records from a ACS approved extractive sampling and testing procedure are to be available on board.

Records of cleaning and replacement of lubrication filters/separators are to be maintained on board. The pumping and water filtration system is to be considered part of the continuous survey cycle and is to be subject to a Periodical Survey.

- e. For closed cycle water systems the records from water analysis results carried out regularly at intervals not exceeding six months are to be retained on board. The analysis is to include the following parameters:
  - i. Chloride content
  - ii. Bearing material and metal particles content.

Note Samples are to be taken under service conditions and are to be representative of the water circulating within the sterntube.

Note Records of cleaning and replacement of lubrication filters/separators are to be maintained on board. The pumping and water filtration system is to be considered part of the continuous survey cycle and is to be subject to a Periodical Survey.

- 18. 4. 5 For maintenance of the descriptive note **SCM**, the records of all data collected in [Pt 1, Ch 3, 18.4 Screwshaft Condition Monitoring \(SCM\) 18.4.2](#) and [Pt 1, Ch 3, 18.4 Screwshaft Condition Monitoring \(SCM\) 18.4.4](#) are to be retained on board and audited by ACS annually.
- 18. 4. 6 Where the requirements for the descriptive note **SCM** have been complied with, the screwshaft need not be withdrawn at surveys as required by [Pt 1, Ch 3, 18.3 Normal surveys 18.3.1](#), provided all condition monitoring data are found to be within permissible limits and all exposed areas of the shaft are examined by a magnetic particle crack detection method or an alternative approved means for shafts with a protective liner or coating [Pt 5, Ch 6, 4.1 Screwshaft Condition Monitoring \(SCM\) 4.1.3.\(f\)](#). The remaining requirements of [Pt 1, Ch 3, 18.3 Normal surveys 18.3.1](#) are to be complied with. Where the Attending Surveyor considers that the data presented is not sufficient to determine the condition of the shaft, the shaft may be required to be withdrawn in accordance with [Pt 1, Ch 3, 18.3 Normal surveys 18.3.1](#). For water lubricated bearings, the screwshaft is to be withdrawn for examination, as [Pt 1, Ch 3, 18.3 Normal surveys 18.3.1](#), when the ship reaches 18 years from the date of build or the third Special Survey, whichever comes first.

## 18. 5 Modified Survey

- 18. 5. 1 A Modified Survey may be accepted at alternate five-yearly surveys for shafts described in [Pt 1, Ch 3, 18.2 Frequency of surveys 18.2.1](#), provided they are fitted with oil lubricated bearings and approved oil glands, and also for those in [Pt 1, Ch 3, 18.2 Frequency of surveys 18.2.2](#) and [Pt 1, Ch 3, 18.2 Frequency of surveys 18.2.3](#).
- 18. 5. 2 The Modified Survey is to consist of the partial withdrawal of the shaft, sufficient to ascertain the condition of the stern bearing and shaft in way. For keyless propellers or shafts with a solid flange connection to the propeller, a visual examination to confirm the good condition of the sealing arrangements is to be made. The oil glands are to be capable of being replaced without removal of the propeller. The forward bearing and all accessible parts, including the propeller connection to the shaft, are to be examined as far as possible. Wear down is to be measured and found satisfactory. Where a controllable pitch propeller is fitted, at least one of the blades is to be dismantled complete for examination of the working parts and the controlgear.
- 18. 5. 3 For keyed propellers, the after end of the cylindrical part of the shaft and forward one-third of the shaft cone is to be examined by a magnetic particle crack detection method, for which dismantling of the propeller and removal of the key will be required.
- 18. 5. 4 Where the requirements for the descriptive note **SCM** have been complied with, as described in [Pt 1, Ch 3, 18.4 Screwshaft Condition Monitoring \(SCM\) 18.4.1](#) and all data are found to be within permissible limits, partial withdrawal of the shaft will not be required. Where doubt exists regarding any of the above findings, the shaft is to be withdrawn to permit an entire examination.

## **18. 6 Partial Survey**

- 18. 6. 1 For shafts where the Modified Survey is applicable, upon application by the Owner, the Committee will be prepared to give consideration to postponement of the survey for a maximum period of half the specified cycle provided a Partial Survey is held.
- 18. 6. 2 The Partial Survey is to consist of the propeller being backed off in any keyed shaft and the top half of the cone examined by an efficient crack detection method for which the removal of the key will be required. On ships less than 15 years old, propellers with keyless connections to the screwshaft are not required to be backed off. Exposed areas of screwshaft, oil gland and seals are to be examined and dealt with as necessary. Wear down is to be measured, recorded and reviewed at each screwshaft survey and found satisfactory. Propeller and fastenings are to be examined.
- 18. 6. 3 The Committee will be prepared to give consideration to the circumstances of any special case upon application by the Owner.

CHAPTER **3 Periodical Survey Regulations**SECTION **19 Inert gas systems****19. 1 Frequency of surveys**

19. 1. 1 Inert gas systems installed on board ships intended for the carriage of oil or liquid chemicals in bulk are to be surveyed annually in accordance with the requirements of [Pt 1, Ch 3, 2.2 Annual Surveys 2.2.34](#). A Special Survey of the inert gas system, in accordance with the requirements of [Pt 1, Ch 3, 19.2 Scope of surveys](#), is to be held at intervals not exceeding five years.

**19. 2 Scope of surveys**

19. 2. 1 At each Special Survey of the inert gas system, the inert gas generator, scrubber and blower are to be opened out as considered necessary and examined. Gas distribution lines and shut-off valves, including soot blower interlocking devices are to be examined as considered necessary. The deck seal and non-return valve are to be examined. Cooling water systems including the effluent piping and overboard discharge from the scrubbers are to be examined. All automatic shutdown devices and alarms are to be tested. The complete installation is to be tested under working conditions on completion of survey.
19. 2. 2 When, at the request of an Owner, it has been agreed by the Committee that the Complete Survey of the inert gas systems may be carried out on the Continuous Survey basis, the various items of machinery are to be opened for survey in rotation, so far as practicable, to ensure that the interval between consecutive examinations of each item will not exceed five years. In general, approximately one-fifth of the machinery is to be examined each year.
19. 2. 3 If any examination during Continuous Survey reveals defects, further parts are to be opened up and examined as considered necessary by the Surveyors, and the defects are to be made good to their satisfaction.
19. 2. 4 See [Pt 1, Ch 3, 9.7 Special Survey I \(ships five years old\) – General requirements 9.7.12](#) for inert gas systems on ships for liquefied gases.
19. 2. 5 See [Pt 1, Ch 3, 24.3 Annual Surveys - General Requirements for Fuel Systems 24.3.7](#) and [Pt 1, Ch 3, 24.7 Intermediate Surveys 24.7.1](#) for inert gas systems on ships with a fuel installation using **gases or other low-flashpoint fuels**.

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **20 Classification of ships not built under survey**

## **20. 1 General**

- 20. 1. 1 When classification is desired for a ship not built under the supervision of ACS's Surveyors, application should be made to the Committee in writing.
- 20. 1. 2 Periodical Surveys of such ships, when classed, are subsequently to be held as in the case of ships built under survey.
- 20. 1. 3 Where classification is desired for a ship which is classed by another recognized Society, special consideration will be given to the scope of the survey.

## **20. 2 Hull and equipment**

- 20. 2. 1 Plans showing the main scantlings and arrangements of the actual ship, together with any proposed alterations, are to be submitted for approval. These should comprise plans of the midship section, longitudinal section and decks, and such other plans as may be requested. If plans cannot be obtained or prepared by the Owner, facilities are to be given for ACS's Surveyor to obtain the necessary information from the ship.
- 20. 2. 2 Particulars of the process of manufacture and the testing of the material of construction are to be supplied.
- 20. 2. 3 In all cases, the full requirements of [Pt 1, Ch 3, 5 Special Survey - General - Hull requirements](#), [Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements](#), [Pt 1, Ch 3, 7 Special Survey - Oil tankers \(including ore/oil ships and ore/bulk/oil ships\) - Hull requirements](#), [Pt 1, Ch 3, 8 Special Survey - Chemical Tankers - Hull requirements](#), [Pt 1, Ch 3, 9 Ships for liquefied gases](#) and [Pt 1, Ch 3, 10 Dredgers, hopper dredgers, sand carriers, hopper barges and reclamation craft](#) are to be carried out as applicable. Ships of recent construction will receive special consideration.
- 20. 2. 4 During the survey, the Surveyors are to satisfy themselves regarding the workmanship and verify the approved scantlings and arrangements. For this purpose, and in order to ascertain the amount of any deterioration, parts of the structure will require to be gauged as necessary. Full particulars of the anchors, chain cables and equipment are to be submitted. For ships to which [Pt 6, Ch 4 Fire Protection, Detection and Extinction Requirements](#) applies, fire protection, detection and extinction are to be in accordance with that Chapter. Loading instruments, where required, are to be in accordance with the Rules, see [Pt 3, Ch 3, 4.8 Watertight tunnels and passageways](#) as applicable.
- 20. 2. 5 When the full survey requirements indicated in [Pt 1, Ch 3, 20.2 Hull and equipment 20.2.3](#) and [Pt 1, Ch 3, 20.2 Hull and equipment 20.2.4](#) cannot be completed at one time, the Committee may consider granting an interim record for a limited period. The conditions regarding the completion of the survey will depend on the merits of each particular case, which should be submitted for consideration.

## 20. 3 Machinery

20. 3. 1 To facilitate the survey, plans of the following items (plans of piping are to be diagrammatic), together with the particulars of the materials used in the construction of the boilers, air receivers and important forgings, are to be furnished:
- General pumping arrangements, including air and sounding pipes (Shipbuilder's plan).
  - Pumping arrangements at the forward and after ends of oil tankers and drainage of cofferdams and pump rooms.
  - General arrangement of cargo piping in tanks and on deck of oil tankers.
  - Piping arrangements for cargo oil (F.P. 60°C or above, closed cup test).
  - Bilge, ballast and fuel oil pumping arrangements in the machinery space, including the capacities of the pumps on bilge service.
  - Arrangement and dimensions of main steam pipes.
  - Arrangement of fuel oil pipes and fittings at settling and service tanks.
  - Arrangement of fuel oil piping in connection with oil burning installations.
  - Fuel oil and cargo oil overflow systems, where these are fitted.
  - Arrangement of boiler feed systems.
  - Fuel oil settling, service and other fuel oil tanks not forming part of the ship's structure.
  - Boilers, superheaters and economizers.
  - Air receivers.
  - Crank, thrust, intermediate and screw shafting.
  - Clutch and reversing gear with methods of control.
  - Reduction gearing.
  - Propeller (including spare propeller if supplied).
  - Electrical circuits.
  - Arrangement of compressed air systems for main and axiliary services.
  - Arrangement of lubricating oil systems.
  - Arrangement of flammable liquids used for power transmission, control and heating systems
  - Arrangement of cooling water systems for main and axiliary services.
  - General arrangement of cargo tank vents. The plan is to indicate the type and position of the vent outlets from any superstructure, erection, air intake, etc. Ventilation arrangements of cargo and/or ballast pump rooms and other enclosed spaces which contain cargo handling equipment.
20. 3. 2 Plans additional to those detailed in [Pt 1, Ch 3, 20.3 Machinery 20.3.1](#) are not to be submitted unless the machinery is of a novel or special character affecting classification.
20. 3. 3 Where remote and/or automatic controls are fitted to propulsion machinery and essential auxiliaries, a description of the scheme is to be submitted.

- 20. 3. 4 For new ships and ships which have been in service less than two years, calculations of the torsional vibration characteristics of the propelling machinery are to be submitted for consideration, as required for ships constructed under Special Survey. For older ships, the circumstances will be specially considered in relation to their service record and type of machinery installed. Where calculations are not submitted, the Committee may require that the machinery certificate be endorsed to this effect. When desired by the Owner, the calculations and investigation of the torsional vibration characteristics of the machinery may be carried out by ACS upon special request.
- 20. 3. 5 The main and auxiliary machinery, feed pipes, compressed air pipes and boilers are to be examined as required at Complete Surveys. Working pressures are to be determined from the actual scantlings in accordance with the Rules.
- 20. 3. 6 The screwshaft is to be drawn and examined.
- 20. 3. 7 The steam pipes are to be examined and tested as required by [Pt 1, Ch 3, 16 Steam pipes](#).
- 20. 3. 8 The bilge, ballast and fuel oil pumping arrangements are to be examined and amended, as necessary, to comply with the Rules.
- 20. 3. 9 Oil burning installations are to be examined as required at Complete Surveys and found, or modified, to comply with the requirements of the Rules; they are also to be tested under working conditions.
- 20. 3. 10 The electrical equipment is to be examined as required at Complete Surveys.
- 20. 3. 11 Where an inert gas system is fitted on ships intended for the carriage of oil in bulk having a flash point not exceeding 60°C, the requirements of [Pt 5, Ch 15, 7 Inert gas systems on Tankers of 8,000 tonnes DWT and above](#) apply.
- 20. 3. 12 The whole of the machinery, including essential controls, is to be tried under working conditions to the Surveyor's satisfaction.
- 20. 3. 13 First entry reports are to be prepared by the Surveyors.

## **20. 4 Refrigerated cargoes**

- 20. 4. 1 When classification is desired for an installation not constructed under the supervision of ACS's Surveyors, application is to be made to the Committee in writing.
- 20. 4. 2 Full particulars and plans are to be forwarded for consideration, together with the particulars of the materials of the crankshafts, pressure vessels and pressure piping. The requirements of [Pt 6, Ch 3, 1 General requirements](#) and [Pt 6, Ch 3, 4 Refrigeration plant, pipes, valves and fittings](#) are to be used for guidance in regard to the information required.
- 20. 4. 3 A special examination is to be made at least to the extent required for subsequent Special Surveys, see [Pt 1, Ch 3, 21.3 Subsequent Special Survey](#).
- 20. 4. 4 The thickness and material of the insulation, the particulars of the frames, beams, stiffeners and other steelwork within the insulation, the air coolers and/or chamber grid piping, the compressors, evaporators and condensers are to be verified so far as practicable.
- 20. 4. 5 The installation is to conform to the requirements of the relevant Sections of [Pt 6, Ch 3 Refrigerated Cargo Installations](#).
- 20. 4. 6 Acceptance tests are to be carried out in accordance with the requirements of [Pt 6, Ch 3 Refrigerated Cargo Installations](#).

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **21 Refrigerated cargo installations**

## **21. 1 Annual Surveys**

- 21. 1. 1 The Surveyors are to examine the machinery under working conditions as soon as practicable after a ship's arrival at a port of discharge before the cargo is unloaded. An examination of the refrigerated cargo installation log book (or other records) is to be made and any breakdowns or malfunctions of the plant during the previous twelve months are to be noted and reported to the Committee.
- 21. 1. 2 A General Examination of the refrigerating plant is to be carried out, and satisfactory operation of safety devices, controls and thermometry is to be verified. Insulated cargo spaces are to be inspected, and the condition of insulation, lining, scuppers, hatches, coolers, air ducting and air refreshing arrangements are to be checked. The Surveyors may request opening out of suspected items, or recommend repair or renewal of defective items, as a result of inspection.
- 21. 1. 3 A General Examination is to be made of electrical motors driving refrigerant compressors, pumps and fans, together with their controlgear and cables. Random tests for insulation resistance are to be made on the cables, switchgear, motors, etc. and this resistance is to be not less than 1 MΩ between individual conductors and between those conductors and earth. The installation may be subdivided for the purpose of this test, and the Surveyor may at his discretion accept the results of tests carried out by a competent member of staff or contractor.
- 21. 1. 4 A survey book or other permanent record is to be kept on board the ship to show the date of examination of the various parts. This is to be available to the Surveyor at all times, and is to be signed by the Surveyor on the occasion of each survey.

## **21. 2 Special Surveys**

- 21. 2. 1 At the first Special Survey, the examinations outlined below are to be carried out. Where there is a programme of replacement instead of maintenance on board, alternative survey arrangements will be considered. Each case will be given individual consideration.
- 21. 2. 2 Detailed internal examination of each reciprocating compressor, opened up for inspection of cylinders, pistons, connection rods, valves, seats, glands, relief devices, filters, lubrication and crankshaft.
- 21. 2. 3 For screw-type compressors, the period before opening up may be extended to six years or 25 000 running hours, whichever is the earlier. Examination should be made of rotors, clearances, gearing, etc.
- 21. 2. 4 Refrigerant condenser cooling water pumps, including standby pump(s) which may be used on other services, are to be opened up and their working parts exposed.
- 21. 2. 5 Primary and secondary refrigerant pumps are to be opened up and their working parts exposed.

- 21. 2. 6 The water end covers of condensers are to be removed for examination of the tubes, tubeplates and covers.
- 21. 2. 7 In the case of pressure vessels covered by insulation, any evidence of dampness or deterioration of the insulation which could lead to external corrosion of the vessels or their connections is to be investigated.
- 21. 2. 8 Sufficient insulation is to be stripped from insulated pressure vessels to allow the condition of the vessels and their connections to be ascertained. Care is to be taken that in replacement of the insulation, the vapour sealing of the outer covering is made good.
- 21. 2. 9 Sufficient insulation is to be stripped from pipes carrying the refrigerant at various points of the system both outside and inside the insulated chambers to permit the condition of the pipes to be ascertained. Sections of piping exposed are to include locations where lengths of piping have been connected by screwed couplings or butt welding. Care is to be taken that when ungalvanized portions of the piping in way of joints have been exposed, they are to be suitably coated and taped, after pressure testing, to prevent corrosion. On replacement of the insulation, the vapour sealing of the outer covering is to be made good.
- 21. 2. 10 A General Examination is to be made of all pressure relief valves and/or safety discs throughout the refrigerating plant to ensure that they are in good order and covered by current certification. However, no attempt is to be made to test primary refrigerant pressure relief on board ship. Relief valves are to be removed, overhauled and recalibrated every five years or in accordance with the manufacturer's recommendations, whichever is sooner.
- 21. 2. 11 Sea connections to refrigerant condenser cooling water pumps are to be opened up on the occasion of the hull and/or main machinery Special Survey.
- 21. 2. 12 The electric motors driving refrigerant compressors, pumps and fans, together with their controlgear and cables, are to have their insulation resistance tested and this is to be not less than 1 MΩ between individual conductors and between those conductors and earth. The installation may be subdivided to any desired extent by opening switches, removing fuses or disconnecting appliances for the purpose of this test.
- 21. 2. 13 All automatic controls, alarms and safety systems are to be tested and correct operation confirmed.
- 21. 2. 14 Sufficient air ducting and insulation lining is to be stripped from the cargo spaces or chamber's overhead and vertical surfaces to allow the condition of the insulation, insulation linings, grounds, supports, hangers and fixtures which support the insulation, grids, meat rails, etc. to be ascertained. Care is to be taken that on replacement, the ducts and linings are sealed against air blowing into the insulation, or against moisture ingress from refrigerated cell or space atmosphere.
- 21. 2. 15 Sufficient tank top insulation is to be stripped to allow the condition of the grounds and inner insulation lining to be ascertained.
- 21. 2. 16 Due consideration is to be given to the type of insulation used in the cargo spaces and chambers when determining the amount of insulation lining to be removed. Where organic foam insulants have been used, including panel systems or foamed *in situ*, or other insulants in slab form, the removal of panels or linings is to be at the Surveyor's discretion.
- 21. 2. 17 Under normal circumstances, the condition of the cargo space and chamber insulation, grounds, etc. can be ascertained when the Special Survey of the ship's steel structure is being held.
- 21. 2. 18 Arrangements made for defrosting air coolers, and for draining condensate from trays below coolers, are to be examined to ascertain that they are in working order. Trace heating elements around drain pipes should be specially examined.
- 21. 2. 19 Any air refreshing arrangements are to be examined.

## 21. 3 Subsequent Special Survey

- 21. 3. 1 A subsequent Special Survey is to be held approximately five years from the date of the previous Special Survey. Where a Continuous Survey procedure has been agreed, the interval between consecutive examinations of each item should not exceed five years.
- 21. 3. 2 In addition to the requirements for the first Special Survey as detailed in [Pt 1, Ch 3, 21.2 Special Surveys](#) and [Pt 1, Ch 3, 21.3 Subsequent Special Survey 21.3.3](#) are to be complied with.
- 21. 3. 3 'Shell-and-tube' condensers and evaporators (secondary refrigerant coolers) in which the primary refrigerant is in the shell, are to have the shell pneumatically tested with the refrigerant, or air, or a mixture of inert gas and refrigerant (with the end covers removed) at pressures as stated in [Pt 6, Ch 3, 2.5 Design pressures 2.5.5](#).
- 21. 3. 4 Shell-and-tube evaporators (secondary refrigerant coolers) in which the secondary refrigerant is in the shell are to have the shell hydraulically tested (with the end covers removed) to 1.5 times the design pressure, but in no case less than 0.29 MPa. After refitting the end covers, the primary refrigerant side is to be pneumatically tested as stated in [Pt 1, Ch 3, 21.3 Subsequent Special Survey 21.3.3](#), and an examination made as far as practicable for gas leakage in the shell with the secondary refrigerant connection removed.
- 21. 3. 5 Heat exchangers used for cooling refrigerant liquid by the suction return gas to a compressor are not subject to internal corrosion, and would normally require to be specially examined internally only if leakage is suspected between high and low pressure sides. This type of heat exchanger, together with others using brine or water, are to be examined and tested at the discretion of the Surveyor according to the design of such equipment.

## 21. 4 Loading Port Surveys

- 21. 4. 1 When a Loading Port Certificate is required by the Owner or his representative, a survey as detailed in [Pt 1, Ch 3, 21.4 Loading Port Surveys 21.4.2](#) to [Pt 1, Ch 3, 21.4 Loading Port Surveys 21.4.7](#) is to be carried out at the loading port. The certificate is not in respect of the cargo to be loaded or the manner in which it is to be stowed.
- 21. 4. 2 The refrigerating installation is to be examined under working conditions, and the temperatures in the cargo chambers are to be noted.
- 21. 4. 3 A General Examination of the generating plant supplying electric power to the refrigerated cargo installation is to be carried out to confirm that it complies with [Pt 6, Ch 3, 6.1 General](#).
- 21. 4. 4 The refrigerated cargo spaces and chambers are to be examined in an empty state to ascertain that they are clean and free from odour which may adversely affect the cargo to be loaded, that the air cooler coils and cooling grids and their connections are free from leakage, that cargo battens, where fixed to the vertical surfaces, are in good order, that cargo gratings or dunnage battens (*see* [Pt 6, Ch 3 Refrigerated Cargo Installations](#)) are available as necessary for the floors or decks, and that no damage has been sustained to the insulation or its lining prior to the loading of the refrigerated cargo. Any indications of defective insulation not considered to warrant immediate attention are to be noted and specially reported.
- 21. 4. 5 All scuppers and bilge suctions draining insulated spaces are to be examined to ensure that they are in good working order, and that any liquid seals are primed.
- 21. 4. 6 If the ship loads at more than one port, one survey only at the first loading port will be required, provided that it includes the examination of all spaces or chambers which are to be used for refrigerated cargo during the voyage, and that general cargo is not subsequently carried in any of the spaces or chambers prior to loading the refrigerated cargo.
- 21. 4. 7 In the case of ships engaged on voyages of less than two months' duration, a Loading Port Certificate will be considered as valid for two months, provided that the cargoes carried are of such a nature as not to damage the insulation or appliances in the insulated chambers, nor to affect,

by taint or mould, the refrigerated cargoes loaded during that period. For longer voyages, the certificate is valid for only one cargo from the loading port(s) to the discharge port(s).

21. 4. 8 If there is no ACS Surveyor available at the loading port(s), or if none is obtainable from a port within a reasonable distance, the Committee will accept the report of a survey held at the loading port by two competent engineers of the ship.

## **21. 5 Refrigerating plant on ships not classed with ACS**

21. 5. 1 In the case of refrigerating installations being constructed under Special Survey on ships not intended to be classed with ACS, the installation is to comply with the applicable requirements of [Pt 6, Ch 3 Refrigerated Cargo Installations](#).
21. 5. 2 The generator engines and electrical equipment, which supply power to the refrigerating installations are to be constructed in accordance with the requirements of the Classification Society concerned and the installation is also to comply with the requirements of [Pt 6, Ch 3, 6.1 General 6.1.2](#). Such plant is to be examined generally and under working conditions by the Surveyors.

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **22 Controlled atmosphere systems**

## **22. 1 Retention of class**

- 22. 1. 1 It is a prerequisite of the CA notation that the refrigeration installation on board already conforms to a ✕ ACS's RMC class notation. See [Pt 1, Ch 2, 2.6 Class notations \(refrigerated cargo installations \(RMC\), controlled atmosphere \(CA\) systems and carriage of refrigerated containers \(CRC\)\) 2.6.1.](#)
- 22. 1. 2 For the retention of Class, the CA systems are to be submitted for Periodical Surveys by ACS's Surveyors as specified in [Pt 1, Ch 3, 22.2 Annual Surveys](#) and [Pt 1, Ch 3, 22.3 Special Surveys](#).

## **22. 2 Annual Surveys**

- 22. 2. 1 Annual Surveys are to be carried out from the date of the Initial Classification Survey to verify that the CA system remains satisfactory.
- 22. 2. 2 The complete CA installation is to be visually examined and tested for the following main aspects:
  - a. CA zone sealing arrangements including cleats and hinges, pressure/vacuum (P/V) valves, door locks, ventilation of adjacent spaces, warning notices.
  - b. CA zones to be individually tested for airtightness to the design pressure. Testing by ship's staff, within one month prior to the survey may be accepted, based on a written report by the Master subject to visual inspection confirming the airtightness.
  - c. Operation and performance testing of the gas supply equipment, including controls, alarms, interlocks, safety devices.
  - d. Ventilation arrangements including fans.
  - e. Electrical supply arrangements.
  - f. Gas analyzers and analyzing equipment and calibration.
  - g. RH sensors and calibrations.
  - h. Permanent and portable gas monitoring, calibration and personnel safety equipment.
  - i. Witnessing of the air leakage.
  - j. Voyage logs, records of CA zone airtightness and calibration of instruments.
  - k. Verification that an Operating and Safety Manual is on board, is complete and that the responsible officers have countersigned to confirm that they are familiar with its contents.
- 22. 2. 3 On satisfactory completion of this survey, a new Annual Survey 'AS', with date, will be assigned.

## **22. 3 Special Surveys**

- 22. 3. 1 Special Surveys are to be carried out at intervals of five years from the date of the Initial Classification Survey to verify that all machinery, CA zones and safety arrangements remain

satisfactory. On request from Owners, all surveyable items may be examined on a continuous basis. With this option, 20 per cent of all items are to be presented for survey annually.

- 22. 3. 2 Each CA zone is to be subjected to an airtightness test.
- 22. 3. 3 The extent of dismantling is to be at the ACS Surveyor's discretion, but is to be sufficient for the Surveyor to be satisfied as to the condition of the installation.
- 22. 3. 4 On satisfactory completion of this survey, a new Special Survey 'SS', or 'RMC CS' with date, will be assigned.

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **23 Bow, inner, side shell and stern doors on Ro-Ro ships**

## 23. 1 General

- 23. 1. 1 The requirements of [Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements](#) to [Pt 1, Ch 3, 5 Special Survey - General - Hull requirements](#) are to be complied with, as applicable.
- 23. 1. 2 The requirements in this Section are applicable to the survey of bow, inner, side shell and stern doors on roll on-roll off passenger (Ro-Pax) ships and roll on-roll off (Ro-Ro) cargo ships.
- 23. 1. 3 Annual Survey and Special Survey of bow, inner, side shell and stern doors are to include examinations, tests and checks to a sufficient extent in order to verify that they are in satisfactory condition, remain in compliance with applicable requirements, and are subject to proper maintenance and operation in accordance with the Operation and Maintenance Manual (OMM) or manufacturer's recommendations.

## 23. 2 Definitions

- 23. 2. 1 For the application of the requirements in this Section, a **Ro-Ro ship** is a ship that utilises a loading ramp to enable wheeled vehicles to be rolled on and rolled off the ship.
- 23. 2. 2 A **Ro-Pax ship** is a passenger ship with Ro-Ro spaces or special category spaces.
- 23. 2. 3 **Ro-Ro spaces** are those that extend over a substantial length or the entire length of the ship, and are not normally sub-divided. These spaces can be loaded and unloaded (normally in a horizontal direction) with motor vehicles with fuel in their tanks for their own propulsion and/or goods (either packaged or in bulk, in rail or road cars (including tankers), trailers, containers, pallets, demountable tanks or in other stowage units or receptacles).
- 23. 2. 4 **Special category spaces** are enclosed vehicle spaces (above or below the bulkhead deck) that vehicles can be driven on to and from, and that can be accessed by passengers. Special category spaces may be accommodated on more than one deck, provided that the total overall clear height for vehicles does not exceed 10 m.
- 23. 2. 5 **Securing devices** are used to keep the door closed by preventing it from rotating about its hinges.
- 23. 2. 6 **Supporting devices** are used to transmit external or internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure.
- 23. 2. 7 A **locking device** is used to lock a securing device in the closed position.
- 23. 2. 8 A **Close-up Survey** is defined in [Pt 1, Ch 3, 1.5 Definitions](#).

### 23. 3 Annual Surveys

- 23. 3. 1 The survey is to consist of an examination to verify, as far as is practicable, that the bow, inner, side shell and stern doors are maintained in a satisfactory condition.
- 23. 3. 2 The Surveyor is to obtain confirmation that no unapproved changes have been made to the bow, inner, side shell and stern doors since the last survey.
- 23. 3. 3 Where applicable, Surveyors are to verify that the Operation and Maintenance Manual (OMM), including any revisions, is available on board. It is to be verified that documented operating procedures for closing and securing the doors are kept on board and posted at the appropriate place(s). The Surveyor is to apply particular attention to the register of inspections and its contents (contained within the OMM) as a basis for the survey.
- 23. 3. 4 An examination of the bow, inner, side shell and stern doors is to be carried out, with particular attention to be applied to the following:
  - a. The structural arrangement of doors, including plating, secondary stiffeners, primary structure, hinging arms and weld connections;
  - b. Shell structure surrounding the opening of the doors and the securing, supporting and locking devices, including shell plating, secondary stiffeners, primary structure and associated weld connections;
  - c. Hinges and bearings, thrust bearings;
  - d. Hull and door side supports for securing, supporting and locking devices.

Note If a crack is identified, an examination by non-destructive testing is to be carried out in the surrounding area and for similar items, as considered necessary by the Surveyor.
- 23. 3. 5 A Close-up Survey of the securing, supporting and locking devices is to be carried out. As a minimum, the Close-up Survey is to include the following:
  - a. Cylinder securing pins, supporting brackets, back-up brackets (where fitted) and their weld connections;
  - b. Hinge pins, supporting brackets, back-up brackets (where fitted) and their weld connections;
  - c. Locking hooks, securing pins, supporting brackets, back-up brackets (where fitted) and their weld connections;
  - d. Locking pins, supporting brackets, back-up brackets (where fitted) and their weld connections;
  - e. Locating and stopper devices and their weld connections.
- 23. 3. 6 The clearances of hinges, bearings and thrust bearings are to be measured where no dismantling is required. If the function test is not satisfactory, dismantling may be required to measure the clearances. If dismantling is carried out, a visual examination of hinge pins and bearings, together with non-destructive testing of the hinge pin, is to be carried out. The clearances of the securing, supporting and locking devices are to be measured, where indicated in the Operation and Maintenance Manual (OMM).
- 23. 3. 7 An examination of the sealing arrangements, including packing material/rubber gaskets, retaining bars or channels and associated weld connections, is to be carried out.
- 23. 3. 8 An examination of the drainage arrangements, including bilge wells and drain pipes, where fitted, is to be carried out. A test of the bilge system between the inner and outer doors is to be carried out.
- 23. 3. 9 A function test of doors is to be carried out. The Surveyor is to check the satisfactory operation of the bow, inner, side shell and stern doors during a complete opening and closing operation including, as applicable:
  - a. Proper working of the hinging arms and hinges;
  - b. Proper engagement of the thrust bearings;
  - c. Device for locking the door in the open position;

- d. Securing, supporting and locking devices;
  - e. Proper sequence of the interlock system for the opening/ closing system and the securing and locking devices;
  - f. Mechanical lock of the securing devices;
  - g. Proper locking of hydraulic securing devices in the event of a loss of the hydraulic fluid, according to the procedure contained in the Operation and Maintenance Manual (OMM);
  - h. Correct indication of open/closed position of doors and securing/locking devices at navigation bridge and other control stations;
  - i. Isolation of the hydraulic securing/locking devices from other hydraulic systems;
  - j. Confirmation that the operating panels are inaccessible to unauthorised persons;
  - k. Verification that a notice plate giving instructions to the effect that all securing devices are to be closed and locked before leaving harbour is placed at each operating panel and supplemented by warning indicator lights;
  - l. Examination of electrical equipment for opening, closing and securing the doors.
23. 3. 10 A function test of the indicator system is to be carried out. The Surveyor is to check the satisfactory operation of the indicator system, where fitted, including the following, as applicable:
- a. Proper visible indication and audible alarm on the navigation bridge panel, according to the selected function 'harbour/sea voyage' and on the operating panel;
  - b. Lamp test function on both panels;
  - c. Verification that it is not possible to turn off the indicator light on both panels;
  - d. Verification of fail safe performance, according to the procedure contained in the Operation and Maintenance Manual (OMM);
  - e. Confirmation that power supply for the indicator system is supplied by the emergency source or other secure power supply and is independent of the power supply for operating the doors;
  - f. Proper condition of sensors and protection from water, ice formation and mechanical damage.
23. 3. 11 A test of the water leakage detection system, where fitted, is to be carried out. The test is to include verification of a proper audible alarm on the navigation bridge panel and on the engine control room panel, according to the procedure contained in the Operation and Maintenance Manual (OMM).
23. 3. 12 A test of the television surveillance system, where fitted, is to be carried out. The test is to include verification of a proper indication on the navigation bridge monitor and on the engine control room monitor.
23. 3. 13 A hose test, or equivalent, is to be carried out. If the results of the visual examination and function test are satisfactory, the tightness test need not be carried out unless considered necessary by the Surveyor.
23. 3. 14 Following the visual examinations and function tests, non-destructive testing and thickness measurements may be required as considered necessary by the Surveyor.

## 23. 4 Special Surveys

- 23. 4. 1 The requirements of [Pt 1, Ch 3, 23.3 Annual Surveys](#) are to be complied with as applicable.
- 23. 4. 2 The securing, supporting and locking devices, including their weld connections, are to be subjected to non-destructive testing and thickness measurement to the extent considered necessary by the Surveyor. The maximum allowable diminution is 15 per cent of the as-built thickness.
- 23. 4. 3 The effectiveness of the sealing arrangements is to be verified by carrying out a hose test, or equivalent.
- 23. 4. 4 The clearances of hinges, bearings and thrust bearings are to be measured. Unless otherwise specified in the Operation and Maintenance Manual (OMM), or by the manufacturer's recommendation, the measurement of clearances may be limited to representative bearings where

dismantling is needed in order to measure the clearances. If dismantling is carried out, a visual examination of hinge pins and bearings, together with non-destructive testing of the hinge pin, is to be carried out.

23. 4. 5 The non-return valves of the drainage system are to be dismantled and examined.

PART

# 1

CHAPTER **3 Periodical Survey Regulations**

SECTION **24 Fuel installations using gases or other low-flashpoint fuels**

## 24. 1 General

- 24. 1. 1 The requirements of [Pt 1, Ch 3, 11 Machinery surveys - General requirements](#) are to be complied with, as applicable.
- 24. 1. 2 In addition to the survey requirements below, further survey requirements may be imposed; as identified during the risk assessment process, see [Pt 1, Ch 2, 3.6 Surveys for novel/complex systems, machinery and equipment](#)
- 24. 1. 3 This Section provides requirements for the survey of a fuel installation using gases or other low-flashpoint fuels as defined in [Pt 1, Ch 3, 1.5 Definitions 1.5.35](#) (gases or other low-flashpoint fuels are hereinafter referred to as fuel).
- 24. 1. 4 The fuel installation is to be surveyed in working condition except at special survey where internal examination of some components will be required. See [Pt 1, Ch 3, 24.8 Complete Surveys - General requirements](#) and [Pt 1, Ch 3, 24.9 Complete Surveys - Consumers and other equipment](#).
- 24. 1. 5 The Annual Survey shall be scheduled, as far as practicable, to coincide with a bunkering operation to allow for verification of fuel storage tank level alarms and bunkering control, alert and safety systems under operational conditions. At annual survey physical testing of alarms and shutdowns is not required unless it is considered necessary by the attending Surveyor. In any case records of the alarms are to be retained for the verification of the attending Surveyor.
- 24. 1. 6 The Intermediate Survey supplements the Annual Survey by testing the fuel bunkering system including automatic control, alert and safety systems to confirm satisfactory operation. The extent of the testing required for the Intermediate Survey may briefly interrupt the fuel installation and therefore vessel operations and the survey are to be scheduled accordingly.
- 24. 1. 7 The extent of the testing required for Complete Surveys will normally be such that the full survey cannot be carried out with the fuel installation operating or loaded with fuel. Consequently, aspects of the survey shall be coordinated to correspond with dry-docking or another period when the system will be gas free. Completion of the survey requires verification of satisfactory condition of the installation at the normal operating temperatures and pressures so will normally be completed once the vessel has been bunkered following reactivation of the system.
- 24. 1. 8 Prior to any internal inspection of fuel storage tanks, associated piping, fittings and equipment, etc. the respective items are to be made safe for access by means of isolating relevant valves, purging and gas-freeing the space.
- 24. 1. 9 Where an approved condition-monitoring system is employed for the fuel system and its constituent components, and the applicable Descriptive Note is assigned, the requirements of these regulations for opening up and internal examination may be waived where the condition of the

equipment can be shown to be within agreed acceptable limits as detailed in [Pt 5, Ch 21 Requirements for Condition Monitoring and Condition-Based Maintenance Systems](#).

24. 1. 10 The following documentation, as applicable, is to be available on board the ship:
  - a. Relevant instruction and information such as loading limit curve information, bunkering procedures, cooling down procedures and fuel installation test and inspection procedures.
  - b. Condition-Monitoring or Condition-Based Maintenance documentation as applicable.
  - c. Test records for bunkering ESD systems.
  - d. Records of crew tests/inspections of the fuel installation.
24. 1. 11 For Special Survey requirements for electrical equipment see [Pt 1, Ch 3, 14 Electrical equipment](#).
24. 1. 12 Where the design of any part of the fuel installation does not permit opening up for internal examination, as required by these regulations, alternative arrangements for testing and/or inspection will be specially considered.

## 24. 2 Survey Following Repair

24. 2. 1 Following repairs, independent fuel storage tanks of Type C are to be hydrostatically tested in accordance with *Rules and Regulations for the Classification of Ships using Gases or other Low-flashpoint Fuels* and in accordance with the manufacturer's testing procedures. The tank shall be subjected to a hydrostatic test at a pressure measured at the top of the tanks of not less than 1.5 times the design vapour pressure. Other types of fuel storage tank, such as membrane tanks, are to be tested in accordance with approved procedures, provided by the fuel storage tank designers. After testing, suitable drying and consequent air-purging procedures are to be followed to return the tank to operational condition.

## 24. 3 Annual Surveys - General Requirements for Fuel Systems

24. 3. 1 The Annual Survey is to be carried out with the fuel installation operational. Gas-freeing will not generally be necessary.
24. 3. 2 The ship's log and operational records covering the period from the previous survey, are to be examined, with regard to correct functioning of the gas detection systems, fuel supply/gas systems, and other equipment related to the fuel installation. The operating hours per day of the reliquefaction plant, the gas combustion unit, as applicable, the boil-off rate, and nitrogen consumption (for membrane containment systems) are to be reviewed and evaluated for equivalence on the balance of the fuel handling, and considered together with any existing gas detection records.
24. 3. 3 Any malfunction of the installation recorded in the log is to be investigated. It is to be verified that any repairs have been carried out to an acceptable standard and in accordance with the applicable Rules and Regulations.
24. 3. 4 The manufacturer/Builder instructions and manuals covering the operations, safety and maintenance requirements and occupational health hazards relevant to fuel storage, fuel bunkering, and fuel supply and associated systems for the use of the fuel, are to be confirmed as being aboard the vessel.
24. 3. 5 All control systems, alerts and safety systems are to be tested as follows:
  - a. The control, alert and safety systems for the fuel storage tanks and processing system are to be verified in satisfactory condition by one or more of the following methods:
    - i. Comparison of read-outs from local and remote indicators.
    - ii. Consideration of read-outs with regard to the actual conditions.
    - iii. Examination of maintenance records with reference to the approved maintenance management system.

- iv. Verification of calibration status of the measuring instruments.
  - b. All control, alerts and safety systems are to be tested, where testing is not possible due to operational reasons simulated testing may be accepted by the attending Surveyor. Which are to include but are not limited to:
    - i. fuel storage tank and processing system high and low pressure.
    - ii. fuel storage tank high and high-high level
    - iii. fuel storage tank overfill level
    - iv. fuel storage tank high temperature.
  - c. Gas detection and other leakage detection equipment in spaces containing fuel storage, fuel bunkering, and fuel supply equipment or components or associated systems, including indicators and alarms, is to be confirmed as being in satisfactory operating condition. Recalibration of the gas detection systems shall be verified in accordance with the manufacturers' recommendations.
  - d. Fuel leakage detection systems (temperature sensors and gas detection as applicable) are to be examined and tested in accordance with the manufacturer's instructions and calibrated using sample gas.
  - e. The electrical installation, equipment and cables in areas which may contain flammable gas are to be examined in order to verify that they are in good condition and have been properly maintained. Bonding straps that are installed to control static electricity are to be visually examined.
  - f. Alerts and safety systems associated with pressurised installations and any safety device associated with non-safe type electrical equipment that is protected by air-locks or pressurisation, are to be verified.
  - g. Verification, as far as is practicable, of the satisfactory operation of the control, monitoring and automatic shutdown systems of the fuel supply and bunkering systems.
  - h. Operational test, as far as practicable, of the shutdown of ESD protected machinery spaces.
24. 3. 6 Fuel installations are to be surveyed as follows:
- a. Portable and/or fixed drip trays, or insulation providing protection in the event of fuel leakage, are to be examined.
  - b. Components of the fuel installation fitted with insulation to provide protection against ice formation are to be examined for satisfactory condition.
  - c. Fuel piping, valves and fittings are to be generally examined, with particular attention to double-wall or ventilated ducting arrangements, expansion bellows, supports and vapour seals on insulated piping.
  - d. Fuel piping and components associated with the fuel processing equipment are to be visually examined.
24. 3. 7 Inerting arrangements and associated alarms are to be verified as being in satisfactory condition, including the means for prevention of backflow of fuel vapour to the inert gas system.
24. 3. 8 Ventilation systems including portable ventilating equipment where fitted, for spaces containing fuel storage, fuel bunkering, and fuel supply units or components, or associated systems, including air locks, pump rooms, compressor rooms, fuel preparation rooms, fuel valve rooms, control rooms and spaces containing gas burning equipment, are to be surveyed as follows:
- a. Ventilation systems and air-locks including their alarm system are to be generally examined.
  - b. Ventilation fans in hazardous areas are to be visually examined.
  - c. For ventilated double-walled piping or ducting containing fuel piping within machinery spaces, exhaust fans and/or supply fans are to be examined to ensure that the air-flow is not impeded.
  - d. Where alarms, such as differential pressure and loss of pressure alarms, are fitted, these shall be operationally tested as far as practicable.

- 24. 3. 9 The closing devices for all air-intakes and openings into accommodation spaces, service spaces, machinery spaces, control stations and approved openings in superstructures and deckhouses less than 10m from deck-mounted fuel storage tanks, are to be examined.
- 24. 3. 10 Venting arrangements, including protection screens if provided, for fuel storage tanks, inter-barrier spaces and tank hold spaces as applicable, are to be visually examined externally. The external condition of the fuel storage tank relief valves is to be verified and records of the last test of the opening/closing pressures are to be reviewed.
- 24. 3. 11 Means for draining the vent arrangements from fuel storage tank pressure relief valves and other system relief valves are to be examined to ensure that there is no liquid build-up that would impede effective operation, drain valves are to be checked as applicable.
- 24. 3. 12 Heating arrangements, if fitted, for steel structures in cofferdams and other spaces are to be verified in satisfactory condition.
- 24. 3. 13 All gastight bulkhead penetrations, including any gastight shaft seals, are to be visually examined.
- 24. 3. 14 Electrical equipment and bulkhead/deck penetrations, including access openings in hazardous areas, are to be examined for continued suitability for their intended service and installation area.
- 24. 3. 15 Electrical bonding arrangements in hazardous areas, including bonding straps where fitted, are to be examined.

## **24. 4 Annual Surveys – Fuel Processing Equipment**

- 24. 4. 1 The following fuel processing equipment is to be generally examined in working condition and operational parameters verified. Insulation, where fitted, need not be removed but any deterioration of insulation, or evidence of dampness which could lead to external corrosion of the vessels or their connections, is to be investigated:
  - a. Heat exchangers and pressure vessels.
  - b. Fuel heaters, vaporisers, masthead heaters.
  - c. Heating arrangements, including provision for continuous heating and circulation of heating medium to prevent freezing during start up and when the fuel installation is not in use.
  - d. Fuel piping and components associated with the fuel processing equipment.
- 24. 4. 2 Where the double wall or duct containing fuel piping is protected using a pressurised inert gas atmosphere the monitoring and maintenance of the inert atmosphere is to be confirmed in satisfactory condition.
- 24. 4. 3 The condition of the fuel isolation valve and double block and bleed arrangements for each consumer is to be examined with respect to:
  - a. Containment to prevent fuel leakage from any valve arrangements installed within the machinery space.
  - b. Connections to the inerting and venting arrangements.
  - c. General examination to confirm that the valve arrangement and all associated fuel monitoring, control, and shutdown equipment are in satisfactory condition. The external examination is to be supplemented by a review of relevant operational, maintenance and service reports.
- 24. 4. 4 Where fuel processing equipment is located within an independent space that functions as containment in the event of a fuel spill (e.g. a tank connection space), the space is to be examined internally and externally to verify that the structure remains in a satisfactory condition to contain any potential leakage of fuel including any thermal isolation to protect the surrounding structure from damage due to cryogenic leakage.
- 24. 4. 5 Records of testing the operation of the master fuel valve for each engine space are to be verified. Tests are to be carried out on regular basis as agreed with ACS and the scope of the testing shall

incorporate a full test of the Emergency Shutdown sequence. Where practicable, operation of the valve as described above is to be witnessed at the time of survey.

## **24. 5 Annual Surveys – Fuel Storage**

- 24. 5. 1 Areas in which fuel storage tanks are located (on and below deck) are to be examined for any changes to the arrangements within those areas that may affect the hazardous area rating.
- 24. 5. 2 For Type C pressurised fuel storage tanks the external surface of the fuel storage tank insulation is to be visually examined for cold spots to verify the condition of the insulation arrangements. This examination is to be carried out with the fuel storage tanks loaded. Ideally fuel storage tanks shall be loaded to the maximum loading limit; examination of partially-filled fuel storage tanks may be accepted alongside a review of records of periodic cold spot examinations carried out by suitably trained and qualified crew.
- 24. 5. 3 The supporting structure between the deck plating and the tank is to be examined to confirm that the saddle arrangement remains in satisfactory condition in accordance with the approved design.
- 24. 5. 4 For vacuum-insulated fuel storage tanks, monitoring records are to be reviewed to confirm satisfactory maintenance of the vacuum. Any trends identifying a breakdown or loss of vacuum containment are to be investigated.
- 24. 5. 5 For Type B fuel storage tanks where the insulation arrangements are such that the insulation cannot be examined, the surrounding structures of wing tanks, double bottom tanks and cofferdams are to be visually examined for cold spots. This examination is to be carried out with the fuel storage tanks loaded. Ideally fuel storage tanks shall be loaded to the maximum loading limit; examination of partially-filled fuel storage tanks may be accepted alongside a review of records of periodic cold spot examinations carried out by suitable trained and qualified crew.
- 24. 5. 6 For membrane fuel storage tanks the performance of the insulation arrangements is to be confirmed in accordance with approved procedures submitted by the containment designers.
- 24. 5. 7 The fuel storage hold space is to be generally examined.
- 24. 5. 8 The tank connection space is to be internally examined.
- 24. 5. 9 Tank and relief valves are to be externally examined.
- 24. 5. 10 Satisfactory operation of the tank monitoring system is to be verified.
- 24. 5. 11 Bilge alarms and means of drainage of the space are to be examined and tested.
- 24. 5. 12 Remote and local closing of the main tank valve is to be tested.

## **24. 6 Annual Survey - Fuel Bunkering System**

- 24. 6. 1 The fuel-bunkering system, including manifold connections, isolation valves, bunker piping and linked Emergency Shutdown (ESD) system connection equipment (including cabling and connectors), are to be visually examined.
- 24. 6. 2 Bunkering operations are to be observed as far as practicable; satisfactory condition of the bunkering control, alert and safety system is to be verified. During annual survey it is not expected that ESD1 (stoppage of bunker transfer) or ESD2 (disconnection of bunker piping) will be operationally tested where applicable but records of maintenance and testing are to be reviewed. However, prior to starting the bunkering operation, it is expected that an ESD1 is tested with no fuel in the system (i.e. a dry test). Records of the testing are to be available during survey.

## 24. 7 Intermediate Surveys

24. 7. 1 In addition to the requirements below, the requirements of [Pt 1, Ch 3, 24.1 General](#) to [Pt 1, Ch 3, 24.6 Annual Survey - Fuel Bunkering System](#) are to be complied with.
- Control, alert and safety systems for the bunkering system, fuel-containment systems and processing equipment, together with any associated shutdown and/or interlock, are to be tested under working conditions and, if necessary, recalibrated. Shutdown sequence and extent are to be verified against documented procedures where applicable. Such safety systems include but are not limited to:
    - Bunkering ESD system is to be tested, without fuel in the piping, to verify that ESD system operation will result in a closure of the isolation valves and a shutdown of machinery associated with bunkering operations. All ESD activations and outputs are to be tested including fuel storage tank overfill protection, bunkering isolation valve closure and automatic shutdown of machinery associated with bunkering operations.
    - Fuel-processing equipment shutdown and closure of isolation valves resulting from:
      - loss of the valve-actuating medium;
      - loss of ventilation in fuel piping double wall /ventilated duct; or
      - loss of pressure of inert gas in pressurised double-walled pipe arrangement.
    - Fuel processing equipment shutdown and closure of isolation valves as a result of deviation in the fuel supply to the engine-room from the normal operating conditions (temperature and pressure).
    - Fuel installation shutdown as a result of gas detection.
    - Safety interlocks on fuel-processing equipment are to be examined and tested as necessary to confirm satisfactory condition.
  - Gas detectors, temperature sensors, pressure sensors, level indicators, and other equipment providing input to the safety system are to be randomly tested to confirm satisfactory operating condition. The proper response of the safety system upon fault conditions is to be verified.
24. 7. 2 Consideration will be given to simulated testing, provided that it is considered representative. Comprehensive maintenance records, including details of tests carried out in accordance with the fuel plant and instrumentation maintenance manuals may be presented for review. Acceptance of either simulated testing or maintenance records including reports of testing as described above is subject to the satisfaction of the attending Surveyor.

## 24. 8 Complete Surveys - General requirements

24. 8. 1 The requirements of [Pt 1, Ch 3, 24.1 General](#) to [Pt 1, Ch 3, 24.7 Intermediate Surveys](#) are to be complied with.
24. 8. 2 The items covered by [Pt 1, Ch 3, 24.8 Complete Surveys - General requirements 24.8.3](#) to [Pt 1, Ch 3, 24.9 Complete Surveys - Consumers and other equipment 24.9.5](#) may, at the request of the Owner, be examined on a Continuous Survey basis provided that the interval between examinations of each item does not exceed five years. Exceptions may be made to this requirement if Condition Based Maintenance arrangements have been agreed and maintained satisfactorily (see [Pt 1, Ch 3, 24.1 General 24.1.9](#)).
24. 8. 3 Except where alternative provisions are given in [Pt 1, Ch 3, 24.8 Complete Surveys - General requirements 24.8.6](#) and [Pt 1, Ch 3, 24.8 Complete Surveys - General requirements 24.8.7](#) below, all fuel storage tanks are to be examined externally and internally, particular attention being paid to the plating in way of supports of securing arrangements for independent tanks, pipe connections, also to sealing arrangements in way of the deck penetrations. Insulation is to be removed as required.
24. 8. 4 Provided that the structural examination is satisfactory, that the gas detection systems have been found to be in satisfactory condition, routine on board checks and maintenance records are

satisfactory and that the voyage records have not shown any abnormal operation, fuel storage tanks will not require hydrostatic testing (except as required by [Pt 1, Ch 3, 24.8 Complete Surveys - General requirements 24.8.6](#)).

24. 8. 5 The non-destructive testing (NDT) of independent fuel storage tanks is to supplement visual inspection with particular attention to be given to the integrity of the main structural members, tank shell and highly-stressed parts, including welded connections as deemed necessary by the Surveyor. The following items are considered as highly-stressed parts:
- structure in way of tank supports and anti-rolling/anti-pitching devices,
  - web frames or stiffening rings,
  - swash bulkhead boundaries,
  - dome and sump connections to tank shell,
  - foundations for pumps, towers, ladders, etc.
  - pipe connections.
24. 8. 6 The NDT testing requirements for different types of independent fuel storage tanks are detailed below; where radiographic or ultrasonic testing is required, at least 10 per cent of the length of the applicable welded connections is to be tested. This testing is to be carried out internally and externally as applicable. Insulation is to be removed as necessary for the required non-destructive testing:
- a. For independent fuel storage tanks of Type B, the extent of non-destructive testing is to be given in the test schedule specially prepared for the tank design. The Owner is to submit proposals for the extent of non-destructive testing of the fuel storage tanks in advance of the survey.
  - b. For vacuum-insulated independent fuel storage tanks of Type C vacuum monitoring is accepted as a demonstration of the internal integrity of the tank. This is subject to verification that the monitoring equipment is being maintained, operated and calibrated in a satisfactory condition. There is no further requirement for internal examination and testing of these tanks. The tank support arrangements are to be visually examined; non-destructive testing may be required if the condition raises doubt as to the structural integrity.
  - c. For non-vacuum insulated independent fuel storage tanks of Type C non-destructive testing is required on the plating in way of supports and also over selected lengths of welds. Where such testing raises doubt as to the structural integrity, further testing is to be carried out in accordance with the requirements of the manufacturer's test and inspection instructions for hydraulic testing (normally at 1.25 times the approved maximum vapour pressure). Alternatively, consideration will be given to pneumatic testing under special circumstances, provided full details are submitted for approval.
  - d. At each alternate Complete Survey (i.e. at 10 year intervals); non-vacuum insulated independent fuel storage tanks of Type C are to be either:
    - i. Hydrostatically or hydro-pneumatically tested to not less than 1.25 times MARVS in accordance with the requirements of the manufacturer's test and inspection instructions. The requirements for non-destructive testing in [Pt 1, Ch 3, 24.8 Complete Surveys - General requirements 24.8.5](#) are to be carried out following this test as required by the Surveyor; or
    - ii. Subject to a thorough, planned, non-destructive testing. This testing is to be carried out in accordance with a test schedule specially prepared for the tank design. If a special programme does not exist, the following shall be tested:
      - structure in way of tank supports and anti-rolling/anti-pitching devices;
      - stiffening rings;
      - Y-connections between tank shell and a longitudinal bulkhead of bi-lobe tanks;
      - swash bulkhead boundaries if applicable;

- dome and sump connections to the tank shell if applicable;
  - pipe connections.
24. 8. 7 Membrane fuel storage tank surveys are to be carried out in accordance with approved testing procedures provided by the containment designers.
24. 8. 8 Fuel bunkering, supply and storage tank pipe connections and fittings are to be examined, and all valves and cocks in direct communication with the interiors of the storage tanks are to be opened out for inspection and the connection pipes are to be examined internally, so far as practicable. Special attention is to be paid to the fuel storage tank master isolation valve(s); the valve seat is to be visually examined and the valve tested at the maximum working pressure of the fuel storage tank prior to re-commissioning the fuel installation.
24. 8. 9 All emergency shutdown valves, check valves, block and bleed valves, master gas valves, remote operating valves, isolating valves for pressure relief valves in the fuel storage, fuel bunkering, and fuel supply piping systems are to be examined and proven operable. A random selection of valves is to be opened for examination.
24. 8. 10 Relief valves are to be surveyed as follows:
- a. The pressure relief valves for the fuel storage tanks are to be opened for examination, adjusted to the correct operating pressure as indicated in [Pt 1, Ch 3, 24.8 Complete Surveys - General requirements 24.8.10.\(b\)](#), function-tested, and sealed. If the tanks are equipped with relief valves with non-metallic membranes in the main or pilot valves, such non-metallic membranes are to be replaced. Valves may be removed from the tank for the purpose of making this adjustment under pressure of air or other suitable gas.
  - b. Valves are to lift at a pressure not more than the percentage given below, above the maximum vapour pressure for which the tanks have been approved:
    - i. For 0 to 0.15 MPa, 10 per cent.
    - ii. For 0.15 to 0.3 MPa, 6 per cent.
    - iii. For pressures exceeding 0.3 MPa, 3 per cent.
  - c. Pressure relief valves for the fuel supply and bunkering piping are to be opened for examination, adjusted, and function tested. Where a detailed record of continuous overhaul and retesting of individually-identifiable relief valves is maintained, consideration will be given to acceptance on the basis of opening, internal examination, and testing of a representative sampling of valves, including each size and type of liquefied gas or vapour relief valve in use, provided there is logbook evidence that the remaining valves have been overhauled and tested since the previous Complete Survey.
  - d. Relief valves on fuel piping are to have their pressure settings checked. The valves may be removed from the piping for this purpose. At the Surveyor's discretion a sample of each size and type of valve may be opened for examination and testing.
  - e. The pressure/vacuum relief valves, rupture discs and other pressure relief devices for interbarrier spaces and hold spaces are to be opened, examined, tested and readjusted as necessary, depending on their design.
24. 8. 11 All fuel pumps, booster pumps and vapour pumps are to be opened out for examination. Where applicable, pumping systems for inter-barrier spaces are to be checked and verified to be in satisfactory condition.
24. 8. 12 Compressors, process pressure vessels, heat exchangers and other components used in connection with fuel handling are to be examined.
24. 8. 13 Piping for the fuel processing system including valves, actuators and compensators is to be opened for examination. Insulation may need to be removed, as deemed necessary, to ascertain the condition of the piping. If any doubt exists regarding the integrity of the piping based upon visual examination then, where deemed necessary by the Surveyor, a pressure test at 1.25 times MARVS of the piping is to be carried out. The complete piping systems are to be tested for leaks after re-

assembly. Where water cannot be tolerated and the piping cannot be dried prior to putting the system into service, the Surveyor shall accept alternative testing fluids or alternative means of testing.

- 24. 8. 14 Equipment for the production of inert gas is to be examined and shown to be in satisfactory condition, operating within the gas specification limits. Piping, valves, etc. for the distribution of the inert gas are to be generally examined. Pressure vessels for the storage of inert gas are to be examined internally and externally and the securing arrangements are to be specially examined. Pressure relief valves are to be demonstrated to be in satisfactory condition. Liquid nitrogen storage vessels are to be examined, so far as practicable, and all control equipment, alarms and safety devices are to be verified as operational.
- 24. 8. 15 Gastight bulkhead shaft seals are to be opened out so that the sealing arrangements may be checked.
- 24. 8. 16 Any sea connections associated with the fuel handling equipment are to be opened out when the ship is in dry dock.
- 24. 8. 17 Where an approved condition-monitoring system or condition-based maintenance system is in place, the requirements for opening up of equipment may be reduced accordingly where the condition of the equipment can be shown to be within agreed acceptable limits as detailed in [Pt 5, Ch 21 Requirements for Condition Monitoring and Condition-Based Maintenance Systems](#).
- 24. 8. 18 Testing of the tank connection space and cofferdam leakage-detection arrangement (temperature sensors and gas detectors) is to be carried out.
- 24. 8. 19 Examination of electrical equipment to include the physical condition of electrical cables and supports, intrinsically safe, explosion proof, or any other increased safety features on the electrical equipment.
- 24. 8. 20 Functional testing of the equipment which is necessary to establish and maintain the pressure within pressurised electrical equipment enclosures (Ex p) and associated alarms is to be carried out.
- 24. 8. 21 Testing of arrangements for de-energizing electrical equipment which is not certified for use in hazardous areas.
- 24. 8. 22 An electrical insulation resistance test of the circuits terminating in, or passing through, hazardous areas, is to be carried out. If the ship is not in a gas-free condition, the results of previously recorded test readings may be accepted together with a review of the on-board monitoring of the earth loop impedance of relevant circuits.
- 24. 8. 23 Gas detectors, temperature sensors, pressure sensors, level indicators, and other equipment providing input to the fuel safety system are to be tested to confirm satisfactory operating condition. Pressure, temperature and level indicating equipment are to be calibrated in accordance with the manufacturer's requirements.

## **24. 9 Complete Surveys - Consumers and other equipment**

- 24. 9. 1 Heat exchangers associated with the fuel installation are to be opened out and examined as follows:
  - a. The water end covers of evaporators are to be removed for examination of the tubes, tube plates and covers.
  - b. Heating medium pumps, including standby pump(s) which may be used on other services, are to be opened out for examination.
  - c. Where a pressure vessel is insulated, sufficient insulation is to be removed, especially in way of connections and supports, to enable the vessel's condition to be ascertained.
  - d. Note this refers to external insulation, not additional insulation that may be installed in the annular space of a vacuum insulated tank.

- e. Insulated piping is to have sufficient insulation removed to enable its condition to be ascertained. Vapour seals are to be specially examined for their condition. Vacuum-insulated piping is to be visually examined and records of maintenance and vacuum monitoring are to be reviewed.
- 24. 9. 2 The steam side of steam heaters is to be hydraulically tested to 1.5 times the design pressure.
- 24. 9. 3 Fuel pipe ducts or casings are to be generally examined and the exhaust or inerting arrangements are to be verified.
- 24. 9. 4 All alarms associated with the fuel burning systems are to be verified; including, but not limited to, main and auxiliary engines, boilers, incinerators and gas combustion units.
- 24. 9. 5 The satisfactory condition of all pressure relief valves and/or safety discs throughout the installation is to be verified.

CHAPTER **3 Periodical Survey Regulations**

SECTION **25 Classification of rigs not built under survey**

**25. 1 General**

- 25. 1. 1 When classification is desired for a rig not built under the supervision of ACS's Surveyors, application should be made to the Committee in writing.
- 25. 1. 2 When the **RIGGING\*** notation is assigned, Periodical Surveys are to be carried out at the time of application and thereafter.
- 25. 1. 3 Where classification is desired for a rig which is classed by another recognised Society, special consideration may be given to the scope of the survey.

| SECTION 4        | Ductility tests for pipes and tubes .....                                  | 261        |
| SECTION 5        | Embrittlement tests .....  | 264        |
| SECTION 6        | Crack tip opening displacement tests .....                                 | 266        |
| SECTION 7        | Bend tests .....   | 269        |
| SECTION 8        | Hardness testing .....   | 271        |
| SECTION 9        | Corrosion tests .....  | 272        |
| <b>CHAPTER 3</b> | <b>Rolled Steel Plates, Strip, Sections and Bars .....</b>                 | <b>274</b> |
| SECTION 1        | General requirements.....  | 280        |
| SECTION 2        | Normal strength steels for ship and other structural applications .....    | 292        |
| SECTION 3        | Higher strength steels for ship and other structural applications .....    | 297        |
| SECTION 4        | Steels for boilers and pressure vessels .....                              | 306        |
| SECTION 5        | Steels for machinery fabrications .....                                    | 314        |
| SECTION 6        | Carbon–manganese and nickel alloy steels for low temperature service ..... | 316        |
| SECTION 7        | Austenitic and duplex stainless steels .....                               | 321        |

|                  |   |            |
|------------------|---|------------|
| SECTION 8        | Plates with specified through thickness properties .....        | 325        |
| SECTION 9        | Bars for welded chain cables.....                               | 328        |
| SECTION 10       | High strength steels for welded structures.....                 | 334        |
| <b>CHAPTER 4</b> | <b>Steel Castings .....</b>                                     | <b>341</b> |
| SECTION 1        | General requirements.....                                       | 346        |
| SECTION 2        | Castings for ship and other structural applications .....       | 352        |
| SECTION 3        | Castings for machinery construction.....                        | 360        |
| SECTION 4        | Castings for crankshafts.....                                   | 363        |
| SECTION 5        | Castings for propellers .....                                   | 369        |
| SECTION 6        | Castings for boilers, pressure vessels and piping systems.....  | 373        |
| SECTION 7        | Ferritic steel castings for low temperature service .....       | 377        |
| SECTION 8        | Stainless steel castings .....                                  | 379        |
| SECTION 9        | Steel castings for container corner fittings .....              | 382        |
| <b>CHAPTER 5</b> | <b>Steel Forgings .....</b>                                     | <b>385</b> |
| SECTION 1        | General requirements.....                                       | 391        |
| SECTION 2        | Forgings for ship and other structural applications .....       | 398        |
| SECTION 3        | Forgings for shafting and machinery .....                       | 403        |
| SECTION 4        | Forgings for crankshafts.....                                   | 413        |
| SECTION 5        | Forgings for gearing .....                                      | 421        |
| SECTION 6        | Forgings for turbines .....                                     | 428        |
| SECTION 7        | Forgings for boilers, pressure vessels and piping systems.....  | 433        |
| SECTION 8        | Ferritic steel forgings for low temperature service .....       | 438        |
| SECTION 9        | Stainless steel forgings .....                                  | 440        |
| <b>CHAPTER 6</b> | <b>Steel Pipes and Tubes .....</b>                              | <b>443</b> |
| SECTION 1        | General requirements.....                                       | 446        |
| SECTION 2        | Seamless pressure pipes .....                                   | 451        |
| SECTION 3        | Welded pressure pipes.....                                      | 456        |
| SECTION 4        | Ferritic steel pressure pipes for low temperature service ..... | 458        |
| SECTION 5        | Stainless steel pressure pipes.....                             | 461        |
| SECTION 6        | Boiler and superheater tubes .....                              | 464        |
| <b>CHAPTER 7</b> | <b>Iron Castings .....</b>                                      | <b>466</b> |
| SECTION 1        | General requirements.....                                       | 469        |
| SECTION 2        | Grey iron castings .....  | 473        |
| SECTION 3        | Spheroidal or nodular graphite iron castings .....              | 474        |
| SECTION 4        | Compacted or vermicular graphite iron castings.....             | 478        |
| SECTION 5        | Iron castings for crankshafts.....                              | 480        |

|  |            |
|--|------------|
| <b>CHAPTER 8 Aluminium Alloys .....</b>  | <b>482</b> |
| SECTION 1 Plates, bars and sections .....  | 486        |
| SECTION 2 Aluminium alloy rivets.....  | 494        |
| SECTION 3 Aluminium alloy castings .....   | 497        |
| SECTION 4 Aluminium/steel transition joints .....  | 501        |
| <b>CHAPTER 9 Copper Alloys.....</b>  | <b>505</b> |
| SECTION 1 Castings for propellers .....  | 509        |
| SECTION 2 Castings for valves, liners and bushes .....   | 521        |
| SECTION 3 Tubes.....   | 528        |
| <b>CHAPTER 10 Equipment for Mooring and Anchoring .....</b>                                      | <b>533</b> |
| SECTION 1 Anchors.....   | 538        |
| SECTION 2 Stud link chain cables for ships .....   | 547        |
| SECTION 3 Offshore Mooring chain cables.....   | 565        |
| SECTION 4 Fittings for offshore mooring chain .....  | 579        |
| SECTION 5 Short link chain cables .....  | 584        |
| SECTION 6 Steel wire ropes .....   | 588        |
| SECTION 7 Fibre ropes.....   | 593        |
| <b>CHAPTER 11 Approval of Welding Consumables .....</b>  | <b>595</b> |
| SECTION 1 General .....  | 600        |
| SECTION 2 Mechanical testing procedures.....   | 605        |
| SECTION 3 Electrodes for manual and gravity welding .....  | 606        |
| SECTION 4 Wire-flux combinations for submerged-arc automatic welding .....                       | 621        |
| SECTION 5 Wires and wire-gas combinations for manual, semi-automatic and automatic welding ..... | 634        |
| SECTION 6 Consumables for use in electro-slag and electro-gas welding .....                      | 640        |
| SECTION 7 Consumables for use in one-side welding with temporary backing materials .....         | 645        |
| SECTION 8 Consumables for welding austenitic and duplex stainless steels .....                   | 651        |
| SECTION 9 Consumables for welding aluminium alloys .....   | 655        |
| <b>CHAPTER 12 Welding Qualifications.....</b>  | <b>663</b> |
| SECTION 1 General qualification requirements.....  | 667        |
| SECTION 2 Welding procedure qualification tests for steels.....                                  | 669        |
| SECTION 3 Specific requirements for stainless steels.....  | 698        |
| SECTION 4 Welding procedure tests for non-ferrous alloys.....                                    | 701        |
| SECTION 5 Welder qualification tests .....   | 708        |
| SECTION 6 Qualification of friction stir welding of aluminium alloys .....                       | 720        |

SECTION **1 Scope**

## 1.1 General

- 1.1.1 Materials used for the construction, conversion, modification or repair of ships, other marine structures and associated machinery which are classed or are intended for classification by Asia Classification Society (hereinafter referred to as ACS), are to be manufactured, tested and inspected in accordance with these Rules.
- 1.1.2 Wrought, cast and extruded materials are to comply with the requirements of [Ch 1 General Requirements](#) and [Ch 2 Testing Procedures for Metallic Materials](#), and the appropriate specific requirements of [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#) to [Ch 9 Copper Alloys](#). Mooring and anchoring equipment is to comply with the requirements of [Ch 1 General Requirements](#) and [Ch 2 Testing Procedures for Metallic Materials](#), and the appropriate specific requirements of [Ch 10 Equipment for Mooring and Anchoring](#). Manufacturers of these materials must be approved by ACS according to the requirements in [Ch 1, 2 Approval and survey requirements](#) or [Ch 1, 3 Certification of materials](#). Only those materials within a manufacturer's scope of approval may be used.
- 1.1.3 Welding consumables are to comply with the requirements of [Ch 11 Approval of Welding Consumables](#) of these Rules.
- 1.1.4 Where welding is used for the construction, conversion, modification or repair of ships, other marine structures and associated machinery which are classed or are intended for classification by ACS, welding qualifications and tests shall be performed according to [Ch 12 Welding Qualifications](#) of these Rules. All welding shall be performed according to [Ch 13 Requirements for Welded Construction](#) of these Rules.
- 1.1.5 Plastics materials are to comply with the requirements of [Ch 14 Plastics Materials and other Non-Metallic Materials](#) of these Rules.
- 1.1.6 Coatings, corrosion prevention systems and their components are to comply with the requirements of [Ch 15 Corrosion Prevention](#).
- 1.1.7 The materials and components which are to comply with these requirements for the purposes of classification are defined in the relevant Rules dealing with design and construction.
- 1.1.8 Materials, manufacturing processes and inspection methods not listed in the [Pt 2 Rules for the Manufacture, Testing and Certification of Materials](#), will be specially considered.

**CHAPTER 1 General Requirements****SECTION 2 Approval and survey requirements****2.1 Approval and survey requirements – General**

- 2.1.1 Marine materials manufactured in accordance with [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#) to [Ch 10 Equipment for Mooring and Anchoring](#) of these Rules are to be made at works which have been approved by ACS for the type and grade of product being supplied.
- 2.1.2 Materials manufactured in accordance with [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#) to [Ch 10 Equipment for Mooring and Anchoring](#) of these Rules are to be manufactured, tested and inspected under Survey according to the requirements of one of the following two schemes:
  - a. The Materials Survey Scheme, See [Ch 1, 2.3, Materials Survey Scheme](#).
  - b. The Materials Quality Scheme, See [Ch 1, 2.4 Materials Quality Scheme](#).
- 2.1.3 For the purposes of survey, ACS Surveyors are to be allowed access to all relevant parts of the works, and are to be provided with the necessary facilities and information to enable them to verify that the manufacture is being carried out in accordance with the approved procedures. Facilities are also to be provided for the selection of test material, the witnessing of mechanical tests and the examination of materials, as required by these Rules.
- 2.1.4 Where a production process, testing or examination of materials is sub-contracted, this must be with the approval of ACS. Surveyors are to be allowed access to the sub-contractor's premises in order to conduct Surveys according to the requirements of these Rules.
- 2.1.5 Products manufactured in accordance with [Ch 11 Approval of Welding Consumables](#), [Ch 14 Plastics Materials and other Non-Metallic Materials](#) and [Ch 15, 2 Coatings](#) and [Ch 15, 3 Corrosion Resistant Steels](#) of [Ch 15 Corrosion Prevention](#) are to be approved in accordance with the requirements therein. For these materials, approval is given for a specific product on a type approval basis, rather than the approved manufacturer/survey arrangements applied to materials covered by [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#) to [Ch 10 Equipment for Mooring and Anchoring](#).

**2.2 ACS Approval – General**

- 2.2.1 Unless specifically stated in other Chapters of these Rules, all ACS approvals apply to materials used in applications intended for marine service, as described in [Ch 1, 1.1 General](#).
- 2.2.2 The procedures for application for approval of manufacturers and products, the details of the information to be supplied by the manufacturer, and the test programme to be conducted on the products are given in the appropriate book of ACS's *Materials and Qualification Procedures for Ships* (MQPS). This is published in the Approval section of ACS's web site at <http://www.asiaclass.org>.
- 2.2.3 ACS publishes lists of approved manufacturers and approved products. The lists are published in the Approval section of ACS's website, <http://www.asiaclass.org>. The lists are as follows:

|                |          |  |
|----------------|----------|--|
| <b>PART</b>    | <b>2</b> | <b>Rules for the Manufacture, Testing and Certification of Materials</b> |
| <b>CHAPTER</b> | <b>1</b> | <b>General Requirements</b>  |
| <b>SECTION</b> | <b>2</b> | <b>Approval and survey requirements</b>                                  |

---

- Type Approval
  - Service Suppliers
  - Recognized Specialists
  - Approved Manufacturers
2. 2. 4 For initial ACS approval as an Approved Manufacturer for a particular material, the manufacturer is required to demonstrate to the satisfaction of ACS that the necessary manufacturing and testing facilities are available, and are supervised by suitably qualified personnel. A specified programme of tests is to be carried out under the supervision of ACS Surveyors, and the results are to be to the satisfaction of ACS.
2. 2. 5 If the results of the initial assessment of the manufacturer, and the test programme are considered satisfactory, the manufacturer will be added to the list of approved manufacturers of materials, and a certificate of approval will be issued to the manufacturer by ACS, showing the scope of materials and grades covered by the approval. Initial approval will generally be under the Materials Survey Scheme, *See [Ch 1, 2.3, Materials Survey Scheme](#)*.
2. 2. 6 Approved manufacturers who meet the entry requirements may apply for approval under the Materials Quality Scheme, *See [Ch 1, 2.4 Materials Quality Scheme](#)*.
2. 2. 7 When a manufacturer has more than one works, the manufacturer's approval shall only be valid for the works where the test programme was conducted.
2. 2. 8 It is the manufacturer's responsibility to advise ACS of all changes to the manufacturing process parameters that may affect the application of the material, prior to the adoption of the changes in production. Additional approval tests may be required to maintain the approval.
2. 2. 9 Maintenance of approval is dependent on the manufacturer continuing to meet the requirements of the applicable sections of these Rules.
2. 2. 10 Where it is considered that an approved manufacturer is not maintaining its responsibilities to comply with these Rules, the approval may be suspended by ACS until such time that agreed corrective and preventive actions are considered to have been satisfactorily carried out. If considered necessary, ACS may require that the normal level of testing and inspection is increased.
2. 2. 11 In all instances, ACS will reduce the scope of, or withdraw approval from, a manufacturer where it becomes apparent that the manufacturer is unable to maintain compliance with these Rules or the scope of approval.
2. 2. 12 Where a manufacturer disagrees with any decisions made with regard to ACS approval, they may appeal in writing to ACS.
2. 2. 13 Any documents, data or other information received as part of the approval process will be treated as strictly confidential, and will not be disclosed to any third party, without the manufacturer's prior written consent.
2. 2. 14 The approved works will be subject to a periodic inspection of all relevant parts of the works, at intervals not exceeding three years. The procedure for this periodic inspection is given in Book B of ACS's *Materials and Qualification Procedures for Ships* (MQPS). This periodic inspection is in addition to the regular visits made according to [Ch 1, 2.3 Materials Survey Scheme 2.3.7](#).

## 2. 3 Materials Survey Scheme

2. 3. 1 Materials according to [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#) to [Ch 10 Equipment for Mooring and Anchoring](#) of these Rules and produced under the Materials Survey Scheme will be subject to Direct Survey by an ACS Surveyor. The scheme requires the Surveyor to survey and certify all materials according to the requirements of these Rules.

- 2. 3. 2 Approved manufacturers are to request a survey of the material by an ACS Surveyor, when required. Manufacturers must provide the Surveyor with details of the order, specification and any special conditions additional to the requirements of these Rules.
- 2. 3. 3 All mechanical tests required by these Rules are to be witnessed. The Surveyor may allow part of this task to be carried out by a member of the works staff by prior written agreement.
- 2. 3. 4 Before final acceptance, all materials are to be submitted to the specified tests and examinations under conditions acceptable to the Surveyor. The results are to comply with the Rules, and all materials are to be to the satisfaction of the Surveyor.
- 2. 3. 5 The specified tests and examinations are to be carried out prior to the despatch of finished materials from the manufacturer's works. Where materials are supplied in the rough or unfinished condition, as many as possible of the specified tests are to be carried out by the manufacturer, and any tests or examinations that are not completed are to be carried out under survey at a subsequent stage of manufacture.
- 2. 3. 6 In the event of any material proving unsatisfactory during subsequent working, machining or fabrication, such material is to be rejected, notwithstanding any previous certification.
- 2. 3. 7 In addition to witnessing test results, the Surveyor is responsible for ensuring that the manufacturing process, inspection, testing, identification and certification are properly conducted. As part of the Materials Survey Scheme, regular visits will be made to all relevant parts of the works, including the subcontractors who are conducting any process which will affect the properties of the final products, to check for compliance against the requirements of these Rules, and to ensure that the manufacturer is maintaining the capability to consistently produce approved materials.
- 2. 3. 8 The Surveyor, when satisfied that the material fully meets the requirements of these Rules, will certify the material in accordance with [Ch 1, 3 Certification of materials](#) and the appropriate Chapter of these Rules.

## 2. 4 Materials Quality Scheme

- 2. 4. 1 The manufacturer may apply to be approved under the Materials Quality Scheme where the following requirements are met:
  - a. The manufacturer has been approved by ACS for a minimum of three years and continues to maintain their ACS works approval according to [Ch 1, 2.2 ACS Approval – General 2.2.14](#); and
  - b. The manufacturer has a quality management system, which has been certified as meeting the requirements of ISO 9001 by a certification body recognised by ACS, which is one accredited by a member of the International Accreditation Forum; and
  - c. The manufacturer has a satisfactory history of quality performance in the manufacture and supply of ACS approved materials.
- 2. 4. 2 Special consideration may be given to manufacturers who have not been approved under the Materials Survey Scheme, and may be considered onto the Materials Quality Scheme providing:
  - a. They have a quality management system which has been certified as meeting the requirements of ISO 9001 by a certification body recognised by ACS, which is one accredited by a member of the International Accreditation Forum.
  - b. They can demonstrate a history of satisfactory supply of materials which ACS deems to be equivalent to those for which approval under the Materials Quality Scheme is requested.

In this case, the initial assessment of the manufacturer will include the product testing regime, as required for initial approval under the Materials Survey Scheme See [Ch 1, 2.2 ACS Approval – General 2.2.4](#).

2. 4. 3 The Scheme is based on a Scheme Certification Schedule, made between ACS and each individual manufacturer. The schedule will stipulate:
  - a. The scope of approved products covered by the approval.
  - b. The process route applied by the manufacturer for each approved product.
  - c. The arrangements for ACS scheme, audits, including scope, frequency, schedule, etc.
  - d. Agreed procedures for certification of approved materials.
  - e. Information to be supplied periodically to ACS by the manufacturer.
  - f. Procedures for the use of the scheme mark.
2. 4. 4 The contents of the Scheme Certification Schedule are to remain confidential between ACS and the manufacturer.
2. 4. 5 The Materials Quality Scheme is based on a technical audit approach, and is designed to complement the quality management systems audits performed to ISO 9001. The role of the Surveyor in scheme audits is to:
  - a. Verify that the quality management system is being maintained and audited to the requirements of ISO 9001.
  - b. Verify that the requirements of these Rules are being implemented.
  - c. Verify that the requirements of this Scheme are being implemented.
  - d. Perform Scheme audits, which focus on the technical aspects of the product realisation process, particularly with regard to Rule requirements.
  - e. Perform witness testing as required.
  - f. Verify the data supplied to ACS periodically by the manufacturer as part of the Scheme requirements.
2. 4. 6 The Materials Quality Scheme may be applied to any approved manufacturer who meets the eligibility requirements, and who applies to be approved under the scheme. If approved under the scheme, the manufacturer's name will appear on the List of Approved Manufacturers published by ACS, with an indication that they are approved under this scheme.
2. 4. 7 The scheme is available to manufacturers producing approved materials according to [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#) to [Ch 10 Equipment for Mooring and Anchoring](#) of these Rules.
2. 4. 8 The procedures for application for approval for the Materials Quality Scheme are given in Book M of ACS's *Materials and Qualification Procedures for Ships* (MQPS).
2. 4. 9 Where ACS is satisfied that the manufacturer meets all of the requirements of the Scheme, and that it is appropriate for the products being manufactured, a Scheme Certification Schedule will be issued, which must be signed by an authorised representative of the manufacturer.
2. 4. 10 Once the Scheme Certification Schedule has been signed by both parties, ACS will issue the manufacturer with a certificate of approval according to the Materials Quality Scheme.
2. 4. 11 Maintenance of approval will be according to the Scheme Certification Schedule agreed between ACS and the manufacturer, and these Rules.
2. 4. 12 It is the responsibility of the attending Surveyor to perform regular Scheme audits at the manufacturer's works in accordance with the Scheme Certification Schedule, and the requirements of these Rules.
2. 4. 13 It is not the intention to repeat the audit according to ISO 9001 conducted by the recognised certification body. The Surveyor is, however, to be satisfied that these audits are being conducted effectively. Where appropriate, the Surveyor may conduct a partial audit to ISO 9001 to verify this.
2. 4. 14 Witness tests may be conducted as part of the Scheme audit. This will involve the selection of material, and the witness of sampling and testing according to the requirements of the appropriate

chapter of these Rules. Such witness testing may be on ACS grades, or materials which the Surveyor deems to be equivalent (for the purposes of audit testing only).

- 2. 4. 15 Once every three years, a full assessment of scheme compliance will be conducted by a Surveyor who is not the regular attending Surveyor. This assessment is in addition to the periodic inspection requirement made according to [Ch 1, 2.2 ACS Approval – General 2.2.14](#).
- 2. 4. 16 In the event of any change which means that the manufacturer no longer meets the requirements for the Materials Quality Scheme (for example the loss of ISO 9001 approval), the Scheme certificate of approval will be revoked. The manufacturer will revert to the Materials Survey Scheme, and will be subject to survey according to that scheme.

**CHAPTER 1 General Requirements****SECTION 3 Certification of materials****3.1 General**

- 3.1.1 All materials subject to these Rules are to be supplied with appropriate certification, as required by the relevant requirements of these Rules. This will normally be an ACS certificate or a manufacturer's certificate validated by ACS, although a manufacturer's certificate may be accepted where allowed by the relevant requirements of these Rules.
- 3.1.2 Manufacturers approved under the Materials Quality Scheme are licensed to apply the scheme mark to manufacturer's certificates according to the requirements of the scheme, *See [Ch 1, 2.4 Materials Quality Scheme](#)*.
- 3.1.3 The following certificate types are to be used, (a) and (b) for the Materials Survey Scheme, and (d) for the Materials Quality Scheme:
  - a. **ACS Certificate**  
This type of certificate is issued by ACS based on the results of testing and inspection being satisfactorily carried out in accordance with the requirements of these Rules.
  - b. **Manufacturer's certificate validated by ACS**  
A manufacturer's certificate, validated by ACS on the basis of inspection and testing carried out by the manufacturer and which is in accordance with the requirements of these Rules, may be accepted. In this case, the certificate will include the following statement:  
"We hereby certify that the material has been made by an approved process and satisfactorily tested in accordance with the Rules of Asia Classification Society."
  - c. **Manufacturer's certificate**  
This type of certificate is issued by the manufacturer based on the results of testing and inspection being satisfactorily carried out in accordance with the requirements of these Rules or the applicable National or International standard. The certificate is to be validated by the manufacturer's authorised representative, independent of the manufacturing department. The certificate will contain a declaration that the products are in compliance with the requirements of these Rules or the applicable National or International standard.
  - d. **Manufacturer's certificate issued under the Materials Quality Scheme**  
Where a manufacturer is approved according to the Materials Quality Scheme, they will issue manufacturer's certificates bearing the scheme mark. The certificates must also bear the following statement:  
"This certificate is issued under the arrangements authorised by Asia Classification Society (operating group) in accordance with the requirements of the Materials Quality Scheme and scheme number MQS ....."
- 3.1.4 Where these Rules allow for the issue of a manufacturer's certificate for materials, either validated by an ACS Surveyor, or bearing the Materials Quality Scheme mark, the manufacturer is to ensure that a copy of the certificate is supplied to ACS.

## 3. 2 Materials Survey Scheme

- 3. 2. 1 The requirements for certification of materials according to the Materials Survey Scheme are established by the relevant requirements of these Rules.
- 3. 2. 2 The manufacturer is to supply the surveyor with any additional customer order requirements that are in addition to the requirements of these Rules, when the request for the issue or validation of the certificate is made.

## 3. 3 Materials Quality Scheme

- 3. 3. 1 Part of the certification schedule will include an agreement for the manufacturer to apply the scheme mark to manufacturer's certificates relating to approved products within the scope of approval of the manufacturer.
- 3. 3. 2 The use of the scheme mark is governed by the following:
  - a. The use of the scheme mark is not transferable. It is only to be used in conjunction with the manufacturer and works name and location shown on the certificate of approval.
  - b. The scheme mark must be applied to all manufacturers' certificates relating to approved materials produced under the Scheme.
  - c. In no circumstances is the scheme mark to be applied to test certificates relating to non-approved products.
  - d. The scheme mark is not to be used in any way which may imply approval for products which are not covered within the manufacturer's scope of approval.
  - e. Where a manufacturer is removed or suspended from the scheme, use of the scheme mark must cease immediately.
- 3. 3. 3 The certificate as given in [Ch 1, 3.1 General 3.1.3.d](#) is to be validated by an authorised representative of the manufacturer. The size and position of the scheme mark and statement on the manufacturer's certificate must be agreed by ACS.
- 3. 3. 4 Where manufacturers are approved under this scheme, the manufacturer's certificate issued according to these requirements fully meets the materials certification requirements of these Rules.

## 3. 4 Electronic certification

- 3. 4. 1 Where these Rules allow the issue of manufacturers' test certificates, under either the Materials Survey Scheme or the Materials Quality Scheme, these may be issued in electronic format provided that:
  - a. All tests and inspections have been satisfactorily completed according to the requirements of these Rules.
  - b. Procedures are in place to ensure that electronic certificates are only issued according to the requirements of these Rules.
  - c. The certification system is subject to regular inspection by the attending Surveyor.
  - d. A copy of the electronic certificate is supplied to ACS. This copy will be deemed to be the original of the test certificate.
- 3. 4. 2 In addition to the requirements of [Ch 1, 3.4 Electronic certification 3.4.1](#), for items certified under the Materials Survey Scheme, the ACS office stamp and Surveyor's name may be applied electronically. This is only allowed where the Surveyor has access to the results of the relevant tests and inspections, and is able to authorise by access to the electronic system, the application of the ACS office stamp and Surveyor's name on the test certificate. The name of the authorising Surveyor is to be the name included on the certificate. The authorisation may be conducted electronically either at the manufacturers' works, or remotely by the Surveyor.

|                |          |  |
|----------------|----------|--|
| <b>PART</b>    | <b>2</b> | <b>Rules for the Manufacture, Testing and Certification of Materials</b> |
| <b>CHAPTER</b> | <b>1</b> | <b>General Requirements</b>  |
| <b>SECTION</b> | <b>3</b> | <b>Certification of materials</b>  |

---

- 3.4.3 If the ACS office stamp and name are being applied electronically according to [Ch 1, 3.4 Electronic certification 3.4.2](#), then the manufacturer is to ensure that the Surveyor is provided with all relevant information regarding the customer order, when the request for authorisation is made.

PART

# 2

CHAPTER **1** **General Requirements**

SECTION **4** **General requirements for manufacture**

## **4. 1 General**

4. 1. 1 The following definitions are applicable to these Rules:

|              |  |
|--------------|--|
| Item:        | A single forging, casting, plate, tube or other rolled product as delivered.   |
| Piece:       | The rolled product from a single slab or billet or from a single ingot if this is rolled directly into plates, strip, sections or bars.  |
| Batch:       | A number of similar items or pieces presented as a group for acceptance testing.   |
| Wide Flat:   | Flat product of a width over 150 mm, up to and including 1250 mm and thickness generally over 4 mm. Edges are square cut, i.e. hot rolled on the four sides. Supplied in lengths, not coils.     |
| Plate/Sheet: | Flat rolled product whereby the edges are allowed to deform freely. Supplied flat and generally in square or rectangular shapes with a width of 600 mm or over, but other shapes may also apply. |

4. 1. 2 Where a manufacturer purchases semi-finished products (e.g. slabs) for the purpose of re-processing (e.g. rolling), the manufacturer is to ensure that the materials are from an ACS approved manufacturer, and manufactured within the scope of approval of that manufacturer. The aim of chemical analysis, dimensions, surface and internal quality checks are to be agreed between the manufacturer and purchaser. The semi-finished materials must be supplied with appropriate certification, according to these Rules.
4. 1. 3 It is the responsibility of the manufacturer to ensure compliance with all relevant aspects of these Rules. All deviations are to be recorded as non-compliances, and brought to the attention of the Surveyor, along with corrective actions taken. Failure to do this is considered to render the material as not complying with these Rules.
4. 1. 4 The manufacturer is to maintain all test and inspection records required by these Rules for at least seven years. Records are to be made available to ACS on request.
4. 1. 5 Where material is produced which does not meet all aspects of these Rules, the manufacturer may apply to ACS for a concession to certify the material as approved. ACS will consider each application on a case-by-case basis, although concession will only normally be granted in exceptional circumstances. If the concession is granted, a formal written numbered concession will be issued to the manufacturer. The concession number must be applied to the approval certificate, whether it is an ACS certificate or a validated manufacturer's certificate.

## **4. 2 Chemical composition**

- 4. 2. 1 The ladle analysis used for certification purposes is to be determined after all alloying elements have been added and sufficient time allowed for such additions to equalise throughout the ladle.
- 4. 2. 2 The method of taking samples is to ensure that the reported analysis is representative of the cast. In addition, the manufacturer must determine and certify the chemical composition of every heat of material.
- 4. 2. 3 Where more than one sample is taken, the method of averaging for the final certificate result and the determination of acceptable variations in composition are to be agreed with the Surveyor.
- 4. 2. 4 The chemical composition of ladle samples is to be determined by the manufacturer in an adequately equipped and competently staffed laboratory. The manufacturer's analysis will be accepted, but may be subject to occasional independent checks if required by the Surveyor.
- 4. 2. 5 The analysis is to include the content of all the elements detailed in the relevant Sections of the Rules and, where appropriate, the National or International Standard applied.
- 4. 2. 6 At the discretion of the Surveyors, a check chemical analysis of suitable samples from products may also be required. These samples are to be taken from the material used for mechanical tests but, where this is not practicable, an alternative procedure for obtaining a representative sample is to be agreed with the manufacturer. For product samples, the permissible limits of deviation from the specified ladle analysis are to be in accordance with an appropriate International or National Standard specification.

## **4. 3 Heat treatment**

- 4. 3. 1 Materials are to be supplied in the condition specified in, or permitted by, the relevant Chapters of these Rules.
- 4. 3. 2 Heat treatment is to be carried out in properly constructed furnaces which are efficiently maintained and have adequate means for control and recording of temperature. The furnace dimensions are to be such as to allow the whole item to be uniformly heated to the necessary temperature. In the case of very large components which require heat treatment, alternative methods will be specially considered.
- 4. 3. 3 The manufacturer is to maintain the records, including the temperature charts of all heat treatments for at least seven years.

## **4. 4 Test material**

- 4. 4. 1 Sufficient test material is to be provided for the preparation of the test specimen detailed in the specific requirements. It is, however, in the interests of manufacturers to provide additional material for any re-tests which may be necessary, as insufficient or unacceptable test material may be a cause for rejection.
- 4. 4. 2 The test material is to be representative of the item or batch and is not to be separated until all the specified heat treatment has been completed, except where provision for an alternative procedure is made in subsequent Chapters of these Rules.
- 4. 4. 3 All test material is to be selected by the Surveyor or an authorised deputy and identified by suitable markings which are to be maintained during the preparation of the test specimens.

## 4. 5 Mechanical tests

4. 5. 1 The dimensions, number and direction of test specimens are to be in accordance with the requirements of [Ch 2 Testing Procedures for Metallic Materials](#) and the specific requirements for the product.
4. 5. 2 Where Charpy impact tests are required, a set of three test specimens is to be prepared and the average energy value is to comply with the requirements of subsequent Chapters. One individual value may be less than the required average value provided that it is not less than 70 per cent of that value.
4. 5. 3 In the Rules, mechanical properties are specified in SI units, but alternative units may be used for acceptance testing. In such cases, the specified values are to be converted in accordance with the appropriate conversions given in [Table 1. 4. 1: Conversions from SI units to metric and imperial units](#). It is preferred that test results be reported in SI units, but alternative units may be used provided that the test certificate gives, in the same units, the equivalent specification values.

**Table 1. 4. 1: Conversions from SI units to metric and imperial units**

|  |
|--|
| 1 N/mm <sup>2</sup> or MPa = 0.102 kgf/mm <sup>2</sup>                   |
| 1 N/mm <sup>2</sup> or MPa = 0.0647 tonf/in <sup>2</sup>                 |
| 1 N/mm <sup>2</sup> or MPa = 0.145 x 10 <sup>3</sup> lbf/in <sup>2</sup> |
| 1J = 0.102 kgf m   |
| 1J = 0.738 ft lbs  |
| 1 kgf/mm <sup>2</sup> = 9.81 N/mm <sup>2</sup> or MPa                    |
| 1 tonf/in <sup>2</sup> = 15.4 N/mm <sup>2</sup> or MPa                   |
| 1 lbf/in <sup>2</sup> = 6.89 x 10 <sup>-3</sup> N/mm <sup>2</sup> or MPa |
| 1 kgf m = 9.81 J   |
| 1 ft lbf = 1.36 J  |

## 4. 6 Re-test procedures

4. 6. 1 Re-test procedures are to be in accordance with the requirements of [Ch 2, 1.4, Re-testing procedures](#).

## 4. 7 Rectification of defective material

4. 7. 1 Small surface imperfections may be removed by mechanical means provided that, after such treatment, the dimensions are acceptable, the area is proved free from defects and the rectification has been completed in accordance with any applicable requirements of subsequent Chapters of these Rules and to the satisfaction of the Surveyor.
4. 7. 2 The repair of defects by welding can be accepted only when permitted by the appropriate specific requirements and provided that the agreement of the Surveyor is obtained before the work is commenced. When a repair has been agreed, it is necessary in all cases to prove by suitable methods of non-destructive examination that the defects have been completely removed before welding is commenced. Welding procedures and inspection on completion of the repair are to be in accordance with the appropriate specific requirements and are to be to the satisfaction of the Surveyor.
4. 7. 3 Manufacturers wishing to carry out welding work must have at their disposal the necessary workshops, lifting gear, welding equipment, pre-heating, and where necessary annealing facilities and testing devices, as well as certified welders and supervisors to enable them to perform the work properly. Proof shall be furnished to the Surveyor that these conditions are satisfied before welding work begins.

## **4. 8 Identification of materials**

- 4. 8. 1 The manufacturer is to adopt a system of identification which will enable all finished materials to be traced to the original cast, and the Surveyors are to be given full facilities for tracing the material when required. When any item has been identified by the personal mark of a Surveyor, or his deputy, this is not to be removed until an acceptable new identification mark has been made by a Surveyor. Failure to comply with this condition will render the item liable to rejection.
- 4. 8. 2 Before any item is finally accepted it is to be clearly marked by the manufacturer in at least one place with the particulars detailed in the appropriate specific requirements.
- 4. 8. 3 Where hard stamps such as the ACS brand stamp are issued to manufacturers to carry out the stamping on behalf of ACS, the procedure for issue, maintenance and use of stamps is to be agreed in writing.
- 4. 8. 4 Hard stamping is to be used except where this may be detrimental to the material, in which case stencilling, painting or electric etching is to be used. Paints used to identify alloy steels are to be free from lead, copper, zinc or tin, i.e. the dried film is not to contain any of these elements in quantities of more than 250 ppm.
- 4. 8. 5 Where a number of identical items are securely fastened together in bundles, the manufacturer need only brand the top item of each bundle. Alternatively, a durable label giving the required particulars may be attached to each bundle.

## CHAPTER 1 General Requirements

### SECTION 5 Non-destructive examination

#### 5.1 General NDE requirements

- 5.1.1 Prior to the final acceptance of materials, surface inspection and verification of dimensions, non-destructive examination is to be carried out in accordance with the requirements detailed in this Section and subsequent Chapters of these Rules.
- 5.1.2 It is the manufacturer's responsibility for maintaining the required tolerances and making the necessary measurements. Periodic surveys by the Surveyor do not absolve the manufacturer from this responsibility.
- 5.1.3 When there is visible evidence to doubt the soundness of any material or component, such as flaws in test specimens or suspicious surface marks, the manufacturer is expected to prove the quality of the material by a suitable method.
- 5.1.4 Acceptance criteria are detailed in subsequent Chapters of these Rules. Alternative specifications may be submitted for consideration, provided they demonstrate equivalence to these Rules.

#### 5.2 Personnel qualifications

- 5.2.1 The shipyard, fabricator or manufacturer is to ensure that personnel carrying out non-destructive examination or interpreting the results of non-destructive examination are qualified to the appropriate level of a nationally recognised scheme such as ISO 9712, PCN, ACCP or SNT-TC-1A. Level 1 personnel are not permitted to interpret results to Codes or Standards.
- 5.2.2 When certification of personnel is made on an inhouse basis under a scheme such as SNT-TC-1A, practical examinations are to be relevant to material, product type, joint configuration, material thickness and acceptance criteria of items inspected for Classification purposes.
- 5.2.3 Personnel qualifications of NDE operators are to be randomly checked by the Surveyor.

#### 5.3 Non-destructive examination methods

- 5.3.1 Non-destructive examination methods are to comply with the relevant requirements of these Rules.

#### 5.4 Non-destructive examination procedures

- 5.4.1 All non-destructive examinations are to be carried out to a procedure that is representative of the item under inspection. As a minimum the procedures are to be in accordance with the following:
  - a. Procedures are to identify the component to be examined, the NDE method, equipment to be used and the full extent of the examinations including any test restrictions.

- b. Procedures are to specify the qualification and certification requirements of the inspection personnel to be employed.
  - c. Procedures are to state the degree of surface preparation required and the methods of preparation to be used before the examinations are made.
  - d. Procedures are to state the reference standards for testing and the acceptance criteria to be applied to the results of the inspections.
  - e. Procedures are to include the requirement for components to be positively identified and for a datum system or marking system to be applied to ensure repeatability of inspections.
  - f. Procedures are to identify any requirements for increasing the extent of applied NDE where defects have been found during spot examination.
  - g. Procedures are to identify reporting requirements.
  - h. Procedures are to be reviewed by the Surveyor to ensure they are appropriate for the product type.
  - i. Procedures for radiography are to specify the acceptable optical density within the area of interest on the radiograph.
  - j. The minimum optical density within the area of interest on a radiograph is to be equal to or greater than 2.0 for gamma ray and 1.8 for X-ray. A maximum density of 4.0 is acceptable.
  - k. Procedures are to include the method and requirements for equipment calibrations and functional checks.
  - l. Procedures are to be approved by an operator qualified to a minimum of Level III in accordance with a recognised standard.
  - m. The Surveyor will review procedures for compliance with this Section.
5. 4. 2 The shipyard, fabricator or manufacturer may submit other Codes or Standards for consideration by ACS, providing they are equivalent to these Rules. Where no agreed acceptance standard is in place, the acceptance levels contained in the subsequent Chapters of these Rules are to apply.
5. 4. 3 In the event that proposed acceptance criteria are not considered to be equivalent to these Rules, the criteria may be submitted for special consideration.

## **5. 5 Non-destructive examination reports**

5. 5. 1 NDE reports are to include all information required to identify how the examination was executed and are to include the following information where appropriate:
- a. Date of test.
  - b. Name and qualification of operator with signatures of the operator.
  - c. Details of the component identification, description of test location and volume examined.
  - d. Heat treatment status.
  - e. Weld type, procedure and configuration.
  - f. Surface condition.
  - g. Test procedure.
  - h. Equipment used.
  - i. Test results with a map or record of reportable and/or reject indications, giving location, dimensions and nature of indications.
  - j. Reference to acceptance criteria and evaluation in accordance to these criteria.
  - k. Material type and thickness.
  - l. Calibration

CHAPTER **2 Testing Procedures for Metallic Materials**

SECTION **1 General requirements for testing**

## **1.1 Preparation of test specimens**

- 1. 1. 1 The requirements specified below detail all the tests that may be applied to metallic materials. The specific tests and the test specimen types required for each material type, grade and product type are detailed in the subsequent Chapter of these Rules.
- 1. 1. 2 Where test material is cut from products by shearing or flame cutting, a reasonable margin is required to allow sufficient material to be removed from the cut edges during machining of the test specimens.
- 1. 1. 3 Test specimens are to be prepared in such a manner that they are not subjected to any significant work hardening, cold straining or heating during straightening or machining.
- 1. 1. 4 Test samples are not to be removed from the material they represent until heat treatment is complete. For castings in cases where test samples are separately cast, the castings and samples are to be heat treated together.
- 1. 1. 5 Dimensional tolerances are to comply with a relevant ISO specification.

## **1.2 Testing machines**

- 1. 2. 1 All tests are to be carried out by competent personnel. Testing machines are to be maintained in a satisfactory and accurate condition and are to be recalibrated at approximately annual intervals. This calibration is to be carried out by organisations of standing that have been approved or recognised by a Naval Authority and are to be to the satisfaction of the Surveyor. A record of all calibrations is to be kept available in the test house.
- 1. 2. 2 Tensile testing machine load cells are to be calibrated with an accuracy of  $\pm$  one per cent in accordance with ISO 7500-1 or another recognised National Standard.
- 1. 2. 3 Impact tests are to be carried out on Charpy V-notch machines calibrated to ISO 148 or ASTM E23 dependent on the testing machine type. The testing machines are to be calibrated using either a direct or indirect method. Other National Standards equivalent to ISO 148 may be considered.
- 1. 2. 4 Hardness testing machines, together with their associated measuring microscopes, are to be directly and indirectly calibrated to ISO 6506-2, 6507-2 or equivalent standards applicable to the type of hardness test. Other National Standards equivalent to ISO 6507-2 and 6506-2 standards may be considered. Routine hardness checks with standard hardness blocks calibrated to ISO 6506-3 or ISO 6507-3 or equivalent are to be carried out at a frequency which demonstrates calibration consistency.

### 1. 3 Discarding of test specimens

1. 3. 1 If a test specimen fails because of faulty preparation or incorrect operation of the testing machine it may be discarded and replaced by a new test specimen prepared from material adjacent to the original test.
1. 3. 2 In addition to the discarding of test specimens as indicated in [Ch 2, 1.3 Discarding of test specimens 1.3.1](#), a tensile test specimen may also be discarded when the specified minimum elongation is not obtained and the distance between the fracture and the nearest gauge mark is less than one-third of the gauge length.

### 1. 4 Re-testing procedures

1. 4. 1 Where the result of any test, other than an impact test, does not comply with the requirements, two additional tests of the same type are to be made from the same test sample, or if sufficient material is not available, a further representative sample taken from the item under test. For acceptance of the material, satisfactory results are to be obtained from both of these additional tests.
1. 4. 2 Where the result of any test taken from a weld procedure approval test, other than an impact test, does not comply with the requirements, two additional tests of the same type are to be made from the same weld test assembly. Where insufficient original welded assembly is available, a new assembly is to be prepared using the same conditions as the original test weld. For acceptance, satisfactory results are to be obtained from both of these additional tests.
1. 4. 3 Where the result of any test taken from a welding consumable approval test, other than an impact test, does not comply with the requirements, two additional tests of the same type are to be made from the same weld test assembly. Where insufficient original welded assembly is available, a new assembly is to be prepared using welding consumables from the same batch. If the new assembly is made with the same procedure (particularly the same number of runs) as the original assembly, only the duplicate re-test specimens need be prepared and tested. For acceptance of a weld consumable batch, satisfactory results are to be obtained from both of these additional tests.
1. 4. 4 Where the results from a set of three impact test specimens do not comply with the requirements, an additional set of three impact test specimens may be tested provided that, of the original set tested, not more than two individual values are less than the required average value and, of these, not more than one is less than 70 per cent of this average value. The results obtained are to be combined with the original results to form a new average which, for acceptance, is to be not less than the required average value. Additionally, for these combined results, not more than two individual values are to be less than the required average value and, of these, not more than one is to be less than 70 per cent of this average value.
1. 4. 5 The additional tests detailed in [Ch 2, 1.4 Re-testing procedures 1.4.1](#) and [Ch 2, 1.4 Re-testing procedures 1.4.2](#) are, where possible, to be made on material adjacent to the original samples. For castings, where insufficient material remains in the original test samples, the additional test may be made on other test samples representative of the castings. *See also* [Ch 2, 1.3, Discarding of test specimens](#) for discarding of test specimens.
1. 4. 6 When unsatisfactory results are obtained from tests representative of a batch of material, the item or piece from which the tests were taken is to be rejected. The remainder of the material in the batch may be accepted provided that two further items or pieces are selected and tested with satisfactory results. If the tests from one or both of these additional items or pieces give unsatisfactory results, the batch is to be rejected.
1. 4. 7 When a batch of material is rejected, the remaining items or pieces in the batch may be resubmitted individually for test, and those which give satisfactory results may be accepted.
1. 4. 8 At the option of the manufacturer, rejected material may be resubmitted as another grade and may then be accepted, provided that the test results comply with the appropriate requirements.

1. 4. 9 When material which is intended to be supplied in the ‘as-rolled’ or ‘hot-finished’ condition fails test, it may be suitably heat treated and resubmitted for test. Similarly, materials supplied in the heat treated condition may be reheat treated and resubmitted for test. Unless otherwise agreed by the Surveyor, such reheat treatment is to be limited to one repeat of the final heat treatment cycle.

## CHAPTER 2 Testing Procedures for Metallic Materials

## SECTION 2 Tensile tests

## 2.1 Dimensions of test specimens

- 2.1.1 Proportional test specimens with a gauge length  $L_0$  of  $5.65\sqrt{S_0}$  or  $5d$  where  $S_0$  is the cross-sectional area,  $d$  the diameter and  $L_c$  the parallel test length, have been adopted as the standard form of test specimen, and in subsequent Chapters in these Rules the minimum percentage elongation values are given for test specimens of these proportions.
- 2.1.2 The gauge length is to be greater than 20 mm and may be rounded off to the nearest 5 mm provided that the difference between the adjusted gauge length and the calculated one is less than 10 per cent of the calculated gauge length.
- 2.1.3 For forgings and castings (excluding those in grey cast iron) proportional test specimens of circular cross-section are to be machined to the dimensions shown in [Figure 2. 2. 1: Test specimen dimensions for plates, strip and sections - I and aluminum alloys](#).

**Figure 2. 2. 1: Test specimen dimensions for plates, strip and sections - I and aluminum alloys**

Note: For nodular cast iron and materials with a specified elongation less than 10%,  $R \geq 20 \text{ mm}$

- 2.1.4 For hot rolled bars and similar products, the test specimens are to be as in [Figure 2. 2. 1: Test specimen dimensions for plates, strip and sections - I and aluminum alloys](#), except that for small sizes they may consist of a suitable length of bar or other product tested in the full cross-section.
- 2.1.5 As an alternative to [Ch 2, 2.1 Dimensions of test specimens 2.1.3](#) and [Ch 2, 2.1 Dimensions of test specimens 2.1.4](#), proportional or non-proportional test specimens of other dimensions may be used, subject to any requirements for minimum cross-sectional area given in subsequent Chapters of these Rules. Where the size of proportional test specimens is other than as shown in [Figure 2. 2. 1: Test specimen dimensions for plates, strip and sections - I and aluminum alloys](#), the general dimensions are to conform with [Figure 2. 2. 2: Test specimen dimensions for forgings and castings - II and aluminum alloys](#).

**Figure 2. 2. 2: Test specimen dimensions for forgings and castings - II and aluminum alloys**

Note For nodular cast iron and materials with a specified elongation less than 10%,  $R \geq 1.5d$

2. 1. 6 For plates, strip and sections, the test specimens are to be machined to the dimensions shown in [Figure 2. 2. 1: Test specimen dimensions for plates, strip and sections - I and aluminum alloys](#) and aluminum alloys or [Figure 2. 2. 2: Test specimen dimensions for forgings and castings - II and aluminum alloys](#). Where the capacity of the available testing machine is insufficient to allow the use of a test specimen of full thickness, this may be reduced by machining one of the rolled surfaces. Alternatively, for materials over 40 mm thick, test specimens of circular cross-section machined to the dimensions shown in [Figure 2. 2. 1: Test specimen dimensions for plates, strip and sections - I and aluminum alloys](#) may be used. The axes of these test specimens are to be located at approximately one quarter of the thickness from one of the rolled surfaces as shown in [Figure 3. 1. 2: Position of test material](#).

**Figure 2. 2. 3: Test specimen dimensions for plates, strip and sections - I and aluminum alloys**

**Figure 2. 2. 4: Test specimen dimensions for plates, strip and sections - II**

2. 1. 7 As an alternative to [Ch 2, 2.1 Dimensions of test specimens 2.1.6](#), test specimens with a width of other than 25 mm may be used subject to any requirements for minimum cross-sectional area given in subsequent Chapters of these Rules. A ratio of width/thickness of 8:1 should not be exceeded.
2. 1. 8 For pipes and tubes, the test specimens may consist of a suitable length tested in full cross-section with the ends plugged. The gauge length is to be  $5.65\sqrt{S_0}$  or 50 mm, and the length of the test specimen between the grips or plugs, whichever is the smaller, is to be not less than the gauge length plus D, where D is the external diameter. Alternatively, test specimens may be prepared from strips cut longitudinally and machined to the dimensions shown in [Figure 2. 2. 5: Test specimen dimensions for pipes and tubes - I](#) or [Figure 2. 2. 6: Test specimen dimensions for pipes and tubes - II](#). The parallel test length is not to be flattened, but the enlarged ends may be flattened for gripping in the testing machine. The cross-sectional area of this type of test specimen is to be calculated from:

$$S_0 = ab$$

where

$$S_0 = \text{cross-sectional area}$$

$$a = \text{average radial thickness}$$

$$b = \text{average width}$$

est specimens of circular cross-section may also be used provided that the wall thickness is sufficient to allow the machining of such specimens to the dimensions shown in [Figure 2. 2. 1: Test specimen dimensions for plates, strip and sections - I and aluminum alloys](#), with their axes located at the mid-wall thickness.

**Figure 2. 2. 5: Test specimen dimensions for pipes and tubes - I**

**Figure 2. 2. 6: Test specimen dimensions for pipes and tubes - II**

2. 1. 9 For wire, the test specimen may consist of a suitable length tested in full cross-section. The gauge length is to be 200 mm and the parallel test length 250 mm.
2. 1. 10 For grey iron castings, the test specimens are to be machined to the dimensions shown in [Figure 2. 2. 7: Test specimen dimensions for grey iron castings – I](#) or [Figure 2. 2. 8: Test specimen dimensions for grey iron castings - II](#).

**Figure 2. 2. 7: Test specimen dimensions for grey iron castings – I**

**Figure 2. 2. 8: Test specimen dimensions for grey iron castings - II**

2. 1. 11 For aluminium alloy plates and sections of thickness,  $a$ , less than or equal to 12.5 mm; the dimensions of rectangular cross-sectioned test specimens are to be as shown in [Figure 2. 2. 3: Test specimen dimensions for plates, strip and sections - I and aluminum alloys](#). The rectangular cross-sectioned test specimen surfaces should remain as rolled/extruded. Where the thickness,  $a$ , is greater than 12.5 mm the test specimens are to be of round type as shown in [Figure 2. 2. 2: Test specimen dimensions for forgings and castings - II and aluminum alloys](#).
2. 1. 12 Deposited weld metal tensile test specimens are to be machined to the dimensions shown in [Figure 2. 2. 9: Test specimen for deposited weld metal tensile](#), and may be heated to a temperature not exceeding 250°C for a period not exceeding 16 hours for hydrogen removal, prior to testing.

**Figure 2. 2. 9: Test specimen for deposited weld metal tensile**

2. 1. 13 Butt weld tensile test specimens are to be machined to the dimensions shown in [Figure 2. 2. 10: Test specimen for butt weld](#). For thicknesses of more than 2 mm, the test width is to be 25 mm. For thicknesses less than 2 mm, the test width is to be reduced to 12 mm. The upper and lower surfaces of the weld are to be filed, ground or machined flush with the surface of the plate.

**Figure 2. 2. 10: Test specimen for butt weld**

2. 1. 14 Through thickness tensile test specimens may be, at the option of the steelmaker, either plain test specimens, or test specimens with welded extensions, in accordance with a Recognised Standard. The extension pieces are to be of steel with a tensile strength exceeding that of the plate to be tested and may be attached to the plate surfaces by manual, resistance or friction welding carried out in such a way as to ensure a minimal heat affected zone.
2. 1. 15 Tolerances on tensile specimen dimensions are to be in accordance with ISO 6892-1 or another Recognised Standard as appropriate.

## 2. 2 Definition of yield stress for steel

2. 2. 1 The yield phenomenon is not exhibited by all the steels detailed in these Rules but, except for austenitic and duplex stainless steels, the term 'yield stress' is used throughout when requirements are specified for acceptance testing at ambient temperature. For the purposes of the Rules, the terms 'yield stress' and 'yield strength' are to be regarded as synonymous.
2. 2. 2 Where reference is made to 'yield stress' in the requirements for carbon, carbon-manganese and alloy steel products and in the requirements for the approval of welding consumables, either the upper yield stress or, where this is not clearly exhibited, the 0.2 per cent proof stress or the 0.5 per cent proof stress under load is to be determined. In cases of dispute, the 0.2 per cent proof stress is to be determined.
2. 2. 3 For austenitic and duplex stainless steel products and welding consumables, both the 0.2 and the 1.0 per cent proof stresses are to be determined.

## 2. 3 Procedure for testing at ambient temperature

2. 3. 1 Except as provided in [Ch 2, 2.3 Procedure for testing at ambient temperature 2.3.5](#), the elastic stress rate for the determination of the upper yield for steels and copper alloys is to be between 6 and 60 N/mm<sup>2</sup> per second and between 2 and 20 N/mm<sup>2</sup> per second for aluminium. After reaching the yield or proof load, the straining rate may be increased to a maximum of 0.008s<sup>-1</sup> for the determination of the tensile strength.
2. 3. 2 For steel, the upper yield stress is to be calculated from:
- the value of stress measured at the commencement of plastic deformation, or
  - on a load/extension diagram using the value of stress measured at the first peak obtained during yielding even when the peak is equal to or less than any subsequent peaks observed during plastic deformation at yield.

2. 3. 3 When a well defined yield point cannot be obtained, the 0.2 or 1.0 per cent proof stress (non-proportional elongation) is to be determined from an accurate load/extension diagram by drawing a line parallel to the straight elastic portion and a distance from it where the amount represents 0.2 or 1.0 per cent of the extensometer gauge length. The point of intersection of this line with the plastic portion of the diagram represents the proof load, from which the 0.2 or 1.0 per cent proof stress can be calculated.
2. 3. 4 For stainless steels the 1.0 per cent proof stress and/or 0.2 per cent proof stress is specified as required by the relevant Chapters in these Rules.
2. 3. 5 For the determination of the tensile strength of flake graphite cast iron, the stress rate is not to exceed 10 N/mm<sup>2</sup> per second.

## 2. 4 Equivalent elongations

2. 4. 1 When a gauge length other than  $5.65\sqrt{S_o}$  is used, the equivalent percentage elongation value is to be calculated using the following formula:

$$A = \frac{A_R}{2} \left( \frac{L_o}{\sqrt{S_o}} \right)^{0.4}$$

where

|       |   |  |
|-------|---|--|
| $A_R$ | = | actual measured percentage elongation of test specimen                                       |
| $S_o$ | = | actual cross-sectional area of test specimen   |
| $L_o$ | = | actual gauge length of test piece  |
| $A$   | = | equivalent percentage elongation for a test specimen with a gauge length of $5.65\sqrt{S_o}$ |

2. 4. 2 Alternatively, where a number of test specimens of similar material and dimensions are involved, the actual percentage elongation values may be recorded, provided that the equivalent specified minimum elongation value appropriate for the test specimen dimensions is calculated from the formula in [Ch 2, 2.4 Equivalent elongations 2.4.1](#) and is recorded on the test certificate.
2. 4. 3 For proportional test specimens having a gauge length other than  $5.65\sqrt{S_o}$ , the equivalent elongation may be calculated using the following factors (d is the diameter of the test specimen):

| Actual gauge length | Factor for equivalent elongation on $5.65\sqrt{S_o}$ |
|---------------------|--|
| $4\sqrt{S_o}$       | $\times 0.870$                                       |
| $8.16\sqrt{S_o}$    | $\times 1.158$                                       |
| $11.3\sqrt{S_o}$    | $\times 1.317$                                       |
| 4d                  | $\times 0.916$                                       |
| 8d                  | $\times 1.207$                                       |

2. 4. 4 For non-proportional test specimens with gauge lengths of 50 mm and 200 mm, the equivalent elongation values tabulated in ISO 2566 are to apply.
2. 4. 5 The above conversions are reliable only for carbon, carbon-manganese and low alloy steels with a tensile strength not exceeding 700 N/mm<sup>2</sup> in the hot rolled, annealed, normalised, or normalised and tempered condition.

2. 4. 6 For alloy steels in the quenched and tempered condition, the following conversions may be used for proportional test specimens with a gauge length of  $4\sqrt{S_0}$ :

| Actual percentage elongation on $4\sqrt{S_0}$ | Equivalent elongation on $5.65\sqrt{S_0}$ |
|---|---|
| 22  | 17  |
| 20  | 15  |
| 18  | 13  |
| 17  | 12  |
| 16  | 12  |
| 15  | 11  |
| 14  | 10  |
| 12  | 8   |
| 10  | 7   |
| 8   | 5   |

2. 4. 7 Any proposals to use conversion factors for equivalent elongation values for the following materials are to be agreed with the Surveyors:
- Carbon, carbon-manganese and alloy steels in the normalised or normalised and tempered condition with a tensile strength exceeding 700 N/mm<sup>2</sup>.
  - Cold-worked steels.
  - Austenitic stainless steels.
  - Non-ferrous alloys.

## 2. 5 Procedure for testing at elevated temperatures

2. 5. 1 Tensile testing at elevated temperatures is to be carried out according to ISO 6892-2 Method B or an equivalent National Standard.

CHAPTER **2 Testing Procedures for Metallic Materials**SECTION **3 Impact tests****3. 1 Dimensions of test specimens**

3. 1. 1 Impact tests are to be of the Charpy V-notch type. The test specimens are to be machined to the dimensions and tolerances given in [Table 2. 3. 1: Dimensions and tolerances for Charpy V-notch impact test specimens](#) and are to be carefully checked for dimensional accuracy.
3. 1. 2 For material under 10 mm in thickness, the largest possible size of standard subsidiary Charpy V-notch test specimen is to be prepared with the notch cut on the narrow face. Generally, impact tests are not required when the thickness of the material is less than 6 mm.

**3. 2 Testing procedures**

3. 2. 1 All impact tests are to be carried out on Charpy machines approved by Asia Classification Society (hereinafter referred as ACS) and having a striking energy of not less than 150 J.

**Table 2. 3. 1: Dimensions and tolerances for Charpy V-notch impact test specimens**

| Dimension  | Nominal | Tolerance               |
|--|---------|-------------------------|
| Length, in mm  | 55      | ±0.60                   |
| Height, in mm, <i>See Note 1</i>   | 10      | ±0.075                  |
| Width , in mm, <i>See Note 1</i>   |         |                         |
| - standard specimen  | 10      | ±0.11                   |
| - standard subsidiary specimen   | 7.5     | ±0.11                   |
| - standard subsidiary specimen   | 5       | ±0.06                   |
| Angle of notch   | 45°     | ±2°                     |
| Height below notch, in mm  | 8       | ±0.075                  |
| Root radius, mm  | 0.25    | ±0.025                  |
| Distance of plane of symmetry of notch from ends of test piece, in mm, <i>See Note 1</i> | 27.5    | ±0.42 <i>See Note 2</i> |
| Angle between plane of symmetry of notch and longitudinal axis of test piece             | 90°     | ±2°                     |
| Angle between adjacent longitudinal faces of test piece                                  | 90°     | ±2°                     |

**Note 1** The test piece is to have a surface roughness better than Ra 5  $\mu\text{m}$  except for the ends.

**Note 2** For machines with automatic positioning of the test piece the tolerance is to be taken as  $\pm 0.165$  mm.

3. 2. 2 Charpy V-notch impact tests may be carried out at ambient or lower temperatures in accordance with the specific requirements given in subsequent Chapters of these Rules. Where the test temperature is other than ambient, the temperature of the test specimen is to be controlled to within  $\pm 2^\circ\text{C}$  for sufficient time to ensure uniformity throughout the cross-section of the test specimen, and suitable precautions are to be taken to prevent any significant change in temperature during the actual test. In cases of dispute, ambient temperature is to be considered as  $18^\circ\text{C}$  to  $25^\circ\text{C}$ .
3. 2. 3 For acceptance, the average energy value for a set of three impact tests must be equal to or greater than the appropriate specified minimum average value. Additionally, only one individual value may be less than the required average value but not less than 70 per cent of this average value.
3. 2. 4 Where standard subsidiary Charpy V-notch test specimens are necessary, the minimum energy values required are to be reduced as follows:
  - Specimen 10 x 7.5 mm: 5/6 of tabulated energy.
  - Specimen 10 x 5 mm: 2/3 of tabulated energy.
3. 2. 5 When reporting results, the specimen dimensions and the units used for expressing the energy absorbed (Joules) and the testing temperature are to be clearly stated.

## CHAPTER 2 Testing Procedures for Metallic Materials

## SECTION 4 Ductility tests for pipes and tubes

## 4. 1 Bend tests

- 4. 1. 1 The test specimens are to be cut as circumferential strips of full wall thickness and with a width of not less than 40 mm. For thick walled pipes, the thickness of the test specimens may be reduced to 20 mm by machining. The edges of the specimens may be rounded to a radius of 1.6 mm.
- 4. 1. 2 Testing is to be carried out at ambient temperature, and the specimens are to be doubled over a former whose diameter is to be in accordance with the specific requirements for the material. For submerged arc welded tube the test piece is to be bent with the root of the weld in tension. For other tubes, the test piece is to be bent in the original direction of curvature. In all cases, the welds are to be in the middle of the test specimen. The test is considered to be satisfactory if, after bending, the specimens are free from cracks and laminations. Small cracks at the edges of the test specimens are to be disregarded.

## 4. 2 Flattening tests

- 4. 2. 1 Ring test specimens are to be cut with the ends perpendicular to the axis of the pipe or tube. The length of the specimen is to be equal to 1.5 times the external diameter of the pipe or tube, but is to be not less than 10 mm or greater than 100 mm. Alternatively, the length of the test specimen may be 40 mm irrespective of the external diameter.
- 4. 2. 2 Testing is to be carried out at ambient temperature and is to consist of flattening the specimens in a direction perpendicular to the longitudinal axis of the pipe. Flattening is to be carried out between two plain parallel and rigid platens which extend over both the full length and the width after flattening of the test specimen. Flattening is to be continued until the distance between the platens, measured under load, is not greater than the value given by the formula:

$$H = \frac{t(1 + C)}{C + \frac{t}{D}}$$

where

|     |   |  |
|-----|---|--|
| $H$ | = | distance between plates, in mm   |
| $t$ | = | specified thickness of the pipe, in mm   |
| $D$ | = | specified outside diameter, in mm  |
| $C$ | = | a constant dependent on the steel type and detailed in the specific requirements |

After flattening, the specimens are to be free from cracks or other flaws. Small cracks at the ends of the test specimens may be disregarded.

4. 2. 3 For welded pipes or tubes, the weld is to be placed at 90° to the direction of flattening.

### 4. 3 Drift expanding tests

4. 3. 1 The test specimens are to be cut with the ends perpendicular to the axis of the tube. The edges of the end to be tested may be rounded by filing.
4. 3. 2 For metallic tubes, the length of the specimen is to be at least 1.5 times the external diameter of the tube except when a mandrel with an included angle of 30° is used, in which case the length of the specimen is to be twice the external diameter of the tube. In all cases the length of section remaining cylindrical after test is not be less than 0.5 times the external diameter.
4. 3. 3 Testing is to be carried out at ambient temperature and is to consist of expanding the end of the tube symmetrically by means of a hardened conical steel mandrel having a total included angle of 30°, 45° or 60°, See [Figure 2. 4. 1: Drift expanding test](#). The mandrel is to be forced into the test specimen at a rate not exceeding 50 mm/min until the percentage increase in the outside diameter of the end of the test specimen is not less than the value given in the specific requirements for boiler and superheater tubes, See [Ch 6 Steel Pipes and Tubes](#). The mandrel is to be lubricated, but there is to be no rotation of the tube or mandrel during the test. The expanded portion of the tube is to be free from cracks or other flaws.

**Figure 2. 4. 1: Drift expanding test**

### 4. 4 Flanging tests

4. 4. 1 The test specimens are to be cut with the ends perpendicular to the axis of the tube. The length of the specimens is to be at least equal to the external diameter of the tube and such that after testing the portion that remains cylindrical is not less than half the external diameter. The edges of the end to be tested may be rounded by filing.
4. 4. 2 Testing is to be carried out at ambient temperature and is to consist of flanging the end of the tube symmetrically by means of hardened conical steel mandrels. The rate of flanging is not to exceed 50 mm/min.
4. 4. 3 The first stage of flanging is to be carried out with a conical angled mandrel having an included angle of approximately 90°, See [Figure 2. 4. 2: Flanging test](#). The completion of the test is achieved with a second forming tool as shown in [Figure 2. 4. 2: Flanging test](#). The mandrels are to be lubricated and there is to be no rotation of the tube or mandrels during the test. The test is to

CHAPTER **2** **Testing Procedures for Metallic Materials**

SECTION **5** **Embrittlement tests**

**5.1 Temper embrittlement tests**

- 5.1.1 The test material is to be heat treated in accordance with the specification except that after tempering:
  - a. half the material is to be water quenched;
  - b. the other half is to be cooled from the tempering temperature to 300°C at a rate not exceeding 10°C per minute.
- 5.1.2 Impact tests in accordance with [Ch 2, 3 Impact tests](#) are to be made on the material in each condition at temperatures over a range wide enough to establish the upper and lower shelf energies and temperatures, tests being made at no less than three intermediate temperatures.
- 5.1.3 A set of three specimens is to be tested at each temperature. The results are to be plotted separately for each condition, in the form illustrated in [Figure 2. 5. 1: Idealized transition curve](#). In addition, the test temperatures, proportions of crystallinity and absorbed energies for all the specimens tested are to be reported.
- 5.1.4 The transition temperature for each condition is to be taken as the mid-temperature of the fracture transition zone. The difference between the two transition temperatures is to be reported.

**5.2 Strain age embrittlement tests**

- 5.2.1 The test material is to be heat treated in accordance with the specification and then subjected to five per cent strain. The test material is then to be heated to 250°C and held for one hour.
- 5.2.2 Impact tests in accordance with [Ch 2, 5.1 Temper embrittlement tests 5.1.2](#) are to be made in both the strain aged and unstrained conditions.

**Figure 2. 5. 1: Idealized transition curve**

5. 2. 3 The tests are to comply with [Ch 2, 5.1 Temper embrittlement tests 5.1.3.](#)
5. 2. 4 The test results are treated in accordance with [Ch 2, 5.1 Temper embrittlement tests 5.1.4.](#)

### 5. 3 Hydrogen embrittlement tests

5. 3. 1 Two specimens are to be tested. The specimens are to be of a diameter of 20 mm. Where this is not practicable a diameter of 14 mm may be accepted.
5. 3. 2 One specimen is to be tested within a maximum of 3 hours after machining. Where the specimen diameter is 14 mm, the time limit is 1.5 hours. Alternatively, the specimen may be cooled to  $-60^{\circ}\text{C}$  immediately after machining and kept at that temperature for a maximum period of 5 days before being tested.
5. 3. 3 The other specimen is to be tested after baking at  $250^{\circ}\text{C}$  for 4 hours. Where the specimen diameter is 14 mm the baking time is to be 2 hours.
5. 3. 4 A strain rate not exceeding  $0.0003\text{s}^{-1}$  is to be used during the entire test, until fracture occurs.
5. 3. 5 Tensile strength, elongation and reduction of area are to be reported.
5. 3. 6 The ratio  $Z_1/Z_2$  is to be reported, where  $Z_1$  is the reduction in area without baking and  $Z_2$  the reduction in area after baking.

## CHAPTER 2 Testing Procedures for Metallic Materials

## SECTION 6 Crack tip opening displacement tests

## 6.1 Dimensions of test specimens

- 6.1.1 Unless agreed otherwise, tests are to be made on specimens of the full section thickness and which conform to a nationally agreed standard.
- 6.1.2 Normally the specimens are to be rectangular with the main dimensions as indicated in [Figure 2.6.1: Outline dimensions of the preferred specimen](#) and are to be tested in three point bending.
- 6.1.3 A subsidiary specimen as in [Figure 2.6.2: Outline dimensions of the subsidiary specimen](#) may be used by agreement.
- 6.1.4 In each case the notch is to be positioned at the center of the loading span; its root radius is not to exceed 0.10 mm. The notch is to be extended by the generation of a fatigue crack to give an effective crack length of the dimension  $a$ . For this purpose, the fatigue stress ratio,  $R_1$ , is to be within the range 0 to 0.1 and the fatigue intensity is not to exceed  $0.63\sigma_y B^{1/2}$  where  $\sigma_y$  is the 0.2 per cent proof stress at the test temperature.

Figure 2.6.1: Outline dimensions of the preferred specimen

|     |   |                        |                             |
|-----|---|------------------------|-----------------------------|
| $B$ | = | thickness              |                             |
| $W$ | = | Width                  | $= 2B$                      |
| $a$ | = | effective crack length | $= 0.45W \text{ to } 0.55W$ |
| $L$ | = | loading span           | $4W$                        |

**Figure 2. 6. 2: Outline dimensions of the subsidiary specimen**

$B$  = thickness

$W$  = Width =  $B$

$a$  = effective crack length (to be agreed between the purchaser and manufacturer)

$L$  = loading span =  $4W$

## 6. 2 Test equipment

6. 2. 1 Whenever possible, tests are to be made using machines operating under displacement control. The type of control is to be recorded.
6. 2. 2 The test equipment is to be calibrated annually.
6. 2. 3 The crack opening displacement gauge is to have an accuracy of at least one per cent. It is to be calibrated at least once every day of testing and at intervals of no more than 10 tests. It should be demonstrated that the calibration is satisfactory for the test conditions.

## 6. 3 Testing procedures

6. 3. 1 Tests are to be made in a recognised test house in accordance with a nationally accepted standard.
6. 3. 2 Unless otherwise agreed, all tests on unwelded wrought material are to be made on specimens taken transverse to the principal working direction and are to be through thickness notched.
6. 3. 3 Where tests are made on weld material, the fatigue crack should be arranged to sample the maximum amount of unrefined weld metal.
6. 3. 4 Where tests are made on the Heat Affected Zone (H.A.Z.) of a weld, a K or single bevel weld preparation is recommended. The region of lowest fracture toughness in the Heat Affected Zone should be identified for the particular steel and weld procedure by means of preliminary tests. The fatigue crack is to be accurately positioned to sample as high a proportion of this critical region as possible and after testing has been completed, the specimen is to be sectioned to check that this has been achieved. Sufficient tests should be made to ensure that the critical region has been sampled in at least three specimens.
6. 3. 5 At least three valid tests are to be made for each material condition. Invalid tests are to be disregarded and the tests repeated.
6. 3. 6 Local pre-compression of the test specimen ahead of the notch is acceptable in order to provide an acceptably even fatigue crack front.

6. 3. 7 The temperature of the test piece is to be measured to within  $\pm 2^{\circ}\text{C}$  over the range minus  $196^{\circ}\text{C}$  to  $+200^{\circ}\text{C}$  and to within  $\pm 5^{\circ}\text{C}$  outside this range. The temperature should be measured at a point on the specimen not farther than 2 mm away from the crack tip.

## 6. 4 Validity requirements

6. 4. 1 The test is to be regarded as invalid if:
- the fatigue crack front is not in a single plane;
  - any part of the fatigue crack surface lies in a plane whose angle with the plane of the notch exceeds  $10^{\circ}$ ;
  - the length of any part of the fatigue crack is less than  $0.025W$  or 1.25 mm, whichever is the greater;
  - the difference between the maximum and minimum lengths of the fatigue crack exceeds  $0.1W$ ;
  - the difference between any two of the lengths of the fatigue crack at 0.25B, 0.5B and 0.75B exceeds  $0.05W$ .
6. 4. 2 In addition, for tests on welds and Heat Affected Zones (H.A.Z.), the following criteria are to be complied with:
- Weld metal. The fatigue crack front shall not extend outside the weld metal deposit and 80 per cent should be within 2 mm of the fusion line.
  - Grain coarsened H.A.Z.. The fatigue crack should be within 0.5 mm of the fusion line and should sample all of the grain coarsened H.A.Z. present. However, if fusion line irregularities prevent this, a sample including as much grain coarsened H.A.Z. as possible may be accepted.
  - Subcritical/intercritical H.A.Z. boundary. The fatigue crack is to sample the boundary between the subcritical and intercritical regions of the H.A.Z. However, if fusion line irregularities prevent this, a sample including as much relevant microstructure as possible may be accepted.

## 6. 5 Test reports

6. 5. 1 The test report is to include:
- details of the material, its condition and size;
  - the thickness and width of the test specimen;
  - the fatigue pre-cracking conditions;
  - the test temperature and environment;
  - the test machine control system and rate of change of displacement or load;
  - crack length measurements;
  - force/displacement records, preferably in the form of an autographic record;
  - the critical crack opening displacement;
  - a photograph of the fracture;
  - any observation on the fracture surface.

CHAPTER **2** **Testing Procedures for Metallic Materials**SECTION **7** **Bend tests****7.1 Dimensions of test specimens**

- 7.1.1 Flat bend test specimens are to be of rectangular cross-section with dimensions as defined in [Figure 2.7.1: Bend test specimen](#)

**Figure 2.7.1: Bend test specimen**

- 7.1.2 For plates, sections and strip the dimensions shall be full thickness and width 30 mm. Where the rolled thickness exceeds 25 mm the compression face may be reduced to 25 mm.
- 7.1.3 For forgings, castings and semi-finished products the thickness shall be 20 mm and width 25 mm.
- 7.1.4 Butt weld face and root bend test specimens are to be 30 mm in width and of the full plate thickness. Where the thickness exceeds 12mm, two side bend test specimens may be tested in place of the face and root specimens specified. The side bend specimens should be 10 mm minimum thickness. The upper and lower surfaces of the weld are to be filed, ground or machined flush with the surface of the plate.
- 7.1.5 The edges on the tension side of bend samples are to be rounded to a radius of 1 to 2 mm.

**7.2 Testing procedures**

- 7.2.1 The bend sample is plastically deformed by plunging a mandrel between two fixed points as shown in [Figure 2.7.2: Bend test](#).

**Figure 2. 7. 2: Bend test**

$a$  = thickness of bend sample  
 $R$  = radius of roller  
 $D$  = outside diameter of former

7. 2. 2 For aluminium welds a guided bend is required to ensure even deformation as shown in [Figure 2. 7. 3: Guide bend test for aluminium](#).

**Figure 2. 7. 3: Guide bend test for aluminium**

$a$  = plate tickness  
 $D$  = mandrel diameter  
 $R$  = former radius

7. 2. 3 Bend tests are to be conducted at ambient temperature at the highest convenient rate of bending (but not impact).

CHAPTER **2 Testing Procedures for Metallic Materials**

SECTION **8 Hardness testing**

## **8. 1 Dimensions of test specimens**

- 8. 1. 1 Test pieces must be held rigidly in relation to the indenter and located such that the surface to be tested is at right angles to the axis of the indenter.
- 8. 1. 2 The surface finish of the test piece is to be such as to be able to measure the indent accurately.

## **8. 2 Testing procedure**

- 8. 2. 1 Hardness testing is to be carried out according to ISO 6506-1, ISO 6507-1 or equivalent for the type of hardness test.

## CHAPTER 2 Testing Procedures for Metallic Materials

## SECTION 9 Corrosion tests

## 9.1 Intergranular corrosion test

- 9.1.1 For all products other than pipes, the material for the test specimens is to be taken adjacent to that for the tensile test and is to be machined to suitable dimensions for either a round or rectangular section bend test. The diameter or thickness is to be not more than 12 mm, and the total surface area is to be between 1500 mm<sup>2</sup> and 3500 mm<sup>2</sup>.
- 9.1.2 For pipes with an outside diameter not exceeding 40 mm, the test specimens are to consist of a full cross-section. For larger pipes, the test specimens are to be cut as circumferential strips of full wall thickness and having a width of not less than 12.5 mm. In both cases the total surface area is to be between 1500 mm<sup>2</sup> and 3500 mm<sup>2</sup>.
- 9.1.3 Specimens are to be heated to a temperature of 700±10 °C for 30 minutes, followed by rapid cooling in water. They are then to be placed on a bed of copper turnings (50 g per litre of test solution) and immersed for 15 to 24 hours in a boiling solution of the following composition:
- 100 g of hydrated copper sulphate granules (CuSO<sub>4</sub> · 5H<sub>2</sub>O)
  - 184 g (100 ml) sulphuric acid (density 1.84 g/ml) added dropwise to distilled water to make 1 litre of solution.
- Precautions are to be taken during boiling to prevent concentration of the solution by evaporation.
- 9.1.4 After immersion, the full cross-section test specimens from pipes are to be subjected to a flattening test in accordance with [Ch 2, 4.2 Flattening tests](#). All other test specimens are to be bent, at ambient temperature, through 90 ° over a former with a diameter equal to twice the diameter or thickness of the test specimen.
- 9.1.5 After flattening or bending, the test specimens are to be free from cracks on the outer, convex surface.

## 9.2 Pitting corrosion test

- 9.2.1 The material for the test specimens is to be taken adjacent to that for the tensile test and is to be machined to a round or rectangular test piece of thickness approximately 6 mm with total surface area between 1500 mm<sup>2</sup> and 3500 mm<sup>2</sup>. Any deformed material at the edges is to be removed.
- 9.2.2 All surfaces of the specimen are to be polished to a uniform finish using 120 grit abrasive paper. Sharp edges are to be removed and, after polishing, the specimen should be thoroughly washed and dried.
- 9.2.3 The dimensions of the surface are to be measured in order to calculate the exposed area.
- 9.2.4 The specimen is to be weighed to an accuracy of 0.001 g or greater.

9. 2. 5 For the corrosive media 100g of reagent grade ferric chloride,  $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$ , is dissolved in 900ml of de-ionised water and filtered to remove insoluble particles.
9. 2. 6 At least 250ml of ferric chloride solution is to be added to a glass test container. The container is to be placed in a water bath and allowed to reach the required test temperature. The bath temperature shall be monitored and recorded in order to ensure that the temperature is satisfactorily maintained throughout the test. Once the test temperature has been achieved, the test piece is to be placed in a glass cradle and lowered into the solution.
9. 2. 7 A glass cover is to be placed over the vessel to allow the test piece to remain undisturbed throughout the duration of the test. The standard duration of the test is 72 hours.
9. 2. 8 At the end of the test, the specimen is to be removed from the solution. It shall be rinsed with water, scrubbed with a nylon bristle brush under running water to remove corrosion products, and then dried.
9. 2. 9 The surface of the specimen is to be thoroughly inspected to a magnification of x20 and the specimen is weighed to an accuracy of 0.001 g or better.
9. 2. 10 The results obtained shall be recorded and these shall include the weight loss expressed as  $\text{g/m}^2$  and a description of the surface appearance, noting any evidence of pitting corrosion.
9. 2. 11 Unless otherwise agreed, the acceptance criteria for the test are that there shall be no evidence of pitting at x20 magnification and that the maximum weight loss shall be  $0.8 \text{ g/m}^2$ .

**CHAPTER 3 Rolled Steel Plates, Strip, Sections and Bars****SECTION 1 General requirements****1.1 Scope**

- 1.1.1 This Section gives the general requirements for hot rolled plates and sections intended for use in the construction of ships, other marine structures, machinery, boilers and pressure vessels.
- 1.1.2 This Chapter is not applicable to hot rolled bars intended for the manufacture of bolts, plain shafts, etc. by machining operations only. Where used for this purpose, hot rolled bars are to comply with the requirements of [Ch 5 Steel Forgings](#).
- 1.1.3 Plate and strip which is hot coiled after rolling and subsequently uncoiled, cold flattened and cut to the required dimensions are also subject to the appropriate requirements of this Chapter.
- 1.1.4 Plates, strip, sections and bars are to be manufactured and tested in accordance with the requirements of [Ch 1 General Requirements](#) and [Ch 2 Testing Procedures for Metallic Materials](#), the general requirements of this Section and the appropriate specific requirements given in Sections [Ch 3, 2 Normal strength steels for ship and other structural applications](#) to [Ch 3, 10 High strength steels for welded structures](#). Steels differing from the requirements of these Sections in respect of chemical composition, deoxidation practice, condition of supply or mechanical properties may be accepted subject to special approval by ACS. Such steels are to be given a special designation, See [Ch 3, 1.12, Identification of materials](#).
- 1.1.5 As an alternative to [Ch 3, 1.1 Scope 1.1.4](#), materials which comply with National or proprietary specifications may be accepted, provided that these specifications give equivalence to the requirements of this Chapter or are approved for a specific application. Particular attention is to be taken of the minimum required under thickness tolerance, See [Ch 3, 1.7, Dimensional tolerances](#). Generally, survey and certification of such materials are to be carried out in accordance with the requirements of [Ch 1 General Requirements](#).
- 1.1.6 Steels intended for high heat input welding above 50 kJ/cm are to be specially approved. Approval will be indicated on the manufacturer's approval certificate by adding a high heat input welding notation to the grade approved e.g. EH36-W300, indicating approval up to 300 kJ/cm.

**1.2 Steel with guaranteed through thickness properties – 'Z' grade steel**

- 1.2.1 When plate material, intended for welded construction, will be subject to significant strains in a direction perpendicular to the rolled surfaces, it is recommended that consideration be given to the use of special plate material with specified through thickness properties, 'Z' grade steel. These strains are usually associated with thermal contraction and restraint during welding, particularly for full penetration 'T'-butt welds, but may also be associated with loads applied in service or during construction. Where these strains are of sufficient magnitude, lamellar tearing may occur. Requirements for 'Z' grade plate material are detailed in [Ch 3, 8 Plates with specified through thickness properties](#). It is the responsibility of the fabricator to make provision for the use of this material.

1. 2. 2 Steels intended to have guaranteed through thickness properties will include the supplementary suffix Z25 or Z35 in the designation, for example: ACS DH36 Z35.

### 1. 3 Corrosion resistant steels for cargo oil tanks of crude oil tankers

1. 3. 1 This sub-Section refers to normal and higher strength steels that have approved enhanced corrosion resistance properties intended for application in the internal cargo oil tanks of crude oil tankers.
1. 3. 2 The additional approval procedures for these steels include specific corrosion tests, *See [Ch 1, 2.2, ACS Approval – General](#) and [Ch 15, 3 Corrosion Resistant Steels](#)* .
1. 3. 3 1.3.3 Normal and higher strength corrosion resistant steels are to be manufactured, tested and certified in accordance with the applicable requirements detailed in this section, and those of [Ch 3, 2 Normal strength steels for ship and other structural applications](#) or [Ch 3, 3 Higher strength steels for ship and other structural applications](#) , as applicable, and the requirements detailed in [Ch 15, 3 Corrosion Resistant Steels](#) .
1. 3. 4 Corrosion resistant steels for cargo oil tanks are primarily intended to apply to steel plates, wide flats and sections up to 50 mm thick and to bars up to 50 mm in diameter.
1. 3. 5 Corrosion resistant steels for cargo oil tanks are to be identified with one of the following supplementary suffixes, RCU, RCB or RCW in the designation, for example, ACS DH36 RCB. These suffixes relate to the area of the tank for which approval testing has been obtained:
- RCU, for the lower surface of strength deck and surrounding structures, defined as the deckhead with complete internal structure, including brackets connecting to longitudinal and transverse bulkheads. In addition:
    - In tanks with ring frame girder construction the underdeck transverse framing is to be protected down to level of the first tripping bracket below the upper faceplate;
    - Longitudinal and transverse bulkheads are to be protected to the uppermost means of access level. The uppermost means of access and its supporting brackets are to be fully protected.
    - On cargo tank bulkheads without an uppermost means of access the protection is to extend to 10 per cent of the tank's height at centreline but need not extend more than 3 m down from the deck.
  - RCB, for the upper surface of inner bottom plating and surrounding structures, defined as the flat inner bottom and all structure to a height of 0.3 m above inner bottom, is to be protected;
  - RCW, for both strength deck and inner bottom plating.
1. 3. 6 Corrosion resistant steels are not to be used in applications other than those specified in [Ch 3, 1.3 Corrosion resistant steels for cargo oil tanks of crude oil tankers 1.3.1](#).
1. 3. 7 The weldability of corrosion resistant steels is similar to conventional normal and higher strength steels. Therefore the welding requirements specified in [Ch 11 Approval of Welding Consumables](#) to [Ch 13 Requirements for Welded Construction](#) are to be adhered with the exception that each corrosion resistant steel is approved with a specified brand of welding consumable and associated welding process.
1. 3. 8 Each manufacturer's approval certificate for corrosion resistant steels will state the steel grade and area of application designation, specified chemical composition range including additive and/or controlling element percentages to improve corrosion resistance, and brand of welding consumables and welding process used for approval.

### 1. 4 Manufacture

1. 4. 1 All materials are to be manufactured at works which have been approved by Asia Classification Society for the type and grade of steel which is being supplied and for the relevant steel-making and processing route.

1. 4. 2 Steel is to be cast in metal ingot moulds or by the continuous casting process. The size of the ingot, billet or slab is to be proportional to the dimensions of the final product such that the reduction ratio is normally to be at least 3 to 1. Sufficient discard is to be taken to ensure soundness in the portion used for further processing.
1. 4. 3 The cast analysis to be used for certification purposes is to be determined after all alloying additions have been carried out and sufficient time allowed for such an addition to homogenise.
1. 4. 4 Material may be supplied either as-rolled, normalised, normalising rolled, or thermomechanically controlled rolled. The following definitions apply:
  - a. As-rolled (AR) refers to steel being cooled as it is rolled with no further heat treatment. The rolling and finishing temperatures are typically in the austenite recrystallisation region and above the normalising temperature. The strength and toughness properties of steel produced by this process are generally less than those of steel heat treated after rolling or steel produced by advanced processes.
  - b. Normalising (N) refers to an additional heating cycle of rolled steel above the critical temperature,  $A_{c3}$ , and in the lower end of the austenite recrystallisation region for a specific period of time, followed by air cooling. The process improves the mechanical properties of as-rolled steel by refining the grain size and homogenising the microstructure.
  - c. Normalising rolling (NR), also known as controlled rolling, is a rolling procedure in which the final deformation is carried out in the normalising temperature range, and subsequently cooled in air, resulting in a material condition generally equivalent to that obtained by normalising.
  - d. Thermomechanically controlled rolling (TM) is a procedure which involves the strict control of both the steel temperature and the rolling reduction. Generally a high proportion of the rolling reduction is carried out close to the  $A_{r3}$  temperature and may involve the rolling in the dual phase temperature region. Unlike normalising rolling the properties conferred by TM (TMCP) cannot be reproduced by subsequent normalising or other heat treatment. The use of accelerated cooling on completion of TM may also be accepted subject to the special approval by ACS.
  - e. Accelerated Cooling, (AcC) is a process which aims to improve mechanical properties by controlled cooling with rates higher than air cooling immediately after the final TM operation. Direct quenching is excluded from accelerated cooling. The material properties conferred by TM and AcC cannot be reproduced by subsequent normalising or other austenitising heat treatment.
  - f. Quenching and Tempering (QT) is a heat treatment process in which steel is heated to an appropriate temperature above the  $A_{c3}$ , held for a specific period of time, and then cooled with an appropriate coolant for the purpose of hardening the microstructure, followed by tempering, a process in which the steel is re-heated to an appropriate temperature, not higher than the  $A_{c1}$ , maintained at that temperature for a specific period of time to restore the toughness properties by improving the microstructure and reducing the residual stresses resulting from the quenching process
1. 4. 5 Where material is being produced by a normalising rolling or a thermomechanically controlled process (T.M.) an additional program of tests for approval is to be carried out under the supervision of the Surveyors and the results are to be to the satisfaction of ACS.
1. 4. 6 Weldable high strength steels may be supplied in the quenched and tempered condition for other marine structures, See [Ch 3, 10 High strength steels for welded structures](#).

## 1. 5 Surface quality of materials

1. 5. 1 The steel is to be free from surface defects prejudicial to the use of the material for the intended application. The finished material is to have a surface quality in accordance with a recognised

standard such as EN 10163 parts 1, 2 and 3 or an equivalent standard accepted by ACS, unless otherwise specified in this Section.

1. 5. 2 The responsibility for meeting the surface finish requirements rests with the manufacturer of the material, who is to take the necessary manufacturing precautions and is to inspect the products prior to delivery. If, during the subsequent processing operations, surface quality of the material is found to be defective, the materials shall be repaired or rejected.
1. 5. 3 For hot rolled plates, wide flats and sections, the surface quality inspection method shall be in accordance with recognised National or International Standards as agreed between the purchaser and the manufacturer, and accepted by ACS. The surface inspection acceptance criteria are to comply with the following:
  - a. Imperfections  
Imperfections of a harmless nature, for example pitting, rolled-in scale, indentations, roll marks, scratches and grooves, regarded as being inherent in the manufacturing process, are permissible, provided the maximum permissible limits of Class A of EN 10163-2 or limits specified in a recognised equivalent standard accepted by ACS, are not exceeded and the remaining plate or wide flat thickness remains within the average allowable minus thickness tolerance specified in [Ch 3, 1.7, Dimensional tolerances](#). The surface area exhibiting the imperfections is not to exceed 15 per cent of the total subject area.
  - b. Defects  
Affected areas with imperfections with a depth exceeding the limits of Class A of EN 10163-2 or the maximum permissible limits specified in a recognised equivalent standard accepted by ACS, shall be repaired. Cracks, injurious surface flaws, shells (overlapping material with non-metallic inclusion), sand patches, laminations and sharp edged seams (elongated defects) visually evident on surface and/or edge of plate are considered defects which would impair the end use of the product and which require rejection or repair.
1. 5. 4 If agreed by the manufacturer and purchaser, steel can be ordered with higher standards of required surface finish than those shown in [Ch 3, 1.5 Surface quality of materials 1.5.3](#).
1. 5. 5 The examination and acceptance standard of surface quality and condition requirement of sections, bars and tubulars is to be agreed between the purchaser and the steel maker, and accepted by ACS. It then has to be included in the manufacturing specification.

## 1. 6 Internal soundness

1. 6. 1 The steel is to be free from segregations and non-metallic inclusions prejudicial to the use of the material for the intended application.
1. 6. 2 Verification of internal soundness is the responsibility of the manufacturer. The acceptance of internal soundness by the ACS Surveyor shall not absolve the manufacturer from this responsibility.

## 1. 7 Dimensional tolerances

1. 7. 1 The tolerances on thickness of a given product are defined as:
  - a. Minus tolerance is the lower limit of the acceptable range below the nominal thickness.
  - b. Plus tolerance is the upper limit of the acceptable range above the nominal thickness.
 Nominal thickness is defined by the purchaser at the time of enquiry and order.
1. 7. 2 The average thickness of a product or products is defined as the arithmetic mean of the measurements made in accordance with the requirements in [Ch 3, 1.7 Dimensional tolerances 1.7.13](#).

1. 7. 3 For materials of nominal thickness 5 mm and more intended for hull structural purposes as detailed in [Ch 3, 2 Normal strength steels for ship and other structural applications](#), [Ch 3, 3 Higher strength steels for ship and other structural applications](#) and [Ch 3, 10 High strength steels for welded structures](#), the minus tolerance on thickness of plates, strip and wide flats, where the width is greater than or equal to 600 mm, is 0.3 mm, irrespective of nominal thickness. The average thickness of a product or products is not to be less than the nominal thickness. Plus tolerance is to be in accordance with a National or International Standard unless agreed otherwise by ACS and the purchaser.
1. 7. 4 Class C of ISO 7452 or equivalent National or International Standards may be applied in lieu of [Ch 3, 1.7 Dimensional tolerances 1.7.3](#). Where this standard is applied, the steel mill is to ensure that the number of measurements and measurement distribution is appropriate to establish that the plates produced are greater than or equal to the specified nominal thickness.
1. 7. 5 For materials of nominal thickness below 5 mm intended for hull structural purposes as detailed in [Ch 3, 2 Normal strength steels for ship and other structural applications](#), [Ch 3, 3 Higher strength steels for ship and other structural applications](#) and [Ch 3, 10 High strength steels for welded structures](#), the minus tolerances on thickness of plates, strip and wide flats, where the width is greater than or equal to 600 mm, is 0.3 mm. The plus tolerance is to be in accordance with Class B of ISO 7452 or an equivalent National or International Standard.
1. 7. 6 The minus tolerance on bars and sections (except for wide flats with a width  $\geq 600$  mm) is to be in accordance with the requirements of a recognised National or International Standard.
1. 7. 7 The Shipbuilder and Owner may agree in individual cases whether they wish to specify a more stringent minus tolerance than that given in this Chapter.
1. 7. 8 The dimensional tolerances for the products intended for the construction of lifting appliances are to be agreed with ACS.
1. 7. 9 The minus tolerances for plates and wide flats intended for machinery structures are given in [Ch 3, 5 Steels for machinery fabrications](#).
1. 7. 10 For materials intended for applications as detailed in [Ch 3, 4 Steels for boilers and pressure vessels](#) and [Ch 3, 6 Carbon–manganese and nickel alloy steels for low temperature service](#), no minus tolerance is permitted in the thickness of plates and strip. The minus tolerances on sections are to comply with the requirements of a recognised National or International Standard.
1. 7. 11 For the materials detailed in [Ch 3, 7 Austenitic and duplex stainless steels](#), the minus tolerance of material intended for use in the construction of cargo tanks is not to exceed 0.3 mm. For other applications, no minus tolerance is permitted in the thickness of plates and strip.
1. 7. 12 Dimensional tolerances for material detailed in [Ch 3, 9 Bars for welded chain cables](#) are given in [Table 3. 9. 3: Dimensional tolerance of bar stock](#).
1. 7. 13 The average thickness and thickness tolerance is to be measured at locations of a product or products as defined below:
  - a. An automated method or manual method may be applied to the thickness measurements. The procedure and the records of measurements are to be made available to the Surveyor and copies provided on request.
  - b. At least two lines among Line 1, Line 2 or Line 3, as shown in [Figure 3. 1. 1: Location of thickness measuring points](#), are to be selected for the thickness measurements and at least three points on each selected line as shown in [Figure 3. 1. 1: Location of thickness measuring points](#) are to be selected for thickness measurement on each piece rolled from a single slab or single ingot. If more than three points are taken on each line, then the number of points shall be equal on each line.
  - c. For automated methods, the measuring points at sides are to be located not less than 10 mm but not greater than 300 mm from the transverse or longitudinal edges of the product.

- d. For manual methods, the measuring points at sides are to be located not less than 10 mm but not greater than 100 mm from the transverse or longitudinal edges of the product.
- e. Additional measurements may be requested by the Surveyor.

**Figure 3. 1. 1: Location of thickness measuring points**

- 1. 7. 14 Local surface depressions resulting from imperfections and ground areas resulting from the elimination of defects may be disregarded provided that they are in accordance with the requirements of a recognised National or International Standard.
- 1. 7. 15 Tolerances relating to length, width, flatness and plus thickness are to comply with a National or International Standard.
- 1. 7. 16 The responsibility for maintaining the required tolerances and making the necessary measurements rests with the manufacturer. Occasional checking by the Surveyor does not absolve the manufacturer from this responsibility.
- 1. 7. 17 The Shipbuilder is responsible for the storage and maintenance of product(s) delivered with acceptable surface conditions.

## **1. 8 Heat treatment**

- 1. 8. 1 Acceptable conditions of supply are specified in subsequent Sections of this Chapter.
- 1. 8. 2 The manufacturer is to carry out any heat treatment which may be necessary to prevent hydrogen cracking or to make the material in a safe condition for transit. The Surveyor is to be advised of any heat treatment proposed.
- 1. 8. 3 Where material is manufactured using a thermomechanically controlled process consideration must be given to the possibility of consequent reduction in mechanical properties if it is subjected to heating for forming or stress relieving or is welded using a high heat input.

## **1. 9 Test material and mechanical tests**

- 1. 9. 1 Depending on the type of product, provision is made in subsequent Sections of this Chapter for the testing of individual items or for batch testing. Where the latter is permitted, all materials in a batch presented for acceptance tests are to be of the same product form, (e.g. plates, flats, sections, etc.), from the same cast and in the same condition of supply.
- 1. 9. 2 The test samples are to be fully representative of the material and, where appropriate, are not to be cut from the material until heat treatment has been completed. The test specimens are not to be separately heat treated in any way.
- 1. 9. 3 The test material is to be taken from the thickest piece in each batch, See [Ch 1, 4.1 General](#).
- 1. 9. 4 Test material is to be taken from the following positions:

- a. At the square cut end of plates and flats greater than 600 mm wide, approximately one-quarter width from an edge, *See* [Figure 3. 1. 2: Position of test material](#).
  - b. For flats 600 mm or less in width, bulb flats and other solid sections, at approximately one-third of the width from an edge, *See* [Figure 3. 1. 2: Position of test material](#), [Figure 3. 1. 2: Position of test material](#) and [Figure 3. 1. 2: Position of test material](#). Alternatively, in the case of channels, beams or bulb angles, at approximately one-quarter of the width from the centreline of the web, *See* [Figure 3. 1. 2: Position of test material](#).
  - c. For rectangular hollow sections, at approximately the centre of any side, *See* [Figure 3. 1. 2: Position of test material](#). For circular hollow sections, at any position on the periphery.
  - d. For bars intended for purposes as detailed in [Ch 3, 2 Normal strength steels for ship and other structural applications](#), [Ch 3, 3 Higher strength steels for ship and other structural applications](#), [Ch 3, 5 Steels for machinery fabrications](#) and [Ch 3, 9 Bars for welded chain cables](#), at approximately one-third of the radius or half-diagonal from the outer surface, *See* [Figure 3. 1. 2: Position of test material](#). For smaller bars, the position of the test material is to be as close as is possible to the above.
  - e. For bars intended for the applications detailed in [Ch 3, 4 Steels for boilers and pressure vessels](#), [Ch 3, 6 Carbon–manganese and nickel alloy steels for low temperature service](#) and [Ch 3, 7 Austenitic and duplex stainless steels](#) at approximately 12.5 mm below the surface. For bars up to 25 mm diameter, the test specimens may be machined coaxially.
  - f. When the capacity of the available testing machine is insufficient, tensile testing is to be carried out in accordance with the requirement of [Ch 2, 2.1 Dimensions of test specimens 2.1.6](#).
1. 9. 5 Tensile test specimens and impact test specimens, where required for the type and grade of product being supplied, are to be prepared from each item or batch of material submitted for acceptance.
  1. 9. 6 Where the finished width of plates and flats is greater than 600 mm, the tensile test specimens are to be cut with their principal axes perpendicular to the final direction of rolling. For all other rolled products, the principal axes are to be parallel to the final direction of rolling.
  1. 9. 7 The tensile test specimens are to be machined to the dimensions detailed in [Ch 2, 2.1 Dimensions of test specimens 2.1.6](#) and [Ch 2, 2.1 Dimensions of test specimens 2.1.7](#).
  1. 9. 8 Impact test specimens are to be cut with their principal axes either parallel (longitudinal test) or perpendicular (transverse test) to the final direction of rolling, as required by subsequent Sections of this Chapter. Where both longitudinal and transverse impact properties are shown for a particular grade, only the longitudinal test is required to be carried out, unless otherwise specified by the purchase order or subsequent Sections of this Chapter. However, for plates and wide flats, by certifying that the product meets the requirements of the Rules, the manufacturer guarantees that the acceptance values will be met if tested in the transverse direction. The Surveyor may request testing in this direction to confirm conformity.
  1. 9. 9 Impact test specimens are to be of the Charpy V-notch type, machined to the dimensions detailed in [Ch 2 Testing Procedures for Metallic Materials](#). They are to be taken from a position within 2 mm of one of the rolled surfaces, except that for plates and sections over 40 mm thick, the axes of the test specimens are to be at one-quarter of the thickness from one of the rolled surfaces. For bars and other similar products the axes of the test specimens are to be as specified in [Ch 3, 1.9 Test material and mechanical tests 1.9.4.d](#).
  1. 9. 10 Standard test specimens 10 mm square are to be used, except where the thickness of the material does not allow this size of test specimen to be prepared. In such cases the largest possible size of subsidiary test specimen, in accordance with [Table 2. 3. 1: Dimensions and tolerances for Charpy V-notch impact test specimens](#) is to be prepared, with the notch cut on the narrow face. Alternatively, for material of suitable thickness, the rolled surfaces may be retained so that the test specimen width will be the full thickness of the material. In such cases the tolerances for width given in [Table 2. 3. 1: Dimensions and tolerances for Charpy V-notch impact test specimens](#) in

Chapter 2 are not applicable. The notch is to be cut in a face of the test specimen which was originally perpendicular to the rolled surface. The position of the notch is to be not nearer than 25 mm to a flame-cut or sheared edge.

- 1. 9. 11 Impact tests are not required when the nominal material thickness is less than 6 mm.
- 1. 9. 12 The test procedures used for all tensile and impact tests are to be in accordance with the requirements of [Ch 2 Testing Procedures for Metallic Materials](#).

## 1. 10 Visual and non-destructive examination

- 1. 10. 1 Surface inspection and verification of dimensions are the responsibility of the steelmaker and are to be carried out on all material prior to despatch. Acceptance by the Surveyors of material later found to be defective shall not absolve the steelmaker from this responsibility.
- 1. 10. 2 With the exception of 'Z' grade plate material (See [Ch 3, 8 Plates with specified through thickness properties](#)) and bars for offshore mooring cable (See [Ch 3, 9 Bars for welded chain cables](#)), the non-destructive examination of materials is not required for acceptance purposes. However, manufacturers are expected to employ suitable methods of non-destructive examination for the general maintenance of quality standards. If agreed by the manufacturer and purchaser that the plates and wide flats products are ordered with an ultrasonic examination requirement, then the examination is to be carried out in accordance with a recognised standard accepted by ACS, which is then to be included in the manufacturing specification.

**Figure 3. 1. 2: Position of test material**

1. 10. 3 Verification of results of visual and non-destructive examination is the responsibility of the manufacturer. The acceptance of internal soundness by the ACS Surveyor shall not absolve the manufacturer from this responsibility.

## 1. 11 Rectification of defects

1. 11. 1 For materials intended for structural purposes as detailed in [Ch 3, 2 Normal strength steels for ship and other structural applications](#), [Ch 3, 3 Higher strength steels for ship and other structural applications](#) and [Ch 3, 5 Steels for machinery fabrications](#), surface defects may be removed by local grinding provided that:
  - a. the thickness is in no place reduced to less than 93 per cent of the nominal thickness, but in no case by more than 3 mm,
  - b. each single ground area does not exceed 0.25 m<sup>2</sup>,
  - c. the total area of local grinding does not exceed two per cent of the total surface,
  - d. adjacent ground areas, lying within a distance of less than their average breadth to each other, are to be regarded as one single area,
  - e. ground areas lying opposite each other on both surfaces shall not decrease the product thickness by values exceeding the limits as stated under [Ch 3, 1.11 Rectification of defects 1.11.1.a](#),
  - f. the ground areas have smooth transitions to the surrounding surface.

Where necessary, the entire surface may be ground to a maximum depth as given by the underthickness tolerances of the product. The extent of such rectification is to be agreed in each case with the Surveyors and is to be carried out under their supervision, unless otherwise agreed. They may request that complete removal of the defect is proven by suitable non-destructive examination of the affected area.
1. 11. 2 Surface defects which cannot be dealt with as in [Ch 3, 1.11, Rectification of defects 1.11.1](#) may be repaired by chipping or grinding followed by welding, subject to the Surveyor's consent and under his supervision, provided that:
  - a. after removal of the defect and before welding, the thickness of the item is in no place reduced by more than 20 per cent,
  - b. each single weld does not exceed 0.125 m<sup>2</sup>,
  - c. the total area of welding does not exceed two per cent of the surface of the side involved,
  - d. the distance between any two welds is not less than their average width,
  - e. the welds are of reasonable size and made with an excess layer of beads which is then ground smooth to the surface level,
  - f. elimination of the defect is proven by suitable non-destructive examination of the affected area,
  - g. welding is carried out by an approved procedure and by competent operators using approved low hydrogen type electrodes and the repaired area is ground smooth to the correct nominal thickness,
  - h. when requested by the Surveyor, the item is normalised or otherwise suitably heat treated after welding and grinding, and
  - i. at the discretion of the Surveyor, the repaired area is proven free from defects by suitable non-destructive examination.
1. 11. 3 For materials intended for applications as detailed in [Ch 3, 4 Steels for boilers and pressure vessels](#), [Ch 3, 6 Carbon–manganese and nickel alloy steels for low temperature service](#) and [Ch 3, 7 Austenitic and duplex stainless steels](#), surface defects may be removed by grinding in accordance with [Ch 3, 1.11, Rectification of defects 1.11.1](#), except that when the thickness is reduced below that given in the approved plans, acceptance will be subject to special consideration. Weld repairs may also be carried out generally in accordance with [Ch 3, 1.11 Rectification of defects 1.11.2](#), except that in all cases suitable heat treatment after welding and non-destructive testing of the repaired areas is required. The fabricator is to be advised regarding the position and extent of all repairs.

| <b>PART</b>    | <b>2</b> | <b>Rules for the Manufacture, Testing and Certification of Materials</b> |
| <b>CHAPTER</b> | <b>3</b> | <b>Rolled Steel Plates, Strip, Sections and Bars</b>                     |
| <b>SECTION</b> | <b>1</b> | <b>General requirements</b>  |

---

1. 11. 4 For plates which have been produced by a T.M. process or by normalising rolling, repair by welding will be approved by the Surveyor only after procedure tests have shown that the mechanical properties have not been impaired.
1. 11. 5 Cracks, shells, sand patches and sharp edged seams are always considered defects which would impair the end use of the product and which require rejection or repair irrespective of their size and number. The same applies to other imperfections exceeding the acceptable limits.

## 1. 12 Identification of materials

1. 12. 1 Every finished item is to be clearly marked by the manufacturer in at least one place with ACS's brand (See [Figure 3. 1. 3: ACS Brand](#)) and the following particulars:
  - a. The manufacturer's name or trade mark.
  - b. The grade of steel. The designations given in subsequent Sections of this Chapter may be preceded by the letters 'ACS' in order to fully describe the grade, e.g. ACS A, ACS 490FG, ACS LT-FH40, ACS 316L , etc.
  - c. When the material complies with the requirements of [Ch 3, 8 Plates with specified through thickness properties](#), the grade is to include the suffix Z25 or Z35, e.g. ACS AH36 Z35.
  - d. Identification number and/or initials which will enable the full history of the item to be traced.
  - e. If required by the purchaser, his order number or other identification mark.
  - f. Steels which have been specially approved and which differ from the requirements in this chapter are to have the letter 'S' after the agreed identification mark.

The above particulars, but excluding the manufacturer's name or trade mark where this is embossed on finished products, are to be encircled with paint or otherwise marked so as to be easily recognisable.
1. 12. 2 Where a number of light materials are securely fastened together in bundles, the manufacturer may brand only the top piece of each bundle or, alternatively, a firmly fastened durable label containing the identification may be attached to each bundle.
1. 12. 3 In the event of any material bearing ACS's brand failing to comply with the test requirements, the brand is to be unmistakably defaced, *See also* [Ch 1, 4.8 Identification of materials](#).

**Figure 3. 1. 3: ACS Brand**

## 1. 13 Certification of materials

1. 13. 1 Unless a ACS certificate is specified in other parts of the Rules, a manufacturer's certificate validated by ACS is to be issued (See [Ch 1, 3.1, General](#)) and is to include the following particulars:
  - a. Purchaser's name and order number.
  - b. If known, the contract number for which the material is intended.

- c. Address to which material is dispatched.
  - d. Name of steelworks.
  - e. Description and dimensions of the material.
  - f. Specification or grade of the steel.
  - g. Identification number of piece, including test specimen number where appropriate.
  - h. Cast number and chemical composition of ladle samples.
  - i. Mechanical test results (not required on shipping statements).
  - j. Condition of supply.
1. 13. 2 Before the test certificates are signed by the Surveyor, the steelmaker is required to provide a written declaration stating that the material has been made by an approved process, and that it has been subjected to and has withstood satisfactorily the required tests in the presence of the Surveyor, or an authorised deputy. The following form of declaration will be accepted if stamped or printed on each test certificate with the name of the steelworks and signed by an authorised representative of the manufacturer:
- ‘We hereby certify that the material has been made by an approved process and satisfactorily tested in accordance with the Rules of Asia Classification Society’.
1. 13. 3 When steel is not produced at the works at which it is rolled, a certificate is to be supplied by the steelmaker stating the process of manufacture, the cast number and the chemical composition of ladle samples. The works at which the steel was produced must be approved by ACS.
1. 13. 4 The manufacturer of coiled plate is required to issue a certificate which clearly identifies the material as coil. The certificate issued should include the words; ‘Coils covered by this certificate require further processing at a works approved by Asia Classification Society before being certified as plate in accordance with the Rules of Asia Classification Society’ in addition to the requirements of [Ch 3, 1.13 Certification of materials 1.13.2](#).
1. 13. 5 The supplier of plate cut from coil is required to issue a certificate validated by the ACS Surveyor which clearly identifies the product as finished plate meeting the requirements of the Rules in accordance with [Ch 3, 1.13 Certification of materials 1.13.2](#).
1. 13. 6 The form of certificates produced by computer systems is to be agreed with the Surveyor.

## PART

# 2

## CHAPTER 3 Rolled Steel Plates, Strip, Sections and Bars

### SECTION 2 Normal strength steels for ship and other structural applications

#### 2.1 Scope

- 2.1.1 The requirements of this Section are primarily intended to apply to steel plates and wide flats not exceeding 100 mm in thickness and sections and bars not exceeding 50 mm in thickness in Grades A, B, D and E. For greater thicknesses, variations in the requirements may be permitted or required for particular applications.
- 2.1.2 Additional approval tests may be required to verify the suitability for forming and welding of Grade E plate exceeding 50 mm in thickness.

#### 2.2 Manufacture and chemical composition

- 2.2.1 The method of deoxidation and the chemical composition of ladle samples are to comply with the requirements given in [Table 3. 2. 1: Chemical composition and deoxidation practice](#).
- 2.2.2 Small variations from the chemical compositions given in [Table 3. 2. 1: Chemical composition and deoxidation practice](#) may be allowed for Grade E steel in thicknesses exceeding 50 mm or when any Grade of steel is supplied in a thermo-mechanically controlled processed condition, provided that these variations are documented and approved in advance.
- 2.2.3 The manufacturer's declared analysis will be accepted subject to occasional checks if required by the Surveyors.

**Table 3. 2. 1: Chemical composition and deoxidation practice**

| Grade  | A   | B   | D  | E  |
|--|---|---|--|--|
| Deoxidation                                    | For $t \leq 50$ mm:<br><br>Any method (for rimmed steel, <i>See</i> Note 1) | For $t \leq 50$ mm:<br><br>Any method except rimmed steel | For $t \leq 25$ mm:<br><br>Killed                                    | Killed and fine grain treated with aluminium |
|  | For $t > 50$ mm:<br><br>Killed  | For $t > 50$ mm:<br><br>Killed                            | For $t > 25$ mm:<br><br>Killed and fine grain treated with aluminium |  |
| Chemical composition %<br>( <i>See</i> Note 5) |   |   |  |  |

|   |                        |                        |                         |                         |
|---|------------------------|------------------------|-------------------------|-------------------------|
| Carbon  | 0.21 max. (See Note 2) | 0.21 max.              | 0.21 max.               | 0.18 max.               |
| Manganese   | 2.5 x C% min.          | 0.80 min. (See Note 3) | 0.60 min.               | 0.70 min.               |
| Silicon   | 0.50 max.              | 0.35 max.              | 0.10 – 0.35             | 0.10 – 0.35             |
| Sulphur   | 0.035 max.             | 0.035 max.             | 0.035 max.              | 0.035 max.              |
| Phosphorus  | 0.035 max.             | 0.035 max.             | 0.035 max.              | 0.035 max.              |
| Aluminium (acid soluble)  | -                      | -                      | 0.015 min. (See Note 4) | 0.015 min. (See Note 4) |
| Carbon + 1 / 6 of the manganese content is not to exceed 0.40%  |                        |                        |                         |                         |
| <p><b>Note 1.</b> For Grade A, rimmed steel may only be accepted for sections up to a maximum thickness of 12.5 mm, provided that it is stated on the test certificates or shipping statements to be rimmed steel.</p> <p><b>Note 2.</b> The maximum carbon content for Grade A steel may be increased to 0.23% for sections.</p> <p><b>Note 3.</b> Where Grade B is impact tested the minimum manganese content may be reduced to 0.60%.</p> <p><b>Note 4.</b> The total aluminium content may be determined instead of the acid soluble content. In such cases the total aluminium content is to be not less than 0.020%.</p> <p><b>Note 5.</b> Where additions of any other elements are made as part of the steel-making practice, the content is to be recorded.</p> |                        |                        |                         |                         |

2. 2. 4 For plate supplied from coil, the chemical analysis can be transposed from the certificate of the coil manufacture onto the re-processor's certificate.

## 2. 3 Condition of supply

2. 3. 1 All materials are to be supplied in a condition complying with the requirements given in [Table 3. 2. 2: Condition of supply](#). Where alternative conditions are permitted these are at the option of the steelmaker, unless otherwise expressly stated in the order for the material, but a steelmaker is to supply materials only in those conditions for which he has been approved by ACS.

**Table 3. 2. 2: Condition of supply**

| Grade   | Thickness mm | Conditions of supply |
|---|--------------|----------------------|
| A and B   | ≤50          | Any (See Note 1)     |
|   | >50 ≤100     | N NR TM (See Note 2) |
| D   | ≤35          | Any (See Note 1)     |
|   | >35 ≤100     | N NR TM (See Note 3) |
| E   | ≤100         | N TM (See Note 4)    |
| N= normalised<br>NR= normalising rolled<br>TM= thermomechanically controlled-rolled |              |                      |

**Note 1.** 'Any' includes as-rolled, normalised, normalising rolled and thermomechanically controlled-rolled.

**Note 2.** Plates, wide flats, sections and bars may be supplied in the as-rolled condition, subject to special approval from ACS.

**Note 3.** Sections in Grade D steel may be supplied in thicknesses greater than 35 mm in the as-rolled condition provided that satisfactory results are consistently obtained from Charpy V-notch impact tests.

**Note 4.** Sections in Grade E steel may be supplied in the as-rolled and normalising rolled conditions provided that satisfactory results are consistently obtained from Charpy V-notch impact tests.

2. 3. 2 Where normalising rolling and thermomechanically controlled rolling (T.M.) processes are used, it is the manufacturer's responsibility to ensure that the programmed rolling schedules are adhered to. Where deviation from the programmed rolling schedule occurs, the manufacturer must ensure that each affected piece is tested and that the local Surveyor is informed.
2. 3. 3 If a steel product supplied in the T.M. condition is to be subjected to heating for forming or stress relieving or is to be welded by a high energy input process, consideration must be given to the possibility of a consequent reduction in mechanical properties.

## 2. 4 Mechanical tests

2. 4. 1 The results of all tensile tests and the average energy value from each set of three impact tests are to comply with the appropriate requirements given in [Table 3. 2. 3: Mechanical properties for acceptance purposes](#) except where enhanced by the requirements of this Section.
2. 4. 2 With the exception given in [Ch 3, 2.4 Mechanical tests 2.4.4](#), one tensile test is to be made for each batch presented unless the mass of finished material is greater than 50 tonnes, in which case one test is to be made from a different piece from each 50 tonnes or fraction thereof. Additional tests are to be made for every variation of 10 mm in the thickness or diameter of products from the same cast. For sections, the thickness to be considered is the thickness of the product at the point at which samples are taken for mechanical tests. A piece is to be regarded as the rolled product from a single slab or billet, or from a single ingot if this is rolled directly into plates, strip, sections or bars.
2. 4. 3 For Grades A and B where plate is supplied from coil, results of the tensile test can be transposed from the certificate of the coil manufacture onto the certificate issued by the re-processor. If the coil mass exceeds 50 tonnes, testing will additionally be required from two locations representing the start and end of the coil. For Grades D and E, the mechanical properties must be sampled from the decoiled plate in accordance with the frequency specified in the Rules.
2. 4. 4 For plates of thickness exceeding 50 mm in Grade E steel, one tensile test is to be made on each piece.

**Table 3. 2. 3: Mechanical properties for acceptance purposes**

| Grade | Yield stress<br>N/mm <sup>2</sup><br>minimum | Tensile<br>strength<br>N/mm <sup>2</sup> | Elongation on<br>$5.65\sqrt{S_0}$ %<br>minimum | Charpy V-notch impact test<br>(See Notes 3, 4, 5, 6) |                          |            |
|-------|--|--|--|--|--------------------------|------------|
|       |  |  |  | Thickness<br>mm                                      | Average energy J minimum |            |
|       |  |  |  |  | Longitudinal             | Transverse |

|   |     |                           |                    |  |                                       |                |     |     |
|---|-----|---------------------------|--------------------|--|---------------------------------------|----------------|-----|-----|
| A, B, D, E  | 235 | 400 - 520<br>(See Note 1) | 22<br>(See Note 2) | ≤50<br>>50≤70<br>>70≤100                 | 27<br>34<br>41                        | 20<br>24<br>27 |     |     |
| Impact tests are to be made on the various grades at the following temperatures:  |     |                           |                    | A grade<br>B grade<br>D grade<br>E grade | not required<br>0°C<br>-20°C<br>-40°C |                |     |     |
| <b>Note 1.</b> For sections in Grade A, the upper limit of the tensile strength range may be exceeded at the discretion of the Surveyor.  |     |                           |                    |  |                                       |                |     |     |
| <b>Note 2.</b> For full thickness tensile test specimens with a width of 25 mm and a gauge length of 200 mm (See <a href="#">Figure 2. 2. 4: Test specimen dimensions for plates, strip and sections - II</a> ), the minimum elongation is to be: |     |                           |                    |  |                                       |                |     |     |
| Thickness mm  |     | >5                        | >10                | >15                                      | >20                                   | >25            | >30 | >35 |
|   |     | ≤5                        | ≤10                | ≤15                                      | ≤20                                   | ≤25            | ≤30 | ≤35 |
| Elongation %  |     | 14                        | 16                 | 17                                       | 18                                    | 19             | 20  | 21  |
| <b>Note 3.</b> See <a href="#">Ch 3, 2.4 Mechanical tests 2.4.5</a> and <a href="#">Ch 3, 2.4 Mechanical tests 2.4.6</a> .  |     |                           |                    |  |                                       |                |     |     |
| <b>Note 4.</b> See <a href="#">Ch 3, 2.4 Mechanical tests 2.4.7</a> .   |     |                           |                    |  |                                       |                |     |     |
| <b>Note 5.</b> See <a href="#">Ch 3, 1.9 Test material and mechanical tests 1.9.11</a> .  |     |                           |                    |  |                                       |                |     |     |

2. 4. 5 For Grade A steel, Charpy V-notch impact tests are not required when the thickness does not exceed 50 mm, or up to 100 mm thick if the material is supplied in either the normalised or thermomechanically controlled-rolled condition and has been fine grain treated. However, the manufacturer should confirm, by way of regular in-house checks, that the material will meet a requirement of 27 J at +20°C. The results of these checks shall be reported to the Surveyor. The frequency of these checks should as a minimum be every 250 tonnes.
2. 4. 6 When Grade A steel is supplied in a thickness greater than 50 mm and either, in the normalising rolled condition, or when special approval has been given to be supply in the as-rolled condition, a set of three impact test specimens is to be tested from each batch of 50 tonnes or fraction thereof.
2. 4. 7 Impact tests are not required for Grade B steel of 25 mm or less in thickness. However, the manufacturer is to confirm, by way of regular in-house tests, and on occasional material selected by the Surveyor, that the material meets the requirement in [Table 3. 2. 3: Mechanical properties for acceptance purposes](#). The results of the tests are to be reported to the Surveyor. The frequency of the in-house checks are to be, as a minimum, one set of three impact test specimens for every 250 tonnes.
2. 4. 8 For Grade B steels of thicknesses above 25 mm, supplied in the as-rolled or normalising rolled condition, one set of three impact test specimens is to be made from the thickest item in each batch presented. If the mass of finished material is greater than 25 tonnes, one extra set of tests is to be made from a different piece from each 25 tonnes or fraction thereof.
2. 4. 9 For Grade B steels of thicknesses above 25 mm, supplied in the furnace normalised or thermomechanically controlled-rolled condition, one set of three impact test specimens is to be made from the thickest item in each batch presented. If the mass of finished material is greater than 50 tonnes, one extra set of tests is to be made from a different piece from each 50 tonnes or fraction thereof.
2. 4. 10 For Grade D steels supplied in the as-rolled or normalising rolled condition, one set of three impact test specimens is to be made from the thickest item in each batch presented. If the mass of finished material is greater than 25 tonnes, one extra set of tests is to be made from a different piece from each 25 tonnes or fraction thereof.

- 2. 4. 11 For Grade D steels, supplied in the furnace normalised or thermomechanically controlled-rolled condition, one set of three impact test specimens is to be made from the thickest item in each batch presented. If the mass of finished material is greater than 50 tonnes, one extra set of tests is to be made from a different piece from each 50 tonnes or fraction thereof.
- 2. 4. 12 For plates in Grade E steel, one set of three impact test specimens is to be made from each piece. For bars and sections in Grade E steel, one set of three test specimens is to be made from each 25 tonnes or fraction thereof. When, subject to the special approval of ACS, sections are supplied in the as-rolled or normalising rolled conditions, one set of impact tests is to be taken from each batch of 15 tonnes or fraction thereof.
- 2. 4. 13 The results of all tensile tests and the average energy values from each set of three impact tests are to comply with the appropriate requirements given in [Table 3. 2. 3: Mechanical properties for acceptance purposes](#). For impact tests, one individual value may be less than the required average value provided that it is not less than 70 per cent of this average value. See [Ch 1, 4.6 Re-test procedures](#) for re-test procedures.
- 2. 4. 14 Where standard subsidiary Charpy V-notch test specimens are necessary, See [Ch 2, 3.2 Testing procedures 3.2.4](#).

## 2. 5 Identification of materials

- 2. 5. 1 The particulars detailed in [Ch 3, 1.12, Identification of materials](#) are to be marked on all materials which have been accepted. Where a number of light materials are bundled, the bundle is to be identified in accordance with [Ch 3, 1.12 Identification of materials 1.12.2](#).

## 2. 6 Certification of materials

- 2. 6. 1 At least two copies of each test certificate are to be provided. They are to be of the type and give the information detailed in [Ch 3, 1.13, Certification of materials](#) and, additionally, are to indicate if sections in Grade A steel of rimming quality have been supplied. As a minimum, the chemical composition is to include the contents of any grain refining elements used and the residual elements, as detailed in [Table 3. 2. 1: Chemical composition and deoxidation practice](#).

## PART

# 2

## CHAPTER 3 Rolled Steel Plates, Strip, Sections and Bars

### SECTION 3 Higher strength steels for ship and other structural applications

#### 3.1 Scope

- 3.1.1 Provision is made for material to be supplied in four strength levels, 27S, 32, 36 and 40.
- 3.1.2 Provision is made for material specifically intended for hatch coamings and deck structure of container ships requiring specified crack arrest properties. Grades of steel of type EH40 in thicknesses above 85 mm and EH47 shall have crack arrest properties demonstrated at time of approval and at batch release. Crack arrest steels are to have a guaranteed crack arrest temperature (CAT) below -10°C.
- 3.1.3 The required notch toughness is designated by subdividing the strength levels into Grades AH, DH, EH and FH.
- 3.1.4 For the designation to fully identify a steel and its properties the appropriate grade letters should precede the strength level number, e.g. AH32 or FH40.
- 3.1.5 The requirements of this Section are primarily intended to apply to plates, wide flats, sections and bars not exceeding the thickness limits given in [Table 3.3.1: Maximum thickness limits](#). For greater thicknesses, variations in the requirements may be permitted or required for particular applications but a reduction of the required impact energy is not allowed.

**Table 3.3.1: Maximum thickness limits**

| Steel designation           |        |                            |       | Maximum thickness mm  |                   |
|-----------------------------|--------|----------------------------|-------|-----------------------|-------------------|
|                             |        |                            |       | Plates and wide flats | Sections and bars |
| AH 27S                      | DH 27S | EH 27S                     | FH27S | 100                   | 50                |
| AH 32                       | DH 32  | EH 32                      | FH32  |                       |                   |
| AH 36                       | DH 36  | EH 36                      | FH36  |                       |                   |
| AH 40                       | DH 40  | EH40 ( <i>See Note 1</i> ) | FH40  |                       |                   |
| EH 47 ( <i>See Note 2</i> ) |        |                            |       |                       |                   |

**Note 1.** Where the thickness of grade EH40 materials exceeds 85 mm the material is to achieve a crack arrest temperature (CAT) below -10°C. The CAT may be measured directly from large scale isothermal tests or be estimated from small scale tests that determine the Nil Ductility Temperature and applying a relationship such as the following, which has been validated at the approval stage:

$$CAT = (NDTT + 10) + \left[ \left( \frac{\ln \sigma}{0.046} \right) - 105 \right] + [153(B - 5)^{1/13} - 190]$$

where

- CAT = crack arrest temperature in °C
- NDTT = nil ductility test temperature in °C
- $\sigma$  = 2/3 of the minimum specified yield strength in N/mm<sup>2</sup>
- B = thickness of the plate in mm

As an alternative to crack arrest temperature, crack arrest properties may be demonstrated by large scale ESSO tests where  $K_{ca} \geq 6000$  N/mm<sup>1.5</sup> at -10°C or other approved methods.

**Note 2.** Grade EH47 applies only to thickness greater than 50 mm. The crack arrest properties of EH47 are to be determined as described in Note 1. Where the  $K_{ca}$  ESSO test is used and where the thickness of the steel exceeds 80 mm, the required  $K_{ca}$  value for the brittle crack arrest steel plate is to be specifically agreed with ACS.

3. 1. 6 It should be noted that the fatigue strength of weldments in steels of high strength levels may not be greater than those of steels of lower strength levels.

## 3. 2 Manufacture

3. 2. 1 All the grades of steel are to be in the killed and fine grain treated condition.

## 3. 3 Chemical composition

3. 3. 1 The chemical compositions of ladle samples for all grades of steel are to comply with the requirements of the approved manufacturing specification and the limits given in [Table 3. 3. 2: Chemical composition](#) or [Table 3. 3. 3: Chemical composition for Grade EH 47](#).

**Table 3. 3. 2: Chemical composition**

| Grades                               | AH, DH, EH              | FH         |
|--------------------------------------|-------------------------|------------|
| Carbon % max.                        | 0.18                    | 0.16       |
| Manganese %                          | 0.9 – 1.60 (See Note 1) | 0.9 – 1.60 |
| Silicon % max.                       | 0.50                    | 0.50       |
| Phosphorus % max.                    | 0.035                   | 0.025      |
| Sulphur % max.                       | 0.035                   | 0.025      |
| Grain refining elements (See Note 2) |                         |            |
| Aluminium (acid soluble) %           | 0.015 min. (See Note 3) |            |
| Niobium %                            | 0.02 – 0.05             |            |
| Vanadium %                           | 0.05 – 0.10             |            |

|  |           |                                     |
|--|-----------|-------------------------------------|
| Titanium %   | 0.02 max. |                                     |
| Total (Nb + V + Ti) % ( <i>See</i> Note 5)   | 0.12 max. |                                     |
| Residual elements  |           |                                     |
| Nickel % max.  | 0.40      | 0.80                                |
| Copper % max.  | 0.35      | 0.35                                |
| Chromium % max.  | 0.20      | 0.20                                |
| Molybdenum % max.  | 0.08      | 0.08                                |
| Nitrogen % max.  |           | 0.009 (0.012 max. if Al is present) |
| <p><b>Note 1.</b> For AH grade steels in all strength levels and thicknesses up to 12.5 mm, the specified minimum manganese content is 0.70%.</p> <p><b>Note 2.</b> The steel is to contain aluminium, niobium, vanadium or other suitable grain refining elements, either singly or in any combination. When used singly, the steel is to contain the specified minimum content of the grain refining element. When used in combination, the specified minimum content of each element is not applicable.</p> <p><b>Note 3.</b> The total aluminium content may be determined instead of the acid soluble content. In such cases the total aluminium content is to be not less than 0.020%.</p> <p><b>Note 4.</b> Alloying elements other than those listed above are to be included in the approved manufacturing specification.</p> <p><b>Note 5.</b> The grain refining elements are to be in accordance with the approved specification</p> |           |                                     |

**Table 3. 3. 3: Chemical composition for Grade EH 47**

| Chemical element   | max. (%)          |
|--|-------------------|
| Carbon   | 0.20              |
| Manganese  | 2.00              |
| Silicon  | 0.55              |
| Phosphorus   | 0.030             |
| Sulphur  | 0.030             |
| Nickel   | 2.00              |
| Chromium   | 0.25              |
| Molybdenum   | 0.08              |
| Grain refining elements  | <i>See</i> Note 1 |
| Residual elements Copper   | 0.35              |
| <p><b>Note 1.</b> The steel is to contain aluminium, niobium, vanadium, titanium, or other suitable grain refining elements, either singly or in any combination, in accordance with the approved specification.</p> |                   |

3. 3. 2 The carbon equivalent is to be calculated from the ladle analysis using the formula given below and is not to exceed the maximum value agreed between the fabricator and the steelmaker when the steel is ordered.

$$\text{Carbon equivalent} = C + \frac{\text{Mn}}{6} + \frac{\text{Cr} + \text{Mo} + \text{V}}{5} + \frac{\text{Ni} + \text{Cu}}{15}$$

For TM steels, the agreed carbon equivalent is not to exceed the values given in [Table 3. 3. 4: Carbon equivalent requirements for higher tensile strength steels up to 100 mm in](#) thickness when supplied in the TM condition.

3. 3. 3 The cold cracking susceptibility,  $P_{cm}$ , may be used instead of the carbon equivalent for evaluating weldability, in which case the following formula is to be used for calculating the  $P_{cm}$  from the ladle analysis:

$$P_{cm} = C + \frac{\text{Si}}{30} + \frac{\text{Mn} + \text{Cr} + \text{Cu}}{20} + \frac{\text{Ni}}{60} + \frac{\text{Mo}}{15} + \frac{\text{V}}{10} + 5B$$

The maximum allowable  $P_{cm}$  is to be agreed with ACS and is to be included in the manufacturing specification and reported on the certificate.

3. 3. 4 The cold cracking susceptibility,  $P_{cm}$ , is to have a maximum value of 0.22 per cent for steels of H47 strength grade.
3. 3. 5 Small deviations in chemical composition from that given in [Table 3. 3. 2: Chemical composition](#) for plates exceeding 50 mm in thickness in Grades EH36, EH40, FH36 and FH40 may be approved provided that these deviations are documented and approved in advance.
3. 3. 6 Where the grain refining elements Niobium, Titanium and Vanadium are used either singly or in combination, the chemical composition is to be specifically approved for each Grade in combination with the rolling procedure to be used.
3. 3. 7 When any grade is supplied in an approved thermomechanically controlled processed condition, variations in the specified chemical composition may be considered, provided that these variations are documented and approved in advance.
3. 3. 8 For plate supplied from coil, the chemical analysis can be transposed from the certificate of the coil manufacture onto the re-processor's certificate.

**Table 3. 3. 4: Carbon equivalent requirements for higher tensile strength steels up to 100 mm in**

| Grades                           | Carbon Equivalent, max. (%)  |              |
|----------------------------------|--|--------------|
|                                  | t ≤ 50   | 50 < t ≤ 100 |
| AH 27S DH 27S EH 27S FH 27S      | 0.36   | 0.38         |
| AH 32 DH 32 EH 32 FH 32          | 0.36   | 0.38         |
| AH 36 DH 36 EH 36 FH 36          | 0.38   | 0.40         |
| AH 40 DH 40 EH 40 FH 40          | 0.40   | 0.42         |
| EH 47                            | Not applicable<br>(See <a href="#">Table 3. 3. 1: Maximum thickness limits</a> ) | 0.49         |
| <b>Note</b> t = thickness in mm. |  |              |

### 3. 4 Condition of supply

3. 4. 1 All materials are to be supplied in a condition complying with the requirements given in [Table 3. 3. 5: Conditions of supply for plates and wide flats](#) or [Table 3. 3. 7: Conditions of supply for sections and bars](#). Where alternative conditions are permitted, these are at the option of the steelmaker, unless otherwise expressly stated in the order for the material.

3. 4. 2 Where normalising rolling and thermomechanically controlled rolling (T.M.) processes are used, it is the manufacturer's responsibility to ensure that the programmed rolling schedules are adhered to. Where deviation from the programmed rolling schedule occurs, the manufacturer must ensure that each affected piece is tested and that the local Surveyor is informed.
3. 4. 3 The use of precipitation hardening steels is not acceptable, except where such hardening is incidental to the use of grain refining elements.

**Table 3. 3. 5: Conditions of supply for plates and wide flats**

| Grade                             | Grain refining practice<br>(See Note 1)               | Thickness range mm               | Conditions of supply<br>(See Note 2)   |
|-----------------------------------|---|----------------------------------|--|
| AH 27S                            | Al or Al + Ti   | ≤20<br>>20 ≤ 100                 | AR N NR TM<br>– N NR TM (See Note 3)   |
| AH 32<br>AH 36                    | Nb or V or Al + (Nb or V)<br>or Al + (Ti) + (Nb or V) | ≤12.5<br>>12.5 ≤ 100             | AR N NR TM<br>– N NR TM                |
| AH 40                             | Any practice  | ≤12.5<br>>12.5 ≤ 50<br>>50 ≤ 100 | AR N NR TM<br>– N NR TM<br>– N – TM QT |
| DH 27S                            | Al or Al + Ti   | ≤20<br>>20 ≤ 100                 | AR N NR TM<br>– N NR TM (See Note 4)   |
| DH 32<br>DH 36                    | Nb or V or Al + (Nb or V)<br>or Al + (Ti) + (Nb or V) | ≤12.5<br>>12.5 ≤ 100             | AR N NR TM<br>– N NR TM                |
| DH 40                             | Any practice  | ≤50<br>> 50 ≤ 100                | – N NR TM<br>– N – TM QT               |
| EH 27S<br>EH 32<br>EH 36          | Any practice  | ≤100                             | – N – TM                               |
| EH 40                             | Any practice  | ≤100                             | – N – TM QT                            |
| FH 27S<br>FH 32<br>FH 36<br>FH 40 | Any practice  | ≤100                             | – N – TM QT                            |
| EH 47                             | Any practice  | ≤50                              | Not applicable                         |
|                                   |   | >50 ≤ 100                        | – – – TM QT                            |

**Note 1.** Grain refining elements used singly or in any combination, require specific approval from Technical Committee, Tehran Head Office.

**Note 2.** AR=as-rolled N=furnace normalised NR=normalising rolled TM=thermomechanically controlled-rolled QT=quenched and tempered.

**Note 3.** Material up to 35 mm thick may be supplied in the as-rolled condition provided that prior approval has been obtained from ACS.

**Note 4.** Material up to 25 mm thick may be supplied in the as-rolled condition provided that prior approval has been obtained from ACS.

### 3. 5 Mechanical tests

3. 5. 1 The results of all tensile tests and the average energy value from each set of three Charpy V-notch impact tests are to comply with the appropriate requirements given in [Table 3. 3. 6: Mechanical properties for acceptance purposes \(See Note 1\)](#).

**Table 3. 3. 6: Mechanical properties for acceptance purposes (See Note 1)**

| Grades<br>(See<br>Note 3)  | Yield<br>Stress<br>N/mm <sup>2</sup><br>min. | Tensile<br>Strength<br>N/mm <sup>2</sup> | Elongation on<br>$5.65\sqrt{S_0}$ %<br>min (See Note<br>2) | Charpy V-notch impact tests (See Notes 3, 4, 5 and 6) |            |                |            |                    |                    |
|--|--|--|--|---|------------|----------------|------------|--------------------|--------------------|
|  |  |  |  | Average energy<br>J minimum                           |            |                |            |                    |                    |
|  |  |  |  | t ≤ 50 mm   |            | 50 < t ≤ 70 mm |            | 70 < t ≤ 100 mm    |                    |

| EH47   | 460  | 570 - 720                                | 17   | -   | -          | 53             | 35         | 64 (See Note<br>1) | 42 (See<br>Note 5) |
| Impact tests are to be made on the various grades at the following temperatures:<br>AH grades 0°C<br>DH grades -20°C<br>EH grades -40°C<br>FH grades -60°C |  |  |  |   |            |                |            |                    |                    |

**Note 1.** The requirements for products thicker than those detailed in the table are subject to agreement, See [Ch 3, 3.1 Scope 3.1.5](#).

**Note 2.** For full thickness tensile test specimens with a width of 25 mm and a gauge length of 200 mm, See [Figure 2. 2. 4: Test specimen dimensions for plates, strip and sections - II](#) in [Ch 2 Testing Procedures for Metallic Materials](#), the minimum elongation is to be:

| Thickness  |                         | ≤ 5 | > 5<br>≤ 10 | > 10<br>≤ 15 | > 15<br>≤ 20 | > 20<br>≤ 25 | > 25<br>≤ 30 | > 30<br>≤ 40 | > 40<br>≤ 50 | > 50                      |
|------------|-------------------------|-----|-------------|--------------|--------------|--------------|--------------|--------------|--------------|---------------------------|
| Elongation | Strenght Levels 27S, 32 | 14  | 16          | 17           | 18           | 19           | 20           | 21           | 22           | To be specifically agreed |
|            | Strenght Levels 36      | 13  | 15          | 16           | 17           | 18           | 19           | 20           | 21           |                           |
|            | Strenght Levels 40      | 12  | 14          | 15           | 16           | 17           | 18           | 19           | 20           |                           |

**Note 3.** Subject to special approval by ACS, the minimum tensile strength may be reduced to 470 N/mm<sup>2</sup>, for grades AH36, DH36, EH36 and FH36, in the TM condition when micro-alloying elements Nb, Ti or V are used singly and not in combination and provided the yield to tensile strength ratio does not exceed 0.89. For plates with a thickness ≤ 12 mm, the yield to tensile strength ratio is to be specially considered.

**Note 4.** See [Ch 3, 1.9 Test material and mechanical tests 1.9.11](#)

**Note 5.** For steel of H47 strength grade, the yield to tensile strength ratio is not to exceed 0.94.

**Note 6.** The Charpy V-notch impact energy for EH47 in thickness between 85 mm and 100 mm are to be 75J in the longitudinal direction and 50J in the transverse direction

3. 5. 2 For steels in the as-rolled, normalised, normalising rolled or T.M. conditions, one tensile test is to be made for each batch of 50 tonnes or fraction thereof. Additional tests are to be made for every variation of 10 mm in the thickness or diameter of products from the same cast.
3. 5. 3 Where plate is supplied from coil, both the tensile tests and the Charpy V-notch tests are to be taken from the de-coiled plate in accordance with the frequency specified for the Grade as required by this Section.
3. 5. 4 For steels in the quenched and tempered condition a tensile test is to be made on each plate as heat treated. For continuously heat treated plates, one tensile test is to be made for each 50 tonnes or fraction thereof from a single cast. Additional tests are to be made for every variation of 10 mm in the thickness of the products from a single cast. The tensile test specimens are to be taken with their axes transverse to the main direction of rolling.
3. 5. 5 For products in the AH and DH grades, at least one set of three impact tests is to be made on the thickest piece in each batch of 50 tonnes when supplied in either the normalised or thermomechanically controlled condition. When the products are supplied in the as-rolled or normalising rolled conditions a set of impact test specimens is to be taken from a different piece from each 25 tonnes or fraction thereof. When supplied in the quenched and tempered condition, a set of impact tests is to be made on each length as heat treated. Test specimens from the quenched and tempered plates are to have their axes transverse to the main rolling direction.
3. 5. 6 For plates and wide flats in the EH and FH grades supplied in the normalised or thermomechanically controlled conditions, one set of impact tests is to be made on each piece. For plates supplied in the quenched and tempered condition a set of impact tests is to be made on each length as heat treated. Test specimens from the quenched and tempered plates are to have their axes transverse to the main rolling direction.
3. 5. 7 For crack arrest steels the brittle crack arrest test frequency is to be as stated in [Ch 3, 3.5 Mechanical tests 3.5.6](#). Small scale test methods may be used to demonstrate brittle crack arrest properties, subject to approval of the test method prior to application
3. 5. 8 For sections and bars in the EH and FH grades supplied in the normalised or thermomechanically controlled conditions, one set of impact tests is to be made on the thickest piece in a batch not

exceeding 25 tonnes. For sections supplied in the as-rolled or normalising rolled conditions the batch size is not to exceed 15 tonnes.

**Table 3. 3. 7: Conditions of supply for sections and bars**

| Grade   | Grain refining practice ( <i>See</i> Note 1)             | Thickness range mm             | Conditions of supply ( <i>See</i> Note 2) |
|---|--|--------------------------------|---|
| AH 27S  | Al or Al + Ti  | $\leq 20$<br>$>20 \leq 50$     | Any<br>N NR TM ( <i>See</i> Note 3)       |
| AH 32<br>AH 36  | Nb or V or Al + Nb or Al + V<br>or Al + (Ti) + (Nb or V) | $\leq 12.5$<br>$>12.5 \leq 50$ | Any<br>N NR TM ( <i>See</i> Note 3)       |

| <p><b>Note 1.</b> Grain refining elements used singly or in any combination require specific approval from Technical Committee, Tehran Head Office.</p> <p><b>Note 2.</b> N = furnace normalised NR = normalising rolled TM = thermomechanically controlled-rolled QT = quenched and tempered</p> <p><b>Note 3.</b> Subject to the special approval of ACS, sections may be supplied in the as-rolled condition provided satisfactory results are consistently obtained from Charpy V-notch impact tests.</p> <p><b>Note 4.</b> Subject to the special approval of ACS, sections may be supplied in the NR condition.</p> |  |                                |   |

3. 5. 9 Where standard subsidiary impact specimens are necessary, *See* [Ch 2, 2.3 Procedure for testing at ambient temperature 2.3.4.](#)

### 3. 6 Identification of materials

3. 6. 1 The particulars detailed in [Ch 3, 1.12, Identification of materials](#) are to be marked on all materials which have been accepted and, for ease of recognition, are to be encircled or otherwise marked with paint. Where a number of light products are bundled, the bundle is to be identified in accordance with [Ch 3, 1.12 Identification of materials 1.12.2](#).

### 3. 7 Certification of materials

3. 7. 1 At least two copies of each test certificate are to be provided. They are to be of the type and give the information detailed in [Ch 3, 1.13, Certification of materials](#) and, additionally, are to state the specified maximum carbon equivalent. As a minimum, the chemical composition is to include the contents of any grain refining elements used and of the residual elements.
3. 7. 2 For steels which have been specially approved, the agreed identification mark, the specified minimum yield stress and, if applicable, the contents of alloying elements are additionally to be stated on the test certificate or shipping statement.
3. 7. 3 The steelmaker is to provide the Surveyor with a written declaration as detailed in [Ch 3, 1.13 Certification of materials 1.13.2](#).

## PART

# 2

### CHAPTER 3 Rolled Steel Plates, Strip, Sections and Bars

### SECTION 4 Steels for boilers and pressure vessels

#### 4.1 Scope

- 4.1.1 Provision is made in this Section for carbon, carbon-manganese and alloy steels intended for use in the construction of boilers and pressure vessels. In addition to specifying mechanical properties at ambient temperature for the purposes of acceptance testing, these requirements also give details of appropriate mechanical properties at elevated temperatures which may be used for design purposes.
- 4.1.2 Where it is proposed to use a carbon or carbon-manganese steel with a specified minimum tensile strength intermediate to those given in this Section, corresponding minimum values for the yield stress, elongation and mechanical properties at elevated temperatures may be obtained by interpolation.
- 4.1.3 Carbon and carbon-manganese steels with a specified minimum tensile strength of greater than 490 N/mm<sup>2</sup> but not exceeding 520 N/mm<sup>2</sup> may be accepted, provided that details of the proposed specification are submitted for approval.
- 4.1.4 Where it is proposed to use alloy steels other than as given in this Section, details of the specification are to be submitted for approval. In such cases the specified minimum tensile strength is not to exceed 600 N/mm<sup>2</sup>.
- 4.1.5 Materials intended for use in the construction of the cargo tanks and process pressure vessels storage tanks for liquefied gases and for other low temperature applications are to comply with the requirements of [Ch 3, 6 Carbon–manganese and nickel alloy steels for low temperature service](#) or [Ch 3, 7 Austenitic and duplex stainless steels](#), as appropriate.

#### 4.2 Manufacture and chemical composition

- 4.2.1 The method of deoxidation and the chemical composition of ladle samples are to comply with the appropriate requirements of [Table 3. 4. 1: Chemical composition and deoxidation practice](#).

**Table 3. 4. 1: Chemical composition and deoxidation practice**

| Grade of steel                     | Deoxidation                    | Chemical composition % |           |             |            |   |    |                   |
|------------------------------------|--------------------------------|------------------------|-----------|-------------|------------|---|----|-------------------|
|                                    |                                | C max.                 | Si        | Mn          | P          | S | Al | Residual elements |
| Carbon and carbon-manganese steels |                                |                        |           |             |            |   |    |                   |
| 360 AR                             | Any method except rimmed steel | 0.18                   | 0.50 max. | 0.40 – 1.20 | 0.040 max. |   | -  | Cr 0.25 max.      |
| 410 AR                             |                                | 0.21                   |           | 0.40 – 1.30 |            |   | -  | Cu 0.30 max.      |
| 460 AR                             |                                | 0.23                   |           | 0.80 – 1.50 |            |   | -  | Mo 0.10 max.      |

|  |                                |              |              |             |             |              |            |              |                                 |
|--|--------------------------------|--------------|--------------|-------------|-------------|--------------|------------|--------------|---------------------------------|
| 360  | Any method except rimmed steel | 0.17         | 0.35 max.    |             | 0.40 – 1.20 |              | 0.035 max. | -            | Ni 0.30 max.<br>Total 0.70 max. |
| 410  |                                | 0.20         |              |             | 0.50 – 1.30 |              |            | -            |                                 |
| 460  |                                | 0.20         | 0.40 max.    |             | 0.80 – 1.40 |              |            | -            |                                 |
| 490  |                                | Killed       | (See Note 1) | 0.10 – 0.50 |             | 0.90 – 1.60  |            | -            |                                 |
| 360 FG   | Killed fine grained            | 0.17         | 0.35 max.    |             | 0.40 – 1.20 |              | 0.035 max. | (See Note 2) |                                 |
| 410 FG   |                                | 0.20         |              |             | 0.50 – 1.30 |              |            |              |                                 |
| 460 FG   |                                | 0.20         | 0.40 max.    |             | 0.80 – 1.50 |              |            |              |                                 |
| 490 FG   |                                | (See Note 1) | 0.10 – 0.50  |             | 0.90 – 1.60 |              |            |              |                                 |
| 510 FG   |                                | 0.22         |              |             |             |              |            |              |                                 |
| Alloy steel  |                                | C            | Si           | Mn          | P S         | Al           | Cr         | Mo           | Residual Elements               |
| 13Cr Mo 45   | Killed                         | 0.10–0.18    | 0.15-0.35    | 0.4-0.8     | 0.035 max.  | (See Note 3) | 0.70-1.30  | 0.40-0.60    | Cu 0.30 max.                    |
| 11Cr Mo 910  |                                | 0.08-0.18    | 0.15-0.50    |             |             |              | 2.00-2.50  | 0.90-1.10    | Ni 0.30 max.                    |
| <b>Note 1.</b> For thicknesses greater than 30 mm, carbon 0.22% max.   |                                |              |              |             |             |              |            |              |                                 |
| <b>Note 2.</b> Aluminium (acid soluble) 0.015% min. or Aluminium (total) 0.018% min. Niobium, vanadium or other suitable grain refining elements may be used either in place of or in addition to aluminium. |                                |              |              |             |             |              |            |              |                                 |
| <b>Note 3.</b> Aluminium (acid soluble or total) 0.020% max.   |                                |              |              |             |             |              |            |              |                                 |

4. 2. 2 For plate supplied from coil, the chemical analysis may be transposed from the certificate of the coil manufacture onto the re-processor's certificate.

### 4. 3 Heat treatment

4. 3. 1 All materials are to be supplied in a condition complying with the requirements given in [Table 3. 4. 2: Condition of supply](#) except that, when agreed, material intended for hot forming may be supplied in the as-rolled condition.

**Table 3. 4. 2: Condition of supply**

| Grade of steel              | Condition of supply                    |
|-----------------------------|--|
| Carbon and carbon-manganese | As-rolled                              |
| 360 AR to 460 AR            | Maximum thickness or diameter is 40 mm |
| Carbon and carbon-manganese | Normalised or normalised rolled        |
| 360 to 490                  |  |
| Carbon and carbon-manganese | Normalised or normalised rolled        |
| 360 FG to 510 FG            |  |
| 13Cr Mo 45                  | Normalised and tempered                |
| 11Cr Mo 910                 | Normalised and tempered                |

## 4. 4 Mechanical tests

4. 4. 1 For plates, a tensile test specimen is to be taken from one end of each piece when the mass does not exceed 5 tonnes and the length does not exceed 15 m. When either of these limits is exceeded, tensile test specimens are to be taken from both ends of each piece. A piece is to be regarded as the rolled product from a single slab or from a single ingot if this is rolled directly into plates.
4. 4. 2 For strip, tensile test specimens are to be taken from both ends of each coil.
4. 4. 3 Sections and bars are to be presented for acceptance test in batches containing not more than 50 lengths, as supplied. The material in each batch is to be of the same section size, from the same cast and in the same condition of supply. One tensile test specimen is to be taken from material representative of each batch, except that additional tests are to be taken when the mass of a batch exceeds 10 tonnes.
4. 4. 4 Where plates are required for hot forming and it has been agreed that the heat treatment will be carried out by the fabricator, the tests at the steelworks are to be made on material which has been cut from the plates and given a normalising and tempering heat treatment in a manner simulating the treatment which will be applied to the plates.
4. 4. 5 If required by the Surveyors or by the fabricator, test material may be given a simulated stress relieving heat treatment prior to the preparation of the test specimens. This has to be stated on the order together with agreed details of the simulated heat treatment and the mechanical properties which can be accepted.
4. 4. 6 The results of all tensile tests are to comply with the appropriate requirements given in [Table 3. 4. 3: Mechanical properties for acceptance purposes: carbon and carbon-manganese steels - As-rolled](#) to [Table 3. 4. 5: Mechanical properties for acceptance purposes: alloy steels - Normalised and tempered](#).

**Table 3. 4. 3: Mechanical properties for acceptance purposes: carbon and carbon-manganese steels - As-rolled**

| Grade of steel | Thickness mm | Yield stress N/mm <sup>2</sup> minimum | Tensile strength N/mm <sup>2</sup> | Elongation on 5.65 $\sqrt{S_0}$ % minimum |
|----------------|--------------|--|------------------------------------|---|
| 360 AR         | ≤40          | 190                                    | 360–480                            | 24  |
| 410 AR         | ≤40          | 215                                    | 410–530                            | 22  |
| 460 AR         | ≤40          | 240                                    | 460–580                            | 21  |

**Table 3. 4. 4: Mechanical properties for acceptance purposes: carbon and carbon-manganese steels - Normalised or normalised rolled**

| Grade of steel | Thickness mm (See Note) | Yield stress N/mm <sup>2</sup> minimum | Tensile strength N/mm <sup>2</sup> | Elongation on 5.65 $\sqrt{S_0}$ % minimum |
|----------------|-------------------------|--|------------------------------------|---|

| <b>Note</b> For thicknesses greater than 63 mm, the minimum values for yield stress may be reduced by 1% for each 5 mm increment in thickness over 63 mm. The minimum elongationvalues may also be reduced one unit, for all thicknesses over 63 mm. For thicknesses over 100 mm, the above values are to be agreed. |        |     |           |    |

4. 4. 7 Where plate is supplied from coil, the tensile tests are to be taken from the de-coiled plate in accordance with the frequency specified for the Grade as required by this Section.

**Table 3. 4. 5: Mechanical properties for acceptance purposes: alloy steels - Normalised and tempered**

| Grade of steel   | Thickness mm (See Note) | Yield stress N/mm <sup>2</sup> minimum | Tensile strength N/mm <sup>2</sup> | Elongation 5.65 $\sqrt{S_0}$ % on minimum |
|--|-------------------------|--|------------------------------------|---|
| 13Cr Mo45  | ≤63                     | 305                                    | 470-620                            | 20  |
| 11Cr Mo910   | ≤16                     | 275                                    | 480-630                            | 18  |
| 11Cr Mo910   | >16≤63                  | 265                                    | 480-630                            | 18  |
| <b>Note</b> For thicknesses greater than 63 mm, the minimum values for yield stress may be reduced by 1% for each 5 mm increment in thickness over 63 mm. The minimum elongation values may also be reduced one unit, e.g. for all thicknesses over 63 mm. For thicknesses over 100 mm, the above values are to be agreed. |                         |  |                                    |   |

4. 4. 8 All test specimens are to be taken in the transverse direction unless otherwise agreed.
4. 4. 9 When material will be subject to strains in a through thickness direction, it is recommended that it should have specified through thickness properties in accordance with the requirements of [Ch 3, 8 Plates with specified through thickness properties](#).

## 4. 5 Identification of materials

4. 5. 1 The particulars detailed in [Ch 3, 1.12, Identification of materials](#) are to be marked on all materials which have been accepted.

## 4. 6 Certification of materials

4. 6. 1 At least two copies of each test certificate are to be provided. They are to be of the type and to give the information detailed in [Ch 3, 1.13, Certification of materials](#) and, additionally, are to state the specified maximum carbon equivalent. As a minimum, chemical composition is to include the content of any grain refining elements used and of the residual elements, as detailed in [Table 3. 4. 1: Chemical composition and deoxidation practice](#).

## 4. 7 Mechanical properties for design purposes

4. 7. 1 Nominal values for the minimum lower yield or 0.2 per cent proof stress at temperatures of 50°C and higher are given in [Table 3. 4. 6: Mechanical properties for design purposes \(See 4.7.1\) : carbon and carbon-manganese steels - As-rolled](#) to [Table 3. 4. 8: Mechanical properties for design purposes \(See 4.7.1\): alloy steels - Normalised and tempered](#).

**Table 3. 4. 6: Mechanical properties for design purposes (See 4.7.1) : carbon and carbon-manganese steels - As-rolled**

| Grade of steel  | Thickness mm | Design temperature °C (See Note)                                   |     |     |     |     |     |     |
|---|--------------|--|-----|-----|-----|-----|-----|-----|
|   |              | 50   | 100 | 150 | 200 | 250 | 300 | 350 |
|   |              | Nominal minimum lower yield or 0.2% proof stress N/mm <sup>2</sup> |     |     |     |     |     |     |
| 360 AR  | ≤40          | 154  | 153 | 152 | 145 | 128 | 108 | 102 |
| 410 AR  | ≤40          | 186  | 183 | 181 | 174 | 155 | 134 | 127 |
| 460 AR  | ≤40          | 218  | 213 | 210 | 203 | 182 | 161 | 153 |
| <b>Note</b> Maximum permissible design temperature is 350°C |              |  |     |     |     |     |     |     |

4. 7. 2 These values are intended for design purposes only, and verification is not required except for materials complying with National or proprietary specifications where the elevated temperature properties used for design purposes are higher than given in [Table 3. 4. 6: Mechanical properties for design purposes \(See 4.7.1\) : carbon and carbon-manganese steels - As-rolled](#) to [Table 3. 4. 8: Mechanical properties for design purposes \(See 4.7.1\): alloy steels - Normalised and tempered](#).
4. 7. 3 In such cases, at least one tensile test at the proposed design or other agreed temperature is to be made on material from each cast. Where materials of more than one thickness are supplied from one cast, the thickest material is to be tested. The test specimens are to be prepared from material adjacent to that used for tests at ambient temperature. The axis of the test specimens is to be between mid and quarter thickness of the material and the test specimens are to be machined to dimensions in accordance with the requirements of [Ch 2 Testing Procedures for Metallic Materials](#). The test procedure is also to be as detailed in [Ch 2 Testing Procedures for Metallic Materials](#), and the results are to comply with the requirements of the National or proprietary specifications.
4. 7. 4 As an alternative to [Ch 3, 4.7 Mechanical properties for design purposes 4.7.3](#), a manufacturer may carry out an agreed comprehensive test program for a stated grade of steel to demonstrate that the specified minimum mechanical properties at elevated temperatures can be consistently obtained. This test program is to be carried out under supervision of the Surveyors, and the results submitted for assessment and approval. When a manufacturer is approved on this basis, tensile tests at elevated temperatures are not required for acceptance purposes but, at the discretion of the Surveyors, occasional check tests of this type may be requested.
4. 7. 5 Values for the estimated average stress to rupture in 100 000 hours are given in [Table 3. 4. 9: Mechanical properties for design purposes \(See 4.7.5\): estimated average values for stress to rupture in 100 000 hours \(units N/mm<sup>2</sup>\)](#) and may be used for design purposes.

**Table 3. 4. 7: Mechanical properties for design purposes (See 4.7.1): carbon and carbon-manganese steels - Normalised or controlled-rolled**

| Grade of steel | Thickness mm<br>(See Note) | Design temperature °C  |     |     |     |     |     |     |     |     |

CHAPTER **3** **Rolled Steel Plates, Strip, Sections and Bars**SECTION **5** **Steels for machinery fabrications****5. 1 General**

5. 1. 1 Steel plates, sections or bars intended for use in the construction of major components of welded machinery structures, such as bedplates, crankcases, frames and entablatures, are to comply with one of the following alternatives:
- Any grade of normal strength structural steel as detailed in [Ch 3, 2 Normal strength steels for ship and other structural applications](#).
  - Any grade of higher tensile structural steel as detailed in [Ch 3, 3 Higher strength steels for ship and other structural applications](#).
  - Any grade of carbon-manganese boiler or pressure vessel steel as detailed in [Ch 3, 4 Steels for boilers and pressure vessels](#), except that for this application batch testing is acceptable. The size of a batch and the number of tensile tests are to be as detailed in [Ch 3, 2 Normal strength steels for ship and other structural applications](#).
5. 1. 2 The minus tolerances for products for machinery structures are to be in accordance with [Table 3. 5. 1: Under thickness tolerances](#).

**Table 3. 5. 1: Under thickness tolerances**

| Nominal thickness, t (mm) | Minus tolerance on nominal thickness (mm) |
|---------------------------|---|
| $3 \leq t < 5$            | -0.3                                      |
| $5 \leq t < 8$            | -0.4                                      |
| $8 \leq t < 15$           | -0.5                                      |
| $15 \leq t < 25$          | -0.6                                      |
| $25 \leq t < 40$          | -0.7                                      |
| $40 \leq t < 80$          | -0.9                                      |
| $80 \leq t < 150$         | -1.1                                      |
| $150 \leq t < 250$        | -1.2                                      |
| $t \geq 250$              | -1.3                                      |

## 5. 2 Certification of materials

5. 2. 1 At least two copies of each test certificate are to be provided. They are to be of the type and give the information detailed in [Ch 3, 1.13, Certification of materials](#) and, additionally, are to state the specified maximum carbon equivalent. As a minimum, chemical composition is to include the contents of any grain refining elements used and of the residual elements.

# PART

# 2

## CHAPTER 3 Rolled Steel Plates, Strip, Sections and Bars

## SECTION 6 Carbon-manganese and nickel alloy steels for low temperature service

### 6.1 Scope

- 6.1.1 This Section gives specific requirements for carbon-manganese and nickel alloy steels intended for use in the construction of cargo tanks, storage tanks and process pressure vessels for liquefied gases.
- 6.1.2 The requirements of this Section are also applicable for other types of pressure vessels where the use of steels with guaranteed impact properties at low temperatures is required.
- 6.1.3 Provision is made for plates and sections up to 40 mm thick.
- 6.1.4 Steels with alternative chemical compositions or mechanical properties or in a different supply condition may be given special consideration.

### 6.2 Manufacture and chemical composition

- 6.2.1 All steels are to be in the killed and fine grain treated condition.
- 6.2.2 The chemical compositions of carbon-manganese steels are to comply with the appropriate requirements for grades AH, DH, EH and FH strength levels 27S, 32, 36 and 40, See [Table 3.3.2: Chemical composition](#). For the uses defined in [Ch 3, 6.1 Scope 6.1.1](#) and [Ch 3, 6.1 Scope 6.1.2](#), however, these grades are to be designated LT-AH, LT-DH, LT-EH and LT-FH respectively.
- 6.2.3 The chemical compositions of nickel alloy steels are to comply with the appropriate requirements of [Table 3.6.1: Chemical compositions of nickel alloy steels](#).

**Table 3.6.1: Chemical compositions of nickel alloy steels**

| Grade of steel | C         | Si        | Mn          | Ni          | P          | S          | Residual elements   | Aluminium   |
|----------------|-----------|-----------|-------------|-------------|------------|------------|---|---|
| 1½ Ni          | 0.18 max. | 0.10–0.35 | 0.30– 1.50  | 1.30– 1.70  | 0.025 max. | 0.020 max. | Cr 0.25 max.<br>Cu 0.35 max.<br><br>Mo 0.08 max.<br>Total 0.60 max. | Total 0.020% min.<br><br><br>Acid soluble<br>0.015 min. |
| 2¼ Ni          | 0.18 max. |           | 0.30 - 0.80 | 2.10 - 2.50 |            |            |   |   |
| 3½ Ni          | 0.15 max. |           | 0.30 – 0.90 | 3.20– 3.80  |            |            |   |   |
| 5Ni            | 0.12 max. |           |             | 4.70– 5.30  |            |            |   |   |
| 9Ni            | 0.10 max. |           |             | 8.50– 10.0  |            |            |   |   |

6. 2. 4 For plate supplied from coil, the chemical analysis may be transposed from the certificate of the coil manufacture onto the re-processor's certificate.

## 6. 3 Heat treatment

6. 3. 1 All materials are to be supplied in a condition complying with the requirements given in [Table 3. 6. 2: Supply conditions](#).

**Table 3. 6. 2: Supply conditions**

| Grade  | Plates  | Sections and bars |
|--|---|-------------------|
| LT – AH  | N TM  | Any               |
| LT – DH  |   |                   |
| LT – EH  | Normalised ( <i>See Note</i> )                          |                   |
| LT – FH  | T.M.C.P. Quenched and tempered                          | N TM              |
| 1½ Ni  | Normalised ( <i>See Note</i> )                          |                   |
| 2 ¼ Ni   | Normalised or Normalised and tempered                   |                   |
| 3½ Ni  | Normalised and tempered                                 |                   |
| 5Ni  | Quenched and tempered                                   |                   |
| 9Ni  | Double normalised and tempered or Quenched and tempered |                   |
| <b>Note</b> Where the term ‘Normalised’ is used it does not include normalising rolling. |   |                   |

## 6. 4 Mechanical tests

6. 4. 1 For plates, tensile test specimens are to be taken from both ends of each piece. A piece is to be regarded as the rolled product from a single slab or from a single ingot if this is rolled directly into plates.
6. 4. 2 For strips, tensile test specimens are to be taken from both ends of each coil.
6. 4. 3 Sections and bars are to be presented for acceptance test in batches containing not more than 50 lengths, as supplied. The material in each batch is to be of the same section size, from the same cast and in the same condition of supply. One tensile test specimen is to be taken from material representative of each batch, except that additional tests are to be taken when the mass of a batch exceeds 10 tonnes.
6. 4. 4 One set of three Charpy V-notch impact test specimens is to be taken for each tensile test specimen required.
6. 4. 5 For plates, these impact test specimens are to be cut with the principal axis perpendicular to the final direction of rolling. For sections, the impact test specimens are to be taken longitudinally.
6. 4. 6 The results of all tensile tests are to comply with the appropriate requirements given in [Table 3. 6. 3: Mechanical properties for acceptance purposes \(See Note 1\)](#). For carbon–manganese steel grades, the ratio between the yield stress and the tensile strength is not to exceed 0.9 for normalised and TM steels and 0.94 for QT steels.

**Table 3. 6. 3: Mechanical properties for acceptance purposes (See Note 1)**

| Grade of steel   | Yield stress<br>N/mm <sup>2</sup><br>min. | Tensile strength<br>N/mm <sup>2</sup> | Elongation on<br>$5.65\sqrt{S_o}$<br>% min. | Charpy V-notch impact tests<br>(See Note 3) |   |
|--|---|---------------------------------------|---|---|---|
|  |   |                                       |   | Test temp. °C                               | Impact energy   |
| 27S<br>LT – AH   | 265                                       | 400 – 530                             | 22  | 0   | Plates – transverse tests<br><br>Average energy 27 J min<br><br>Sections and bars – longitudinal tests<br><br>Average energy 41 J min |

| 27S<br>LT – DH   | 265                                       | 400 – 530                             | 22  | –20   |   |
|  | 32  | 440 – 590                             | 22  |   |   |
|  | 36  | 490 – 620                             | 21  |   |   |
|  | 40  | 510 – 650                             | 20  |   |   |
| 27S<br>LT – EH   | 265                                       | 400 – 530                             | 22  | –40   |   |
|  | 32  | 440 – 590                             | 22  |   |   |
|  | 36  | 490 – 620                             | 21  |   |   |
|  | 40  | 510 – 650                             | 20  |   |   |
| 27S<br>LT – FH   | 265                                       | 400 – 530                             | 22  | –60   |   |
|  | 32  | 440 – 590                             | 22  |   |   |
|  | 36  | 490 – 620                             | 21  |   |   |
|  | 40  | 510 – 650                             | 20  |   |   |
| 1½ Ni  | 275                                       | 490 – 640                             | 22  | –65   |   |
| 2 ¼ Ni   | 275                                       | 490 - 640                             | 21  | –70   |   |
| 3½ Ni  | 285                                       | 450 – 610                             | 21  | –95   |   |
| 5Ni  | 390                                       | 540 – 740                             | 21  | –110  |   |
| 9Ni  | 490                                       | 640 – 790                             | 18  | –196  |   |
| <b>Note 1.</b> These requirements are applicable to products not exceeding 40 mm in thickness. The requirements for thicker products are subject to agreement.   |   |                                       |   |   |   |
| <b>Note 2.</b> The minimum design temperatures at which plates of different thicknesses in the above grades may be used are given in <a href="#">Figure 3. 6. 1: Minimum design temperatures for carbon-manganese grades</a> and <a href="#">Figure 3. 6. 2: Minimum design temperatures for nickel grades</a> . Consideration will be given to the use of thicknesses greater than those in the Tables or to the use of design temperatures below –165°C. |   |                                       |   |   |   |
| <b>Note 3.</b> See <a href="#">Ch 3, 1.9 Test material and mechanical tests 1.9.11</a>   |   |                                       |   |   |   |

- 6.4.7 The average value for the three impact tests is to comply with the appropriate requirements given in [Table 3.6.3: Mechanical properties for acceptance purposes \(See Note 1\)](#). One individual value may be less than the required value provided that it is not less than 70 per cent of this average value. See [Ch 2, 1.4, Re-testing procedures](#) for re-test procedures.
- 6.4.8 Where standard subsidiary impact specimens are necessary, See [Ch 2, 2.3 Procedure for testing at ambient temperature 2.3.4](#).
- 6.4.9 Where plate is supplied from coil, both the tensile tests and the Charpy V-notch tests are to be taken from the de-coiled plate in accordance with the frequency specified for the Grade as required by this Section.

## 6.5 Identification of materials

- 6.5.1 The particulars detailed in [Ch 3, 1.12, Identification of materials](#) are to be marked on all materials which have been accepted.

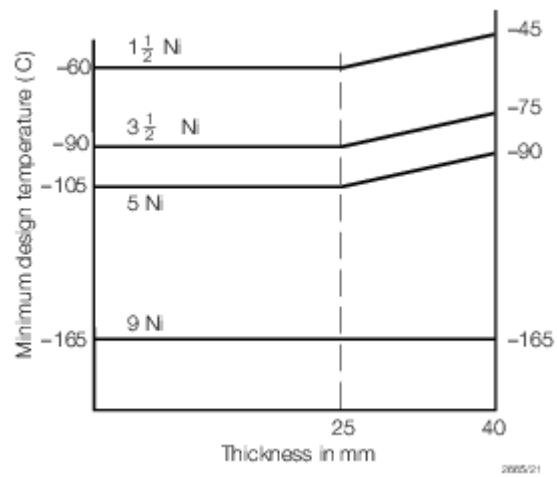

## 6.6 Certification of materials

- 6.6.1 At least two copies of each test certificate are to be provided. They are to be of the type and give the information detailed in [Ch 3, 1.13, Certification of materials](#) together with general details of the heat treatment. As a minimum, chemical composition is to include the contents of any grain refining elements used and the residual elements as detailed in [Table 3.3.2: Chemical composition](#) or [Table 3.6.1: Chemical compositions of nickel alloy steels](#).

**Figure 3.6.1: Minimum design temperatures for carbon-manganese grades**

**Figure 3. 6. 2: Minimum design temperatures for nickel grades**

## PART

# 2

## CHAPTER 3 Rolled Steel Plates, Strip, Sections and Bars

### SECTION 7 Austenitic and duplex stainless steels

#### 7.1 Scope

- 7.1.1 Provision is made in this Section for rolled products in austenitic and duplex (austenite plus ferrite) stainless steels intended for use in the construction of cargo tanks, storage tanks and process pressure vessels for chemicals and liquefied gases.
- 7.1.2 Austenitic stainless steels are suitable for applications where the lowest design temperature is not lower than  $-165^{\circ}\text{C}$ .
- 7.1.3 Austenitic stainless steels are also suitable for service at elevated temperatures, and for such applications the proposed specification should contain, in addition to the requirements of [Ch 3, 7.1 Scope 7.1.6](#), minimum values for 0.2 and 1.0 per cent proof stresses at the design temperature.
- 7.1.4 Duplex stainless steels are suitable for applications where the lowest design temperature is above  $0^{\circ}\text{C}$ . Any requirement to use duplex stainless steels below  $0^{\circ}\text{C}$  will be subject to special consideration.
- 7.1.5 Duplex stainless steels are also suitable for service at temperatures up to  $300^{\circ}\text{C}$ , and for such applications the proposed specification should include, in addition to the requirements of 7.1.6, a minimum value for 0.2 per cent proof stress at the design temperature.
- 7.1.6 A specification giving details of the chemical composition, heat treatment and mechanical properties, including, for the austenitic grades, both the 0.2 and 1.0 per cent proof stresses, is to be submitted for consideration and approval.

#### 7.2 Chemical composition

- 7.2.1 The chemical composition of ladle samples is to comply with the requirements given in [Table 3. 7. 1: Chemical composition](#).
- 7.2.2 Consideration will be given to the use of steels whose compositions are outside the scope of [Table 3. 7. 1: Chemical composition](#).

**Table 3. 7. 1: Chemical composition**

| Type and grade of steel | Chemical composition % ( <i>See Note</i> ) |     |     |       |      |           |          |    |           |       |
|-------------------------|--|-----|-----|-------|------|-----------|----------|----|-----------|-------|
|                         | C  | Si  | Mn  | P     | S    | Cr        | Ni       | Mo | N         | Other |
| Austenitic              |  |     |     |       |      |           |          |    |           |       |
| 304 L                   | 0.03                                       | 1.0 | 2.0 | 0.045 | 0.03 | 17.0-20.0 | 8.0-13.0 | -  | 0.10      | -     |

**Note** All figures are a maximum value except where a range is shown.

## 7.3 Heat treatment

7.3.1 All materials are to be supplied in the solution treated condition.

## 7.4 Mechanical tests

- 7.4.1 Tensile test specimens are to be taken in accordance with the appropriate requirements of [Ch 3, 4.4 Mechanical tests](#) and [Ch 3, 6.4 Mechanical tests 6.4.1](#).
- 7.4.2 For the duplex grades, one set of three Charpy V-notch impact test specimens machined from the longitudinal direction for each tensile test is to be tested at -20°C. The average energy value of the three specimens is to be not less than 41 Joules.
- 7.4.3 Unless otherwise agreed, impact tests are not required from the austenitic grades of steel given in this Section.
- 7.4.4 Where standard subsidiary Charpy V-notch test specimens are necessary, See [Ch 2, 2.3 Procedure for testing at ambient temperature 2.3.4](#).
- 7.4.5 The results of all tensile tests are to comply with the requirements of [Table 3. 7. 2: Mechanical properties for acceptance purposes](#) or the approved specification.

## 7.5 Metallographic examination for sigma phase

- 7.5.1 The microstructure of duplex stainless steel grades listed in [Table 3. 7. 1: Chemical composition](#) are to be examined metallographically at x400 magnification to demonstrate that there is no evidence of sigma phase in the observable area. The frequency of testing shall be one test per heat.

## 7.6 Corrosion tests

- 7.6.1 For certain specific applications such as storage tanks for chemicals, it may be necessary to demonstrate that the material used is not susceptible to corrosion resulting from precipitation of deleterious phases.
- 7.6.2 When required, a corrosion test is to be carried out for each tensile test. The material for the corrosion test is to be taken adjacent to that for the tensile test.
- 7.6.3 Unless otherwise agreed or required for a particular chemical cargo, an intergranular corrosion test for austenitic stainless steels and a pitting corrosion test for duplex stainless steels are to be

performed. The testing procedures are given in , See [Ch 2, 9 Corrosion tests](#) and, for the pitting corrosion test, unless otherwise specified, the test temperatures shall be 20°C for S31803 and 30°C for S32750.

7. 6. 4 Wherever practical, exposed cut edges should be avoided. However, where any such edges are to remain after fabrication is completed it is to be shown by an appropriate test that the corrosion resistance is adequate for the cargoes expected to be encountered.

## 7. 7 Clad plates

7. 7. 1 Carbon or carbon-manganese steel plates, clad on one or both surfaces with a suitable grade of austenitic or duplex stainless steel, may be used for the construction of cargo or storage tanks for chemicals.
7. 7. 2 The carbon or carbon-manganese steel base plates are to comply with the requirements of [Ch 3, 4 Steels for boilers and pressure vessels](#), and the austenitic cladding material generally with the requirements of this Section.
7. 7. 3 The process of manufacture is to be specially approved and may be either by roll cladding or by explosive bonding.
7. 7. 4 Where the use of clad materials is proposed, the material specification is to be submitted for consideration, together with details of the extent, and the acceptance standards for non-destructive examination.

## 7. 8 Identification of materials

7. 8. 1 The particulars detailed in [Ch 3, 1.12, Identification of materials](#) are to be marked on all materials which have been accepted.

**Table 3. 7. 2: Mechanical properties for acceptance purposes**

| Type and grade of steel | 0.2% Proof stress (N/mm <sup>2</sup> ) minimum | 1% Proof stress (N/mm <sup>2</sup> ) minimum | Tensile strength (N/mm <sup>2</sup> ) minimum | Elongation on 5.65 $\sqrt{S_0}$ % minimum |
|-------------------------|--|--|---|---|
| Austenitic              |  |  |   |   |
| 304L                    | 170  | 210  | 485   | 40  |
| 304LN                   | 205  | 245  | 515   | 40  |
| 316L                    | 170  | 210  | 485   | 40  |
| 316LN                   | 205  | 245  | 515   | 40  |
| 317L                    | 205  | 245  | 515   | 40  |
| 317LN                   | 240  | 280  | 550   | 40  |
| 321                     | 205  | 245  | 515   | 40  |
| 347                     | 205  | 245  | 515   | 40  |
| Duplex                  |  |  |   |   |
| UNS S 31803             | 450  | —  | 620   | 25  |
| UNS S 32750             | 550  | —  | 795   | 15  |

## 7. 9 Certification of materials

7. 9. 1 At least two copies of each test certificate are to be provided. They are to be of the type and give the information detailed in [Ch 3, 1.13, Certification of materials](#) and, where applicable, the results obtained from corrosion tests, and sigma phase assessment. Additionally, the specified maximum carbon equivalent is to be stated. As a minimum, the chemical composition is to include the contents of any grain refining elements used and of the residual elements, as detailed in [Table 3. 7. 1: Chemical composition](#).

CHAPTER 3 **Rolled Steel Plates, Strip, Sections and Bars**SECTION 8 **Plates with specified through thickness properties****8.1 Scope**

- 8.1.1 Provision is made in this Section for 'Z' grade plate and wide flat material with improved ductility in the through thickness or 'Z' direction, See [Figure 3. 8. 1: Schematic of testing directions](#). The use of this material is recommended for certain types of welded structures (See [Ch 3, 1.2 Steel with guaranteed through thickness properties – 'Z' grade steel](#)) in order to minimise the possibility of lamellar tearing either during fabrication or erection.
- 8.1.2 Through thickness properties are characterised by specified values for reduction of area in a through thickness tensile test.
- 8.1.3 Provision is made for two grades Z25 and Z35. For normal ship applications the Z25 grade is applicable, whilst the Z35 grade is for more severe applications.
- 8.1.4 This 'Z' grade material is to comply with the requirements of [Ch 3, 2 Normal strength steels for ship and other structural applications](#), [Ch 3, 3 Higher strength steels for ship and other structural applications](#), [Ch 3, 4 Steels for boilers and pressure vessels](#), [Ch 3, 5 Steels for machinery fabrications](#) and [Ch 3, 6 Carbon–manganese and nickel alloy steels for low temperature service](#) as appropriate, and the additional requirements of this Section.
- 8.1.5 The test procedure detailed in this Section may also be used to demonstrate that no unacceptable amount of banding of any detrimental phase, such as sigma is present, See [Ch 3, 7.5 Metallographic examination for sigma phase](#).

**Figure 3. 8. 1: Schematic of testing directions****8.2 Manufacture**

- 8.2.1 All plates and wide flats are to be manufactured at works which have been approved by ACS for this quality of material.
- 8.2.2 It is recommended that the steel should be efficiently vacuum de-gassed. The sulphur content is not to exceed 0.008 per cent.

8. 2. 3 Consideration will be given to proposals for alternative methods of improving through thickness properties.

### 8. 3 Test material

8. 3. 1 Unless otherwise agreed, through thickness tensile tests are only required for plate materials where the thickness exceeds 15 mm for carbon and alloy steels.
8. 3. 2 For plates and wide flats, one test sample is to be taken close to the longitudinal centreline from one end of each rolled piece representing the batch, *See Table 3. 8. 1: Batch size dependent on product and sulphur content* and *Figure 3. 8. 2: Plate and wide flat sampling position*. The test sample must be large enough to accommodate the preparation of 6 specimens. 3 test specimens are to be prepared while the rest of the sample is to be retained for possible retests. The test specimens shall be located in the mid-thickness region of the plate.

**Table 3. 8. 1: Batch size dependent on product and sulphur content**

| Product                                      | $S > 0.005\%$   | $S \leq 0.005\%$  |
|--|---|---|
| Plates                                       | Each piece (parent plate)   | Maximum 50 t of products of the same cast, thickness and heat treatment |
| Wide flats of nominal thickness $\leq 25$ mm | Maximum 10 t of products of the same cast, thickness and heat treatment | Maximum 50 t of products of the same cast, thickness and heat treatment |
| Wide flats of nominal thickness $> 25$ mm    | Maximum 20 t of products of the same cast, thickness and heat treatment | Maximum 50 t of products of the same cast, thickness and heat treatment |

**Figure 3. 8. 2: Plate and wide flat sampling position**

8. 3. 3 The dimensions of the test specimens are to be in accordance with Chapter 2, [Ch 2, 2.1 Dimensions of test specimens 2.1.14](#)
8. 3. 4 Alternatively, test sampling may be carried out in accordance with an accepted National or International Standard.

### 8. 4 Mechanical tests

8. 4. 1 The three through thickness tensile test specimens are to be tested at ambient temperature and for acceptance are to give a minimum average reduction of area value of not less than that shown in [Table 3. 8. 2: Reduction of area acceptance values](#). Only one individual value may be below the minimum average, but should not be less than the minimum individual value shown for the appropriate grade.

**Table 3. 8. 2: Reduction of area acceptance values**

| Grade              | Z25 | Z35 |
|--------------------|-----|-----|
| Minimum average    | 25% | 35% |
| Minimum individual | 15% | 25% |

8. 4. 2 If the average value fails to comply with [Ch 3, 8.4 Mechanical tests 8.4.1](#), three additional tests may be made on specimens from the same test sample. The results of these tests are to be added to those previously obtained to form a new average, which for acceptance is to be not less than 25 per cent for grade Z25 or 35 per cent for grade Z35. No individual results in the re-test shall be below 25 per cent for grade Z25 or 35 per cent for grade Z35, See [Figure 3. 8. 3: Diagram showing acceptance/rejection and retest criteria](#).
8. 4. 3 Where batch testing is permitted, and failure after retest occurs, the tested piece is to be rejected. Each remaining piece in the batch may be individually tested and accepted based on satisfactory results.
8. 4. 4 If the fracture of a test specimen occurs in the weld or in the heat affected zone the test is to be regarded as invalid and is to be repeated on a new test specimen.

**Figure 3. 8. 3: Diagram showing acceptance/rejection and retest criteria**

## 8. 5 Non-destructive examination

8. 5. 1 All 'Z' grade plates are to be ultrasonically tested in the final supply condition with a probe frequency of 2-5 MHz. The testing is to be performed in accordance with and in compliance with either EN 10160 Level S1/E1 or ASTM A 578 Level C.

## 8. 6 Identification of materials

8. 6. 1 Products which comply with the requirements of this Section are to have the notation Z25 or Z35 added to the steel grade designation.

## 8. 7 Certification of materials

8. 7. 1 The following information is required to be included on the certificate in addition to the appropriate steel grade requirements:
- Through thickness reduction in area (%), individual results and average.
  - Steel grade with Z25 or Z35 notation.
8. 7. 2 Steel grade requirements are to comply with [Ch 3, 1 General requirements](#) to [Ch 3, 7 Austenitic and duplex stainless steels](#).

**CHAPTER 3 Rolled Steel Plates, Strip, Sections and Bars****SECTION 9 Bars for welded chain cables****9.1 Scope**

- 9.1.1 Provision is made in this Section for rolled steel bars intended for the manufacture of three Grades (U1, U2 and U3) of stud link chain cable for the anchoring and mooring of ships and five Grades (R3, R3S, R4, R4S and R5) of offshore mooring cable.
- 9.1.2 For the ship grades, U1, U2 and U3, approval will permit the supply of bars of the appropriate grades and size to any chain cable manufacturer.
- 9.1.3 For the offshore grades, R3, R3S, R4, R4S and R5, approval is confined to bar to be supplied to a nominated chain manufacturer and will be given only after successful testing of a completed chain. Separate approvals are required if bar is to be supplied to more than one cable manufacturer. Approval of a higher grade does not cover approval of a lower grade, as all grades must be individually approved. If it is demonstrated to the satisfaction of ACS that the higher and lower grades are produced to the same manufacturing procedure using the same chemistry and heat treatment, consideration will be given to qualification of a lower grade by a higher grade. The parameters applied during qualification are not to be modified during production.
- 9.1.4 For all grades, approval is normally given for diameters of bars no greater than those of the bars used in procedure tests.

**9.2 Manufacture**

- 9.2.1 All grades of bar material are to be made from killed steel, and, all grades of bar material except for Grade U1 chain cables are to be fine grained. For Grades R3, R3S, R4, R4S and R5 the austenite grain size is to be 6 or finer, in accordance with ASTM E112 or equivalent grain size index in accordance to ISO 643. Measurements for circular sections are to be taken at one-third of the radius.
- 9.2.2 The bars are to be made to a specification approved by ACS which should include the manufacturing procedure, deoxidation practice, heat treatment and mechanical properties.
- 9.2.3 The rolling reduction ratio of bars for Grades R3, R3S, R4, R4S and R5 must be at least 5:1.

**9.3 Chemical composition**

- 9.3.1 For Grades U1, U2 and U3 the chemical composition should be generally within the limits given in [Table 3.9.1: Chemical composition of killed steel bars](#).
- 9.3.2 For Grades R3, R3S, R4, R4S and R5 the chemical composition is to comply with an approved specification, See [Ch 3, 9.2 Manufacture 9.2.2](#).

- 9.3.3 For Grades R4, R4S and R5 chain cable the steel should contain a minimum of 0.2 per cent molybdenum. The reported composition is to include the contents of antimony, arsenic, tin, copper, nitrogen, aluminium and titanium.
- 9.3.4 For Grades R4S and R5 the steel used must be vacuum degassed.

## 9.4 Heat treatment

- 9.4.1 Unless stipulated otherwise, the bars are to be supplied in the as-rolled condition, but the supplier is to be advised by the chain manufacturer of the heat treatment to be used for the completed chain in order that the mechanical test specimens may be tested in the condition of heat treatment used for the chain.
- 9.4.2 For Grades U1 and U2, the samples selected from each batch may be tested either in the as-rolled condition, or after heat treatment where the chain is to be used in the heat treated condition, in full cross-section and in a manner simulating the heat treatment applied to the finished cable.
- 9.4.3 For Grades U3, R3, R3S, R4, R4S and R5 the sample is to be tested after heat treatment as detailed in [Ch 3, 9.4 Heat treatment 9.4.2](#).

**Table 3. 9. 1: Chemical composition of killed steel bars**

| Grade | Chemical composition % |           |           |           |           |                                 |                                  |                                  |           |            |            |            |            |
|-------|------------------------|-----------|-----------|-----------|-----------|---------------------------------|----------------------------------|----------------------------------|-----------|------------|------------|------------|------------|
|       | C<br>max.              | Si        | Mn        | P<br>max. | S<br>max. | Al                              | Nb<br>max.                       | V<br>max.                        | N<br>max. | Cr<br>max. | Cu<br>max. | Ni<br>max. | Mo<br>max. |
| U1    | 0.20                   | 0.15–0.35 | 0.40 min. | 0.04      | 0.04      | —                               | —                                | —                                | —         | —          | —          | —          | —          |
| U2    | 0.24                   | 0.15–0.55 | 1.60 max. | 0.035     | 0.035     | 0.02 min.<br><i>See Note 1</i>  | —                                | —                                | —         | —          | —          | —          | —          |
| U3    | 0.33                   | 0.15–0.55 | 1.90 max  | 0.035     | 0.035     | 0.065 max.<br><i>See Note 2</i> | 0.05 <i>See</i><br><i>Note 2</i> | 0.10 <i>See</i><br><i>Note 2</i> | 0.015     | 0.25       | 0.35       | 0.40       | 0.08       |

**Note 1.** Aluminium may be partly replaced by other grain refining elements.

**Note 2.** To obtain fine grain steel, at least one of these grain refining elements must be present in sufficient amount.

## 9.5 Embrittlement tests

- 9.5.1 For Grades R3, R3S, R4, R4S and R5 the bar manufacturer is to provide evidence that the material is not susceptible to strain ageing or to temper brittleness under the conditions of manufacture of the chain. The results of the relevant tests are to be reported to ACS at the approval stage. Approval will be restricted to the specified steel composition and if later this is altered then re-approval will be required. Temper brittleness testing may be waived if the chain is to be quenched after tempering.
- 9.5.2 Each heat of steel bars of grades R3S, R4, R4S and R5 is to be tested for hydrogen embrittlement (*See [Ch 2, 5.3 Hydrogen embrittlement tests](#)*). In the case of continuous casting, test samples representing both the beginning and the end of the heat are to be taken. In the case of ingot casting, test samples representing two different ingots are to be taken.
- 9.5.3 Each sample is to be heat treated in a manner simulating the heat treatment of the finished chain. From each sample two specimens are to be prepared from the mid-diameter of the bar and tested in accordance with [Ch 2, 5.3 Hydrogen embrittlement tests](#).
- 9.5.4 The ratio  $Z_1/Z_2$  is to be greater than or equal to 0.85, where  $Z_1$  is the reduction in area without baking and  $Z_2$  the reduction in area after baking.

9. 5. 5 If the requirement is not met, the material is to be subjected to a hydrogen degassing treatment which is subject to approval by ACS. Further tests are to be performed after degassing.

## 9. 6 Mechanical tests

9. 6. 1 Bars of the same nominal diameter are to be presented for test in batches of 50 tonnes or fraction thereof from the same cast. A suitable length from one bar in each batch is to be selected for test purposes. Test pieces are to be taken from the positions as shown in [Figure 3. 9. 1: Sampling of steel bars](#).

**Figure 3. 9. 1: Sampling of steel bars**

9. 6. 2 For all grades, one tensile test is to be taken from each sample length selected. Additionally, for Grades U3, R3, R3S, R4, R4S and R5 material, one set of three Charpy V-notch impact test specimens is to be prepared. Impact tests are also required for Grade U2 when the chain is to be supplied in as-welded condition.
9. 6. 3 The results of all tensile and, where applicable, impact tests are to be in accordance with the appropriate requirements of [Table 3. 9. 2: Mechanical properties](#).

**Table 3. 9. 2: Mechanical properties**

| Grade | Yield stress<br>N/mm <sup>2</sup><br>minimum | Tensile strength<br>N/mm <sup>2</sup> | Elongation on<br>$5.65\sqrt{S_0}\%$<br>minimum | Reduction of area %<br>minimum | Charpy V-notch impact tests |                             |  |
|-------|--|---------------------------------------|--|--------------------------------|-----------------------------|-----------------------------|--|
|       |  |                                       |  |                                | Test temperature<br>°C      | Average energy J<br>minimum | Average energy flash weld J<br>minimum |
| U1    | —  | 370–490                               | 25   | —                              | —                           | —                           | —                                      |
| U2    | 295  | 490–690                               | 22   | —                              | 0 (See Note 1)              | 27                          | —                                      |
| U3    | 410  | 690<br>minimum                        | 17   | 40                             | 0                           | 60                          | —                                      |

|                                 |                     |                                    |    |    |     |                     |    |    |
|---------------------------------|---------------------|------------------------------------|----|----|-----|---------------------|----|----|
|                                 |                     |                                    |    |    |     | –20 (See<br>Note 2) | 35 | —  |
| R3                              | 410 (See<br>Note 3) | 690<br>minimum<br>(See<br>Note 3)  | 17 | 50 | 0   |                     | 60 | 50 |
|                                 |                     |                                    |    |    |     | –20 (See<br>Note 2) | 40 | 30 |
| R3S                             | 490 (See<br>Note 3) | 770<br>minimum<br>(See<br>Note 3)  | 15 | 50 | 0   |                     | 65 | 53 |
|                                 |                     |                                    |    |    |     | –20 (See<br>Note 2) | 45 | 33 |
| R4                              | 580 (See<br>Note 3) | 860<br>minimum<br>(See<br>Note 3)  | 12 | 50 | –20 |                     | 50 | 36 |
| Grade<br>R4S<br>(See<br>Note 4) | 700 (See<br>Note 3) | 960<br>minimum<br>(See<br>Note 3)  | 12 | 50 | –20 |                     | 56 | 40 |
| Grade<br>R5 (See<br>Note 4)     | 760 (See<br>Note 3) | 1000<br>minimum<br>(See<br>Note 3) | 12 | 50 | –20 |                     | 58 | 42 |

**Note 1.** Impact tests may be waived when the chain cable is to be supplied in one of the heat treated conditions given in [Table 10. 2. 3: Condition of supply and scope of mechanical tests for finished chain cables and fittings](#).

**Note 2.** Testing may be carried out at either 0°C or –20°C, at the option of ACS.

**Note 3.** The ratio of yield strength to tensile strength should be 0.92 maximum unless specially approved.

**Note 4.** The aim maximum hardness for R4S is to be HB330, and for R5 is to be HB340.

9. 6. 4 Failure to meet the requirements will result in the rejection of a batch of material, unless it is clearly attributed to improper simulated heat treatment. This is to be confirmed to be to the satisfaction of ACS, and further heat treatment and testing will be required prior to acceptance.

## 9. 7 Structure and hardenability tests

9. 7. 1 For Grades R4S and R5, the following tests are to be carried out on each heat:
- Assessment and quantification of the level of non-metallic micro inclusion. These must be acceptable for the final product.
  - Macro etching on a representative sample, in accordance with ASTM E381 or equivalent. This must be free from any injurious segregation or porosity.

- c. Jominy hardenability tests in accordance with ASTM A255 or equivalent.

## 9. 8 Dimensional tolerances

9. 8. 1 The tolerances on diameter and ovality of the bar are to be in accordance with [Table 3. 9. 3: Dimensional tolerance of bar stock](#).

**Table 3. 9. 3: Dimensional tolerance of bar stock**

| Nominal diameter mm | Tolerance on diameter mm | Tolerance on roundness ( $\underline{d}_{\max} - \underline{d}_{\min}$ ) mm |
|---------------------|--------------------------|---|
| $\leq 20$           | -0/+1.0                  | 0.60  |
| $>20 \leq 25$       | -0/+1.0                  | 0.60  |
| $>26 \leq 35$       | -0/+1.2                  | 0.80  |
| $>36 \leq 50$       | -0/+1.6                  | 1.10  |
| $>51 \leq 80$       | -0/+2.0                  | 1.50  |
| $>81 \leq 100$      | -0/+2.6                  | 1.95  |
| $>101 \leq 120$     | -0/+3.0                  | 2.25  |
| $>121 \leq 160$     | -0/+4.0                  | 3.00  |
| $>161 \leq 210$     | -0/+5.0                  | 4.00  |

## 9. 9 Non-destructive examination

9. 9. 1 For the grades U1, U2 and U3 all bars are to be free from internal and surface defects that might impair proper workability, use and strength. Subject to agreement by the Surveyor, surface defects may be removed by grinding provided the acceptable tolerances are not exceeded.
9. 9. 2 For the R3, R3S, R4, R4S and R5 grades all bars are to be inspected by a magnetic particle or eddy current method and are also to be subjected to ultrasonic examination.
9. 9. 3 All non-destructive examination is to be carried out in accordance with approved procedures, in accordance with [Ch 1, 5 Non-destructive examination](#).
9. 9. 4 All non-destructive examination operators are to be qualified in the method of non-destructive examination to a minimum of Level II in accordance with a recognised standard.
9. 9. 5 The bars are to be free from pipes, cracks, flakes, and injurious surface defects such as seams, laps, and rolled in mill scale. Longitudinal discontinuities may be removed by blending to a smooth contour provided that their depth is not greater than 1 per cent of the bar diameter, and that the required diameter tolerances are not compromised. The contour radiuses are to be a minimum of four times the excavation depth.
9. 9. 6 The frequency of non-destructive testing may be reduced at the discretion of ACS, provided statistical evidence is available that the required quality is achieved consistently.

## 9. 10 Identification

9. 10. 1 Each bar is to be identified in accordance with [Ch 3, 1.12, Identification of materials](#) and, in addition, is to be marked with the appropriate grade of chain cable.

| CHAPTER | 3 | Rolled Steel Plates, Strip, Sections and Bars                     |
| SECTION | 9 | Bars for welded chain cables                                      |

---

## 9. 11 Certification of materials

9. 11. 1 Each consignment of bars is to be accompanied by a certificate of a type and in accordance with [Ch 3, 1.13, Certification of materials](#) but with the addition of the grade of chain cable, the rolling reduction ratio, the results of the hydrogen embrittlement, micro inclusion, macro etch and hardenability tests, where required by each grade.

## PART

# 2

## CHAPTER 3 Rolled Steel Plates, Strip, Sections and Bars

### SECTION 10 High strength steels for welded structures

#### 10. 1 Scope

10. 1. 1 Provision is made in this Section for hot-rolled, fine-grain treated, weldable high strength structural steels intended for use in marine and offshore structural applications. These requirements are not intended to apply to steels for the hull structure of ships.
10. 1. 2 The required notch toughness is designated by subdividing the strength levels into Grades AH, DH, EH and FH.
10. 1. 3 The steels may be supplied in eight strength levels with minimum yield stresses of 420, 460, 500, 550, 620, 690, 890 and 960 N/mm<sup>2</sup> respectively. For yield strength level of 890 and 960 N/mm<sup>2</sup> grade F is not applicable.
10. 1. 4 Steels covered by the scope of these Rules requirements may be supplied either in the normalised (N), normalising rolled (NR), thermomechanically controlled rolled (TM) or quench and tempered (QT) condition.
10. 1. 5 The requirements of this Section are primarily intended to apply to plates, wide flats, sections, bars and seamless tubulars, generally not exceeding the thickness limits given in [Table 3. 10. 1: Maximum Thickness Limits](#). Steels with a thickness beyond the maximum thickness as given in [Table 3. 10. 1: Maximum Thickness Limits](#) are to be specially considered by ACS.

**Table 3. 10. 1: Maximum Thickness Limits**

| Steel Grade  | Condition of supply | Maximum thickness (mm) ( <i>See Note 1</i> ) |                     |      |          |
|--|---------------------|--|---------------------|------|----------|
|  |                     | Plates                                       | Sections            | Bars | Tubulars |
| AH42, AH46   | N                   | 250  | 50                  | 250  | 65       |
| DH42, DH46   | NR                  | 150  | <i>(See Note 2)</i> |      |          |
| EH42, EH46   | TM                  | 150  | 50                  | -    | -        |
| FH42, FH46   | QT                  | 150  | 50                  | -    | 50       |
| AH50, AH55,<br>AH62, AH69                              | TM                  | 150  | -                   | -    | -        |
| DH50, DH55,<br>DH62, DH69<br>EH50, EH55,<br>EH62, DE69 | QT                  | 150  | -                   | -    | 50       |

|   |    |     |   |   |   |
|---|----|-----|---|---|---|
| FH50, FH55,<br>FH62, FH69   |    |     |   |   |   |
| AH89<br>DH89  | TM | 100 | - | - | - |
| EH89  | QT | 100 | - | - | - |
| AH96<br>DH96<br>EH96  | QT | 50  | - | - | - |
| <p><b>Note 1.</b> Thicknesses in excess of these limits or those indicated by ‘-’ may be considered for approved applications.</p> <p><b>Note 2.</b> The maximum thickness limits of sections and bars produced by the NR process route are generally lower than those applicable when manufactured by the N route and are subject to special consideration by ACS.</p> |    |     |   |   |   |

## 10. 2 Manufacture

10. 2. 1 The steel is to be made to a specification approved by ACS which should include the manufacturing procedure, deoxidation practice, heat treatment and mechanical properties.
10. 2. 2 Vacuum degassing treatment shall be applied for all steels with enhanced through thickness properties and for grades with yield strength level of 690, 890 and 960 N/mm<sup>2</sup>.
10. 2. 3 The steel is to be supplied in the fully killed and fine grain treated condition as detailed in the approved manufacturing specification.

## 10. 3 Chemical composition

10. 3. 1 The chemical analysis is to be in accordance with the approved manufacturing specification. All the elements listed in [Table 3. 10. 2: Chemical Composition](#) are to be reported.
10. 3. 2 All alloying elements, including residuals, are to be as detailed in the approved manufacturing specification. Where Boron is added, this is not to exceed 0.005 per cent.
10. 3. 3 The steel shall contain nitrogen binding elements as detailed in the approved manufacturing specification.

**Table 3. 10. 2: Chemical Composition**

| Condition of supply/Steel Grade |      |      |      |      |      |           |
|---------------------------------|------|------|------|------|------|-----------|
| N/NR                            |      | TM   |      | QT   |      |           |
| Chemical<br>Composition         | AH42 | EH42 | AH42 | EH42 | AH42 | EH42 FH42 |
|                                 | DH42 | EH46 | DH42 | FH42 | DH42 | EH46 FH46 |
|                                 | AH46 |      | AH46 | EH46 | AH46 | EH50 FH50 |
|                                 | DH46 |      | DH46 | FH46 | DH46 | EH55 FH55 |

| Oxygen ppm max (See<br>Note 5)        | Not applicable |       | Not applicable   | 50   | Not applicable   | 30                                  |

- Note 1.** For sections the P and S content can be 0.005 per cent higher than the value specified in the Table,
- Note 2.** The total aluminium to nitrogen ratio shall be a minimum of 2:1, When other nitrogen binding elements are used, the minimum Al value and Al/N-ratio do not apply,
- Note 3.** Total Nb+V+Ti ≤ 0.26 % and Mo+Cr ≤ 0.65%, not applicable for QT steels,
- Note 4.** Higher Ni content may be approved at the discretion of ACS,
- Note 5.** The requirement on maximum Oxygen content is only applicable to DH89; EH89; DH96 and EH96.

- 10.3.4 The carbon equivalent value is to be calculated from the ladle analysis using the formula given below. Maximum values are specified in [Table 3. 10. 3: Maximum Ceq, CET and Pcm values](#).

$$Ceq = c + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15} (\%)$$

For steel grades H46 and higher, CET may be used instead of Ceq at the discretion of the manufacturer, and is to be calculated according to the following formula:

$$CET = c + \frac{(Mn + Mo)}{10} + \frac{(Cr + Cu)}{20} + \frac{Ni}{40} (\%)$$

For TM and QT steels with carbon content not exceeding 0.12 per cent, the cold cracking susceptibility *Pcm* for evaluating weldability may be used instead of carbon equivalent of *Ceq* or *CET* at the manufacturer's discretion, and is to be calculated using the following formula:

$$Pcm = C + \frac{Si}{30} + \frac{Mn}{20} + \frac{Cu}{20} + \frac{Ni}{60} + \frac{Cr}{20} + \frac{Mo}{15} + \frac{V}{10} + 5B (\%)$$

**Table 3. 10. 3: Maximum Ceq, CET and Pcm values**

| Steel yield strength level / Condition of supply | Ceq (%)   |               |                |           |                     |           | CET (%) | Pcm (%) |

Note N/A = Not applicable

## 10. 4 Mechanical tests

10. 4. 1 For steels in the normalising rolled (NR) or thermomechanically controlled rolled (TM) conditions, one tensile test is to be made for each batch of 25 tonnes or fraction thereof. Additional tests are to be made for every variation of 10 mm in the thickness or diameter of products from the same cast. One set of three Charpy V-notch impact tests specimens are to be taken from each piece. A piece is to be regarded as the rolled product from a single slab or billet, or from a single ingot if this is rolled directly into plates. Charpy V-notch impact test specimens from plates and flats with a finished width more than 600 mm are to have their axes transverse to the main rolling direction.
10. 4. 2 For normalised (N) and quenched and tempered (QT) plates, one tensile test piece and a set of three Charpy V-notch impact test specimens are to be taken from each plate as heat treated. Charpy V-notch impact test specimens from quenched and tempered plates and flats with a finished width more than 600 mm are to have their axes transverse to the main rolling direction.
10. 4. 3 For sections, bars and tubulars, one tensile test piece and one set of three Charpy V-notch impact test specimens are to be taken from each batch of 25 tonnes or fraction thereof. Additional tests are to be made for every variation of 10 mm in the thickness or diameter of products from the same cast. For sections, the thickness to be considered is the thickness of the product at the point at which samples are taken for mechanical tests. A piece is to be regarded as the rolled product from a single slab or billet, or from a single ingot if this is rolled directly into sections, bars or tubulars.
10. 4. 4 For material with a thickness in excess of 50 mm, impact tests shall be taken at the quarter thickness (t/4) location and additionally at mid-thickness (t/2) location. As an alternative to a full thickness or a sub-sized flat tensile specimen, the specimens are to be located at a position lying at a distance of t/4 from the surface and additionally at t/2 for thickness above 100 mm or as near as possible to these positions.
10. 4. 5 For steels designated with improved through thickness properties, through thickness tensile tests are to be performed in accordance with the requirement of [Ch 3, 8 Plates with specified through thickness properties](#). Through-thickness tensile strength is required to be not less than 80 % of the specified minimum tensile strength.
10. 4. 6 The results of the tests are to comply with the appropriate requirements of [Table 3. 10. 4: Mechanical properties for acceptance purpose](#).

**Table 3. 10. 4: Mechanical properties for acceptance purpose**

#### Symbols

T = Transverse

L = Longitudinal

Impact tests are to be made on the various grades at the following temperatures:

- AH grades 0°C
- DH grades -20°C
- EH grades -40°C
- FH grades -60°C

**Note 1.** For tensile test either the upper yield stress (ReH) or where ReH cannot be determined, the 0.2 per cent proof stress (Rp0.2) is to be determined.

**Note 2.** The ratio of actual yield strength to tensile strength shall not exceed 0.94. A higher yield strength to tensile strength ratio may be acceptable on a project specific basis, subject to special consideration.

**Note 3.** For full thickness flat test specimens with a width of 25 mm and a gauge length of 200 mm the elongation is to comply with the minimum values shown in [Table 3. 10. 5: Elongation minimum values for a width of 25 mm and a 200 mm gauge length](#).

**Table 3. 10. 5: Elongation minimum values for a width of 25 mm and a 200 mm gauge length**

| Thickness (mm)<br>(See Note 1) |                        | ≤10        | >10<br>≤15 | >15<br>≤20 | >20<br>≤25 | >25<br>≤40 | >40<br>≤50 | >50<br>≤70 |
|--------------------------------|------------------------|------------|------------|------------|------------|------------|------------|------------|

|                                | H42                    | 11         | 13         | 14         | 15         | 16         | 17         | 18         |
|                                | H46                    | 11         | 12         | 13         | 14         | 15         | 16         | 17         |
|                                | H50                    | 10         | 11         | 12         | 13         | 14         | 15         | 16         |
|                                | H55                    | 10         | 11         | 12         | 13         | 14         | 15         | 16         |
|                                | H62                    | 9          | 11         | 12         | 12         | 13         | 14         | 15         |
|                                | H69<br>(See<br>note 2) | 9          | 10         | 11         | 11         | 12         | 13         | 14         |
|                                | H89<br>H96             | See Note 3 |            |            |            |            |            |            |

**Note 1.** The tabulated elongation minimum values are the requirements for testing specimen in transversed direction.

**Note 2.** Re-test can be carried out on the standards proportional test specimen witha gauge length of  $L_0=5.65\sqrt{S_0}$  to meet the requirement of [Table 3. 10. 4: Mechanical properties for acceptance purpose](#) when the elongation does not meeting the requirement in this table. See [Ch 2, 2.4 Equivalent elongations](#).

**Note 3.** Steel with strength level of 89 and 96 shall be tested by proportional specimens witha gauge length of  $L_0=5.65\sqrt{S_0}$ .

## 10. 5 Identification of materials

10. 5. 1 The particulars detailed in [Ch 3, 1.12, Identification of materials](#) are to be marked on each piece which has been accepted and, for ease of recognition, are to be encircled or otherwise marked with paint.

## 10. 6 Certification of materials

10. 6. 1 At least two copies of each test certificate are to be provided. They are to be of the type and give the information detailed in [Ch 3, 1.13, Certification of materials](#) and, additionally, are to state the specified maximum *Ceq*, *CET* or *Pcm*. As a minimum, chemical composition is to include the contents of any grain refining elements used and of the residual elements as detailed in [Table 3. 10. 2: Chemical Composition](#).

PART

# 2

CHAPTER **4 Steel Castings**

SECTION **1 General requirements**

## 1.1 Scope

- 1.1.1 This Section gives the general requirements for steel castings intended for use in the construction of ships, other marine structures, machinery, boilers, pressure vessels and piping systems.
- 1.1.2 Where required by the relevant Rules dealing with design and construction, castings are to be manufactured and tested in accordance with [Ch 1 General Requirements](#) and [Ch 2 Testing Procedures for Metallic Materials](#), together with the general requirements given in this Section and the appropriate specific requirements given in Sections [Ch 4, 2 Castings for ship and other structural applications](#) to [Ch 4, 9 Steel castings for container corner fittings](#).
- 1.1.3 As an alternative to [Ch 4, 1.1 Scope 1.1.2](#), castings which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Chapter or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of [Ch 1 General Requirements](#).
- 1.1.4 Where small castings are produced in large quantities, or where castings of the same type are produced in regular quantities, alternative survey procedures, in accordance with [Ch 1, 2.4 Materials Quality Scheme](#), may be adopted.

## 1.2 Manufacture

- 1.2.1 Castings are to be made at foundries approved by ACS. The steel used is to be manufactured by a process approved by Asia Classification Society (hereinafter referred as 'ACS').
- 1.2.2 All flame cutting, scarfing or arc-air gouging to remove surplus metal is to be undertaken in accordance with recognised good practice and is to be carried out before the final heat treatment. Preheating is to be employed where necessitated by the chemical composition and/or thickness of the casting. The affected areas are to be either machined or ground smooth for a depth of about 2 mm unless it has been shown that the material has not been damaged by the cutting process. Special examination will be required to find any cracking in way of the cut surfaces.
- 1.2.3 Where two or more castings are joined by welding to form a composite item, details of the proposed welding procedure are to be submitted for approval. Welding approval procedure tests will be required, *See also* the requirements of [Ch 4, 1.9, Rectification and dressing of castings](#).

## 1.3 Quality of castings

- 1.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service. The surface finish is to be in accordance with good practice and any specific requirements of the approved specification.

- 1. 3. 2 The surfaces are not to be hammered, peened or treated in any way which may obscure defects.
- 1. 3. 3 The locations of all chaplets are to be noted and to be subject to close visual inspection (and when necessary ultrasonic examination) to ensure complete fusion.

## 1. 4 Chemical composition

- 1. 4. 1 All castings are to be made from killed steel. The chemical composition of the ladle sample is to be within the limits given in the relevant Section of this Chapter. Where general overall limits are specified, the chemical composition is to be appropriate for the type of steel, dimensions and required mechanical properties of the castings.
- 1. 4. 2 Except where otherwise specified, suitable grain refining elements may be used at the discretion of the manufacturer. The content of such elements is to be reported in the ladle analysis.

## 1. 5 Heat treatment

- 1. 5. 1 All castings are to be heat treated in accordance with the requirements given in the relevant Section of this Chapter.
- 1. 5. 2 Heat treatment is to be carried out in a properly constructed furnace which is efficiently maintained and has adequate means of temperature control. The furnace dimensions are to be such as to allow the steel castings to be uniformly heated to the necessary temperature. Sufficient thermocouples are to be connected to the steel castings to show that their temperature is adequately uniform and the temperatures are to be recorded throughout the heat treatment. Alternative procedures are to be approved by ACS, Materials and NDE department. Copies of these records are to be presented to the Surveyor together with a sketch showing the positions at which the temperature measurements were carried out. The records are to identify the furnace that was used and give details of the individual steel castings, the heat treatment temperature and time at temperature and the date. The Surveyor is to examine the charts and confirm the details on the certificate. In the case of very large components which require heat treatment, alternative methods will be specially considered.
- 1. 5. 3 If a casting is locally reheated, or any straightening operation is performed after the final heat treatment, a subsequent stress relieving heat treatment may be required in order to avoid the possibility of harmful residual stresses.

## 1. 6 Test material and test specimens

- 1. 6. 1 Test material sufficient for the tests specified in Sections [Ch 4, 2 Castings for ship and other structural applications](#) to [Ch 4, 9 Steel castings for container corner fittings](#) and for possible re-test purposes is to be provided for each casting. The test samples are to be either integrally cast or gated to the casting and are to have a thickness of not less than 30 mm.
- 1. 6. 2 The test samples are not to be detached from the casting until the heat treatment specified in [Ch 4, 1.5 Heat treatment 1.5.1](#) has been completed and they have been properly identified.
- 1. 6. 3 As an alternative to [Ch 4, 1.6 Test material and test specimens 1.6.1](#) and [Ch 4, 1.6 Test material and test specimens 1.6.2](#), where a number of small castings of about the same size, each of which is under 1000 kg in mass, are made from one cast and heat treated in the same furnace charge, a batch testing procedure may be adopted, using separately cast test samples of suitable dimensions. The test samples are to be properly identified and heat treated together with the castings which they represent. At least one test sample is to be provided for each batch of castings.
- 1. 6. 4 The test specimens are to be prepared in accordance with the requirements of [Ch 2 Testing Procedures for Metallic Materials](#). Tensile test specimens are to have a cross-sectional area of not less than 150 mm<sup>2</sup>.

1. 6. 5 Re-test procedures are to be in accordance with [Ch 2, 1.4, Re-testing procedures](#).

## 1. 7 Visual and non-destructive examination

1. 7. 1 This Section gives the general requirements for non-destructive examination of steel castings. As an alternative, castings may be examined in accordance with a National Specification, provided it gives reasonable equivalence to these Rules.
1. 7. 2 All castings are to be cleaned and adequately prepared for inspection. Suitable methods include pickling, caustic cleaning, wire brushing, local grinding, shot or sand blasting.
1. 7. 3 The surfaces are not to be hammered, peened or treated in any way which may obscure defects.
1. 7. 4 Unless otherwise agreed, the accuracy and verification of dimensions are the responsibility of the manufacturer.
1. 7. 5 All castings are to be presented to the Surveyor for visual examination. Where applicable, this is to include the examination of internal surfaces. Castings are to be subject to magnetic particle examination or dye penetrant inspection (for austenitic stainless steel castings, See [Ch 4, 8 Stainless steel castings](#)) in accordance with [Ch 4, 1.7 Visual and non-destructive examination 1.7.9](#), unless more specific requirements for non-destructive examination are included in subsequent Sections of this Chapter, other parts of the Rules or the agreed specification.
1. 7. 6 Where specified or required by the Rules non-destructive examination is to be carried out before acceptance. All tests are to be in accordance with the requirements of [Ch 1, 5 Non-destructive examination](#).
1. 7. 7 The manufacturer is to provide the Surveyor with a signed report confirming that non-destructive examination has been carried out and that such inspection has not revealed any significant defects.
1. 7. 8 Where magnetic particle examination is specified or required, this is to be carried out using a suspension of magnetic particles in a suitable fluid. The dry powder method is not acceptable for the final inspection. Prods are not permitted on finished machined surfaces.
1. 7. 9 Where required, magnetic particle or dye penetrant testing is to be carried out by the manufacturer whenever appropriate and also when the castings are in the finished condition. The tests are to be made in the presence of the Surveyor unless otherwise specially agreed. The castings are to be examined in the following areas:
  - a. At all accessible fillets and changes of section.
  - b. At positions where surplus metal has been removed by flame cutting, scarfing or arc-air gouging.
  - c. In way of fabrication weld preparations, for a distance not less than 50 mm from the edge.
  - d. In way of welds.
  - e. In way of chaplets.
  - f. At other positions agreed with the Surveyor to include areas which may be subjected to high stress in service.
1. 7. 10 Where required by subsequent Sections or by the agreed specification, ultrasonic examination is to be carried out by the manufacturer, but Surveyors may request to be present in order to verify that the examination is carried out in accordance with the agreed procedure. This examination is to be carried out in the following areas:
  - a. At positions which may be subjected to high stresses in service, as agreed with the Surveyor.
  - b. In way of fabrication weld preparations, for a distance not less than 50 mm from the edge.
  - c. At positions where subsequent machining may expose filamentary shrinkage or other defects (e.g. bolt holes, bearing bores).
  - d. In way of welding.
  - e. In way of riser positions.

- f. At positions where experience shows that significant internal defects may occur: these are to be agreed between the manufacturer and the Surveyor.
- 1. 7. 11 Radiographic examination, where required, is to be carried out by the manufacturer in areas generally as indicated for ultrasonic examination in [Ch 4, 1.7 Visual and non-destructive examination 1.7.10](#). All radiographs are to be submitted to the Surveyor for examination and acceptance. The radiographic technique and acceptance standards are to be to the satisfaction of the Surveyor and in accordance with any requirements of the approved specification.
- 1. 7. 12 In the event of any casting proving to be defective during subsequent machining or testing it is to be rejected notwithstanding any previous certification.
- 1. 7. 13 The general acceptance criteria given in [Ch 4, 2.6, Acceptance levels for NDE of castings](#) are to be applied where no specific acceptance criteria are stated in the subsequent Sections of this Chapter.

## 1. 8 Pressure testing

- 1. 8. 1 Where required by the relevant Rules, castings are to be pressure tested in the final machined condition before final acceptance. These tests are to be carried out in the presence of the Surveyors and are to be to their satisfaction.

## 1. 9 Rectification and dressing of castings

- 1. 9. 1 When unacceptable defects are found in a casting, these are to be removed by machining or chipping. Flame-scarfing or arc-air gouging may also be used provided that preheating is employed when necessary and that the surfaces of the resulting excavation are subsequently ground smooth. Complete elimination of the defective material is to be proven by adequate non-destructive examination. Shallow grooves or excavations resulting from the removal of defects may, at the discretion of the Surveyor, be accepted provided that they will cause no appreciable reduction in the strength of the castings and that they are suitably blended by grinding. Complete elimination of the defective material is to be verified by magnetic particle or dye penetrant testing.
- 1. 9. 2 Where flame scarfing or arc-air gouging is used, the requirements detailed in [Ch 4, 1.2 Manufacture 1.2.2](#) are to apply.
- 1. 9. 3 Grinding wheels for use on austenitic stainless steels are to be of an iron-free type and shall have been used only on stainless steels.
- 1. 9. 4 All proposals to repair a defective casting by welding are to be submitted to the Surveyor before this work is commenced. The Surveyor is to satisfy himself that the number, position and size of the defects are such that the casting can be effectively repaired.
- 1. 9. 5 A statement and/or sketch detailing the extent and position of all welds is to be prepared by the manufacturer. Copies of these sketches are to be submitted to ACS.
- 1. 9. 6 All welding is to be carried out by an approved welder and in accordance with an approved welding procedure which includes the features referred to in [Ch 4, 1.9 Rectification and dressing of castings 1.9.6](#) to [Ch 4, 1.9 Rectification and dressing of castings 1.9.13](#).
- 1. 9. 7 Where welding is required, a grain refining heat treatment is to be given to the whole casting prior to carrying out welding unless agreed otherwise with the Surveyor. Grain refining heat treatment requires heating above the upper critical temperature.
- 1. 9. 8 Any excavations are to be of suitable shape to allow good access for welding and, after final preparation for welding, are to be re-examined by suitable non-destructive testing methods to ensure that all defective material has been eliminated.
- 1. 9. 9 All castings in alloy steels other than austenitic and duplex stainless steels are to be suitably preheated prior to welding. Castings in carbon-manganese steels may also be required to be

preheated, depending on their chemical composition, the dimensions, configuration and positions of the welds.

1. 9. 10 Welding is to be carried out under cover, in positions free from draughts and adverse weather conditions. As far as possible, all welding is to be carried out in the downhand (flat) position.
1. 9. 11 The welding consumables used are to be of an appropriate composition, giving a weld deposit with mechanical properties similar and in no way inferior to those of the parent castings. The use of low hydrogen type welding consumables is preferred. Welding procedure tests are to be carried out by the manufacturer to demonstrate that satisfactory mechanical properties can be obtained after heat treatment as detailed in [Ch 4, 1.9 Rectification and dressing of castings 1.9.12](#), and the results of these tests are to be presented to the Surveyor.
1. 9. 12 After welding is completed, the castings are to be given the heat treatment specified in [Ch 4, 2 Castings for ship and other structural applications](#) to [Ch 4, 9 Steel castings for container corner fittings](#), or a stress relieving heat treatment at a temperature of not less than 550°C. The type of heat treatment required will be dependent on the chemical composition of the casting and the dimensions, positions and nature of the repairs.
1. 9. 13 Special consideration may be given to a local stress relieving heat treatment where both the welded area is small and machining of the casting has reached an advanced stage, but prior agreement is to be obtained from ACS in writing. The welding procedure is to be such that residual stresses are minimised.
1. 9. 14 On completion of heat treatment, all welds and adjacent material are to be ground smooth and examined by magnetic particle, or liquid penetrant testing, ultrasonic or radiographic examination. The Surveyor is to attend at these inspections, to witness the results of magnetic particle or liquid penetrant examination and to examine any radiographs. Satisfactory results are to be obtained from all forms of non-destructive examination used. The acceptance criteria for the NDE of welds are to be in accordance with subsequent Sections of this Chapter or where these do not exist, [Table 13. 2. 5: Acceptance criteria for visual testing, magnetic particle and liquid penetrant testing](#) to [Table 13. 2. 7: Acceptance criteria for ultrasonic testing](#), as appropriate.
1. 9. 15 Where no welding has been made on a casting, the manufacturer is to provide the Surveyor with a written statement that this is the case.
1. 9. 16 The foundry is to maintain full records detailing the weld procedure, heat treatment and the extent and location of all welds made to each casting. These records are to be available for review by the Surveyor, and copies of individual records are to be supplied to the Surveyor on request.
1. 9. 17 For rectification of defective steel castings for crankshafts, See [Ch 4, 4.7, Rectification of defective castings](#).

## 1. 10 Identification of castings

1. 10. 1 The manufacturer is to adopt a system of identification, which will enable all finished castings to be traced to the original cast, and the Surveyor is to be given full facilities to trace the castings when required.
1. 10. 2 Before acceptance, all castings which have been tested and inspected with satisfactory results are to be clearly marked by the manufacturer with the following particulars:
  - a. Identification number, cast number or other marking which will enable the full history of the casting to be traced.
  - b. Manufacturer's name or trade mark.
  - c. ACS or Asia Classification Society and the abbreviated name of ACS's local office.
  - d. Personal stamp of Surveyor responsible for inspection.
  - e. Test pressure, where applicable.
  - f. Date of final inspection.

1. 10. 3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

## 1. 11 Certification of materials

1. 11. 1 A ACS certificate is to be issued, See [Ch 1, 3.1, General](#).
1. 11. 2 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting or batch of castings which has been accepted:
- Purchaser's name and order number.
  - Description of castings and steel grade.
  - Identification number.
  - Steel-making process, cast number, chemical analysis of ladle samples and, in the case of the Special grade (See [Ch 4, 2 Castings for ship and other structural applications](#)), the chemical analysis of the product or test bar.
  - General details of heat treatment including the temperature and time at temperature.
  - Results of mechanical tests.
  - Test pressure, where applicable.
1. 11. 3 Where applicable, the manufacturer is to provide a signed report regarding non-destructive examination as required by [Ch 4, 1.7 Visual and non-destructive examination 1.7.7](#) together with a statement and/or a sketch detailing the extent and position of all weld repairs made to each casting as required by [Ch 4, 1.9 Rectification and dressing of castings 1.9.5](#) or the statement detailed in [Ch 4, 1.9 Rectification and dressing of castings 1.9.15](#).

CHAPTER 4 **Steel Castings**SECTION 2 **Castings for ship and other structural applications****2. 1 Scope**

- 2. 1. 1 The requirements for carbon-manganese steel castings, intended for ship and other structural applications where the design and acceptance tests are related to mechanical properties at ambient temperature, are given in this Section.
- 2. 1. 2 Provision is made for two quality grades, Normal and Special.
- 2. 1. 3 Where it is proposed to use carbon-manganese steels of higher specified minimum tensile strength than required by [Ch 4, 2.4 Mechanical tests 2.4.3](#), or alloy steels, particulars of the chemical composition, mechanical properties and heat treatment are to be submitted for approval.

**2. 2 Chemical composition**

- 2. 2. 1 The chemical composition of ladle samples is to comply with [Table 4. 2. 1: Chemical composition](#).

**Table 4. 2. 1: Chemical composition**

| Quality grade                | Normal       | Special<br>(See Note 3)               |
|------------------------------|--------------|---------------------------------------|
| Carbon                       | 0.23% max.   | 0.23% max.                            |
| Silicon                      | 0.60% max.   | 0.60% max.                            |
| Manganese                    | 0.70 – 1.60% | 0.70 – 1.60%                          |
| Sulphur                      | 0.040% max.  | 0.035% max.                           |
| Phosphorus                   | 0.040% max.  | 0.035% max.                           |
| Aluminium    -(acid soluble) | –            | 0.015 – 0.080%<br>(See Notes 1 and 2) |
| Residual elements:           |              |                                       |
| Copper                       | 0.30% max.   | 0.30% max.                            |
| Chromium                     | 0.30% max.   | 0.30% max.                            |
| Nickel                       | 0.40% max.   | 0.40% max.                            |
| Molybdenum                   | 0.15% max.   | 0.15% max.                            |

|   |            |            |
|---|------------|------------|
| Total   | 0.80% max. | 0.80% max. |
| <p><b>Note 1.</b> The total aluminium content may be determined instead of the acid soluble content, in which case the total aluminium content is to be 0.020 – 0.10%.</p> <p><b>Note 2.</b> Grain refining elements other than aluminium may be used subject to special agreement with ACS.</p> <p><b>Note 3.</b> For the Special grade, the nitrogen content is to be determined.</p> |            |            |

2. 2. 2 For the Special grade, the product of the aluminium and nitrogen contents is to comply with the following formula:

$$(\%Al_{\text{acid sol}} \times \%N)10^5 \leq 60$$

2. 2. 3 For the Special grade, a check chemical analysis on the product or a test bar is mandatory. The check analysis on the product or test bar is to comply with the requirements of [Table 4. 2. 1: Chemical composition](#).

## 2. 3 Heat treatment

2. 3. 1 Castings are to be supplied:
- fully annealed; or
  - normalised; or
  - normalised and tempered at a temperature of not less than 550°C; or
  - quenched and tempered at a temperature of not less than 550°C.
2. 3. 2 For larger castings where a coarser microstructure may be present in heavier thickness, a double austenising heat treatment may be required to ensure adequate grain refinement. A coarse microstructure will be indicated by an increased attenuation of approximately 30 dB/m at 2 MHz during ultrasonic examination.
2. 3. 3 Following weld repair and or the attachment of handling brackets, all castings are to be subject to post weld heat treatment at a temperature of not less than 550°C before delivery.

## 2. 4 Mechanical tests

2. 4. 1 At least one tensile test is to be made on material representing each casting or batch of castings.
2. 4. 2 Where the casting is of complex design, or where the finished mass exceeds 10 tonnes, two test samples are to be provided. Where large castings are made from two or more casts which are not mixed in a ladle prior to pouring, two or more test samples are required corresponding to the number of casts involved. These are to be integrally cast at locations as widely separated as possible.
2. 4. 3 The results of these tests are to comply with the following requirements:
- |                                |                            |
|--------------------------------|----------------------------|
| Yield stress                   | 200 N/mm <sup>2</sup> min. |
| Tensile strength               | 400 N/mm <sup>2</sup> min. |
| Elongation on $5.65\sqrt{S_0}$ | 25% min.                   |
| Reduction of area              | 40% min.                   |
2. 4. 4 A set of three Charpy V-notch impact test specimens is to be provided with each casting in the Special grade. These may be taken from a small extension of the thickest part of the casting or from a block cast integrally with the casting and having dimensions representative of the largest

section thickness of the casting. These are to be tested in accordance with [Ch 2 Testing Procedures for Metallic Materials](#) and are to have an average energy of not less than 27J at 0°C.

## 2. 5 Non-destructive examination

2. 5. 1 Castings used in ship construction for the sternframe, rudder and propeller shaft supports are to be examined by ultrasonic and magnetic particle methods in accordance with [Ch 4, 1.7, Visual and non-destructive examination](#). The type and extent of non-destructive examination of castings for other structural applications are to be specially agreed by the Surveyor.
2. 5. 2 The extent and methods of non-destructive examination to be applied to typical hull steel castings are shown in [Figure 4. 2. 1: Extent of non-destructive evaluation for stern frame castings](#) to [Figure 4. 2. 6: Extent of non-destructive evaluation for rudder \(lower part\) castings](#) in addition to the areas specified in [Ch 4, 1.7 Visual and non-destructive examination 1.7.9](#) and [Ch 4, 1.7 Visual and non-destructive examination 1.7.10](#).

**Figure 4. 2. 1: Extent of non-destructive evaluation for stern frame castings**

**Figure 4. 2. 2: Extent of non-destructive evaluation for rudder stock castings**

**Figure 4. 2. 3: Extent of non-destructive evaluation for stern boss castings**

- Location of non-destructive examination
1. All surfaces: Visual examination
  2. Location indicated with (ooo): Magnetic particle and ultrasonic testing
  3. Location indicated with (wavy line): Ultrasonic testing

**Figure 4. 2. 4: Extent of non-destructive evaluation for rudder hanging castings**

|-----------------------------------|---|
| 1. All surfaces:                  | Visual examination                          |
| 2. Location indicated with (ooo): | Magnetic particle and<br>Ultrasonic testing |
| 3. Location indicated with (www): | Ultrasonic testing                          |

2. 5. 3 Acceptance levels for Visual Inspection are to be taken as follows:
- No cracks or hot tears are permitted.
  - Castings are to be free of other injurious indications to the satisfaction of the Surveyor.
  - Additional magnetic particle, dye penetrant or ultrasonic testing may be required for a more detailed evaluation of surface irregularities at the request of the Surveyor. These examinations are in addition to those required by [Ch 4, 2.6, Acceptance levels for NDE of castings](#).

## 2. 6 Acceptance levels for NDE of castings

2. 6. 1 The following definitions apply to indications associated with magnetic particle and dye penetrant inspection:
- Linear indication.** An indication in which the length is at least three times the width.
  - Non-linear indication.** An indication of circular or elliptical shape with a length less than three times the width.
  - Aligned indication.** Three or more indications in a line, separated by 2 mm or less edge-to-edge.
  - Open indication.** An indication visible after removal of the magnetic particles or that can be detected by the use of contrast dye penetrant.
  - Non-open indication.** An indication that is not visually detectable after removal of the magnetic particles or that cannot be detected by the use of contrast dye penetrant.
  - Relevant indication.** An indication that is caused by a condition or type of discontinuity that requires evaluation. Only indications which have any dimension greater than 1.5 mm are to be considered relevant.
2. 6. 2 For the purpose of evaluating indications, the surface is to be divided into reference band length of 150 mm for level MT1/PT1 and into reference areas of 225 cm<sup>2</sup> for level MT2/PT2. The band length and/or area is to be taken in the most unfavourable location relative to the indications being evaluated.

2. 6. 3 The following quality levels recommended for magnetic particle testing (MT) and/or dye penetrant testing (PT) are;

- Level MT1/PT1 – fabrication weld preparation areas.
- Level MT2/PT2 – other locations indicated on [Figure 4. 2. 1: Extent of non-destructive evaluation for stern frame castings](#) to [Figure 4. 2. 6: Extent of non-destructive evaluation for rudder \(lower part\) castings](#).

The acceptance criteria are shown in [Table 4. 2. 2: Acceptance criteria for surface inspection evaluation](#). Cracks and hot tears are not acceptable.

2. 6. 4 Acceptance criteria for ultrasonic testing are shown in [Table 4. 2. 3: Ultrasonic acceptance criteria for marine steel castings](#) as UT1 and UT2. Discontinuities within the examined zones interpreted to be cracks or hot tears are not acceptable.

**Table 4. 2. 2: Acceptance criteria for surface inspection evaluation**

| Quality level  | Maximum number of indication     | Type of indication | Maximum number each type | Maximum dimension of single indication, mm (See Note 2) |
|--|----------------------------------|--------------------|--------------------------|---|
| MT1/PT1  | 4 in 150 mm length               | Non-linear         | 4, See Note 1            | 5   |
|  |                                  | Linear             | 4, See Note 1            | 3   |
|  |                                  | Aligned            | 4, See Note 1            | 3   |
| MT2/PT2  | 20 in 22500 mm <sup>2</sup> area | Non-Linear         | 10                       | 7   |
|  |                                  | Linear             | 6                        | 5   |
|  |                                  | Aligned            | 6                        | 5   |
| <b>Note 1.</b> Minimum of 30 mm between relevant indications.  |                                  |                    |                          |   |
| <b>Note 2.</b> In weld repairs, the maximum dimension is 2 mm. |                                  |                    |                          |   |

**Table 4. 2. 3: Ultrasonic acceptance criteria for marine steel castings**

| Quality level   | Allowable disc shape according to the Distance-Gain Size (DGS), mm | Maximum number of indications to be registered, See Note 1 | Allowable length of linear indications, mm, See Note 2 |
|---|--|--|--|
| UT1   | >6   | 0  | 0  |
| UT2   | 12–15  | 5  | 50   |
|   | >15  | 0  | 0  |
| <b>Note 1.</b> Grouped in an area measuring 300 x 300 mm. |  |  |  |
| <b>Note 2.</b> Measured on the scanning surface.          |  |  |  |

2. 6. 5 Level UT1 is applicable to the following:

- Fabrication weld preparations for a distance of 50 mm.
- 50 mm depth from the final machined surface including boltholes.
- Fillet radii to a depth of 50 mm and within a distance of 50 mm from the radius end.
- Castings subject to cyclic bending stresses, e.g. rudder horn, rudder castings and rudder stocks, the outer one third of thickness in the zones shown in [Figure 4. 2. 1: Extent of non-destructive evaluation for stern frame castings](#) to [Figure 4. 2. 6: Extent of non-destructive evaluation for rudder \(lower part\) castings](#).

- 2. 6. 6 Level UT2 is applicable to the following:
  - a. For locations which are not specified in [Ch 4, 2.6 Acceptance levels for NDE of castings 2.6.5](#), nominated for ultrasonic testing in [Figure 4. 2. 1: Extent of non-destructive evaluation for stern frame castings](#) to [Figure 4. 2. 6: Extent of non-destructive evaluation for rudder \(lower part\) castings](#) or on the inspection plan.
  - b. Positions outside locations nominated for level UT1 examination where feeders and gates have been removed.
  - c. Castings subject to cyclic bending stresses, at the central one third of thickness in the zones shown in [Figure 4. 2. 1: Extent of non-destructive evaluation for stern frame castings](#) to [Figure 4. 2. 6: Extent of non-destructive evaluation for rudder \(lower part\) castings](#).
- 2. 6. 7 Ultrasonic acceptance criteria for casting areas not nominated in [Figure 4. 2. 1: Extent of non-destructive evaluation for stern frame castings](#) to [Figure 4. 2. 6: Extent of non-destructive evaluation for rudder \(lower part\) castings](#) will be subject to special consideration based on the anticipated stress levels and the type, size and position of the discontinuity.
- 2. 6. 8 Parts which are welded are to be examined by the same method as at the initial inspection as well as by additional methods as required by the Surveyor.

CHAPTER 4 **Steel Castings**SECTION 3 **Castings for machinery construction****3.1 Scope**

- 3.1.1 This Section gives the material requirements for carbon-manganese steel castings intended for use in machinery construction and which are not within the scope of [Ch 4, 4 Castings for crankshafts](#) to [Ch 4, 7 Ferritic steel castings for low temperature service](#).
- 3.1.2 Where it is proposed to use steels of higher carbon content than is indicated in [Ch 4, 3.2 Chemical composition 3.2.1](#), or alloy steels, particulars of the chemical composition, mechanical properties and heat treatment are to be submitted for approval.
- 3.1.3 The manufacture or repair of cast steel connecting rods is not permitted, except where the manufacturing and quality control procedures have been approved by ACS. For approval purposes, tests are to be carried out at the place of manufacture using the proposed process to demonstrate that the castings are sound. Tests are to be carried out to confirm that the appropriate mechanical properties are attained within the casting, including areas where weld repairs have been performed. Any changes to manufacturing, repair and quality control procedures are to be submitted to ACS for approval, *See also* [Ch 1, 2.2, ACS Approval – General](#).

**3.2 Chemical composition**

- 3.2.1 The chemical composition of ladle samples is to comply with the following limits, except as specified in [Ch 4, 3.2 Chemical composition 3.2.2](#):

|                    |             |
|--------------------|-------------|
| Carbon             | 0.40% max.  |
| Silicon            | 0.60% max.  |
| Manganese          | 0.50-1.60%  |
| Sulphur            | 0.040% max. |
| Phosphorus         | 0.040% max. |
| Residual elements: |             |
| Copper             | 0.30% max.  |
| Chromium           | 0.30% max.  |
| Nickel             | 0.40% max.  |
| Molybdenum         | 0.15% max.  |
| Total 0.80% max.   |             |

3. 2. 2 Castings which are intended for parts of a welded fabrication are to be of weldable quality with a carbon content generally not exceeding 0.23 per cent.
3. 2. 3 Proposals to use steels with higher carbon content, or alloy steels, for welded construction will be subject to special consideration.

### 3. 3 Heat treatment

3. 3. 1 Castings are to be supplied:
- fully annealed; or
  - normalised; or
  - normalised and tempered at a temperature of not less than 550°C; or
  - quenched and tempered at a temperature of not less than 550°C.
3. 3. 2 Engine bedplate castings, turbine castings and any other castings where dimensional stability and freedom from internal stresses are important, are to be given a stress relief heat treatment. This is to be at a temperature not lower than 550°C, followed by furnace cooling to 300°C or lower. Alternatively, full annealing may be used provided that the castings are furnace cooled to 300°C or lower.

### 3. 4 Mechanical tests

3. 4. 1 At least one tensile test is to be made on material representing each casting or batch of castings.
3. 4. 2 Where the casting is of complex design, or where the finished mass exceeds 10 tonnes, two test samples are to be provided. Where large castings are made from two or more casts which are not mixed in a ladle prior to pouring, two or more test samples are required corresponding to the number of casts involved. The test samples are to be integrally cast at locations as widely separated as possible.
3. 4. 3 [Table 4. 3. 1: Mechanical properties for acceptance purposes: carbon and carbon-manganese steel castings for machinery construction](#) gives the minimum requirements for yield stress, elongation and reduction of area corresponding to different strength levels, but it is not intended that these should necessarily be regarded as specific grades. Intermediate levels of minimum tensile strength may be specified, in which case minimum values for yield stress, elongation and reduction of area may be obtained by interpolation.

**Table 4. 3. 1: Mechanical properties for acceptance purposes: carbon and carbon-manganese steel castings for machinery construction**

| Tensile strength<br>N/mm <sup>2</sup> | Yield stress<br>N/mm <sup>2</sup> minimum | Elongation on<br>$5.65\sqrt{S_0}$ % minimum | Reduction of area<br>% minimum |
|---------------------------------------|---|---|--------------------------------|
| 400 – 550                             | 200                                       | 25  | 40                             |
| 440 – 590                             | 220                                       | 22  | 30                             |
| 480 – 630                             | 240                                       | 20  | 27                             |
| 520 – 670                             | 260                                       | 18  | 25                             |
| 560 – 710                             | 300                                       | 15  | 20                             |
| 600 – 750                             | 320                                       | 13  | 20                             |

3. 4. 4 Castings may be supplied to any specified minimum tensile strength selected within the general limits detailed in [Table 4. 3. 1: Mechanical properties for acceptance purposes: carbon and carbon-manganese steel castings for machinery construction](#).

- 3. 4. 5 The results of all tensile tests are to comply with the requirements of [Table 4. 3. 1: Mechanical properties for acceptance purposes: carbon and carbon-manganese steel castings for machinery construction](#) appropriate to the specified minimum tensile strength.
- 3. 4. 6 For alloy steel castings and carbon-manganese steel castings containing more than 0.40 per cent carbon, the results of all mechanical tests are to comply with an approved specification.
- 3. 4. 7 When a casting, or a batch of castings, has failed to meet the mechanical test requirements, it may be re-heat treated and re-submitted for acceptance tests but this may not be carried out more than twice, See [Ch 1, 4.6 Re-test procedures](#).

### 3. 5 Non-destructive examination

- 3. 5. 1 All piston crowns and cylinder heads are to be examined by ultrasonic testing unless otherwise agreed with ACS. Piston crowns intended for engines having a bore size larger than 400 mm and cylinder heads intended for engines having a bore size larger than 300 mm are additionally to be examined by magnetic particle or penetrant testing in accordance with [Ch 4, 1.7, Visual and non-destructive examination](#).
- 3. 5. 2 Engine bedplate and transverse girder castings are to be examined by ultrasonic and magnetic particle or penetrant testing in accordance with [Ch 4, 1.7, Visual and non-destructive examination](#).
- 3. 5. 3 Turbine castings are to be examined by magnetic particle or dye penetrant testing in accordance with [Ch 4, 1.7, Visual and non-destructive examination](#). In addition, an ultrasonic or radiographic examination is to be made in way of fabrication weld preparations.
- 3. 5. 4 Other castings are to be examined by non-destructive methods where specified.

CHAPTER 4 **Steel Castings**SECTION 4 **Castings for crankshafts****4. 1 Scope**

4. 1. 1 This Section gives the requirements for carbon and carbon-manganese steel castings for semi-built crankshafts.
4. 1. 2 Where it is proposed to use steels of higher carbon content than is indicated in [Ch 4, 4.3 Chemical composition 4.3.1](#), or alloy steels, particulars of the chemical composition, mechanical properties and heat treatment are to be submitted for approval. For alloy steels, the specified minimum tensile strength is not to exceed 700 N/mm<sup>2</sup>.

**4. 2 Manufacture**

4. 2. 1 The method of producing combined web and pin castings is to be approved. For this purpose, tests to demonstrate the soundness of the casting and the properties at important locations may be required.

**4. 3 Chemical composition**

4. 3. 1 The chemical composition of ladle samples is to comply with the following limits:

|                    |  |
|--------------------|--|
| Carbon             | 0.40% max. (but <i>See</i> <a href="#">Ch 4, 4.7 Rectification of defective castings 4.7.4.c</a> ) |
| Silicon            | 0.60% max.   |
| Manganese          | 0.50-1.60%   |
| Sulphur            | 0.040% max.  |
| Phosphorus         | 0.040% max.  |
| Residual elements: |  |
| Copper             | 0.30% max.   |
| Chromium           | 0.30% max.   |
| Nickel             | 0.40% max.   |
| Molybdenum         | 0.15% max.   |
| Total 0.80% max.   |  |

## 4. 4 Heat treatment

4. 4. 1 Castings are to be supplied either:
- fully annealed and cooled in the furnace to a temperature of 300°C or lower; or
  - normalised and tempered at a temperature of not less than 550°C, and cooled in the furnace to a temperature of 300°C or lower.

## 4. 5 Mechanical tests

4. 5. 1 Proposals for the number of tests and the location of test material on the casting are to be submitted by the manufacturer.
4. 5. 2 Not less than one tensile test and three impact tests are to be made on material representing each casting. The impact tests are to be carried out at ambient temperature.
4. 5. 3 [Table 4. 4. 1: Mechanical properties for acceptance purposes: carbon - manganese steel castings for crankshafts](#) gives the minimum requirements for yield stress and elongation corresponding to different strength levels, and it is not intended that these should necessarily be regarded as specific grades. The strength levels have been given in multiples of 40 N/mm<sup>2</sup> to facilitate interpolation for intermediate values of specified minimum tensile strength.
4. 5. 4 Castings may be supplied to any specified minimum tensile strength selected within the general limits detailed in [Table 4. 4. 1: Mechanical properties for acceptance purposes: carbon - manganese steel castings for crankshafts](#).
4. 5. 5 The results of all tests are to comply with the requirements of [Table 4. 4. 1: Mechanical properties for acceptance purposes: carbon - manganese steel castings for crankshafts](#) appropriate to the specified minimum tensile strength. For the impact tests, one individual value may be less than the required average value provided that it is not less than 70 per cent of this average value. See [Ch 1, 4.6 Re-test procedures](#) for re-test procedures.

**Table 4. 4. 1: Mechanical properties for acceptance purposes: carbon - manganese steel castings for crankshafts**

| Tensile strength<br>N/mm <sup>2</sup>                           | Yield stress<br>N/mm <sup>2</sup> minimum | Elongation on<br>$5.65\sqrt{S_0}$ % minimum | Reduction of area<br>% minimum | Charpy V-notch impact<br>tests average energy<br>J minimum(See Note) |
|---|---|---|--------------------------------|--|
| 400 – 550   | 200                                       | 28  | 45                             | 32   |
| 440 – 590   | 220                                       | 26  | 45                             | 28   |
| 480 – 630   | 240                                       | 24  | 40                             | 25   |
| 520 – 670   | 260                                       | 22  | 40                             | 20   |
| 550 – 700   | 275                                       | 20  | 35                             | 18   |
| <b>Note</b> Impact tests are to be made at ambient temperature. |   |   |                                |  |

## 4. 6 Non-destructive examination

4. 6. 1 Magnetic particle examination is to be carried out over all surfaces in accordance with [Figure 4. 4. 1: Magnetic particle inspection acceptance levels](#).

**Figure 4. 4. 1: Magnetic particle inspection acceptance levels**

4. 6. 2 Each casting is to be examined by ultrasonic testing, and the extent of examination and defect acceptance criteria, using the DGS (Distance Gain Size) technique, are to be as shown in [Figure 4. 4. 2: Ultrasonic examination acceptance levels](#). Alternative ultrasonic procedures may be submitted for approval.

## 4. 7 Rectification of defective castings

4. 7. 1 The requirements of [Ch 4, 1.9, Rectification and dressing of castings](#) apply, except where amended by this Section.
4. 7. 2 Where castings have shallow surface defects, consideration is first to be given to removing such defects by grinding and blending or by machining the surface where there is excess metal on the Rule dimension.
4. 7. 3 Subject to prior agreement and submission of the detailed welding procedure for approval by ACS, welding may be carried out prior to the final austenitising heat treatment.
4. 7. 4 Approval for welding will not be given in the following circumstances:
- For the rectification of repetitive defects caused by improper foundry technique or practice.
  - For the building up by welding of surfaces or large shallow depressions.
  - Where the carbon content of the steel exceeds 0.30 per cent.
  - Where the carbon equivalent of the steel, given by

$$C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15} \text{ exceeds } 0.65 \text{ per cent}$$

4. 7. 5 Provided that the Surveyors are satisfied that welding is justified, they may also authorise welding to the surfaces of crankwebs, following the final austenitising heat treatment, within the following limits:
- In general, the volume of the largest groove which is to be welded is not to exceed  $3.2t \text{ cm}^3$ , where  $t$  is the web axial thickness, in cm. The total volume of all grooves which are to be welded is not to exceed  $9.6t \text{ cm}^3$  per crankweb.
  - The welds do not extend within the cross-hatched zones marked on [Figure 4. 4. 3: Areas of semi-built crankthrows to which weld repairs are not permitted](#) for semi-built crankthrows.
  - Larger welds on balance weights may be permitted at the discretion of the Surveyor, provided that such repairs are wholly contained within the balance weight and do not affect the strength of the crankweb.
4. 7. 6 Subsequent to the final austenitising heat treatment, welding may be authorised in the surface of the bore for the journal (or pin) within the following limits:
- In general, the welds are to be not less than 125 mm apart.
  - The welds are not to be located within circumferential bands of  $\frac{t}{5}$  from the edges of the bores, nor at any position within the inner  $120^\circ$  arc of the bores, as cross-hatched on [Figure 4. 4. 3: Areas of semi-built crankthrows to which weld repairs are not permitted](#).
  - The volume of the largest weld is to be not more than  $1.1t \text{ cm}^3$ , where  $t$  is the web axial thickness at the bore, in cm, and not more than three welds are to be made in any one bore surface.

Figure 4. 4. 2: Ultrasonic examination acceptance levels

Figure 4. 4. 3: Areas of semi-built crankthrows to which weld repairs are not permitted

4. 7. 7 After all defective material has been removed from a region, and this has been proven in the presence of the Surveyor by magnetic particle inspection or other suitable method, the excavation is to be suitably shaped to allow good access for welding.

- 4. 7. 8 At the discretion of the Surveyor, the size of a groove may be increased beyond the limiting sizes given in [Ch 4, 4.7 Rectification of defective castings 4.7.5](#) or [Ch 4, 4.7 Rectification of defective castings 4.7.6](#), if the removal of further metal will facilitate welding.
- 4. 7. 9 Welding is to be carried out by approved welders using approved procedures. The welds are to be made by an electric arc process using low hydrogen type consumables which will produce a deposited metal that is not inferior in properties to the parent metal.
- 4. 7. 10 All castings are to be given a preliminary refining heat treatment prior to the commencement of welding. Before welding, the material is to be preheated in accordance with the qualified procedure. Where possible, preheating is to be carried out in a furnace. The preheat temperature is to be maintained until welding is completed, and preferably until the casting is placed in the furnace for post-weld heat treatment.
- 4. 7. 11 Where welding is carried out after the final austenitising heat treatments, a post-weld stress relieving heat treatment is to be applied at a temperature of not less than 600°C, *See also* [Ch 4, 1.5 Heat treatment 1.5.2](#).
- 4. 7. 12 Welds are to be dressed smooth by grinding. The surfaces of the welds and adjacent parent steel are to be proven by magnetic particle and, where appropriate, ultrasonic inspection, *See* [Ch 4, 1.9 Rectification and dressing of castings 1.9.14](#) and [Ch 4, 1.9 Rectification and dressing of castings 1.9.15](#).

## CHAPTER 4 Steel Castings

## SECTION 5 Castings for propellers

### 5.1 Scope

- 5.1.1 This Section gives the requirements for steel castings for one-piece propellers and separately cast blades and hubs for fixed pitch and controllable pitch propellers (CPP). These include contra-rotating propellers, azipods and azimuth thrusters. The requirements for copper alloy propellers, blades and hubs are given in [Ch 9, 1 Castings for propellers](#).
- 5.1.2 These castings are to be manufactured and tested in accordance with the appropriate requirements of [Ch 1 General Requirements](#) and [Ch 2 Testing Procedures for Metallic Materials](#) and [Ch 4, 1 General requirements](#) as well as the requirements of this Section.
- 5.1.3 Full details of the manufacturer's specification are to be submitted for approval. These should include the chemical composition, heat treatment, mechanical properties, microstructure and repair procedures.
- 5.1.4 Special requirements are given for castings which are intended for ice service in [Table 4. 5. 2: Typical mechanical properties for steel propeller castings](#).

### 5.2 Chemical composition

- 5.2.1 The chemical composition of ladle samples is to comply with the approved specification, See [Ch 4, 5.1 Scope 5.1.3](#).
- 5.2.2 Typical cast steel propeller alloys are given in [Table 4. 5. 1: Typical chemical composition for steel propeller castings](#).

**Table 4. 5. 1: Typical chemical composition for steel propeller castings**

| Alloy type  | C Max. (%) | Mn Max. (%) | Cr (%)      | Mo Max. (%)<br>(See Note) | Ni (%)     |
|---|------------|-------------|-------------|---------------------------|------------|
| Martensitic<br>(12Cr 1Ni)   | 0.15       | 2.0         | 11.5 – 17.0 | 0.5                       | Max. 2.0   |
| Martensitic<br>(13Cr 4Ni)   | 0.06       | 2.0         | 11.5 – 17.0 | 1.0                       | 3.5 – 5.0  |
| Martensitic<br>(16Cr 5Ni)   | 0.06       | 2.0         | 15.0 – 17.5 | 1.5                       | 3.5 – 6.0  |
| Austenitic<br>(19Cr 11Ni)   | 0.12       | 1.6         | 16.0 – 21.0 | 4.0                       | 8.0 – 13.0 |
| <b>Note</b> Minimum values are to be in accordance with the agreed specification or recognised National or International Standards. |            |             |             |                           |            |

### 5.3 Heat treatment

- 5.3.1 Martensitic stainless steel castings are to be austenitised, quenched and tempered in accordance with the approved specification, See [Ch 4, 5.1 Scope 5.1.3](#).
- 5.3.2 Austenitic stainless steel castings are to be solution treated in accordance with the approved specification, See [Ch 4, 5.1 Scope 5.1.3](#).

### 5.4 Mechanical tests

- 5.4.1 The test material is to be cast integral with the boss of propeller castings, or with the flange of separately cast propeller blades. Alternatively, the test material may be attached on blades in an area between 0.5 and 0.6R, where R is the radius of the propeller.
- 5.4.2 The test material is not to be removed from the casting until final heat treatment has been carried out. Removal is to be by non-thermal procedures.
- 5.4.3 At least one tensile test and for the martensitic stainless steel grades one set of three Charpy V-notch impact tests are to be made on material representing each casting. The results are to comply with the requirements of [Table 4. 5. 2: Typical mechanical properties for steel propeller castings](#) or the approved specification.

**Table 4. 5. 2: Typical mechanical properties for steel propeller castings**

| Alloy type  | Yield stress or, 0.2% proof stress minimum, N/mm <sup>2</sup> | Tensile strength minimum N/mm <sup>2</sup> | Elongation on 5.65 $\sqrt{S_0}$ % minimum | Reduction of area % minimum | Charpy impact minimum (See Notes 1 and 2) | V-notch tests J (See Notes 1 and 2) |
|---|---|--|---|-----------------------------|---|-------------------------------------|
| Martensitic (12Cr 1Ni)  | 440   | 590  | 15  | 30                          | 20  |                                     |
| Martensitic (13Cr 4Ni)  | 550   | 750  | 15  | 35                          | 30  |                                     |
| Martensitic (16Cr 5Ni)  | 540   | 760  | 15  | 35                          | 30  |                                     |
| Austenitic (19Cr 11Ni)  | 180 (See Note 3)  | 440  | 30  | 40                          | -   |                                     |
| <b>Note 1.</b> When a general service notation <b>Ice Class 1AS, 1A, 1B or 1C</b> is required, the tests are to be made at -10°C. |   |  |   |                             |   |                                     |
| <b>Note 2.</b> For general service or where the notation <b>Ice Class 1D</b> is required, the tests are to be made at 0°C.        |   |  |   |                             |   |                                     |
| <b>Note 3.</b> $R_{p1.0}$ value is 205 N/mm <sup>2</sup> .  |   |  |   |                             |   |                                     |

- 5.4.4 As an alternative to [Ch 4, 5.4 Mechanical tests 5.4.3](#), where a number of small propeller castings of about the same size, and less than 1 m in diameter, are made from one cast and heat treated together in the same furnace, a batch testing procedure may be adopted using separately cast test samples of suitable dimensions. At least one set of mechanical tests is to be provided for each multiple of five castings in the batch.
- 5.4.5 Separately cast test bars may be used subject to prior approval of the Surveyor. Test bars must be cast from the same heat, or heats, and must also be heat treated with castings they represent.

### 5.5 Non-destructive examination

- 5.5.1 On completion of machining and grinding, the whole surface of each casting is to be examined in accordance with [Ch 9, 1.8, Inspection and non-destructive examination](#).
- 5.5.2 When appropriate, magnetic particle inspection may be used in lieu of liquid penetrant testing.
- 5.5.3 Castings are to be free from cracks and hot tears.

## 5. 6 Rectification of defective castings

5. 6. 1 The rectification of defective castings is to be undertaken in accordance with [Ch 4, 1.9, Rectification and dressing of castings](#) and the following paragraphs.
5. 6. 2 Removal of defective material is to be by mechanical means, e.g. by grinding, chipping or milling. The resultant grooves are to be blended into the surrounding surface so as to avoid any sharp contours.
5. 6. 3 Grinding in severity zone A may be carried out to an extent that maintains the blade thickness. Repair by welding is generally not permitted in zone A and will only be allowed after special consideration.
5. 6. 4 Defects in severity zone B that are not deeper than  $t/40$  mm ( $t$  is the minimum local thickness according to the Rules) or 2 mm, whichever is the greater, are to be removed by grinding. Those defects that are deeper may be repaired by welding subject to prior approval of the Surveyor.
5. 6. 5 Repair welding is generally permitted in severity zone C.
5. 6. 6 Welds having an area of less than 5 cm<sup>2</sup> are to be avoided. The maximum surface area of repairs is to be in accordance with [Table 9. 1. 4: Permissible rectification of new propellers by welding](#) in Chapter 9.
5. 6. 7 Welding is to be in accordance with the approved specification, See [Ch 4, 5.1 Scope 5.1.3](#).
5. 6. 8 After weld repair, the propeller or blade is to be heat treated in such fashion as will minimise the residual stresses. For martensitic stainless steels, this will involve full heat treatment as specified in the approved specification.
5. 6. 9 ACS reserves the right to restrict the amount of repair work accepted from a manufacturer when it appears that repetitive defects are the result of improper foundry techniques or practices.
5. 6. 10 All welds are to be inspected by the appropriate NDE method, See [Ch 4, 1.7, Visual and non-destructive examination](#).

## 5. 7 Identification

5. 7. 1 Castings are to be clearly marked by the manufacturer in accordance with the requirements of [Ch 1 General Requirements](#). The following details are to be shown on all castings which have been accepted:
  - a. Identification mark which will enable the full history of the item to be traced.
  - b. Type of steel, this should include or allow identification of the chromium and nickel contents.
  - c. ACS or Asia Classification Society and the abbreviated name of Asia Classification Society's local office.
  - d. Personal stamp of Surveyor responsible for the final inspection.
  - e. ACS certificate number.
  - f. Skew angle, if in excess of 25°.
  - g. Ice class symbol, where applicable.
  - h. Date of final inspection.

## 5. 8 Certification of materials

5. 8. 1 In addition to the requirements in [Ch 4, 1.11 Certification of materials](#), the manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting:
  - a. Description of casting with drawing number.
  - b. Diameter, number of blades, pitch, direction of turning.
  - c. Skew angle, if in excess of 25°
  - d. Final mass.

|                |          |  |

- e. Vessel identification, where known.

CHAPTER **4 Steel Castings**SECTION **6 Castings for boilers, pressure vessels and piping systems****6. 1 Scope**

- 6. 1. 1 This Section gives the requirements for carbon-manganese and alloy steel castings for boilers, pressure vessels and piping systems for use at temperatures not lower than 0°C.
- 6. 1. 2 Where it is proposed to use alloy steels other than as given in this Section, details of the specification are to be submitted for approval. In such cases, the specified minimum tensile strength is not to exceed 600 N/mm<sup>2</sup>.
- 6. 1. 3 Castings which comply with these requirements are acceptable for liquefied gas piping systems where the design temperature is not lower than 0°C. Where the design temperature is lower than 0°C, and for other applications where guaranteed impact properties at low temperatures are required, the castings are to comply with the requirements of [Ch 4, 7 Ferritic steel castings for low temperature service](#) or [Ch 4, 8 Stainless steel castings](#).

**6. 2 Chemical composition**

- 6. 2. 1 The chemical composition of ladle samples is to comply with the limits specified in [Table 4. 6. 1: Chemical composition of steel castings for boilers, pressure vessels and piping systems](#).

**6. 3 Heat treatment**

- 6. 3. 1 Castings are to be supplied:
  - a. fully annealed; or
  - b. normalised; or
  - c. normalised and tempered; or
  - d. quenched and tempered.

**6. 4 Mechanical tests**

- 6. 4. 1 A tensile test is to be made on material representing each casting, unless a batch testing procedure has been agreed, *See* [Ch 4, 1.6, Test material and test specimens](#).
- 6. 4. 2 The tensile test is to be carried out at ambient temperature, and unless agreed otherwise with the Surveyor the results are to comply with the requirements of [Table 4. 6. 2: Mechanical properties for acceptance purposes: steel castings for boilers, pressure vessels and piping systems](#).

**Table 4. 6. 1: Chemical composition of steel castings for boilers, pressure vessels and piping systems**

| Type of steel   | Chemical composition %            |                              |  |                                  |                                  |   |

6. 4. 3 Where it is proposed to use a carbon-manganese steel with a specified minimum tensile strength intermediate to those given in this Section, corresponding minimum values for the yield stress, elongation and reduction of area may be obtained by interpolation.
6. 4. 4 Carbon-manganese steels with a specified minimum tensile strength of greater than 490 N/mm<sup>2</sup>, but not exceeding 520 N/mm<sup>2</sup>, may be accepted provided that details of the proposed specification are submitted for approval.

## 6. 5 Non-destructive examination

6. 5. 1 The non-destructive examination of castings is to be carried out in accordance with the appropriate requirements of [Ch 4, 1.7 Visual and non-destructive examination 1.7.7](#) to [Ch 4, 1.7 Visual and non-destructive examination 1.7.11](#) and additionally as agreed between the manufacturer, purchaser and Surveyor.

## 6. 6 Mechanical properties for design purposes

6. 6. 1 Nominal values for the minimum lower yield or 0.2 per cent proof stress at temperatures of 100°C and higher are given in [Table 4. 6. 3: Mechanical properties for design purposes \(See 6.6.1\)](#). These values are intended for design purposes only, and verification is not required except for materials complying with National or proprietary specifications where the elevated temperature properties used for design purposes are higher than those given in [Table 4. 6. 3: Mechanical properties for design purposes \(See 6.6.1\)](#).
6. 6. 2 In such cases, at least one tensile test at the proposed design or other agreed temperature is to be made on each casting or each batch of castings. The test specimen is to be taken from material adjacent to that used for tests at ambient temperature, and the test procedure is to be in accordance with the requirements of [Ch 2 Testing Procedures for Metallic Materials](#). The results of all tests are to comply with the requirements of the National or proprietary specification.
6. 6. 3 Values for the estimated average stress to rupture in 100 000 hours are given in [Table 4. 6. 4: Mechanical properties for design purposes \(See 6.6.3\): estimated average stresses to rupture in 100000 hours \(N/mm<sup>2</sup>\)](#) and may be used for design purposes.

**Table 4. 6. 4: Mechanical properties for design purposes (See 6.6.3): estimated average stresses to rupture in 100000 hours (N/mm<sup>2</sup>)**

| Temperature °C | Type of steel |          |            |                |

CHAPTER 4 **Steel Castings**SECTION 7 **Ferritic steel castings for low temperature service****7.1 Scope**

- 7.1.1 This Section gives the requirements for castings in carbon-manganese and nickel alloy steels intended for use in liquefied gas piping systems where the design temperature is lower than 0°C, and for other applications where guaranteed impact properties at low temperatures are required.
- 7.1.2 Where it is proposed to use alternative steels, particulars of the specified chemical composition, mechanical properties and heat treatment are to be submitted for approval.

**7.2 Chemical composition**

- 7.2.1 The chemical composition of ladle samples is to comply with the limits specified in [Table 4.7.1: Chemical composition of ferritic steel castings for low temperature service](#). Carbon-manganese steels are to be made by fine grain practice.

**Table 4.7.1: Chemical composition of ferritic steel castings for low temperature service**

| Type of steel    | Chemical composition % |         |           |        |        |           |                        |
|------------------|------------------------|---------|-----------|--------|--------|-----------|------------------------|
|                  | C max.                 | Si max. | Mn        | S max. | P max. | Ni        | Residual elements max. |
| Carbon-manganese | 0.23                   | 0.60    | 0.70-1.60 | 0.030  | 0.030  | 0.80 max. | Cr 0.25                |
| 2 1/4Ni          | 0.25                   | 0.60    | 0.50-0.80 | 0.025  | 0.030  | 2.00-3.00 | Cu 0.30                |
| 3 1/2Ni          | 0.15                   | 0.60    | 0.50-0.80 | 0.020  | 0.025  | 3.00-4.00 | Mo 0.15                |
|                  |                        |         |           |        |        |           | V 0.03                 |
|                  |                        |         |           |        |        |           | Total 0.60             |

**7.3 Heat treatment**

- 7.3.1 Castings are to be supplied:
- normalised; or
  - normalised and tempered; or
  - quenched and tempered.

## 7.4 Mechanical tests

- 7.4.1 One tensile test and one set of three Charpy V-notch impact test specimens are to be prepared from material representing each casting or batch of castings.
- 7.4.2 The tensile test is to be carried out at ambient temperature, and the results are to comply with the appropriate requirements given in [Table 4.7.2: Mechanical properties for acceptance purposes: ferritic steel castings for low temperature service](#).
- 7.4.3 The average value for impact test specimens is to comply with the appropriate requirements given in [Table 4.7.2: Mechanical properties for acceptance purposes: ferritic steel castings for low temperature service](#). One individual value may be less than the required average value provided that it is not less than 70 per cent of this average value. See [Ch 2, 1.4, Re-testing procedures](#) for re-test procedure.

**Table 4.7.2: Mechanical properties for acceptance purposes: ferritic steel castings for low temperature service**

| Type of steel  | Grade | Yield stress<br>N/mm <sup>2</sup><br>minimum | Tensile strength<br>N/mm <sup>2</sup> | Elongation on<br>$5.65\sqrt{S_0}$ %<br>minimum | Reduction of area %<br>minimum | Charpy V-notch impact test |                             |
|--|-------|--|---------------------------------------|--|--------------------------------|----------------------------|-----------------------------|
|  |       |  |                                       |  |                                | Test temperature<br>°C     | Average energy J<br>minimum |
| Carbon-manganese   | 400   | 200  | 400-550                               | 25   | 40                             |                            |                             |
|  | 430   | 215  | 430-580                               | 23   | 35                             | –60(See Note)              | 27                          |
|  | 460   | 230  | 460-610                               | 22   | 30                             |                            |                             |
| 2 <sup>1</sup> / <sub>4</sub> Ni   | 490   | 275  | 490-640                               | 20   | 35                             | –70                        | 34                          |
| 3 <sup>1</sup> / <sub>2</sub> Ni   | 490   | 275  | 490-640                               | 20   | 35                             | –95                        | 34                          |
| <b>Note</b> The test temperature for carbon-manganese steels may be 5°C below the design temperature if the latter is above –55°C, with a maximum test temperature of –20°C. |       |  |                                       |  |                                |                            |                             |

## 7.5 Non-destructive examination

- 7.5.1 The non-destructive examination of castings is to be carried out in accordance with the appropriate requirements of [Ch 4, 1.7 Visual and non-destructive examination 1.7.7](#) to [Ch 4, 1.7 Visual and non-destructive examination 1.7.11](#), and additionally agreed between the manufacturer, purchaser and Surveyor.

CHAPTER 4 **Steel Castings**SECTION 8 **Stainless steel castings****8.1 Scope**

- 8.1.1 This Section gives the requirements for castings in austenitic and duplex stainless steels for machinery, marine structures, piping systems in ships for liquefied gases, and in bulk chemical tankers.
- 8.1.2 Austenitic stainless steels castings are suitable for applications where the lowest design temperature is not lower than  $-165^{\circ}\text{C}$ .
- 8.1.3 Duplex stainless steels castings are suitable for applications where the lowest design temperature is above  $0^{\circ}\text{C}$ . Any requirement to use duplex stainless steels castings below  $0^{\circ}\text{C}$  will be subject to special consideration.
- 8.1.4 Where it is proposed to use alternative steels, particulars of the specified chemical composition, mechanical properties and heat treatment are to be submitted for approval.

**8.2 Chemical composition**

- 8.2.1 The chemical composition of ladle samples is to comply with the requirements given in [Table 4.8.1: Chemical composition of stainless steel castings](#).

**8.3 Heat treatment**

- 8.3.1 Austenitic stainless steel castings are to be solution treated at a temperature of not less than  $1000^{\circ}\text{C}$  and cooled rapidly in water.
- 8.3.2 Duplex stainless steels castings are to be solution treated at a temperature of not less than  $1100^{\circ}\text{C}$  and cooled rapidly in water.

**8.4 Mechanical tests**

- 8.4.1 One tensile test specimen is to be prepared from material representing each casting or batch of castings. In addition, where the castings are intended for liquefied gas applications, where the design temperature is lower than  $-55^{\circ}\text{C}$ , one set of three Charpy V-notch impact test specimens is to be prepared.

**Table 4.8.1: Chemical composition of stainless steel castings**

| Type of steel | Chemical composition % |    |    |   |   |    |    |    |        |
|---------------|------------------------|----|----|---|---|----|----|----|--------|
|               | C                      | Si | Mn | S | P | Cr | Mo | Ni | Others |

|--|--|---|---|--------------------------------|----------------------------|--------------------------|
|  |  |   |   |                                | Test temperature °C        | Average energy J minimum |
| Austenitic   |  |   |   |                                |                            |                          |
| 304L   | 430  | 215   | 26  | 40                             | −196                       | 41                       |
| 304  | 480  | 220   |   |                                |                            |                          |
| 316L   | 430  | 215   | 26  | 40                             | −196                       | 41                       |
| 316  | 480  | 220   |   |                                |                            |                          |
| 317  | 480  | 240   |   |                                |                            |                          |
| 347  | 480  | 215   | 22  | 35                             | −196                       | 41                       |
| Duplex   |  |   |   |                                |                            |                          |
| UNS J 92205<br>(See Note)  | 600  | 420   | 20  | 35                             | 0                          | 41                       |
| <b>Note</b> The grade UNS J 92205 is the cast equivalent of UNS S 31803. |  |   |   |                                |                            |                          |

- 8. 4. 2 The tensile test is to be carried out at ambient temperature, and the results are to comply with the requirements given in [Table 4. 8. 2: Mechanical properties for acceptance purposes: austenitic stainless steel castings](#).
- 8. 4. 3 The average value for impact test specimens is to comply with the appropriate requirements given in [Table 4. 8. 2: Mechanical properties for acceptance purposes: austenitic stainless steel castings](#). One individual value may be less than the required average value provided that it is not less than 70 per cent of this average value. See [Ch 2, 1.4, Re-testing procedures](#) for re-test procedures.

## 8. 5 Corrosion tests

- 8. 5. 1 Where corrosive conditions are anticipated in service, for grades 304, 316 and 317, intergranular corrosion tests are required in accordance with [Ch 2, 9.1 Intergranular corrosion test](#). Such tests may also be required for grades 304L, 316L and 347.
- 8. 5. 2 Where corrosive conditions are anticipated in service, for duplex stainless pitting corrosion tests are required in accordance with [Ch 2, 9.2 Pitting corrosion test](#) . For UNS J 92205 the test temperature is to be 20°C.

## 8. 6 Non-destructive examination

- 8. 6. 1 The non-destructive examination of castings is to be carried out in accordance with the appropriate requirements of [Ch 4, 1.7 Visual and non-destructive examination 1.7.7](#) to [Ch 4, 1.7 Visual and non-destructive examination 1.7.11](#) and additionally agreed between the manufacturer, purchaser and Surveyor.

CHAPTER 4 **Steel Castings**SECTION 9 **Steel castings for container corner fittings****9.1 General**

- 9.1.1 This Section gives the requirements for cast steel corner fittings used in the fabrication of freight and tank containers. The fittings are also to comply with the requirements of the latest edition of International Standard ISO 1161.
- 9.1.2 The castings are to be made in foundries approved by ACS. These foundries are also to be specially approved for the manufacture of container corner castings. In order to comply with these requirements, the manufacturer is required to verify that the casting soundness, mechanical properties, weldability and dimensional tolerances required by this Section and the manufacturing specification are met.
- 9.1.3 Castings may be released on the basis of an ACS survey or, alternatively, the manufacturer may be approved by means of a Quality Assurance Scheme as detailed in [Ch 1, 2 Approval and survey requirements](#).

**9.2 Chemical composition**

- 9.2.1 Chemical analysis is to be carried out on each cast.
- 9.2.2 The chemical composition of the ladle samples is to comply with the limits given in [Table 4.9.1: Chemical composition of steel castings for container corner fittings](#).
- 9.2.3 The carbon equivalent

$$Ceq = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15} \%$$

must not exceed 0.45 per cent.

**9.3 Heat treatment**

- 9.3.1 Castings are to be supplied either :
  - a. normalised; or
  - b. water or oil quenched and tempered at a temperature of not less than 550°C.

**9.4 Mechanical tests**

- 9.4.1 At least one tensile test is to be made on each batch of castings, using separately cast test bars which are to be from the same cast and heat treatment lot as the castings they represent.

**Table 4. 9. 1: Chemical composition of steel castings for container corner fittings**

| Chemical composition %  |                 |            |           |           |            |            |            |            |  |                      |
|---|-----------------|------------|-----------|-----------|------------|------------|------------|------------|--|----------------------|
| C<br>max.   | Mn              | Si<br>max. | P<br>max. | S<br>max. | Cr<br>max. | Ni<br>max. | Cu<br>max. | Mo<br>max. | Al acid<br>soluble<br>min.<br>(See<br>Notes) | Cr +Ni+Cu+Mo<br>max. |
| 0.20  | 0.90 to<br>1.50 | 0.50       | 0.035     | 0.035     | 0.25       | 0.30       | 0.20       | 0.08       | 0.015  | 0.70                 |
| <p><b>Note 1.</b> The total aluminium content may be determined instead of the acid soluble content. In such cases, the total aluminium content is to be not less than 0.02%.</p> <p><b>Note 2.</b> Aluminium may be replaced partly or totally by other grain refining elements as stated in the approved specification.</p> |                 |            |           |           |            |            |            |            |  |                      |

9. 4. 2 The results of the tensile tests are to comply with the following:

Yield stress                      220 N/mm<sup>2</sup> min.

Tensile strength              430 - 600 N/mm<sup>2</sup>

Elongation on  $\sqrt{S_0}$       25% min.

Reduction of area          40% min.

9. 4. 3 Impact tests are not required on all casts but may be required on a random basis at the discretion of the Surveyor.
9. 4. 4 When required, the impact test specimens are to be tested in accordance with [Ch 1, 4.5 Mechanical tests](#) and [Ch 2, 3.2, Testing procedures](#). In general, tests are to be made at a temperature of -20°C and the minimum average energy obtained is to be 27J.

## 9. 5 Non-destructive examination

9. 5. 1 Ultrasonic or radiographic testing is to be carried out, in accordance with [Ch 4, 1.7 Visual and non-destructive examination 1.7.10](#) or [Ch 4, 1.7 Visual and non-destructive examination 1.7.11](#) respectively, on at least one casting from each cast or from every 400 castings, whichever is the lesser.

## 9. 6 Repair of defects

9. 6. 1 Minor defects may be removed by grinding provided that the allowable minus tolerance is not exceeded.
9. 6. 2 Defects which exceed the allowable minus tolerance may be removed by grinding or chipping followed by welding, provided the weld depth does not exceed 40 per cent of the wall thickness and that the following requirements are met:
- welding is not to be carried out in the as-cast condition; the grain structure has to be refined by heat treatment,
  - the casting is to be preheated to 80 - 100 °C,
  - welding is to be performed only by qualified welders in accordance with a qualified welding procedure,
  - all welded castings are to be post-weld heat treated at a temperature not less than 550°C,

- e. the welded areas are to be ground or machined flush with the adjacent surface and inspected by magnetic particle or dye penetrant examination as appropriate.

## 9. 7 Identification

- 9. 7. 1 Each casting is to be clearly marked by the manufacturer with at least the following:
  - a. manufacturer's name or trade mark,
  - b. cast number or identification number which will enable the full history of the casting to be traced.
- 9. 7. 2 Where the casting has been inspected and found acceptable it is to be marked with the Surveyor's personal stamp.
- 9. 7. 3 The markings may be stamped or cast on the inner surface of the casting.

## 9. 8 Certification of materials

- 9. 8. 1 For each consignment an ACS certificate, *See [Ch 1, 3.1, General](#)*, is to be issued for castings made under ACS survey or alternatively a manufacturer's certificate is to be issued containing at least the following:
  - a. Purchaser's name and order number.
  - b. Grade of steel.
  - c. Drawing and/or specification number.
  - d. Cast number and chemical composition.
  - e. Details of the heat treatment.
  - f. Number and weight of the castings.
  - g. Results of inspections and mechanical tests.*See ([Ch 1, 3.1, General](#))*, for manufacturers approved under a Quality Assurance Scheme.

**CHAPTER 5 Steel Forgings****SECTION 1 General requirements****1.1 Scope**

- 1.1.1 This Section gives the general requirements for steel forgings intended for use in the construction of ships, other marine structures, machinery, boilers, pressure vessels and piping systems. These requirements are also applicable to rolled slabs and billets used as a substitute for forgings and to rolled bars used for the manufacture (by machining operations only) of shafts, bolts, studs and other components of similar shape.
- 1.1.2 When required by the relevant Rules dealing with design and construction, forgings are to be manufactured and tested in accordance with [Ch 1 General Requirements](#) and [Ch 2 Testing Procedures for Metallic Materials](#), together with the general requirements given in this Section and the appropriate specific requirements given in Sections [Ch 5, 2 Forgings for ship and other structural applications](#) to [Ch 5, 9 Stainless steel forgings](#).
- 1.1.3 As an alternative to [Ch 5, 1.1 Scope 1.1.2](#), steel forgings which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Chapter or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of [Ch 1 General Requirements](#).
- 1.1.4 Normalised forgings with mass up to 1000 kg each may be batch tested. A batch is to consist of forgings of similar shape and dimensions, made from the same steel-making heat, heat treated together and with a total mass not exceeding 6 tonnes.
- 1.1.5 Quenched and tempered forgings with mass up to 500 kg each may be batch tested. A batch is to consist of forgings of similar shape and dimensions, made from the same steel-making heat, heat treated together in the same furnace and with a total mass not exceeding 3 tonnes.
- 1.1.6 A batch testing procedure may also be used for hot rolled bars, See [Ch 5, 3.4 Mechanical tests 3.4.3](#).
- 1.1.7 Where small forgings are produced in large quantities, or where forgings of the same type are produced in regular quantities, alternative survey procedures in accordance with [Ch 1, 2.4 Materials Quality Scheme](#) may be adopted.

**1.2 Manufacture**

- 1.2.1 Forgings are to be made at works which have been approved by Asia Classification Society (hereinafter referred to as ACS). The steel used is to be manufactured in accordance with the requirements of [Ch 3, 1.4 Manufacture](#).
- 1.2.2 When forgings are made directly from ingots, or from blooms or billets forged from ingots, the ingots are to be cast in chill moulds with the larger cross-section uppermost and with efficient feeder heads.

1. 2. 3 Adequate top and bottom discards are to be made to ensure freedom from piping and harmful segregations in the finished forgings.
1. 2. 4 The forgings are to be gradually and uniformly hot worked and are to be formed as closely as possible to the finished shape and size. The plastic deformation is to be such as to ensure soundness, uniformity of structure and satisfactory mechanical properties after heat treatment.
1. 2. 5 For certain components, such as crankshafts, where grain flow is required in the most favourable direction having regard to the mode of stressing in service, the proposed method of manufacture may require special approval by ACS. In such cases, tests may be required to demonstrate that a satisfactory structure and grain flow are obtained.
1. 2. 6 The reduction ratio (reduction of area expressed as a ratio) is to be calculated with reference to the average cross-sectional area of the ingot or continuously cast material, where appropriate. Where an ingot is initially upset, this reference area may be taken as the average cross-sectional area after this operation.
1. 2. 7 For components forged directly from ingots or from forged blooms or billets, and in which the fibre deformation is mainly longitudinal, the reduction ratio is not to be less than 3:1.
1. 2. 8 For forgings made from rolled billets, or where fibre deformation has taken place in more than one direction, the reduction ratio is not to be less than 4:1.
1. 2. 9 Where rolled bars are used as a substitute for forgings and the requirements of [Ch 5, 1.2 Manufacture 1.2.2](#) are not complied with, the reduction ratio is to be not less than 6:1 unless otherwise accepted by the ACS Surveyor.
1. 2. 10 Where the length of any section of a shaft forging is less than its diameter (e.g. a collar), the reduction ratio is to be not less than half that given in [Ch 5, 1.2 Manufacture 1.2.7](#), [Ch 5, 1.2 Manufacture 1.2.8](#) or [Ch 5, 1.2 Manufacture 1.2.9](#) respectively.
1. 2. 11 Disc type forgings, such as gear wheels, are to be made by upsetting, and the thickness of any part of the disc is to be not more than one-half of the length of the billet from which it was formed, provided that this billet has received an initial forging reduction of not less than 1.5:1. Where the piece used has been cut directly from an ingot, or where the billet has received an initial reduction of less than 1.5:1, the thickness of any part of the disc is to be not more than one-third of the length of the original piece.
1. 2. 12 Rings and other types of hollow forgings are to be made from pieces cut from ingots or billets and which have been suitably punched, bored or trepanned prior to expanding or hollow forging. Alternatively, pieces from hollow cast ingots may be used. The wall thickness of the forging is to be not more than one-half of the thickness of the prepared hollow piece from which it was formed. Where this is not practicable, the forging procedure is to be such as to ensure that adequate work is given to the piece prior to punching, etc. This may be either longitudinal or upset working of not less than 2:1.
1. 2. 13 The shaping of forgings or rolled slabs and billets by flame cutting, scarfing or arc-air gouging is to be undertaken in accordance with recognised good practice and, unless otherwise approved, is to be carried out before the final heat treatment. Preheating is to be employed where necessitated by the composition and/or thickness of the steel. For certain components, subsequent machining of all flame cut surfaces may be required, See [Ch 5, 4.2 Manufacture 4.2.4](#).
1. 2. 14 Where two or more forgings are joined by welding to form a composite component, details of the proposed welding procedure are to be submitted for approval. Welding approval procedure tests may be required.

### 1. 3 Quality

1. 3. 1 All forgings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

## 1. 4 Chemical composition

1. 4. 1 All forgings are to be made from killed steels, and the chemical composition of ladle samples is to comply with the requirements detailed in subsequent Sections in this Chapter. Where general overall limits are specified, the chemical composition selected is to be appropriate for the type of steel, dimensions and required mechanical properties of the forgings being manufactured.
1. 4. 2 Except where otherwise specified, suitable grain refining elements such as aluminium, niobium or vanadium may be used at the discretion of the manufacturer. The content of such elements is to be reported in the ladle analysis.
1. 4. 3 For alloy steel forgings, the chemical composition of ladle samples is to generally comply with the following overall limits and the requirements of the approved specifications:

Carbon        0.45% max.

Silicon        0.45% max.

Manganese    0.30% min.

Sulphur       0.035% max.

Phosphorus    0.035% max.

Copper        0.30% max.

And at least one of the following elements to comply with the minimum content:

Chromium      0.40% min.

Molybdenum   0.15% min.

Nickel         0.40% min.

The contents of all alloying elements and significant impurities detailed in the specification are to be reported.

## 1. 5 Heat treatment

1. 5. 1 At an appropriate stage of manufacture, after completion of all hot working operations, forgings are to be suitably heat treated to refine the grain structure and to obtain the required mechanical properties. Acceptable heat treatment procedures are to be such as to avoid the formation of hair-line cracks and are detailed in Sections [Ch 5, 2 Forgings for ship and other structural applications](#) to [Ch 5, 9 Stainless steel forgings](#).
1. 5. 2 Heat treatment is to be carried out in a properly constructed furnace which is efficiently maintained and has adequate means of temperature control. The furnace dimensions are to be such as to allow all the steel forgings to be uniformly heated to the necessary temperature. In the case of very large forgings, alternative methods of heat treatment will be specially considered. Sufficient thermocouples are to be connected to the steel forging(s) in the furnace to show that the temperature is adequately uniform and the temperatures are to be recorded throughout the heat treatment. Copies of these records are to be presented to the Surveyor together with a sketch showing the positions at which the temperature measurements were carried out. The records are to identify the furnace that was used and give details of the steel-making heat, the heat treatment temperature, time at temperature and the date. The Surveyor is to examine the charts and confirm the details on the certificate. Alternative procedures are to be approved by ACS's Materials and NDE Department.
1. 5. 3 Where forgings are to be quenched and tempered and cannot be hot worked close to size and shape, they are to be suitably rough machined or flame cut prior to being subjected to this treatment.

- 1. 5. 4 If for any reason a forging is subsequently heated for further hot working, the forging is to be reheat treated.
- 1. 5. 5 If any straightening operation is performed after the final heat treatment, consideration should be given to a subsequent stress relieving heat treatment in order to avoid the possibility of harmful residual stresses.
- 1. 5. 6 Where it is intended to surface harden forgings, full details of the proposed procedure and specification are to be submitted for approval. For the purposes of this approval, the manufacturer will be required to demonstrate by tests that the proposed procedure gives a uniform surface layer of the required hardness and depth and that it does not impair the soundness and properties of the steel.
- 1. 5. 7 Where induction hardening or nitriding is to be carried out after machining, forgings are to be heat treated at an appropriate stage to a condition suitable for this subsequent surface hardening.
- 1. 5. 8 Where carburising is to be carried out after machining, forgings are to be heat treated at an appropriate stage (generally either by full annealing or by normalising and tempering) to a condition suitable for subsequent machining and carburising.
- 1. 5. 9 The forge is to maintain records of heat treatment identifying the furnace used, furnace charge, thermocouple location, date, temperature and time at temperature. The records are to be presented to the Surveyor on request.

## 1. 6 Test material

- 1. 6. 1 Test material, sufficient for the required tests and for possible re-test purposes, is to be provided with a cross-sectional area of not less than that part of the forging which it represents. This test material is to be integral with each forging, except in the case of small forgings which are batch tested, *See [Ch 5, 1.6 Test material 1.6.4](#)*.
- 1. 6. 2 Where a forging is subsequently divided into a number of components, all of which are heat treated together in the same furnace, for test purposes this may be regarded as one forging and the number of tests required is to be related to the total length and mass of the original multiple forging, *See [Ch 5, 2.4 Mechanical tests 2.4.2](#)*.
- 1. 6. 3 Except for components which are to be carburised, test material is not to be cut from a forging until the heat treatment detailed in [Ch 5, 2 Forgings for ship and other structural applications](#) to [Ch 5, 9 Stainless steel forgings](#) has been completed. The testing procedure for components which are to be carburised is to be in accordance with the details given in [Ch 5, 5 Forgings for gearing](#).
- 1. 6. 4 Where a number of small forgings of about the same size are made from one cast and heat treated together in the same furnace, batch testing procedures (*See [Ch 5, 1.1 Scope 1.1.4](#)*) may be adopted using one of the forgings for test purposes, or alternatively using separately forged test samples. These test samples are to have a forging reduction similar to that used for the forgings which they represent. They are to be properly identified and heat treated together with the forgings.

## 1. 7 Mechanical tests

- 1. 7. 1 Specimens for mechanical tests are to be prepared as required by [Ch 5, 2 Forgings for ship and other structural applications](#) to [Ch 5, 9 Stainless steel forgings](#).
- 1. 7. 2 Test specimens are normally to be cut with their axes either mainly parallel (longitudinal test) or mainly tangential (tangential test) to the principal axial direction of each product.
- 1. 7. 3 Unless otherwise agreed, the longitudinal axis of the test specimens is to be positioned as follows:
  - a. for thickness or diameter  $\leq 50$  mm, the axis is to be at the mid-thickness or the centre of the cross section;

- b. for thickness or diameter > 50 mm, the axis is to be at one quarter thickness (mid-radius) or 80 mm, whichever is less, below any heat treated surface;

Test pieces shall be taken in such a way that no part of the gauge length is machined from material closer than 12.5 mm to any heat treated surface. For impact testing, this requirement is to apply to the complete test piece.

- 1. 7. 4 Tensile test specimens are to be machined to the dimensions detailed in [Ch 2 Testing Procedures for Metallic Materials](#). Where this is precluded by the dimensions of the forging, the test specimen is to be of the largest practicable cross-sectional area.
- 1. 7. 5 Impact test specimens are to be prepared in accordance with the requirements of [Ch 2 Testing Procedures for Metallic Materials](#).
- 1. 7. 6 The procedures used for the tensile and impact tests are to be in accordance with the requirements of [Ch 2 Testing Procedures for Metallic Materials](#).
- 1. 7. 7 Hardness tests, preferably of the Brinell type, are to be carried out when specified in subsequent Sections in this Chapter.

## 1. 8 Visual and non-destructive examination

- 1. 8. 1 Before acceptance, all forgings are to be presented to the Surveyor for visual examination. Where applicable, this is to include the examination of internal surfaces and bores.
- 1. 8. 2 Forgings are to be examined in the condition for final delivery. Surfaces are to be clean and free from dirt, grease, paint, etc. Black forgings are to be suitably descaled by either shotblasting or flame descaling methods.
- 1. 8. 3 All forgings are to be free of cracks, crack-like indications, laps, seams, folds, or other injurious indications. At the request of the Surveyor, additional magnetic particle, dye penetrant and ultrasonic testing may be required for a more detailed evaluation of surface irregularities.
- 1. 8. 4 When specified in subsequent Sections in this Chapter, or by an approved procedure for welding composite components, See [Ch 5, 1.2 Manufacture 1.2.14](#), appropriate non-destructive examination is also to be carried out before acceptance. All tests are to be carried out in accordance with the requirements of [Ch 1, 5 Non-destructive examination](#).
- 1. 8. 5 Magnetic particle and dye penetrant testing is to be carried out when the forgings are in the finished machined condition, See also [Ch 1, 2.3 Materials Survey Scheme 2.3.5](#). For magnetic particle testing, attention is to be paid to the contact between the forging and the clamping devices of stationary magnetisation benches in order to avoid local overheating or burning damage on its surface. Prods are not permitted on finished machined items. Unless otherwise agreed, these tests are to be carried out in the presence of the Surveyor.
- 1. 8. 6 The following definitions apply to indications associated with magnetic particle and dye penetrant inspection:
  - a. **Linear indication.** An indication in which the length is at least three times the width.
  - b. **Nonlinear indication.** An indication of circular or elliptical shape with a length less than three times the width.
  - c. **Aligned indication.** Three or more indications in a line, separated by 2 mm or less edge-to-edge.
  - d. **Open indication.** An indication visible after removal of the magnetic particles or that can be detected by the use of contrast dye penetrant.
  - e. **Non-open indication.** An indication that is not visually detectable after removal of the magnetic particles or that cannot be detected by the use of contrast dye penetrant.
  - f. **Relevant indication.** An indication that is caused by a condition or type of discontinuity that requires evaluation. Only indications which have any dimension greater than 1.5 mm are to be considered relevant.

- 1. 8. 7 Acceptance standards for defects found by visual or non destructive examinations are to be in accordance with any specific requirements of the approved plan, and with equivalence to any additional requirements of this Chapter. In all cases they are to be to the satisfaction of the Surveyor.
- 1. 8. 8 Where required, ultrasonic examination is to be carried out after the forgings have been machined to a condition suitable for this type of examination and after the final heat treatment. Both radial and axial scanning are to be carried out where appropriate for the shape and the dimensions of the forgings being examined. Scanning is to take into account near surface examination. Unless otherwise agreed, examinations are to be carried out by the manufacturer, although Surveyors may request to be present in order to verify that the examination is being carried out in accordance with the agreed procedure.
- 1. 8. 9 If the forging is supplied in the black condition for machining at a separate works, the manufacturer is to ensure that a suitable ultrasonic examination is carried out to verify the internal quality of the forging.
- 1. 8. 10 In the circumstance detailed in either [Ch 5, 1.8 Visual and non-destructive examination 1.8.8](#) or [Ch 5, 1.8 Visual and non-destructive examination 1.8.9](#), the manufacturer is to provide the Surveyor with a signed report confirming that ultrasonic examination has been carried out and that such inspection has not revealed any significant internal defects.
- 1. 8. 11 Unless otherwise agreed, the accuracy and verification of dimensions are the responsibility of the manufacturer.
- 1. 8. 12 In the event of any forging proving defective during subsequent machining or testing, it is to be rejected notwithstanding any previous certification.
- 1. 8. 13 When required by the conditions of approval for surface hardened forgings (See [Ch 5, 1.5 Heat treatment 1.5.6](#)) additional test samples are to be processed at the same time as the forgings which they represent. These test samples are subsequently to be sectioned in order to determine the hardness, shape and depth of the locally hardened zone and which are to comply with the requirements of the approved specification.

## 1. 9 Rectification of defects

- 1. 9. 1 Small surface imperfections may be removed by grinding or by chipping and grinding. Complete elimination of these imperfections is to be proved by magnetic particle or dye penetrant examination (as appropriate to the material). At the discretion of the Surveyor, the resulting shallow grooves or depressions can be accepted, provided that they are blended by grinding.
- 1. 9. 2 Repairs by welding are not generally permitted, but special consideration will be given to such repairs where they are of a minor nature and in areas of low working stresses. In such cases, full details of the proposed repair and subsequent inspection procedures are to be submitted for review by the Surveyors prior to the commencement of the proposed rectification. A report and/or sketch detailing the extent and location of all repairs, together with details of the post-weld heat treatment and non-destructive examination are to be provided for record purposes and are to be attached to the certificate.
- 1. 9. 3 Repair welding is not permitted for crankshafts or similar rotating components.
- 1. 9. 4 Where fabrication welding is involved, See [Ch 5, 1.2 Manufacture 1.2.14](#), any repair of defects is to be carried out in accordance with the approved welding procedure.
- 1. 9. 5 The forging manufacturer is to maintain records of repairs and subsequent inspections traceable to each forging. The records are to be presented to the Surveyor on request.
- 1. 9. 6 Non-open indications evaluated as segregation are acceptable.

## 1. 10 Identification

1. 10. 1 The manufacturer is to adopt a system of identification, which will enable all finished forgings to be traced to the original cast, forging process and heat treatment batch, and the Surveyor is to be given full facilities for so tracing the castings when required.
1. 10. 2 Forgings are to be clearly marked by the manufacturer in accordance with the requirements of [Ch 1 General Requirements](#). The following details are to be shown on all forgings which have been accepted:
  - a. Identification number, cast number or other marking which will enable the full history of the forging to be traced.
  - b. ACS or Asia Classification Society and the abbreviated name of ACS's.
  - c. Personal stamp of Surveyor responsible for inspection.
  - d. Test pressure, where applicable.
  - e. Date of final inspection.
1. 10. 3 Modified arrangements for the identification of small forgings manufactured in large numbers, as with closed-die forgings may be agreed with the Surveyor.

## 1. 11 Certification of materials

1. 11. 1 A ACS certificate is to be issued, *See* [Ch 1, 3.1, General](#).
1. 11. 2 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each forging or batch of forgings which has been accepted:
  - a. Purchaser's name and order number.
  - b. Description of forgings and steel quality.
  - c. Identification number.
  - d. Steel-making process, cast number and chemical analysis of ladle samples.
  - e. General details of heat treatment.
  - f. Results of mechanical tests.
  - g. Test pressure, where applicable.
1. 11. 3 As a minimum, the chemical composition of ladle samples is to include the content of all the elements detailed in the specific requirements.
1. 11. 4 Where applicable, the manufacturer is also to provide a signed report regarding ultrasonic examination as required by [Ch 5, 1.8 Visual and non-destructive examination 1.8.8](#), a report of magnetic particle inspection and a statement and/or sketch detailing all repairs by welding as required by [Ch 5, 1.9 Rectification of defects 1.9.2](#).
1. 11. 5 When steel is not produced at the works at which it is forged, a certificate is to be supplied by the steelmaker stating the process of manufacture, cast number and the chemical composition of ladle samples. The works at which the steel was produced is to have been approved by ACS, *See* [Ch 5, 1.4 Chemical composition 1.4.3](#).

## PART

**2**CHAPTER **5 Steel Forgings**SECTION **2 Forgings for ship and other structural applications****2. 1 Scope**

2. 1. 1 This Section gives the specific requirements for carbon-manganese steel forgings intended for ship and other structural applications such as rudder stocks, pintles, etc.
2. 1. 2 Where it is proposed to use an alloy steel, particulars of the chemical composition, mechanical properties and heat treatment are to be submitted for approval, See [Ch 5, 1.4 Chemical composition 1.4.3.](#)

**2. 2 Chemical composition**

2. 2. 1 For forgings to which structural items are to be attached by welding or which are intended for parts of a fabricated component, or are to be weld clad or may be subject to weld repair in service, the chemical composition of ladle samples is to comply with the following:

|                    |  |
|--------------------|--|
| Carbon             | 0.23% max.   |
| Silicon            | 0.45% max.   |
| Manganese          | 0.30–1.50% but not less than 3 times the actual carbon content for components which are not given a post-weld heat treatment |
| Sulphur            | 0.035% max.  |
| Phosphorus         | 0.035% max.  |
| Residual elements: |  |
| Copper             | 0.30% max.   |
| Chromium           | 0.30% max.   |
| Molybdenum         | 0.15% max.   |
| Nickel             | 0.40% max.   |
| Total              | 0.85% max.   |

For samples from forgings, the carbon content is not to exceed 0.26 per cent.

2. 2. 2 It is recommended that forgings for rudder stocks, pintles and rudder coupling bolts comply with [Ch 5, 2.2 Chemical composition 2.2.1](#) in order to obtain satisfactory weldability for any future repairs by welding in service.

2. 2. 3 For forgings not intended for welding the carbon content may be 0.65per cent max., See [Ch 5, 3.2 Chemical composition 3.2.1.](#)

## 2. 3 Heat treatment

2. 3. 1 Carbon-manganese steel forgings are to be:
- fully annealed; or
  - normalised; or
  - normalised and tempered at a temperature of not less than 550°C.
  - quenched and tempered.
2. 3. 2 Alloy steel forgings are to be quenched and then tempered at a temperature of not less than 550°C. Alternatively, they may be supplied in the normalised and tempered condition, in which case the specified mechanical properties are to be agreed by ACS.

## 2. 4 Mechanical tests

2. 4. 1 At least one tensile specimen is to be taken from each forging or batch of forgings.
2. 4. 2 Where a forging exceeds both 4 tonnes in mass and 3 m in length, tensile test specimens are to be taken from each end. These limits refer to the 'as forged' mass and length but exclude the test material.
2. 4. 3 Unless otherwise agreed between the manufacturer and the Surveyor, the test specimens are to be cut in a longitudinal direction.
2. 4. 4 The results of all tensile tests are to comply with the requirements given in [Table 5. 2. 1: Mechanical properties for ship and other structural applications](#) appropriate to the specified minimum tensile strength. Forgings may be supplied to any specified minimum tensile strength within the general limits given in [Table 5. 2. 1: Mechanical properties for ship and other structural applications](#), and intermediate values may be obtained by interpolation. See [Ch 5, 2.4 Mechanical tests 2.4.6](#) for rudder stocks, pintles, and rudder coupling keys and bolts.
2. 4. 5 For large forgings, where tensile tests are taken from each end, the variation in tensile strength is not to exceed 70 N/mm<sup>2</sup>.
2. 4. 6 For rudder stocks, pintles, and rudder coupling keys and bolts, the minimum specified yield strength is not to be less than 200 N/mm<sup>2</sup>, See [Table 13. 2. 1: Rudder material factor, k](#) in [Pt 3 Ship Structures \(General\)](#) of the *Rules and Regulations for the Classification of Ships*.

**Table 5. 2. 1: Mechanical properties for ship and other structural applications**

| Steel type | Yield stress<br>N/mm <sup>2</sup><br>minimum | Tensile strength<br>N/mm <sup>2</sup> | Elongation<br>on $5.65 \sqrt{S_0}$<br>min. % |       | Reduction of<br>area min. % |       |
|------------|--|---------------------------------------|--|-------|-----------------------------|-------|
|            |  |                                       | Long.  | Tang. | Long.                       | Tang. |
| C and C-Mn | 180  | 360-480                               | 28   | 20    | 50                          | 35    |
|            | 200  | 400-520                               | 26   | 19    | 50                          | 35    |
|            | 220  | 440-560                               | 24   | 18    | 50                          | 35    |
|            | 235  | 470-590                               | 23   | 17    | 45                          | 35    |
|            | 240  | 480-600                               | 22   | 16    | 45                          | 30    |
|            | 260  | 520-640                               | 21   | 15    | 45                          | 30    |

|       |     |         |    |    |    |    |
|-------|-----|---------|----|----|----|----|
|       | 280 | 560-680 | 20 | 14 | 40 | 27 |
|       | 300 | 600-750 | 18 | 13 | 40 | 27 |
|       | 320 | 640-790 | 17 | 12 | 40 | 27 |
|       | 340 | 680-830 | 16 | 12 | 35 | 24 |
|       | 360 | 720-870 | 15 | 11 | 35 | 24 |
|       | 380 | 760-910 | 14 | 10 | 35 | 24 |
| Alloy | 350 | 550-700 | 20 | 14 | 50 | 35 |
|       | 400 | 600-750 | 18 | 13 | 50 | 35 |
|       | 450 | 650-800 | 17 | 12 | 50 | 35 |

2. 4. 7 Impact tests are required for rudder stocks to be fitted to vessels which have an ice class notation. The tests are to be carried out at minus 10°C and the average energy value is to be not less than 27J.

## 2. 5 Non-destructive examination

2. 5. 1 Surface inspections are to be carried out by visual examination and magnetic particle testing (or dye penetrant testing where appropriate).
2. 5. 2 Surface inspections are to be carried out in the zones I and II as indicated in [Figure 5. 2. 1: Inspection zones for magnetic particle/dye penetrant testing on rudder stocks](#).

**Figure 5. 2. 1: Inspection zones for magnetic particle/dye penetrant testing on rudder stocks**

2. 5. 3 For the purpose of evaluating indications, the surface is to be divided into reference areas of 225 cm<sup>2</sup>. The area is to be taken in the most unfavourable location relative to the indication being evaluated.
2. 5. 4 The allowable number and size of indications in the reference area is given in [Table 5. 2. 2: Steel forgings surface inspection](#).

**Table 5. 2. 2: Steel forgings surface inspection**

| Inspection zone  | Maximum number of indications | Type of indication | Maximum number each type | Maximum dimension, mm |
|--|-------------------------------|--------------------|--------------------------|-----------------------|
| I  | 3                             | Linear             | 0, <i>See Note</i>       | —                     |
|  |                               | Non-linear         | 3                        | 3.0                   |
|  |                               | Aligned            | 0, <i>See Note</i>       | —                     |
| II   | 10                            | Linear             | 3, <i>See Note</i>       | 3.0                   |
|  |                               | Non-linear         | 7                        | 5.0                   |
|  |                               | Aligned            | 3, <i>See Note</i>       | 3.0                   |
| <b>Note</b> Linear or aligned indications are not permitted on bolts, which receive a direct fluctuating load, e.g.<br>main bearing bolts, connecting rod bolts, crosshead bearing bolts and cylinder cover bolts. |                               |                    |                          |                       |

2. 5. 5 Volumetric inspection is to be carried out by ultrasonic testing using the contact method.
2. 5. 6 Ultrasonic testing is to be carried out on rudder stocks having a finished diameter of 200 mm or greater.
2. 5. 7 Ultrasonic testing is to be carried out in the zones II and III as indicated in [Figure 5. 2. 2: Inspection zones for ultrasonic testing on rudder stocks](#). Areas may be upgraded to a higher zone at the discretion of the Surveyor.
2. 5. 8 Ultrasonic acceptance criteria are shown in [Table 5. 3. 3: Acceptance criteria for ultrasonic testing](#), alternatively *See* [Ch 1, 5 Non-destructive examination](#).

**Figure 5. 2. 2: Inspection zones for ultrasonic testing on rudder stocks**

**3.1 Scope**

- 3.1.1 Detailed in this Section are the requirements for carbon-manganese steel forgings for shafting and other items of machinery which are not within the scope of [Ch 5, 4 Forgings for crankshafts](#) to [Ch 5, 8 Ferritic steel forgings for low temperature service](#).
- 3.1.2 Where it is proposed to use alloy steel forgings, particulars of the chemical composition, mechanical properties and heat treatment are to be submitted for approval.

**3.2 Chemical composition**

- 3.2.1 The chemical composition of ladle samples for carbon and carbon-manganese steels is to comply with the following overall limits:
- |            |             |
|------------|-------------|
| Carbon     | 0.65% max.  |
| Silicon    | 0.45% max.  |
| Manganese  | 0.30- 1.50% |
| Sulphur    | 0.035% max. |
| Phosphorus | 0.035% max. |
- Residual elements:
- |            |            |
|------------|------------|
| Copper     | 0.30% max. |
| Chromium   | 0.30% max. |
| Molybdenum | 0.15% max. |
| Nickel     | 0.40% max. |
| Total      | 0.85% max. |
- 3.2.2 For alloy steels, See [Ch 5, 1.4 Chemical composition 1.4.3](#).
- 3.2.3 For forgings to which structural items are to be attached by welding, or which are intended for parts of a fabricated component, are to be of weldable quality, See [Ch 5, 2.2 Chemical composition 2.2.1](#).

### 3.3 Heat treatment

- 3.3.1 3.3.1 Forgings are to be:
- fully annealed; or
  - normalised; or
  - normalised and tempered; or
  - quenched and tempered.
- The tempering temperature is to be not less than 550°C.

### 3.4 Mechanical tests

- 3.4.1 At least one tensile test is to be made on each forging, or each batch of forgings. Impact tests are not required except on screwshafts for ice service, See [Ch 5, 3.4 Mechanical tests 3.4.12](#).
- 3.4.2 Where a forging exceeds both 4 tonnes in mass and 3 m in length, a tensile test is to be taken from each end. These limits refer to the 'as forged' mass and length but exclude the test material.
- 3.4.3 A batch testing procedure may be used for hot rolled bars not exceeding 250 mm diameter, which are intended for the manufacture (by machining operations only) of straight shafting, bolts, studs and other machinery components of similar shape. A batch is to consist of either:
- material from the same piece provided that, where this is cut into individual lengths, these are all heat treated together in the same furnace, or
  - bars of the same diameter and cast, heat treated together in the same furnace and with a total mass not exceeding 2.5 tonnes.
- 3.4.4 The test specimens are to be taken in the longitudinal direction but, at the discretion of the manufacturer and if agreed by the Surveyor, alternative directions or positions as shown in Figs. [Figure 5.3.1: Directions and positions of test specimens](#), [Figure 5.3.2: Directions and positions of test specimens](#), and [Figure 5.3.3: Directions and positions of test specimens](#) may be used.

**Figure 5.3.1: Directions and positions of test specimens**

**Figure 5. 3. 2: Directions and positions of test specimens**

**Figure 5. 3. 3: Directions and positions of test specimens**

3. 4. 5 For carbon-manganese steels, [Table 5. 3. 1: Mechanical properties for acceptance purposes: carbon and carbon-manganese steel forgings for machinery and shafting](#) gives the minimum requirements for yield stress, elongation and reduction of area, corresponding to different strength levels, but it is not intended that these should necessarily be regarded as specific grades. Intermediate values for other specified minimum tensile strengths should be calculated by interpolation.
3. 4. 6 Forgings may be supplied to any specified minimum tensile strength selected within the general limits detailed in [Table 5. 3. 1: Mechanical properties for acceptance purposes: carbon and carbon-manganese steel forgings for machinery and shafting](#), except that for main propulsion shafting forgings the specified minimum tensile strength is to be as defined in the relevant Rules dealing with design.

**Table 5. 3. 1: Mechanical properties for acceptance purposes: carbon and carbon-manganese steel forgings for machinery and shafting**

| Tensile strength<br>N/mm <sup>2</sup><br>(See Note 1) | Yield stress<br>N/mm <sup>2</sup> | Elongation on 5.65<br>$\sqrt{S_0}$ min % |            | Reduction of area min. % |            |
|---|-----------------------------------|--|------------|--------------------------|------------|
|   |                                   | Longitudinal                             | Tangential | Longitudinal             | Tangential |
| 360 – 480   | 180                               | 28                                       | 20         | 50                       | 35         |
| 400 – 520   | 200                               | 26                                       | 19         | 50                       | 35         |

|           |                  |     |    |    |    |
|-----------|------------------|-----|----|----|----|
| 440 – 560 | 220              | 24  | 18 | 50 | 35 |
| 470 – 590 | 235              | 23  | 17 | 45 | 35 |
| 480 – 600 | 240              | 22  | 16 | 45 | 30 |
| 520 – 640 | 260              | 21  | 15 | 45 | 30 |
| 560 – 680 | 280              | 20  | 14 | 40 | 27 |
| 600 – 750 | 300              | 18  | 13 | 40 | 27 |
| 640 – 790 | 320              | 17  | 12 | 40 | 27 |
| 680 – 830 | 340              | 16  | 12 | 35 | 24 |
| 700 – 850 | See<br>Note<br>2 | 350 | 15 | 11 | 35 |
| 720 – 870 |                  | 360 | 15 | 11 | 35 |
| 760 – 910 |                  | 380 | 14 | 10 | 35 |

**Note 1.** For main propulsion shafting forgings, the specified minimum tensile strength is to be as defined in the relevant Rules dealing with design.

**Note 2.** Where the specified minimum tensile strength exceeds 700 N/mm<sup>2</sup>, forgings are to be supplied only in the quenched and tempered condition.

- 3.4.7 The results of all tensile tests are to comply with the requirements given in [Table 5.3.1: Mechanical properties for acceptance purposes: carbon and carbon-manganese steel forgings for machinery and shafting](#) appropriate to the specified minimum tensile strength.
- 3.4.8 The minimum requirements for yield stress, elongation and reduction of area, corresponding to different strength levels in alloy steel forgings are given in [Table 5.3.2: Mechanical properties for acceptance purposes: alloy steel forgings for machinery and shafting](#).

**Table 5.3.2: Mechanical properties for acceptance purposes: alloy steel forgings for machinery and shafting**

| Tensile strength<br>N/mm <sup>2</sup><br>(See Note) | Yield stress<br>N/mm <sup>2</sup> | Elongation on $5.65 \sqrt{S_0}$<br>min % |            | Reduction of area min. % |            |
|---|-----------------------------------|--|------------|--------------------------|------------|
|   |                                   | Longitudinal                             | Tangential | Longitudinal             | Tangential |
| 600 – 750   | 420                               | 18                                       | 14         | 50                       | 35         |
| 650 – 800   | 450                               | 17                                       | 13         | 50                       | 35         |
| 700 – 850   | 480                               | 16                                       | 12         | 45                       | 30         |
| 750 – 900   | 530                               | 15                                       | 11         | 45                       | 30         |
| 800 – 950   | 580                               | 14                                       | 10         | 40                       | 27         |
| 850 – 1000  | 630                               | 13                                       | 9          | 40                       | 27         |
| 900 – 1100  | 690                               | 13                                       | 9          | 40                       | 27         |
| 950 – 1150  | 750                               | 12                                       | 8          | 35                       | 24         |
| 1000 – 1200   | 810                               | 12                                       | 8          | 35                       | 24         |
| 1050 – 1250   | 870                               | 11                                       | 7          | 35                       | 24         |

|   |     |    |   |    |    |
|---|-----|----|---|----|----|
| 1100 – 1300   | 930 | 11 | 7 | 35 | 24 |
| <p><b>Note</b> For main propulsion shafting forgings, the minimum specified tensile strength is to be as defined in the relevant Rules dealing with design. For other forgings the minimum specified tensile strength is not to exceed 1100 N/mm<sup>2</sup> (1100–1300 N/mm<sup>2</sup> acceptance range).</p> |     |    |   |    |    |

3. 4. 9 Forgings in alloy steels may be supplied to any specified minimum tensile strength selected within the general limits detailed in [Table 5. 3. 2: Mechanical properties for acceptance purposes: alloy steel forgings for machinery and shafting](#), and minimum yield stress, elongation and reduction of area, obtained by interpolation, except that for main propulsion shafting forgings the specified minimum tensile strength is to be as defined in the relevant Rules dealing with design.
3. 4. 10 The results of all tensile tests are to comply with the requirements given in [Table 5. 3. 2: Mechanical properties for acceptance purposes: alloy steel forgings for machinery and shafting](#) appropriate to the specified minimum tensile strength.
3. 4. 11 Where more than one tensile test is taken from a forging, the variation in tensile strength is not to exceed the following:
- | Specified minimum tensile strength N/mm <sup>2</sup> | Difference in tensile strength N/mm <sup>2</sup> |
|--|--|
| <600   | 70   |
| ≥600 <900  | 100  |
| ≥900   | 120  |
3. 4. 12 For screwshafts intended for ships with the notation **Ice Class 1AS** or **1A** and where the connection between the propeller and the screwshaft is by means of a key, a set of three Charpy V-notch impact tests (longitudinal test) is to be made on material from the propeller end of each shaft. The tests are to be carried out at –10°C and the average energy value is to be not less than 20 J.

### 3. 5 Non-destructive examination

3. 5. 1 Magnetic particle or penetrant testing (where appropriate) is to be carried out on forgings for main propulsion shafting (including propeller shafts, intermediate shafts, and thrust shafts with minimum diameter not less than 100 mm), on all connecting rod and tie rod forgings and on the following components:
- Cylinder heads (when intended for engines having a bore diameter larger than 300 mm)  
Piston crowns (when intended for engines having a bore diameter larger than 400 mm)  
Piston rods (when intended for engines having a bore diameter larger than 400 mm)  
Turbocharger shaft and rotor (when required by the relevant Rules dealing with engine design and construction)
- When intended for engines having a bore diameter larger than 300 mm, bolts and studs for:
- Cylinder heads
  - Crossheads
  - Connecting rod bearings
  - Main bearings
  - Crankshafts
  - Tie rods

- Holding down bolts
- Propeller blades
- Propeller bosses

Regardless of the above, bolts and studs which are subjected to dynamic loading (for example, but not limited to, cylinder head bolts, tie rods, crankpin bolts, main bearing bolts, engine holding down bolts, propeller blade fastening bolts) and have a diameter of 50mm or greater are to be subjected to surface examinations.

3. 5. 2 The areas to be tested by magnetic particle or dye penetrant testing are shown in [Figure 5. 3. 4: Zones for magnetic particle/dye penetrant testing on machinery components](#) and [Figure 5. 3. 5: Zones for magnetic particle/dye penetrant testing on machinery components](#). Areas of other components not shown in these figures are to be agreed with the Surveyor. For tie rods, only threaded portions and the adjacent material over a length equal to that of the thread need be tested.

**Figure 5. 3. 4: Zones for magnetic particle/dye penetrant testing on machinery components**

**NOTE**

For propeller shaft, intermediate shafts and thrust shafts, all areas with stress raisers such as radial holes, slots and key ways are to be treated as Zone I.

**Figure 5. 3. 5: Zones for magnetic particle/dye penetrant testing on machinery components**

3. 5. 3 Surface inspection acceptance criteria are to be in accordance with [Ch 5, 2.5 Non-destructive examination](#). Other acceptance criteria may be applied, providing they meet these minimum criteria, and are to the satisfaction of the Surveyor.
3. 5. 4 Ultrasonic testing is to be carried out in accordance with [Ch 5, 2.5 Non-destructive examination](#) on the following items unless otherwise agreed with ACS:
- Shafts having a finished diameter of 200 mm or larger when intended for main propulsion or other essential services.
  - All piston crowns
  - All cylinder heads.
  - Piston rods for engines having a bore diameter greater than 400 mm.
  - Connecting rods
  - Turbocharger shaft and rotor (when required by the relevant Rules dealing with design and construction).
  - Bolts and studs (as listed in [Ch 5, 3.5 Non-destructive examination 3.5.1](#)) for engines having a bore diameter greater than 300 mm.

The areas to be tested are shown in [Figure 5. 3. 6: Zones for ultrasonic testing on shafts](#) and [Figure 5. 3. 7: Zones for ultrasonic testing on machinery components](#). Areas of other components not shown in these drawings are to be agreed with the Surveyor.

**Figure 5. 3. 6: Zones for ultrasonic testing on shafts**

**NOTES**

1. For hollow shafts, 360° radial scanning applies to Zone III
2. Circumferences of the bolt holes in the flanges are to be treated as Zone II
3. Axial scan from end face also required

**Figure 5. 3. 7: Zones for ultrasonic testing on machinery components**

NOTE  
Axial scan from end face also required

3. 5. 5 Ultrasonic acceptance criteria are shown in [Table 5. 3. 3: Acceptance criteria for ultrasonic testing](#). Other acceptance criteria may be applied, providing they meet these minimum criteria, and are to the satisfaction of the Surveyor.

**Table 5. 3. 3: Acceptance criteria for ultrasonic testing**

| Type of forging    | Zone | Allowable disc shape according to Distance Gain Size (DGS), See Note 1, mm | Allowable length of indication, mm. See Note 2 |
|--------------------|------|--|--|
| Propeller shaft    | II   | Outer $\underline{d} \leq 2$   | $\leq 10$                                      |
| Intermediate shaft |      | Inner $\underline{d} \leq 4$   | $\leq 15$                                      |
| Thrust shaft       | III  | Outer $\underline{d} \leq 3$   | $\leq 10$                                      |

|   |     |                              |           |
|---|-----|------------------------------|-----------|
| Rudder stock  |     | Inner $\underline{d} \leq 6$ | $\leq 15$ |
| Connecting rod  | II  | $\underline{d} \leq 2$       | $\leq 10$ |
| Piston rod  | III | $\underline{d} \leq 4$       | $\leq 10$ |
| <p><b>Note 1.</b> Outer part means the part beyond one third of the shaft radius from the centre. The inner part means the remaining core area.</p> <p><b>Note 2.</b> For accumulations of two or more isolated indications which are subjected to registration, the minimum distance between two neighbouring indications is to be at least the length of the larger indication.</p> |     |                              |           |

CHAPTER **5 Steel Forgings**SECTION **4 Forgings for crankshafts****4. 1 Scope**

- 4. 1. 1 The specific requirements for solid forged crankshafts and forgings for use in the construction of fully built and semi-built crankshafts are detailed in this Section.
- 4. 1. 2 Where it is proposed to use alloy steel forgings, particulars of the chemical composition (*See [Ch 5, 1.4 Chemical composition 1.4.3](#)*), heat treatment and mechanical properties are to be submitted for approval. The specified minimum tensile strength is not to exceed 1000 N/mm<sup>2</sup> (1000–1200 N/mm<sup>2</sup> acceptance range).

**4. 2 Manufacture**

- 4. 2. 1 For closed die and continuous grain flow crankshafts forgings, where an allowance is given for design purposes, full details of the proposed method of manufacture are to be submitted for approval. In such cases, tests will be required to demonstrate that a satisfactory structure and grain flow are obtained. The number and positions of test specimens are to be agreed with ACS.
- 4. 2. 2 For the manufacture of welded crankshafts, approval is required for the welding procedure.
- 4. 2. 3 For combined crankweb and pin forgings, the proposed method of forging is to be submitted for approval. It is recommended that these forgings be made by a folding method. Other methods which can be shown to produce sound forgings with satisfactory mechanical properties will be considered, but where the gapping method is used for cranks having a pin diameter exceeding 510 mm this will only be accepted provided that an upsetting operation is included in the manufacturing sequence. In general, the amount of work during the upsetting operation is to be such that the reduction in the original length of the ingot (after discard) or bloom is not less than 50 per cent.
- 4. 2. 4 Where crankwebs are flame cut from forged or rolled slabs, the procedure used is to be in accordance with [Ch 5, 1.2 Manufacture 1.2.13](#), and additionally, unless specially agreed, a depth of at least 7.5 mm is to be removed by machining from all flame-cut surfaces.

**4. 3 Chemical composition**

- 4. 3. 1 The chemical composition of ladle samples is to comply with [Ch 5, 3.2 Chemical composition 3.2.1](#) for carbon and carbon-manganese steels and [Ch 5, 1.4 Chemical composition 1.4.3](#) for alloy steels.
- 4. 3. 2 For alloy steel forgings which are to be nitrided, the phosphorus or sulphur contents are not to exceed 0.02 per cent.

## 4. 4 Heat treatment

4. 4. 1 For forgings in all types of steels, heat treatment is to be either:
- normalising and tempering, or
  - quenching and tempering.
- The temperature used for tempering is to be not less than 550°C.
4. 4. 2 Where it is proposed to surface harden crankshaft forgings by nitriding or induction hardening, full details of the proposed procedure are to be submitted as required by [Ch 5, 1.5 Heat treatment 1.5.6](#).

## 4. 5 Mechanical tests

4. 5. 1 At least one tensile test specimen is to be taken from each forging.
4. 5. 2 For solid forged crankshafts, tests are to be taken in the longitudinal direction from the coupling end of each forging (test position A in [Figure 5. 4. 1: Solid forged crankshaft](#)). Where the mass, as heat treated but excluding test material, exceeds 3 tonnes, a second set of tests is to be taken from the end opposite the coupling, in addition (test position B in [Figure 5. 4. 1: Solid forged crankshaft](#)). Where the crankthrows are formed by machining or flame cutting, the second set of tests is to be taken in a tangential direction from material removed from the crankthrow at the end opposite the coupling (test position C in [Figure 5. 4. 1: Solid forged crankshaft](#)). For continuous grain flow (CGF) crankshaft forgings, where insufficient material exists for a second longitudinal test, the second set of tests may be taken in a tangential direction from the crankthrow (test position C in [Figure 5. 4. 2: CGF Crankshaft](#)).

**Figure 5. 4. 1: Solid forged crankshaft**

**Figure 5. 4. 2: CGF Crankshaft**

4. 5. 3 The number and position of test specimens from combined crankweb and pin forgings are to be in accordance with the requirements of the approved method of manufacture.
4. 5. 4 For other crankshaft forgings, tests are to be taken as detailed in [Ch 5, 3 Forgings for shafting and machinery](#), except that for crankwebs the test specimens are to be cut in a tangential direction.
4. 5. 5 As an alternative to [Ch 5, 4.5 Mechanical tests 4.5.2](#), small solid forged crankshafts may be batch tested in accordance with [Ch 5, 1.6 Test material 1.6.4](#), provided that, in addition, hardness tests are carried out on each forging.
4. 5. 6 [Table 5. 4. 1: Mechanical properties for acceptance purposes: carbon-manganese steel forgings for crankshafts](#) to [Table 5. 4. 1: Mechanical properties for acceptance purposes: carbon-manganese steel forgings for crankshafts](#) give the minimum requirements for yield stress and elongation corresponding to different strength levels, but it is not intended that these should necessarily be regarded as specific grades. The strength levels have been given in multiples of 40 N/mm<sup>2</sup>, or 50 N/mm<sup>2</sup> in the case of alloy steels, to facilitate interpolation for intermediate values of specified minimum tensile strength.

**Table 5. 4. 1: Mechanical properties for acceptance purposes: carbon-manganese steel forgings for crankshafts**

| Tensile strength<br>N/mm <sup>2</sup>                 | Yield stress<br>N/mm <sup>2</sup> minimum | Elongation on<br>5.65 $\sqrt{S_0}$ % minimum |       | Hardness Brinell |
|---|---|--|-------|------------------|
|   |   | Long.  | Tang. |                  |
| 400 – 520   | 200                                       | 26   | 19    | 110 – 150        |
| 440 – 560   | 220                                       | 24   | 18    | 125 – 160        |
| 480 – 600   | 240                                       | 22   | 16    | 135 – 175        |
| 520 – 640   | 260                                       | 21   | 15    | 150 – 185        |
| 560 – 680   | 280                                       | 20   | 14    | 160 – 200        |
| 600 – 750   | 300                                       | 18   | 13    | 175 – 215        |
| 640 – 790   | 320                                       | 17   | 12    | 185 – 230        |
| 680 – 830   | 340                                       | 16   | 12    | 200 – 240        |
| 720 – 870   | 350                                       | 15   | 11    | 210 – 250        |
| 760 – 910   | 380                                       | 14   | 18    | 225 – 265        |
| Intermediate values may be obtained by interpolation. |   |  |       |                  |

4. 5. 7 Forgings may be supplied to any specified minimum tensile strength selected within the general limits detailed in [Table 5. 4. 1: Mechanical properties for acceptance purposes: carbon-manganese steel forgings for crankshafts](#) to [Table 5. 4. 3: Mechanical properties for acceptance purposes: alloy steel forgings for crankshafts - Quenched and tempered](#).
4. 5. 8 The results of all tensile tests are to comply with the requirements of [Table 5. 4. 1: Mechanical properties for acceptance purposes: carbon-manganese steel forgings for crankshafts](#), [Table 5. 4. 2: Mechanical properties for acceptance purposes: alloy steel forgings for crankshafts - Normalised and tempered](#) or [Table 5. 4. 3: Mechanical properties for acceptance purposes: alloy steel forgings for crankshafts - Quenched and tempered](#) appropriate to the specified minimum tensile strength.
4. 5. 9 Where more than one tensile test is taken from a forging, the variation in tensile strength is not to exceed the following:

|   |   |
|---|---|
| Specified minimum<br>tensile strength N/mm <sup>2</sup> | Difference in tensile<br>strength N/mm <sup>2</sup> |
| <600  | 70  |
| ≥600 <900   | 100   |
| ≥900  | 120   |

4. 5. 10 For small crankshaft forgings which have been batch tested, the hardness values are to be not less than those given in [Table 5. 4. 1: Mechanical properties for acceptance purposes: carbon-manganese steel forgings for crankshafts](#) to [Table 5. 4. 3: Mechanical properties for acceptance purposes: alloy steel forgings for crankshafts - Quenched and tempered](#), as appropriate. The variation in hardness in each batch is to comply with the following:

|  |  |
|--|--|
| Specified minimum<br>tensile strength (N/mm <sup>2</sup> ) | Difference in hardness<br>(Brinell number) |
| <600   | not more than 25                           |
| ≥600 <900  | not more than 35                           |
| ≥900   | not more than 42                           |

**Table 5. 4. 2: Mechanical properties for acceptance purposes: alloy steel forgings for crankshafts - Normalised and tempered**

| Tensile strength<br>N/mm <sup>2</sup>                 | Yield stress<br>N/mm <sup>2</sup> minimum | Elongation on<br>5.65 $\sqrt{S_0}$ % minimum |       | Hardness Brinell |
|---|---|--|-------|------------------|
|   |   | Long.  | Tang. |                  |
| 600 – 750   | 330                                       | 18   | 14    | 175 – 215        |
| 650 – 800   | 355                                       | 17   | 13    | 190 – 235        |
| 700 – 850   | 380                                       | 16   | 12    | 205 – 245        |
| 750 – 900   | 405                                       | 15   | 11    | 215 – 260        |
| 800 – 950   | 430                                       | 14   | 10    | 235 – 275        |
| Intermediate values may be obtained by interpolation. |   |  |       |                  |

**Table 5. 4. 3: Mechanical properties for acceptance purposes: alloy steel forgings for crankshafts - Quenched and tempered**

| Tensile strength<br>N/mm <sup>2</sup> | Yield stress<br>N/mm <sup>2</sup> minimum | Elongation on<br>5.65 $\sqrt{S_0}$ % minimum |       | Hardness Brinell |
|---------------------------------------|---|--|-------|------------------|
|                                       |   | Long.  | Tang. |                  |
| 600-750                               | 420                                       | 18   | 14    | 175-215          |
| 650-800                               | 450                                       | 17   | 13    | 190-235          |
| 700-850                               | 480                                       | 16   | 12    | 205-245          |

|   |     |    |    |         |
|---|-----|----|----|---------|
| 750-900   | 530 | 15 | 11 | 215-260 |
| 800-950   | 590 | 14 | 10 | 235-275 |
| 850-1000  | 640 | 13 | 9  | 245-290 |
| 900-1100  | 690 | 13 | 9  | 260-320 |
| 950-1150  | 750 | 12 | 8  | 275-340 |
| 1000-1200   | 810 | 12 | 8  | 290-365 |
| Intermediate values may be obtained by interpolation. |     |    |    |         |

## 4. 6 Non-destructive examination

4. 6. 1 Magnetic particle or dye penetrant testing as detailed in [Ch 5, 1.8 Visual and non-destructive examination 1.8.5](#) is to be carried out on all forgings for crankshafts. Where applicable, this is to include all surfaces which have been flame-cut, but not subsequently machined during manufacture. Particular attention is to be given to the testing of the pins, journals and associated fillet radii of solid forged crankshafts and to the pins and fillet radii of combined web and pin forgings. The extent of testing is shown in [Figure 5. 4. 3: Zones for magnetic particle/dye penetrant testing on crankshafts](#).

**Figure 5. 4. 3: Zones for magnetic particle/dye penetrant testing on crankshafts**

**NOTES**

- Where the crankpin or journal has oil holes, the circumferential surfaces of the oil are to be treated as Zone I, (see the figure on the right)
- In the above figures:  
 $\theta = 60^\circ$   
 $a = 1,5r$   
 $b = 0,05d$  (: circumferential surfaces of shrinkage fit)  
 where  
 $r$ : fillet radius  
 $d$ : journal diameter
- Identification of the Zones:  
 Zone I: Dark grey  
 Zone II: Medium grey  
 Zone III: Light grey

$db$ : Oil hole bore diameter

4. 6. 2 The manufacturer is to carry out an ultrasonic examination of all forgings as detailed in [Ch 5, 1.8 Visual and non-destructive examination 1.8.8](#). The extent of ultrasonic testing is shown in [Figure 5. 4. 4: Zones for ultrasonic testing on crankshafts](#).

Figure 5. 4. 4: Zones for ultrasonic testing on crankshafts

NOTES

- In the above figures:  
 $a = 0,1d$  or 25 mm, whichever is greater  
 $b = 0,05d$  or 25 mm, whichever is greater (: circumstances of shrinkage fit)  
 where  
 $d$  : pin or journal diameter
- The mid third area of crank pins and/or journals within a radius of  $0,25d$  between the webs may generally be coordinated to Zone II
- Identification of the Zones:  

|  |            |
|--|------------|
|  | : Zone I   |
|  | : Zone II  |
|  | : Zone III |

4. 6. 3 Surface inspection acceptance criteria are to be in accordance with [Ch 5, 1.8, Visual and non-destructive examination](#) and with [Table 5. 4. 4: Surface inspection acceptance for crankshaft forgings – Allowable number and size of indications in a reference area of 225 cm<sup>2</sup>](#). Other acceptance criteria may be applied, providing they meet these minimum criteria, and is to the satisfaction of the Surveyor.

**Table 5. 4. 4: Surface inspection acceptance for crankshaft forgings – Allowable number and size of indications in a reference area of 225 cm<sup>2</sup>**

| Inspection zone             | Maximum number of indication | Type of indication | Maximum number each type | Maximum dimension of single indication, mm |
|-----------------------------|------------------------------|--------------------|--------------------------|--|
| I<br>Critical fillet area   | 0                            | Linear             | 0                        | -  |
|                             |                              | Non-linear         | 0                        | -  |
|                             |                              | Aligned            | 0                        | -  |
| II<br>Important fillet area | 3                            | Linear             | 0                        | -  |
|                             |                              | Non-linear         | 3                        | 3.0  |
|                             |                              | Aligned            | 0                        | -  |
| III<br>Journal surfaces     | 3                            | Linear             | 0                        | -  |
|                             |                              | Non-linear         | 3                        | 5.0  |
|                             |                              | Aligned            | 0                        | -  |

4. 6. 4 Ultrasonic acceptance criteria are shown in [Table 5. 4. 5: Ultrasonic acceptance criteria for crankshafts](#). Other acceptance criteria may be applied, providing they meet these minimum criteria, and is to the satisfaction of the Surveyor.

**Table 5. 4. 5: Ultrasonic acceptance criteria for crankshafts**

| Type of forging   | Zone | Allowable disc shape according to Distance Gain Size (DGS), mm | Allowable length of indication, mm <i>See Note</i> |
|---|------|--|--|
| Crank shaft   | I    | $\underline{d} \leq 2.0$                                       | –  |
|   | II   | $\underline{d} \leq 3.0$                                       | $\leq 10$  |
|   | III  | $\underline{d} \leq 4.0$                                       | $\leq 15$  |
| <b>Note</b> For accumulations of two or more isolated indications which are subjected to registration, the minimum distance between two neighbouring indications is to be at least the length of the larger indication. This applies to the distance in axial direction as to the distance in depth. Isolated indications with less distance are to be determined as one single indication. |      |  |  |

CHAPTER **5 Steel Forgings**SECTION **5 Forgings for gearing****5. 1 Scope**

- 5. 1. 1 Provision is made in this Section for carbon-manganese and alloy steel forgings intended for use in the construction of gearing for main propulsion and for driving electric generators.
- 5. 1. 2 Gear wheel and rim forgings with a specified minimum tensile strength not exceeding 760 N/mm<sup>2</sup> (760–910 N/mm<sup>2</sup> acceptance range) may be made in carbon-manganese steel. Gear wheel or rim forgings where the specified minimum tensile strength is in excess of 760 N/mm<sup>2</sup>, and all pinion or pinion sleeve forgings, are to be made in a suitable alloy steel. Specifications for alloy steel components and for quill shafts, giving chemical composition, heat treatment and mechanical properties, are to be submitted for approval.
- 5. 1. 3 Forgings for flexible couplings, quill shafts and gear wheel shafts are to comply with the requirements of [Ch 5, 3 Forgings for shafting and machinery](#).
- 5. 1. 4 Manufacturers' test certificates for forgings may be accepted where the transmitted power does not exceed 220 kW (300 shp) for main propulsion and 100 kW (150 shp) for auxiliary drives.

**5. 2 Manufacture**

- 5. 2. 1 All forgings are to be made with sufficient material to allow an adequate machining allowance on all surfaces for the removal of unsound or decarburised material.
- 5. 2. 2 The hardenability of the forged material is to be checked at random intervals using an end quench test complying with a National or International Standard.
- 5. 2. 3 The grain size is to be checked on a random basis in accordance with the testing and reporting procedures of ASTM E 112, or an equivalent National Standard, and is to be within the range 5 to 8.
- 5. 2. 4 The microstructure of the hardened case is to be mainly martensite, with a maximum content of 15 per cent of retained austenite.

**5. 3 Chemical composition**

- 5. 3. 1 The chemical composition of ladle samples is to comply with [Ch 5, 3.2 Chemical composition 3.2.1](#) for carbon and carbon-manganese steels and [Ch 5, 1.4 Chemical composition 1.4.3](#) for alloy steels.

## 5. 4 Heat treatment

5. 4. 1 Except as provided in [Ch 5, 5.4 Heat treatment 5.4.4](#) and [Ch 5, 5.4 Heat treatment 5.4.5](#), forgings may be either normalised and tempered or quenched and tempered in accordance with the approved specification. The tempering temperature is to be not less than 550°C.
5. 4. 2 Where forgings are machined prior to heat treatment, the allowance left for final machining is to be sufficient to remove the decarburised surface material, taking into account any bending or distortion which may occur.
5. 4. 3 When the teeth of a pinion or gear wheel are to be surface hardened, i.e. carburised, nitrided or induction hardened, the proposed specification together with details of the process and practice are to be submitted for approval. For purposes of initial approval, the gear manufacturer is required to demonstrate by test that the surface hardening of the teeth is uniform and of the required depth and that it does not impair the soundness and quality of the steel.
5. 4. 4 Where induction hardening of nitriding is to be carried out after machining of the gear teeth, the forgings are to be heat treated at an appropriate stage to a condition suitable for this subsequent surface hardening.
5. 4. 5 Forgings for gears which are to be carburised after final machining are to be supplied in either the fully annealed or the normalised and tempered condition, suitable for subsequent machining and carburising.

## 5. 5 Mechanical tests for through hardened, induction hardened or nitrided forgings

5. 5. 1 At least one tensile test specimen is to be taken from each forging in carbon or carbon-manganese steel, and at least one tensile specimen from forgings in alloy steel. Sufficient test material is to be provided for this purpose and the test specimens are to be taken as follows:
  - a. For pinion forgings where the finished diameter of the toothed portion exceeds 200 mm, tests are to be taken in a tangential direction and adjacent to the toothed portion (test position B in [Figure 5. 5. 1:Test positions for forgings for gearing](#)). Where the dimensions preclude the preparation of tests from this position, tests in a tangential direction are to be taken from the end of the journal (test position C in [Figure 5. 5. 1:Test positions for forgings for gearing](#)). If, however, the journal diameter is 200 mm or less, tests are to be taken in a longitudinal direction (test position A in [Figure 5. 5. 1:Test positions for forgings for gearing](#)). Where the finished length of the toothed portion exceeds 1250 mm, tests are to be taken from each end.
  - b. For small pinion forgings where the finished diameter of the toothed portion is 200 mm or less, tests are to be taken in a longitudinal direction (test position A in [Figure 5. 5. 1:Test positions for forgings for gearing](#)).
  - c. For gear wheel forgings, tests are to be taken in a tangential direction (from one of the test positions B in [Figure 5. 5. 2: Test position B](#)).
  - d. For gear wheel rim forgings, tests are to be taken in a tangential direction (from one of the test positions A in [Figure 5. 5. 3: Test position A](#)). Where the finished diameter exceeds 2500 mm or the mass (as heat treated but excluding test material) exceeds 3 tonnes, tests are to be taken from two diametrically opposite positions (test positions A in [Figure 5. 5. 3: Test position A](#)).
  - e. For pinion sleeve forgings, tests are to be taken in a tangential direction (from one of the test positions C in [Figure 5. 5. 4: Test position C](#)). Where the finished length exceeds 1250 mm, tests are to be taken from each end.

**Figure 5. 5. 1: Test positions for forgings for gearing**

**Figure 5. 5. 2: Test position B**

**Figure 5. 5. 3: Test position A**

**Figure 5. 5. 4: Test position C**

5. 5. 2 As an alternative to [Ch 5, 5.5 Mechanical tests for through hardened, induction hardened or nitrided forgings 5.5.1](#), small forgings may be batch tested in accordance with [Ch 5, 1.6 Test material 1.6.4](#) provided that, in addition, hardness tests are carried out on each forging.
5. 5. 3 [Table 5. 5. 1: Mechanical properties for acceptance purposes: carbon-manganese steels for gear wheel and rim forgings](#) to [Table 5. 5. 3: Mechanical properties for acceptance purposes: alloy steel gear forgings - Quenched and tempered](#) give the minimum requirements for yield stress and elongation corresponding to different strength levels, but it is not intended that these should necessarily be regarded as specific grades. The strength levels have been given in multiples of 40 N/mm<sup>2</sup>, or 50 N/mm<sup>2</sup> in the case of alloy steels, to facilitate interpolation for intermediate values of specified minimum tensile strength.

**Table 5. 5. 1: Mechanical properties for acceptance purposes: carbon-manganese steels for gear wheel and rim forgings**

| Tensile strength<br>N/mm <sup>2</sup> (See Note)   | Yield stress<br>N/mm <sup>2</sup><br>minimum | Elongation on $5.65 \sqrt{S_0}$<br>% minimum |        | Hardness<br>Brinell |
|--|--|--|--------|---------------------|
|  |  | Rims   | Wheels |                     |
| 400 - 520  | 200  | 26   | 22     | 110 - 150           |
| 440 - 560  | 220  | 24   | 21     | 125 - 160           |
| 480 - 600  | 240  | 22   | 19     | 135 - 175           |
| 520 - 640  | 260  | 21   | 18     | 150 - 185           |
| 560 - 680  | 280  | 20   | 17     | 160 - 200           |
| 600 - 750  | 300  | 18   | 15     | 175 - 215           |
| 640 - 790  | 320  | 17   | 14     | 185 - 230           |
| 680 - 830  | 340  | 16   | 14     | 200 - 240           |
| 720 - 870  | 360  | 15   | 13     | 210 - 250           |
| 760 - 910  | 380  | 14   | 12     | 225 - 265           |
| Intermediate values may be obtained by interpolation.  |  |  |        |                     |
| <b>Note</b> When the specified minimum tensile strength exceeds 700 N/mm <sup>2</sup> forgings are to be supplied only in the quenched and tempered condition. |  |  |        |                     |

5. 5. 4 Forgings may be supplied to any specified minimum tensile strength selected within the general limits detailed in [Table 5. 5. 1: Mechanical properties for acceptance purposes: carbon-manganese](#)

steels for gear wheel and rim forgings to [Table 5. 5. 3: Mechanical properties for acceptance purposes: alloy steel gear forgings - Quenched and tempered](#).

5. 5. 5 The results of all tensile tests are to comply with the requirements of [Table 5. 5. 1: Mechanical properties for acceptance purposes: carbon-manganese steels for gear wheel and rim forgings](#), [Table 5. 5. 2: Mechanical properties for acceptance purposes: alloy steel gear wheel and rim forgings - Normalised and tempered](#) or [Table 5. 5. 3: Mechanical properties for acceptance purposes: alloy steel gear forgings - Quenched and tempered](#), appropriate to the specified minimum tensile strength. Unless otherwise agreed, the specified minimum tensile strength is to be not less than 800 N/mm<sup>2</sup> (800–950 N/mm<sup>2</sup> acceptance range) for induction hardened or nitrided gear forgings.

5. 5. 6 Where more than one tensile test is taken from a forging, the variation in tensile strength is not to exceed the following:

| Specified minimum<br>tensile strength N/mm <sup>2</sup> | Difference in tensile<br>strength N/mm <sup>2</sup> |
|---|---|
| <600  | 70  |
| ≥600 <900   | 100   |
| ≥900  | 120   |

5. 5. 7 Hardness tests are to be carried out on all forgings after completion of heat treatment and prior to machining the gear teeth. The hardness is to be determined at four positions equally spaced around the circumference of the surface where teeth will subsequently be cut. Where the finished diameter of the toothed portion exceeds 2500 mm, the number of test positions is to be increased to eight. Where the width of a gear wheel rim forging exceeds 1250 mm, the hardness is to be determined at eight positions at each end of the forging.

**Table 5. 5. 2: Mechanical properties for acceptance purposes: alloy steel gear wheel and rim forgings - Normalised and tempered**

| Tensile strength<br>N/mm <sup>2</sup>                 | Yield stress<br>N/mm <sup>2</sup> minimum | Elongation on<br>5.65 $\sqrt{S_0}$ % minimum |        | Hardness Brinell |
|---|---|--|--------|------------------|
|   |   | Rims   | Wheels |                  |
| 600 – 750   | 330                                       | 18   | 16     | 175 – 215        |
| 650 – 800   | 355                                       | 17   | 15     | 190 – 235        |
| 700 – 850   | 380                                       | 16   | 14     | 205 – 245        |
| 750 – 900   | 405                                       | 15   | 13     | 215 – 260        |
| 800 – 950   | 430                                       | 14   | 12     | 235 – 275        |
| 850 – 1000  | 455                                       | 13   | 11     | 245 – 290        |
| Intermediate values may be obtained by interpolation. |   |  |        |                  |

| = Column A is applicable to tests from gear rims and to longitudinal tests from pinions.<br>= Column B is applicable to tests from gear wheels and to tangential tests from pinions.<br>= Column C is applicable to tests from pinion sleeves.                          |     |    |    |    |           |
| Intermediate values may be obtained by interpolation  |     |    |    |    |           |
| <b>Note 1.</b> For gear wheel and rim forgings the specified minimum tensile strength is not to exceed 850 N/mm <sup>2</sup> .<br><b>Note 2.</b> For carburised gear forgings the requirements for minimum yield stress and maximum tensile strength are not applicable |     |    |    |    |           |

5. 5. 8 For small gear forgings which are batch tested, at least one hardness test is to be carried out on each forging.

5. 5. 9 The results of all hardness tests are to comply with the appropriate requirements of [Table 5. 5. 1: Mechanical properties for acceptance purposes: carbon-manganese steels for gear wheel and rim forgings](#) to [Table 5. 5. 3: Mechanical properties for acceptance purposes: alloy steel gear forgings - Quenched and tempered](#). The difference between the highest and lowest values on any one forging is not to exceed the following:

| Specified minimum<br>tensile strength (N/mm <sup>2</sup> ) | Difference in hardness<br>(Brinell number) |
|--|--|
| <600   | 25   |
| ≥600 <900  | 35   |
| ≥900   | 42   |

5. 5. 10 On nitrided or induction hardened components, hardness tests are also to be made on the teeth when surface hardening and grinding have been completed. The results are to comply with the approved specification.

## 5. 6 Mechanical tests for carburised forgings

5. 6. 1 Sufficient test material is to be provided for preliminary tests at the forge and for final tests after completion of carburising. For this purpose, duplicate sets of test material are to be taken from

positions as detailed in [Ch 5, 5.5 Mechanical tests for through hardened, induction hardened or nitrided forgings 5.5.1](#), except that, irrespective of the dimensions or mass of the forging, tests are required from one position only, and in the case of forgings with integral journals are to be cut in a longitudinal direction. The test material which is to be used for measurements of case depth, hardness, grain size and residual austenite as well as mechanical properties is to be machined to a coupon of diameter of  $\frac{D}{4}$  or 30 mm, whichever is less, where  $D$  is the finished diameter of the toothed portion.

5. 6. 2 For small forgings, where a system of batch testing is adopted, the test material may be prepared from surplus steel from the same cast provided that the forging reduction approximates to that of the actual gear forgings. The test samples are to be correctly identified and heat treated with the forgings they represent.
5. 6. 3 For preliminary tests at the forge, one set of test material is to be given a blank carburising and heat treatment cycle simulating that which will be subsequently applied to the forgings.
5. 6. 4 For final acceptance tests, the second set of test material is to be blank carburised and heat treated together with the forgings which it represents.
5. 6. 5 At the discretion of the forgemaster or gear manufacturer, test samples of larger cross-section than in [Ch 5, 5.6 Mechanical tests for carburised forgings 5.6.1](#) may be either carburised or blank carburised, but these are to be machined to the required diameter prior to the final quenching and stress relieving heat treatment.
5. 6. 6 At least one tensile specimen is to be prepared from each sample of test material.
5. 6. 7 Unless otherwise agreed, the specified minimum tensile strength is to be not less than 750 N/mm<sup>2</sup>, and the results of all tensile tests are to comply with the requirements given in [Table 5. 5. 3: Mechanical properties for acceptance purposes: alloy steel gear forgings - Quenched and tempered](#).
5. 6. 8 Where it is proposed to adopt alternatives to the requirements of [Ch 5, 5.6 Mechanical tests for carburised forgings 5.6.1](#) to [Ch 5, 5.6 Mechanical tests for carburised forgings 5.6.7](#), full details are to be submitted to the Surveyor for consideration.

## 5. 7 Non-destructive examination

5. 7. 1 Magnetic particle or liquid penetrant testing is to be carried out on the teeth of all surface hardened forgings. This examination may also be requested on the finished machined teeth of through hardened gear forgings.
5. 7. 2 The manufacturer is to carry out an ultrasonic examination of all forgings where the finished diameter of the surfaces, where teeth will be cut, is in excess of 200 mm, and is to provide the Surveyor with a signed statement that such inspection has not revealed any significant internal defects.
5. 7. 3 On gear forgings where the teeth have been surface hardened, additional test pieces may be required to be processed with the forgings and subsequently sectioned to determine the depth of the hardened zone. These tests are to be carried out at the discretion of the Surveyor, and for induction or carburised gearing the depth of the hardened zone is to be in accordance with the approved specification. For nitrided gearing, the full depth of the hardened zone, (i.e. depth to core hardness), is to be not less than 0.5 mm and the hardness at a depth of 0.25 mm is to be not less than 500 HV.

**CHAPTER 5 Steel Forgings****SECTION 6 Forgings for turbines****6. 1 Scope**

- 6. 1. 1 Provision is made in this Section for ferritic steel forgings for turbine rotors, discs and spindles, turbine-driven generator rotors and compressor rotors.
- 6. 1. 2 Plans for rotor forgings are to state whether the rotor is intended for propulsion or auxiliary machinery and the shaft power of auxiliary turbines. In the case of a rotor which is to be tested for thermal stability, the maximum operating temperature and the proposed test temperature are also to be stated.
- 6. 1. 3 Specifications of alloy steel forgings giving the proposed chemical composition, heat treatment and mechanical properties are to be submitted for approval with the plans of the components.
- 6. 1. 4 Where it is proposed to use rotors of welded construction, the compositions of the steels for the forgings are to be submitted for special consideration, together with details of the proposed welding procedure. Welding procedure tests may be required.

**6. 2 Manufacture**

- 6. 2. 1 Forgings are to be manufactured in accordance with the requirements of [Ch 5, 1 General requirements](#), except that for rotors the forging reduction is to be not less than 2.5 to 1. Where an upsetting operation is included in the manufacturing procedure, the above requirement applies to the cross-sectional area of the upset bloom and not to that of the ingot.

**6. 3 Chemical composition**

- 6. 3. 1 The chemical composition of ladle samples is to comply with [Ch 5, 3.2 Chemical composition 3.2.1](#) for carbon and carbon-manganese steels and [Ch 5, 1.4 Chemical composition 1.4.3](#) for alloy steels.

**6. 4 Heat treatment**

- 6. 4. 1 Forgings are to be supplied in the heat treated condition, and the thermal treatment at all stages is to be such as to avoid the formation of hair-line cracks. At a suitable stage of manufacture, the forgings are to be reheated above the upper critical point to refine the grain, cooled in an approved manner and then tempered to produce the desired mechanical properties.
- 6. 4. 2 Where forgings receive their main heat treatment before machining, they are to be stress relieved after rough machining. Forgings which are heat treated in the rough machined condition need not be stress relieved provided that they have been slowly cooled from the tempering temperature.

6. 4. 3 The tempering and stress relieving temperatures are to be not less than 550°C for carbon and carbon-manganese steels, and not less than 600°C for alloy steels. The holding times and subsequent cooling rates are to be such that the forging in its final condition is free from harmful residual stresses.
6. 4. 4 Details of the proposed heat treatment for rotors of welded construction are to be submitted for approval.

## 6. 5 Mechanical tests

6. 5. 1 At least one tensile test specimen, cut in a longitudinal direction, is to be taken from each rotor forging. For forgings exceeding both 3 tonnes in mass and 2000 mm in length, tests are to be taken from each end.
6. 5. 2 For rotor forgings of all main propulsion machinery and of auxiliary turbines exceeding 1100 kW, tangential and, where the dimensions permit, radial tensile tests are to be taken from the end of the body corresponding to the top end of the ingot, See [Figure 5. 6. 1: Test positions for turbine rotor forgings](#).

**Figure 5. 6. 1: Test positions for turbine rotor forgings**

6. 5. 3 For each turbine disc, at least one tensile test specimen is to be cut in a tangential direction from material at the hub, See [Figure 5. 6. 2: Test positions for turbine disc forgings](#).
6. 5. 4 For the tests required by [Ch 5, 6.5 Mechanical tests 6.5.1](#) to [Ch 5, 6.5 Mechanical tests 6.5.3](#), sufficient test material is to be left on each forging and is not to be removed until all heat treatment, including stress relieving, has been completed. In this connection, a thermal stability test does not form part of the heat treatment of a turbine forging. Any excess test material is not to be completely severed from a forging until all the mechanical tests have been completed with satisfactory results.

**Figure 5. 6. 2: Test positions for turbine disc forgings**

6. 5. 5 [Table 5. 6. 1: Mechanical properties for acceptance purposes: carbon-manganese steel forgings for turbines - Normalised and tempered](#) and [Table 5. 6. 2: Mechanical properties for acceptance purposes: alloy steel forgings for turbines - Quenched and tempered or normalised and tempered](#) give the minimum requirements for yield stress, elongation and reduction of area corresponding to different strength levels, but it is not intended that these should necessarily be regarded as specific grades. The strength levels have been given in multiples of 40 N/mm<sup>2</sup>, or 50 N/mm<sup>2</sup> for alloy steels, to facilitate interpolation for intermediate values of specified minimum tensile strength.
6. 5. 6 Forgings may be supplied to any specified minimum tensile strength selected within the general limits detailed in [Table 5. 6. 1: Mechanical properties for acceptance purposes: carbon-manganese steel forgings for turbines - Normalised and tempered](#) or [Table 5. 6. 2: Mechanical properties for acceptance purposes: alloy steel forgings for turbines - Quenched and tempered or normalised and tempered](#).
6. 5. 7 The results of all tensile tests are to comply with the requirements of [Table 5. 6. 1: Mechanical properties for acceptance purposes: carbon-manganese steel forgings for turbines - Normalised and tempered](#) or [Table 5. 6. 2: Mechanical properties for acceptance purposes: alloy steel forgings for turbines - Quenched and tempered or normalised and tempered](#) or normalised and tempered appropriate to the specified minimum tensile strength. For monobloc rotor forgings, the specified minimum tensile strength is not to exceed 800 N/mm<sup>2</sup>.

## 6. 6 Non-destructive examination

6. 6. 1 The end faces of the body of rotor forgings and the end faces of the boss and the bore surface of each turbine disc are to be machined to a fine smooth finish for visual and magnetic particle examination.
6. 6. 2 The manufacturer is to carry out an ultrasonic examination of each forging and is to provide the Surveyor with a signed statement that such inspection has not revealed any significant internal defects.
6. 6. 3 Rotor forgings for propulsion machinery and for auxiliary turbines exceeding 1100 kW are to be hollow bored for internal examination. The surface of the bore is to have a fine smooth finish and is to be examined by means of an optical instrument of suitable magnification. Where the bore size permits, magnetic particle examination is also to be carried out. These examinations are to be confirmed by the Surveyor. Alternatively, an approved method of ultrasonic examination may be accepted instead of hollow boring. Details of the proposed method of ultrasonic examination are to be submitted for special consideration.

**Table 5. 6. 1: Mechanical properties for acceptance purposes: carbon-manganese steel forgings for turbines - Normalised and tempered**

| Tensile strength<br>N/mm <sup>2</sup>  | Yield stress<br>N/mm <sup>2</sup> minimum | Elongation<br>5.65 $\sqrt{S_0}$ % minimum |    |    | Reduction of<br>area % minimum |    |    |
|--|---|---|----|----|--------------------------------|----|----|

| Columns A are applicable to longitudinal tests from rotor and spindle forgings.<br>Columns B are applicable to tangential tests from rotor forgings.<br>Columns C are applicable to radial tests from rotor forgings.<br>Intermediate values may be obtained by interpolation. |   |   |    |    |                                |    |    |

## 6. 7 Thermal stability tests

6. 7. 1 Thermal stability tests after heat treatment and rough machining of the turbine rotors, referred to in the relevant Rules dealing with design and construction, are to be undertaken in properly constructed furnaces, using accurate and reliable measuring equipment. Each test is to be carried out in accordance with the following recommended procedure:
- Five bands are to be machined concentric with the axis of rotation. Two of these are to be reference bands and are to be positioned at or near the locations of the bearings. The remaining three bands are to be test bands located one as near as possible to the mid-length, and the other two near each end of the body. Where the length of a rotor is such that five bands cannot be provided, alternative proposals are to be submitted to the Surveyor for his approval.
  - Four positions, 90° apart, are to be stamped A, B, C and D on the coupling end of the rotor.
  - The whole of the body, and as much of the shaft at either end as will include the positions of the glands, is to be enclosed in the furnace. In the case of a rotor having an overhung astern wheel, the astern wheel is also to be enclosed in the furnace during the first test.
  - The rotor is to be rotated at a uniform and very low speed.
  - The deflections at all bands are to be recorded at the A, B, C and D positions. Initial cold readings are to be taken prior to heating.
  - The rotor is to be heated uniformly and slowly. Temperatures are to be recorded continuously at the surface of the rotor and, if practicable, in the bore at the mid-length of the body. In no circumstances is the surface temperature to exceed the temperature at which the rotor was tempered. During heating, the rate of rise of temperature is to be such as to avoid excessive temperature gradients in the rotor.
  - The maximum or holding temperature is to be not less than 28°C above the maximum operating temperature of the rotor. For the purposes of the test, the holding period is to start when the rotor has attained a uniform and specified temperature. The rotor is to be held under the specified temperature conditions until not less than three consecutive hourly readings of deflections show the radial eccentricity to be constant within 0.006 mm on all test bands.
  - The turbine rotor is to be rotated during cooling until the temperature is not more than 100°C. The rate of cooling is to be such as to avoid excessive temperature gradients in the rotor.

- i. Final cold readings are to be taken.

**Table 5. 6. 2: Mechanical properties for acceptance purposes: alloy steel forgings for turbines - Quenched and tempered or normalised and tempered**

| Tensile strength<br>N/mm <sup>2</sup> (See Note) | Yield stress<br>N/mm <sup>2</sup> minimum<br>Normalised and tempered | Yield stress<br>N/mm <sup>2</sup> minimum<br>Quenched and tempered | Elongation on $5.65 \sqrt{S_0}$<br>% minimum |    |    | Reduction of area %<br>minimum |    |    |
|--|--|--|--|----|----|--------------------------------|----|----|
|  |  |  | A  | B  | C  | A                              | B  | C  |
| 500 – 650  | 275  | –  | 22   | 20 | 18 | 50                             | 40 | 35 |
| 550 – 700  | 300  | –  | 20   | 18 | 16 | 50                             | 40 | 35 |
| 600 – 750  | 330  | 410  | 18   | 16 | 14 | 50                             | 40 | 35 |
| 650 – 800  | 355  | 450  | 17   | 15 | 13 | 50                             | 40 | 35 |
| 700 – 850  | 385  | 490  | 16   | 14 | 12 | 45                             | 35 | 30 |
| 750 – 900  | –  | 530  | 15   | 13 | 11 | 45                             | 35 | 30 |
| 800 – 950  | –  | 590  | 14   | 12 | 10 | 45                             | 35 | 30 |
| 850 – 1000                                       | –  | 640  | 13   | 11 | 9  | 40                             | 30 | 25 |
| 900 – 1050                                       | –  | 690  | 13   | 11 | 9  | 40                             | 30 | 25 |
| 950 – 1100                                       | –  | 750  | 12   | 10 | 8  | 40                             | 30 | 25 |
| 1000 – 1150                                      | –  | 810  | 12   | 10 | 8  | 40                             | 30 | 25 |

Columns A are applicable to longitudinal tests from rotor and spindle forgings. Columns B are applicable to tangential tests from rotor and spindle forgings, and to tangential tests from discs – test position B in [Figure 5. 6. 2: Test positions for turbine disc forgings](#). Columns C are applicable to radial test from rotor forgings and to tangential tests from discs – test position C in [Figure 5. 6. 2: Test positions for turbine disc forgings](#). Intermediate values may be obtained by interpolation.

6. 7. 2 The movements of the axis of the rotor in relation to the reference bands are to be determined from polar plots of the deflection readings. The radial movement of the shaft axis, as determined by the difference between the final hot and the final cold movements, is not to exceed 0.025 mm on any one band. As verification that test equipment and conditions are satisfactory, it is required that similar determinations of differences between initial cold and final cold movements do not exceed 0.025 mm on any one band.
6. 7. 3 If the results of the test on a rotor fail to meet either or both of the requirements in [Ch 5, 6.7 Thermal stability tests 6.7.2](#), the test may be repeated if requested by the maker and agreed by the Surveyor. In the case of a rotor failing to meet the requirements of a thermal stability test, the rotor is deemed unacceptable. Proposals for the rectification of thermal instability of a rough machined rotor are to be submitted for special consideration.

CHAPTER 5 **Steel Forgings**SECTION 7 **Forgings for boilers, pressure vessels and piping systems****7.1 Scope**

- 7.1.1 Provision is made in this Section for carbon-manganese and low alloy steel forgings intended for use in the construction of boilers, pressure vessels and piping systems where the design temperature is not lower than 0°C.
- 7.1.2 In addition to specifying mechanical properties at ambient temperature for the purposes of acceptance testing, these requirements give details of appropriate mechanical properties at elevated temperatures to be used for design purposes.
- 7.1.3 Forgings used in the construction of equipment for the containment of liquefied gases are to comply with the requirements of [Ch 5, 8 Ferritic steel forgings for low temperature service](#), except for those used in piping systems, where the design temperature is not lower than 0°C. Forgings for other pressure vessels and piping systems, where the use of steels with guaranteed impact properties at low temperatures is required, are also to comply with [Ch 5, 8 Ferritic steel forgings for low temperature service](#).

**7.2 Chemical composition**

- 7.2.1 The chemical composition of ladle samples is to comply with the appropriate requirements of [Table 5. 7. 1: Chemical composition](#).

**7.3 Heat treatment**

- 7.3.1 Carbon-manganese steel forgings are to be normalised, normalised and tempered or quenched and tempered.
- 7.3.2 Alloy steel forgings are to be normalised and tempered or quenched and tempered.
- 7.3.3 No forging is to be fully heat treated more than twice.

**7.4 Mechanical tests**

- 7.4.1 Except as provided in [Ch 5, 7.4 Mechanical tests 7.4.2](#) and [Ch 5, 7.4 Mechanical tests 7.4.4](#), at least one tensile test is to be taken from each forging and, where the dimensions and shape allow, the test specimen is to be cut in the longitudinal direction.

**Table 5. 7. 1: Chemical composition**

|               |  |   |
|---------------|--|---|
| Type of steel |  | Chemical composition of ladle samples % |
|---------------|--|---|

|   |                                       |           |           |           |           |        |                         | 2.0-2.5           | 0.90-1.20 |
| <p><b>Note 1.</b> Fine grained steels are to contain: aluminium (acid soluble) 0.015% min. or aluminium (total) 0.018% min.</p> <p><b>Note 2.</b> For alloy steels, aluminium (acid soluble) 0.020% max. The determination of the aluminium (total) content is acceptable provided the above value is not exceeded.</p> <p><b>Note 3.</b> Niobium may be used as a grain refiner in place of aluminium, in which case the content is to be in the range 0.01% to 0.06%.</p> |                                       |           |           |           |           |        |                         |                   |           |

7. 4. 2 On seamless drums and headers which are initially forged with open ends, test material is to be provided at each end of each forging. Where forged with one solid end, test material is to be provided at the open end only. Except where the ends are to be subsequently closed by forging, the test material is not to be removed until heat treatment has been completed. Where the ends are to be closed, rings of test material are to be cut off prior to the closing operation and are to be heat treated with the finished forging. In all cases, the test specimens are to be cut in the circumferential direction.
7. 4. 3 Unless otherwise agreed, tensile test specimens are to be taken with their axis at approximately 12.5 mm below the surface of the forging.
7. 4. 4 Small forgings may be batch tested in accordance with [Ch 5, 1.6 Test material 1.6.4](#) provided that hardness tests are carried out on each forging. In such cases, the mass of each forging is not to exceed 1 tonne and that of the batch is not to exceed 10 tonnes and the hardness values are to accord with [Table 5. 7. 2: Mechanical properties for acceptance purposes](#).
7. 4. 5 If required by the Surveyors or by the Fabricators, test material may be given a simulated stress relieving heat treatment prior to the preparation of the test specimens. This has to be stated on the order, together with agreed details of the simulated heat treatment and the mechanical properties which can be expected.
7. 4. 6 Except as provided in [Ch 5, 7.4 Mechanical tests 7.4.7](#), the results of all tensile tests are to comply with the requirements given in [Table 5. 7. 2: Mechanical properties for acceptance purposes](#) appropriate to the specified minimum tensile strength.
7. 4. 7 Where tests are taken at a depth greater than 12.5 mm from the surface or where they are taken in a transverse direction, the mechanical properties which can be expected are to be agreed.

7. 4. 8 On seamless drums and headers where tests are taken from each end, the variation in tensile strength is not to exceed 70 N/mm<sup>2</sup>.
7. 4. 9 For small batch-tested forgings, the hardness values are to comply with the requirements of [Table 5. 7. 2: Mechanical properties for acceptance purposes](#) appropriate to the specified minimum tensile strength. If forgings of more than one thickness are to be supplied from one cast, then the test is to be made on the thickest forging.

## 7. 5 Non-destructive examination

7. 5. 1 Non-destructive testing is to be carried out in accordance with the requirements of the approved forging drawing and specification, or as otherwise agreed between the manufacturer, purchaser and Surveyor.

## 7. 6 Pressure tests

7. 6. 1 Where applicable, pressure tests are to be carried out in accordance with the requirements of the relevant Rules.

## 7. 7 Mechanical properties for design purposes

7. 7. 1 Nominal values for the minimum lower yield or 0.2 per cent proof stress at temperatures of 50°C and higher are given in [Table 5. 7. 3: Mechanical properties for design purposes](#). These values are intended for design purposes only, and verification is not required except for materials complying with National or proprietary specifications where the elevated temperature properties used for design purposes are higher than those given in [Table 5. 7. 3: Mechanical properties for design purposes](#).

**Table 5. 7. 2: Mechanical properties for acceptance purposes**

CHAPTER **5 Steel Forgings**SECTION **8 Ferritic steel forgings for low temperature service****8. 1 Scope**

- 8. 1. 1 The requirements for carbon-manganese and nickel steels suitable for low temperature service are detailed in this Section. They are applicable to all forgings used for the construction of cargo tanks, storage tanks and process pressure vessels for liquefied gases and, where the design temperature is less than 0°C, to forgings for the piping systems.
- 8. 1. 2 The requirements are also applicable to forgings for other pressure vessels and pressure piping systems where the use of steels with guaranteed impact properties at low temperatures is required.
- 8. 1. 3 In all cases, details of the proposed chemical composition, heat treatment and mechanical properties are to be submitted for approval.
- 8. 1. 4 In addition to the steels in this Section, the austenitic stainless steels detailed in [Ch 5, 9 Stainless steel forgings](#) may also be used for low temperature applications.

**8. 2 Chemical composition**

- 8. 2. 1 The chemical composition of ladle samples is, in general, to comply with the requirements given in [Table 5. 8. 1: Chemical composition of ferritic steel forgings](#).

**8. 3 Heat treatment**

- 8. 3. 1 Forgings are to be normalised, normalised and tempered or quenched and tempered in accordance with the approved specification.

**8. 4 Mechanical tests**

- 8. 4. 1 At least one tensile and three Charpy V-notch impact test specimens are to be taken from each forging or each batch of forgings. Where the dimensions and shape allow, the test specimens are to be cut in a longitudinal direction.
- 8. 4. 2 The impact tests are to be carried out at a temperature appropriate to the type of steel and for the proposed application. Where forgings are intended for ships for liquefied gases, the test temperature is to be in accordance with the requirements given in [Ch 3, 6.4 Mechanical tests 6.4.6 in Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#).
- 8. 4. 3 The results of all tensile tests are to comply with the approved specification.
- 8. 4. 4 The average energy values for impact tests are also to comply with the approved specification and generally with the requirements of [Ch 3, 6 Carbon-manganese and nickel alloy steels for low](#)

[temperature service](#). One individual value may be less than the required average value provided that it is not less than 70 per cent of this value. See [Ch 2, 1.4, Re-testing procedures](#) for re-test procedures.

## 8. 5 Non-destructive examination

8. 5. 1 Non-destructive testing is to be carried out in accordance with the requirements of the approved forging drawing and specification, or as otherwise agreed between the manufacturer, purchaser and Surveyor.

## 8. 6 Pressure tests

8. 6. 1 When applicable, pressure tests are to be carried out in accordance with the requirements of the relevant Rules.

| <b>Note</b> The steel is to contain aluminium, niobium, vanadium or other suitable grain refining elements either singly or in any combination. When used singly, the steel is to contain the specified minimum content of the grain refining element. When used in combination, the specified minimum content of each element is not applicable. |           |           |             |             |            |            |   |                         |   |

CHAPTER **5 Steel Forgings**SECTION **9 Stainless steel forgings****9.1 General**

- 9.1.1 Forgings in austenitic and duplex stainless steels are acceptable for use in the construction of cargo tanks, storage tanks and piping systems for chemicals and liquefied gases. They may also be accepted for elevated temperature service in boilers.
- 9.1.2 Where it is proposed to use forgings in these types of steels, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval. These are to comply, in general, with the requirements of [Ch 3, 7 Austenitic and duplex stainless steels](#) for austenitic steel plates.

**9.2 Chemical composition**

- 9.2.1 The chemical composition of ladle samples is to comply with the requirements given in [Table 5.9.1: Chemical composition of stainless steel forgings](#).
- 9.2.2 Consideration will be given to the use of steels whose compositions are outside the scope of [Table 5.9.1: Chemical composition of stainless steel forgings](#).

**9.3 Heat treatment**

- 9.3.1 All materials are to be supplied in the solution treated condition.

**9.4 Mechanical tests**

- 9.4.1 Tensile test specimens are to be taken in accordance with the appropriate requirements of [Ch 5, 1.7 Mechanical tests](#).
- 9.4.2 The results of all tensile tests and impact tests are to comply with the requirements of [Table 5.9.2: Mechanical properties for acceptance purposes: stainless steel forgings](#) or the approved specification.
- 9.4.3 For austenitic stainless steel forgings, impact tests may be omitted subject to prior agreement with ACS.

**9.5 Mechanical properties for design purposes**

- 9.5.1 Where austenitic stainless steel forgings are intended for service at elevated temperatures, the nominal values for the minimum one per cent proof stress at temperatures of 100°C and higher given in [Table 5.9.3: Mechanical properties for design purposes: austenitic stainless steels](#) may be used for design purposes. Verification of these values is not required except for material complying with a National or proprietary specification in which the elevated temperature

properties proposed for design purposes are higher than those given in [Table 5. 9. 3: Mechanical properties for design purposes: austenitic stainless steels](#).

## 9. 6 Non-destructive examination

9. 6. 1 Non-destructive examination is to be carried out in accordance with the requirements of the approved forging drawing and specification or as otherwise agreed between the manufacturer, purchaser and Surveyor.

## 9. 7 Corrosion tests

9. 7. 1 Where corrosive conditions are anticipated in service, for grades 304, 316 and 317 intergranular corrosion tests are required in accordance with [Ch 2, 9.1 Intergranular corrosion test](#). Such tests may also be required for grades 304L, 316L and 347.
9. 7. 2 Where corrosive conditions are anticipated in service, for duplex stainless grades pitting corrosion tests are required in accordance with [Ch 2, 9.2 Pitting corrosion test](#). Unless otherwise specified, the test temperatures shall be 20°C for S31803 and 30°C for S32750.

**Table 5. 9. 1: Chemical composition of stainless steel forgings**

| Type of steel   | Chemical composition % ( <i>See Note</i> ) |       |       |       |       |           |         |           |                     |

CHAPTER **6 Steel Pipes and Tubes**

SECTION **1 General requirements**

## 1.1 Scope

- 1.1.1 This Section gives the general requirements for boiler tubes, superheater tubes and pipes intended for use in the construction of boilers, pressure vessels and pressure piping systems.
- 1.1.2 In addition to specifying mechanical properties for the purpose of acceptance testing, these requirements give details of appropriate mechanical properties at elevated temperatures to be used for design purposes.
- 1.1.3 Except for pipes for Class III pressure systems (as defined in the relevant Rules), all pipes and tubes are to be manufactured and tested in accordance with the requirements of [Ch 1 General Requirements](#) and [Ch 2 Testing Procedures for Metallic Materials](#), the general requirements of this Section and the appropriate specific requirements given in [Ch 6, 2 Seamless pressure pipes](#), [Ch 6, 3 Welded pressure pipes](#), [Ch 6, 4 Ferritic steel pressure pipes for low temperature service](#), [Ch 6, 5 Stainless steel pressure pipes](#) and [Ch 6, 6 Boiler and superheater tubes](#).
- 1.1.4 Steels intended for the piping systems for liquefied gases where the design temperature is less than 0°C are to comply with the specific requirements of [Ch 6, 4 Ferritic steel pressure pipes for low temperature service](#) or [Ch 6, 5 Stainless steel pressure pipes](#).
- 1.1.5 As an alternative to [Ch 6, 1.1 Scope 1.1.3](#) and [Ch 6, 1.1 Scope 1.1.4](#), pipes or tubes which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Chapter or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of [Ch 1 General Requirements](#).
- 1.1.6 At the discretion of the Surveyor, a modified testing procedure may be adopted for small quantities of materials. In such cases, these may be accepted on the manufacturer's declared chemical composition and hardness tests or other evidence of satisfactory properties.
- 1.1.7 Pipes for Class III pressure systems are to be manufactured and tested in accordance with the requirements of an acceptable National specification. The manufacturer's test certificate will be acceptable and is to be provided for each consignment of material. Forge butt welded pipes are not acceptable for fuel oil systems, heating coils in oil tanks, primary refrigerant systems and other applications where the pressure exceeds 0.4 MPa.

## 1.2 Manufacture

- 1.2.1 Pipes for Class I and II pressure systems, boiler and superheater tubes are to be manufactured at works approved by Asia Classification Society (hereinafter referred as 'ACS'). The steel used is to be manufactured and cast in ingot moulds or by an approved continuous casting process as detailed in [Ch 3, 1.4 Manufacture](#).

1. 2. 2 Unless a particular method is requested by the purchaser, pipes and tubes may be manufactured by any of the following methods:
  - Hot finished seamless.
  - Cold finished seamless.
  - Electric resistance or induction welded.
  - Cold finished electric resistance or induction welded.
  - Electric fusion welded.
1. 2. 3 Care is to be taken during manufacture that the pipe or tube surfaces coming in contact with any non-ferrous metals or their compounds are not contaminated to such an extent as could prove harmful during subsequent fabrication and operation.

### **1. 3 Quality**

1. 3. 1 All pipes and tubes are to have a workmanlike finish and are to be clean and free from such surface and internal defects as can be established by the specified tests.
1. 3. 2 All pipes and tubes are to be reasonably straight. The ends are to be cut nominally square with the axis of the pipe or tube, and are to be free from excessive burrs.

### **1. 4 Dimensional tolerances**

1. 4. 1 The tolerances on the wall thickness and diameter of pipes and tubes are to be in accordance with an acceptable National specification.

### **1. 5 Chemical composition**

1. 5. 1 The requirements for the chemical composition of ladle samples and acceptable methods of deoxidation are detailed in subsequent Sections in this Chapter.

### **1. 6 Heat treatment**

1. 6. 1 All pipes and tubes are to be supplied in the condition detailed in the relevant specific requirements.

### **1. 7 Test material**

1. 7. 1 Pipes and tubes are to be presented for test in batches. The size of a batch and the number of tests to be performed are dependent on the application.
1. 7. 2 Where heat treatment has been carried out, a batch is to consist of pipes or tubes of the same size, manufactured from the same types of steel and subjected to the same finishing treatment in a continuous furnace, or heat treated together in the same batch type furnace.
1. 7. 3 Where no heat treatment has been carried out, a batch is to consist of pipes or tubes of the same size manufactured by the same method from material of the same type of steel.
1. 7. 4 For pipes for Class I pressure systems and boiler and superheater tubes, at least two per cent of the number of lengths in each batch is to be selected at random for the preparation of tests at ambient temperature.

1. 7. 5 For pipes for Class II pressure systems, each batch is to contain not more than the number of lengths given in [Table 6. 1. 1: Batch sizes for pipes for Class II pressure systems](#). Tests are to be carried out on at least one pipe selected at random from each batch or part thereof.

**Table 6. 1. 1: Batch sizes for pipes for Class II pressure systems**

| Outside diameter mm | Number in batch   |
|---------------------|-------------------|
| ≤323.9              | 200 pipes as made |
| >323.9              | 100 pipes as made |

## 1. 8 Dimensions of test specimens and test procedures

1. 8. 1 The procedures for mechanical tests and the dimensions of the test specimens are to be in accordance with [Ch 2 Testing Procedures for Metallic Materials](#).

## 1. 9 Visual and non-destructive testing

1. 9. 1 All pipes for Class I and II pressure systems, boiler and superheater tubes, are to be presented for visual examination and verification of dimensions. The manufacturer is to provide adequate lighting conditions to enable an internal and external examination of the pipes and tubes to be carried out.
1. 9. 2 For welded pipes and tubes, the manufacturer is to employ suitable non-destructive methods for the quality control of the welds. It is preferred that this examination is carried out on a continuous basis.

## 1. 10 Hydraulic test

1. 10. 1 Each pipe and tube is to be subjected to a hydraulic test at the manufacturer's works.
1. 10. 2 The hydraulic test pressure is to be determined from the following formula, except that the maximum test pressure need not exceed 14 MPa:

$$P = \frac{2st}{D}$$

= test pressure, in MPa

where

$P$

$D$

$t$

$s$

= nominal outside diameter, in mm

= nominal wall thickness, in mm

= 80 per cent of the specified minimum yield stress, in N/mm<sup>2</sup>, for ferritic steels and 70 per cent of the specified minimum, 1.0 per cent proof stress, in N/mm<sup>2</sup>, for austenitic steels. These relate to the values specified for acceptance testing at ambient temperature.

1. 10. 3 The test pressure is to be maintained for sufficient time to permit proof and inspection. Unless otherwise agreed, the manufacturer's certificate of satisfactory hydraulic test will be accepted.

Where it is proposed to adopt a test pressure other than that determined as in [Ch 6, 1.10 Hydraulic test 1.10.2](#), the proposal will be subject to special consideration.

1. 10. 4 Subject to special approval, either an ultrasonic or eddy current test can be accepted in lieu of the hydraulic test.

## **1. 11 Rectification of defects**

1. 11. 1 Surface imperfections may be removed by grinding provided that the thickness of the pipe or tube after dressing is not less than the required minimum thickness. The dressed area is to be blended into the contour of the tube.
1. 11. 2 By agreement with the Surveyor, the repair of minor defects by welding can be accepted, subject to welding procedure tests which demonstrate acceptable properties appropriate for the grade of pipe to be repaired. Weld procedure tests are to be subjected to the same heat treatment as will be applied to the actual pipes after weld repair.
1. 11. 3 The repaired area is to be tested by magnetic particle examination, or, for austenitic steels, by liquid penetrant examination on completion of welding, heat treatment and surface grinding.

## **1. 12 Identification**

1. 12. 1 Pipes and tubes are to be clearly marked by the manufacturer in accordance with the requirements of [Ch 1 General Requirements](#). The following details are to be shown on all materials which have been accepted:
  - a. ACS or Asia Classification Society.
  - b. Manufacturer's name or trade mark.
  - c. Identification mark for the specification or grade of steel.
  - d. Identification number and/or initials which will enable the full history of the item to be traced.
1. 12. 2 It is recommended that hard stamping be restricted to the end face, but it may be accepted in other positions in accordance with National Standards and practices.

## **1. 13 Certification of materials**

1. 13. 1 Unless a ACS certificate is specified in other parts of the Rules, a manufacturer's certificate validated by ACS is to be issued, *See* [Ch 1, 3.1, General](#).
1. 13. 2 The manufacturer is to provide ACS with the following information:
  - a. Purchaser's name and order number.
  - b. If known, the contract number for which the material is intended.
  - c. Address to which material is despatched.
  - d. Specification or the grade of material.
  - e. Description and dimensions.
  - f. Identification number and/or initials.
  - g. Cast number and chemical composition of ladle samples.
  - h. Mechanical test results, and results of the intercrystalline corrosion tests where applicable.
  - i. Condition of supply.
1. 13. 3 As a minimum, the chemical composition stated on the certificate is to include the content of all the elements detailed in the specific requirements. Where rimming steel is supplied, this is to be stated on the certificate.
1. 13. 4 When steel is not produced at the pipe or tube mill, a certificate is to be supplied by the steelmaker stating the process of manufacture, the cast number and the ladle analysis.

1. 13. 5 The steel manufacturer's works is to be approved by ACS.

## CHAPTER 6 Steel Pipes and Tubes

### SECTION 2 Seamless pressure pipes

#### 2. 1 Scope

2. 1. 1 Provision is made in this Section for seamless pressure pipes in carbon, carbon-manganese and low alloy steels.
2. 1. 2 Where pipes are used for the manufacture of pressure vessel shells and headers, the requirements for forgings in [Ch 5, 7 Forgings for boilers, pressure vessels and piping systems](#) are applicable where the wall thickness exceeds 40 mm.

#### 2. 2 Manufacture and chemical composition

2. 2. 1 Pipes are to be manufactured by a seamless process and may be hot or cold finished.
2. 2. 2 The method of deoxidation and the chemical composition of ladle samples are to comply with the appropriate requirements given in [Table 6. 2. 1: Chemical composition of seamless pressure pipes](#).

**Table 6. 2. 1: Chemical composition of seamless pressure pipes**

| Type of steel                      | Grade | Method of deoxidation | Chemical composition of ladle samples % |           |           |        |        |   |             |             |           |           |   |        |

## 2. 3 Heat treatment

2. 3. 1 Pipes are to be supplied in the condition given in [Table 6. 2. 2: Heat treatment](#).

## 2. 4 Mechanical tests

2. 4. 1 All pipes are to be presented in batches as defined in [Ch 6, 1 General requirements](#).
2. 4. 2 Each pressure pipe selected for test is to be subjected to tensile and flattening or bend tests.
2. 4. 3 The results of all mechanical tests are to comply with the appropriate requirements given in [Table 6. 2. 3: Mechanical properties for acceptance purposes: seamless pressure pipes \(maximum wall thickness 40 mm\)](#), See 2.1.2.

## 2. 5 Mechanical properties for design

2. 5. 1 Values for nominal minimum lower yield or 0.2 per cent proof stress at temperatures of 50°C and higher are given in [Table 6. 2. 4: Mechanical properties for design purposes: seamless pressure pipes](#) and are intended for design purposes only. Verification of these values is not required, except for materials complying with National or proprietary specification where the elevated temperature properties used for design are higher than those given in [Table 6. 2. 4: Mechanical properties for design purposes: seamless pressure pipes](#).
2. 5. 2 In such cases, at least one tensile test at the proposed design or other agreed temperature is to be made on each cast. The test specimen is to be taken from material adjacent to that used for tests at ambient temperature and tested in accordance with the procedures given in [Ch 2 Testing Procedures for Metallic Materials](#). If tubes or pipes of more than one thickness are supplied from one cast, the test is to be made on the thickest tube or pipe.

**Table 6. 2. 2: Heat treatment**

| Type of steel                       | Condition of supply   |
|-------------------------------------|---|
| Carbon and carbon-manganese         |   |
| Hot finished                        | Hot finished ( <i>See Note 1</i> ) Normalised ( <i>See Note 2</i> ) |
| Cold finished                       | Normalised ( <i>See Note 2</i> )                                    |
| Alloy steel                         |   |
| 1Cr1 <sup>1</sup> / <sub>2</sub> Mo | Normalised and tempered   |
| 2 <sup>1</sup> / <sub>4</sub> Cr1Mo |   |
| Grade 410                           | Fully annealed  |
| Grade 490                           | Normalised and tempered<br>650—780°C                                |
| Grade 490                           | Normalised and tempered<br>650—750°C                                |

|   |                         |
|---|-------------------------|
| $\frac{1}{2}\text{Cr}\frac{1}{2}\text{Mo}\frac{1}{4}\text{V}$                                       | Normalised and tempered |
| <b>Note 1.</b> Provided that the finishing temperature is sufficiently high to soften the material. |                         |
| <b>Note 2.</b> Normalised and tempered at the option of the manufacturer.                           |                         |

2. 5. 3 As an alternative to [Ch 6, 2.5 Mechanical properties for design 2.5.2](#), a manufacturer may carry out an agreed comprehensive test program for a stated grade of steel to demonstrate that the specified minimum mechanical properties at elevated temperatures can be consistently obtained. This test program is to be carried out under the supervision of the Surveyors, and the results submitted for assessment and approval. When a manufacturer is approved on this basis, tensile tests at elevated temperatures are not required for acceptance purposes, but at the discretion of the Surveyors occasional check tests of this type may be requested.
2. 5. 4 Values for the estimated average stress to rupture in 100 000 hours are given in [Table 6. 2. 5: Mechanical properties for design purposes: seamless pressure pipes - Estimated values for stress to rupture in 100.000 hours \(units N/mm<sup>2</sup>\)](#) and may be used for design purposes.

**Table 6. 2. 3: Mechanical properties for acceptance purposes: seamless pressure pipes (maximum wall thickness 40 mm), See 2.1.2**

## PART

# 2

## CHAPTER 6 Steel Pipes and Tubes

### SECTION 3 Welded pressure pipes

#### 3.1 Scope

- 3.1.1 Provision is made in this Section for welded pressure pipes in carbon, carbon-manganese and low alloy steels.

#### 3.2 Manufacture and chemical composition

- 3.2.1 Pipes are to be manufactured by the electric resistance or induction welding process and, if required, may be subsequently hot reduced or cold finished.
- 3.2.2 Where it is proposed to use other welding processes, details of the welding processes and procedures are to be submitted for review.
- 3.2.3 In all cases, welding procedure tests are required. Test samples are to be subjected to the same heat treatment as the pipe.
- 3.2.4 The method of deoxidation and the chemical composition of ladle samples are to comply with the appropriate requirements given in [Table 6.3.1: Chemical composition of welded pressure pipes](#).

#### 3.3 Heat treatment

- 3.3.1 Pipes are to be supplied in the heat treated condition given in [Table 6.3.3: Heat treatment: welded pressure pipes](#).

#### 3.4 Mechanical tests

- 3.4.1 All pipes are to be presented in batches as defined in [Ch 6, 1 General requirements](#).
- 3.4.2 Each pressure pipe selected for test is to be subjected to tensile and flattening or bend tests.
- 3.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in [Table 6.3.2: Mechanical properties for acceptance purposes: welded pressure pipes](#).

#### 3.5 Mechanical properties for design

- 3.5.1 The mechanical properties at elevated temperature for carbon and carbon-manganese steels in Grades 320 to 460 and 1Cr $\frac{1}{2}$ Mo steel can be taken from the appropriate Tables in [Ch 6, 2 Seamless pressure pipes](#).

**CHAPTER 6 Steel Pipes and Tubes****SECTION 4 Ferritic steel pressure pipes for low temperature service****4. 1 Scope**

4. 1. 1 Provision is made in this Section for carbon, carbon-manganese and nickel pipes intended for use in the piping arrangements for liquefied gases where the design temperature is less than 0°C. These requirements are also applicable for other types of pressure piping systems where the use of steels with guaranteed impact properties at low temperatures is required.

**4. 2 Manufacture and chemical composition**

4. 2. 1 Carbon and carbon-manganese steel pipes are to be manufactured by a seamless, electric resistance or induction welding process.
4. 2. 2 Nickel steel pipes are to be manufactured by a seamless process.
4. 2. 3 Seamless pipes may be hot finished or cold finished. Welded pipes may be as-welded, hot finished or cold finished. The terms 'hot finished', 'cold finished' and 'as-welded' apply to the condition of the pipes before final heat treatment.
4. 2. 4 The method of deoxidation and the chemical composition of ladle samples are to comply with the appropriate requirements given in [Table 6. 4. 1: Chemical composition](#).

**4. 3 Heat treatment**

4. 3. 1 Pipes are to be supplied in the condition given in [Table 6. 4. 3: Heat treatment](#).

**4. 4 Mechanical tests**

4. 4. 1 All pipes are to be presented for test in batches as defined in [Ch 6, 1 General requirements](#) for Class 1 pressure piping systems, but in addition the material in each batch is to be from the same cast.
4. 4. 2 At least two per cent of the number of lengths in each batch is to be selected at random for the preparation of tests.
4. 4. 3 Each pressure pipe selected for test is to be subjected to tensile, flattening or bend test at room temperature and, where the wall thickness is 6 mm or greater, an impact test at the test temperature specified in [Table 6. 4. 2: Mechanical properties for acceptance purposes](#).
4. 4. 4 The impact tests are to consist of a set of three Charpy V-notch test specimens cut in the longitudinal direction with the notch perpendicular to the original surface of the pipe. The

dimensions of the test specimens are to be in accordance with the requirements of [Ch 2 Testing Procedures for Metallic Materials](#).

4. 4. 5 The results of all tensile, impact (when applicable), flattening and bend tests are to comply with the appropriate values in [Table 6. 4. 2: Mechanical properties for acceptance purposes](#). See [Ch 2, 1.4, Re-testing procedures](#) for re-testing procedures.

**Table 6. 4. 1: Chemical composition**

| Type of steel  | Grade       | Method of deoxidation | Chemical composition of ladle sample % |           |           |        |        |           |                               |  |

**CHAPTER 6 Steel Pipes and Tubes****SECTION 5 Stainless steel pressure pipes****5.1 Scope**

- 5.1.1 Provision is made in this Section for austenitic and duplex stainless steel pipes suitable for use in the construction of the piping systems for chemicals and for liquefied gases where the design temperature is not less than minus 165°C and for bulk chemical tankers.
- 5.1.2 Austenitic stainless steels may be suitable for service at elevated temperatures. Where such applications are proposed, details of the chemical composition, heat treatment and mechanical properties are to be submitted for consideration and approval.
- 5.1.3 Where it is intended to supply seamless pipes in the direct quenched condition, a programme of tests for approval is to be carried out under the supervision of the Surveyors, and the results are to be to the satisfaction of ACS, See [Ch 1, 2.2, ACS Approval – General](#).

**5.2 Manufacture and chemical composition**

- 5.2.1 Pipes are to be manufactured by a seamless or a continuous automatic electric fusion welding process.
- 5.2.2 Welding is to be in a longitudinal direction, with or without the addition of filler metal.
- 5.2.3 The chemical composition of the ladle samples is to comply with the appropriate requirements of [Table 6. 5. 1: Chemical composition](#).

**5.3 Heat treatment**

- 5.3.1 Pipes are generally to be supplied by the manufacturer in the solution treated condition over their full length.
- 5.3.2 Alternatively, seamless pipes may be direct quenched immediately after hot forming, while the temperature of the pipes is not less than the specified minimum solution treatment temperature.

**5.4 Mechanical tests**

- 5.4.1 All pipes are to be presented in batches as defined in [Ch 6, 1 General requirements](#) for Class I and II piping systems.
- 5.4.2 Each pipe selected for test is to be subjected to tensile and flattening or bend tests.
- 5.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in [Table 6. 5. 2: Mechanical properties for acceptance purposes](#).

## 5. 5 Corrosion tests

5. 5. 1 For materials used for piping systems for chemicals, corrosion tests are to be carried out on one per cent of the number of pipes in each batch, with a minimum of one pipe. For austenitic stainless

steels this should be an intercrystalline corrosion test (See [Ch 2, 9.1 Intergranular corrosion test](#)) and for duplex stainless steels this should be a pitting corrosion test (See [Ch 2, 9.2 Pitting corrosion test](#)). For the latter, the test temperatures shall be 20°C for S31803 and 30°C for S32750.

- 5. 5. 2 For pipes with an outside diameter not exceeding 40 mm, the test specimens are to consist of a full cross-section. For larger pipes, the test specimens are to be cut as circumferential strips of full wall thickness and having a width of not less than 12.5 mm. In both cases, the total surface area is to be between 15 and 35 cm<sup>2</sup>.
- 5. 5. 3 Unless otherwise agreed or required for a particular chemical cargo, the testing procedure is to be in accordance with [Ch 2, 9 Corrosion tests](#) for austenitic stainless steels and [Ch 12, 3.3 Duplex stainless steels 3.3.3.c](#) for duplex stainless steels.
- 5. 5. 4 After immersion, the full cross-section test specimens are to be subjected to a flattening test in accordance with the requirements of [Ch 2 Testing Procedures for Metallic Materials](#). The strip test specimens are to be subjected to a bend test through 90° over a mandrel of diameter equal to twice the thickness of the test specimen.

## 5. 6 Fabricated pipework

- 5. 6. 1 Fabricated pipework is to be produced from material manufactured in accordance with [Ch 6, 5.2 Manufacture and chemical composition](#), [Ch 6, 5.3 Heat treatment](#), [Ch 6, 5.4 Mechanical tests](#) and [Ch 6, 5.5 Corrosion tests](#).
- 5. 6. 2 Welding is to be carried out in accordance with an approved and qualified procedure by suitably qualified welders.
- 5. 6. 3 Fabricated pipework may be supplied in the as-welded condition without subsequent solution treatment provided that welding procedure tests have demonstrated satisfactory material properties including resistance to intercrystalline corrosion (austenitic stainless steel) or pitting corrosion (duplex stainless steel).
- 5. 6. 4 In addition, butt welds are to be subjected to 5 per cent radiographic examination for Class I, and 2 per cent for Class II pipes.
- 5. 6. 5 Fabricated pipework in the as-welded condition and intended for systems located on deck is to be protected by a suitable corrosion control coating.

## 5. 7 Certification of materials

- 5. 7. 1 Each test certificate is to be of the type and give the information detailed in [Ch 1, 3.1, General](#) together with general details of heat treatment and, where applicable, the results obtained from the appropriate corrosion tests. As a minimum, the chemical composition is to include the content of all the elements detailed in [Table 6. 5. 1: Chemical composition](#).

**CHAPTER 6 Steel Pipes and Tubes****SECTION 6 Boiler and superheater tubes****6.1 Scope**

- 6.1.1 Provision is made in this Section for boiler and superheater tubes in carbon, carbon-manganese and low alloy steels.
- 6.1.2 Austenitic stainless steels may also be used for this type of service. Where such applications are proposed, details of the chemical composition, heat treatment and mechanical properties are to be submitted for consideration and approval.

**6.2 Manufacture and chemical composition**

- 6.2.1 Tubes are to be seamless or welded and are to be manufactured in accordance with the requirements of [Ch 6, 2 Seamless pressure pipes](#) and [Ch 6, 3 Welded pressure pipes](#), respectively.
- 6.2.2 The method of deoxidation and the chemical composition of ladle samples are to comply with the requirements given in [Table 6. 2. 1: Chemical composition of seamless pressure pipes](#) or [Table 6. 3. 1: Chemical composition of welded pressure pipes](#), as appropriate.

**6.3 Heat treatment**

- 6.3.1 All tubes are to be supplied in accordance with the requirements given in [Table 6. 2. 2: Heat treatment](#) or [Table 6. 3. 3: Heat treatment: welded pressure pipes](#) as appropriate, except that 1Cr½Mo steel may be supplied in the normalised only condition when the carbon content does not exceed 0.15 per cent.

**6.4 Mechanical tests**

- 6.4.1 Tubes are to be presented for test in batches as defined in [Ch 6, 1 General requirements](#).
- 6.4.2 Each boiler and superheater tube selected for test is to be subjected to at least the following:
  - a. Tensile test.
  - b. Flattening or bending test.
  - c. Expanding or flanging test.
- 6.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in [Table 6. 6. 1: Mechanical properties for acceptance purposes: boiler and superheater tubes](#).

## 6. 5 Mechanical properties for design

6. 5. 1 The mechanical properties at elevated temperature for carbon and carbon-manganese steels in Grades 320 to 460, 1Cr $\frac{1}{2}$ Mo and 2 $\frac{1}{4}$ Cr1Mo steels can be taken from the appropriate Tables in [Ch 6, 2 Seamless pressure pipes](#).
6. 5. 2 Where rimming steel is used, the design temperature is limited to 400°C.

**Table 6. 6. 1: Mechanical properties for acceptance purposes: boiler and superheater tubes**

| Type of steel                                     | Grade                    | Yield stress<br>N/mm <sup>2</sup> | Tensile strength<br>N/mm <sup>2</sup> | Elongation on<br>$5.65\sqrt{S_0}\%$<br>minimum | Flattening test<br>constant<br>$\frac{C}{t}$ | Bend test<br>diameter of former<br>( $t$ = thickness) | Drift expanding and flanging test minimum % increase in outside diameter |          |      |

## PART

# 2

## CHAPTER 7 Iron Castings

### SECTION 1 General requirements

#### 1.1 Scope

- 1.1.1 This Section gives the general requirements for grey (flake), spheroidal (nodular) graphite and compacted (vermicular) graphite iron castings intended for use in the construction of ships, other marine structures, machinery, boilers, pressure vessels and piping systems.
- 1.1.2 Where required by the relevant Rules dealing with design and construction, castings are to be manufactured and tested in accordance with [Ch 1 General Requirements](#) and [Ch 2 Testing Procedures for Metallic Materials](#), together with the requirements given in this Section and either [Ch 7, 2 Grey iron castings](#) for grey iron castings, [Ch 7, 3 Spheroidal or nodular graphite iron castings](#) for spheroidal graphite iron castings or [Ch 7, 4 Compacted or vermicular graphite iron castings](#) for compacted graphite iron castings. Castings for crankshafts are additionally to comply with the requirements detailed in [Ch 7, 5 Iron castings for crankshafts](#).
- 1.1.3 As an alternative to [Ch 7, 1.1 Scope 1.1.2](#), castings which comply with National or proprietary specifications may be accepted, provided that these specifications give reasonable equivalence to the requirements of this Chapter or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of [Ch 1 General Requirements](#).
- 1.1.4 Where small castings are produced in large quantities, or where castings of the same type are produced in regular quantities, alternative survey procedures, in accordance with [Ch 1, 2.2, ACS Approval – General](#), may be adopted subject to approval by Asia Classification Society (hereinafter referred as ‘ACS’).

#### 1.2 Manufacture

- 1.2.1 Castings as designated in [Ch 7, 1.1 Scope 1.1.2](#) are to be made at foundries approved by ACS.
- 1.2.2 Suitable mechanical methods are to be employed for the removal of surplus material from castings. Thermal cutting processes are not acceptable, except as a preliminary operation to mechanical methods.

#### 1.3 Quality of castings

- 1.3.1 Castings are to be free from surface or internal defects which would be prejudicial to their proper application in service. The surface finish is to be in accordance with good practice and any specific requirements of the approved plan.

## 1.4 Chemical composition

- 1.4.1 The chemical composition of the iron used is left to the discretion of the manufacturer, who is to ensure that it is suitable to obtain the mechanical properties specified for the castings.

## 1.5 Heat treatment

- 1.5.1 Except as required by [Ch 7, 1.5 Heat treatment 1.5.2](#), castings may be supplied in either the as cast or heat treated condition.
- 1.5.2 For some applications, such as elevated temperature service, or where dimensional stability is important, castings may require to be given a suitable tempering or stress relieving heat treatment. This is to be carried out after any refining heat treatment and before machining.
- 1.5.3 Where it is proposed to carry out local hardening of the surface of a casting, full details of the proposed procedure are to be submitted for approval.

## 1.6 Test material

- 1.6.1 At least one test sample is to be provided for each casting or batch of castings. For large castings, where more than one ladle of metal is used, one test sample is to be provided, from each ladle used.
- 1.6.2 A batch testing procedure may be adopted for castings with a fettled mass of 1 tonne or less. All castings in a batch are to be of similar type and dimensions, and cast from the same ladle of metal. One test sample is to be provided for each multiple of two tonnes of fettled castings in the batch.
- 1.6.3 Where separately cast test samples are used, they are to be cast in moulds made from the same type of material as used for the castings and are not to be stripped from the moulds until the temperature is below 500°C.
- 1.6.4 All test samples are to be suitably marked to identify them with the castings which they represent.
- 1.6.5 Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent. For cast-on test samples, the sample is not to be separated from the casting until after heat treatment.

## 1.7 Mechanical tests

- 1.7.1 One tensile specimen is to be prepared from each test sample. The dimensions of the test specimens and the testing procedures used are to be in accordance with [Ch 2 Testing Procedures for Metallic Materials](#).
- 1.7.2 The results of all tensile tests are to comply with the requirements given in [Ch 7, 2 Grey iron castings](#), [Ch 7, 3 Spheroidal or nodular graphite iron castings](#), [Ch 7, 4 Compacted or vermicular graphite iron castings](#) or [Ch 7, 5 Iron castings for crankshafts](#), as appropriate.
- 1.7.3 In the case of castings supplied in the as cast condition which initially do not meet the requirements of [Ch 7, 1.7 Mechanical tests 1.7.2](#), the manufacturer, by agreement with the purchaser, has the right to heat treat the castings, together with the representative test samples, and re-submit them for acceptance.
- 1.7.4 In the case of a batch of castings supplied in the heat treated condition which initially do not meet the requirements of [Ch 7, 1.7 Mechanical tests 1.7.2](#), the manufacturer has the right to re-heat treat the batch together with the representative test samples, and re-submit the castings for acceptance. The number of reheat treatments and retestings will be restricted to two.

## **1. 8 Visual and non-destructive examination**

- 1. 8. 1 All castings are to be cleaned and adequately prepared for examination. The surfaces are not to be hammered, peened or treated in any way which may obscure defects.
- 1. 8. 2 The accuracy and verification of dimensions are the responsibility of the manufacturer, unless otherwise agreed.
- 1. 8. 3 All castings are to be presented to the Surveyor for visual examination and this is to include the examination of internal surfaces where applicable.
- 1. 8. 4 The non-destructive examination of castings is not required unless otherwise stated in the approved plan or where there is reason to suspect the soundness of the casting.
- 1. 8. 5 In the event of any casting proving defective during subsequent machining or testing it is to be rejected notwithstanding any previous certification.

## **1. 9 Rectification of defective castings**

- 1. 9. 1 At the discretion of the Surveyor, small surface blemishes may be removed by local grinding.
- 1. 9. 2 Subject to the prior approval of the Surveyor, castings containing local porosity may be rectified by vacuum impregnation with a suitable plastic filler, provided that the extent of the porosity is such that it does not adversely affect the strength of the casting.
- 1. 9. 3 Repairs by welding are not permitted on grey cast iron castings or compacted graphite iron castings and generally not permitted for spheroidal or nodular graphite iron castings, but may be considered in special circumstances for spheroidal or nodular graphite iron castings. In such cases, full details of the proposed repair procedure are to be submitted for approval prior to the commencement of the proposed rectification.

## **1. 10 Pressure testing**

- 1. 10. 1 When required by the relevant Rules, castings are to be pressure tested before final acceptance. These tests are to be carried out in the presence and to the satisfaction of the Surveyor.

## **1. 11 Identification of castings**

- 1. 11. 1 The manufacturer is to adopt a system of identification which will enable all finished castings to be traced to the original cast, and the Surveyor is to be given full facilities for tracing the castings when required.
- 1. 11. 2 Before acceptance, all castings which have been tested and inspected with satisfactory results are to be clearly marked by the manufacturer with the following particulars:
  - a. Type and grade of cast iron.
  - b. Identification number, cast number or other marking which will enable the full history of the casting to be traced.
  - c. Manufacturer's name or trade mark.
  - d. ACS or Asia Classification Society and the abbreviated name of ACS's.
  - e. Personal stamp of Surveyor responsible for inspection.
  - f. Test pressure, where applicable.
  - g. Date of final inspection.
- 1. 11. 3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

## 1. 12 Certification of materials

1. 12. 1 A ACS certificate is to be issued, See [Ch 1, 3.1, General](#).
1. 12. 2 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting or batch of castings which has been accepted:
  - a. Purchaser's name and order number.
  - b. Description of castings and quality of cast iron.
  - c. Identification number.
  - d. General details of heat treatment, where applicable.
  - e. Results of mechanical tests.
  - f. Test pressure, where applicable.
  - g. When specially required, the chemical analysis of ladle samples.
1. 12. 3 Where applicable, the manufacturer is to provide a signed statement regarding non-destructive testing as required by [Ch 7, 1.8 Visual and non-destructive examination](#), together with a statement and/or a sketch detailing the extent and position of all weld repairs made to each casting as required by [Ch 7, 1.9 Rectification of defective castings](#).

PART

# 2

CHAPTER **7 Iron Castings**

SECTION **2 Grey iron castings**

## **2. 1 Scope**

2. 1. 1 This Section gives the specific requirements for grey cast iron castings.

## **2. 2 Test material**

2. 2. 1 Separately cast test samples in the form of cylindrical bars, 30 mm diameter and of a suitable length, are to be used unless otherwise agreed by ACS. Test samples of other dimensions may be specially required for some components as may cast-on samples. In these circumstances, the tensile strength requirements are to be agreed.
2. 2. 2 When two or more test samples are cast simultaneously in a single mould, the bars are to be at least 50 mm apart.
2. 2. 3 Test samples may be cast integrally when a casting is both more than 20 mm thick and its mass exceeds 200 kg, subject to agreement between the manufacturer and the purchaser. The type and location of the samples are to be such as to provide approximately the same cooling conditions as for the casting it represents and are also subject to agreement.
2. 2. 4 For continuous melting of the same grade of cast iron in large tonnages the mass of a batch may be taken as the output of two hours of pouring.
2. 2. 5 Where [Ch 7, 2.2 Test material 2.2.4](#) applies and production is carefully monitored by systematic checking of the melting process by, for example, chill testing, chemical analysis or thermal analysis, test samples may be taken at longer intervals as agreed by the Surveyor.

## **2. 3 Mechanical tests**

2. 3. 1 Only the tensile strength is to be determined, and the results obtained from tests are to comply with the minimum value specified for the castings being supplied. Except for crankshaft castings (See [Ch 7, 5 Iron castings for crankshafts](#)), the specified tensile strength is to be not less than 200 N/mm<sup>2</sup> subject to any additional requirements of the relevant Rules. The fractured surfaces of all tensile test specimens are to be granular and entirely grey in appearance.

CHAPTER **7** **Iron Castings**SECTION **3** **Spheroidal or nodular graphite iron castings****3. 1 Scope**

3. 1. 1 This Section gives the specific requirements for spheroidal or nodular graphite iron castings.
3. 1. 2 These requirements are generally applicable to castings intended for use at ambient temperatures. Additional requirements will be necessary when the castings are intended for service at either low or elevated temperatures. Impact test requirements are given for low temperature service in [Ch 7, 3.4 Mechanical tests 3.4.2.](#)

**3. 2 Heat treatment**

3. 2. 1 The special qualities with 350 N/mm<sup>2</sup> and 400 N/mm<sup>2</sup> nominal tensile strength and impact test are to undergo a ferritising heat treatment, *See* [Ch 7, 3.4 Mechanical tests 3.4.2.](#)

**3. 3 Test material**

3. 3. 1 The test samples are to be as detailed in [Table 7. 3. 1: Type A \(U-type\) test samples](#), [Table 7. 3. 2: Type B \(Double U-type\) test samples](#) or [Table 7. 3. 3: Type C \(Y-type\) test samples](#). The dimensions of the test specimens and testing procedures used are to be in accordance with [Ch 2 Testing Procedures for Metallic Materials](#). Test samples of other dimensions may be specially required for some castings and these are to be agreed with the Surveyor.

**Table 7. 3. 1: Type A (U-type) test samples**

| Dimension                            | Standard sample, mm                     | Alternative samples when specially required, mm |     |     |
|--------------------------------------|---|---|-----|-----|
| $\underline{u}$                      | 25                                      | 12  | 50  | 75  |
| $\underline{v}$                      | 55                                      | 40  | 90  | 125 |
| $\underline{x}$                      | 40                                      | 30  | 60  | 65  |
| $\underline{y}$                      | 100                                     | 80  | 150 | 165 |
| $\underline{Z}$<br>$\underline{R_s}$ | To suit testing machine Approximately 5 |   |     |     |

**Table 7. 3. 2: Type B (Double U-type) test samples**

| Dimension | Standard sample,mm      |
|-----------|-------------------------|
| $u$       | 25                      |
| $v$       | 90                      |
| $x$       | 40                      |
| $y$       | 100                     |
| $z$       | To suit testing machine |
| $R_s$     | Approximately 5         |

**Table 7. 3. 3: Type C (Y-type) test samples**

| Dimension  | Standard sample, mm     | Alternative samples when specially required, mm |     |     |
|--|-------------------------|---|-----|-----|
| $u$  | 25                      | 12  | 50  | 75  |
| $v$  | 55                      | 40  | 100 | 125 |
| $x$  | 40                      | 25  | 50  | 65  |
| $y$  | 140                     | 135   | 150 | 175 |
| $z$  | To suit testing machine |   |     |     |
| Minimum thickness of mould surrounding test sample | 40                      | 40  | 80  | 80  |

- 3.3.2 The test samples may be either gated to the casting or separately cast.
- 3.3.3 Where separately cast test samples are used, they are to be taken towards the end of pouring of the castings.

### 3.4 Mechanical tests

- 3.4.1 The tensile strength and elongation are to be determined and are to comply with the requirements of [Table 7.3.4: Mechanical properties for acceptance purposes: spheroidal or nodular graphite iron castings](#). Minimum values for the 0.2 per cent proof stress are also included in this Table but are to be determined only if included in the specification. Typical ranges of hardness values are also given in [Table 7.3.4: Mechanical properties for acceptance purposes: spheroidal or nodular graphite iron castings](#) and are intended for information purposes.
- 3.4.2 Impact tests may be required for some applications in which case the selection of the grade is to be confined to those listed in [Table 7.3.5: Mechanical properties: special qualities](#). These castings are to be given a ferritising heat treatment. The mechanical test results are to comply with [Table 7.3.5: Mechanical properties: special qualities](#).
- 3.4.3 Castings may be supplied to any specified minimum tensile strength selected within the general limits detailed in [Table 7.3.4: Mechanical properties for acceptance purposes: spheroidal or nodular graphite iron castings](#) and [Table 7.3.5: Mechanical properties: special qualities](#) but subject to any additional requirements of the relevant Rules.

**Table 7.3.4: Mechanical properties for acceptance purposes: spheroidal or nodular graphite iron castings**

| Specified minimum tensile strength<br>N/mm <sup>2</sup> | 0.2% proof stress<br>(See Note) N/mm <sup>2</sup> minimum | Elongation on<br>$5.65\sqrt{s_0}\%$<br>minimum | Typical hardness value<br>(See <a href="#">Ch 7, 3.4 Mechanical tests 3.4.1</a> ) | Typical structure of matrix<br>(See <a href="#">Ch 7, 3.5 Metallographic examination 3.5.2</a> ) |
|---|---|--|---|--|
| 370   | 230   | 17   | 120 – 180   | Ferrite  |
| 400   | 250   | 12   | 140 – 200   | Ferrite  |
| 500   | 320   | 7  | 170 – 240   | Ferrite/pearlite   |
| 600   | 370   | 3  | 190 – 270   | Pearlite/ferrite   |
| 700   | 420   | 2  | 230 – 300   | Pearlite   |
| 800   | 480   | 2  | 250 – 350   | Pearlite or tempered structure   |

Note Proof stresses need only be determined if specifically requested.

**Table 7. 3. 5: Mechanical properties: special qualities**

| Specified minimum tensile strength<br>N/mm <sup>2</sup> | 0.2% proof stress minimum<br>(See Note 1)<br>N/mm <sup>2</sup> | Elongation on $5.65\sqrt{s_0}$ minimum% (See Note 2) | Typical hardness value | Charpy V-notch impact tests         |                                       |
|---|--|--|------------------------|-------------------------------------|---------------------------------------|
|   |  |  |                        | Test temperature °C<br>(See Note 3) | Average energy J minimum (See Note 4) |
| 350   | 220  | 22   | 110 – 170              | 20                                  | 17 (14)                               |
|   |  |  |                        | –40                                 | 12 (10)                               |
| 400   | 250  | 18   | 140 – 200              | 20                                  | 14 (11)                               |
|   |  |  |                        | –20                                 | 12 (10)                               |

**Note 1.** Proof stresses need only be determined if specifically requested.

**Note 2.** In the case of integrally cast samples, the acceptable elongation may be taken as 2 percentage points less.

**Note 3.** Tests need only be made at either of the temperatures listed, as appropriate.

**Note 4.** The average value measured on three Charpy V-notch specimens. One of the three values may be below the specified minimum average value, but not less than the value shown in brackets.

**Note 5.** Typical structure of the matrix is ferrite.

### 3. 5 Metallographic examination

3. 5. 1 Samples for metallographic examination are to be prepared for spheroidal or nodular graphite iron castings. These samples are to be representative of each ladle used and may conveniently be taken from the tensile test specimens. Alternative arrangements for the provision of these samples may, however, be adopted subject to the concurrence of the Surveyor. They are, however, to be taken towards the end of the pour.
3. 5. 2 Examination of the samples is to show that at least 90 per cent of the graphite is in a dispersed spheroidal or nodular form. Details of typical matrix structures are given in [Table 7. 3. 4: Mechanical properties for acceptance purposes: spheroidal or nodular graphite iron castings](#) and are intended for information purposes.

**CHAPTER 7 Iron Castings****SECTION 4 Compacted or vermicular graphite iron castings****4. 1 Scope**

- 4. 1. 1 This Section gives the specific requirements for compacted or vermicular graphite iron castings.
- 4. 1. 2 These requirements are generally applicable to castings intended for use at ambient temperatures.

**4. 2 Heat treatment**

- 4. 2. 1 Where castings do not meet the specified mechanical property requirements in the as-cast condition, a corrective heat treatment may be carried out. This is to be restricted to a single heat treatment and the test coupons must be heat treated with the castings.

**4. 3 Test material**

- 4. 3. 1 The test samples are to be as detailed in [Table 7. 3. 1: Type A \(U-type\) test samples](#), [Table 7. 3. 2: Type B \(Double U-type\) test samples](#) or [Table 7. 3. 3: Type C \(Y-type\) test samples](#). The dimensions of the test specimens and testing procedures used are to be in accordance with [Ch 2 Testing Procedures for Metallic Materials](#). Test samples of other dimensions may be specially agreed with the Surveyor.
- 4. 3. 2 The test samples may be either gated to the casting or separately cast.
- 4. 3. 3 Where separately cast test samples are used, they are to be taken towards the end of pouring of the castings.

**4. 4 Mechanical tests**

- 4. 4. 1 The tensile strength and elongation are to be determined and are to comply with the requirements of [Table 7. 4. 1: Mechanical properties for acceptance purposes: compacted or vermicular graphite iron castings](#). Minimum values for the 0.2 per cent proof stress are also included in this Table but are to be determined only if included in the specification. Typical ranges of hardness values are also given in [Table 7. 4. 1: Mechanical properties for acceptance purposes: compacted or vermicular graphite iron castings](#) and are intended for information purposes.
- 4. 4. 2 Castings may be supplied to any specified minimum tensile strength grade.

**Table 7. 4. 1: Mechanical properties for acceptance purposes: compacted or vermicular graphite iron castings**

| Specified minimum tensile strength N/mm <sup>2</sup>                          | 0.2% proof stress (See Note) N/mm <sup>2</sup> minimum | Elongation on 5.65 $\sqrt{s_0}$ % minimum | Typical hardness value HB (See Ch 7.4.4 Mechanical tests 4.4.1) | Typical structure of matrix (See Ch 7.4.5 Metallographic examination 4.5.2) |
|---|--|---|---|---|
| 300   | 210  | 2   | 140 – 210   | Ferrite   |
| 350   | 245  | 1.5                                       | 160 – 220   | Ferrite/pearlite  |
| 400   | 280  | 1   | 180 – 240   | Pearlite/ferrite  |
| 450   | 315  | 1   | 200 – 250   | Pearlite  |
| 500   | 350  | 0.5                                       | 220 – 260   | Fully pearlitic   |
| <b>Note</b> Proof stresses need only be determined if specifically requested. |  |   |   |   |

## 4. 5 Metallographic examination

4. 5. 1 Samples for metallographic examination are to be prepared for compacted or vermicular graphite iron castings. These samples are to be representative of each ladle used and may conveniently be taken from the tensile test specimens. Alternative arrangements for the provision of these samples may, however, be adopted subject to the concurrence of the Surveyor. They are, however, to be taken towards the end of the pour.
4. 5. 2 Examination of the samples is to show that at least 80 per cent of the graphite is in a dispersed, compacted or vermicular form. The remaining 20 per cent of the graphite may be in spheroidal forms. Details of typical matrix structures are given in [Table 7. 4. 1: Mechanical properties for acceptance purposes: compacted or vermicular graphite iron castings](#) and are intended for information purposes.

## PART

# 2

## CHAPTER 7 Iron Castings

### SECTION 5 Iron castings for crankshafts

#### 5.1 Scope

- 5.1.1 This Section gives additional requirements for cast iron crankshafts intended for engines and compressors. For both of these applications, details of the proposed specification are to be submitted for approval.
- 5.1.2 Crankshaft castings in grey iron and compacted graphite iron are acceptable only for compressors, and the specified minimum tensile strength is to be not less than 300 N/mm<sup>2</sup>.
- 5.1.3 For crankshaft castings in spheroidal or nodular graphite iron, the specified minimum tensile strength is to be not less than 370 N/mm<sup>2</sup>.

#### 5.2 Manufacture

- 5.2.1 Details of the method of manufacture, including the arrangements proposed for the provision of test material, are to be submitted for approval.
- 5.2.2 Tests to demonstrate the soundness of prototype castings and the mechanical properties at important locations will be required.

#### 5.3 Heat treatment

- 5.3.1 In general, crankshaft castings other than those which are fully annealed, normalised or oil quenched and tempered, are to receive a suitable stress relief heat treatment before machining.
- 5.3.2 Where it is proposed to harden the surfaces of machined pins and/or journals of cast iron crankshafts, details of the process are to be submitted for approval. Before such a process is applied to a crankshaft it is to be demonstrated by procedure tests, and to the satisfaction of the Surveyor, that the process is suitably controlled and does not impair the strength or soundness of the material.

#### 5.4 Test material

- 5.4.1 Unless otherwise approved, the dimensions of the test samples are to be such as to ensure that they have mechanical properties representative of those of the average section of the crankshaft casting.
- 5.4.2 For large crankshaft castings, the test samples are to be cast integral with, or gated from, each casting.
- 5.4.3 The batch testing procedure detailed in [Ch 7, 1.6 Test material 1.6.2](#) may be adopted only where small and identical crankshaft castings are produced in quantity. Generally, the fettled mass of each casting in a batch is not to exceed 100 kg, and in addition to tensile tests, the hardness of each casting is to be determined. For this purpose, a small flat is to be ground on each crankshaft,

and Brinell hardness tests are to be carried out. The results obtained from these tests are to comply with the approved specification.

## **5. 5 Non-destructive examination**

- 5. 5. 1 Cast crankshafts are to be subjected to a full magnetic particle or dye penetrant examination after final machining and completion of any surface hardening operations.
- 5. 5. 2 Particular attention is to be given to the testing of the pins, journals and associated fillet radii.
- 5. 5. 3 Cracks and crack-like defects are not acceptable. Fillet radii are to be free from any indications.

## **5. 6 Rectification of defective castings**

- 5. 6. 1 Cast iron crankshafts are not to be repaired by welding, and blemishes are not to be plugged with a filler.

## **5. 7 Certification of materials**

- 5. 7. 1 The chemical composition of ladle samples is to be given in addition to the other particulars detailed in [Ch 7, 1.12 Certification of materials 1.12.2.](#)

CHAPTER **8 Aluminium Alloys**

SECTION **1 Plates, bars and sections**

## **1.1 Scope**

- 1.1.1 This Section makes provision for aluminium alloy plates, bars and sections intended for use in the construction of ships and other marine structures and for cryogenic applications.
- 1.1.2 Except as provided in [Ch 8, 1.1 Scope 1.1.4](#), all items are to be manufactured and tested in accordance with the appropriate requirements of [Ch 1 General Requirements](#) and [Ch 2 Testing Procedures for Metallic Materials](#) and those detailed in this Section.
- 1.1.3 The thickness of plates, sections and bars described by these requirements will be in the range between 3 and 50 mm. Plates and sections less than 3.0 mm thick may be manufactured and tested in accordance with the requirements of an acceptable national specification.
- 1.1.4 Plates less than 3.0 mm thick and sections less than 40 mm × 40 mm × 3.0 mm may be manufactured and tested in accordance with the requirements of an acceptable National specification.
- 1.1.5 Where the section thickness exceeds 50 mm the requirements will be subject to special consideration.
- 1.1.6 Materials intended for the construction of cargo tanks or storage for liquefied gases, and for other low temperature applications, are to be manufactured in the 5083 alloy in the annealed condition.
- 1.1.7 As an alternative to [Ch 8, 1.1 Scope 1.1.2](#) and [Ch 8, 1.1 Scope 1.1.4](#), materials which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section and are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of [Ch 1 General Requirements](#).

## **1.2 Manufacture**

- 1.2.1 Aluminium alloys are to be manufactured at works approved by Asia Classification Society (hereinafter referred as 'ACS').
- 1.2.2 The alloys may be cast either in ingot moulds or by an approved continuous casting process. Plates are to be formed by rolling and may be hot or cold finished. Bars and sections may be formed by extrusion, rolling or drawing.
- 1.2.3 All melts are to be suitably degassed prior to casting such that the aim hydrogen content is less than 0.2 ml per 100 g.

### 1.3 Quality of materials

- 1.3.1 Materials are to be free from surface or internal defects of such a nature as would be harmful in service.
- 1.3.2 The manufacturer is to verify the integrity of pressure welds of closed extrusion profiles in accordance with [Ch 8, 1.10 Pressure weld tests](#).

### 1.4 Dimensional tolerances

- 1.4.1 Underthickness tolerances for rolled products for marine construction are given in [Table 8.1.1: Underthickness tolerances for rolled products for marine construction](#).

**Table 8.1.1: Underthickness tolerances for rolled products for marine construction**

| Nominal thickness<br>range, mm | Underthickness tolerance for<br>nominal width range, mm |             |             |
|--------------------------------|---|-------------|-------------|
|                                | ≤1500   | >1500 ≤2000 | >2000 ≤3500 |
| ≥3.0 <4.0                      | 0.10  | 0.15        | 0.15        |
| ≥4.0 <8.0                      | 0.20  | 0.20        | 0.25        |
| ≥8.0 <12                       | 0.25  | 0.25        | 0.25        |
| ≥12 <20                        | 0.35  | 0.40        | 0.50        |
| ≥20 <50                        | 0.45  | 0.50        | 0.65        |

- 1.4.2 Underthickness tolerances for extruded products are to comply with an acceptable National or International Standard.
- 1.4.3 There are to be no underthickness tolerances for materials for application in cryogenic process pressure vessels.
- 1.4.4 Dimensional tolerances other than permitted underthicknesses are to comply with an acceptable National or International Standard.
- 1.4.5 Verification of dimensions is the responsibility of the manufacturer. Acceptance by Surveyors of material which is later found to be defective does not absolve the manufacturer from this responsibility.

### 1.5 Chemical composition

- 1.5.1 Samples for chemical analysis are to be taken representative of each cast, or the equivalent where a continuous melting process is involved.
- 1.5.2 The chemical composition of these samples is to comply with the requirements of [Table 8.1.2: Chemical composition, percentage](#).

**Table 8.1.2: Chemical composition, percentage**

| Element | 5083      | 5383      | 5059      | 5086      | 5754      | 5456      | 6005-A<br>(See Note 1) | 6061 (See<br>Note 1) | 6082         |

|   | $3 \leq t \leq 12.5$  | 230–315 | 315–405 | 12 | –  |
| 5456-H321   | $12.5 \leq t \leq 40$ | 215–305 | 305–385 | –  | 10 |
|   | $40 \leq t \leq 50$   | 200–295 | 285–370 | –  | 10 |
| 5754-O  | $3 \leq t \leq 50$    | 80      | 190–240 | 18 | 17 |
| <p><b>Note 1.</b> 8% for thickness up to and including 6.3 mm.</p> <p><b>Note 2.</b> For application to liquefied natural gas carriers or liquefied natural gas tankers where thicknesses are in excess of 50 mm, the mechanical properties given in this table are, in general, to be complied with</p> <p><b>Note 3.</b> The mechanical properties for the O and H111 tempers are the same for all alloys shown in this Table. However, they are separated in this Table as they are made using different manufacturing processes</p> |                       |         |         |    |    |

## 1. 6 Heat treatment

1. 6. 1 The Aluminium 5000 series alloys, capable of being strain hardened, are to be supplied in any of the following temper conditions:

O annealed

H111 annealed with slight strain hardening

H112 strain hardened from working at elevated temperatures

H116 strain hardened and with specified resistance to exfoliation corrosion for alloys where the magnesium content is 4 per cent or more

H321 strain hardened and stabilised.

- 1. 6. 2 The H116 temper is specially developed for use in a marine environment.
- 1. 6. 3 The Aluminium 6000 series alloys, capable of being age hardened, are to be supplied in either of the following temper conditions:
  - T5 hot worked and artificially aged.
  - T6 solution treated and artificially aged.

## 1. 7 Test material

- 1. 7. 1 Plate with the same thickness and from a single cast or equivalent, are to be presented for test in batches of not more than 2 tonnes, with the exceptions of those given in [Ch 8, 1.7 Test material 1.7.2](#) and [Ch 8, 1.7 Test material 1.7.3](#).
- 1. 7. 2 For single plates or coils weighing more than 2 tonnes, only one tensile specimen per plate or coil is to be taken.
- 1. 7. 3 A tensile test specimen is required from each plate to be used in the construction of cargo tanks, secondary barriers and process pressure vessels with design temperatures below -55°C.
- 1. 7. 4 Bars and sections of less than 1 kg/m in nominal weight are to be tested in batches of 1 tonne. Bars and sections with a nominal weight between 1 kg/m and 5 kg/m are to be tested in batches of 2 tonnes. Where the nominal weight is greater than 5 kg/m, one tensile test is to be carried out for every 3 tonnes produced, or fractions thereof.
- 1. 7. 5 If the material is supplied in the heat treated condition, each batch is to be treated together in the same furnace or subjected to the same finishing treatment when a continuous furnace is used.
- 1. 7. 6 For plates over 300 mm in width, tensile test specimens are to be cut with their length transverse to the principal direction of rolling. For narrow plates and for sections and bars, the test specimens are to be cut in the longitudinal direction. Longitudinal tensile test specimens are accepted for the strain hardenable 5000 series alloys.
- 1. 7. 7 Longitudinal tensile test specimens from a plate are to be taken at  $\frac{1}{3}$  width from the longitudinal edge. Longitudinal tensile test specimens taken from extruded sections should be taken in the range from  $\frac{1}{3}$  to  $\frac{1}{2}$  of the distance from the edge to the centre of the thickest region of the section.

## 1. 8 Mechanical tests

- 1. 8. 1 At least one tensile test specimen is to be prepared from each batch of material submitted for acceptance.
- 1. 8. 2 Tensile test specimens are to be machined to the dimensions given in [Figure 2. 2. 3: Test specimen dimensions for plates, strip and sections - I and aluminum alloys](#) in Chapter 2. Alternatively, machined proportional test specimens of circular cross-section in accordance with [Figure 2. 2. 2: Test specimen dimensions for forgings and castings - II and aluminum alloys](#) in Chapter 2 may be used provided that the diameter is not less than 10 mm. Round bars may be tested in full section, or test specimens may be machined in accordance with the dimensions given in [Figure 2. 2. 2: Test specimen dimensions for forgings and castings - II and aluminum alloys](#) in Chapter 2.
- 1. 8. 3 The results of all tensile tests are to comply with the values given in [Table 8. 1. 3: Minimum mechanical properties for acceptance purposes of selected rolled aluminium alloy products](#) and [Table 8. 1. 4: Minimum mechanical properties for acceptance purposes of selected extruded aluminium alloy products](#), as applicable.

**Table 8. 1. 4: Minimum mechanical properties for acceptance purposes of selected extruded aluminium alloy products**

| Alloy and temper condition, <i>See Note 2</i>   | Thickness, t, mm   | 0.2% proof stress<br>$R_p$ , N/mm <sup>2</sup> | Tensile strength $R_m$<br>N/mm <sup>2</sup> | Elongation on 4d, % | Elongation on $5.65\sqrt{S_0}5d$ , % |
|---|--------------------|--|---|---------------------|--------------------------------------|
| 5083-O  | $3 \leq t \leq 50$ | 110  | 270–350                                     | 14                  | 12                                   |
| 5083-H111   | $3 \leq t \leq 50$ | 165  | 275   | 12                  | 10                                   |
| 5083-H112   | $3 \leq t \leq 50$ | 110  | 270   | 12                  | 10                                   |
| 5086-O  | $3 \leq t \leq 50$ | 95   | 240–315                                     | 14                  | 12                                   |
| 5086-H111   | $3 \leq t \leq 50$ | 145  | 250   | 12                  | 10                                   |
| 5086-H112   | $3 \leq t \leq 50$ | 95   | 240   | 12                  | 10                                   |
| 5059-H112   | $3 \leq t \leq 50$ | 200  | 330   | 10                  | 10                                   |
| 5383-O  | $3 \leq t \leq 50$ | 145  | 290   | 17                  | 17                                   |
| 5383-H111   | $3 \leq t \leq 50$ | 145  | 290   | 17                  | 17                                   |
| 5383-H112   | $3 \leq t \leq 50$ | 190  | 310   | 13                  | 13                                   |
| 6005A-T5  | $3 \leq t \leq 50$ | 215  | 260   | 9                   | 8                                    |
| 6005A-T6  | $3 \leq t \leq 10$ | 215  | 260   | 8                   | 6                                    |
|   | $10 < t \leq 50$   | 200  | 250   | 8                   | 6                                    |
| 6061-T6   | $3 \leq t \leq 50$ | 240  | 260   | 10                  | 8                                    |
| 6082-T5   | $3 \leq t \leq 50$ | 230  | 270   | 8                   | 6                                    |
| 6082-T6   | $3 \leq t \leq 5$  | 250  | 290   | 6                   | –                                    |
|   | $5 < t \leq 50$    | 260  | 310   | 10                  | 8                                    |
| <p><b>Note 1.</b> The values are applicable for longitudinal and transverse tensile test specimens as well.</p> <p><b>Note 2.</b> The mechanical properties for the O and H111 tempers are the same for all alloys shown in this Table. However, they are separated in this Table as they are made using different manufacturing processes.</p> |                    |  |   |                     |                                      |

## 1. 9 Corrosion tests

1. 9. 1 Rolled 5000 series alloys of type 5083, 5383, 5059, 5456 and 5086 in the H116 and H321 tempers intended for use in marine hull construction or in marine applications with frequent direct contact with seawater are to be corrosion tested with respect to exfoliation and intergranular corrosion resistance.
1. 9. 2 The manufacturer is to establish the relationship between microstructure and resistance to corrosion when the above alloys are approved. A reference photomicrograph taken at 500x, under the conditions specified in ASTM B928 Section 9.4.1, is to be prepared for each of the alloy-tempers and thickness ranges relevant. The reference photographs are to be taken from samples which have exhibited no evidence of exfoliation corrosion and a pitting rating of PB or better, when subjected to the test described in ASTM G66 (ASSET). The samples are also to have exhibited resistance to intergranular corrosion at a mass loss no greater than 15 mg/cm<sup>2</sup>, when subjected to the test described in ASTM G67 (NAMLT). Upon satisfactory establishment of the relationship between microstructure and resistance to corrosion, the master photomicrographs and

the results of the corrosion tests are to be approved by ACS. Production practices are not to be changed after approval of the reference micrographs.

1. 9. 3 For batch acceptance of 5000 series alloys in the H116 and H321 tempers, metallographic examination of one sample selected from mid width at one end of a coil or random sheet or plate is to be carried out. The microstructure of the sample is to be compared to the reference photomicrograph of acceptable material in the presence of the Surveyor. A longitudinal section perpendicular to the rolled surface is to be prepared for metallographic examination, under the conditions specified in ASTM B928 Section 9.6.1. If the microstructure shows evidence of continuous grain boundary network of aluminium-magnesium precipitate in excess of the reference photomicrographs of acceptable material, the batch is either to be rejected or tested for exfoliation corrosion resistance and intergranular corrosion resistance subject to the agreement of the Surveyor. The corrosion tests are to be in accordance with ASTM G66 and G67 or equivalent standards. Acceptance criteria are that the sample shall exhibit no evidence of exfoliation corrosion and a pitting rating of PB or better when test subjected to ASTM G66 (ASSET) test, and the sample is to exhibit resistance to intergranular corrosion at a mass loss no greater than 15 mg/cm<sup>2</sup> when subjected to ASTM G67 (NAMLT) test. If the results from testing satisfy the acceptance criteria stated in [Ch 8, 1.9 Corrosion tests 1.9.2](#), the batch is accepted, otherwise it is to be rejected.
1. 9. 4 As an alternative to metallographic examination, each batch may be tested for exfoliation corrosion resistance and intergranular corrosion resistance, in accordance with ASTM G66 and G67 under the conditions specified in ASTM B298, or equivalent standards. If this alternative is used, then the results of the test must satisfy the acceptance criteria stated in [Ch 8, 1.9 Corrosion tests 1.9.2](#).
1. 9. 5 Tempers that are corrosion tested in accordance with [Ch 8, 1.9 Corrosion tests 1.9.3](#) are to be marked 'M' after the temper condition, e.g. 5083 H321 M.

## 1. 10 Pressure weld tests

1. 10. 1 The integrity of pressure welds of closed profile extrusions is to be verified by examination of macrosections or drift expansion tests.
1. 10. 2 Every closed profile extrusion is to be sampled, except where the closed profile extrusions are equal to or shorter than 6.0 m long, in which case a batch is to comprise of five profiles. Every sample is to be tested at both ends after final heat treatment.
1. 10. 3 Where verification is by examination of macrosections, no indication of lack of fusion is permitted.
1. 10. 4 Where verification of fusion at pressure welds of closed profile extrusions is by drift expansion test, testing is to be generally in accordance with [Ch 2, 4.3 Drift expanding tests](#). The minimum included angle of the mandrel is to be 60°, and the minimum specimen length, 50 mm. For acceptance, there is to be no failure by a clean split along the weld line.

## 1. 11 Visual and non-destructive examination

1. 11. 1 Surface inspection and verification of dimensions are the responsibility of the manufacturer, and acceptance by the Surveyors of material later found to be defective shall not absolve the manufacturer from this responsibility.
1. 11. 2 In general, the non-destructive examination of materials is not required for acceptance purposes. Manufacturers are expected, however, to employ suitable methods of non-destructive examination for the general maintenance of quality standards.

1. 11. 3 For applications where the non-destructive examination of materials is considered to be necessary, the extent of this examination, together with appropriate acceptance standards, are to be agreed between the purchaser, manufacturer and Surveyor.

## 1. 12 Rectification of defects

1. 12. 1 Slight surface imperfections may be removed by mechanical means, provided that the prior agreement of the Surveyor is obtained, that the work is carried out to his satisfaction and that the final dimensions are acceptable. The repair of defects by welding is not allowed.

## 1. 13 Identification

1. 13. 1 The manufacturer is to adopt a system of identification which will ensure that all finished material in a batch presented for test is of the same nominal chemical composition.
1. 13. 2 Products are to be clearly marked by the manufacturer in accordance with the requirements of [Ch 1 General Requirements](#). The following details are to be shown on all materials which have been accepted:
  - a. Manufacturer's name or trade mark.
  - b. Alloy grade and temper condition.
  - c. Identification mark which will enable the full history of the item to be traced.
  - d. The stamp of the ACS brand.

## 1. 14 Certification of materials

1. 14. 1 A manufacturer's certificate validated by ACS is to be issued, *See* [Ch 1, 3.1, General](#).
1. 14. 2 Each test certificate is to include the following particulars:
  - a. Purchaser's name and order number.
  - b. Contract number.
  - c. Address to which material is to be despatched.
  - d. Description and dimensions.
  - e. Alloy grade and temper condition.
  - f. Identification mark which will enable the full history of the item to be traced.
  - g. Chemical composition.
  - h. Mechanical test results (not required on shipping statement).
  - i. Details of temper condition and heat treatment, where applicable.
  - j. Corrosion test results (as applicable).
1. 14. 3 Where the alloy is not produced at the works at which it is wrought, a certificate is to be supplied by the manufacturer of the alloy stating the cast number and chemical composition. The works at which the alloy was produced must be approved by ACS.

## CHAPTER 8 Aluminium Alloys

### SECTION 2 Aluminium alloy rivets

#### 2.1 Scope

- 2.1.1 Provision is made in this Section for aluminium alloy rivets intended for use in the construction of marine structures.
- 2.1.2 They are to be manufactured and tested in accordance with the appropriate requirements of [Ch 8, 1 Plates, bars and sections](#) and those detailed in this Section.

#### 2.2 Chemical composition

- 2.2.1 The chemical composition of bars used for the manufacture of rivets is to comply with the requirements of [Table 8. 2. 1: Chemical composition, percentage](#).

**Table 8. 2. 1: Chemical composition, percentage**

| Element              | 5154A     | 6082      |
|----------------------|-----------|-----------|
| Copper               | 0.10 max. | 0.10 max. |
| Magnesium            | 3.1 – 3.9 | 0.6 – 1.2 |
| Silicon              | 0.50 max. | 0.7 – 1.3 |
| Iron                 | 0.50 max. | 0.50 max. |
| Manganese            | 0.1 – 0.5 | 0.4 – 1.0 |
| Zinc                 | 0.20 max. | 0.20 max. |
| Chromium             | 0.25 max. | 0.25 max. |
| Titanium             | 0.20 max. | 0.10 max. |
| Other elements: each | 0.05 max. | 0.05 max. |
| total                | 0.15 max. | 0.15 max. |
| Aluminium            | Remainder | Remainder |

#### 2.3 Heat treatment

- 2.3.1 Rivets are to be supplied in the following condition:
- 5154A - annealed

6082 - solution treated.

## 2. 4 Test material

2. 4. 1 Bars intended for the manufacture of rivets are to be presented for test in batches of not more than 250 kg. The material in each batch is to be the same diameter and nominal chemical composition.
2. 4. 2 At least one test sample is to be selected from each batch and, prior to testing, is to be heat treated in full cross-section and in a manner simulating the heat treatment applied to the finished rivets.

## 2. 5 Mechanical tests

2. 5. 1 At least one tensile and one dump test specimen are to be prepared from each test sample.
2. 5. 2 The tensile test specimen may be either a suitable length of bar tested in full cross-section or a specimen machined to the dimensions given in [Figure 2. 2. 2: Test specimen dimensions for forgings and castings - II and aluminum alloys](#) in Chapter 2.
2. 5. 3 The dump test specimen is to consist of a section cut from the bar with the ends perpendicular to the axis. The length of this section is to be equal to the diameter of the bar.
2. 5. 4 The results of tensile tests are to comply with the appropriate requirements of [Table 8. 2. 2: Mechanical properties for acceptance purposes](#).

**Table 8. 2. 2: Mechanical properties for acceptance purposes**

| Mechanical properties                    | 5154A | 6082 |
|--|-------|------|
| 0.2% proof stress N/mm <sup>2</sup> min. | 90    | 120  |
| Tensile strength N/mm <sup>2</sup> min.  | 220   | 190  |
| Elongation on 5.65√S% min.               | 18    | 16   |

2. 5. 5 The dump test is to be carried out at ambient temperature and is to consist of compressing the specimen until the diameter is increased to 1.6 times the original diameter. After compression, the specimen is to be free from cracks.

## 2. 6 Tests from manufactured rivets

2. 6. 1 At least three samples are to be selected from each consignment of manufactured rivets. Dump tests as detailed in [Ch 8, 2.5 Mechanical tests](#) are to be carried out on each sample.

## 2. 7 Identification

2. 7. 1 Each package of manufactured rivets is to be identified with attached labels giving the following details:
  - a. Manufacturer's name or trade mark.
  - b. Alloy grade.
  - c. Rivet size.

## 2. 8 Certification of materials

2. 8. 1 A manufacturer's certificate is to be issued (See [Ch 1, 3.1, General](#)) and for each consignment of manufactured rivets is to include the following particulars:

|                |          |  |
|----------------|----------|--|
| <b>PART</b>    | <b>2</b> | <b>Rules for the Manufacture, Testing and Certification of Materials</b> |
| <b>CHAPTER</b> | <b>8</b> | <b>Aluminium Alloys</b>  |
| <b>SECTION</b> | <b>2</b> | <b>Aluminium alloy rivets</b>  |

---

- a. Purchaser's name and order number.
- b. Description and dimensions.
- c. Specification.

## CHAPTER 8 Aluminium Alloys

### SECTION 3 Aluminium alloy castings

#### 3.1 Scope

- 3.1.1 Provision is made in this Section for aluminium alloy castings intended for use in the construction of ships, ships for liquid chemicals and other marine structures and liquefied gas piping systems where the design temperature is not lower than minus 165°C. These materials should not be used for piping systems outside cargo tanks except for short lengths of pipes attached to the cargo tanks in which case fire-resisting insulation should be provided.
- 3.1.2 Castings are to be manufactured and tested in accordance with Chapters [Ch 1 General Requirements](#) and [Ch 2 Testing Procedures for Metallic Materials](#) and also with the requirements of this Section.
- 3.1.3 As an alternative to [Ch 8, 3.1 Scope 3.1.2](#), castings which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of [Ch 1 General Requirements](#).

#### 3.2 Manufacture

- 3.2.1 Castings are to be manufactured at foundries approved by ACS.

#### 3.3 Quality of castings

- 3.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

#### 3.4 Chemical composition

- 3.4.1 The chemical composition of a sample from each cast is to comply with the requirements given in [Table 8.3.1: Chemical composition, percentage](#). Suitable grain refining elements may be used at the discretion of the manufacturer. The content of such elements is to be reported in the ladle analysis.

**Table 8.3.1: Chemical composition, percentage**

| Alloy Element | Al-Mg 3 | Al-Si 12 | Al-Si 10 Mg | Al-Si 7<br>High purity |
|---------------|---------|----------|-------------|------------------------|
| Copper        | 0.1 max | 0.1 max. | 0.1 max.    | 0.1 max.               |

|             |           |           |           |           |
|-------------|-----------|-----------|-----------|-----------|
| Magnesium   | 2.5-4.5   | 0.1 max.  | 0.15-0.4  | 0.25-0.45 |
| Silicon     | 0.5 max.  | 11.0-13.5 | 9.0-11.0  | 6.5-7.5   |
| Iron        | 0.5 max.  | 0.7 max.  | 0.6 max.  | 0.2 max.  |
| Manganese   | 0.6 max.  | 0.5 max.  | 0.6 max.  | 0.1 max.  |
| Zinc        | 0.2 max.  | 0.1 max.  | 0.1 max.  | 0.1 max.  |
| Chromium    | 0.1 max.  | -         | -         | -         |
| Titanium    | 0.2 max.  | 0.2 max.  | 0.2 max.  | 0.2 max.  |
| Others each | 0.05 max. | 0.05 max. | 0.05 max. | 0.05 max. |
| Total       | 0.15 max. | 0.15 max. | 0.15 max. | 0.15 max. |
| Aluminium   | Remainder | Remainder | Remainder | Remainder |

3. 4. 2 Where it is proposed to use alloys not specified in [Table 8. 3. 1: Chemical composition, percentage](#), details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval.
3. 4. 3 When a cast is wholly prepared from ingots for which an analysis is already available, and provided that no significant alloy additions are made during melting, the ingot maker's certified analysis can be accepted subject to occasional checks as required by the Surveyor.

### 3. 5 Heat treatment

3. 5. 1 Castings are to be supplied in the following conditions:
- Grade AI-Mg 3 - as-manufactured
  - Grade AI-Si 12 - as-manufactured
  - Grade AI-Si 10 Mg - as-manufactured or solution heat treated and precipitation hardened
  - Grade AI-Si 7 Mg - solution heat treated and
  - (high purity) - precipitation hardened.

### 3. 6 Mechanical tests

3. 6. 1 At least one tensile specimen is to be tested from each cast and, where heat treatment is involved, for each heat treatment batch from each cast. Where continuous melting is employed, 500 kg of fettled castings may be regarded as a cast.
3. 6. 2 The test samples are to be separately cast in moulds made from the same type of material as used for the castings. These moulds should conform to National Standards.
3. 6. 3 The method and procedures for the identification of the test specimens, and the castings they represent, are to be agreed with the Surveyor. The identification marks are to be maintained during the preparation of test specimens.
3. 6. 4 Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent prior to testing.
3. 6. 5 The results of all tensile tests are to comply with the appropriate requirements given in [Table 8. 3. 2: Minimum mechanical properties for acceptance purposes of sand-cast and investment cast](#)

[reference test pieces](#) and/or [Table 8. 3. 3: Minimum mechanical properties for acceptance purposes of chill-cast reference test pieces](#).

**Table 8. 3. 2: Minimum mechanical properties for acceptance purposes of sand-cast and investment cast reference test pieces**

| Alloy   | Temper ( <i>See Note</i> ) | Tensile strength N/mm <sup>2</sup> | Elongation % |
|---|----------------------------|------------------------------------|--------------|
| Al-Mg 3   | M                          | 150                                | 5            |
| Al-Si 12  | M                          | 150                                | 3            |
| Al-Si 10 Mg   | M                          | 150                                | 2            |
| Al-Si 10 Mg   | TF                         | 220                                | 1            |
| Al-Si 7 Mg  | TF                         | 230                                | 5            |
| <b>Note</b> <i>M</i> refers to as cast condition.   |                            |                                    |              |
| <b>Note</b> <i>TF</i> refers to solution heat treated and precipitation hardened condition. |                            |                                    |              |

3. 6. 6 Where the results of a test do not comply with the requirements, the re-test procedure detailed in [Ch 2, 1.4, Re-testing procedures](#) is to be applied. Where castings are to be used in the heat treated condition, the re-test sample must have been heat treated together with the castings it represents.

**Table 8. 3. 3: Minimum mechanical properties for acceptance purposes of chill-cast reference test pieces**

| Alloy   | Temper( <i>See Note</i> ) | Tensile strength N/mm <sup>2</sup> | Elongation % |
|---|---------------------------|------------------------------------|--------------|
| Al-Mg 3   | M                         | 150                                | 5            |
| Al-Si 12  | M                         | 170                                | 3            |
| Al-Si 10 Mg   | M                         | 170                                | 3            |
| Al-Si 10 Mg   | TF                        | 240                                | 1.5          |
| Al-Si 7 Mg  | TF                        | 250                                | 5            |
| <b>Note</b> <i>M</i> refers to as cast condition.   |                           |                                    |              |
| <b>Note</b> <i>TF</i> refers to solution heat treated and precipitation hardened condition. |                           |                                    |              |

### 3. 7 Visual examination

3. 7. 1 All castings are to be cleaned and adequately prepared for inspection.
3. 7. 2 The accuracy and verification of dimensions are the responsibility of the manufacturer, unless otherwise agreed.
3. 7. 3 Before acceptance, all castings are to be presented to the Surveyor for visual examination.

### 3. 8 Rectification of defective castings

3. 8. 1 At the discretion of the Surveyor, small surface blemishes may be removed by local grinding.
3. 8. 2 Where appropriate, repair by welding may be accepted at the discretion of the Surveyor. Such repair is to be made in accordance with an approved procedure.

### 3. 9 Pressure testing

3. 9. 1 Where required by the relevant Rules, castings are to be pressure tested before final acceptance. Unless otherwise agreed, these tests are to be carried out in the presence and to the satisfaction of the Surveyor.

### 3. 10 Identification

3. 10. 1 The manufacturer is to adopt a system of identification which will enable all finished castings to be traced to the original cast and the Surveyor is to be given full facilities for tracing the casting when required.
3. 10. 2 All castings which have been tested and inspected with satisfactory results are to be clearly marked with the following details:
- Identification number, cast number or other markings which will enable the full history of the casting to be traced.
  - ACS or Asia Classification Society and the abbreviated name of ACS's.
  - Personal stamp of the Surveyor responsible for the inspection.
  - Test pressure where applicable.
  - Date of final inspection.
3. 10. 3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

### 3. 11 Certification of materials

3. 11. 1 A ACS certificate is to be issued (*See [Ch 1, 3.1, General](#)*) giving the following particulars for each casting or batch of castings which have been accepted:
- Purchaser's name and order number.
  - Description of castings and alloy type.
  - Identification number.
  - Ingot or cast analysis.
  - General details of heat treatment, where applicable.
  - Results of mechanical tests.
  - Test pressure, where applicable.

**CHAPTER 8 Aluminium Alloys****SECTION 4 Aluminium/steel transition joints****4.1 Scope**

- 4.1.1 Provision is made in this Section for explosion bonded composite aluminium/steel transition joints used for connecting aluminium structures to steel plating.
- 4.1.2 Each individual application is to be separately approved as required by the relevant Rules dealing with design and construction.

**4.2 Manufacture**

- 4.2.1 Transition joints are to be manufactured by an approved producer in accordance with an approved specification which is to include the maximum temperature allowable at the interface during welding.
- 4.2.2 The aluminium material is to comply with the requirements of [Ch 8, 1 Plates, bars and sections](#) and the steel is to be of an appropriate grade complying with the requirements of [Ch 3, 2 Normal strength steels for ship and other structural applications](#).
- 4.2.3 Alternative materials which comply with International, National or proprietary specifications may be accepted provided that they give reasonable equivalence to the requirements of [Ch 8, 4.2 Manufacture 4.2.2](#) or are approved for a specific application.
- 4.2.4 Intermediate layers between the aluminium and steel may be used, in which case the material of any such layer is to be specified by the manufacturer and is to be recorded in the approval certificate. Any such intermediate layer is then to be used in all production transition joints.

**4.3 Visual and non-destructive examination**

- 4.3.1 Each composite plate is to be subjected to 100 per cent visual and ultrasonic examination in accordance with a relevant National Standard to determine the extent of any unbonded areas. Unbonded areas are unacceptable and any such area plus 25 mm of surrounding sound material is to be discarded.

**4.4 Mechanical tests**

- 4.4.1 Two shear test specimens and two tensile test specimens are to be taken from each end of each composite plate for tests to be made on the bond strength. One shear and one tensile test specimen from each end are to be tested at ambient temperature after heating to the maximum allowable interface temperature, See [Ch 8, 4.2 Manufacture 4.2.1](#); the other two specimens are to be tested without heat treatment.

4. 4. 2 Shear tests may be made on a specimen as shown in [Figure 8. 4. 1: Specimen and procedure for shear tests](#) or an appropriate equivalent. Tensile tests may be made across the interface by welding extension pieces to each surface or by the ram method shown in [Figure 8. 4. 2: Ram tensile test](#) or by an appropriate alternative method.

**Figure 8. 4. 1: Specimen and procedure for shear tests**

4. 4. 3 The shear and tensile strengths of all the test specimens are to comply with the requirements of the manufacturing specification.
4. 4. 4 If either the shear or tensile strength of the bond is less than the specified minimum but not less than 70 per cent of the specified minimum, two additional shear and two tensile test specimens from each end of the composite plate are to be tested and, in addition, bend tests as described in [Ch 8, 4.4 Mechanical tests 4.4.6](#) and [Table 8. 4. 1: Bend tests on explosion bonded aluminium/steel composites](#) are to be made.

**Figure 8. 4. 2: Ram tensile test**

**Table 8. 4. 1: Bend tests on explosion bonded aluminium/steel composites**

| Type of test   | Minimum bend, degrees | Diameter of former |
|--|-----------------------|--------------------|
| Aluminium in tension   | 90                    | $3T$               |
| Steel in tension   | 90                    | $3T$               |
| Side bend  | 90                    | $6T$               |
| <b>Note</b> $T$ is the total thickness of the composite plate. |                       |                    |

4. 4. 5 If either the shear or tensile strength of the bond is less than 70 per cent of the specified minimum the cause is to be investigated. After evaluation of the results of this investigation, ACS will consider the extent of composite plate which is to be rejected.
4. 4. 6 Bend tests, when required, are to be made under the following conditions, as listed in [Table 8. 4. 1: Bend tests on explosion bonded aluminium/steel composites](#):
- The aluminium plate is in tension.
  - The steel plate is in tension.
  - A side bend is applied.

## 4. 5 Identification

4. 5. 1 Each acceptable transition strip is to be clearly marked with the following particulars:
- The aluminium plate is in tension.
  - Manufacturer's name or trade mark.
  - Identification mark for the grade of aluminium.

d. Identification mark for the grade of steel.

The particulars are to be stamped on the aluminium surface at one end of the strip.

## 4. 6 Certification of materials

4. 6. 1 A manufacturer's certificate validated by ACS is to be issued (See [Ch 1, 3.1, General](#)) and as a minimum is to include the following particulars:
- Purchaser's name and order number.
  - The contract number for which the material is intended, if known.
  - Address to which the material is dispatched.
  - Description and dimensions of the material.
  - Specifications or grades of both the aluminium alloy and the steel and any intermediate layer.
  - Cast numbers of the steel and aluminium plates.
  - Identification number of the composite plate.
  - Mechanical test results (not required on shipping statement).

**CHAPTER 9 Copper Alloys****SECTION 1 Castings for propellers****1.1 Scope**

- 1.1.1 This Section gives the requirements for copper alloy castings for one-piece propellers and separately cast blades and bosses for fixed pitch and controllable pitch propellers (CPP). These include contra-rotating propellers and propulsors fitted to podded drives and azimuth units.
- 1.1.2 These castings are to be manufactured and tested in accordance with the appropriate requirements of Chapters [Ch 1 General Requirements](#) and [Ch 2 Testing Procedures for Metallic Materials](#) and the specific requirements of this Section.
- 1.1.3 As an alternative to [Ch 9, 1.1 Scope 1.1.2](#), castings which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or alternatively are approved for a specific application.
- 1.1.4 The appropriate requirements of this Section may also be applied to the repair and inspection of propellers which have been damaged during service.
- 1.1.5 Generally, survey and certification are to be carried out in accordance with the requirements of [Ch 1 General Requirements](#).

**1.2 Manufacture**

- 1.2.1 All castings are to be manufactured at foundries approved by Asia Classification Society (hereinafter referred as 'ACS').
- 1.2.2 The pouring is to be carried out into dried moulds using degassed liquid metal. The pouring is to avoid turbulent flow. Special devices and/or procedures are to be used to prevent slag flowing into the mould.

**1.3 Quality of castings**

- 1.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service.
- 1.3.2 The removal and repair of defects are dealt with in [Ch 9, 1.9, Rectification of defective castings](#) and [Ch 9, 1.10, Weld repair procedure](#).

**1.4 Chemical composition**

- 1.4.1 The chemical compositions of samples from each melt are to comply with the manufacturing specification approved by ACS and also with the overall limits given in [Table 9. 1. 1: Chemical composition of propeller and propeller blade castings](#). In addition to carrying out chemical analysis

for the elements given in the Table, it is expected that manufacturers will ensure that any harmful residual elements are within acceptable limits.

1. 4. 2 The use of alloys whose chemical compositions are different from those detailed in [Table 9. 1. 1: Chemical composition of propeller and propeller blade castings](#) will be given special consideration by ACS.
1. 4. 3 The manufacturer is to maintain records of all chemical analyses, which are to be made available to the Surveyor so that he can satisfy himself that the chemical composition of each casting is within the specified limits.
1. 4. 4 When a melt is wholly prepared from ingots for which an analysis is already available, and provided that no significant alloy additions are made during melting, the ingot maker's certified analysis can be accepted subject to occasional checks as required by the Surveyor. If any foundry returns are added to the melts, the ingot manufacturer's chemical analyses are to be supplemented by frequent checks as required by the Surveyor.

**Table 9. 1. 1: Chemical composition of propeller and propeller blade castings**

| Alloy designation  | Chemical composition of ladle samples % |          |          |           |                       |                       |          |          |
|--|---|----------|----------|-----------|-----------------------|-----------------------|----------|----------|
|  | Cu                                      | Sn       | Zn       | Pb        | Ni                    | Fe                    | Al       | Mn       |
| Grade Cu 1<br>Manganese bronze<br>(high tensile brass)                                 | 52–62                                   | 1.5 max. | 35–40    | 0.5 max.  | 1.0 max.              | 0.5–2.5               | 0.5–3.0  | 0.5–4.0  |
| Grade Cu 2<br>Ni-manganese bronze<br>(high tensile brass)                              | 50–57                                   | 0.1–1.5  | 33–38    | 0.5 max.  | 3.0–8.0               | 0.5–2.5               | 0.5–2.0  | 1.0–4.0  |
| Grade Cu 3<br>Ni-aluminium bronze  | 77–82                                   | 0.1 max. | 1.0 max. | 0.03 max. | 3.0–6.0<br>(See Note) | 2.0–6.0<br>(See Note) | 7.0–11.0 | 0.5–4.0  |

| <b>Note</b> For Naval ships, the nickel content is to be higher than the iron content. |   |          |          |           |                       |                       |          |          |

1. 4. 5 For alloys Grade Cu 1 and Cu 2, the zinc equivalent shall not exceed 45 per cent, and is to be calculated using the following formula:

$$\text{zinc equivalent \%} = 100 - \frac{100 \times \% \text{ Cu}}{100 + A}$$

**where** A is the algebraic sum of the following:

$$1 \times \% \text{ Sn}$$

$$5 \times \% \text{ Al}$$

$$-0.5 \times \% \text{ Mn}$$

$$-0.1 \times \% \text{ Fe}$$

$$-2.3 \times \% \text{ Ni}$$

1. 4. 6 Samples for metallographic examination are to be prepared from the ends of test bars cast from every melt of Grade Cu 1 and Cu 2 alloys. The proportion of alpha-phase determined from the average of at least five counts is to be not less than 25 per cent.

## 1.5 Heat treatment

- 1.5.1 At the option of the manufacturer, castings may be supplied in the 'as cast' or heat treated condition. However, if heat treatment is to be applied, full details are to be included in the manufacturing specification.
- 1.5.2 If any welds are made in the propeller casting, stress relief heat treatment is required in order to minimise the residual stresses. Requirements concerning such heat treatment are given in [Ch 9, 1.10, Weld repair procedure](#).

## 1.6 Test material

- 1.6.1 Test samples are to be cast separately from each melt used for the manufacture of propeller or propeller blade castings.
- 1.6.2 The test samples are to be of the keel block type, generally in accordance with the dimensions given in [Figure 9. 1. 1: Keel block type test sample](#) and are to be cast in moulds made from the same type of material as used for the castings.
- 1.6.3 The method and procedures for the identification of the test specimens, and the castings they represent, are to be agreed with the Surveyor. The identification marks are to be transferred and maintained during the preparation of test specimens.
- 1.6.4 Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent.

## 1.7 Mechanical tests

- 1.7.1 At least one tensile test specimen representative of each cast is to be prepared. The dimensions of this test specimen are to be in accordance with [Figure 2. 2. 1: Test specimen dimensions for plates, strip and sections - I](#) in Chapter 2.
- 1.7.2 The results of all tensile tests are to comply with the requirements given in [Table 9. 1. 2: Mechanical properties for acceptance purposes: propeller and propeller blade castings](#).

**Figure 9. 1. 1: Keel block type test sample**

**Table 9. 1. 2: Mechanical properties for acceptance purposes: propeller and propeller blade castings**

| Alloy designation   | 0.2% proof stress<br>N/mm <sup>2</sup> minimum | Tensile strength<br>N/mm <sup>2</sup> minimum | Elongation on<br>$5.65\sqrt{S_0}$ % minimum |
|---|--|---|---|
| Grade Cu 1<br>Manganese bronze<br>(high tensile brass)    | 175  | 440   | 20  |
| Grade Cu 2<br>Ni-manganese bronze<br>(high tensile brass) | 175  | 440   | 20  |
| Grade Cu 3 Ni-aluminium<br>bronze                         | 245  | 590   | 16  |
| Grade Cu 4 Mn-aluminium<br>bronze                         | 275  | 630   | 18  |

1. 7. 3 The mechanical properties of alloys whose chemical compositions do not accord with [Table 9. 1. 1: Chemical composition of propeller and propeller blade castings](#) are to comply with a manufacturing specification approved by ACS.

## 1. 8 Inspection and non-destructive examination

1. 8. 1 Propeller castings should be visually inspected at all stages of manufacture. The manufacturer is to draw any significant imperfections to the attention of the Surveyor. Such imperfections are to be verified in accordance with [Ch 9, 1.9, Rectification of defective castings](#).
1. 8. 2 All finished castings are to be subjected to a comprehensive visual examination by the Surveyor, including internal surfaces such as the bore and bolt holes. Where unauthorised weld repairs are suspected by the Surveyor, the area is to be etched (e.g. by iron chloride) for the purpose of confirmation.
1. 8. 3 For the purpose of these requirements, the blades of propellers, including CPP blades, are divided into three severity Zones A, B and C as shown in [Figure 9. 1. 2: Severity zones in all propeller blades](#) and detailed in [Ch 9, 1.8 Inspection and non-destructive examination 1.8.4](#) for blades having skew angles of 25° or less and [Ch 9, 1.8 Inspection and non-destructive examination 1.8.5](#) for blades having skew angles of greater than 25°.

**Figure 9. 1. 2: Severity zones in all propeller blades**

**NOTE**

For a definition of skew angle, see the relevant Rules

**1. 8. 4 Skew angles of 25° or less:**

- Zone A is the area on the pressure side of the blade from and including the root fillet to  $0.4R$  and bounded by the trailing edge and by a line at a distance 0.15 times the chord length from the leading edge.
- Zone B includes the areas inside  $0.7R$  on both sides of the blade, excluding Zone A.
- Zone C includes the areas outside  $0.7R$  on both sides of the blade.

**1. 8. 5 Skew angles of greater than 25°:**

- Zone A is the area on the pressure side of the blade bounded by, and including, the root fillet and a line running from the junction of the leading edge with the root fillet to the trailing edge at  $0.9R$  and passing through the mid-point of the chord at  $0.7R$  and a point situated at 0.3 of the chord length from the leading edge at  $0.4R$ .
- Zone A also includes the area along the trailing edge on the suction side of the blade from the root to  $0.9R$  and with its inner boundary at 0.15 of the chord length tapering to meet the trailing edge at  $0.9R$ .
- Zone B constitutes the whole of the remainder of the blade surfaces.

**1. 8. 6 In propeller blades with continuously loaded tips (CLT), the whole of the tip plate and the adjoining blade to a distance of 100 mm is to be regarded as severity Zone B, See [Figure 9. 1. 3: Severity Zone B at continuously loaded blade tip](#). For propellers with diameters less than 2 m, the width of this zone may be reduced to one tenth of the propeller radius.**

**Figure 9. 1. 3: Severity Zone B at continuously loaded blade tip**

1. 8. 7 In addition, the palm of a CPP blade is divided into severity Zones A and B as shown in [Figure 9. 1. 4: Severity zones for controllible pitch propeller blades](#).
1. 8. 8 If a CPP blade has an integrally cast journal, the fillets of the journal and the adjoining material up to a distance of 20 mm from the fillet run-outs are to be regarded as Zone B, as indicated in [Figure 9. 1. 5: Severity zones in integrally cast CPP blade journals](#). The remainder of the surface of the journal may be regarded as Zone C.
1. 8. 9 Hubs of controllible pitch propellers are to contain a Zone A region at each blade port as shown in [Figure 9. 1. 6: Severity zones for controllible pitch propeller hub](#). The remainder may be regarded as Zone C.
1. 8. 10 On completion of machining and grinding, the whole surface of each casting is to be subjected to a dye penetrant inspection in accordance with a procedure acceptable to ACS.
1. 8. 11 All dye penetrant inspections on Zone A areas in the finished condition are to be made in the presence of the Surveyor.

**Figure 9. 1. 4: Severity zones for controllible pitch propeller blades**

The surfaces of blades are to be divided into severity zones in accordance with Fig. 9.1.2

**Figure 9. 1. 5: Severity zones in integrally cast CPP blade journals**

The surfaces of the journal which are not shaded are to be regarded as severity Zone C

**Figure 9. 1. 6: Severity zones for controllable pitch propeller hub**

( $d_1$  and  $d_2$  = diameters)

1. 8. 12 Dye penetrant inspections on Zones B and C are to be performed by the manufacturer and may be witnessed at the Surveyor's request.
1. 8. 13 The surface to be inspected shall be divided into reference areas of 100 cm<sup>2</sup>. The indications detected shall, with respect to their size and number, not exceed the values given in [Table 9. 1. 3: Allowable number and size of dye penetrant indications in a reference area of 100 cm<sup>2</sup> \(See Note 1\)](#). The area shall be taken in the most unfavourable location relative to the indication being evaluated.
1. 8. 14 Indications exceeding the acceptance standard in [Table 9. 1. 3: Allowable number and size of dye penetrant indications in a reference area of 100 cm<sup>2</sup> \(See Note 1\)](#) shall be repaired in accordance with [Ch 9, 1.9, Rectification of defective castings](#).
1. 8. 15 All defects requiring repair by welding in new propeller castings are to be recorded on sketches showing their locations and dimensions. Copies of these sketches are to be presented to the Surveyor prior to repair.

1. 8. 16 Where repairs have been made either by grinding or welding, the repaired areas are to be subjected to dye penetrant inspection in the presence of the Surveyor, regardless of their location.
1. 8. 17 Where no welds have to be made on a casting, the manufacturer is to provide the Surveyor with a statement that this is the case.
1. 8. 18 Where it is suspected that a casting contains internal defects, radiographic and/or ultrasonic examination may be required by the Surveyor. The acceptance criteria are to be agreed between the manufacturer and ACS in accordance with a recognised standard. The standard ASTM E272-99 (Severity Level 2) or equivalent is to be the radiographic acceptance standard for copper alloy castings. Ultrasonic testing of Cu 1 and Cu 2 is not considered in these Rules. For Cu 3 and Cu 4, ultrasonic inspection of defects may be possible and is to comply with the requirements for steel castings.
1. 8. 19 The measurement of dimensional accuracy is the responsibility of the manufacturer but the report on dimensional inspection is to be presented to the Surveyor who may require checks to be made and to witness such checks.
1. 8. 20 Static balancing is to be carried out on all propellers in accordance with the approved plan. Dynamic balancing is necessary for propellers running above 500 rpm.

## 1. 9 Rectification of defective castings

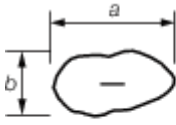

1. 9. 1 The rectification of defective propeller and propeller blade castings is to be carried out in accordance with the requirements given in [Ch 9, 1.9 Rectification of defective castings 1.9.2](#) to [Ch 9, 1.9 Rectification of defective castings 1.9.12](#).
1. 9. 2 The rectification of small indications within the acceptance standard of [Table 9. 1. 3: Allowable number and size of dye penetrant indications in a reference area of 100 cm<sup>2</sup> \(See Note 1\)](#) is not generally required except where they occur in closely spaced groups.
1. 9. 3 Where, in the surface of the end face or bore of a propeller boss, local pores are present which do not themselves adversely affect the strength of the casting, they may be filled with a suitable plastic filler after the appropriate preparation of the defective area. The foundry is to maintain records and details of all castings which have been so rectified.
1. 9. 4 Where unacceptable defects are found in a casting, they are to be removed by mechanical means, and the surfaces of the resulting depressions are subsequently to be ground smooth. Complete elimination of the defects is to be proved by adequate dye penetrant inspection.
1. 9. 5 Shallow grooves or depressions resulting from the removal of defects may, at the discretion of the Surveyor, be accepted provided that they will cause no appreciable reduction in the strength of the castings and that they are suitably blended by grinding.
1. 9. 6 Welded repairs are to be undertaken only when they are considered to be necessary and approved by the Surveyor. In general, welds having an area less than 5 cm<sup>2</sup> are to be avoided.
1. 9. 7 All weld repairs are to be carried out in accordance with qualified procedures by suitably qualified welders, and are to be completed to the satisfaction of the Surveyor. Records are to be made available to the Surveyor.
1. 9. 8 Welding is generally not permitted in Zone A and will only be allowed after special consideration.
1. 9. 9 Prior approval by the Surveyor is required for any welds in Zone B. Complete details of the repair procedure are to be submitted for each case.
1. 9. 10 Repair by welding is allowed in Zone C provided that there is compliance with [Ch 9, 1.9 Rectification of defective castings 1.9.6](#) and [Ch 9, 1.9 Rectification of defective castings 1.9.7](#).
1. 9. 11 The maximum area of any single repair and the maximum total area of repair in any one zone or region are given in [Table 9. 1. 4: Permissible rectification of new propellers by welding](#).

**Table 9. 1. 3: Allowable number and size of dye penetrant indications in a reference area of 100 cm<sup>2</sup> (See Note 1)**

| Severity Zones | Max. total number of indications | Type of indications (See Note 2) | Max. number of each type (See Notes 3 and 4) | Max. acceptable value for 'a' or 'l' of indications (mm) (See Note 2) |
|----------------|----------------------------------|----------------------------------|--|---|
| A              | 7                                | Non-linear                       | 5  | 4   |
|                |                                  | Linear                           | 2  | 3   |
|                |                                  | Aligned                          | 2  | 3   |
| B              | 14                               | Non-linear                       | 10   | 6   |
|                |                                  | Linear                           | 4  | 6   |
|                |                                  | Aligned                          | 4  | 6   |
| C              | 20                               | Non linear                       | 14   | 8   |
|                |                                  | Linear                           | 6  | 6   |
|                |                                  | Aligned                          | 6  | 6   |

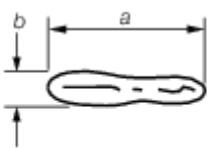

**Note 1.** The reference area is defined as an area of 0.01 m<sup>2</sup>, which may be square or rectangular, with the major dimension not exceeding 250 mm. The area shall be taken in the most unfavourable location relative to the indication being evaluated.

**Note 2.** Non-linear, linear and aligned indications are defined as follows:

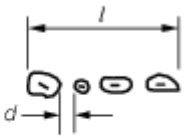

$$\frac{a}{b} < 3$$

non-linear

$$\frac{a}{b} \geq 3$$

linear

$$d \leq 2 \text{ mm}$$

aligned

**Note 3.** Only indications that have any dimension greater than 1.5 mm shall be considered relevant.

**Note 4.** Single non-linear indications less than 2 mm in Zone A and less than 3 mm in other zones may be disregarded.

**Note 5.** The total number of non-linear indications may be increased to the maximum total number, or part thereof, represented by the absence of linear or aligned indications.

1. 9. 12 Where it is proposed to exceed the areas given in [Table 9. 1. 4: Permissible rectification of new propellers by welding](#), the nature and extent of the repair work are to be approved by the Surveyor before commencement of the repair.

**Table 9. 1. 4: Permissible rectification of new propellers by welding**

| Severity zone or region | Maximum individual area of repair    | Maximum total area of repairs |
|-------------------------|--------------------------------------|-------------------------------|
| Zone A                  | Weld repairs not generally permitted |                               |

|  |  |   |
|--|--|---|
| Zone B   | Defects that are not deeper than $(t/40)$ mm or 2 mm, whichever is greater, below the minimum local thickness are to be removed by grinding. Defects which are deeper than allowable for removal by grinding may be repaired by welding. |   |
| Zone C   | 60 cm <sup>2</sup> or 0.6% x S whichever is the greater  | 200 cm <sup>2</sup> or 2% x S, whichever is the greater in combined Zones B and C but not more than 100 cm <sup>2</sup> or 0.8% x S, whichever is the greater, in Zone B on the pressure side |
| Other regions (See Note)   | 17 cm <sup>2</sup> or 1.5% area of the region whichever is the greater   | 50 cm <sup>2</sup> or 5% x area of the region whichever is the greater  |
| <p>where</p> <p><math>t</math> = minimum local thickness in mm</p> <p><math>S</math> = area of one side of a blade = <math>0.79 \frac{D_2 B}{N}</math></p> <p><math>D</math> = finished diameter of propeller</p> <p><math>B</math> = developed area ratio</p> <p><math>N</math> = number of blades</p>  |  |   |
| <p><b>Note</b> Other regions include:</p> <p>(a) the bore;</p> <p>(b) the forward and aft faces of the boss;</p> <p>(c) the outer surface of the boss to the start of the blade root fillets;</p> <p>(d) the inner face of a CPP blade palm;</p> <p>(e) all surfaces of CPP nose cones;</p> <p>(f) the surfaces of integral journals to CPP blades other than the fillets.</p> |  |   |

## 1. 10 Weld repair procedure

1. 10. 1 Welding is to be carried out under cover in positions free from draughts and adverse weather conditions.
1. 10. 2 The manufacturer is to submit a detailed welding procedure specification covering the weld preparation, welding parameters, filler metal, preheating, post-weld heat treatment and inspection procedures.
1. 10. 3 Before welding is started, Welding Procedure Qualification tests are to be carried out and witnessed by the Surveyor. Each welder is to be qualified to carry out the proposed welding using the same process, consumable and position which are to be used for the repair.
1. 10. 4 Defects to be repaired by welding are to be removed completely by mechanical means (e.g. grinding, chipping or milling). Removal of defects in accordance with the requirements for Zone A is to be demonstrated by dye penetrant inspection in the presence of the Surveyor. The excavation is to be prepared in a manner which will allow good fusion and is to be clean and dry.
1. 10. 5 Metal arc welding with the electrodes or filler wire used in the procedure tests is to be used for all types of repairs. Welds should preferably be made in the downhand (flat) position. Where necessary, suitable preheat is to be applied before welding, and the preheat temperature is to be maintained until welding is completed.

1. 10. 6 When flux coated electrodes are used they are to be dried immediately before use, in accordance with the manufacturer's instructions.
1. 10. 7 All slag, undercuts and other defects are to be removed before the subsequent run is deposited.
1. 10. 8 With the exception given in [Ch 9, 1.10 Weld repair procedure 1.10.9](#), all weld repairs in areas of solid propellers exposed to sea-water, and all repairs to separately cast blades, are to be stress relief heat treated.
1. 10. 9 Stress relief heat treatment is not mandatory after welding Grade Cu 3 castings in Zone C unless a welding consumable susceptible to stress corrosion (e.g. complying with the composition range of Grade Cu 4) is used. All welds in Zones A and B however, must be stress relieved by heat treatment, regardless of alloy.

1. 10. 10 Propeller and propeller blades are to be stress relieved within the following temperature ranges:

alloy Grades Cu 1 and Cu 2    350°C to 550°C

alloy Grade Cu 3                    450°C to 500°C

alloy Grade Cu 4                    450°C to 600°C

Soaking times are to be in accordance with [Table 9. 1. 5: Soaking times for stress relief heat treatment of copper alloy propellers](#), and subsequent cooling from the soaking temperature is to be suitably controlled to minimise residual stresses and is not to exceed 50°C per hour until the temperature is below 200°C. Care should be taken to avoid heating castings in the Grade Cu 3 alloy at temperatures between 300 and 400°C for prolonged periods.

**Table 9. 1. 5: Soaking times for stress relief heat treatment of copper alloy propellers**

| Stress relief temperature °C ( <i>See Notes</i> )  | Alloy Grade Cu1 and Cu2      |                                      | Alloy Grade Cu3 and Cu4      |                                      |
|--|------------------------------|--------------------------------------|------------------------------|--------------------------------------|
|  | Hours per 25 mm of thickness | Maximum recommended total time hours | Hours per 25 mm of thickness | Maximum recommended total time hours |
| 350  | 5                            | 15                                   | —                            | —                                    |
| 400  | 1                            | 5                                    | —                            | —                                    |
| 450  | ½                            | 2                                    | 5                            | 15                                   |
| 500  | ¼                            | 1                                    | 1                            | 5                                    |
| 550  | ¼                            | ½                                    | ½                            | 2                                    |
| 600  | —                            | —                                    | ¼                            | 1                                    |
| <p><b>Note 1.</b> Treatment at 550°C is not applicable to alloy Grade Cu3.</p> <p><b>Note 2.</b> Treatment at 600°C is only applicable to alloy Grade Cu4.</p> |                              |                                      |                              |                                      |

1. 10. 11 Stress relief heat treatment is to be carried out, where possible, in furnaces having suitable atmosphere and temperature control. Sufficient thermocouples are to be attached to the casting to measure the temperature at positions of extremes of thickness.
1. 10. 12 As an alternative to [Ch 9, 1.10 Weld repair procedure 1.10.11](#), local stress relief heat treatment may be accepted, provided that the Surveyor is satisfied that the technique will be effective and that adequate precautions are taken to prevent the introduction of detrimental temperature gradients. Where local stress relief heat treatment is approved, adequate temperature control is to be provided. The area of the propeller or blade adjacent to the repair is to be suitably monitored and insulated to ensure that the required temperature is maintained and that temperature gradients

are moderate. Care should be taken to select the shape of an area to be heat treated which will minimise residual stresses.

1. 10. 13 On completion, welds are to be ground smooth for visual examination and dye penetrant inspection. Where a propeller or propeller blade is to be stress relief heat treated, a visual examination is to be made before heat treatment, and both visual and dye penetrant examinations are to be made after the stress relief heat treatment. Irrespective of location, all weld repairs are to be assessed according to Zone A in [Table 9. 1. 3: Allowable number and size of dye penetrant indications in a reference area of 100 cm<sup>2</sup> \(See Note 1\)](#).
1. 10. 14 The foundry is to maintain full records detailing the weld procedure, heat treatment and extent and location on drawings of repairs made to each casting. These records are to be available for review by the Surveyor, and copies of individual records are to be supplied to the Surveyor on request.
1. 10. 15 ACS reserves the right to restrict the amount of repair work accepted from a manufacturer when it appears that repetitive defects are the result of improper foundry techniques or practices.

## 1. 11 Identification

1. 11. 1 Castings are to be clearly marked by the manufacturer in accordance with the requirements of [Ch 1 General Requirements](#). The following details are to be shown on all castings which have been accepted:
  - a. Identification mark which will enable the full history of the item to be traced.
  - b. Alloy grade.
  - c. ACS or Asia Classification Society and the abbreviated name of ACS.
  - d. Personal stamp of Surveyor responsible for the final inspection.
  - e. Date of final inspection.
  - f. Skew angle if in excess of 25°. See [Pt 5, Ch 7, 1 Plans and particulars](#) of the Rules for Ships for the definition of skew angle.

## 1. 12 Certification of materials

1. 12. 1 A ACS certificate is to be issued for each propeller, See [Ch 1, 3.1, General](#).
1. 12. 2 The manufacturer is to provide the Surveyor with the following particulars for each casting:
  - a. Purchaser's name and order number.
  - b. Description of casting.
  - c. Alloy designation and/or trade name.
  - d. Identification number of casting.
  - e. Cast identification number if different from (d).
  - f. Details of heat treatment, where applicable.
  - g. Skew angle if in excess of 25°. See the relevant Rules for the definition of skew angle.
  - h. Final weight of casting.
  - i. Results of non-destructive tests and details of test procedures.
  - j. Proportion of alpha-structure for Cu1 and Cu2 alloys.
  - k. Results of mechanical tests.
  - l. A sketch showing the location and extent of welding repairs (if any).

## PART

# 2

## CHAPTER 9 Copper Alloys

### SECTION 2 Castings for valves, liners and bushes

#### 2.1 Scope

- 2.1.1 This Section makes provision for copper alloy castings for valves, liners, bushes and other fittings intended for use in the construction of ships, other marine structures, machinery and pressure piping systems.
- 2.1.2 Castings are to be manufactured and tested in accordance with Chapters [Ch 1 General Requirements](#) and [Ch 2 Testing Procedures for Metallic Materials](#), and also with the requirements given in this Section.
- 2.1.3 As an alternative to [Ch 9, 2.1 Scope 2.1.2](#), castings which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of [Ch 1 General Requirements](#).

#### 2.2 Manufacture

- 2.2.1 Castings are to be manufactured at foundries approved by ACS.

#### 2.3 Quality of castings

- 2.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

#### 2.4 Chemical composition

- 2.4.1 The chemical composition is to comply with the requirements of a National or International Standard and, where appropriate, with the limits for the principal elements of the preferred alloys listed in [Table 9. 2. 1: Chemical compositions of long freezing range alloys: principal elements only](#) and [Table 9. 2. 2: Chemical compositions of short freezing range alloys: principal elements only](#).

**Table 9. 2. 1: Chemical compositions of long freezing range alloys: principal elements only**

| Alloy type      | Designation | Chemical composition |             |           |           |          |           | Typical applications |
|-----------------|-------------|----------------------|-------------|-----------|-----------|----------|-----------|----------------------|
|                 |             | Cu                   | Sn          | Zn        | Pb        | Ni       | P         |                      |
| Phosphor bronze | Cu Sn11 P   | 87.0 – 89.5          | 10.0 – 11.5 | 0.05 max. | 0.25 max. | 0.10 max | 0.5 – 1.0 |                      |

|                 |                |             |             |             |             |           |          |                                     |
|-----------------|----------------|-------------|-------------|-------------|-------------|-----------|----------|-------------------------------------|
|                 | Cu Sn12        | 85.0 – 88.5 | 11.0 – 13.0 | 0.50 max.   | 0.7 max.    | 2.0 max   | 0.60 max | Liners, bushes, valves and fittings |
| Gunmetal        | Cu Sn10 Zn2    | Remainder   | 9.5 – 10.5  | 1.75 – 2.75 | 1.5 max.    | 1.0 max   | –        | Liners, valves and fittings         |
| Leaded gunmetal | Cu Sn5 Zn5 Pb5 | 83.0 – 87.0 | 4.0 – 6.0   | 4.0 – 6.0   | 4.0 – 6.0   | 2.0 max   | 0.10 max | Bushes, valves and fittings         |
|                 | Cu Sn7 Zn2 Pb3 | 85.0 – 89.0 | 6.0 – 8.0   | 1.5 – 3.0   | 2.5 – 3.5   | 2.0 max   | 0.10 max |                                     |
|                 | Cu Sn7 Zn4 Pb7 | 81.0 – 85.0 | 6.0 – 8.0   | 2.0 – 5.0   | 5.0 – 8.0   | 2.0 max   | 0.10 max |                                     |
|                 | Cu Sn6 Zn4 Pb2 | 86.0 – 90.0 | 5.5 – 6.5   | 3.0 – 5.0   | 1.0 – 2.0   | 1.0 max   | 0.05 max |                                     |
| Leaded bronze   | Cu Sn10 Pb10   | 78.0 – 82.0 | 9.0 – 11.0  | 2.0 max.    | 8.0 – 11.0  | 2.0 max   | 0.10 max | Bushes                              |
|                 | Cu Sn5 Pb9     | 80.0 – 87.0 | 4.0 – 6.0   | 2.0 max.    | 8.0 – 10.0  | 2.0 max   | 0.10 max |                                     |
|                 | Cu Sn7 Pb15    | 74.0 – 80.0 | 6.0 – 8.0   | 2.0 max.    | 13.0 – 17.0 | 0.5 – 2.0 | 0.10 max |                                     |
|                 | Cu Sn5 Pb20    | 70.0 – 78.0 | 4.0 – 6.0   | 2.0 max.    | 18.0 – 23.0 | 0.5 – 2.5 | 0.10 max |                                     |

**Table 9. 2. 2: Chemical compositions of short freezing range alloys: principal elements only**

| Alloy type        | Designation                     | Chemical composition |                      |                      |          |         |          |            |           | Typical applications         |
|-------------------|---------------------------------|----------------------|----------------------|----------------------|----------|---------|----------|------------|-----------|------------------------------|
|                   |                                 | Cu                   | Ni                   | Fe                   | Mn       | Cr      | Nb       | Si         | Al        |                              |
| Copper 30% nickel | Cu Ni30 Fe1 Mn1                 | 64.5 min.            | 29.0–31.0            | 0.5–1.5              | 0.6–1.2  | –       | –        | 0.1 max.   | –         | Flanges, valves and fittings |
|                   | Cu Ni30 Fe1 Mn1 Nb Si           | Remainder            | 29.0–31.0            | 0.5–1.5              | 0.6–1.2  | –       | 0.5–1.0  | 0.3–0.7    | –         |                              |
|                   | Cu Ni30 Cr2 Fe Mn Si (See Note) | Remainder            | 29.0–32.0            | 0.5–1.0              | 0.5–1.0  | 1.5–2.0 | –        | 0.15–0.50  | –         |                              |
| Copper 10% nickel | Cu Ni10 Fe1 Mn1                 | 84.5 min.            | 9.0–11.0             | 1.0–1.8              | 1.0–1.5  | –       | 1.0 max. | 0, 10 max. | –         | Flanges, valves and fittings |
| Aluminium bronze  | Cu Al10 Fe5 Ni5                 | 76.0–83.0            | 4.0–6.0 (See Note 2) | 4.0–5.5 (See Note 2) | 3.0 max. | –       | –        | 0.1 max.   | 8.5–10.5  | Bushes, valves and fittings  |
|                   | Cu Al11 Fe6 Ni6                 | 72.0–78.0            | 4.0–7.5 (See Note 2) | 4.0–7.0 (See Note 2) | 2.5 max. | –       | –        | 0.1 max.   | 10.0–12.0 |                              |

**Note 1.** Normally alloy Cu Ni30 Cr2 Fe Mn Si contains 0.1 to 0.25% titanium and 0.05 to 0.15% zirconium.

**Note 2.** For Naval ships, the nickel content is to be higher than the iron content.

- 2. 4. 2 With the exception given in [Ch 9, 2.4 Chemical composition 2.4.3](#), chemical analysis is required on each cast.
- 2. 4. 3 Where a cast is wholly prepared from ingots for which an analysis is already available, and provided that no significant alloy additions are made during melting, the ingot maker's certified analysis can be accepted subject to occasional check tests as requested by the Surveyor. The frequency of these check tests should, as a minimum, be one in every ten casts. If one of these check analyses fails to comply with the specification, checks are to be made on the previous and subsequent melts. If one or both of these further analyses is unsatisfactory, chemical analysis is to be carried out on all further melts until the Surveyor is satisfied that a return can be made to the use of occasional check tests.

## 2. 5 Heat treatment

- 2. 5. 1 Where required by the specification, castings may be supplied in either the 'as-cast' or heat treated condition.
- 2. 5. 2 Where castings are supplied in a heat treated condition, the test samples are to be heat treated with the castings they represent prior to the preparation of the tensile test specimens.

## 2. 6 Test material

- 2. 6. 1 Test material sufficient for the tests specified in [Ch 9, 2.6 Test material 2.6.4](#) and for possible re-test purposes is to be provided for each cast of material.
- 2. 6. 2 The test material is to be separately cast into moulds made of the same material as that used for the castings they represent.
- 2. 6. 3 For the alloys listed in [Table 9. 2. 1: Chemical compositions of long freezing range alloys: principal elements only](#), sand cast test bars are generally to be in accordance with [Figure 9. 2. 1: Sand cast test bars for long freezing range alloys](#).
- 2. 6. 4 For the alloys listed in [Table 9. 2. 2: Chemical compositions of short freezing range alloys: principal elements only](#), keel block type test samples are to be in accordance with [Figure 9. 1. 1: Keel block type test sample](#).
- 2. 6. 5 If it is proposed to use any other form of test bar, this is to be agreed in advance with the Surveyor.
- 2. 6. 6 As an alternative, for liners and bushes, the test material may be taken from the ends of the castings.

## 2. 7 Mechanical tests

- 2. 7. 1 A tensile test specimen is to be prepared from each test sample. The dimensions of the specimens are to comply with [Figure 2. 2. 1: Test specimen dimensions for plates, strip and sections - I](#) or [Figure 2. 2. 2: Test specimen dimensions for forgings and castings - II and aluminum alloys](#) in Chapter 2.
- 2. 7. 2 The results of all tests are to comply with the appropriate requirements given in [Table 9. 2. 3: Mechanical properties of long freezing range alloys for acceptance purposes](#) and [Table 9. 2. 4: Mechanical properties of short freezing range alloys for acceptance purposes](#).

**Table 9. 2. 3: Mechanical properties of long freezing range alloys for acceptance purposes**

| Alloy type  | Designation    | 0.2% proof stress<br>N/mm <sup>2</sup> minimum<br>(See Note 1) |             | Tensile strength<br>N/mm <sup>2</sup> minimum |             | Elongation on<br>5.65√S <sub>0</sub> %<br>minimum |             |
|---|----------------|--|-------------|---|-------------|---|-------------|
|   |                | Sand   | Centrifugal | Sand  | Centrifugal | Sand  | Centrifugal |
| Phosphor bronze   | Cu Sn11 P      | 130  | 170         | 250   | 330         | 5   | 4           |
|   | Cu Sn12        | 140  | 150         | 260   | 280         | 7   | 5           |
| Gunmetal  | Cu Sn10 Zn2    | 130  | 130         | 270   | 250         | 13  | 5           |
| Leaded gunmetal   | Cu Sn5 Zn5 Pb5 | 90   | 110         | 200   | 250         | 13  | 13          |
|   | Cu Sn7 Zn2 Pb3 | 130  | 130         | 230   | 260         | 14  | 12          |
|   | Cu Sn7 Zn4 Pb7 | 120  | 120         | 230   | 260         | 15  | 12          |
|   | Cu Sn6 Zn4 Pb2 | 110  | 110         | 220   | 240         | 15  | 12          |
| Leaded bronze   | Cu Sn10 Pb10   | 80   | 110         | 180   | 220         | 8   | 6           |
|   | Cu Sn5 Pb9     | 60   | 90          | 160   | 200         | 7   | 6           |
|   | Cu Sn7 Pb15    | 80   | 90          | 170   | 200         | 8   | 7           |
|   | Cu Sn5 Pb20    | 70   | 80          | 150   | 170         | 5   | 6           |
| <p><b>Note 1.</b> The 0.2% proof stress values are given for information purposes only and, unless otherwise agreed, are not required to be verified by test.</p> <p><b>Note 2.</b> Castings may be supplied in the chill cast condition in which case the mechanical properties requirements are to be in accordance with a specification agreed by ACS.</p> |                |  |             |   |             |   |             |

**Table 9. 2. 4: Mechanical properties of short freezing range alloys for acceptance purposes**

| Alloy type        | Designation           | 0.2% proof stress<br>N/mm <sup>2</sup> minimum |             | Tensile strength<br>N/mm <sup>2</sup> minimum |             | Elongation on<br>5.65√S <sub>0</sub> %<br>minimum |             |

| Aluminium Bronze  | Cu Al10 Fe5 Ni5       | 250  | 280         | 600   | 650         | 13  | 13          |
|                   | Cu Al11 Fe6 Ni6       | 320  | 380         | 680   | 750         | 5   | 5           |

## 2. 8 Inspection

2. 8. 1 All castings are to be cleaned and adequately prepared for inspection. Before acceptance, all castings are to be presented to the Surveyor for visual examination. This is to include the examination of internal surfaces, where applicable.
2. 8. 2 For valves and other pressure components, dye penetrant inspection is required and the Surveyor is to witness the tests. Unless otherwise agreed, the acceptance criteria to be applied are to meet the requirements of [Table 9. 2. 5: Visual and surface NDE acceptance criteria for valves and pressure components](#), or equivalent.

**Table 9. 2. 5: Visual and surface NDE acceptance criteria for valves and pressure components**

|   |  |
|---|--|
| fect type   | Acceptance criteria for visual and surface NDE, <i>See Note</i>  |
| Linear indications  | Not permitted  |
| Porosity  | Individual pores are not to exceed 3 mm diameter bleed out, and the sum of the diameters of all indications in an area of 70 x 70 mm is not to exceed 24 mm <sup>2</sup> |
| <b>Note</b> Inspection is to be in accordance with a procedure acceptable to ACS. |  |

2. 8. 3 The accuracy and verification of dimensions are the responsibility of the manufacturer. However, the report on dimensional inspection is to be presented to the Surveyor who may request to witness confirmatory measurements.

## 2. 9 Rectification of defective castings

2. 9. 1 Subject to the prior approval of the Surveyor, castings containing local porosity may be rectified by impregnation with a suitable plastic filler provided that the extent of the porosity is such that it does not adversely affect the strength of the casting.
2. 9. 2 Proposals to repair a defective casting by welding are to be submitted to the Surveyor before this work is commenced. The Surveyor is to be satisfied that the number, position and size of the defects are such that the castings can be efficiently repaired.
2. 9. 3 Where approval is given for the repair by welding, complete elimination of the defects is to be proven by adequate non-destructive testing.

**Figure 9. 2. 1: Sand cast test bars for long freezing range alloys**

- 2. 9. 4 All welding is to be in accordance with an approved and qualified weld procedure and carried out by a qualified welder.
- 2. 9. 5 A statement and/or sketch detailing the extent and position of all weld repairs is to be prepared by the manufacturer as a permanent record. These records are to be available for review by the Surveyor, and copies of individual records are to be supplied to the Surveyor on request.
- 2. 9. 6 The alloys listed in [Table 9. 2. 1: Chemical compositions of long freezing range alloys: principal elements only](#) are not satisfactory for repair by welding which is generally not permitted. Weld repairs may, however, be considered in special circumstances provided that a suitable procedure, with proof of previous satisfactory repairs is submitted to the Surveyor.
- 2. 9. 7 The welding during manufacture of liners is not permitted in any alloy containing more than 0.5 per cent lead.

## 2. 10 Pressure testing

- 2. 10. 1 Where required by the relevant Rules, castings are to be pressure tested before final acceptance. Unless otherwise agreed, these tests are to be carried out in the presence of the Surveyors and are to be to their satisfaction.

## 2. 11 Identification

- 2. 11. 1 The manufacturer is to adopt a system of identification which will enable all finished castings to be traced to the original cast, and the Surveyor is to be given full facilities for so tracing the casting when required.
- 2. 11. 2 Before acceptance, all castings which have been tested and inspected with satisfactory results are to be clearly marked by the manufacturer with the following details:
  - a. Identification number, cast number or other markings which will enable the full history of the casting to be traced.
  - b. ACS or Asia Classification Society and the abbreviated name of ACS 's.
  - c. Personal stamp of the Surveyor responsible for inspection.
  - d. Test pressure, where applicable.
  - e. Date of final inspection.

2. 11. 3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

## **2. 12 Certification of materials**

2. 12. 1 A ACS certificate is to be issued, See [Ch 1, 3.1, General](#).
2. 12. 2 The manufacturer is to provide the Surveyor with the following particulars for each casting or batch of castings which has been accepted:
- a. Purchaser's name and order number.
  - b. Description of castings and alloy grade.
  - c. Identification number.
  - d. Ingot or cast analysis.
  - e. Full details of heat treatment, where applicable.
  - f. Mechanical test results.
  - g. Test pressure, where applicable.
2. 12. 3 In addition to [Ch 9, 2.12 Certification of materials 2.12.2](#), the manufacturer is to provide, where applicable, a statement and/or sketch detailing the extent and position of all weld repairs made to each casting.

PART

# 2

CHAPTER **9 Copper Alloys**

SECTION **3 Tubes**

## **3. 1 Scope**

- 3. 1. 1 Provision is made in this Section for seamless copper and copper alloy tubes intended for use in condensers, heat exchangers and pressure piping systems.
- 3. 1. 2 Tubes for Class I and II pressure systems (as defined in the relevant Rules), are to be manufactured and tested in accordance with the requirements of Chapters [Ch 1 General Requirements](#) and [Ch 2 Testing Procedures for Metallic Materials](#) and the requirements of this Section.
- 3. 1. 3 As an alternative to [Ch 9, 3.1 Scope 3.1.2](#), tubes which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of [Ch 1 General Requirements](#).
- 3. 1. 4 Tubes for Class III pressure systems are to be manufactured and tested in accordance with the requirements of a National or International Standard recognised by ACS. The manufacturer's test certificate will be acceptable and is to be provided for each batch of material.

## **3. 2 Manufacture**

- 3. 2. 1 Tubes for Class I and II pressure systems are to be manufactured at a works approved by ACS for the grade of material being supplied.
- 3. 2. 2 Tubes for Class III pressure systems are not required to be manufactured at a works approved by ACS.

## **3. 3 Quality**

- 3. 3. 1 Tubes are to be clean and free from surface and internal defects and residues from manufacturing operations.
- 3. 3. 2 The tubes are to be supplied in smooth, round, straight lengths and the manufacturer is to guarantee freedom from deleterious films in the bore. The ends are to be cut clean and square with the axis of the tube and are to be de-burred.

## **3. 4 Dimensional tolerances**

- 3. 4. 1 The tolerances on the wall thickness and diameter of the tubes are to be in accordance with a National or International Standard recognised by ACS.

3. 4. 2 The measurement of dimensional accuracy and compliance with the specification are the responsibility of the manufacturer, but the reports are to be made available to the ACS Surveyors, who may require checks to be made in their presence.

### 3. 5 Chemical composition

3. 5. 1 The chemical composition is to comply with the requirements of a National or International Standard recognised by ACS and comply with the base limits for the principal elements given in [Table 9. 3. 1: Chemical composition of principal elements only](#).

**Table 9. 3. 1: Chemical composition of principal elements only**

| Designation  | Chemical composition % |            |             |           |            |           |         |         |           |
|--|------------------------|------------|-------------|-----------|------------|-----------|---------|---------|-----------|
|  | Cu                     | As         | P           | Fe        | Pb         | Ni        | Al      | Mn      | Zn        |
| Copper-phosphorus deoxidised–non-arsenical   | 99.85 min.             | —          | 0.013–0.050 | —         | —          | —         | —       | —       | —         |
| Copper-phosphorus deoxidised–arsenical   | 99.2 min.              | 0.30–0.50  | 0.013–0.050 | —         | —          | —         | —       | —       | —         |
| Aluminium brass  | 76.0–79.0              | 0.02–0.06  | —           | 0.06 max. | 0.07 max.  | —         | 1.8–2.5 | —       | Remainder |
| 90/10 Copper-nickel-iron<br>(See Note)   | Remainder              | —          | —           | 1.0-2.0   | —          | 9.0–11.0  | —       | 0.5–1.0 | —         |
| 70/30 Copper-nickel-iron<br>(See Note)   | Remainder              | —          | —           | 0.40–1.00 | —          | 29.0–33.0 | —       | 0.5–1.5 | —         |
| <b>Note</b>  |                        |            |             |           |            |           |         |         |           |
| Where the purchaser specifies that the product is intended for subsequent welding applications, the following limits will apply: |                        |            |             |           |            |           |         |         |           |
|  | Zn                     | 0.50% max. |             | S         | 0.02% max. |           |         |         |           |
|  | Pb                     | 0.02% max. |             | C         | 0.05% max. |           |         |         |           |
|  | P                      | 0.02% max. |             |           |            |           |         |         |           |

### 3. 6 Heat treatment

3. 6. 1 Copper-phosphorus and aluminium brass tubes are to be supplied in the annealed condition. Aluminium brass tubes may additionally be required to be given a suitable stress relieving heat treatment when subjected to a cold straightening operation after annealing.
3. 6. 2 Tubes in the copper-nickel iron alloys are to be supplied in a solution heat treated condition to ensure that no iron rich phases are present.

### 3. 7 Mechanical tests

3. 7. 1 Tubes are to be presented for test in batches of 300 lengths. A batch is to consist of tubes of the same size, manufactured from the same material grade.
3. 7. 2 At least one length is to be selected at random from each batch and subjected to the following tests:
- Tensile test.
  - Flattening test.
  - Drift expanding test.
3. 7. 3 The procedures for mechanical tests and the dimensions of the test specimens are to be in accordance with [Ch 2 Testing Procedures for Metallic Materials](#).
3. 7. 4 The flattening test is to be continued until the interior surfaces of the tube meet.
3. 7. 5 For the drift expanding test, the mandrel is to have an included angle of 45°.
3. 7. 6 The results of all mechanical tests are to comply with the appropriate requirements given in [Table 9. 3. 2: Mechanical properties for acceptance purposes](#).

**Table 9. 3. 2: Mechanical properties for acceptance purposes**

| Designation   | 0.2% proof stress<br>N/mm <sup>2</sup><br>minimum | Tensile strength<br>N/mm <sup>2</sup><br>minimum | Elongation on<br>$5.65\sqrt{S_0}\%$<br>minimum | Drift expansion test<br>%<br>minimum | Grain size mm maximum<br>(See Note) |
|---|---|--|--|--------------------------------------|-------------------------------------|
| Copper-phosphorus deoxidised–non-arsenical  | 65  | 220  | 40   | 40                                   | –                                   |
| Copper-phosphorus deoxidised–arsenical  | 65  | 220  | 40   | 40                                   | –                                   |
| Aluminium brass   | 125   | 320  | 40   | 30                                   | 0.045                               |
| 90/10 Copper-nickel-iron  | 100   | 270  | 30   | 30                                   | 0.045                               |
| 70/30 Copper-nickel-iron  | 120   | 360  | 30   | 30                                   | 0.045                               |
| <b>Note</b> When a maximum grain size is specified, the structure is to be completely re-crystallised. The manufacturer is to guarantee the grain size, but testing of each batch will not be required. |   |  |  |                                      |                                     |

3. 7. 7 At the discretion of the Surveyor, a modified testing procedure may be adopted for small quantities of materials. In such cases, these may be accepted on the manufacturer's declared chemical composition and hardness tests or other evidence of satisfactory properties.

### 3. 8 Visual examination

3. 8. 1 All tubes are to be visually examined. The manufacturer is to provide adequate lighting conditions to enable an internal and external examination of the tubes to be carried out.

3. 8. 2 The inner and outer surfaces are to be clean and smooth but may have a superficial, dull iridescent film on both the inner and outer surfaces.

### 3. 9 Hydraulic test

3. 9. 1 Each tube is to be subjected to a hydraulic test at the manufacturer's works.
3. 9. 2 The hydraulic test pressure is to be determined from the following formula, except that the maximum test pressure need not exceed 7 MPa:

$$P = \frac{2st}{D}$$

where  $P$  = test pressure, in MPa

$D$

= nominal outside diameter, in mm

$t$

= nominal wall thickness, in mm

$s$

= 40 for copper-phosphorous

= 40 for copper-phosphorous

= 60 for 90/10 copper nickel iron

= 75 for 70/30 copper nickel iron

3. 9. 3 The test pressure is to be maintained for sufficient time to permit proof that the tubes do not weep, leak or undergo a permanent increase in diameter. Unless otherwise agreed, the manufacturer's certificate of satisfactory hydraulic test will be accepted.
3. 9. 4 Where it is proposed to adopt a test pressure other than that determined in [Ch 9, 3.9 Hydraulic test 3.9.2](#), the proposal will be subject to special consideration.
3. 9. 5 Subject to special approval, an automated eddy current test can be accepted in lieu of the hydraulic test. Discontinuous irregularities on the external and internal surfaces of the tubes are permitted if they are within the agreed dimensional tolerances, with the exception of cracks, which are not permitted.

### 3. 10 Rectification of defects

3. 10. 1 The repair of defects by welding is not permitted.

### 3. 11 Identification

3. 11. 1 Tubes are to be clearly marked by the manufacturer in accordance with the requirements of [Ch 1 General Requirements](#). The following details are to be shown on all materials which have been accepted:
- ACS or Asia Classification Society.
  - Manufacturer's name or trade mark.
  - Grade of material or designation code.
  - Identification number and/or initials which will enable the full history of the item to be traced.
3. 11. 2 Identification is to be by rubber stamp or stencils. Hard stamping is not permitted.

### 3. 12 Certification of materials

3. 12. 1 A manufacturer's certificate validated by ACS is to be issued (*See [Ch 1, 3.1, General](#)*), giving the following particulars for each casting or batch of castings which has been accepted:
- Purchaser's name and order number.
  - Specification or grade of material.
  - Description and dimensions.
  - Cast number and chemical composition.
  - Mechanical test results.
  - Results of stress corrosion cracking test, where applicable.
  - Hydraulic test report.

CHAPTER **10 Equipment for Mooring and Anchoring**SECTION **1 Anchors****1.1 Scope**

- 1.1.1 This Section makes provision for the manufacture and testing of anchors constructed from cast, forged and fabricated components.
- 1.1.2 This Section is applicable to the following types of anchor:
  - a. Ordinary.
  - b. High holding power (HHP).
  - c. Super high holding power (SHHP).
- 1.1.3 In the context of this Section, the reference to swivels refers to those directly attached to the anchor shank in lieu of the conventional 'D' shackle. For other mooring equipment swivels, See [Ch 10, 2.13, Fittings for chain cables](#).

**1.2 Design requirements**

- 1.2.1 All anchors are to be of an approved design. In addition, HHP and SHHP anchor designs are required to be tested in accordance with [Ch 10, 1.3 Anchor holding power tests for HHP and SHHP anchors](#) so as to confirm the holding power.

**1.3 Anchor holding power tests for HHP and SHHP anchors**

- 1.3.1 Anchor designs for which approval is sought as HHP anchors are to be tested at sea to show that they have holding powers of at least twice those of approved standard stockless anchors of the same mass. In the case of SHHP anchors, a holding power of at least four times that of an ordinary stockless anchor of same mass is to be demonstrated.
- 1.3.2 Full scale tests are to be carried out at sea on various types of bottom, normally, soft mud or silt, sand or gravel and hard clay or similar compounded material. The tests are to be applied to anchors of mass which are as far as possible representative of the full range of sizes proposed.
- 1.3.3 HHP and SHHP anchors are to be tested along with an ordinary stockless anchor to establish the holding power. They are to be of approximately the same mass and tested in association with the size of chain required for that anchor mass.
- 1.3.4 Where an ordinary stockless anchor is not available for testing a HHP anchor, the use of a previously approved HHP anchor may be considered. For testing SHHP anchors, a previously approved HHP or SHHP anchor may be considered.
- 1.3.5 The length of the cable attached to each anchor is to be such that the pull on the shank remains horizontal during the test. For this purpose a scope of 10 is considered normal but a scope of not less than 6 may be accepted. Scope is defined as the ratio of length of cable to depth of water.

1. 3. 6 Three tests are to be taken for each anchor and each type of bottom. The stability of the anchor and ease of breaking out are to be noted where possible. Tests are to be carried out from a tug but, alternatively, shore based tests will be specially considered. The pull is to be measured by dynamometer. Measurements of pull, based on the RPM/bollard pull curve of the tug will be considered as an alternative to a dynamometer.
1. 3. 7 For approval and/or acceptance for a range of HHP anchor sizes, tests are to be carried out for at least two anchor sizes. The mass of the maximum size approved is not to be more than 10 times the mass of the largest size tested.
1. 3. 8 For approval and/or acceptance for a range of SHHP anchor sizes, at least three anchor sizes are to be tested, indicative of the bottom, middle and top of the mass range.
1. 3. 9 The holding power test load is not to exceed the proof load of the anchor.

## 1. 4 Cast steel anchors

1. 4. 1 Cast steel anchor heads, shanks, shackles and swivels are to be manufactured and tested in accordance with the requirements of [Ch 4, 1 General requirements](#) and [Ch 4, 2 Castings for ship and other structural applications](#). The Special grade quality is to be used for anchor heads, shanks and shackles.
1. 4. 2 Special consideration will be given to the use of other grades of steel for the manufacture of swivels.
1. 4. 3 To confirm the quality of cast anchor components, the Surveyor is to witness drop and hammering tests.
1. 4. 4 When drop and hammering tests are required, they are to be carried out as follows:
  - a. Each anchor, or the components of an anchor made from more than one piece, is to be dropped from a clear height of 4 m onto a steel slab laid on a solid foundation.
  - b. Separately cast shanks and shackles are to be suspended horizontally from a clear height of 4 m before being dropped. Cast anchor flukes are to be suspended vertically, from a clear height of 4 m before being dropped. Alternatively, a horizontal drop test for the anchor fluke can be carried out as agreed by the manufacturer and Surveyor.
  - c. Anchors cast in one piece are to be drop tested twice from a clear height of 4 m. For the first test, the shank and flukes are to be horizontal. For the second test, two steel blocks are to be placed on the slab, arranged so that the middle of each fluke makes contact with the blocks without the crown making contact with the slab, and the orientation of the anchor is to be vertical with the crown nearest the slab.
  - d. If the slab is broken by the impact, the test is to be repeated on a new slab.
1. 4. 5 When hammering tests are required, they are to be carried out after the drop test on each anchor head and shank, which is slung clear of the ground, using a nonmetallic sling, and hammered to check the soundness of the component. A hammer of at least 3 kg mass is to be used.
1. 4. 6 As part of the manufacturer's works approval, consideration may be given to carrying out drop tests in alternative locations to the manufacturer's when the facilities and location are not suitable.
1. 4. 7 Repair of fractures or unsoundness detected during the drop or hammering tests are not permitted and the component is to be rejected.

## 1. 5 Forged steel anchors

1. 5. 1 Forged steel anchor pins, swivels, shanks and shackles are to be manufactured and tested in accordance with the requirements of [Ch 5, 1 General requirements](#) and [Ch 5, 2 Forgings for ship and other structural applications](#) carbon and carbon-manganese steel for welded construction.

Rolled steel bar may be used provided that the requirements of [Ch 5, 1.2 Manufacture 1.2.9](#) are met.

1. 5. 2 Special consideration will be given to other grades of steel for the manufacture of swivels.

## 1. 6 Fabricated steel anchors

1. 6. 1 Where it is proposed to use plate material for fabricated steel anchors, it is to comply with the requirements of [Ch 3, 2 Normal strength steels for ship and other structural applications](#) or [Ch 3, 3 Higher strength steels for ship and other structural applications](#), and the proposed manufacturing procedure is to be submitted for approval.
1. 6. 2 Fabricated anchors are to be manufactured in accordance with [Ch 13 Requirements for Welded Construction](#).
1. 6. 3 Stress relief is to be carried out as required in the approved welding procedure.

## 1. 7 Rectification

1. 7. 1 All rectification is to be agreed with the Surveyor.
1. 7. 2 Rectification of defective castings is to be carried out in accordance with [Ch 4, 1.9, Rectification and dressing of castings](#).
1. 7. 3 Rectification of defective forgings is to be carried out in accordance with [Ch 5, 1.9, Rectification of defects](#).
1. 7. 4 Rectification of defective fabricated anchors is to be carried out by suitably qualified welders within the parameters of the approved welding procedure used in construction.
1. 7. 5 Rectification of defective castings, forgings or fabricated anchors by welding is to be carried out using qualified weld procedures in accordance with [Ch 12, 1 General qualification requirements](#) and [Ch 12, 2 Welding procedure qualification tests for steels](#), and in accordance with [Ch 13, 1 General welding requirements](#) and [Ch 13, 2 Specific requirements for ship hull structure and machinery](#).

## 1. 8 Super high holding power (SHHP) anchors

1. 8. 1 The impact test requirements for SHHP anchor shackles are to be in accordance with the requirements for Grade U3 in [Table 10. 2. 1: Mechanical properties of finished chain cable and fittings](#).

## 1. 9 Assembly

1. 9. 1 Assembly and fitting is to be carried out in accordance with the approved design.
1. 9. 2 Securing of anchor pins, shackle pins or swivels by welding is to be carried out by suitably qualified welders in accordance with an approved welding procedure.

## 1. 10 Proof test of anchors

1. 10. 1 Anchors are to be tested in the presence of the Surveyor at a proving establishment recognised by ACS. A list of recognised proving establishments is published separately by ACS. In addition to the requirements stated in this Chapter, attention must be given to any relevant statutory requirements of the National Authority of the country in which the ship or mobile offshore unit is to be registered.

1. 10. 2 The anchor is to be visually examined before application of the proof test load to ensure that it is free from cracks, notches, inclusions and other surface defects that would impair the performance of the product.
1. 10. 3 As required by [Ch 10, 1.10, Proof test of anchors](#), each anchor is to be subjected to a proof loading test in an approved testing machine and is to withstand the load given in [Table 10. 1. 1: Proof load tests for anchors \(See Notes 1 and 2\)](#) for the appropriate mass of the anchor. The proof load is to be applied on the arm or on the palm at a spot which, measured from the extremity of the bill, is one-third of the distance between it and the centre of the crown. For stocked anchors, each arm is to be tested individually. For stockless anchors, both arms are to be tested at the same time, first on one side of the shank, then reversed and tested on the other.

**Table 10. 1. 1: Proof load tests for anchors (See Notes 1 and 2)**

| Mass of anchor<br>( <a href="#">Ch 10, 1.10<br/>Proof test of<br/>anchors 1.10.5</a> ) | Proof<br>test load | Mass of anchor<br>( <a href="#">Ch 10, 1.10<br/>Proof test of<br/>anchors 1.10.5</a> ) | Proof<br>test<br>load | Mass of anchor<br>( <a href="#">Ch 10, 1.10<br/>Proof test of<br/>anchors 1.10.5</a> ) | Proof<br>test load |
|--|--------------------|--|-----------------------|--|--------------------|
| kg   | kN                 | kg   | kN                    | kg   | kN                 |

| Proof loads for intermediate mass are to be determined by linear interpolation   |       |      |       |        |        |
| <p><b>Note 1.</b> Where ordinary anchors have a mass exceeding 48 000 kg, the proof loads are to be taken as <math>2.059 (\text{mass of anchor in kg})^{2/3}</math> kN.</p> <p><b>Note 2.</b> Where high holding power anchors have a mass exceeding 36 000 kg, the proof loads are to be taken as <math>2.452 (\text{actual mass of anchor in kg})^{2/3}</math> kN.</p> |       |      |       |        |        |

1. 10. 4 The general arrangements for the test are to be such that the complete anchor, including the shackle, shackle pins and any welded or bolted connections are included in the test. If a replacement shackle is needed which requires welding or heating for fitting, the combined anchor and shackle are to be proof load tested. If welding or heating is not involved in fitting, the shackle may be proof load tested separately from the anchor.
1. 10. 5 The mass to be used in [Table 10. 1. 1: Proof load tests for anchors \(See Notes 1 and 2\)](#) is:
  - a. For stockless anchors, the total mass of the anchor.
  - b. For stocked anchors, the mass of the anchor excluding the stock.
  - c. For high holding power anchors, a nominal mass equal to 1.33 times the actual total mass of the anchor.
  - d. For mooring anchors, including positional mooring anchors, a nominal mass equal to 1.33 times the actual total mass of the anchor, unless specifically agreed otherwise.
  - e. For super high holding power anchors, a nominal mass equal to twice the actual total mass of the anchor.
1. 10. 6 For positional mooring anchors, the proof test loading is to be that required by [Ch 10, 1.10 Proof test of anchors 1.10.3](#) or 50 per cent of the minimum break strength of the intended anchor line, whichever is the greater.
1. 10. 7 The gauge length is to be measured with 10 per cent of the required load applied, before and after proof test. The two measurements shall differ by no more than 1 per cent. The gauge length is the distance between the tip of each fluke and a point on the shank adjacent to the shackle pin, See [Figure 10. 1. 1: Location of gauge length measurement during proof load](#).

**Figure 10. 1. 1: Location of gauge length measurement during proof load**

1. 10. 8 After proof testing, all accessible surfaces are to be visually inspected by the Surveyor.
1. 10. 9 Following proof testing, NDE is to be conducted as described in [Table 10. 1. 2: NDE requirements following proof testing for Ordinary and HHP anchors](#) for ordinary and HHP anchors and [Table 10. 1. 3: NDE requirements following proof testing for SHHP anchors](#).

**Table 10. 1. 2: NDE requirements following proof testing for Ordinary and HHP anchors**

| Location  | Method of NDE   |
|---|---|
| Feeder heads, runners and risers of castings  | Magnetic particle inspection and ultrasonic test, <i>See Note 1</i> |
| All welds   | Magnetic particle inspection  |
| Forged components   | Not required  |
| Fabrication welds   | Magnetic particle inspection  |
| <b>Note 1.</b> <i>See also <a href="#">Ch 10, 1.10 Proof test of anchors 1.10.10</a>.</i><br><b>Note 2.</b> Penetrant testing is to be used in lieu of magnetic particle testing for stainless steel, aluminium and copper alloy anchors. |   |

**Table 10. 1. 3: NDE requirements following proof testing for SHHP anchors**

| Location  | Method of NDE   |
|---|---|
| Feeder heads, runners and risers of castings  | Magnetic particle inspection and ultrasonic test, <i>See Note 1</i> |
| All surfaces of castings  | Magnetic particle inspection  |
| All welds   | Magnetic particle inspection  |
| Forged components   | Not required  |
| Fabrication welds   | Magnetic particle inspection  |
| <b>Note 1.</b> <i>See also <a href="#">Ch 10, 1.10 Proof test of anchors 1.10.10</a>.</i><br><b>Note 2.</b> Additionally, all surfaces of all SHHP anchors are to be surface inspected by the magnetic particle or penetrant method as appropriate.<br><b>Note 3.</b> Penetrant is to be used in lieu of magnetic particle testing for stainless steel, aluminium and copper alloy anchors. |   |

1. 10. 10 Each casting is to be subjected to ultrasonic inspection in the region of runners and risers, or where excess material has been removed by thermal methods. This examination is to extend around the whole periphery of the casting and for a distance of  $t/3$  beyond the area affected, where  $t$  is the maximum thickness. In addition, random areas are to be selected by the Surveyor and examined.
1. 10. 11 Acceptance criteria for castings are to be in accordance with [Ch 4 Steel Castings](#).
1. 10. 12 Acceptance criteria for forgings are to be in accordance with [Ch 5 Steel Forgings](#).
1. 10. 13 Paint or anti-corrosive coatings are not to be applied until these inspections are completed to the satisfaction of the Surveyor.
1. 10. 14 On completion of the proof testing, anchors made in more than one piece are to be examined for free movement of their heads over the complete range of rotation.

## 1. 11 Clearances and tolerances

1. 11. 1 Where no fitting tolerances are specified on the approved plans the following assembly and fitting tolerance are to be applied.
1. 11. 2 The clearance either side of the shank within the shackle jaws and the shackle pin in the shank end hole is to be no more than 3 mm for small anchors up to 3 tonnes, 4 mm for anchors up to 5 tonnes, 6 mm for anchors up to 7 tonnes and is not to exceed 12 mm for larger anchors.
1. 11. 3 The shackle pin to hole tolerance is to be no more than 0.5 mm for pins up to 57 mm and 1.0 mm for pins of larger diameter and the eyes of the shackle are to be chamfered on the outside to ensure a good tightness when the pin is fitted. The shackle pin is to mate with the shackle such that it can be inserted with moderate hand pressure, allowing disassembly if required.
1. 11. 4 The trunnion pin is to fit within the chamber such that it will achieve the closest fit which can be carried out by hand. The pin is to be long enough to prevent horizontal movement. The gap is to be no more than 1 per cent of the chamber length.
1. 11. 5 The lateral movement of the shank is not to exceed 3 degrees from the centreline datum, See [Figure 10. 1. 2: Allowable lateral movement of shank](#).

**Figure 10. 1. 2: Allowable lateral movement of shank**

1. 11. 6 Unless otherwise agreed, the verification of mass and dimensions is the responsibility of the manufacturer. The Surveyor is only required to monitor this inspection. The mass of the anchor is to exclude the mass of the swivel, unless the swivel is in lieu of the conventional 'D' shackle.

## 1. 12 Identification

1. 12. 1 Identification marks on the shank are to be approximately level with the fluke tips. On the fluke, these markings are to be approximately at a distance of two thirds from the tip of the bill to the centre line of the crown on the right hand fluke, looking from the crown towards the shank.
1. 12. 2 The following details are to be shown on all anchors:
  - a. ACS or Asia Classification Society and abbreviated name of ACS's issuing the certificate.
  - b. Number of the certificate.
  - c. Month and year of test.
  - d. Mass (also the letters 'HHP' when approved as high holding power anchors or 'SHHP' when approved as super high holding power anchors).
  - e. Mass of stock (in the case of stocked anchors).
  - f. National Authority requirements, as applicable.
  - g. Manufacturer's mark.
1. 12. 3 In addition to [Ch 10, 1.12 Identification 1.12.2](#), each important part of an anchor is to be plainly marked by the maker with the words 'forged steel' or 'cast steel' as appropriate. Fabricated steel anchor heads do not require special marking.

## 1. 13 Certification

1. 13. 1 The manufacturer is to provide the Surveyor with a written statement that the anchor has been manufactured and tested in accordance with ACS Rules together with the following particulars:
  - a. Purchaser's name and order number.
  - b. Type of anchor and principal dimensions.
  - c. Mass of anchor.
  - d. Identification mark which will enable the full history of manufacture to be traced.
  - e. Chemical composition.
  - f. Details of heat treatment.
  - g. Mechanical test results.
  - h. Proof load.
  - i. Results of the non-destructive examination.
  - j. Weld location maps (cast steel anchors only).
1. 13. 2 Shanks, heads, pins, shackles and swivels are to be certified by ACS in accordance with the relevant sections of Chapters [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#), [Ch 4 Steel Castings](#) and [Ch 5 Steel Forgings](#).
1. 13. 3 An ACS Anchor Certificate is to be issued for the completed anchor which will include the following particulars:
  - a. Manufacturer's name.
  - b. Type of anchor.
  - c. Mass of anchor.
  - d. Grade of materials.
  - e. Proof test load.
  - f. Heat treatment.
  - g. Marking applied to anchor.
  - h. Dimensions.
  - i. General Approval of an Anchor Design Certificate Number.
  - j. Fluke and shank identification numbers.

**CHAPTER 10 Equipment for Mooring and Anchoring****SECTION 2 Stud link chain cables for ships****2. 1 Scope**

- 2. 1. 1 Provision is made in this Section for a range of grades, U1, U2 and U3, of stud link chain and fittings intended for anchor cables for ships.
- 2. 1. 2 The requirements for mooring chain cables are given in [Ch 10, 3 Offshore Mooring chain cables](#).
- 2. 1. 3 The design of chain cables and fittings is to be to a Standard recognised by ACS, such as ISO 1704.

**2. 2 Manufacture**

- 2. 2. 1 All grades of chain cable and accessories are to be manufactured by approved procedures at works approved by ACS. A list of approved manufacturers of stud link chain cables and fittings is published separately by ACS.
- 2. 2. 2 The links may be made by the flash-butt or other approved welding process, or in the case of Grades U2 and U3 they may be flash-butt welded or drop forged, designated U2(a) or U3(a), or cast steel designated U2(b) or U3(b), See [Table 10. 2. 5: Number of breaking tests from completed cables](#).
- 2. 2. 3 As far as practicable, consecutive links in all chain cable should originate from a single cast or batch of bar stock (See [Ch 3, 9.6 Mechanical tests 9.6.1](#)), and indicating marks should be stamped on the final link formed from one cast or batch and the first link formed from a separate cast or batch.
- 2. 2. 4 A length of chain cable is to measure not more than 27.5m and is to comprise an odd number of links. In this context, a length is a statutory term and is the basis for the number of test samples.
- 2. 2. 5 Where end links or enlarged links are manufactured and heat treated as part of and at the same time as the chain cable and are of the same cast heat of steel, they may be excluded from separate mechanical tests and break load tests.

**2. 3 Flash butt welded chain cable**

- 2. 3. 1 Bar material is to comply with the requirements of [Ch 3, 9 Bars for welded chain cables](#) and may be heated either by electrical resistance or in a furnace. For electrical resistance heating, the process is to be controlled by an optical heat sensor. For furnace heating, thermocouples in close proximity to the bars are to be used for control. The temperature is to be continuously recorded. In both cases, the controls are to be checked at least once every eight hours and checks are to be recorded.
- 2. 3. 2 Mechanical properties testing of U1 cable is not required. For Grade U2 cable supplied in the as-welded condition, and Grade U3 in all conditions, one tensile and one set of three Charpy V-notch

impact test specimens are to be taken at the side of a link opposite the weld from at least every fourth 27.5m length of cable. A further set of three impact test specimens is to be taken with the notch positioned at the centre of the weld, See [Table 10. 2. 3: Condition of supply and scope of mechanical tests for finished chain cables and fittings](#). The test specimens are not to be selected from the same length as that from which the breaking test sample is taken, unless breaking test samples are to be taken from every length of the batch. All test samples are to be correctly identified with the lengths of cable represented.

- 2. 3. 3 The test links from which the mechanical test specimens are prepared are to be made as part of the chain cable and are to be heat treated with it. They may be removed from the cable prior to heat treatment provided that each sample is heat treated with, and in the same manner as, the chain it represents prior to preparation of the mechanical test specimens.
- 2. 3. 4 The results of tests on specimens taken from the non-welded areas are to comply with the appropriate requirements of [Table 10. 2. 1: Mechanical properties of finished chain cable and fittings](#). The results of tests on the welds are to comply with the requirements of [Table 10. 2. 6: Mechanical properties of welds in chain cables](#).

## 2. 4 Cast chain cables

- 2. 4. 1 The manufacture of cast steel chain cable is generally to be in accordance with the requirements of [Ch 4, 1 General requirements](#), as appropriate.
- 2. 4. 2 The chemical composition of ladle samples is to comply with the specification approved by ACS.
- 2. 4. 3 Separately cast test samples are to be provided from each cast. They are to be of similar dimensions to the links they represent and are to be heat treated together with, and in the same manner as, the completed chain cable, See [Table 10. 2. 3: Condition of supply and scope of mechanical tests for finished chain cables and fittings](#).
- 2. 4. 4 Tensile and Charpy V-notch impact test specimens are to be taken from each test sample and machined to the dimensions given in [Ch 2, 3 Impact tests](#).
- 2. 4. 5 The results of all tests are to comply with the requirements given in [Table 10. 2. 1: Mechanical properties of finished chain cable and fittings](#) for the relevant grade.

## 2. 5 Forged chain cables

- 2. 5. 1 The procedure for the manufacture and testing of drop forgings for chain cable will be specially considered, but is generally to be in accordance with the appropriate requirements of [Ch 5, 1 General requirements](#).
- 2. 5. 2 The chemical composition is to comply with [Table 10. 2. 2: Chemical composition of butt welded and forged chain cable](#).
- 2. 5. 3 The completed forgings are to be heat treated in accordance with [Table 10. 2. 3: Condition of supply and scope of mechanical tests for finished chain cables and fittings](#).
- 2. 5. 4 Test samples are to be provided in the form of forgings of similar dimensions to the links they represent. These test samples are to be from the same steel-making heat and heat treated together with the links they represent.
- 2. 5. 5 One tensile and three Charpy V-notch specimens are to be taken from each test sample.
- 2. 5. 6 The results of mechanical tests are to comply with the requirements of [Table 10. 2. 1: Mechanical properties of finished chain cable and fittings](#) for the relevant grade.

**Table 10. 2. 1: Mechanical properties of finished chain cable and fittings**

|             |                     | Normalised and Tempered |   |   |   |
|             |                     | Quenched and Tempered   |   |   |   |

## 2. 6 Stud material

2. 6. 1 Steel studs are to be used for all grades of welded chain cable. In general, the carbon content should not exceed 0.23 per cent but mechanical tests for acceptance purposes are not required.

## 2. 7 Welding of studs

2. 7. 1 Where studs are welded into the links this is to be completed before the chain cable is heat treated.
2. 7. 2 The stud ends must be a good fit inside the link, and the weld is to be confined to the stud end opposite the flash-butt weld. Welding of studs both ends is not permitted unless specially approved. The full periphery of the stud end is to be welded. If, however, it can be demonstrated to the Surveyor that the quality of welding is of a high standard then partial peripheral welding may be accepted provided that welds are made only at the sides of the stud and that each run extends continuously for at least 25 per cent of the stud periphery. Weld start/stop positions are not to be located in the plane of the chain cable.
2. 7. 3 The welds are to be made by qualified welders using an approved procedure and consumables approved to Grade 3 and low hydrogen, in accordance with [Ch 11 Approval of Welding Consumables](#).
2. 7. 4 The welds are to be of good quality and free from defects liable to impair the proper use of the chain. Undercuts, end craters and similar stress raising defects shall, where necessary, be ground off.
2. 7. 5 All stud welds are to be visually inspected. At least one stud weld within each length of cable is to be inspected using magnetic particle inspection or dye penetrant testing in accordance with [Ch 1, 5 Non-destructive examination](#) after the chain has been proof loaded. If a crack is found, the stud welds in the adjoining links are to be inspected; if a crack is found in either link, all the stud welds in that length are to be inspected using magnetic particle inspection or dye penetrant testing.

## 2. 8 Heat treatment of completed chain cables

2. 8. 1 The completed chain cable is to be heat treated in accordance with [Table 10. 2. 3: Condition of supply and scope of mechanical tests for finished chain cables and fittings](#) for the appropriate grade of cable.
2. 8. 2 Special consideration will be given to the heat treatment of certain types of drop forged chain cable.
2. 8. 3 In all cases, heat treatment is to be carried out prior to the proof loading and breaking tests.
2. 8. 4 All test samples are to be heat treated with, and in the same way as, the chain cables they represent.

## 2. 9 Testing of completed chain cables

2. 9. 1 All chain cables are to be subjected to a Proof Load test and a Breaking Load test. In addition, mechanical tests should be carried out where required, See [Table 10. 2. 3: Condition of supply and scope of mechanical tests for finished chain cables and fittings](#).
2. 9. 2 All chain cables are to be tested in the presence of a Surveyor, at a proving establishment recognised by ACS. A list of recognised proving establishments is published separately by ACS. In addition to the requirements stated in this Chapter, attention must be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

## 2. 10 Proof load tests

2. 10. 1 Each length of chain cable is to be subjected to a proof loading test in an approved testing machine and is to withstand the load given in [Table 10. 2. 4: Test loads for stud link anchor chain cables](#) for the appropriate grade and size of cable.

**Table 10. 2. 4: Test loads for stud link anchor chain cables**

| Chain diameter<br>d mm | Grade U1                                     |   | Grade U2                                     |  | Grade U3                                     |  |
|------------------------|--|---|--|--|--|--|
|                        | Proof load kN<br>$0.00686d^2$<br>(44– 0.08d) | Breaking load kN<br>$0.00981d^2$<br>(44– 0.08d) | Proof load kN<br>$0.00981d^2$<br>(44– 0.08d) | Breaking load kN<br>$0.01373d^2$ (44– 0.08d) | Proof load kN<br>$0.01373d^2$<br>(44– 0.08d) | Breaking load kN<br>$0.01961d^2$ (44– 0.08d) |

| 162 | 5588 | 7991 | 7991 | 11185 | 11185 | 15975 |

2. 10. 2 On completion of the test, each link is to be visually examined and is to be free from significant defects. Special attention is to be given to welds.
2. 10. 3 Should any link be found to be defective it is to be replaced by an approved connecting link (joining shackle or substitute link as detailed in [Ch 10, 2.14 Substitute single links](#)). The chain is then to be subjected to a repeat of the proof load test followed by re-examination.
2. 10. 4 If a link breaks during proof load testing, a sample consisting of three common links is to be taken from each side of the broken link and subjected to a breaking test as detailed in [Ch 10, 2.12 Breaking load tests](#). If either of these samples fails, the length of cable is not to be accepted. A thorough examination of all broken links is to be made to determine the cause of failure and, after evaluation, ACS will consider the extent of cable which is to be rejected.

## 2. 11 Dimensional inspection

2. 11. 1 The measurement of dimensions in [Ch 10, 2.11 Dimensional inspection 2.11.2](#) and [Ch 10, 2.11 Dimensional inspection 2.11.3](#) is to take place after the proof load has been applied to the chain and subsequently reduced to the load of 10 per cent of the proof load. All other dimensional checks are to be carried out without application of load.
2. 11. 2 On every 27.5 m length of chain, five links are to be selected for measurement of length to ensure that the maximum allowable tolerance on a length of five links is plus 2.5 per cent. No under-tolerance is permitted.
2. 11. 3 If a five-link length of chain exceeds the tolerance given in [Ch 10, 2.11 Dimensional inspection 2.11.2](#), then the entire chain is to be checked for length, five links at a time with an overlap of two links, which is to include the first five links. Oversize links are to be removed and an approved connecting link inserted.
2. 11. 4 Checks of all other dimensions are to be made on three links from every four 27.5 m lengths. All measurements are to be made on links selected by the Surveyor and are to be carried out to the Surveyor's satisfaction.
2. 11. 5 If one of the links detailed in [Ch 10, 2.11 Dimensional inspection 2.11.4](#) fails to comply with the required tolerances, measurements are to be made on all four 27.5 m lengths.
2. 11. 6 If more than one link in a 27.5 m length of chain cable fails to meet the tolerance requirements, all the links in that length are to be measured.
2. 11. 7 Links that fail to comply with tolerance requirements are to be removed and approved connecting links inserted. Where a significant number of links fail to comply with the tolerance requirements the chain is to be rejected.
2. 11. 8 The form and proportion of links and shackles are to be in accordance with a standard recognised by ACS, such as ISO 1704, *See* [Figure 10. 2. 2: Common link](#) to [Figure 10. 2. 9: Lugless shackle of the Kenter type](#); alternatively, the design may be specifically approved by ACS.
2. 11. 9 Manufacturing tolerances on stud link chain are to be within  $\pm 2.5$  per cent (taking into account that all components of the chain are to be a good fit with one another), except for those detailed in [Ch 10, 2.11 Dimensional inspection 2.11.10](#).
2. 11. 10 The nominal diameter,  $d$ , is to be the average of the diameters, measured in the plane of the link,  $d_e$ , and perpendicular to the plane of the link,  $d_p$ , *See* [Figure 10. 2. 2: Common link](#). The negative tolerance on the nominal diameter is not to exceed the following:
  - a. Minus 1 mm when  $d \leq 40$  mm
  - b. Minus 2 mm when  $40 \text{ mm} < d \leq 84$  mm
  - c. Minus 3 mm when  $84 \text{ mm} < d \leq 122$  mm
  - d. Minus 4 mm when  $d > 122$  mm

For diameters of 20mm or greater, the plus tolerance on the diameter at the crown measured perpendicular to the plane of the link,  $d_p$ , is not to exceed 5 per cent. For diameters less than 20mm, the plus tolerance is to be agreed between the chain manufacturer and bar material supplier.
2. 11. 11 The cross-sectional area is to be calculated using the nominal diameter,  $d$ . The cross-sectional area at the crown of the link is to have no negative tolerance.
2. 11. 12 The diameter measured at locations other than the crown is to have no negative tolerance. For diameters of 20mm or greater, the plus tolerance may be up to 5 percent of the nominal diameter except at the butt weld where it is to be in accordance with the manufacturer's specification, which is to be agreed by ACS. For diameters less than 20mm, the plus tolerance is to be agreed between the chain manufacturer and bar material supplier.
2. 11. 13 Studs must be located in the links centrally and at right angles to the sides of the link, although the studs at each end of any length may also be located off-centre to facilitate the insertion of the

joining shackle. The following tolerances in [Figure 10. 2. 1: Manufacturing tolerances](#) will be accepted provided that the stud fits snugly and its ends lie practically flush against the inside of the link:

- Maximum off-centre distance 'X': 10 per cent of the nominal diameter  $\underline{d}$
- Maximum deviation ' $\alpha$ ' from the  $90^\circ$  – position:  $4^\circ$ .

**Figure 10. 2. 1: Manufacturing tolerances**

2. 11. 14 All individual parts must have a clean surface consistent with the method of manufacture and the surface is to be free from cracks, notches, inclusions and other defects which could impair the performance of the product. Crack-like imperfections less than 3 mm in length can be ignored. The flash produced by upsetting or drop forging must be properly removed.
2. 11. 15 Minor surface imperfections may be ground off so as to leave a gentle transition to the surrounding surface provided that the cross-sectional area remains equal to or greater than the nominal cross-sectional area. Remote from the crown, local grinding up to 5 per cent of the nominal diameter may be permitted.
2. 11. 16 Paint or anti-corrosive coatings are not to be applied until these inspections are completed to the satisfaction of the Surveyor.

## 2. 12 Breaking load tests

2. 12. 1 Breaking load tests are to be carried out on three-link samples selected by the Surveyor from the completed (including heat treatment) chain. The test links may be removed from the chain prior to heat treatment provided that each sample is heat treated with, and in the same manner as the chain it represents. They are to be properly identified with the lengths of chain they represent.
2. 12. 2 The number of tests required is to be in accordance with [Table 10. 2. 5: Number of breaking tests from completed cables](#) except that for chafing chain for Emergency Towing Arrangements (ETA), See [Pt 3, Ch 13, 12.2 Chafing chain and wire or fibre rope for Emergency Towing Arrangements](#), one test is to be carried out on each 110 m of finished chains.
2. 12. 3 Breaking test specimens are to withstand the load given in [Table 10. 2. 4: Test loads for stud link anchor chain cables](#) for the appropriate grade and size of cable. The specimen is considered to have passed this test if it has shown no sign of fracture after application of the required load for a minimum of 30 seconds.

**Table 10. 2. 5: Number of breaking tests from completed cables**

| Designation | Method of manufacture | Number of breaking test specimens |
|-------------|-----------------------|-----------------------------------|
|-------------|-----------------------|-----------------------------------|

|                      |  |  |
|----------------------|--|--|
| Grade U1             | Flash-butt welded and heat treated                 | One from every four lengths of 27.5 m or less  |
| Grade U2(a)<br>U3(a) | Flash-butt welded, or drop forged and heat treated | One from every four lengths of 27.5 m or less  |
| Grade U1<br>U2(a)    | Flash-butt welded but not heat treated             | One from each length of 27.5 m or less   |
| Grade U2(b)<br>U3(b) | Cast and heat treated                              | One per heat treatment batch with a minimum of one from every four lengths of 27.5 m or less |

**Table 10. 2. 6: Mechanical properties of welds in chain cables**

| Grade  | Charpy V-notch impact test |                      |
|--|----------------------------|----------------------|
|  | Test temperature °C        | Average energy J min |
| U1   | —                          | —                    |
| U2   | 0 ( <i>See Note 1</i> )    | 27                   |
| U3   | 0                          | 50                   |
|  | –20 ( <i>See Note 2</i> )  | 27                   |
| <p><b>Note 1.</b> Impact tests are only required if the chain cable is not heat treated.</p> <p><b>Note 2.</b> Impact testing may be carried out at 0°C or minus 20°C.</p> |                            |                      |

2. 12. 4 Where a breaking test specimen fails, a further specimen is to be cut from the same length of cable and subjected to test. If this re-test fails, the length of cable from which it was taken is to be rejected. When this test is also representative of other lengths, each of the remaining lengths is to be individually tested by taking a breaking test specimen from each length of the batch. If one of these further tests fails, the entire set of lengths represented by the original test is to be rejected.
2. 12. 5 For large diameter cables where the required breaking load is greater than the capacity of the testing machines, special consideration will be given to acceptance of an alternative testing procedure.

## 2. 13 Fittings for chain cables

2. 13. 1 Cable fittings are to be manufactured at an approved works.
2. 13. 2 The materials from which the fittings are made are to be manufactured at approved works, in accordance with the appropriate requirements of [Ch 4, 1 General requirements](#) or [Ch 5, 1 General requirements](#) respectively. Alternative arrangements may be agreed provided that full details concerning the manufacturer are submitted to ACS.
2. 13. 3 All fittings are to be manufactured to an approved manufacturing specification, and provision is to be made for tensile specimens and, where applicable, impact test specimens, *See [Table 10. 2. 3: Condition of supply and scope of mechanical tests for finished chain cables and fittings](#)*. The mechanical test requirements are the same as those for the relevant grade of chain cable, *See [Table 10. 2. 1: Mechanical properties of finished chain cable and fittings](#)*.

2. 13. 4 The test samples are to be prepared in accordance with [Ch 10, 2.4 Cast chain cables 2.4.3](#) or [Ch 10, 2.5 Forged chain cables 2.5.4](#) as applicable. The test specimens are to be subjected to heat treatment with the fittings they represent.
2. 13. 5 For mechanical testing, a batch is defined as fittings of the same grade, size and heat treatment furnace load and is to have originated from a single cast heat of steel.
2. 13. 6 Mechanical tests of pins are to be taken in accordance with [Ch 10, 4.6 Mechanical tests 4.6.7](#).
2. 13. 7 Fittings such as shackles, swivels and swivel shackles are to be forged or cast in steel of at least Grade U2. The welded construction of fittings may also be approved providing that full details of the manufacturing process and the heat treatment are submitted.
2. 13. 8 All chain cable accessories, including spares, are to be subjected to the proof loads appropriate to the grade and size of cable for which they are intended. These include shackles, swivels, swivel shackles, enlarged links and end links. Anchor shackles, however, are to be tested in combination with the anchor.
2. 13. 9 The appropriate breaking load is to be applied for a minimum of 30 seconds to at least one item out of every batch of up to 25 detachable links, shackles, swivels, swivel shackles, enlarged end links and end links and at least one item out of every batch of up to 50 for lugless (Kenter) shackles. The item tested is to be destroyed and not used as part of an outfit. For the purposes of break load testing, a batch of accessories is to consist of:
  - a. the same accessory type, grade and size;
  - b. the same rolling or forging or casting process; and
  - c. accessories that are heat treated together in the same furnace.
2. 13. 10 Where a break load batch as defined in [Ch 10, 2.13 Fittings for chain cables 2.13.9](#) requires a normalise or normalise and temper heat treatment, the size of accessories may vary within a batch provided that the heat treatment cycle is chosen to satisfy the accessory with the largest cross-section size. The batch may consist of more than one steel-making heat provided that the two accessories are break tested, one with the largest cross-section size and one with the smallest cross-section size.
2. 13. 11 Where a break load batch as defined in [Ch 10, 2.13 Fittings for chain cables 2.13.9](#) requires a quench and temper heat treatment, the size of the accessories within the batch is to be the same and is limited to the same steel-making heat.
2. 13. 12 If the sample fails to withstand the breaking load without fracture, two more samples from the same batch may be tested. If either of these samples fails, the batch is to be rejected.
2. 13. 13 Fittings of increased dimensions or higher grade material may be used subject to approval by ACS.
2. 13. 14 Where items of increased dimensions are used or if material of a higher grade than is specified is used, the breaking load is to be applied to each item, and the items so tested included with the outfit. For the purpose of this paragraph, items of increased dimensions are those so designed that their breaking strength is not less than 1.4 times the Rule minimum breaking load of the chain cable with which they are to be used.
2. 13. 15 ACS may waive the breaking load test provided that:
  - a. the breaking load test has been completed satisfactorily during approval testing, and
  - b. the tensile and impact properties of each manufacturing batch are proved and
  - c. the accessories are subjected to suitable non-destructive testing.
2. 13. 16 All testing is to be carried out in the presence of the Surveyor and to his satisfaction.
2. 13. 17 The following tolerances are applicable to accessories:
  - a. Nominal diameter: plus 5 per cent, minus 0 per cent
  - b. Other dimensions:  $\pm 2.5$  per cent
  - c. The radii of all machined corners are to be not less than 0.03 times the nominal chain diameter

2. 13. 18 All fittings are to be stamped in accordance with [Ch 10, 2.15, Identification](#).

## 2. 14 Substitute single links

- 2. 14. 1 Single links to connect lengths of chain cable or to substitute for defective links, without the necessity for re-heat treatment of the whole cable length, are to be made by the chain manufacturer in accordance with an approved procedure. Separate approvals are required for each grade of chain cable and the tests are to be made on the maximum size of chain for which approval is sought. Re-approval is required annually.
- 2. 14. 2 Manufacture and heat treatment of the substitute link are not to affect the strength of the adjoining links. The temperature reached by these links is nowhere to exceed 250°C.
- 2. 14. 3 The steel bar used is to conform with the specification for the chain in accordance with [Ch 3, 9 Bars for welded chain cables](#).
- 2. 14. 4 Details of the method of manufacture, including heat treatment, are to be submitted for approval, together with the results of a series of tests laid down by ACS.
- 2. 14. 5 All links involved in the approval tests are to be destroyed and are not to be used as part of a chain cable.
- 2. 14. 6 Every substitute link included in a chain cable is to be subjected to the proof load appropriate to the grade and size of chain in which it is incorporated, as detailed in [Table 10. 2. 6: Mechanical properties of welds in chain cables](#).
- 2. 14. 7 Each substitute link is to be stamped on the stud with the identification marks listed in [Ch 10, 2.15 Identification 2.15.1](#) plus a unique number for the link. The adjoining links are also to be stamped on the studs.

## 2. 15 Identification

- 2. 15. 1 All lengths of Grades U1, U2 and U3 cable and all fittings are to be stamped with the following identification marks:
  - a. ACS or Asia Classification Society and abbreviated name of ACS's issuing the certificate.
  - b. Number of certificate.
  - c. Proof load and grade of chain.
  - d. Surveyor's personal stamp.
  - e. Each length of chain cable is to be stamped on both ends.

## 2. 16 Certification

- 2. 16. 1 An ACS certificate is to be issued for chain cable only, fittings only or chain cable with associated fittings.
- 2. 16. 2 Each test certificate is to include the following particulars for all items included on the certificate:
  - a. Manufacturer's name.
  - b. Purchaser's name and order number.
  - c. Description and dimensions.
  - d. Grade of chain cable.
  - e. Identification mark which will enable the full history of the chain or fitting to be traced.
  - f. Chemical composition.
  - g. Details of heat treatment.
  - h. Mechanical test results.
  - i. Breaking test load.
  - j. Proof load.

2. 16. 3 Where appropriate, the certificate is to include a list of all substitute links together with their grade of steel, the name of the steelmaker, the heat number and the purchase order number.

**Figure 10. 2. 2: Common link**

$$d = \text{nominal diameter} \left( \frac{d_c + d_p}{2} \right)$$

$$d_c = \text{nominal diameter at crown measured in plane of link}$$

$$d_p = \text{nominal diameter at crown measured perpendicular to plane of link}$$

$$l = 6d_c$$

$$p = 4d_c$$

$$w = 3,6d_c \text{ to the nearest millimetre}$$

**Figure 10. 2. 3: Enlarged link**

$$d = \text{nominal diameter of common stud link}$$

$$d_1 = \text{nominal diameter of enlarged stud link} = 1,1d$$

$$l_1 = 6d_1 \approx 6,6d$$

$$p_1 = 4d_1 \approx 4,4d$$

$$w_1 = 3,6d_1 \approx 3,96d$$

**Figure 10. 2. 4: End link**

$d$  = nominal diameter of common stud link  
 $d_2$  = nominal diameter of end link =  $1,2d$   
 $l_2$  =  $p_2 + 2d_2 \approx 6,75d$  to  $7d$   
 $p_2$  =  $3,65d_2 \approx 4,35d$   
 $w_2$  =  $3,3d_2 \approx 4d$

Figure 10. 2. 7: Lugless shackle

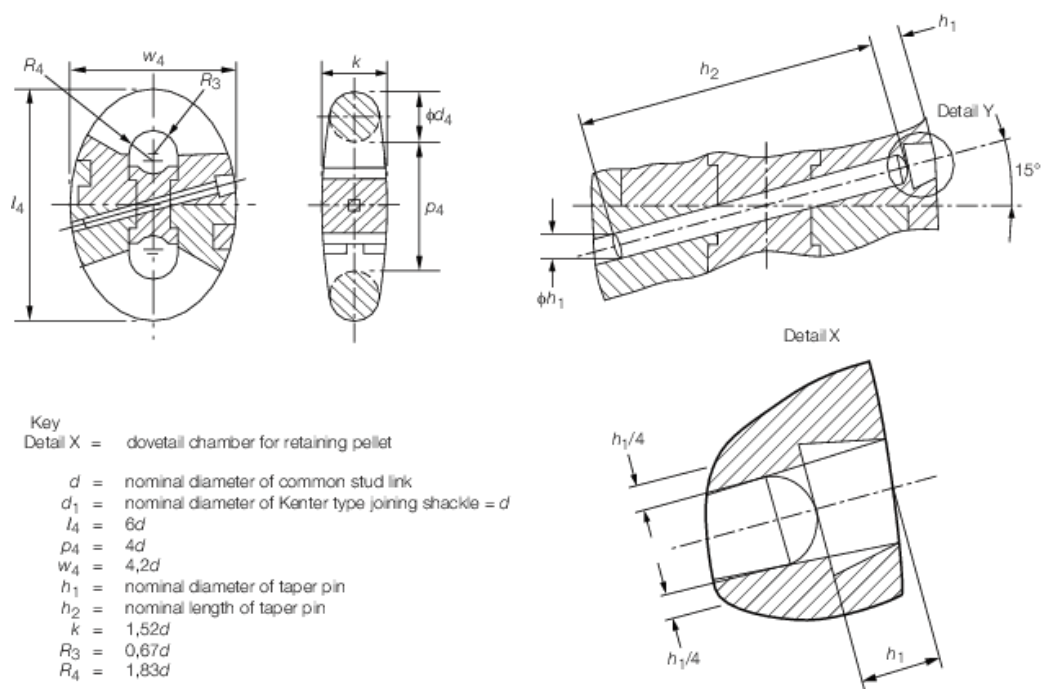

Figure 10. 2. 8: Swivel

$d$  = nominal diameter of common stud link  
 $d_6$  = nominal diameter of swivel =  $1,2d$   
 $l_6$  =  $9,7d$   
 $p_6$  =  $d_9 = 3,4d$   
 $w_6$  =  $4,7d$   
 $d_7$  =  $1,1d$   
 $a_3$  =  $1,75d$   
 $m_1$  =  $2d$   
 $h_3$  =  $d_8 = 1,4d$   
 $c$  =  $3,35d$

**Figure 10. 2. 9: Lugless shackle of the Kenter type**

The radii indicated by  $r$  are to be not less than  $0,03 \times d_4$

**CHAPTER 10 Equipment for Mooring and Anchoring****SECTION 3 Offshore Mooring chain cables****3.1 Scope**

- 3.1.1 Provision is made in this Section for five grades, R3, R3S, R4, R4S and R5, of stud link chain and studless flash butt welded chain cable intended for offshore mooring applications such as mooring of mobile offshore units, mooring of floating production units, offshore loading systems and gravity based structures during fabrication. Special consideration will be given to the use of grades outside the existing scope.
- 3.1.2 Design of stud link chain cables must be to a recognised Standard, such as ISO 1704. For studless chain the shape and dimensions are to comply with the requirements of this Section. Non-Standard designs of chain are to be subject to special consideration, and may require a fatigue analysis and tests to confirm relevant performance.
- 3.1.3 In addition, chain cable conforming to the requirements of the current edition of API specification 2F is acceptable provided that it has been manufactured, inspected and tested under survey by ACS, and that the bar stock has also been certified by ACS in accordance with [Ch 3, 9 Bars for welded chain cables](#).
- 3.1.4 The studless link chain is generally expected to be deployed only once, being intended for long-term mooring applications with a pre-determined service life.

**3.2 Manufacture**

- 3.2.1 All grades of chain cable and fittings are to be manufactured by approved procedures at works approved by ACS. A list of approved manufacturers for offshore mooring chain cables is published separately by ACS.
- 3.2.2 Approval is confined to a single works and is limited to one grade of cable made from bar from a nominated and approved supplier. Separate approvals are required if steel bar is supplied from more than one works and for other grades of cable, *See also* [Ch 3, 9 Bars for welded chain cables](#).
- 3.2.3 Details of the method of manufacture and the specification of the steel, are to be submitted.
- 3.2.4 Offshore mooring chains are to be made in continuous lengths by flash-butt welding.
- 3.2.5 Bar material may be heated by electric resistance, induction or in a furnace. For electrical resistance heating or induction heating, the process is to be controlled by an optical heat sensor. For furnace heating, thermocouples in close proximity to the bars are to be used for control and the temperature is to be continuously recorded. In both cases, the controls are to be checked at least once every eight hours and records taken.
- 3.2.6 The following welding parameters (as approved in the weld procedure) are to be controlled during welding of each link:
  - a. platen motion;

- b. current as a function of time; and
- c. hydraulic pressure.

The controls are to be checked at least once every four hours and records taken.

- 3. 2. 7 The records of bar heating, flash-butt welding and heat treatment are to be made available to the Surveyor when required.
- 3. 2. 8 As far as practicable, consecutive links in all chain cable should originate from a single batch of bar stock (See [Ch 3, 9.6 Mechanical tests 9.6.1](#)) and indicating marks should be stamped on the final link formed from one batch and the first link formed from a separate batch.

### 3. 3 Studs

- 3. 3. 1 The studs are to be made of steel corresponding to that of the chain or in compliance with a specification approved by ACS. In general, the carbon content should not exceed 0.23 per cent if the studs are to be welded in place.
- 3. 3. 2 Studs may be welded into grade R3 and R3S chains. The welding of studs into grade R4, R4S and R5 chain is not permitted unless specially approved.
- 3. 3. 3 In all cases where studs are welded into links, this is to be carried out in accordance with [Ch 10, 2.7 Welding of studs](#). The visual and NDE inspection of the stud welds is to be carried out in accordance with [Ch 10, 3.6, Proof load tests and non-destructive examination](#).
- 3. 3. 4 The size of the stud welds is to be in accordance with [Figure 10. 3. 1: Dimensions and tolerances of stud welds](#).

**Figure 10. 3. 1: Dimensions and tolerances of stud welds**

- 3. 3. 5 Where plastic straining is used to set studs, the applied load is not to be greater than that qualified in approval tests. The combined effect of shape and depth of the impression of the stud in the link is not to cause any harmful notch effect or stress concentration.

### 3. 4 Heat treatment of completed chain cables

- 3. 4. 1 The chain is to be normalised, normalised and tempered or quenched and tempered in accordance with the specification approved by ACS.
- 3. 4. 2 The chains are to be heat treated in a continuous furnace; batch heat treatment is not permitted unless specially approved.

3. 4. 3 The temperature and time, or temperature and chain speed, are to be controlled and continuously recorded.
3. 4. 4 Heat treatment is to be carried out prior to the proof loading, breaking tests and sample mechanical tests.
3. 4. 5 The heat treatment furnace is to be properly constructed, efficiently maintained and has adequate means of temperature control. Calibration of furnaces is to be verified by measurement and recording of a calibration test piece with dimensions equivalent to the maximum size of link manufactured.

### 3. 5 Testing of completed chain cables

3. 5. 1 All chain cables are to be subjected to proof load tests, non-destructive examination, sample break load tests and sample mechanical tests after final heat treatment in the presence of a Surveyor. In addition to the requirements stated in this Chapter, attention must be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.
3. 5. 2 The chain is to be shot or sand-blasted prior to testing in order to ensure that its surfaces are free from scale, paint or other coating for inspection and have a suitably prepared surface in accordance with the NDE standard applied.
3. 5. 3 All non-destructive examination is to be carried out in accordance with approved procedures, in accordance with [Ch 1, 5 Non-destructive examination](#).

### 3. 6 Proof load tests and non-destructive examination

3. 6. 1 The entire length of chain cable is to be subjected to a proof loading test at a Proving Establishment recognised by ACS. A list of recognised Proving Establishments is published in the Class Direct section of ACS's website. The chain cable is to withstand the load given in [Ch 10, 3.6 Proof load tests and non-destructive examination 3.6.1](#) for the appropriate grade and size of cable.

**Table 10. 3. 1: Test loads for mooring chain cables**

| Nominal diameter <i>d</i> | Grade R3        |                |                 | Grade R3S       |                 |                 | Grade R4        |                |                 | Grade R4S       |                |                 | Grade R5        |                |                 |

3. 6. 2 Care should be taken to obtain a uniform stress distribution in the links being tested.
3. 6. 3 On completion of the proof load test, each link is to be visually examined and is to be free from significant defects such as mill defects, surface cracks, dents and cuts, especially where gripped by clamping dies during flash butt welding. Studs are to be securely fastened and any burrs, irregularities and rough edges are to be removed by careful grinding. In order to ensure adequate inspection, the chain is to be positioned to facilitate access to all surfaces.
3. 6. 4 All flash butt welds, including the area gripped by the clamping dies on every link, plus 10 per cent of links on all accessible surfaces, are to be examined by magnetic particle inspection in accordance with standards recognized by ACS, using wet continuous fluorescent magnetization technique. Non-fluorescent techniques can be accepted in special cases where the standard inspection procedures are impractical. The inspected area is to be free from cracks, lack of fusion, gross porosity, and any imperfections with the following maximum allowable dimensions:
  - relevant linear indications exceeding 1.6 mm in transverse direction;
  - relevant linear indications exceeding 3.2 mm in longitudinal direction;
  - relevant non-linear indications exceeding 4.8 mm.
3. 6. 5 Surface defects in the region of the flash butt welds may be removed by grinding, provided that the depth of grinding does not exceed five per cent of the link diameter and is smoothly contoured into the surrounding material. The final dimensions are still to conform with the agreed standard.
3. 6. 6 All flash butt welds on every link are also to be examined by ultrasonic testing in accordance with standards recognised by ACS using appropriate scanning techniques designed to detect all expected defects, including any defects within the relevant fusion zones. The flash butt weld must be free from defects causing ultrasonic back reflections equal to or greater than the calibration standard. The single probe technique has limitations as far as testing of the central region is concerned and the flash butt weld imperfections such as flat spots may have poor reflectivity. Where it is deemed necessary, detectability of imperfections may need to be carried out by using a tandem technique, TOFD (Time-of-flight diffraction) or PAUT (phased array ultrasonic testing).
3. 6. 7 Stud welds, if used, are to be visually inspected. The toes of the fillets are to have a smooth transition to the link with no undercuts exceeding 1.0 mm. In addition, at least 10 per cent of the stud welds distributed through the length is to be magnetic particle or dye penetrant tested in accordance with standards recognised by ACS. Cracks, lack of fusion or gross porosity are not acceptable. If defects are found, testing is to be extended to all stud welds in that length of chain.
3. 6. 8 If a link breaks during proof load testing, a sample consisting of three common links is to be taken from each side of the broken link and subjected to a breaking test as detailed in [Ch 10, 3.8 Breaking load tests 3.8.1](#) and [Ch 10, 3.8 Breaking load tests 3.8.2](#). If either of these samples fails, the proof loaded length of cable is not to be accepted.
3. 6. 9 In the event that two or more links break during the proof load testing, the proof loaded length is to be rejected.
3. 6. 10 In all cases when a link breaks during the proof load testing, a thorough examination of all broken links is to be made to determine the cause of failure and, after evaluation, ACS will consider the extent of cable which is to be rejected and also the possibility that similar factors to those which caused the failure may also be present in other parts of the cable, or other chain cables, i.e.:
  - Where multiple chains are produced simultaneously, it is recognised that the preceding flash butt welded link and subsequent flash butt welded link will be on an alternative chain length

or the other end of the chain length. In such cases, ACS may require that two additional break tests are to be taken from the lengths of chain that include the preceding and subsequent welded links.

- If the investigation identifies defects in the flash butt weld or a lower strength flash butt weld is found, additional NDE is to be carried out to identify if other links are affected. A full assessment of the flash butt welding machine it to be carried out, together with assessment of the condition of the bar ends prior to welding.
- The Surveyor is to be advised in advance of all examinations, with reasonable notice being given.

### 3. 7 Dimensional inspection

3. 7. 1 After proof testing, the entire chain is to be checked for length, five links at a time with an overlap of two links, which is to include the first five links, to ensure that the chain meets the tolerances given in [Ch 10, 3.7 Dimensional inspection 3.7.3](#). The measurements are to be made while the chain is loaded to about 5-10 per cent of the minimum proof load.
3. 7. 2 The links held in the end blocks may be excluded from these measurements.
3. 7. 3 The maximum allowable tolerance on a length of five links measured in accordance with [Ch 10, 3.7, Dimensional inspection 3.7.1](#) is +2.5 per cent. No under-tolerance is permitted.
3. 7. 4 If the length over five links is less than the nominal, the chain may be stretched by loading above the specified proof test load provided that the applied load is not greater than ten per cent above the proof test load, and that only random lengths of the chain need to be stretched.
3. 7. 5 Checks of all other dimensions are to be made on at least five per cent of the links in the cable.
3. 7. 6 A manufacturing tolerance on all other dimensions of  $\pm 2.5$  per cent is acceptable subject to all parts fitting properly together.
3. 7. 7 The form and proportions of links are to be in accordance with ISO1704, See [Figure 10. 2. 2: Common link](#). Link tolerances are to be in accordance with [Ch 10, 3.7 Dimensional inspection 3.7.4](#) to [Ch 10, 3.7 Dimensional inspection 3.7.10](#).

The negative tolerance on the nominal diameter measured at the crown is not to exceed the following:

- Minus 1 mm when  $d_c < 40$  mm
- Minus 2 mm when  $40 \text{ mm} < d_c < 84$  mm
- Minus 3 mm when  $84 \text{ mm} < d_c < 122$  mm
- Minus 4 mm when  $122 \text{ mm} < d_c < 152$  mm
- Minus 6 mm when  $152 \text{ mm} < d_c < 184$  mm
- Minus 7.5 mm when  $184 \text{ mm} < d_c < 222$  mm

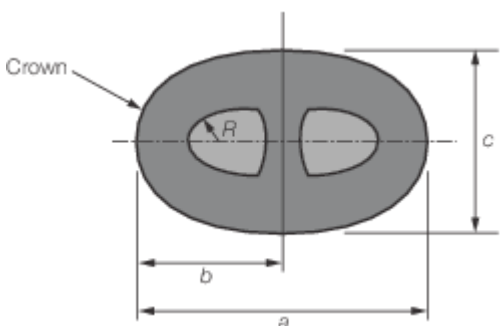

For diameters of 20 mm or greater, the plus tolerance on the diameter at the crown measured perpendicular to the plane of the link,  $d_p$ , is not to exceed 5 per cent. For diameters less than 20 mm, the plus tolerance is to be agreed between the chain manufacturer and bar material supplier.

3. 7. 8 The cross-sectional area at the crown is to be calculated using the average of the measured diameters, which are to be taken from at least two locations approximately 90 degrees apart. The cross-sectional area at the crown is to have no negative tolerance.
3. 7. 9 The diameter measured at locations other than the crown is to have no negative tolerance. For diameters of 20 mm or greater, the plus tolerance may be up to 5 per cent of the nominal diameter

except at the butt weld where it is to be in accordance with the manufacturer's specification, which is to be agreed by ACS. For diameters less than 20 mm, the plus tolerance is to be agreed between the chain manufacturer and bar material supplier.

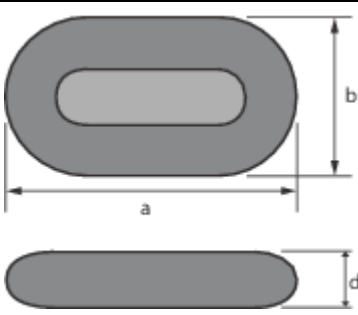

3. 7. 10 If any link fails to meet the above dimensional tolerance requirements, measurements are to be made on 20 more links on each side of the incorrect one. If failure to meet any particular dimensional requirements occurs in more than two of the measured links, then all the links are to be dimensionally checked.
3. 7. 11 should any link be found to be defective or fail to meet the dimensional tolerance requirements or if a five link length of chain exceeds the specified tolerance, the unsatisfactory links are to be removed from the chain and connecting common links complying with the requirements of [Ch 10, 3.10, Connecting common links or substitute links](#) inserted in their places. Proposals for other methods of repair must be subject to approval by ACS and the purchaser. Weld repair of chain is not permitted.
3. 7. 12 The tolerances for common links are to be measured in accordance with [Table 10. 3. 2: Stud link chain cable common link tolerances](#) and [Table 10. 3. 3: Studless link chain cable common link tolerances](#).
3. 7. 13 The chain is then to be subjected to a further proof load test and re-examined.
3. 7. 14 The number of connecting common links which may be used to replace defective links is not to exceed three in any 100m length of chain. The number and type of joining shackles which may be used are to be subject to the written agreement of the end user.
3. 7. 15 All measurements are to be made on links selected by the Surveyor and are to be carried out to the Surveyor's satisfaction.
3. 7. 16 For stud link chain, studs are to be located in the links centrally, and at right angles to the sides of the link, although the studs of the final link at each end of any length may also be located off-centre to facilitate the insertion of the joining shackle. The tolerances in accordance with [Table 10. 3. 2: Stud link chain cable common link tolerances](#) are acceptable provided that the stud fits snugly and its ends lie flush against the inside of the link.
3. 7. 17 Chain dimensions are to be recorded and the information retained on file.

**Table 10. 3. 2: Stud link chain cable common link tolerances**

| The internal link radii ( $R$ ) and external radii should be uniform                 |                  |                               |                 |                |

| Symbols  |                             |                               |                 |                |
| $d$  | = nominal diameter of chain |                               |                 |                |
| <b>Note</b> Other dimensional ratios are subject to special approval.              |                             |                               |                 |                |

## 3. 8 Breaking load tests

3. 8. 1 In addition to the requirements of [Ch 10, 3.6 Proof load tests and non-destructive examination 3.6.1](#), three link samples are to be selected by the Surveyors from the completed chain for breaking tests. The number of tests required is to be in accordance with [Ch 10, 3.8 Breaking load tests 3.8.5](#). Extra links are to be provided for the mechanical tests detailed in [Ch 10, 3.9 Mechanical tests 3.9.1](#). All test links are to be made as part of the chain cable and are to be heat treated with it. These may be removed from the cable prior to heat treatment provided that each sample is heat treated with, and in the same manner as, the chain it represents prior to selection of the mechanical test specimens. They are to be properly identified with the length of chain they represent.
3. 8. 2 Breaking test specimens are to withstand the load given in [Table 10. 3. 1: Test loads for mooring chain cables](#) for the appropriate grade and size of cable for a period of 30 seconds. The specimen is considered to have passed this test if it has shown no sign of fracture and must not crack in the flash butt weld after application of the required load.
3. 8. 3 If a breaking test specimen fails, two further specimens are to be cut from the same sampling length and both are to be subjected to the breaking test load. If one of the re-test specimens fails the length is to be rejected. All the broken links are to be subjected to an investigation into the

cause of failure. ACS will then decide which lengths of chain can be accepted and on further action.

3. 8. 4 For chain diameters over 100 mm, alternative break-test proposals to the above break-test will be considered whereby a one link specimen is used. Alternatives are to be approved by ACS; every heat is to be represented, the test frequency is to be in accordance with [Table 10. 3. 4: Frequency of break and mechanical tests](#), and it is to be demonstrated that the alternative test represents an equivalent load application to the three link test.
3. 8. 5 For large diameter cables where the required breaking load is greater than the capacity of the testing machines, special consideration will be given to acceptance of an alternative testing procedure.

**Table 10. 3. 4: Frequency of break and mechanical tests**

| Nominal chain diameter mm   | Maximum sampling interval m ( <i>See Note</i> ) |
|---|---|
| Min. — 48   | 91  |
| 49 — 60   | 110   |
| 61 — 73   | 131   |
| 74 — 85   | 152   |
| 86 — 98   | 175   |
| 99 — 111  | 198   |
| 112 — 124   | 222   |
| 125 — 137   | 250   |
| 138 — 149   | 274   |
| 150 — 162   | 297   |
| 163 — 175   | 322   |
| 176 — 186   | 346   |
| 187 — 198   | 370   |
| 199 — 210   | 395   |
| 211 — 222   | 420   |
| <b>Note</b> If the sampling interval contains links made from more than one cast, extra break and mechanical tests are required so that tests are made on every cast. |   |

## 3. 9 Mechanical tests

3. 9. 1 One tensile and three sets of Charpy V-notch impact test specimens are to be taken from links cut from the heat treated and proof loaded chain at intervals no greater than those indicated in [Table 10. 3. 4: Frequency of break and mechanical tests](#) provided that every cast is sampled. The tensile specimen and one set of impact specimens are to be taken from the side of the link opposite the weld. One set of impact test specimens is to have the notches positioned at the centre of the flash

butt weld and the third set is to be taken from the bend. All the specimens are to be taken from positions in accordance with [Figure 10. 3. 2: Sampling of chain links](#).

3. 9. 2 The frequency of testing at the link bends may be reduced at the discretion of ACS provided it can be verified that the required toughness is achieved consistently.
3. 9. 3 The results of the mechanical tests are to comply with the requirements of [Table 10. 3. 5: Mechanical properties of chain cable materials](#).
3. 9. 4 If the tensile test requirements are not achieved, two further specimens from the same sample are to be tested. The related length of chain will be considered acceptable if both re-test specimens meet the requirements but failure of either of the re-test specimens will result in rejection of the sampling length of chain represented by the tests.
3. 9. 5 If the impact test requirements are not achieved, re-tests may be carried out in accordance with [Ch 2, 1.4, Re-testing procedures](#). Failure to meet the re-test requirements will result in rejection of the sampling length of chain represented by the tests.
3. 9. 6 A grain size determination must be made for the final product. The austenitic grain size for R3, R3S, R4, R4S and R5 is to be 6 or finer in accordance with ASTM E112 or equivalent grain size index in accordance to ISO 643. Measurements for circular sections are to be taken at surface, at one-third of the radius and centre for the base material, HAZ and weld.
3. 9. 7 Hardness tests are to be carried out on finished chain. The frequency and locations are to be agreed with ACS. The recorded values are for information only and used as an additional check to verify that the heat treatment process has been stable during the chain production.
3. 9. 8 The mass per unit length of stud link mooring cable is to comply with [Table 10. 3. 6: Mass per unit length of stud link chain cable](#).

**Figure 10. 3. 2: Sampling of chain links**

**Table 10. 3. 5: Mechanical properties of chain cable materials**

| Grade | Yield stress<br>N/mm <sup>2</sup><br>minimum | Tensile strength<br>N/mm <sup>2</sup> | Elongation %<br>minimum | Reduction of area<br>minimum<br>(See Note 3) | Charpy V-notch impact tests |                             |   |
|-------|--|---------------------------------------|-------------------------|--|-----------------------------|-----------------------------|---|
|       |  |                                       |                         |  | Test temperature<br>°C      | Average energy J<br>minimum | Average energy flash butt weld J<br>minimum |
| R3    |  |                                       | 17                      | 50   | 0                           | 60                          | 50  |

|                     |                     |                                |    |    |                     |    |    |
|---------------------|---------------------|--------------------------------|----|----|---------------------|----|----|
|                     |                     | 690<br>minimum<br>(See Note 1) |    |    | –20 (See<br>Note 2) | 40 | 30 |
| R3S                 | 410 (See<br>Note 1) | 770<br>minimum<br>(See Note 1) | 15 | 50 | 0                   | 65 | 53 |
|                     | 490 (See<br>Note 1) |                                |    |    | –20 (See<br>Note 2) | 45 | 33 |
| R4                  | 580 (See<br>Note 1) | 860<br>minimum<br>(See Note 1) | 12 | 50 | –20                 | 50 | 36 |
| R4S (See<br>Note 4) | 700 (See<br>Note 1) | 960 (See<br>Note 1)            | 12 | 50 | –20                 | 56 | 40 |
| R5 (See<br>Note 4)  | 760 (See<br>Note 1) | 1000 (See<br>Note 1)           | 12 | 50 | –20                 | 58 | 42 |

**Note 1.** The ratio of yield strength to tensile strength should be 0.92 maximum unless specially approved.

**Note 2.** Testing may be carried out at either 0°C or –20°C.

**Note 3.** For cast fittings, the minimum values for reduction of area are to be 40% for Grades R3 and R3S and 35% for Grades R4, R4S and R5.

**Note 4.** The aim maximum hardness for Grade R4S is to be HB330, and for Grade R5 is to be HB340.

**Table 10. 3. 6: Mass per unit length of stud link chain cable**

| Nominal chain<br>diameter (mm) | Mass per unit length<br>$0.0219d^2$ (kg/m) |
|--------------------------------|--|

### 3. 10 Connecting common links or substitute links

3. 10. 1 Single links to connect lengths of heat treated chain cable or to substitute for test links or defective links without the necessity for re-heat treatment of the whole length of cable are to be made by the chain manufacturer in accordance with an approved procedure. Separate approvals are required for each grade of chain cable and tests are to be made on the maximum size of chain for which approval is sought.
3. 10. 2 Manufacture and heat treatment of the connecting common link is not to affect the strength of the adjoining links. The temperature reached by these links is nowhere to exceed 250°C.
3. 10. 3 The steel bar used is to conform with the specification for the chain and approved by ACS in accordance with [Ch 3, 9 Bars for welded chain cables](#).
3. 10. 4 Details of the method of manufacture, including heat treatment, are to be submitted for approval, together with the results of a series of tests laid down by ACS.
3. 10. 5 All links involved in the approval tests are to be destroyed and are not to be used as part of a chain cable.
3. 10. 6 Every connecting common link included in a chain cable is to be subjected to the proof load appropriate to the grade and size of chain in which it is incorporated as detailed in [Table 10. 3. 1: Test loads for mooring chain cables](#).
3. 10. 7 Every connecting common link is to be inspected in accordance with [Ch 10, 3.6 Proof load tests and non-destructive examination 3.6.3](#).

- 3. 10. 8 A second identical link is to be made for mechanical tests which are to be in accordance with [Ch 10, 3.9 Mechanical tests 3.9.1](#). This test link is also to be inspected in accordance with [Ch 10, 3.10 Connecting common links or substitute links 3.10.7](#).
- 3. 10. 9 Each connecting common link is to be stamped with the identification marks listed in [Ch 10, 3.11 Identification 3.11.1](#) plus a unique number for the link. The adjoining links are also to be stamped.

### 3. 11 Identification

- 3. 11. 1 Each length of chain is to be permanently marked with the following:
  - a. ACS and abbreviated name of ACS's issuing the certificate.
  - b. Certificate number (this may be abbreviated provided it is stated in the certificate).
  - c. Grade and proof load of chain.
- 3. 11. 2 The chain is to be marked as follows:
  - a. at each end (the marking should identify the leading and tail end of each chain),
  - b. at intervals not exceeding 100 m,
  - c. on all connecting common links or shackles and the immediately adjacent links,
  - d. on the first and last common link of each individual heat used in the continuous length.
- 3. 11. 3 All identification marks are to be made on the studs for stud link chain or, on the outside of the straight part of the link, opposite the flash butt weld for studless chain, and are to be permanent and legible throughout the expected service life of the chain.

### 3. 12 Documentation

- 3. 12. 1 A complete Chain Inspection and Testing Report, in booklet form, is to be provided by the chain manufacturer for each continuous chain length, and for each order for chain and fittings. It is to include all dimensional checks, test and inspection reports, non-destructive test reports, process records, photographs (for fittings, example photographs of components positioned in furnaces), as well as any non-conformity, together with corrective action and repair work.
- 3. 12. 2 All documents, including reports and appendices, are to contain a reference to the relevant certificate number.
- 3. 12. 3 The chain manufacturer is responsible for storing all the documentation in a safe and retrievable manner for a period of at least 10 years.

### 3. 13 Certification

- 3. 13. 1 An ACS certificate is to be issued for each continuous single length of chain, and each type of fitting, See [Ch 1, 3.1, General](#).
- 3. 13. 2 Each test certificate is to include the following particulars:
  - a. Purchaser's name and order number.
  - b. Description and dimensions.
  - c. Grade of chain cable.
  - d. Identification mark which will enable the full history of the chain to be traced.
  - e. Chemical composition.
  - f. Details of heat treatment.
  - g. Mechanical test results.
  - h. Breaking test load.
  - i. Proof load.
  - j. The number and locations of all connecting common links and all marked links.

**CHAPTER 10 Equipment for Mooring and Anchoring****SECTION 4 Fittings for offshore mooring chain****4. 1 Scope**

- 4. 1. 1 Provision is made in this Section for five grades, R3, R3S, R4, R4S and R5 of fittings for offshore mooring chain. Fittings include, but are not limited to, shackles, triplates, end shackles, swivels, and swivel shackles.
- 4. 1. 2 Design of fittings must be to a recognised Standard, such as ISO1704, *See [Figure 10. 2. 3: Enlarged link](#) to [Figure 10. 2. 9: Lugless shackle of the Kenter type](#)*; alternatively, non-standard designs of fittings are to be subject to special consideration, and may require a fatigue analysis and tests to confirm relevant performance.

**4. 2 Manufacture**

- 4. 2. 1 The materials from which the fittings are made are to be manufactured at works approved by ACS, in accordance with the appropriate requirements of [Ch 4, 1 General requirements](#) or [Ch 5, 1 General requirements](#), and the requirement in this Section. Alternative arrangements may be agreed provided that full details concerning the manufacturer are submitted to ACS.
- 4. 2. 2 Steel used for fittings must be manufactured by an approved process, and be killed and fine grain treated.
- 4. 2. 3 The austenite grain size of steel used for fittings must be 6, or finer, as measured in accordance with ASTM E112 or equivalent grain size index in accordance to ISO 643. Measurements for circular sections are to be taken at one-third of the radius. Measurements for non-circular sections are to be taken at one-quarter of the thickness.
- 4. 2. 4 Steel used for forgings or castings for grades R4S and R5 must be vacuum degassed.
- 4. 2. 5 For steel used for forgings or castings for grades R4S and R5 the following tests are to be carried out on each heat:
  - a. assessment and quantification of the level of non-metallic micro inclusions. These must be acceptable for the final product.
  - b. macro-etching on a representative sample, in accordance with ASTM E381 or equivalent; this must be free from any injurious segregation or porosity.
  - c. hardenability tests in accordance with ASTM A255 or equivalent.The results of these tests are to be supplied by the steel manufacturer, and the results are to be included in the final fitting documentation.
- 4. 2. 6 Fittings for chain are to be heat treated in accordance with procedures that have been approved by ACS.

### 4. 3 Testing of fittings

4. 3. 1 For fittings for mooring chain, a batch is defined as fittings from the same steel-making heat that have been heat treated together in the same furnace.
4. 3. 2 All fittings are to be subjected to proof load tests, non-destructive examination, sample break load tests and sample mechanical tests after final heat treatment in the presence of a Surveyor. In addition to the requirements stated in this section, attention must be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

### 4. 4 Proof and break load tests

4. 4. 1 All chain cable fittings, including spares, are to be subjected to the proof loads appropriate to the grade and size of cable for which they are intended, *See [Table 10. 3. 1: Test loads for mooring chain cables](#)*. Prior to this test, the fittings are to be shot or sand blasted to ensure that their surfaces are free from scale, paint or any other coating which could interfere with any subsequent inspection.
4. 4. 2 The appropriate breaking load as required by [Table 10. 3. 1: Test loads for mooring chain cables](#) is to be applied to at least one item out of every batch of up to 25, and this item is to be destroyed and not used as part of an outfit.
4. 4. 3 If the sample fails to withstand the breaking load without fracture, or in the event of failure of any other test, then the entire batch is to be rejected unless the cause of failure has been determined and it can be demonstrated that the condition causing failure is not present in any of the other fittings in the batch. If this can be demonstrated, then two more samples from the same batch may be tested. If either of these samples fails, the batch is to be rejected.
4. 4. 4 For very large fittings where the required breaking load is greater than the capacity of the testing machine and for individually produced fittings or fittings produced in small batches (less than five), proposals for an alternative method of testing will be given special consideration. All proposals for alternative testing methods are to be detailed in writing for approval and the following additional conditions may apply:
  - a. Alternative testing is described in a written procedure and manufacturing specification.
  - b. A finite element analysis is provided at the break load and demonstrates that the fitting has a safety margin over and above the break load of the chain.
  - c. Strain age testing (in accordance with a procedure approved by ACS) is carried out on the material grade produced to the same parameters at the time of qualification.
  - d. If a fitting is of a large size that will make heat treating in batches unfeasible or has a unique design, strain gauges are to be applied during the proof and break load tests during initial qualification and during production. The strain gauge results from production are to be comparable with the results from qualification.
4. 4. 5 All fittings are to be subjected to close visual examination after proof load testing, particular attention being paid to machined surfaces and highly stressed regions.
4. 4. 6 Each fitting is subject to fluorescent magnetic particle or dye penetrant inspection on all surfaces and ultrasonic testing in accordance with a recognised Standard. As a minimum requirement surfaces must be free from:
  - relevant linear indications exceeding 1.6 mm in transverse direction;
  - relevant linear indications exceeding 3.2 mm in longitudinal direction;
  - relevant non-linear indications exceeding 4.8 mm.

When required by ACS, ultrasonic testing is to be carried out on 100 per cent of cast or forged fittings. The acceptance/rejection criteria established for the design is to be met.

- 4. 4. 7 All non-destructive examination is to be carried out in accordance with approved procedures, in accordance with [Ch 1, 5 Non-destructive examination](#).
- 4. 4. 8 Fittings of increased dimensions or higher grade material may be used subject to approval by ACS.
- 4. 4. 9 Where fittings with increased dimensions, or fittings of a higher material grade are included in an outfit:
  - a. each item must be successfully tested at the required breaking load for the chain cable for which it is intended; and
  - b. strain age properties must have been carried out on the material grade produced to the same parameters;
  - c. strain gauges are to be applied during the break load test in the high stress locations to monitor that the strains stay within allowable limits.

For the purpose of this paragraph, items of increased dimensions are so designed that their breaking strength is not less than 1.4 times the Rule minimum breaking load for the chain cable for which it is intended, and this has been verified by procedure tests.
- 4. 4. 10 Weld repairs of finished fittings are not permitted.

## 4. 5 Dimensional inspection

- 4. 5. 1 At least one fitting from each batch of up to 25 is to be checked dimensionally after proof load testing. The manufacturer is to provide a statement that the dimensions comply with the specified requirements.
- 4. 5. 2 The following tolerances apply to the unmachined dimensions of all fittings;
  - a. nominal diameter plus 5 per cent, minus 0 per cent; and
  - b. other dimensions plus or minus 2.5 per cent.

## 4. 6 Mechanical tests

- 4. 6. 1 All fittings are to be manufactured to a manufacturing specification approved by ACS, and provision is to be made for tensile and impact test specimens. The test samples are to be subjected to heat treatment with the fittings they represent. The mechanical test requirements are the same as those for the relevant grade of chain cable, See [Table 10. 3. 5: Mechanical properties of chain cable materials](#).
- 4. 6. 2 Mechanical tests for fittings are to be taken from full size fittings that have been heat treated with the production batch they represent, and the tests are to be taken after the fitting has been proof load tested. It is not permitted to use separate representative coupons unless approved by ACS in accordance with [Ch 10, 4.6 Mechanical tests 4.6.6](#). At least one fitting out of every batch of up to 25 is to be tested. Hardness tests are to be carried out on finished fittings. The frequency and locations are to be agreed with ACS. The recorded values are for information only and used as an additional check to verify that the heat treatment process has been stable during the fitting production.
- 4. 6. 3 Forged shackle bodies and forged Kenter shackles are to have a set of three Charpy impact tests and a tensile test taken from the crown of the shackle. For smaller diameter shackles, where the geometry does not allow for the tensile test to be taken from the crown, this may be taken from the straight portion from the locations specified in [Figure 10. 4. 1: Sampling of steel bars, forgings and castings](#), with the Charpy impact test specimens on the outside radius.
- 4. 6. 4 The mechanical test pieces for cast shackle bodies and cast Kenter shackles can be taken from the straight portion of the fitting from the locations shown in [Figure 10. 4. 1: Sampling of steel bars, forgings and castings](#).

**Figure 10. 4. 1: Sampling of steel bars, forgings and castings**

4. 6. 5 For fittings with complex geometries the locations of mechanical test pieces taken are to be approved by ACS. For non-circular sections, one-quarter of  $t$  (thickness) from the surface is considered appropriate. Rolled plates are to be tested to the standard to which they are produced.
4. 6. 6 Where fittings are individually heat treated or produced in small batches (less than five), alternative testing may be approved; a proposal must be submitted in a written procedure for consideration and the following additional conditions may apply:
- If separately forged or cast coupons are used, they are to have a cross-section and, for forged coupon, a reduction ratio similar to that of the fittings represented, and are to be heat treated in the same furnace and quenched in the same tank at the same time, as the actual forgings or castings. Thermocouples are to be attached to the coupon and to the fittings.
  - If separately forged or cast coupons are agreed, it is to be verified by a procedure test that coupon properties are representative of fitting properties.
4. 6. 7 Mechanical tests of pins are to be taken as shown in [Figure 10. 4. 1: Sampling of steel bars, forgings and castings](#) from the mid- length of a sacrificial pin of the same diameter as the final pin. For oval pins, the diameter taken is to represent the smaller dimension. Mechanical tests may be taken from an extended pin of the same diameter as the final pin that incorporates a test prolongation and a heat treatment buffer prolongation, where equivalence with mid-length test values have been established. The length of the buffer is to be at least equal to 1 pin diameter which is removed after the heat treatment cycle is finished. The test coupon can then be removed from the pin. The buffer and test are to come from the same end of the pin, as shown in [Figure 10. 4. 2: Buffer and test piece location for pins](#).

**Figure 10. 4. 2: Buffer and test piece location for pins**

4. 6. 8 Manufacturers intending to supply fittings in the machined condition are to submit detailed drawings for approval by ACS. Machining of Kenter shackles must result in a fillet radius of a minimum of 3 per cent of the nominal diameter.

## 4. 7 Identification

4. 7. 1 Each fitting is to be permanently marked with the following information:
- identification number, cast number or other marking which will enable the full history of the casting to be traced;
  - manufacturer's name or trade mark;
  - ACS or Asia Classification Society, the abbreviated name of ACS's and number of certificate;
  - personal stamp of Surveyor responsible for inspection;
  - date of final inspection; and
  - chain grade.
- g. 4.7.2 Where small casting/forging fittings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

## 4. 8 Documentation

4. 8. 1 A complete Inspection and Testing Report in booklet form is to be provided by the manufacturer for each order. This booklet include all dimensional checks, test and inspection reports, NDE reports, process records and example photographs of components positioned in furnaces, as well as any non-conformity, corrective action and repair work.
4. 8. 2 Each type of fitting must be covered by separate certificates.
4. 8. 3 All documents, including reports and appendices, are to contain a reference to the relevant certificate number.
4. 8. 4 The manufacturer is responsible for storing all the documentation in a safe and retrievable manner for a period of at least 10 years.

## 4. 9 Certification

4. 9. 1 Certificates are to be issued in accordance with [Ch 10, 3.13 Certification](#).

PART

# 2

CHAPTER **10 Equipment for Mooring and Anchoring**

SECTION **5 Short link chain cables**

## **5. 1 Scope**

- 5. 1. 1 This Section gives the requirements for electrically welded steel short link chain cable for marine use but excluding those applications covered by the *Code for Lifting Appliances in a Marine Environment*.
- 5. 1. 2 Provision is made for grade M(4), as defined in ISO 1834.

## **5. 2 Manufacture**

- 5. 2. 1 Short link chain cables are to be manufactured at works approved by ACS. A list of approved manufacturers for short link chain cable is published separately by ACS.
- 5. 2. 2 The chain is to be supplied in either the normalised or quenched and tempered condition. Heat treatment is to be carried out prior to proof and breaking load testing.
- 5. 2. 3 The chain may be galvanised using a hot dipping process provided that this is carried out prior to proof and breaking load testing. If galvanised, it is recommended that the thickness of the zinc coating be not less than 70 microns.
- 5. 2. 4 Unless otherwise agreed, the finished chain is to be free from coatings other than zinc.

## **5. 3 Bar material**

- 5. 3. 1 Bars for the manufacture of short link chain cable are to be made and tested in accordance with the appropriate requirements of [Ch 3, 1 General requirements](#) and to the requirements of an International or acceptable National Standard.
- 5. 3. 2 The bars are to be made at a works approved by ACS.
- 5. 3. 3 The steel is to be fully killed and fine grain treated.
- 5. 3. 4 The steel is to have mechanical properties which will allow the chain to meet the mechanical test requirements of [Ch 10, 5.4 Testing and inspection of chain cables 5.4.7](#) and [Table 10. 5. 1: Mechanical test requirements for short link chain cables](#).

## **5. 4 Testing and inspection of chain cables**

- 5. 4. 1 All chain cable of 12.5 mm diameter and above, and all steering chains irrespective of diameter, are to be tested in the presence of a Surveyor at a proving establishment recognised by ACS. A list of recognised proving establishments is published by ACS. In addition to the requirements stated in this Chapter, attention is to be given to any relevant statutory requirements of the National Authority of the country in which the ship or other marine structure is to be registered.

**Table 10. 5. 1: Mechanical test requirements for short link chain cables**

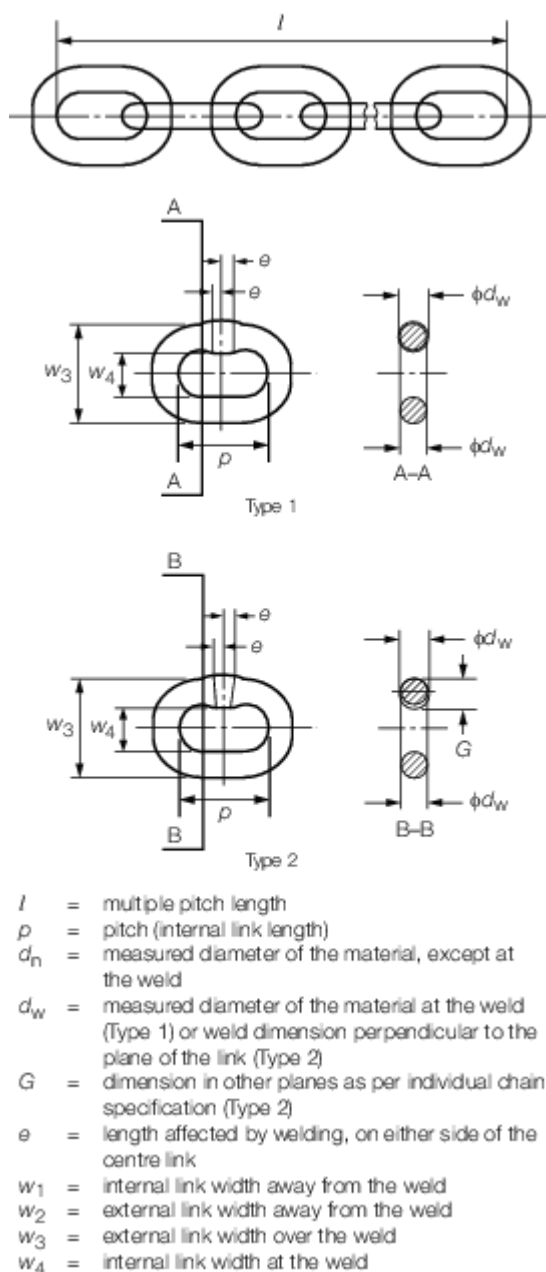

| Chain diameter mm | Grade M(4)    |                          |
|-------------------|---------------|--------------------------|
|                   | Proof load kN | Breaking load minimum kN |
| 5                 | 7.9           | 15.8                     |
| 6.3               | 12.5          | 25                       |
| 7.1               | 15.9          | 31.8                     |
| 8                 | 20.2          | 40.4                     |
| 9                 | 25.5          | 51                       |
| 10                | 29.5          | 63                       |
| 11.2              | 31.5          | 79                       |
| 12.5              | 49.1          | 98.2                     |
| 14                | 63            | 126                      |
| 16                | 81            | 162                      |
| 18                | 102           | 204                      |
| 20                | 126           | 252                      |
| 22.4              | 158           | 316                      |
| 25                | 197           | 394                      |
| 28                | 247           | 494                      |
| 32                | 322           | 644                      |
| 36                | 408           | 816                      |
| 40                | 503           | 1006                     |
| 45                | 637           | 1274                     |

5. 4. 2 For chain of diameter less than 12.5 mm, other than steering chains, the manufacturer's tests will be acceptable.
5. 4. 3 After completion of all manufacturing processes, including heat treatment and galvanising, the whole of the chain is to be subjected to the appropriate proof load specified in [Table 10. 5. 1: Mechanical test requirements for short link chain cables](#).
5. 4. 4 The whole of the chain is to be inspected after the proof load test and is to be free from significant defects.
5. 4. 5 At least one sample, consisting of seven or more links, is to be selected by the Surveyor from each 200 m or less of chain for breaking load tests. Two additional links may be required for engagement in the jaws of the testing machine. These extra links are not to be taken into account in determining the total elongation, See [Ch 10, 5.4 Testing and inspection of chain cables 5.4.7](#).
5. 4. 6 The breaking load is to comply with the appropriate requirements of [Table 10. 5. 1: Mechanical test requirements for short link chain cables](#).
5. 4. 7 The total elongation of the breaking load sample at fracture, expressed as a percentage of the original inside length of the sample after proof loading, is to be not less than 20 per cent.

## 5.5 Dimensions and tolerances

- 5.5.1 The form and proportions of links are to be in accordance with [Figure 10. 5. 1: Form and proportions of links](#).

**Figure 10. 5. 1: Form and proportions of links**

- 5.5.2 Manufacturing tolerances are to be within the following limits:

|                                   |                    |
|-----------------------------------|--------------------|
| Nominal diameter, $d_n$           | $\pm 5\%$          |
| Pitch of chain, $p_1$             | $\pm 3\%$          |
| Length measured over 11 links $l$ | $\pm 2\%$          |
| Inside width, $w_1$               | 1.35 $d_n$ minimum |

Outside width,  $w$   $3.6 d_n$  maximum

The tolerances are to apply after galvanising. All measurements are to be taken after proof testing.

## 5. 6 Identification

5. 6. 1 All lengths of cable are to be stamped with the following identification marks:
  - a. Inspector's mark and date.
  - b. Reference mark or number of certificate.
  - c. Manufacturer's mark or name.
  - d. Chain cable quality mark, M, is to be stamped on at least each twentieth link or at intervals of one metre, whichever is the lesser distance.
5. 6. 2 Where the inspection is performed under ACS's supervision, the inspector's mark and date are to be replaced by ACS and the abbreviated name of ACS's issuing the certificate.

## 5. 7 Certification

5. 7. 1 The manufacturer is to supply the Surveyor with a certificate stating compliance with an appropriate ISO standard, and also, in the event of the requirements of [Ch 10, 5.4, Testing and inspection of chain cables](#) being undertaken other than in the presence of the Surveyor, stating that the test and inspection requirements have been complied with at a recognised proving establishment.
5. 7. 2 Each test certificate is to include the following particulars:
  - a. the quality and description of chain,
  - b. identification mark,
  - c. nominal size of chain,
  - d. proof load,
  - e. breaking load,
  - f. total elongation at fracture,
  - g. where appropriate, the name of the proving establishment.

CHAPTER **10 Equipment for Mooring and Anchoring**SECTION **6 Steel wire ropes****6.1 Scope**

- 6.1.1 Provision is made in this Section for the requirements for the manufacture, testing and certification of steel wire ropes intended to be used for general marine purposes, as well as permanent anchoring, mooring and marine lifting applications.

**6.2 General requirements**

- 6.2.1 For general marine purposes, such as stream wires, towlines and ship mooring lines, the construction is to be in accordance with [Table 10. 6. 1: Recommended rope construction](#). The construction, diameter and strength of steel wire ropes for permanent offshore applications, such as mooring, anchoring and lifting, are covered by other ACS Rules. Alternative applications of wire ropes may be accepted, subject to special consideration.
- 6.2.2 The manufacturer's plant and method of production are to be approved by ACS. A list of approved manufacturers of steel wire ropes is published annually in the *List of Approved Manufacturers of Materials*.

**Table 10. 6. 1: Recommended rope construction**

| Purpose   | Construction of rope |       |                 | Construction of strands       |
|---|----------------------|-------|-----------------|-------------------------------|
|   | Strands              | Wires | Core            |                               |
| Stream wires, towlines and mooring lines                            | 6                    | 24    | Fibre           | 15 over 9 over fibre core     |
|   | 6                    | 37    | Fibre           | 18 over 12 over 6 over 1      |
|   | 6                    | 26    | Fibre           | 10 over (5 + 5) over 5 over 1 |
|   | 6                    | 31    | Fibre           | 12 over (6 + 6) over 6 over 1 |
|   | 6                    | 36    | Fibre           | 14 over (7 + 7) over 7 over 1 |
|   | 6                    | 41    | Fibre           | 16 over (8 + 8) over 8 over 1 |
|   | 6                    | 30    | Fibre           | 18 over 12 over fibre core    |
| Towlines and mooring lines used in association with mooring winches | 6                    | 31    | 7 x 7 wire rope | 12 over (6 + 6) over 6 over 1 |
|   | 6                    | 36    | 7 x 7 wire rope | 14 over (7 + 7) over 7 over 1 |
|   | 6                    | 41    | 7 x 7 wire rope | 16 over (8 + 8) over 8 over 1 |

6. 2. 3 For shaped wire, for example, for large diameter ropes for permanent mooring, where there are no established Standards, the manufacturer is to provide evidence by way of test reports that specifications have been developed and agreed with the purchaser and ACS for the purposes intended.

### 6. 3 Steel wire for ropes

6. 3. 1 Steel wire is to be of homogeneous quality, uniform strength and free of defects likely to impair the manufacture and performance of the rope.
6. 3. 2 For all ropes, the specified minimum tensile strength of the wire is to be 1420, 1570, 1770 or 1960 N/mm<sup>2</sup>. The specified minimum tensile strength of the wire is the designated grade for the rope, unless otherwise defined by the purchaser's specification. The actual tensile strength of the wire is not to exceed 120 per cent of the specified minimum tensile strength.
6. 3. 3 For new rope construction, the manufacturer is to carry out prototype testing suitable for the application of the rope and this is to include tests on wire used for the construction.
6. 3. 4 Tensile and torsion tests, coating, and adhesion (wrap) tests are to be carried out on wire used for the manufacture of rope.
6. 3. 5 At least 10 per cent of the spools used for the manufacture of the strand are to be tested. The manufacturer is to demonstrate that tests have been carried out on at least one wire intended for each of the outer and inner strands, and for each diameter and grade used.
6. 3. 6 The heat number, wire diameter and strength of wire used for a particular construction are to be recorded by the manufacturer.
6. 3. 7 Torsion tests are to be carried out on the wire by causing one or both of the securing vices to be revolved until fracture occurs (a tensile load not exceeding two per cent of the breaking load of the wire may be applied to keep the wire stretched).
6. 3. 8 The uncoated wire is to withstand, without fracture, the number of complete twists given for Grades 1 or 3 in [Table 10. 6. 2: Torsion test](#).
6. 3. 9 The galvanised wire is to withstand, without fracture, the number of complete twists given in the specification, as agreed with the purchaser and ACS. In the absence of a suitable specification, the results are to comply with [Table 10. 6. 2: Torsion test](#).
6. 3. 10 Hot dipped galvanised steel wire is to be used for the manufacture of ropes for marine applications. Depending upon the application, the coating may comply with any of the grades in [Table 10. 6. 3: Zinc coating](#). Grades 1 and 2 are heavy coatings. Grade 3 is the minimum coating weight where the galvanising is carried out prior to final wire drawing. Uncoated wire may be considered for approved applications.

**Table 10. 6. 2: Torsion test**

| Diameter<br>coated wire<br>mm | Minimum number of twists           |      |                                    |      |      |      |
|-------------------------------|------------------------------------|------|------------------------------------|------|------|------|
|                               | Grade 2                            |      | Grade 1 or 3                       |      |      |      |
|                               | Minimum strength N/mm <sup>2</sup> |      | Minimum strength N/mm <sup>2</sup> |      |      |      |
|                               | 1570                               | 1770 | 1420                               | 1570 | 1770 | 1960 |
| <1.3                          | 19                                 | 18   | 29                                 | 26   | 23   | 23   |
| ≥1.3 <2.3                     | 18                                 | 17   | 26                                 | 24   | 21   | 21   |
| ≥2.3 <3.0                     | 16                                 | 14   | 24                                 | 22   | —    | 19   |

|                  |    |    |    |    |   |    |
|------------------|----|----|----|----|---|----|
| $\geq 3.0 < 4.0$ | 12 | 10 | 20 | 18 | — | 17 |
| $\geq 4.0 < 4.6$ | —  | —  | 18 | 16 | — | —  |
| $\geq 4.6 < 5.0$ | —  | —  | 16 | 14 | — | —  |
| $\geq 5.0 < 6.0$ | —  | —  | 14 | 11 | — | —  |

**Note** The minimum test length is  $100d$  or 300 mm, where  $d$  is the wire diameter.

**Table 10. 6. 3: Zinc coating**

| Diameter of coated wire mm | Zinc coating, minimum g/m <sup>2</sup> |         |         |
|----------------------------|--|---------|---------|
|                            | Grade 1                                | Grade 2 | Grade 3 |
| $\geq 0.20 < 0.25$         | —                                      | 30      | 20      |
| $\geq 0.25 < 0.33$         | —                                      | 45      | 30      |
| $\geq 0.33 < 0.40$         | —                                      | 60      | 30      |
| $\geq 0.40 < 0.50$         | 60                                     | 75      | 40      |
| $\geq 0.50 < 0.60$         | 70                                     | 90      | 50      |
| $\geq 0.60 < 0.80$         | 85                                     | 110     | 60      |
| $\geq 0.80 < 1.00$         | 95                                     | 130     | 70      |

| $\geq 1.20 < 1.50$         | 120                                    | 165     | 90      |
| $\geq 1.50 < 1.90$         | 130                                    | 180     | 100     |
| $\geq 1.90 < 2.50$         | —                                      | 205     | 110     |
| $\geq 2.50 < 3.20$         | —                                      | 230     | 125     |
| $\geq 3.20 < 4.00$         | —                                      | 250     | 135     |

6. 3. 11 The mass per unit area of the zinc coating is to be determined in accordance with a recognised National or International Standard.
6. 3. 12 Zinc coating tests are to be carried out for each designated grade of wire. The manufacturer is to demonstrate that the coatings are continuous and uniform and suitable for the intended purpose.
6. 3. 13 Unless otherwise specified by the purchaser, zinc coating tests are to be carried out on the wire prior to stranding.
6. 3. 14 The adhesion of the coating is to be tested by wrapping the wire round a cylindrical mandrel for 10 complete turns. The ratio between the diameter of the mandrel and that of the wire is to be as in [Table 10. 6. 4: Wrap test for adhesion of coating](#). After wrapping on the appropriate mandrel, the zinc coating is to have neither flaked nor cracked to such an extent that any zinc can be removed by rubbing with a cloth.

**Table 10. 6. 4: Wrap test for adhesion of coating**

| Coating       | Diameter of coated wire mm | Maximum ratio of mandrel to wire diameter |
|---------------|----------------------------|---|
| Grade 1 and 2 | <1.5                       | 4   |
|               | ≥1.5                       | 6   |
| Grade 3       | <1.5                       | 2   |
|               | ≥1.5                       | 3   |

## 6. 4 Tests on completed ropes

6. 4. 1 Every length of wire rope is to be subjected to a breaking strength test.
6. 4. 2 A sample of sufficient length is to be provided for the breaking load test. The rope ends are to be enclosed in a suitable socket. Testing is to be carried out in accordance with a recognised National or International Standard.
6. 4. 3 The rope may be subject to cyclic loading for bedding purposes prior to testing. The rope is to be tested at a suitable strain rate in accordance with a recognised National or International Standard.
6. 4. 4 The load is to be applied until one wire break is witnessed or 130 per cent of the minimum breaking load is recorded. The maximum recorded load is to be reported by the manufacturer.
6. 4. 5 Tests in which a breakage occurs adjacent to and as a result of damage from the grips are to be rejected, if the applied load is less than the specified minimum requirement. The rope is to be retested to withstand the agreed minimum breaking load.
6. 4. 6 With the exception of offshore mooring ropes, consideration may be given to determining the breaking load by summation or aggregating actual test results on individual wires, if facilities are not available for undertaking a breaking test on a production basis. A suitable spin factor or lay-up deduction allowance in accordance with a recognised National or International Standard for the applicable rope diameter, designated grade and construction is to be applied.
6. 4. 7 Where spin factors or lay-up deduction allowances are proposed by the manufacturer, a report on suitable cyclic load testing of prototype ropes of the same construction, strength and diameter is to be approved by ACS. In addition, the manufacturer is to show that a satisfactory breaking load test has been carried out in the previous two years, and witnessed by ACS for the same rope construction, diameter and designated grade.
6. 4. 8 ACS may give special consideration to spin factors or lay deductions based on data extrapolated from smaller diameter ropes of the same construction, provided that these ropes have been tested in accordance with [Ch 10, 6.4 Tests on completed ropes 6.4.7](#).
6. 4. 9 All data arising from smaller diameter ropes for the extrapolation in [Ch 10, 6.4 Tests on completed ropes 6.4.8](#) are to have been derived from tests carried out within two years of the manufacture of the larger diameter rope.
6. 4. 10 The finished rope is to have no more than one wire connecting weld in any length of  $18d$ , where  $d$  is the diameter of the rope.

## 6. 5 Dimensional inspection

6. 5. 1 The dimensions and discard criteria are to comply with a recognised National or International Standard.

## 6. 6 Identification

6. 6. 1 All completed ropes are to be identified with attached labels detailing the rope type, diameter and length.

## 6. 7 Certification

6. 7. 1 Unless otherwise requested by the purchaser, a manufacturer's certificate, in accordance with [Ch 1, 3.1 General 3.1.3.c](#), is to be issued.
- Each test certificate is to contain the following particulars:
  - Purchaser's name and order number.
  - Details of the rope construction.
  - Core material.
  - Grade of zinc coating.
  - Mechanical test results.
  - Adhesion test results.
  - Dimensions.
  - Method of breaking load testing.
  - Breaking load.

## CHAPTER 10 Equipment for Mooring and Anchoring

### SECTION 7 Fibre ropes

#### 7.1 Manufacture

- 7.1.1 Fibre ropes intended as mooring lines may be made of coir, hemp, manila or sisal, or may be composed of synthetic (man-made) fibres. They may be three-strand (hawser laid), four-strand (shroud laid) or nine-strand (cable laid), but other constructions will be specially considered.
- 7.1.2 Each length of rope is to be manufactured from suitable material of good and consistent quality. Rope materials should, in general, comply with a recognised National Standard.
- 7.1.3 Synthetic fibre ropes are to be suitable for the purpose intended and should comply with a recognised standard.
- 7.1.4 Weighting and loading matter is not to be added, and any lubricant is to be kept to a minimum. Any rot-proofing or water repellancy treatment is not to be deleterious to the fibre nor is it to add to the weight or reduce the strength of the rope.

#### 7.2 Tests of completed ropes

- 7.2.1 The breaking load is to be determined by testing to destruction a sample cut from the completed rope.
- 7.2.2 The minimum test length and the initial test load are to be as given in [Table 10. 7. 1: Breaking load test](#). After application of the initial load, the diameter and evenness of lay up of the sample are to be checked. The sample is then to be uniformly strained at the rate given in [Table 10. 7. 1: Breaking load test](#) until it breaks.

**Table 10. 7. 1: Breaking load test**

| Material   | Test length mm minimum | Initial load % ( <i>See Note</i> ) | Rate of straining mm/min |
|--|------------------------|------------------------------------|--------------------------|
| Natural fibre  | 1800                   | 2                                  | 150 ± 50                 |
| Synthetic fibre  | 900                    | 1                                  | 100 max.                 |
| <b>Note</b> Percentage of specified minimum breaking load. |                        |                                    |                          |

- 7.2.3 The actual breaking load is to be not less than that given in an appropriate National Standard.
- 7.2.4 If the sample is held by grips and the break occurs within 150 mm of the grips, the test may be repeated, but not more than two tests may be made on any one coil.

7. 2. 5 Where difficulty is experienced in testing a sample of a completed synthetic fibre rope, ACS will consider alternative methods of testing.

### **7. 3 Identification**

7. 3. 1 Each coil of rope is to be identified with an attached label detailing the material, construction, diameter and length.

### **7. 4 Certification**

7. 4. 1 A manufacturer's certificate, in accordance with [Ch 1, 3.1 General 3.1.3.c](#), is to be issued. The certificate is to be validated by the manufacturer's representative, who is to be independent of the production process and ACS.
7. 4. 2 Each test certificate is to include the following particulars:
- Manufacturer's name.
  - Purchaser's name and order number.
  - Rope type.
  - Dimensions.
  - Test length.
  - Rate of straining.
  - Breaking load.

PART

# 2

CHAPTER **11 Approval of Welding Consumables**

SECTION **1 General**

## 1.1 Scope

- 1.1.1 Provision is made in this Chapter for the approval by Asia Classification Society (hereinafter referred to as 'ACS') of electrodes, wires, fluxes and other consumables intended for use in the welding of the following types of materials:
  - a. Steel of various grades as represented by Grade A through to Grade EH96, *See [Ch 11, 3 Electrodes for manual and gravity welding](#) to [Ch 11, 7 Consumables for use in one-side welding with temporary backing materials](#).*
  - b. A wide range of low-temperature service steels, *See [Ch 11, 3 Electrodes for manual and gravity welding](#) to [Ch 11, 7 Consumables for use in one-side welding with temporary backing materials](#).*
  - c. Stainless steels including nitrogen strengthened grades and some of the duplex varieties, *See [Ch 11, 8 Consumables for welding austenitic and duplex stainless steels](#).*
  - d. Aluminium alloys, *See [Ch 11, 9 Consumables for welding aluminium alloys](#).*
- 1.1.2 For this purpose, welding, consumables are categorised and subject to the special requirements of different Sections of this Chapter.
  - a. Covered electrodes for manual welding and gravity welding.
  - b. Combinations of wire and flux for automatic submerged-arc welding.
  - c. Combinations of wire and gas for gas metal-arc welding and wires for self-shielding welding.
  - d. Combinations for electro-slag and electro-gas welding.
  - e. Combinations with temporary backing materials for one-side welding.
  - f. Consumables for welding austenitic and duplex stainless steels.
  - g. Combinations for welding aluminium.

## 1.2 Grading

- 1.2.1 Consumables for welding structural steels are graded into twelve strength levels, and each of these is further subdivided into several levels in respect of notch toughness. The five basic levels of toughness are indicated by a number (1 to 5). Normal tensile strength is indicated by 'N'. Higher tensile strength is indicated by 'Y', and if the yield strength is higher than 375 N/mm<sup>2</sup> the Y is followed by a number (40 to 96), as shown in [Table 11. 1. 1: Welding consumable grades appropriate to structural and low temperature service steel grades](#).

**Table 11. 1. 1: Welding consumable grades appropriate to structural and low temperature service steel grades**

|                   |  |
|-------------------|--|
| Consumables grade | Suitable for steel grades ( <i>See Notes</i> ) |
|-------------------|--|

|  |             |              |             |             |

| 9 Ni  | 9 Ni | —    | — | — |
| <p><b>Note 1.</b> Steel grades shown in bold italic type include the equivalent (LT-xxxx) low temperature service grades referenced in <a href="#">Ch 3, 6 Carbon–manganese and nickel alloy steels for low temperature service</a>.</p> <p><b>Note 2.</b> The Table applies to the multi-run welding techniques (i.e. m, S, M).</p> <p><b>Note 3.</b> Approval of consumables intended for welding high strength steels in <a href="#">Ch 3, 10 High strength steels for welded structures</a> also includes the standard ship steel grades as shown in bold italic type and equivalent low temperature service steel grades referenced in <a href="#">Ch 3, 6 Carbon–manganese and nickel alloy steels for low temperature service</a>.</p> |      |      |   |   |

1. 2. 2 In addition to the grade, consumables are also allocated a suffix indicating the welding technique used. These are defined in the context of the following Sections of this Chapter.
1. 2. 3 Consumables for structural and low temperature service steels may be controlled low hydrogen and approved as such. Grade marking H15, H10 or H5 will be applied, as appropriate.
1. 2. 4 For joining higher strength steels, approval granted for 1Y consumables will be limited to maximum material thickness of 25 mm.
1. 2. 5 Test assemblies are not to be subjected to any heat treatment, except in those higher strength grades where it is considered necessary to use the welded joint in the stress relieved (tempered) condition. In those cases, the code 'sr' will be added to the approval grade.

1. 2. 6 Further details of grading are given in subsequent Sections of this Chapter.

### 1. 3 Manufacture

1. 3. 1 The manufacturer's plant and method of production of welding consumables are to be such as to ensure reasonable uniformity in manufacture.

### 1. 4 Approval procedures

1. 4. 1 Welding consumables will be approved subject to a satisfactory inspection of the works by the Surveyor for compliance with the test requirements detailed in subsequent Sections in this Chapter.

1. 4. 2 The test assemblies are to be prepared under the supervision of the Surveyor, and using samples selected by him. All tests are to be carried out in his presence.

1. 4. 3 For Charpy V-notch tests, a set of three test specimens is to be prepared and the average energy value is to comply with the requirements of subsequent Sections in this Chapter. One individual value may be less than the required average value provided that it is not less than 70 per cent of this value.

1. 4. 4 Where chemical analysis is required for approval, the results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

1. 4. 5 ACS may require, in any particular case, such additional tests or requirements as may be necessary.

1. 4. 6 *A List of Approved Welding Consumables* is published by ACS.

1. 4. 7 ACS is to be notified of any alteration proposed to be made in the process of manufacture subsequent to approval. Sufficient detail is to be provided to determine the need for further testing to maintain the approval. Consideration will be given to alternative procedures for approval in the case of manufacturers producing consumables under the control of another manufacturer or plant already having approval of one or more products.

1. 4. 8 Consideration will be given to alternative procedures for approval in the case of manufacturers producing consumables under the control of another manufacturer or plant already having approval of one or more products.

### 1. 5 Annual inspection and tests

1. 5. 1 All establishments where approved welding consumables are manufactured, and the associated quality control procedures, are to be subjected to annual inspection. On these occasions, samples of the approved consumables are to be selected by the Surveyor and subjected to the tests detailed in subsequent Sections in this Chapter. These are to be completed and reported before the end of the one year period beginning at the initial approval date, and repeated annually so as to provide at least an average of one annual test per year.

### 1. 6 Changes in grading

1. 6. 1 Changes in grading of welding consumables will be considered only at the manufacturer's request, preferably at the time of annual testing. For upgrading in connection with impact properties, and uprating in connection with tensile properties, tests from butt weld assemblies will be required in addition to the normal annual approval tests. For upgrading in connection with hydrogen testing, specific tests will be required in accordance with ISO 3690. Downgrading and downrating may be imposed by ACS where tests and re-tests fail to meet the requirements of this Chapter.

## 1. 7 Manufacturers' Quality Assurance Systems

1. 7. 1 As an alternative to [Ch 11, 1.5 Annual inspection and tests](#), manufacturers may *Seek* maintenance of approval based on acceptance by ACS of their 'in house' quality assurance system, and by regular audit of that system carried out in accordance with procedures approved by ACS.

## 1. 8 Certification

1. 8. 1 Each carton or package of approved consumables is to contain a certificate from the manufacturer, generally in accordance with the following: 'The *<insert name of manufacturer>* company certifies that the composition and quality of these consumables conform with those of the consumables used in making the test pieces submitted to and approved by the approval bodies nominated on the label of this package.'

CHAPTER **11 Approval of Welding Consumables**

SECTION **2 Mechanical testing procedures**

**2. 1 Dimensions of test specimens**

- 2. 1. 1 Dimensions of test pieces for deposited metal tensile tests, butt weld tensile tests, bend tests and Charpy V-notch impact test are to machined to the dimensions and tolerances detailed in [Ch 2 Testing Procedures for Metallic Materials](#).

**2. 2 Testing procedures**

- 2. 2. 1 The procedures used for all tensile and impact tests are to comply with the requirements of [Ch 2 Testing Procedures for Metallic Materials](#).
- 2. 2. 2 Butt weld bend test specimens are to be tested at ambient temperature and are to be bent through an angle of 120° over a former having a diameter which relates to the thickness of the test specimen as detailed in subsequent Sections. For each pair of bend test specimens, one specimen is to be tested with the face of the weld in tension and the other with the root of the weld in tension.
- 2. 2. 3 Macro examinations are to be carried out on polished and etched specimens at a maximum magnification not exceeding x10. The examination is to ensure complete fusion, inter-run penetration and freedom of defects.

**2. 3 Re-testing procedures**

- 2. 3. 1 Re-testing procedures are to comply with [Ch 2, 1.4, Re-testing procedures](#).

CHAPTER **11 Approval of Welding Consumables**SECTION **3 Electrodes for manual and gravity welding****3.1 Grading**

- 3.1.1 Dependent on the results of the mechanical and other tests, approval will be allocated as one of the grades from [Table 11. 1. 1: Welding consumable grades appropriate to structural and low temperature service steel grades](#).
- 3.1.2 Approval of an electrode will be given in conjunction with a welding technique indicated by a suffix 'm' for manual welding, 'G' for gravity or contact electrode and 'p' for deep penetration electrode.
- 3.1.3 If the electrodes are in compliance with the requirements of the hydrogen test given in [Ch 11, 3.4 Hydrogen test](#), a suffix 'H15' or 'H10' or 'H5' will be added to the grade mark. [Table 11. 3. 1: Minimum low hydrogen approval requirements for manual and gravity electrodes](#) shows the mandatory levels of low hydrogen approval for the various approval grades.

**Table 11. 3. 1: Minimum low hydrogen approval requirements for manual and gravity electrodes**

| Approval grades        | Low hydrogen grade required |
|------------------------|-----------------------------|
| 1 (1N), 2 (2N), 3 (3N) | NR                          |
| 2Y, 3Y, 4Y             | H15 ( <i>See Note 2</i> )   |
| 2Y40 to 5Y40           | H15                         |
| 3Y47                   | H10                         |
| 3Y42 to 5Y42           | H10                         |
| 3Y46 to 5Y46           | H10                         |
| 3Y50 to 5Y50           | H10                         |
| 3Y55 to 5Y55           | H5                          |
| 3Y62 to 5Y62           | H5                          |
| 3Y69 to 5Y69           | H5                          |
| 3Y89 to 4Y89           | H5                          |
| 3Y96 to 4Y96           | H5                          |
| $1\frac{1}{2}$ Ni      | H15                         |

|   |                          |
|---|--------------------------|
| $2\frac{1}{4}$ Ni   | H15                      |
| $3\frac{1}{2}$ Ni   | H15                      |
| 5 Ni  | NR ( <i>See Note 3</i> ) |
| 9 Ni  | NR ( <i>See Note 3</i> ) |
| <p><b>Note 1.</b> NR – Not required. Approval may be obtained when requested.</p> <p><b>Note 2.</b> Optional in this case. If low hydrogen approval is not obtained, there is a limitation on the carbon equivalent of the steel which is permitted to be welded.</p> <p><b>Note 3.</b> Assumes use of an austenitic, non-transformable, filler material.</p> |                          |

3. 1. 4 For each strength level, electrodes which have satisfied the requirements for a higher toughness grade are considered as complying with the requirements for a lower grade.
3. 1. 5 Electrodes approved for normal and higher strength levels up to and including 'Y' are also considered suitable for welding steels in the three strength levels below that for which they have been approved.
3. 1. 6 Electrodes approved for strength levels Y40 to Y50, but excluding Y47 are also considered suitable for welding steels in two strength levels below that for which they have been approved.
3. 1. 7 Electrodes approved for strength levels Y47, Y55 and above are also considered suitable for welding steels in only one strength level below that for which they have been approved.
3. 1. 8 Electrodes approved for strength level Y89 are considered suitable for this strength level only.
3. 1. 9 Electrodes approved for strength level Y96 are also considered suitable for welding steels in one strength level below that for which they have been approved.
3. 1. 10 The welding current used is to be within the range recommended by the manufacturer and, where an electrode is stated to be suitable for both a.c. and d.c., a.c. is to be used for the preparation of the test assemblies.
3. 1. 11 Where an electrode is submitted only for approval for fillet welding and to which the butt weld test provided in [Ch 11, 3.3, Butt weld test assemblies](#) is not considered applicable, approval tests are to consist of the fillet weld tests as given in [Ch 11, 3.5, Fillet weld test assemblies](#) and deposited metal tests with chemical analyses as given in [Ch 11, 3.2 Deposited metal test assemblies](#).

## 3. 2 Deposited metal test assemblies

3. 2. 1 The deposited metal test assemblies are to be prepared in the downhand position as shown in [Figure 11. 3. 1: Deposited metal test assembly](#), one with 4 mm diameter electrodes and the other with 8 mm diameter electrodes, or the largest size manufactured if this is less than 8 mm diameter. If an electrode is available in one diameter only, one test assembly is sufficient. Any of the grades of steel in [Table 11. 1. 1: Welding consumable grades appropriate to structural and low temperature service steel grades](#) may be used for the preparation of these assemblies, up to a strength level which is not more than two levels above that for which approval is sought.

**Figure 11. 3. 1: Deposited metal test assembly**

3. 2. 2 For Y47 grades, as an alternative to [Figure 11. 3. 1: Deposited metal test assembly](#), the thickness of the plate used for the test assembly may be taken as 50 mm.
3. 2. 3 The weld metal is to be deposited in single- or multi-run layers according to normal practice, and the direction of deposition of each layer is to alternate from each end of the plate, each run of weld metal being not less than 2 mm and not more than 4 mm thick. Between each run, the assembly is to be left in still air until it has cooled to less than 250°C, the temperature being taken in the centre of the weld, on the surface of the seam. After being welded, the test assemblies are not to be subjected to any heat treatment, except in those higher strength grades where it is considered necessary to use the welded joint in the stress-relieved (tempered) condition. In those cases, the code 'sr' will be added to the approval grading.
3. 2. 4 The chemical analysis of the deposited weld metal in each deposited metal test assembly is to be supplied by the manufacturer and is to include the content of all significant alloying elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.
3. 2. 5 One tensile and three impact test specimens are to be taken from each test assembly as shown in [Figure 11. 3. 1: Deposited metal test assembly](#). Care is to be taken that the axis of the tensile test specimen coincides with the centre of the weld and the mid-thickness of the plates. The impact test specimens are to be cut perpendicular to the weld, with their axes 10 mm from the upper surface. The notch is to be positioned in the centre of the weld and cut in the face of the test specimen perpendicular to the surface of the plate.
3. 2. 6 The results of all tests are to comply with the requirements of [Table 11. 3. 2: Requirements for deposited metal tests \(covered electrodes\)](#) as appropriate.

**Table 11. 3. 2: Requirements for deposited metal tests (covered electrodes)**

| <p><b>Note 1.</b> Single values are the minimum requirements.</p> <p><b>Note 2.</b> Energy values from individual impact test specimens are to comply with <a href="#">Ch 11, 1.4 Approval procedures 1.4.3</a>.</p> <p><b>Note 3.</b> Grade 1Y is not applicable to SMAW consumables referenced in <a href="#">Ch 11, 3 Electrodes for manual and gravity welding</a>.</p> |     |            |    |      |    |

### 3.3 Butt weld test assemblies

- 3.3.1 Butt weld assemblies, as shown in [Figure 11.3.2: Butt weld test assembly](#), are to be prepared for each welding position (downhand, horizontal-vertical, vertical-upward, vertical-downward, and overhead) for which the electrode is recommended by the manufacturer. In the case of electrodes for normal strength and higher strength steels (up to 355 N/mm<sup>2</sup> minimum specified yield strength), electrodes satisfying the requirements for downhand and vertical-upward positions will be considered as also complying with the requirements for the horizontal-vertical position. In all other cases, approval for the horizontal-vertical position will require a butt weld to be made in that position and fully tested.

**Figure 11.3.2: Butt weld test assembly**

- 3.3.2 For Y47 grades, as an alternative to [Figure 11.3.2: Butt weld test assembly](#), the thickness of the plate used for the test assembly may be taken as 50 mm.
- 3.3.3 Where the electrode is to be approved only in the downhand position, an additional test assembly is to be prepared in that position.
- 3.3.4 The grades of steel used for the preparation of the test assemblies are to be as follows:

Grade 1 (1N) electrodes A

|                         |  |
|-------------------------|--|
| Grade 2 (2N) electrodes | A, B or D  |
| Grade 3 3(N) electrodes | A, B, D or E                                       |
| Grade 2Y electrodes     | AH32, AH36, DH32 or DH36                           |
| Grade 3Y electrodes     | AH32, AH36, DH32, DH36, EH32 or EH36               |
| Grade 4Y electrodes     | AH32<br>AH36, DH32, DH36, EH32, EH36, FH32 or FH36 |
| Grade 2Y40 electrodes   | AH40 or DH40                                       |
| Grade 3Y40 electrodes   | AH40, DH40 or EH40                                 |
| Grade 4Y40 electrodes   | AH40, DH40, EH40 or FH40                           |
| Grade 5Y40 electrodes   | AH40, DH40, EH40 or FH40                           |
| Grade 3Y47 electrodes   | EH47   |

Where Grade 32 higher tensile steel is used, the tensile strength is to be not less than 490 N/mm<sup>2</sup>. The chemical composition, including the content of grain refining elements, is to be reported in all cases where higher tensile steel is used.

3. 3. 5 For all other grades, the steel plates used are to be selected by reference to [Table 11. 1. 1: Welding consumable grades appropriate to structural and low temperature service steel grades](#), and are to have at least their chemical composition and tensile properties within the limits specified for that grade in [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#). The strength grade used is to be the same as that for which approval is sought, and the toughness grade is to be no higher than that for which approval is also sought.
3. 3. 6 The test assemblies are to be made by welding together two plates of equal thickness (15 to 20 mm), not less than 100 mm in width and of sufficient length to allow the cutting out of test specimens of the prescribed number and size. The plate edges are to be prepared to form a single V-joint, the included angle between the fusion faces being 60° and the root gap 2 to 3 mm. The root face is to be 0 to 2 mm.
3. 3. 7 The following welding procedure is to be adopted in making the test assemblies:
 

**Downhand (a).** The first run with 4 mm diameter electrode. Remaining runs (except the last two layers) with 5 mm diameter electrodes or above according to the normal welding practice with the electrodes. The runs of the last two layers with the largest diameter of electrode manufactured or 8 mm whichever is the lesser.

**Downhand (b)** (where a second downhand test is required). First run with 4 mm diameter electrode. Next run with an electrode of intermediate diameter of 5 mm or 6 mm, and the remaining runs with the largest diameter of electrode manufactured or 8 mm whichever is the lesser.

**Horizontal-vertical.** First run with 4 mm or 5 mm diameter electrode. Subsequent runs with 5 mm diameter electrodes.

**Vertical-upward and overhead.** First run with 3.25 mm diameter electrode. Remaining runs with 4 mm diameter electrodes or possibly with 5 mm if this is recommended by the manufacturer for the positions concerned.

**Vertical-downward.** If the electrode being tested is intended for vertical welding in the downward direction, this technique is to be adopted for the preparation of the test assembly using electrode diameters as recommended by the manufacturer.
3. 3. 8 For all assemblies, the back sealing runs are to be made with 4 mm diameter electrodes in the welding position appropriate to each test sample, after cutting out the root run to clean metal. For

electrodes suitable for downhand welding only, the test assemblies may be turned over to carry out the back sealing run.

- 3.3.9 Normal welding practice is to be used and, between each run, the assembly is to be left in still air until it has cooled to less than 250°C, the temperature being taken in the centre of the weld, on the surface of the seam. After being welded, the test assemblies are not to be subjected to any heat treatment, except in those higher strength grades where it is considered necessary to use the welded joint in the stress-relieved (tempered) condition. In those cases, the code 'sr' will be added to the approval grading.
- 3.3.10 It is recommended that the welded assemblies be subjected to a radiographic examination to ascertain if there are any defects in the weld prior to the preparation of test specimens.
- 3.3.11 The test specimens as shown in [Figure 11.3.2: Butt weld test assembly](#) and [Figure 11.3.3: Butt weld test assembly position of impact test specimens](#) are to be prepared from each test assembly.

**Figure 11.3.3: Butt weld test assembly position of impact test specimens**

- 3.3.12 The results of all tensile and impact tests are to comply with the requirements of [Table 11.3.3: Requirements for butt weld tests \(covered electrodes\)](#) as appropriate. The position of fracture in the transverse tensile test is to be reported.

**Table 11.3.3: Requirements for butt weld tests (covered electrodes)**

| Grade<br>(See Note 3)  | Tensile strength<br>N/mm <sup>2</sup> | Bend test ratio: $\frac{D}{t}$ | Charpy V-notch impact tests |                                       |
|------------------------|---------------------------------------|--------------------------------|-----------------------------|---------------------------------------|
|                        |                                       |                                | Test temperature °C         | Average energy (See Note 1) J minimum |
|                        |                                       |                                |                             | All positions (See Note 2)            |
| 1N, 2N, 3N             | 400                                   | 3                              | +20, 0, -20                 | 47 (34)                               |

|  |           |   |      |    |
|--|-----------|---|------|----|
| 5Y55   | 640 – 820 | 5 | –60  | 55 |
| 5Y62   | 700 – 890 | 5 | –60  | 62 |
| 5Y69   | 770 – 940 | 5 | –60  | 69 |
| 1½Ni   | 490       | 3 | –80  | 27 |
| 2¼Ni   | 490       | 3 | –90  | 27 |
| 3½Ni   | 490       | 3 | –100 | 27 |
| 5 Ni   | 540       | 4 | –120 | 27 |
| 9 Ni   | 640       | 4 | –196 | 27 |
| <p><b>Note 1.</b> Energy values from individual impact test specimens are to comply with <a href="#">Ch 11, 1.4 Approval procedures 1.4.3</a>.</p> <p><b>Note 2.</b> Values in ( ) apply only to welds made in the vertical position with upward progression.</p> <p><b>Note 3.</b> Grade 1Y is not applicable to SMAW consumables referenced in <a href="#">Ch 11, 3 Electrodes for manual and gravity welding</a>.</p> |           |   |      |    |

3. 3. 13 The bend test specimens can be considered as complying with the requirements if, after bending, no crack or other open defect exceeding 3 mm in dimensions can be Seen on the outer surface.

### 3. 4 Hydrogen test

3. 4. 1 The hydrogen gradings are specified in [Ch 11, 3.1 Grading 3.1.3](#). The hydrogen grading required determines the method of testing permitted as shown in [Table 11. 3. 4: Permitted methods for obtaining low hydrogen grading](#). Four test specimens are to be prepared and tested, and all four hydrogen test results must be below the maximum value for the hydrogen mark required.

**Table 11. 3. 4: Permitted methods for obtaining low hydrogen grading**

| Hydrogen Grade                    | Permitted Method  |
|-----------------------------------|---|
| H15                               | ISO 3690 (Mercury or Thermal Conductivity Detector Method) Or Glycerine ( <i>See Note</i> ) |
| H10                               | ISO 3690 (Mercury or Thermal Conductivity Detector Method)                                  |
| H5                                | ISO 3690 (Mercury or Thermal Conductivity Detector Method)                                  |
| <b>Note</b> ISO method preferred. |   |

3. 4. 2 The minimum holding time at a given test temperature for Thermal Conductivity Method should be as shown in [Table 11. 3. 5: Temperature and minimum holding time](#).

**Table 11. 3. 5: Temperature and minimum holding time**

| Measuring Method  |                    | Test Temperature (°C) | Minimum Holding Time (h) |
|---|--------------------|-----------------------|--------------------------|
| Thermal Conductivity Method (See Note 1)  | Gas Chromatography | 45                    | 72                       |
|   |                    | 150                   | 6                        |
| <b>Note 1.</b> The use of hot carrier gas extraction method will be specially considered subject to verification of testing procedure to confirm that collection and measurement of the hydrogen occurs continuously until all the diffusible hydrogen is quantified. |                    |                       |                          |

### 3. 5 Fillet weld test assemblies

3. 5. 1 Fillet weld assemblies as shown in [Figure 11. 3. 4: Fillet weld test assembly](#) are to be prepared for each welding position (horizontal-vertical, vertical-upward, vertical-downward or overhead) for which the electrode is recommended by the manufacturer. The grade of steel used for the test assemblies is to be as detailed in [Ch 11, 3.3 Butt weld test assemblies 3.3.4](#). The length of the test assembly,  $L$ , is to be sufficient to allow at least the deposition of the entire length of the largest diameter electrode being tested. Where an electrode is submitted for approval of both butt and fillet welding, approval tests are to include the deposited metal tests as given in [Ch 11, 3.2 Deposited metal test assemblies](#), the butt weld tests as given in [Ch 11, 3.3, Butt weld test assemblies](#), and only one fillet weld test as given in subsequent paragraphs of this sub-Section welded in the horizontal-vertical position.

**Figure 11. 3. 4: Fillet weld test assembly**

3. 5. 2 For Y47 grades, as an alternative to [Figure 11. 3. 4: Fillet weld test assembly](#), the thickness of the plate used for the test assembly may be taken as 50 mm.
3. 5. 3 The electrode sizes to be used are the maximum and minimum diameters recommended by the manufacturer for fillet welding. The first side is to be welded using the maximum diameter. The second side is to be welded only after the assembly has been allowed to cool below 50°C using the minimum diameter. The size of these single run fillet welds will, in general, be determined by the electrode size and the welding current employed during testing and should represent the range of fillet weld bead sizes recommended by the manufacturer.
3. 5. 4 Each test assembly is to be sectioned to form three macro-sections, each about 25 mm thick. These are to be examined for root penetration, satisfactory profile, freedom from cracking and reasonable freedom from porosity and slag inclusions. Any undercut is not to exceed 0.5 mm in depth.

Convexity or concavity of the profile is not to exceed one-tenth of the fillet bead throat dimension. All such observations are to be reported.

**Figure 11. 3. 5: Hardness tests for fillet weld test assembly**

- 3. 5. 5 Hardness measurements are to be made on the central macro-section only, as shown in [Figure 11. 3. 5: Hardness tests for fillet weld test assembly](#). The results are to be reported.
- 3. 5. 6 One of the remaining sections of the assembly is to have the weld on the first side gouged or machined to facilitate breaking the fillet weld on the second side by closing the two plates together, subjecting the root of the weld to tension. On the other remaining section, the weld on the second side is to be gouged or machined and the section fractured using the same procedure. The fractured surfaces are to be examined. They are to show satisfactory penetration, freedom from cracks and reasonable freedom from porosity and this should be reported.

### 3. 6 Electrodes designed for deep penetration welding

- 3. 6. 1 Where an electrode is designed solely for the deep penetration welding of downhand butt joints and horizontal-vertical fillets in normal tensile strength steel, only the tests detailed in [Ch 11, 3.7 Deep penetration butt weld test assemblies](#) and [Ch 11, 3.8 Deep penetration fillet weld test assemblies](#) are required for approval purposes.
- 3. 6. 2 Electrodes designed solely for the deep penetration welding technique will be approved as complying with Grade 1 requirements only and will be given the suffix 'p'.
- 3. 6. 3 Where a manufacturer recommends that an electrode having deep penetrating properties can also be used for downhand butt welding of thicker plates with prepared edges, the electrode will be treated as a normal penetration electrode, and the full series of tests in the downhand position is to be carried out, together with the deep penetration tests given in [Ch 11, 3.7 Deep penetration butt weld test assemblies](#) and [Ch 11, 3.8 Deep penetration fillet weld test assemblies](#).
- 3. 6. 4 Where a manufacturer desires to demonstrate that an electrode, in addition to its use as a normal penetration electrode, also has deep penetrating properties when used for downhand butt welding and horizontal fillet welding, the additional tests given in [Ch 11, 3.7 Deep penetration butt weld test assemblies](#) and [Ch 11, 3.8 Deep penetration fillet weld test assemblies](#) are to be carried out.
- 3. 6. 5 Electrodes approved for both normal and deep penetration welding will have the suffix 'p' added after the appropriate grade mark for normal penetration welding.
- 3. 6. 6 Where the manufacturer prescribes a different welding current and procedure for the electrode when used as a deep penetration electrode and a normal penetration electrode, the recommended current and procedure are to be used when making the test assemblies in each case.

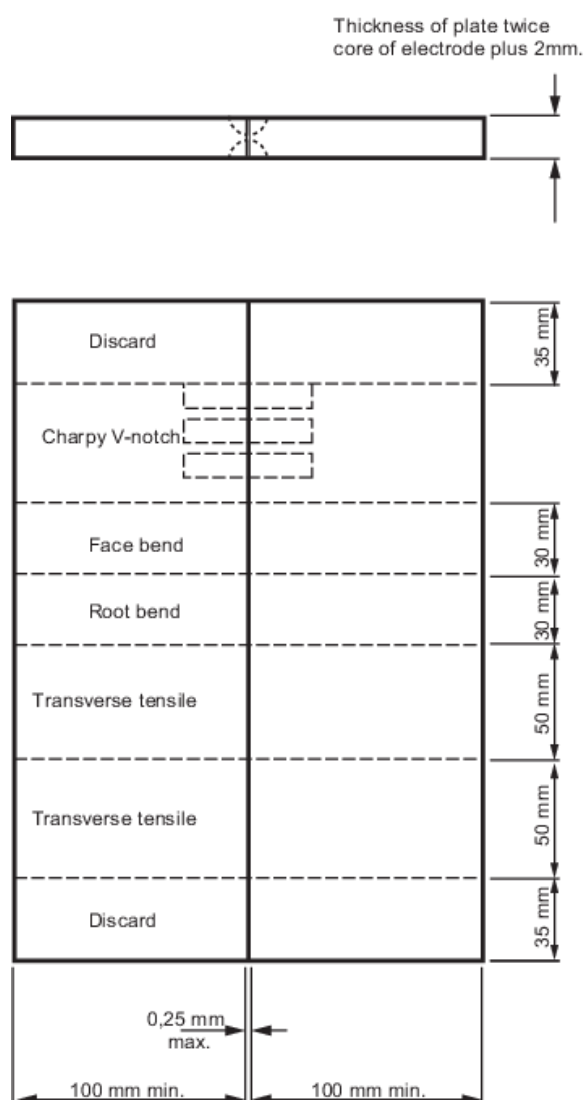

### 3. 7 Deep penetration butt weld test assemblies

- 3. 7. 1 Two plates of thickness equal to twice the diameter of the core of the electrode plus 2 mm are to be butt welded together with one downhand run of welding from each side. The plates are to be

not less than 100 mm wide and of sufficient length to allow the cutting out of the test specimens of the correct number and size as shown in [Figure 11. 3. 6: Deep penetration butt weld test assembly](#). Grade A steel is to be used for these test assemblies. The joint edges are to be prepared square and smooth and, after tacking, the gap is not to exceed 0.25 mm. The test assembly is to be welded using an 8 mm diameter electrode, or the largest diameter manufactured if this is less than 8 mm and the assembly is to be allowed to cool below 50°C between runs.

3. 7. 2 The test specimens as shown in [Figure 11. 3. 3: Butt weld test assembly position of impact test specimens](#) and [Figure 11. 3. 6: Deep penetration butt weld test assembly](#) are to be prepared from each test assembly.

**Figure 11. 3. 6: Deep penetration butt weld test assembly**

3. 7. 3 The results of tensile and impact tests are to comply with the requirements of [Table 11. 3. 3: Requirements for butt weld tests \(covered electrodes\)](#) for Grade 1 electrodes. The position of fracture in the tensile test is to be reported. The bend test specimens are to be in accordance with [Ch 11, 3.3 Butt weld test assemblies 3.3.13](#).
3. 7. 4 The discards at the end of the welded assemblies are to be not more than 35 mm wide. The joints of these discards are to be polished and etched and must show complete fusion and interpenetration of the weld beads. At each cut in the test assembly, the joints are also to be examined to ensure that complete fusion has taken place.

### 3. 8 Deep penetration fillet weld test assemblies

3. 8. 1 A fillet weld assembly is to be prepared as shown in [Figure 11. 3. 7: Deep penetration fillet weld test assembly](#) with plates about 12.5 mm in thickness. The welding is to be carried out with one run for each fillet with plate A in the horizontal plane during the welding operations. The length of the fillet is to be 160 mm and the gap between the plates is to be not more than 0.25 mm. Grade A steel is to be used for these test assemblies.

**Figure 11. 3. 7: Deep penetration fillet weld test assembly**

3. 8. 2 The fillet weld on one side of the assembly is to be carried out with a 4 mm diameter electrode, and that on the other side with the maximum diameter of electrode manufactured. The welding current used is to be within the range recommended by the manufacturer, and the welding is to be carried out using normal welding practice except that the assembly is to be allowed to cool below 50°C between runs.
3. 8. 3 The welded assembly is to be cut by sawing or machining within 35 mm of the ends of the fillet welds, and the joints are to be polished and etched. The welding of the fillet made with a 4 mm diameter electrode is to show a penetration of 4 mm (See [Figure 11. 3. 7: Deep penetration fillet weld test assembly](#)) and the corresponding penetration of the fillet made with the maximum diameter of electrode manufactured is to be reported.

### 3. 9 Electrodes designed for gravity or contact welding

3. 9. 1 Approval for welding using the gravity, 'G', technique is available for welding only normal strength and higher tensile steels up to and including Grade 36.
3. 9. 2 Where an electrode is submitted solely for approval for use in contact welding using automatic gravity or similar welding devices, deposited metal tests, butt weld tests and, where appropriate, fillet weld tests similar to those for normal manual electrodes are to be carried out using the process for which the electrode is recommended by the manufacturer.
3. 9. 3 Where an electrode is submitted for approval for use in contact welding using automatic gravity or similar welding devices in addition to normal manual welding, butt weld and, where appropriate, fillet weld tests, using the gravity or other contact device as recommended by the manufacturer, are to be carried out in addition to the normal approval tests.

### 3. 10 Annual tests

- 3. 10. 1 For normal penetration electrodes, the annual tests are to consist of two deposited metal test assemblies. These are to be prepared and tested in accordance with [Ch 11, 3.2 Deposited metal test assemblies](#). If an electrode is available in one diameter only, one test assembly is sufficient.
- 3. 10. 2 Where an electrode is approved solely for deep penetration welding, the annual test is to consist of one butt welded test assembly. This is to be prepared and tested in accordance with [Ch 11, 3.7 Deep penetration butt weld test assemblies](#).
- 3. 10. 3 Where an electrode is approved for both normal and deep penetration welding, annual tests as detailed in [Ch 11, 3.10 Annual tests 3.10.1](#) and [Ch 11, 3.10 Annual tests 3.10.2](#) are to be carried out.
- 3. 10. 4 Where an electrode is approved solely for gravity or contact welding, the annual test is to consist of one deposited metal test assembly using the gravity or other contact device as recommended by the manufacturer.
- 3. 10. 5 Where an electrode is approved for both manual and gravity welding, annual tests as detailed in [Ch 11, 3.10 Annual tests 3.10.1](#) and [Ch 11, 3.10 Annual tests 3.10.4](#) are to be carried out.
- 3. 10. 6 A hydrogen test is required for Y89 and Y96 grades.

CHAPTER **11 Approval of Welding Consumables**SECTION **4 Wire-flux combinations for submerged-arc automatic welding****4. 1 General**

4. 1. 1 Wire-flux combinations for single and multiple electrode submerged-arc automatic welding, without the use of temporary backing, are divided into the following two categories:
- For use with the multi-run technique.
  - For use with the two-run technique.

Where particular wire-flux combinations are intended for welding with both techniques, tests are to be carried out for each technique.

4. 1. 2 Dependent on the results of mechanical and other tests, approval will be allocated as one of the grades from [Table 11. 1. 1: Welding consumable grades appropriate to structural and low temperature service steel grades](#).
4. 1. 3 The suffixes T or M will be added after the grade mark to indicate approval for the two-run technique or multi-run technique respectively.
4. 1. 4 Wire-flux combinations satisfying the requirements for multi-run or two-run techniques will also be approved for fillet welding in the downhand and horizontal-vertical position, subject to agreement by the manufacturer.
4. 1. 5 If the consumable combination is in compliance with the requirements of the hydrogen test given in [Ch 11, 3.4 Hydrogen test](#), a suffix H15, H10, or H5 will be added to the grade. [Table 11. 4. 1: Minimum low hydrogen approval requirements for wire-flux combinations](#) shows the mandatory levels of low hydrogen approval for the various approval grades.

**Table 11. 4. 1: Minimum low hydrogen approval requirements for wire-flux combinations**

| Approval grade         | 'H' grade for Multi-run | 'H' grade for Two-run |
|------------------------|-------------------------|-----------------------|
| 1 (1N), 2 (2N), 3 (3N) | NR                      | NR                    |
| 1Y, 2Y, 3Y, 4Y         | NR                      | NR                    |
| 2Y40 to 5Y40           | H15                     | NR                    |
| 3Y47                   | H10                     | H15                   |
|                        |                         |                       |
| 3Y42 to 5Y42           | H10                     | H15                   |
| 3Y46 to 5Y46           | H10                     | H10                   |

|  |     |     |
|--|-----|-----|
| 3Y50 to 5Y50   | H10 | H10 |
| 3Y55 to 5Y55   | H5  | H10 |
| 3Y62 to 5Y62   | H5  | H5  |
| 3Y69 to 5Y69   | H5  | H5  |
| 3Y89 to 4Y89   | H5  | H5  |
| 3Y96 to 4Y96   | H5  | H5  |
| $1\frac{1}{2}$ Ni  | H15 | NR  |
| $2\frac{1}{4}$ Ni  | H15 | NR  |
| $3\frac{1}{2}$ Ni  | H15 | NR  |
| 5 Ni ( <i>See Note 2</i> )   | NR  | NR  |
| 9 Ni ( <i>See Note 2</i> )   | NR  | NR  |
| <b>Note 1.</b> NR – Not required. Approval can be obtained when requested.       |     |     |
| <b>Note 2.</b> Assumes use of an austenitic, non-transformable, filler material. |     |     |

4. 1. 6 For each strength level, wire-flux combinations which have satisfied the requirements for a higher toughness grade are considered as complying with the requirements for a lower grade.
4. 1. 7 Wire-flux combinations approved with multi-run technique for normal and higher strength levels up to and including 'Y' are also considered suitable for welding steels in the three strength levels below that for which they have been approved.
4. 1. 8 Wire-flux combinations approved with multi-run technique for strength levels Y40 to Y50, but excluding Y47 are also considered suitable for welding steels in two strength levels below that for which they have been approved.
4. 1. 9 Wire-flux combinations approved with multi-run technique for strength levels Y47, Y55 and above are also considered suitable for welding steels in only one strength level below that for which they have been approved.
4. 1. 10 Wire-flux combinations approved with multi-run technique for strength level Y89 are considered suitable for welding steels only in this strength level.
4. 1. 11 Wire-flux combinations approved with multi-run technique for strength level Y96 are also considered suitable for welding steels in one strength level below that for which they have been approved.
4. 1. 12 Wire-flux combinations with two-run technique approval are not considered suitable for welding steels of any other strength level with that technique, *See [Ch 11, 4.5 Approval tests for two-run technique 4.5.1.](#)*
4. 1. 13 The welding current may be either a.c. or d.c. (electrode positive or negative) according to the recommendation of the manufacturer. If both a.c. and d.c. are recommended, a.c. is to be used for the tests.
4. 1. 14 Wire-flux combinations for multiple electrode submerged-arc welding will be subject to separate approval tests. These are to be carried out generally in accordance with the requirements of this Section.
4. 1. 15 Wire-flux combinations are not naturally low hydrogen in character, but for the lower strength grades of steel low hydrogen testing is not normally a requirement for approval. With higher

strength steels it is more important and [Table 11. 4. 1: Minimum low hydrogen approval requirements for wire-flux combinations](#) shows the mandatory minimum low hydrogen status required for approval of wire-flux combinations.

## 4. 2 Approval tests for multi-run technique

4. 2. 1 Where approval for use with the multi-run technique is requested, deposited metal and butt weld tests are to be carried out.

## 4. 3 Deposited metal test assemblies (multi-run technique)

4. 3. 1 One deposited metal test assembly is to be prepared as shown in [Figure 11. 4. 1: Deposited metal test assembly](#), using any of the grades of steel in [Table 11. 1. 1: Welding consumable grades appropriate to structural and low temperature service steel grades](#) up to a strength level which is not more than two levels above that for which approval is sought.

**Figure 11. 4. 1: Deposited metal test assembly**

4. 3. 2 For Y47 grades, as an alternative to [Figure 11. 4. 1: Deposited metal test assembly](#), the thickness of the plate used for the test assembly may be taken as 50 mm.
4. 3. 3 The bevelling of the plate edges is to be carried out by machining or mechanised gas cutting. In the latter case any remaining scale is to be removed from the bevelled edges.
4. 3. 4 Welding is to be in the downhand position, and the direction of deposition of each run is to alternate from each end of the plate. After completion of each run, the flux and welding slag are to be removed. Between each run, the assembly is to be left in still air until it has cooled to less than 250°C, the temperature being taken in the centre of the weld, on the surface of the seam. The

thickness of the layer is to be not less than the diameter of the wire nor less than 4 mm, unless it is clearly stated as part of the consumable manufacturer's published recommendations.

4. 3. 5 The welding conditions (amperage, voltage and rate of travel) are to be in accordance with the recommendations of the manufacturer and are to conform with normal good welding practice for multi-run welding.
4. 3. 6 The chemical analysis of the deposited weld metal in each test assembly is to be supplied by the manufacturer and is to include the content of all significant alloying elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.
4. 3. 7 Two longitudinal tensile and three impact test specimens are to be taken from each test assembly as shown in [Figure 11. 4. 1: Deposited metal test assembly](#). Care is to be taken that the axes of the tensile test specimens coincide with the centre of the weld and the mid-thickness of the plates. The impact test specimens are to be cut perpendicular to the weld with their axes 10 mm from the upper surface. The notch is to be positioned in the centre of the weld and cut in the face of the test specimen perpendicular to the surface of the plate.
4. 3. 8 In those cases where two-run technique approval is also sought, only one longitudinal tensile specimen need be prepared and tested from this assembly.
4. 3. 9 The results of all tests are to comply with the requirements of [Table 11. 4. 2: Requirements for deposited metal tests \(wire-flux combinations\)](#), as appropriate.

**Table 11. 4. 2: Requirements for deposited metal tests (wire-flux combinations)**

| Grade                           | Yield stress<br>N/mm <sup>2</sup><br>minimum | Tensile strength<br>N/mm <sup>2</sup> | Elongation<br>on 50 mm<br>%<br>minimum | Charpy V-notch impact tests |   |

| 9 Ni   | 400 | 640-790   | 25 | –196 | 34 |
| <b>Note</b> Energy values from individual impact test specimens are to comply with <a href="#">Ch 11, 1.4 Approval procedures 1.4.3.</a> |     |           |    |      |    |

#### 4. 4 Butt weld test assemblies (multi-run technique)

4. 4. 1 One butt weld test assembly is to be prepared as shown in [Figure 11. 4. 2: Butt weld test assembly \(multi-run technique\)](#).
4. 4. 2 The grade of steel used for the preparation of the test assembly are to be as follows:

|                                   |  |
|-----------------------------------|--|
| Grade 1 wire-flux combination     | A  |
| Grade 2 wire-flux combinations    | A, B or D  |
| Grade 3 wire-flux combinations    | A, B, D or E                                     |
| Grade 1Y wire-flux combination    | AH32 or AH36                                     |
| Grade 2Y wire-flux combinations   | AH32, AH36, DH32 or DH36                         |
| Grade 3Y wire-flux combinations   | AH32, AH36, DH32, DH36, EH32 or EH36             |
| Grade 4Y wire-flux combinations   | AH32, AH36, DH32, DH36, EH32, EH36, FH32 or FH36 |
| Grade 2Y40 wire-flux combination  | AH40 or DH40                                     |
| Grade 3Y40 wire-flux combinations | AH40, DH40 or EH40                               |
| Grade 4Y40 wire-flux combinations | AH40, DH40, EH40 or FH40                         |
| Grade 5Y40 wire-flux combinations | AH40, DH40, EH40 or FH40                         |
| Grade 3Y47 wire-flux combinations | EH47   |

Where Grade 32 higher tensile steel is used, the tensile strength is to be not less than 490 N/mm<sup>2</sup>. The chemical composition, including the content of grain refining elements, is to be reported in all cases where higher tensile steel is used.

Figure 11. 4. 2: Butt weld test assembly (multi-run technique)

4. 4. 3 For all other grades, the steel plates used are to be selected by reference to [Table 11. 1. 1: Welding consumable grades appropriate to structural and low temperature service steel grades](#), and are to have at least their chemical composition and tensile properties within the limits specified for that grade in [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#). The strength grade used is to be the same as that for which approval is sought, and the toughness grade is to be no higher than that for which approval is also sought.
4. 4. 4 The plate edges are to be prepared to form a single V-joint, the included angle between the fusion faces being 60° and the root face being 4 mm. The bevelling of the plate edges is to be carried out

by machining or mechanised gas cutting. In the latter case, any remaining scale is to be removed from bevelled edges.

4. 4. 5 Welding is to be carried out in the downhand position by the multi-run technique, and the welding conditions are to be the same as those adopted for the deposited metal test assembly. The back sealing run is to be applied in the downhand position after cutting out the root run to clean metal.
4. 4. 6 It is recommended that the welded assembly be subjected to a radiographic examination to ascertain if there are any defects in the weld prior to the preparation of test specimens.
4. 4. 7 The test specimens as shown in [Figure 11. 3. 3: Butt weld test assembly position of impact test specimens](#) and [Figure 11. 4. 2: Butt weld test assembly \(multi-run technique\)](#) are to be prepared from each test assembly.
4. 4. 8 The results of all tensile and impact tests are to comply with the requirements of [Table 11. 4. 3: Requirements for butt weld tests \(wire-flux combinations\)](#), as appropriate. The position of fracture of the transverse tensile test is to be reported.

**Table 11. 4. 3: Requirements for butt weld tests (wire-flux combinations)**

| Grade                           | Tensile strength<br>N/mm <sup>2</sup> | Bend test<br>ratio: $\frac{D}{t}$ | Charpy V-notch impact tests |  |
|---------------------------------|---------------------------------------|-----------------------------------|-----------------------------|--|

| 2¼Ni  | 490          | 3 | –90  | 27      |
| 3½Ni  | 490          | 3 | –100 | 27      |
| 5 Ni  | 540          | 4 | –120 | 27      |
| 9 Ni  | 640          | 4 | –196 | 27      |
| <p><b>Note 1.</b> Energy values from individual impact test specimens are to comply with <a href="#">Ch 11, 1.4 Approval procedures 1.4.3</a>.</p> <p><b>Note 2.</b> Values in ( ) apply only to two-run technique impact test specimens.</p> |              |   |      |         |

4. 4. 9 The bend test specimens can be considered as complying with the requirements if, after bending, no cracks or other open defects exceeding 3 mm in dimension can be *Seen* on the outer surface.

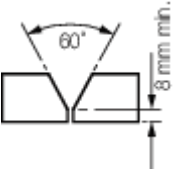

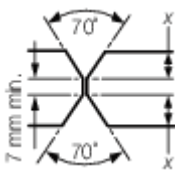

## 4. 5 Approval tests for two-run technique

4. 5. 1 Where approval for use with the two-run technique is requested, two butt weld test assemblies are to be prepared and tested using plates of the strength level for which approval is required. Each strength level requires separate approval.
4. 5. 2 Two welded assemblies are to be made from a pair of plates of matching thicknesses. The thickness of the thicker pair of plates will be the maximum for which the approval is valid. The second assembly is to be welded from plates having approximately half of the thickness of the first assembly.

## 4. 6 Butt weld test assemblies (two-run technique)

4. 6. 1 The grade of steel used for the preparation of the test assemblies is not to be of any higher grade (impact toughness) than that for which approval is required. The chemical composition, including the content of grain refining elements, and the strength properties of the plates used, are to be reported.
4. 6. 2 The maximum diameter of wire and the edge preparation to be used are to be in accordance with [Table 11. 4. 4: Butt weld assembly preparation](#). Small deviations in the edge preparation may be allowed if requested by the manufacturer. The bevelling of the plate edges is to be performed by machining or mechanized gas cutting. In the latter case, any remaining scale is to be removed from the bevelled edges. The root gap should not exceed 0.7 mm.

**Table 11. 4. 4: Butt weld assembly preparation**

| Plate thickness mm | Recommended edge preparation  | Maximum diameter of wire mm |
|--------------------|---|-----------------------------|
| 12.5               |  | 5                           |
| 20–25              |  | 6                           |
| 35–40              |  | 7                           |

4. 6. 3 Each butt weld is to be welded in two runs, one from each side, using amperages, voltages and travel speeds in accordance with the recommendations of the manufacturer and normal good welding practice. After completion of the first run, the flux and welding slag are to be removed and the assembly is to be left in still air until it has cooled to less than 100°C, the temperature being taken in the centre of the weld, on the surface of the seam.
4. 6. 4 It is recommended that the butt weld assemblies be subjected to radiographic examination to ascertain if there are any defects in the weld prior to the preparation of test specimens.

4. 6. 5 The test specimens, as shown in [Figure 11. 4. 3: Butt weld test assembly \(two-run technique\)](#) and [Figure 11. 4. 4: Butt weld test assembly \(two-run technique\): position of impact test specimens](#), are to be prepared from each test assembly, except as detailed in [Ch 11, 4.6 Butt weld test assemblies \(two-run technique\) 4.6.8](#). The edges of two of the discards are to be polished and etched, and must show complete fusion and inter-run penetration of the welds. At each cut in the test assembly, the edges are also to be examined to ensure that complete fusion has taken place.

**Figure 11. 4. 3: Butt weld test assembly (two-run technique)**

**Figure 11. 4. 4: Butt weld test assembly (two-run technique): position of impact test specimens**

4. 6. 6 The results of transverse tensile and impact tests are to comply with the requirements of [Table 11. 4. 3: Requirements for butt weld tests \(wire-flux combinations\)](#) as appropriate. The position of fracture of the transverse tensile tests is to be reported.
4. 6. 7 The bend test specimens can be considered as complying with the requirements if, after bending, no crack or other open defects exceeding 3 mm in dimensions can be *Seen* on the outer surface. One of the specimens from each assembly is to be tested with the side first welded in tension, and the second specimen with the other side in tension.
4. 6. 8 The longitudinal tensile specimen shown in [Figure 11. 4. 3: Butt weld test assembly \(two-run technique\)](#) is to be prepared from the thicker assembly, even in those cases where multi-run technique approval is also sought. This test specimen is to be machined to the dimensions shown in [Ch 11, 2.1 Dimensions of test specimens 2.1.1](#) and the longitudinal axis is to coincide with the centre of the weld about 7 mm below the plate surface on the side from which the second run is made. The test specimen may be given a hydrogen release treatment in accordance with [Ch 11, 2.1 Dimensions of test specimens 2.1.1](#). The results of this test are to comply with the requirements of [Table 11. 4. 2: Requirements for deposited metal tests \(wire-flux combinations\)](#).
4. 6. 9 The chemical analysis of the weld metal of the second run in each assembly is to be determined and reported. This is to include the content of all significant elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

## 4. 7 Annual tests

4. 7. 1 Annual tests are to consist of at least the following:
  - a. For wire-flux combinations approved for the multi-run technique, one deposited metal test assembly.
  - b. For wire-flux combinations approved for the two-run technique, one butt weld test assembly using plate material 20 to 25 mm in thickness. For Y47, the thickness of plate material may be taken as 50 mm.

- c. A hydrogen test for Y89 and Y96 grades.
- 4. 7. 2 The deposited metal assemblies are to be prepared and tested in accordance with [Ch 11, 4.3 Deposited metal test assemblies \(multi-run technique\)](#), except that only one longitudinal tensile, three impact test specimens and a chemical analysis are required.
- 4. 7. 3 The butt weld test assemblies are to be prepared and tested in accordance with [Ch 11, 4.6 Butt weld test assemblies \(two-run technique\)](#), except that only one transverse tensile, two bend, three impact test specimens and a chemical analysis are required. One longitudinal tensile test specimen is also to be prepared where the wire-flux combination is approved solely for the two-run technique.
- 4. 7. 4 Where a wire-flux combination is approved for welding a range of steels with different specified minimum strength levels, steel of the highest strength approved is to be used for the preparation of the butt weld assembly required by [Ch 11, 4.7 Annual tests 4.7.1.b](#).

CHAPTER **11 Approval of Welding Consumables**SECTION **5 Wires and wire-gas combinations for manual, semi-automatic and automatic welding****5. 1 General**

5. 1. 1 Wire-gas combinations and flux-cored or flux-coated wires (for use with or without a shielding gas) are divided into the following categories for the purposes of approval testing:
  - a. For use in manual multi-run welding with the inert gas tungsten arc welding process (GTAW).
  - b. For use in semi-automatic multi-run metal arc welding.
  - c. For use in single electrode multi-run automatic metal arc and GTAW welding.
  - d. For use in single electrode two-run automatic metal arc and GTAW welding.
5. 1. 2 The term 'manual' is used to describe the technique where the gas-shielded tungsten arc torch is held in one hand and the filler is added separately by the other hand.
5. 1. 3 The term 'semi-automatic' is used to describe processes in which the weld is made manually by a welder holding a gun through which the wire is continuously fed.
5. 1. 4 In the GTAW process, 'automatic' refers to the fully mechanized control and application of both torch and separate filler wire.
5. 1. 5 Dependent on the results of mechanical and other tests, approval will be allocated as one of the grades from [Table 11. 1. 1: Welding consumable grades appropriate to structural and low temperature service steel grades](#).
5. 1. 6 A suffix S will be added after the grade mark to indicate approval for semi-automatic multi-run welding.
5. 1. 7 For wires intended for automatic welding, the suffixes T or M will be added after the grade mark to indicate approval for two-run or multi-run welding techniques, respectively.
5. 1. 8 For wires intended for both semi-automatic and automatic welding, the suffixes will be added in combination.
5. 1. 9 Solid wire-gas combinations are considered naturally low hydrogen in character and qualify for 'H15' approval without testing. This is not so for cored wires and continuous coated wires which must be tested if there is a need for low hydrogen approval. For the lower strength grades of steel, low hydrogen testing is not normally a requirement for approval. With higher strength steels, it is more important and [Table 11. 5. 1: Minimum low hydrogen approval requirements for wires and wire-gas combinations](#) shows the mandatory minimum low hydrogen status required for approval of wire-gas combinations.
5. 1. 10 The testing methods to be used for low hydrogen approval are to be in accordance with [Ch 11, 3.4 Hydrogen test](#), modified to use the manufacturer's recommended welding conditions and adjusting the deposition rate to give a weld deposit weight per sample similar to that deposited when using manual electrodes.

5. 1. 11 Where applicable, the approved combination will name either the specific gas composition or its trade name, but in either case the composition of the shielding gas is to be reported. Unless otherwise agreed, additional approval tests are required when a shielding gas is used other than that used for the original approval tests. However a wire and gas combination approved with an argon/carbon dioxide shielding gas where the carbon dioxide is between 15-25 per cent is also approved for other combinations of argon/carbon dioxide, provided the carbon dioxide content is within the range 15-25 per cent. The range of approval is limited to ferritic consumables in solid wire, flux cored and coated wire forms and subject to the agreement of the consumable manufacturer and ACS.
5. 1. 12 Wires and wire-gas combinations for multiple electrode automatic welding will be subject to separate approval tests. Any proposals are to be submitted for consideration.
5. 1. 13 Wires and wire-gas combinations approved with multi-run technique for normal and higher strength levels up to and including 'Y' are also considered suitable for welding steels in the three strength levels below that for which they have been approved.
5. 1. 14 Wires and wire-gas combinations approved with multi-run technique for strength levels Y40 to Y50, but excluding Y47 are also considered suitable for welding steels in two strength levels below that for which they have been approved.
5. 1. 15 Wires and wire-gas combinations approved with multi-run technique for strength levels Y47, Y55 and above are also considered suitable for welding steels in only one strength level below that for which they have been approved.
5. 1. 16 Wires and wire-gas combinations approved with multi-run technique for strength level Y89 are considered suitable for welding steels only in this strength level.
5. 1. 17 Wires and wire-gas combinations approved with multi-run technique for strength level Y96 are also considered suitable for welding steels in one strength level below that for which they have been approved.
5. 1. 18 Wires and wire-gas combinations with two-run technique approval are not considered suitable for welding steels of any other strength level with that technique, See [Ch 11, 5.4 Approval tests for two-run automatic welding 5.4.1.](#)

**Table 11. 5. 1: Minimum low hydrogen approval requirements for wires and wire-gas combinations**

| Approval grades        | 'H' grade for m and S techniques | 'H' grade for M technique | 'H' grade for T technique |
|------------------------|----------------------------------|---------------------------|---------------------------|
| 1 (1N), 2 (2N), 3 (3N) | NR                               | NR                        | NR                        |
| 1Y, 2Y, 3Y, 4Y         | H15 ( <i>See Note 2</i> )        | NR                        | NR                        |
| 2Y40 to 5Y40           | H15                              | H15                       | NR                        |
| 3Y47                   | H10                              | H10                       | H10                       |
| 3Y42 to 5Y42           | H10                              | H10                       | H15                       |
| 3Y46 to 5Y46           | H10                              | H10                       | H15                       |
| 3Y50 to 5Y50           | H10                              | H10                       | H10                       |
| 3Y55 to 5Y55           | H5                               | H5                        | H10                       |
| 3Y62 to 5Y62           | H5                               | H5                        | H5                        |

|   |                 |     |    |
|---|-----------------|-----|----|
| 3Y69 to 5Y69  | H5              | H5  | H5 |
| 3Y89 to 4Y89  | H5              | H5  | H5 |
| 3Y96 to 4Y96  | H5              | H5  | H5 |
| $1\frac{1}{2}$ Ni   | H15             | H15 | NR |
| $2\frac{1}{4}$ Ni   | H15             | H15 | NR |
| $3\frac{1}{2}$ Ni   | H15             | H15 | NR |
| 5 Ni  | NR (See Note 3) | NR  | NR |
| 9 Ni  | NR (See Note 3) | NR  | NR |
| <p><b>Note 1.</b> NR – Not required. Approval may be obtained when requested.</p> <p><b>Note 2.</b> Optional in this case. If low hydrogen approval is not obtained, there is a limitation on the carbon equivalent of the steel which is permitted to be welded.</p> <p><b>Note 3.</b> Assumes use of an austenitic, non-transformable, filler material.</p> |                 |     |    |

## 5.2 Approval tests for manual and semi-automatic multi-run welding

- 5.2.1 Approval tests for manual (GTAW) and semi-automatic multi-run welding are to be carried out generally in accordance with the requirements of [Ch 11, 3 Electrodes for manual and gravity welding](#), except as required by [Ch 11, 5.2, Approval tests for manual and semi-automatic multi-run welding](#), using the respective technique for the preparation of all test assemblies.
- 5.2.2 Two deposited metal test assemblies are to be prepared in the downhand position as shown in [Figure 11.3.1: Deposited metal test assembly](#), one using the smallest diameter, and the other using the largest diameter of wire for which approval is required. Where only one diameter is manufactured, only one deposited metal assembly is to be prepared.
- 5.2.3 For Y47 grades, as an alternative to [Figure 11.3.1: Deposited metal test assembly](#) to [Figure 11.3.4: Fillet weld test assembly](#), the thickness of the plate used for the test assembly may be taken as 50 mm.
- 5.2.4 The weld metal is to be deposited according to the practice recommended by the manufacturer, and the thickness of each layer of weld metal is to be between 2 mm and 6 mm, unless it is clearly stated as part of the consumable manufacturer's published recommendations.
- 5.2.5 The chemical analysis of the deposited weld metal in each test assembly is to be supplied by the manufacturer and is to include the content of all significant alloying elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.
- 5.2.6 Butt weld assemblies as shown in [Figure 11.3.2: Butt weld test assembly](#) are to be prepared for each welding position for which the wire is to be approved. In the case of approvals for normal and higher strength steels (up to 355 N/mm<sup>2</sup> minimum specified yield strength), tests satisfying the requirements in both the downhand and vertical-upward positions will be considered as having also satisfied the requirements for the horizontal-vertical position. In all other cases, approval in the horizontal-vertical position will require a butt weld to be made in that position and be fully tested.
- 5.2.7 The downhand assembly is to be welded using, for the first run, wire of the smallest diameter to be approved and, for the remaining runs, wire of the largest diameter to be approved.

- 5. 2. 8 Where approval is requested only in the downhand position, an additional butt weld assembly is to be prepared in that position using, if possible, wires of different diameter from those required by [Ch 11, 5.2 Approval tests for manual and semi-automatic multi-run welding 5.2.7](#). If only one wire diameter is to be approved, this second downhand butt weld should be made using either larger or smaller beads than the first assembly.
- 5. 2. 9 The butt weld assemblies, in positions other than downhand, are to be welded using, for the first run, wire of the smallest diameter to be approved, and for the remaining runs, the largest diameter of wire recommended by the manufacturer for the position concerned.
- 5. 2. 10 Fillet weld test assemblies as detailed in [Ch 11, 3.5, Fillet weld test assemblies](#) are to be prepared, examined and tested.
- 5. 2. 11 Low hydrogen approval tests are to be carried out if required by [Ch 11, 5.1 General 5.1.9](#).
- 5. 2. 12 Test specimens from each assembly are to be prepared and tested in accordance with the requirements of [Ch 11, 3.2 Deposited metal test assemblies](#) and [Ch 11, 3.3, Butt weld test assemblies](#).

### 5. 3 Approval tests for multi-run automatic welding

- 5. 3. 1 Approval tests for multi-run automatic welding are to be carried out generally in accordance with the requirements of [Ch 11, 4 Wire-flux combinations for submerged-arc automatic welding](#), except as required by [Ch 11, 5.3 Approval tests for multi-run automatic welding](#), using the multi-run automatic welding technique for the preparation of all test assemblies.
- 5. 3. 2 One deposited metal test assembly is to be prepared as shown in [Figure 11. 4. 1: Deposited metal test assembly](#). Welding is to be as detailed in [Ch 11, 4.3 Deposited metal test assemblies \(multi-run technique\) 4.3.4](#), except that the thickness of each layer is to be not less than 3 mm, unless it is clearly stated as part of the consumable manufacturer's published recommendations.
- 5. 3. 3 For Y47 grades, as an alternative to [Figure 11. 4. 1: Deposited metal test assembly](#) and [Figure 11. 4. 2: Butt weld test assembly \(multi-run technique\)](#), the thickness of the plate used for the test assembly may be taken as 50 mm.
- 5. 3. 4 One butt weld test assembly is to be prepared as shown in [Figure 11. 4. 2: Butt weld test assembly \(multi-run technique\)](#) for each welding position to be approved for the automatic multi-run technique.
- 5. 3. 5 Test specimens from each test assembly are to be prepared and tested in accordance with the requirements of [Ch 11, 4 Wire-flux combinations for submerged-arc automatic welding](#) for multi-run submerged-arc automatic welding.
- 5. 3. 6 Low hydrogen approval tests are to be made if required by [Ch 11, 5.1 General 5.1.9](#).
- 5. 3. 7 At the discretion of ACS, wires approved for semi-automatic welding in the downhand position may also be approved without additional tests, for use in multi-run automatic welding.

### 5. 4 Approval tests for two-run automatic welding

- 5. 4. 1 Approval tests for two-run automatic welding are to be carried out generally in accordance with the requirements of [Ch 11, 4 Wire-flux combinations for submerged-arc automatic welding](#), except as required by [Ch 11, 5.4, Approval tests for two-run automatic welding](#), using the two-run automatic welding technique for the preparation of all test assemblies. Two butt weld test assemblies are to be prepared and tested using plates of the strength level for which approval is required. Each strength level requires separate approval.

5. 4. 2 Two butt weld test assemblies are to be prepared generally as detailed in [Ch 11, 4.5, Approval tests for two-run technique](#) and [Ch 11, 4.6 Butt weld test assemblies \(two-run technique\)](#) using plates 12 to 15 mm and 20 to 25 mm in thickness.
5. 4. 3 If approval is requested for welding plate thicker than 25 mm, one assembly is to be prepared using plates approximately 20 mm in thickness and the other using plates of the maximum thickness for which approval is requested.
5. 4. 4 The edge preparation of the test assemblies is to be as shown in [Figure 11. 5. 1: Normal edge preparation for two-run butt weld test assemblies specimens](#). Small deviations in edge preparation may be allowed, if these form part of the consumable manufacturer's recommendations. For assemblies using plates over 25 mm in thickness, the edge preparation is to be reported for information.
5. 4. 5 The diameters of wires used are to be in accordance with the recommendations of the manufacturer and are to be reported.
5. 4. 6 Test specimens from each butt weld assembly are to be prepared and tested in accordance with the requirements of [Ch 11, 4 Wire-flux combinations for submerged-arc automatic welding](#) for two-run submerged-arc automatic welding.
5. 4. 7 The weld metal chemical analysis is to be reported as in [Ch 11, 4.6 Butt weld test assemblies \(two-run technique\) 4.6.9](#). The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

**Figure 11. 5. 1: Normal edge preparation for two-run butt weld test assemblies specimens**

## 5. 5 Annual tests

5. 5. 1 Annual tests are to consist of at least the following:
  - a. Wires approved for manual welding or semi-automatic welding or either of these combined with approval for automatic multi-run welding:
 

one deposited metal test assembly prepared in accordance with [Ch 11, 5.2, Approval tests for manual and semi-automatic multi-run welding](#) using a wire of diameter within the approved range.
  - b. Wire approved for automatic multi-run welding:
 

one deposited metal test assembly prepared in accordance with [Ch 11, 5.3 Approval tests for multi-run automatic welding](#) using a wire of diameter as stated in (a).

|                |           |   |
|----------------|-----------|---|
| <b>PART</b>    | <b>2</b>  | <b>Rules for the Manufacture, Testing and Certification of Materials</b>                |
| <b>CHAPTER</b> | <b>11</b> | <b>Approval of Welding Consumables</b>  |
| <b>SECTION</b> | <b>5</b>  | <b>Wires and wire-gas combinations for manual, semi-automatic and automatic welding</b> |

---

- c. Wires approved for two-run automatic welding:  
one butt weld test assembly prepared in accordance with [Ch 11, 5.4, Approval tests for two-run automatic welding](#) using plates 20 to 25 mm in thickness or the maximum approved thickness.  
The diameter of wire used is to be reported.
- d. A hydrogen test for Y89 and Y96 grades.

CHAPTER **11 Approval of Welding Consumables**SECTION **6 Consumables for use in electro-slag and electro-gas welding****6.1 General**

- 6.1.1 The requirements for the approval of consumables used for electro-slag or electro-gas welding (including consumable nozzles, where applicable) are generally as detailed in [Ch 11, 4 Wire-flux combinations for submerged-arc automatic welding](#) for two-run submerged-arc welding consumables, except as otherwise detailed in this Section.
- 6.1.2 For each grade, approval may be restricted for use with specific compositional types of steel. For Grades 1Y, 2Y, 3Y, 4Y, 2Y40, 3Y40 and 4Y40 this will normally be in respect of the grain refining element content, and tests on niobium grain refined steel will normally qualify for use also on steels treated with aluminium or vanadium or combinations of these elements.
- 6.1.3 Superscript numbers are applied to the 'Y' of higher strength steel consumables, e.g. 2Y<sup>1</sup>, to indicate the type of parent steel for which approval is applicable as follows:
  - Y<sup>1</sup> approval Grade for higher strength steel is limited to parent steel which has been treated only with aluminium.
  - Y<sup>2</sup> approval Grade for higher strength steel is appropriate to niobium-treated steels, whether aluminium treated or not. It also covers steels treated only with aluminium.
- 6.1.4 Each strength level requires separate approval involving the welding and testing of two butt weld assemblies of different thickness. The greater thickness will determine the maximum approved thickness.

**6.2 Butt weld test assemblies**

- 6.2.1 Two butt weld test assemblies are to be prepared, one with plates 20 to 25 mm in thickness and the other with plates 35 to 40 mm in thickness. The steel used is not to be of any higher grade (impact toughness) than that for which approval is required. The limitations of [Ch 11, 6.1 General 6.1.2](#) need to be considered in this Section. The chemical composition of the plate, including the content of grain refining elements, is to be reported.
- 6.2.2 The welding conditions and the edge preparation adopted are to be in accordance with the recommendations of the manufacturer and are to be reported in detail. The manufacturer's maximum recommended gap between plates is to be used in making the test assemblies.
- 6.2.3 It is recommended that the assemblies are subjected to radiographic examination to identify any defects before the preparation of any test specimens.
- 6.2.4 Test specimens as follows, and as shown in [Figure 11.6.1: Butt weld test assembly for electro-slag or electro-gas welding](#), are to be prepared from each test assembly:

|                |           |  |
|----------------|-----------|--|
| <b>PART</b>    | <b>2</b>  | <b>Rules for the Manufacture, Testing and Certification of Materials</b> |
| <b>CHAPTER</b> | <b>11</b> | <b>Approval of Welding Consumables</b>                                   |
| <b>SECTION</b> | <b>6</b>  | <b>Consumables for use in electro-slag and electro-gas welding</b>       |

---

- a. Two longitudinal tensile test specimens.
- b. Two transverse tensile test specimens.
- c. Two bend test specimens.
- d. Two macro-sections.
- e. Two sets of three impact test specimens notched in accordance with [Figure 11. 6. 2: Position of Charpy V-notch impact test specimens](#).

**Figure 11. 6. 1: Butt weld test assembly for electro-slag or electro-gas welding**

6. 2. 5 The chemical analysis of the weld metal in each assembly is to be determined and reported. This is to be supplied by the manufacturer and is to include the content of all significant elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.
6. 2. 6 The results of all transverse tensile and impact tests are to comply with the requirements given in [Table 11. 4. 3: Requirements for butt weld tests \(wire-flux combinations\)](#) as appropriate. The

position of fracture of the transverse tensile test is to be reported. The Charpy V-notch impact test requirements are as for the two-run technique in [Table 11. 4. 3: Requirements for butt weld tests \(wire-flux combinations\)](#).

- 6. 2. 7 The results of all longitudinal tensile tests are to comply with the requirements of [Table 11. 4. 2: Requirements for deposited metal tests \(wire-flux combinations\)](#).
- 6. 2. 8 The bend test specimens are to be in accordance with [Ch 11, 4.6 Butt weld test assemblies \(two-run technique\)](#) 4.6.7 and [Table 11. 4. 3: Requirements for butt weld tests \(wire-flux combinations\)](#). Each surface of the weld is to be tested in tension.

**Figure 11. 6. 2: Position of Charpy V-notch impact test specimens**

### 6. 3 Annual tests

- 6. 3. 1 Annual tests are to consist of at least one butt weld test assembly using plate material 20 to 25 mm in thickness.
- 6. 3. 2 The assembly is to be prepared and tested in accordance with [Ch 11, 6.2 Butt weld test assemblies](#) except that only the following tests are required:
  - a. One longitudinal tensile test.
  - b. One transverse tensile test.
  - c. Two bend tests.
  - d. Two sets of three Charpy V-notch impact tests; one set with the notch at the centre of the weld ([Figure 11. 6. 2: Position of Charpy V-notch impact test specimens](#), (1) In the centre of the weld metal), and one set with the notch in the weld metal 2 mm from the fusion line ([Figure 11. 6. 2: Position of Charpy V-notch impact test specimens](#), (2) In the weld metal, 2 mm from the fusion line).
  - e. Chemical analysis.
  - f. One macro-section.

|                |           |  |
|----------------|-----------|--|
| <b>PART</b>    | <b>2</b>  | <b>Rules for the Manufacture, Testing and Certification of Materials</b> |
| <b>CHAPTER</b> | <b>11</b> | <b>Approval of Welding Consumables</b>                                   |
| <b>SECTION</b> | <b>6</b>  | <b>Consumables for use in electro-slag and electro-gas welding</b>       |

---

- 6.3.3 Where a consumable or combination is approved for a range of steels with different specified minimum strength levels, steel of the highest strength level is to be used for the preparation for the assembly required by [Ch 11, 6.3 Annual tests 6.3.1](#).

PART

# 2

CHAPTER **11 Approval of Welding Consumables**

SECTION **7 Consumables for use in one-side welding with temporary backing materials**

## 7.1 General

- 7.1.1 The requirements for approval of combinations including temporary backing material, for use in one-side welding techniques, are dependent on the technique used and which basic technique it most closely follows. The following are provided for:
  - a. Technique m — for manual electrode/backing combinations.
  - b. Technique S — for wire-gas/backing combinations used with semi-automatic multi-run technique.
  - c. Technique M — for wire-flux or wire-gas in combination with backing material (and maybe supplementary filler materials) used with an automatic multi-run technique.
  - d. Technique A — as for M but using a procedure with a high heat input rate (large bead size relative to thickness welded). This would apply to welds made by four or less runs in 20 mm thickness, or eight or less runs in 35 mm.
- 7.1.2 For technique m, S or M, a single butt weld is to be made in plate of 20–25 mm thickness. For technique A, two butt welds are to be made, one in plate of the maximum thickness recommended by the manufacturer, the other in plate of approximately half the thickness of the first. Usually this will involve thicknesses in the region of 35–40 mm and 20–25 mm respectively.
- 7.1.3 A wire and gas combination approved with an argon/carbon dioxide shielding gas where the carbon dioxide content is between 15-25 per cent is also approved for other combinations of argon/carbon dioxide, provided the carbon dioxide content is within the range 15-25 per cent. The range of approval is limited to ferritic consumables in solid wire, flux cored and coated wire forms and subject to the agreement of the consumable manufacturer and ACS.
- 7.1.4 Any unrecognised techniques or unusual combinations will be considered for approval subject to a test programme to be agreed based on the details of the technique and combination which are to be submitted in advance.
- 7.1.5 Where low hydrogen approval is required either by [Table 11. 7. 1: Minimum low hydrogen approval requirements for one-side welding with combinations including temporary backing material](#) or by the manufacturer, it should be noted that this will generally be achieved through separate testing of:
  - a. the backing material, and
  - b. the welding electrode or combination of wire-flux or wire-gas.
- 7.1.6 The hydrogen potential of the backing material is to be determined using the modified Gayley-Wooding method which expresses the total hydrogen content as water by weight per cent. The qualifying levels are:

To qualify as: H<sub>2</sub>O g/100g sample

H15 0.5

H10 0.3

H5 0.2

7. 1. 7 The sampling and approval of the combinations without the backing are to follow the general requirements of [Ch 11, 3 Electrodes for manual and gravity welding](#), [Ch 11, 4 Wire-flux combinations for submerged-arc automatic welding](#) or [Ch 11, 5 Wires and wire-gas combinations for manual, semi-automatic and automatic welding](#), as appropriate.

**Table 11. 7. 1: Minimum low hydrogen approval requirements for one-side welding with combinations including temporary backing material**

| Approval grades   | 'H' grade for m and S techniques | 'H' grade for M technique | 'H' grade for A technique |
|---|----------------------------------|---------------------------|---------------------------|
| 1 (1N), 2 (2N), 3 (3N)  | NR                               | NR                        | NR                        |
| 1Y, 2Y, 3Y, 4Y  | H15 ( <i>See Note 2</i> )        | NR                        | NR                        |
| 2Y40 to 5Y40  | H15                              | H15                       | NR                        |
| 3Y47  | H10                              | H10                       | H15                       |
| 3Y42 to 5Y42  | H10                              | H10                       | H15                       |
| 3Y46 to 5Y46  | H10                              | H10                       | H15                       |
| 3Y50 to 5Y50  | H10                              | H10                       | H10                       |
| 3Y55 to 5Y55  | H5                               | H5                        | H10                       |
| 3Y62 to 5Y62  | H5                               | H5                        | H5                        |
| 3Y69 to 5Y69  | H5                               | H5                        | H5                        |
| 3Y89 to 4Y89  | H5                               | H5                        | H5                        |
| 3Y96 to 4Y96  | H5                               | H5                        | H5                        |
| $1\frac{1}{2}$ Ni   | H15                              | H15                       | NR                        |
| $2\frac{1}{4}$ Ni   | H15                              | H15                       | NR                        |
| $3\frac{1}{2}$ Ni   | H15                              | H15                       | NR                        |
| 5 Ni ( <i>See Note 3</i> )  | NR                               | NR                        | NR                        |
| 9 Ni ( <i>See Note 3</i> )  | NR                               | NR                        | NR                        |
| <p><b>Note 1.</b> NR – Not required. Approval may be obtained when requested.</p> <p><b>Note 2.</b> Optional in this case. If low hydrogen approval is not obtained, there is a limitation on the carbon equivalent of the steel which is permitted to be welded.</p> <p><b>Note 3.</b> Assumes the use of an austenitic, non-transformable, filler material.</p> |                                  |                           |                           |

- 7. 1. 8 Combinations approved with multi-run technique (m, S and M) for normal and higher strength levels up to and including 'Y' are also considered suitable for welding steels in the three strength levels below that for which they have been approved.
- 7. 1. 9 Combinations approved with multi-run technique (m, S and M) for strength levels Y40 to Y50, but excluding Y47, are also considered suitable for welding steels in two strength levels below that for which they have been approved.
- 7. 1. 10 Combinations approved with multi-run technique (m, S and M) for strength levels Y47, Y55 and above are also considered suitable for welding steels in only one strength level below that for which they have been approved.
- 7. 1. 11 Combinations approved with multi-run technique (m, S and M) for strength level Y89 are considered suitable for welding steels in only this strength level.
- 7. 1. 12 Combinations approved with multi-run technique (m, S and M) for strength level Y96 are also considered suitable for welding steels in one strength level below that for which they have been approved.
- 7. 1. 13 Combinations approved for the 'A' multi-run technique are not considered suitable for welding steels of any other strength level with that technique.

## 7. 2 Approval tests for manual (m), semi-automatic (S) and automatic multi-run (M) techniques

- 7. 2. 1 For each position to be approved, one butt weld assembly is to be prepared using plates of 20 — 25 mm thickness as shown in [Figure 11. 7. 1: Butt weld test assembly and specimens for all techniques](#). The grade of plate used is to be no higher in toughness than that for which approval is required. The strength is to be appropriate to the grade for which welding approval is requested.
- 7. 2. 2 The thickness of test assembly may be taken as 50 mm for Y47 base material.

**Figure 11. 7. 1: Butt weld test assembly and specimens for all techniques**

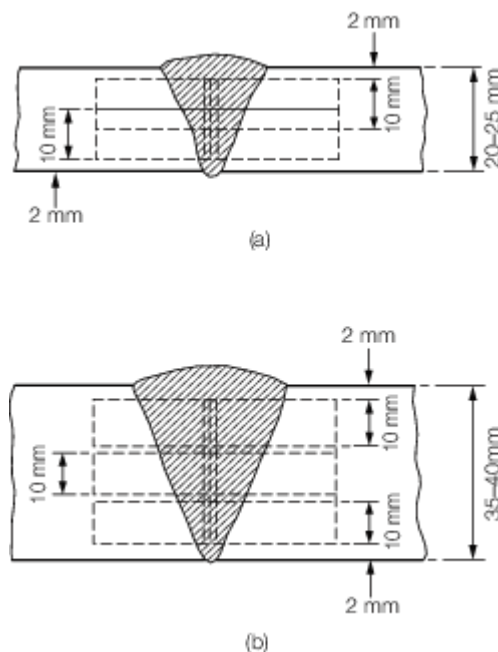

Note See [Figure 11. 7. 2: Position of Charpy V-notch impact tests for one-side automatic welding](#)

- 7. 2. 3 The edge preparation and welding conditions are to be in accordance with the recommendations of the manufacturers. For the m and S techniques, the assembly is to be welded using, for the first run wire of the smallest diameter recommended by the manufacturer and, for the remaining runs, wire of the largest diameter to be approved. For the M technique any size wire as recommended by the manufacturer can be used.

- 7.2.4 Test specimens are to be prepared as shown in [Figure 11.7.1: Butt weld test assembly and specimens for all techniques](#) and [Figure 11.7.2: Position of Charpy V-notch impact tests for one-side automatic welding](#):
- One longitudinal tensile test specimen (from the centre of the weld).
  - Two transverse tensile specimens.
  - Two bend test specimens, one with the face in tension, the other with the root in tension.
  - One macrosection.
  - Two sets of three Charpy impact test specimens positioned and notched in accordance with [Figure 11.7.2: Position of Charpy V-notch impact tests for one-side automatic welding](#).

**Figure 11.7.2: Position of Charpy V-notch impact tests for one-side automatic welding**

- 7.2.5 The results of all transverse tensile, bend and impact tests are to comply with the requirements in [Table 11.3.3: Requirements for butt weld tests \(covered electrodes\)](#) for m and S technique, and [Table 11.3.4: Permitted methods for obtaining low hydrogen grading](#) for M technique. The position of fracture of the transverse tensile test is to be reported. The appearance of the bend test specimens is to be in accordance with [Ch 11, 3.3 Butt weld test assemblies 3.3.13](#).
- 7.2.6 The results of all longitudinal tensile tests are to comply with the requirements in [Table 11.3.2: Requirements for deposited metal tests \(covered electrodes\)](#).
- 7.2.7 Low hydrogen approval is required in accordance with [Table 11.7.1: Minimum low hydrogen approval requirements for one-side welding with combinations including temporary backing material](#).
- 7.2.8 Chemical analyses are to be made and reported from positions corresponding to the weld metal in the upper and lower Charpy specimens of the downhand butt weld. These are to be supplied by the manufacturer and are to include the content of all significant elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

### 7.3 Approval tests for high heat input automatic (A) techniques

- 7.3.1 Two butt weld assemblies are to be prepared, usually one of 35–40 mm thickness, the other 20–25 mm, as shown in [Figure 11.7.1: Butt weld test assembly and specimens for all techniques](#),

noting that in the thinner assembly only two sets of Charpy specimens are required. The grade of plates used is to be no higher in toughness than that for which approval is required. The strength is to be appropriate to the grade for which welding approval is requested.

- 7.3.2 For Y47 grade, the thicker assembly is to be prepared from the maximum thickness for which approval is required, and the thinner assembly is to be prepared from 50 mm thickness. Where approval is required for 50 mm thickness, only one assembly from that thickness is required.
- 7.3.3 The edge preparation and welding conditions are to be in accordance with the manufacturer's recommendations, and are to be reported to ACS. The diameters of wires are to be in accordance with the recommendations of the manufacturer and are to be reported.
- 7.3.4 Test specimens as follows are to be prepared as shown in [Figure 11.7.1: Butt weld test assembly and specimens for all techniques](#) and [Figure 11.7.2: Position of Charpy V-notch impact tests for one-side automatic welding](#):
  - a. One longitudinal tensile test specimen (from centre of weld).
  - b. Two transverse tensile test specimens.
  - c. Two bend test specimens.
  - d. One macro-section.
  - e. From assembly 20 to 25 mm thick, two sets of three impact test specimens positioned and notched in accordance with [Figure 11.7.2: Position of Charpy V-notch impact tests for one-side automatic welding](#).
  - f. From assembly 35 to 40 mm thick, three sets of three impact test specimens positioned and notched in accordance with [Figure 11.7.2: Position of Charpy V-notch impact tests for one-side automatic welding](#).
  - g. From assembly of thickness 50 mm or more, three sets of three impact test specimens positioned and notched in accordance with [Figure 11.7.2: Position of Charpy V-notch impact tests for one-side automatic welding](#). The second set positioned in the mid-thickness of test assembly.

The bend specimens are to be tested, one with the face in tension, the other with the root in tension.
- 7.3.5 The results of all transverse tensile, bend and impact tests are to comply with the requirements of [Table 11.4.3: Requirements for butt weld tests \(wire-flux combinations\)](#). The appearance of the bend test specimens is to be in accordance with [Ch 11, 3.3 Butt weld test assemblies 3.3.13](#). The Charpy V-notch impact test requirements are as for the two-run technique in [Table 11.4.3: Requirements for butt weld tests \(wire-flux combinations\)](#).
- 7.3.6 The results of all longitudinal tensile tests are to comply with the requirements in [Table 11.3.2: Requirements for deposited metal tests \(covered electrodes\)](#), except that for Grades 1Y, 2Y and 3Y the tensile strength is to be not less than 490 N/mm<sup>2</sup>.
- 7.3.7 Low hydrogen approval is required in accordance with [Table 11.7.1: Minimum low hydrogen approval requirements for one-side welding with combinations including temporary backing material](#).
- 7.3.8 Chemical analyses are to be made and reported from positions corresponding to the weld metal in the uppermost and lowest Charpy specimens in the thicker plate weld. This is to be supplied by the manufacturer and is to include the content of all significant elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

## 7.4 Annual tests

- 7.4.1 Annual tests are to consist of, at least, one butt weld test assembly, for each technique approved, using plates of 20 to 25 mm thickness. For the Y47 grade the thickness of plates may be taken as 50mm.

7. 4. 2 The assembly is to be prepared and tested in accordance with [Ch 11, 7.2 Approval tests for manual \(m\), semi-automatic \(S\) and automatic multi-run \(M\) techniques](#) or [Ch 11, 7.3 Approval tests for high heat input automatic \(A\) techniques](#) , as appropriate, except that only the following tests are required:
- a. One longitudinal tensile test (from centre of weld).
  - b. One transverse tensile test.
  - c. Two bend tests.
  - d. One set of three impact tests taken from the root of the weld and the specimens notched in accordance with [Figure 11. 7. 2: Position of Charpy V-notch impact tests for one-side automatic welding](#).
  - e. Chemical analysis (one only).
7. 4. 3 A hydrogen test is required for Y89 and Y96 grades.

CHAPTER **11 Approval of Welding Consumables**SECTION **8 Consumables for welding austenitic and duplex stainless steels****8. 1 General**

8. 1. 1 Tests for the approval of consumables intended for welding the austenitic and duplex stainless steels detailed in [Ch 3, 7 Austenitic and duplex stainless steels](#) are to be carried out generally in accordance with the [Ch 11, 3 Electrodes for manual and gravity welding](#), [Ch 11, 4 Wire-flux combinations for submerged-arc automatic welding](#), [Ch 11, 5 Wires and wire-gas combinations for manual, semi-automatic and automatic welding](#), [Ch 11, 6 Consumables for use in electro-slag and electro-gas welding](#) or [Ch 11, 7 Consumables for use in one-side welding with temporary backing materials](#) relevant to the type of consumable or combination.
8. 1. 2 Approval will be indicated by the grade or grades of parent stainless steel for which the consumable or combination is approved.
8. 1. 3 Where a shielding gas is employed separate approval will be required for each specific shielding gas composition.
8. 1. 4 Consumables for welding the austenitic stainless steels and the duplex stainless steels to carbon or carbon-manganese steels will be approved in a similar manner. Parent plate used for the butt and fillet weld test assemblies will be carbon or carbon-manganese steel with either austenitic stainless steel or duplex stainless steel, as appropriate. Approval will be indicated by 'SS/CMn' and 'Dup/CMn' respectively, however, no buttering of test assembly plates is allowed for these two approvals.
8. 1. 5 Separate approval will be given for welding chemical and cryogenic applications. For chemical use, evidence of relevant corrosion resistance will be required. Charpy impact toughness tests will be required for all uses, but for cryogenic use the Charpy impact toughness requirements are more severe.
8. 1. 6 The welding technique will be indicated in the approval grading by a letter:
- |   |   |  |
|---|---|--|
| m | = | for manual SMAW or GTAW welding.   |
| S | = | for wire-gas combinations used with a semi-automatic multi-run technique.  |
| M | = | for wire-flux or wire-gas combinations used with an automatic multi-run technique.   |
| T | = | for wire-flux or wire-gas combinations used with an automatic two-run technique.   |
| A | = | as for M but using a procedure with a high heat input rate (large bead size relative to thickness welded). This would apply to welds made by four or less runs in 20 mm thickness, or eight or less runs in 35 mm. |

## 8.2 Deposited metal test assemblies

- 8.2.1 Where the relevant Section requires deposited metal assemblies to be made and tested, the plates used must be either of the type for which approval is required or of normal strength carbon, or carbon-manganese steel with the prepared edges built up with stainless steel weld metal and finished with a layer of weld metal from the consumable to be approved.
- 8.2.2 The chemical analysis of the deposited weld metal is to be reported, including all significant elements. The elements reported will be dependent on the type of stainless steel for which approval of the consumables is requested. Any unusual weld metal compositions will have to be justified in respect of the particular approval requested. This is to be supplied by the manufacturer and is to include the content of all significant elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.
- 8.2.3 The results of all tensile and notch impact tests are to comply with the requirements given in [Table 11.8.1: Requirements for deposited metal tests \(manual, semi-automatic and automatic multi-run techniques\)](#) as appropriate.
- 8.2.4 The ferrite content in the last weld run from each deposited metal assembly is to be determined by physical or metallographic means, and reported, indicating the method of determination.

## 8.3 Butt weld test assemblies

- 8.3.1 Where the relevant Section requires butt weld assemblies to be made and tested, the plates used are to be either of the type for which approval is required or of steel having strength and ductility within the range specified for the grade to be approved. In the latter case, provided the consumable is metallurgically compatible with the base material to be used, the prepared edges are to be built up with a layer of weld metal before final machining of the weld preparation.
- 8.3.2 Butt weld assemblies are to be prepared for each position (downhand, horizontal-vertical, vertical-upward, vertical-downward, and overhead) for which the electrode/wire is to be approved.
- 8.3.3 The results of transverse tensile, notch impact and bend tests are to comply with the requirements of [Table 11.8.2: Requirements for butt weld tests \(all techniques\)](#) as appropriate. The position of fracture is to be reported to ACS.
- 8.3.4 The ferrite content at the centre of the weld metal in each butt weld assembly is to be determined by physical or metallographic means, and meet the requirements in [Table 11.8.2: Requirements for butt weld tests \(all techniques\)](#). The method of determination is to be reported.
- 8.3.5 For austenitic and duplex stainless steel approvals (except for types 304L, 316L, 321, 347, SS/CMn and Dup/CMn), an appropriate sample from each butt weld assembly is to be submitted to the corrosion testing provided in ASTM G48, Method 'C'. The results are to be reported so as to allow confirmation of the maximum acceptable pitting corrosion resistance temperature. This will be part of the approval grading and will be set at 5°C intervals. The minimum pitting corrosion temperature would not be expected to be less than 20°C.

## 8.4 Fillet weld test assemblies

- 8.4.1 Where the relevant Section requires fillet weld assemblies to be made and tested, the plates used must be either of the type for which approval is required or of steel having strength and ductility within the range specified for the grade to be approved. In the latter case, the surfaces on which the fillet weld beads are to be deposited are to be cut back by machining and then built up to original dimensions with weld metal from the consumable to be approved.

**Table 11. 8. 1: Requirements for deposited metal tests (manual, semi-automatic and automatic multi-run techniques)**

| Grade   | 0.2% proof stress<br>N/mm <sup>2</sup><br>minimum | 1% proof stress<br>N/mm <sup>2</sup><br>minimum | Tensile strength<br>N/mm <sup>2</sup><br>minimum | Elongation on 50 mm<br>%<br>minimum | Charpy V-notch impact tests     |                                  |  |
|---|---|---|--|-------------------------------------|---------------------------------|----------------------------------|--|

| S 32760 | 750 | 6 | 35-65        | -20 | (See Note 3) | 40 |
| Dup/CMn | 500 | 3 | (See Note 2) | -20 | (See Note 3) | 40 |

**Note 1.** Energy values from individual impact test specimens are to comply with [Ch 11, 1.4 Approval procedures 1.4.3](#).

**Note 2.** To be reported for special consideration.

**Note 3.** Approval for cryogenic applications is to be obtained at the procedure approval stage.

8. 4. 2 The ferrite content at the centre of the weld metal in each fillet weld bead of each assembly is to be determined from the centre macro-section by physical or metallographic means, and reported. The method of determination is also to be reported to ACS.
8. 4. 3 Where approval is sought for fillet welding only, corrosion testing is to be carried out in accordance with [Ch 11, 8.3 Butt weld test assemblies 8.3.5](#) from a sample taken from the deposited metal test assembly.

## 8. 5 Annual tests

8. 5. 1 Annual tests are to be carried out as required by the relevant Section appropriate to the type of consumable and welding technique. The tests are to include a weld ferrite content in accordance with [Ch 11, 8.2 Deposited metal test assemblies 8.2.4](#) or [Ch 11, 8.3 Butt weld test assemblies 8.3.4](#) as appropriate.
8. 5. 2 The results of all tests are to comply with the requirements given in [Table 11. 8. 1: Requirements for deposited metal tests \(manual, semi-automatic and automatic multi-run techniques\)](#) and [Table 11. 8. 2: Requirements for butt weld tests \(all techniques\)](#) as appropriate.

CHAPTER **11 Approval of Welding Consumables**SECTION **9 Consumables for welding aluminium alloys****9.1 General**

- 9.1.1 Tests for the approval of consumables intended for welding the aluminium alloys detailed in [Ch 8 Aluminium Alloys](#) are to be carried out generally in accordance with the requirements of [Ch 11, 1 General](#), [Ch 11, 2 Mechanical testing procedures](#) and [Ch 11, 5 Wires and wire-gas combinations for manual, semi-automatic and automatic welding](#), except as otherwise detailed in this Section.
- 9.1.2 Approval will be indicated by the grade shown in [Table 11.9.1: Requirements for butt weld tests](#). Plate of the corresponding type of aluminium alloy and of appropriate thickness is to be used for the preparation of the weld test assemblies, and may be of any temper listed in ACS Rules.

**Table 11.9.1: Requirements for butt weld tests**

| Consumable Approval Grade ( <i>See Note 1</i> )   | Base material used for the test | Tensile strength N/mm <sup>2</sup> minimum | Bend test ratio: $\frac{D}{t}$ |
|---|---------------------------------|--|--------------------------------|
| ACS RA/ACS WA   | 5754                            | 190  | 3                              |
| ACS RB/ACS WB   | 5086                            | 240  | 6                              |
| ACS RC1/ACS WC1   | 5083                            | 275  | 6                              |
| ACS RC2/ACS WC2 ( <i>See Note 2</i> )   | 5383 or 5456                    | 290  | 6                              |
| ACS RC3/ACS WC3 ( <i>See Note 2</i> )   | 5059                            | 330  | 6                              |
| ACS RD/ACS WD ( <i>See Note 4</i> )   | 6005A                           | 170  | 6                              |
|   | 6061                            | 170  | 6                              |
|   | 6082                            | 170  | 6                              |
| <p><b>Note 1.</b> The prefixes 'R' and 'W' indicate 'rod' form (for Gas Tungsten Arc Welding (GTAW)) or 'wire' form (for Gas Metal Arc Welding (GMAW) and GTAW).</p> <p><b>Note 2.</b> Approval of grade ACS RC2/ACS WC2 confers approval of 5383, 5456 and 5083 base material grade.</p> |                                 |  |                                |

**Note 3.** Approval of grade ACS RC3/ACS WC3 confers approval of 5059, 5383, 5456 and 5083 base material grades.

**Note 4.** Approval of grade ACS RD/ACS WD confers approval of 6005A, 6061 and 6082 base material grades.

9. 1. 3 The welding technique will be indicated in the approval grading by a letter:

|   |   |   |
|---|---|---|
| m | = | manual multi-run welding (GTAW),            |
| S | = | semi-automatic multi-run welding (GMAW),    |
| M | = | automatic multi-run welding (GTAW or GMAW), |
| T | = | automatic two-run welding (GMAW).           |

9. 1. 4 The compositions of the shielding gas and the filler/electrode wire are to be reported.

9. 1. 5 Approval granted using the multi-run technique for a specific filler/electrode wire with a gas in one of the groups listed in [Table 11. 9. 2: Shielding gas compositions](#) will extend to any other gas compositions within that same group, provided that the gas composition is within the range recommended by the consumable manufacturer, subject to agreement with ACS.

**Table 11. 9. 2: Shielding gas compositions**

| Group   | Gas composition (Vol. %)<br>(See Note) |           |
|---|--|-----------|
|   | Helium                                 | Argon     |
| I-1   | —                                      | 100       |
| I-2   | 100                                    | —         |
| I-3   | >0 ≤33                                 | Remainder |
| I-4   | >33 ≤66                                | Remainder |
| I-5   | >66 ≤95                                | Remainder |
| S   | Special gas                            |           |
| <b>Note</b> Gases of other composition (mixed gases) or special purity may be considered as special gases and will require separate approval tests. |  |           |

9. 1. 6 Approval granted for the two-run technique will be for a specific shielding gas composition; additional tests may be required if a change in shielding gas composition is sought.

9. 1. 7 On completion of welding, assemblies are to be allowed to cool naturally to ambient temperature. Welded test assemblies and test specimens are not to be subjected to any heat treatment after welding except for the alloy Grades 6005A, 6061 and 6082. These are to be allowed to naturally age at ambient temperature for a period of 72 hours from the completion of welding, before testing is carried out. A second solution heat treatment is not permitted.

9. 1. 8 All butt test assemblies are to be subjected to both radiographic and visual examination and imperfections such as lack of fusion, lack of penetration, cavities, inclusions, pores and cracks assessed in accordance with Intermediate Level C of ISO 10042, aided where necessary by dye penetrant and ultrasonic examination.

9. 1. 9 Fillet weld test assemblies and macro-sections are to be visually examined for imperfections, such as lack of fusion, lack of penetration, cavities, inclusions, pores and cracks, in accordance with Intermediate Level C of ISO 10042, aided where necessary by radiographic and dye penetrant examination.

## 9. 2 Approval tests for manual, semi-automatic and automatic multi-run techniques

9. 2. 1 Plate of the corresponding type of aluminium alloy and of appropriate thickness is to be used for the preparation of the weld test assemblies.
9. 2. 2 The welding parameters are to be within the range recommended by the manufacturer and are to be reported.
9. 2. 3 Welded assemblies are to be prepared and tested in accordance with [Ch 11, 9.3 Deposited metal test assembly](#), [Ch 11, 9.4, Butt weld test assemblies](#) and [Ch 11, 9.5, Fillet weld test assembly](#).

## 9. 3 Deposited metal test assembly

9. 3. 1 One assembly is to be prepared in the downhand position as shown in [Figure 11. 9. 1: Deposited metal test assembly](#).

Figure 11. 9. 1: Deposited metal test assembly

9. 3. 2 The chemical composition of the plate used for the assembly is to be compatible with the weld metal.
9. 3. 3 The thickness of the plate used, and the length of the assembly, are to be appropriate to the welding process. The plate thickness is to be not less than 12 mm.
9. 3. 4 For the approval of filler wire/gas and electrode wire/gas combinations for manual or semi-automatic welding by GTAW or GMAW, one test assembly is to be welded using any size of wire within the range for which approval is sought.
9. 3. 5 For automatic multi-run approval, one test assembly is to be welded by the respective process using the recommended diameter of wire.
9. 3. 6 The weld metal is to be deposited in multi-run layers in accordance with normal practice. The direction of deposition of each layer is to alternate from each end of the plate.

9. 3. 7 The deposited weld metal in the assembly is to be analysed and reported including the contents of all significant elements. The elements reported will be dependent on the type of aluminium alloy for which approval of the consumables is requested. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

## **9. 4 Butt weld test assemblies**

9. 4. 1 Plate of the corresponding type of aluminium alloy and of an appropriate thickness is to be used for the preparation of the test assemblies.
9. 4. 2 In order to ensure sound and representative welds, it is essential that test assemblies are cleaned and degreased prior to welding. Assemblies as shown in [Figure 11. 9. 2: Butt weld test assembly \(positional, multi-run technique\)](#) are to be prepared for each welding position (downhand, horizontal-vertical, vertical-upward, vertical-downward, and overhead) for which the consumable is recommended by the manufacturer; except that consumables satisfying the requirements for downhand and vertical-upward positions will be considered as also complying with the requirements for the horizontal-vertical position. Any wire diameter(s) to be approved may be used.

**Figure 11. 9. 2: Butt weld test assembly (positional, multi-run technique)**

9. 4. 3 One assembly, as shown in [Figure 11. 9. 3: Butt weld test assembly \(downhand, multi-run technique\)](#), is to be prepared for welding in the downhand position. The assembly is to be welded using, for the first run, wire of the smallest diameter recommended by the manufacturer and, for the remaining runs, wire of the largest diameter to be approved.

**Figure 11. 9. 3: Butt weld test assembly (downhand, multi-run technique)**

9. 4. 4 The welding conditions are to be in accordance with the recommendations of the manufacturer and are to be reported in detail.
9. 4. 5 The welded assemblies are to be subjected to NDE. Imperfections are to be assessed in accordance with [Ch 11, 9.1 General 9.1.8](#).
9. 4. 6 The test specimens are to be taken from the welded assemblies as shown in [Figure 11. 9. 2: Butt weld test assembly \(positional, multi-run technique\)](#) and [Figure 11. 9. 3: Butt weld test assembly \(downhand, multi-run technique\)](#). For each assembly they are to comprise:
  - 2 transverse tensile specimens;
  - 2 face bend specimens; and
  - 2 root bend specimens.
9. 4. 7 All tensile test specimens are to have a tensile strength not less than the respective value shown in [Table 11. 9. 1: Requirements for butt weld tests](#). The position of each fracture is to be reported.
9. 4. 8 The bend test specimens are to be bent around a former having a diameter not more than the number of times the thickness of the test specimen, as shown in [Table 11. 9. 1: Requirements for butt weld tests](#), and can be considered as complying with the requirements if, after bending to an angle of not less than 180°, no crack or other open defect exceeding 3 mm in length can be Seen on the outer surface. Flaws appearing at the corners of a test specimen may be ignored.

9. 4. 9 In order to obtain uniform bending of the bend test specimens, it is recommended that the wrap-around or guided bend test using a roller method is employed.

## 9. 5 Fillet weld test assembly

9. 5. 1 When approval is being sought for both butt and fillet welding, one assembly is to be prepared and welded in the horizontal-vertical position and tested in accordance with the appropriate requirements of [Ch 11, 3.5, Fillet weld test assemblies](#), except that the plates are to be of an aluminium alloy compatible with the weld metal, that no hardness tests are required and that for automatic multi-run approval only one fillet weld bead is to be made using the recommended wire diameter. In this case, the bead size is to be as large as the maximum single bead size recommended by the manufacturer for fillet welding.
9. 5. 2 When approval is being sought for fillet welding only, one assembly is to be prepared and welded in each position for which approval is sought, and tested as detailed in [Ch 11, 9.5 Fillet weld test assembly 9.5.1](#).
9. 5. 3 The results of examination of the macro-specimens and the fractured fillet welds are to be reported in accordance with [Ch 11, 3.5 Fillet weld test assemblies 3.5.4](#) and [Ch 11, 3.5 Fillet weld test assemblies 3.5.6](#). Imperfections are to be assessed in accordance with [Ch 11, 9.1 General 9.1.9](#).

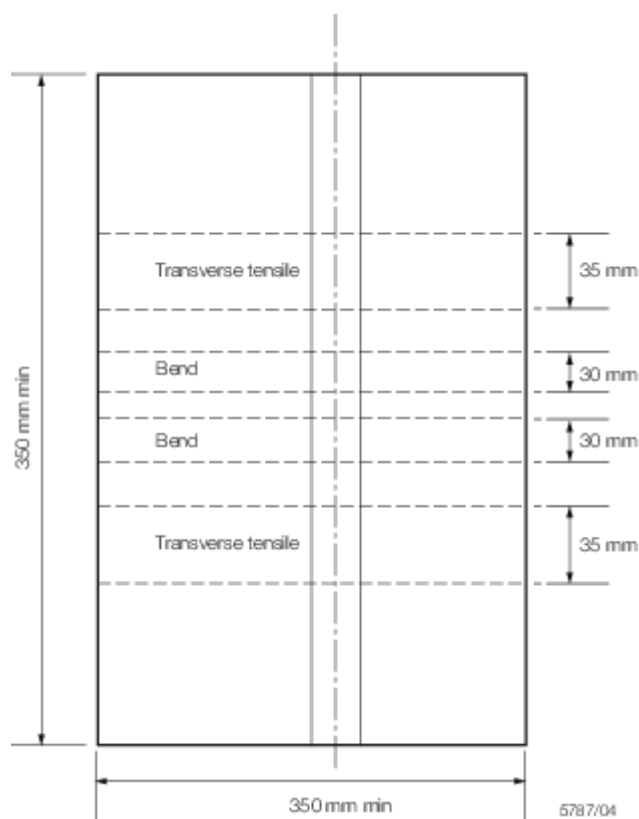

## 9. 6 Approval tests for two-run technique

9. 6. 1 Two butt weld test assemblies are to be prepared using the following plate thicknesses:
- one with the maximum thickness for which approval is requested,
  - one with a thickness approximately one half to two thirds that of the maximum thickness.

## 9. 7 Butt weld test assemblies (two-run technique)

9. 7. 1 The plates used are to be of the aluminium alloy appropriate to the approval required as shown in [Table 11. 9. 1: Requirements for butt weld tests](#). The composition of the plate material is to be within the range specified for that alloy in [Table 11. 8. 2: Requirements for butt weld tests \(all techniques\)](#) in [Ch 8 Aluminium Alloys](#) and is to be reported including all significant elements.
9. 7. 2 The wire diameter, edge preparation, welding current, arc voltage and travel speed are to be in accordance with the manufacturer's recommendations and are to be reported.
9. 7. 3 Each butt weld is to be made in two runs, one from each side. After completion of the first run the assembly is to be left in still air until it has cooled to less than 50°C.
9. 7. 4 The welded assemblies are to be subjected to NDE. Imperfections are to be assessed in accordance with [Ch 11, 9.1 General 9.1.8](#).
9. 7. 5 The test specimens as shown in [Figure 11. 9. 4: Butt weld test assembly \(two-run technique\)](#) are to be prepared from each test assembly. The edges of the discards are to be polished and etched, and must show complete fusion and inter-run penetration of the welds. Each cut in the assembly is also to be examined to confirm that complete fusion and penetration have been achieved.

**Figure 11. 9. 4: Butt weld test assembly (two-run technique)**

9. 7. 6 The results of the transverse tensile tests are to be as in [Ch 11, 9.4 Butt weld test assemblies 9.4.7](#) and of the bend tests as in [Ch 11, 9.4 Butt weld test assemblies 9.4.8](#). The position of the fracture in each transverse tensile specimen is to be reported.

## 9. 8 Annual tests

9. 8. 1 Annual tests are to consist of the following:
- for combinations approved for the multi-run technique, one deposited metal assembly in accordance with [Ch 11, 9.3 Deposited metal test assembly](#) and one downhand butt assembly in accordance with [Ch 11, 9.4, Butt weld test assemblies Figure 11. 9. 2: Butt weld test assembly \(positional, multi-run technique\)](#);
  - for combinations approved for the two-run technique, one butt weld assembly in accordance with [Ch 11, 9.7 Butt weld test assemblies \(two-run technique\)](#) using plate material of thickness equal to one half to two thirds that of the maximum thickness approved.

**CHAPTER 12 Welding Qualifications****SECTION 1 General qualification requirements****1.1 General**

- 1.1.1 This Section applies to all welding qualifications and tests required to be performed in the course of new construction, conversions, modifications or repairs made on ships, other marine structures and their associated pressure vessels, machinery and equipment.
- 1.1.2 These Rules also apply to all welding work related to other applications for which Asia Classification Society (hereinafter referred to as ACS) have issued Rules or have an interest.
- 1.1.3 It is the responsibility of the manufacturer to ensure compliance with all aspects of these Rules. All deviations are to be recorded as non-compliances and brought to the attention of the Surveyor along with the corrective actions taken. Failure to do this is considered to render the welding tests as not complying with the Rules.
- 1.1.4 Welding tests are to be performed under survey at the manufacturer's works. Welding procedure qualification tests and welder qualifications tests are to be performed and approved prior to commencement of fabrication or construction.
- 1.1.5 Weld procedure tests made in accordance with EN, ISO, JIS, ASME or AWS may be considered for acceptance provided that, as a minimum, they are equivalent to and meet the technical intent of these Rules to the satisfaction of the Surveyor.
- 1.1.6 Welding tests that have previously been carried out may be considered for acceptance, provided that they have been supervised by an independent body acceptable to ACS and the Surveyor is satisfied with the authenticity of such tests.
- 1.1.7 The responsibility for the performance of the weld tests rests with the manufacturer. Aspects of the welding tests, such as mechanical testing, non-destructive testing and heat treatment, may be subcontracted by the manufacturer provided that the subcontractor performs the work under the technical control and direction of the manufacturer, and this is agreed with the Surveyor prior to commencing the work.
- 1.1.8 In these Rules, the term 'manufacturer' is considered to include any firm or organisation that performs welding and is considered to be the shipbuilder, or construction firm, or fabricator, or material manufacturer.

**1.2 Design**

- 1.2.1 Welding procedure qualification tests are required to give assurance that construction welds made in accordance with the approved plans or the approved design have acceptable properties. It is the manufacturer's responsibility to establish and document whether a procedure is suitable for a particular application.

1. 2. 2 The requirements relate to mechanical properties of the weld and heat affected zone, however, other tests may be required on certain materials, for example, corrosion or fatigue tests, in order to ensure suitability for the proposed application.

### **1. 3 Materials**

1. 3. 1 Materials used for testing are to be of the same grade, type and from the same manufacturing process as those to be used for construction, unless prior agreement is obtained from the Surveyor. Such agreements will only apply on a case-by-case basis.
1. 3. 2 All materials used for testing are to be suitably marked and identifiable to the original manufacturer's material certificate.

### **1. 4 Performance of welding tests**

1. 4. 1 All welding and subsequent testing is to be performed in accordance with the requirements of this Chapter.
1. 4. 2 The manufacturer is responsible for monitoring the tests and for recording all the welding variables as specified in 2.2 and for compiling all the non-destructive examination (NDE) reports and mechanical test records for submission to the Surveyor.
1. 4. 3 The laboratory or testing establishment used to perform the tests is to have the necessary equipment, maintained in good order and suitably calibrated. The Surveyor is to be satisfied that the laboratory personnel have the appropriate skills and are appropriately qualified in accordance with [Ch 2, 1.2 Testing machines 1.2.1](#).

**CHAPTER 12 Welding Qualifications****SECTION 2 Welding procedure qualification tests for steels****2.1 General**

- 2.1.1 The requirements of this Section relate to welding procedure test requirements of carbon, carbon-manganese steels and low alloys steels. Additional requirements for austenitic and austenitic/ferritic duplex stainless steels, aluminium and copper alloys are specified in Sections 3 and 4 respectively.
- 2.1.2 Prior to performing the welding procedure qualification test, the manufacturer is to present to the Surveyor a preliminary Welding Procedure Specification (pWPS) detailing the welding processes, positions, joint types, materials and heat treatments to be performed during the test. The pWPS is to be presented for information prior to commencing the test.
- 2.1.3 The type and extent of testing to be applied to each welding procedure test is to be in accordance with subsequent Sections of this Chapter.
- 2.1.4 For the welding procedure approval, the welding procedure qualification tests given in this Section are to be carried out with satisfactory results. Welding procedure specifications are to refer to the test results achieved during welding procedure qualification testing.

**2.2 Welding variables**

- 2.2.1 In order that the conditions of the qualification test may be applied to production welding operations, the appropriate variables are to be recorded by the manufacturer during welding and testing from the following list:
  - a. The unique qualification reference number and the date of welding;
  - b. The material type, grade, product form, dimensions and identification;
  - c. Welding process(es), including tack welds;
  - d. Joint type, dimensions and surface condition;
  - e. Welding position(s);
  - f. Welding technique(s), weaving, multiple electrodes, etc;
  - g. Welding consumables including fluxes, shielding gases, etc;
  - h. Control of consumables, baking or drying conditions, etc;
  - i. Welding parameters, current, voltages, travel speeds, etc;
  - j. Number and sequence of weld runs;
  - k. Backing materials including any backing gas;
  - l. Preheats and interpass temperatures;
  - m. Methods used for cleaning and inspection of root deposits;
  - n. Post-weld heat treatment, temperature and cycle times;
  - o. Special weld profiling requirements.

- 2.2.2 Other variables may need to be recorded depending on the particular welding process or application and are to be agreed with the Surveyor, for example the peak and base current and cycle times for pulse welding, electrode type and nozzle size for GTAW welding, etc.

## 2.3 Steel test assemblies

- 2.3.1 Tests are to be performed using the welding process and positions anticipated for actual construction. The weld test assemblies are to be representative of construction conditions and are to be welded in the same manner as intended for the actual production welds. Where prefabrication primers are used in the shipyard, these are to be included in the test assemblies.
- 2.3.2 For plate tests, the direction of plate rolling relative to the weld direction is to be considered. Where the material used for the test requires longitudinal impact tests, the plate rolling direction is to be perpendicular to the weld direction and for material which requires impact testing in the transverse direction, the rolling direction is to be parallel to the weld direction. For weld tests intended for liquefied gas storage or cargo tanks and associated process pressure vessels, the direction of plate rolling is to be parallel to the weld direction in all cases.
- 2.3.3 Typical test assemblies are shown in [Figure 12.2.1: Butt weld test assembly in plate](#) to [Figure 12.2.3: Fillet weld test assembly in plate](#). These are a minimum requirement to permit the removal of all the necessary mechanical test specimens. Where impact tests or other toughness tests are required, the total width is not to be less than 8 times the material thickness of the thicker material being joined.

**Figure 12.2.1: Butt weld test assembly in plate**

**Figure 12. 2. 2: Butt weld test assembly in pipe**

**Figure 12. 2. 3: Fillet weld test assembly in plate**

| Welding Processes     | L (min)<br>mm | W (min)<br>mm | D (min)<br>mm |
|-----------------------|---------------|---------------|---------------|
| Manual/Semi-automatic | 350           | 300           | 50            |
| Automatic             | 1000          | 300           | 75            |

2. 3. 4 Welding procedure test assemblies are to be welded separately from production welds and are to be marked with the unique test identification number. The individual pieces of the test assembly may be held together to maintain their relative joint conditions by means of suitable tack welds, clamps or strongbacks.
2. 3. 5 Welding of the test assemblies and testing of test specimens is to be monitored by the Surveyor.
2. 3. 6 The test assembly is to be placed in one of the welding positions shown in [Figure 12. 2. 4: Plate butt weld test positions](#) to [Figure 12. 2. 7: Pipe fillet weld test positions](#), as specified in the test Welding Procedure Specification (pWPS) and the specified level of preheat applied prior to the start of welding.

## 2. 4 Welding of steel test assemblies

2. 4. 1 Welding of the test assembly is to be carried out in accordance with the agreed pWPS. Where, during the progress of the test, it is found necessary to change the conditions specified on the pWPS, this is to be brought to the attention of the Surveyor. If agreed, the test may be permitted to continue with the new conditions and these are to be recorded.
2. 4. 2 Where the production work requires welding over tack welds, the test is to simulate this condition and the tack welds are to be included in the inspection length of the test weld and their position recorded.
2. 4. 3 For manual and semi-automatic welding processes, weld stops and re-starts are to be included in the inspection length of the test weld.
2. 4. 4 Fillet weld test assemblies are welded on one side only.
2. 4. 5 Where the construction welding is predominately fillet welding, in addition to the butt weld qualification test, a fillet weld qualification test is to be performed to confirm that acceptable weld quality is achieved.

## 2. 5 Non-destructive examination (NDE)

2. 5. 1 On completion of welding, prior to sectioning for mechanical tests, the inspection length of the test assembly is to be subjected to both visual examination and surface crack detection.
2. 5. 2 Butt weld assemblies are also to be subjected to radiographic or ultrasonic examination over the whole inspection length of the weld.
2. 5. 3 For welds in steels with specified yield strength up to 400 N/mm<sup>2</sup>, and with carbon equivalent less than or equal to 0.41 per cent, NDE may be performed as soon as the test assembly has cooled to ambient temperature. For other steels, NDE is to be delayed for a period of at least 48 hours after the test assembly has cooled to ambient temperature.
2. 5. 4 Where post-weld heat treatment is required, NDE is to be performed after the heat treatment is complete.
2. 5. 5 All NDEs are to be carried out in accordance with the requirements of [Ch 1, 5 Non-destructive examination](#). Assessment of results is to be in accordance with ISO 5817 Level B except for excess convexity and excess throat thickness where Level C will apply. Linear porosity is not permitted.
2. 5. 6 As an alternative to radiography, ultrasonic examination may be carried out and acceptance criteria that are considered to result in equivalent weld quality (in accordance with [Ch 12, 2.5 Non-destructive examination \(NDE\) 2.5.5](#)) are to be agreed, with the Surveyor, prior to the tests being carried out. Ultrasonic testing will be subject to the thickness limitation specified in [Ch 13, 2.12 Non-destructive examination of welds 2.12.5](#).
2. 5. 7 Where the test assembly does not satisfy the nondestructive examination acceptance criteria, the test is to be rejected. A duplicate test assembly may be welded using the original welding conditions. If this fails NDE, the welding procedure is to be considered as incapable of achieving the requirements without modification.
2. 5. 8 Subject to prior agreement with the Surveyor, where unacceptable imperfections are of a volumetric nature and are localised in one small area of the test assembly, the test may be permitted to continue and specimens for destructive testing may be removed, avoiding this area.

## 2. 6 Destructive tests – General requirements

2. 6. 1 The weld test assembly may only be sectioned for destructive testing after any heat treatment and the required non-destructive examinations have been completed successfully.
2. 6. 2 The dimensions of the test specimens and testing conditions are to be in accordance with the requirements specified in [Ch 2 Testing Procedures for Metallic Materials](#).
2. 6. 3 The results of destructive tests are to be assessed in accordance with the acceptance criteria specified in [Ch 12, 2.12, Mechanical test acceptance criteria for steels](#), unless other, more stringent requirements are specified for the application.
2. 6. 4 Where a weld test is made between materials of different grades, the acceptance criteria that are to be applied are those applicable to the lower grade material.

## 2. 7 Destructive tests for steel butt welds

2. 7. 1 The test assembly is to be sectioned for mechanical testing in accordance with [Figure 12. 2. 8: Butt welds in plate](#) or [Figure 12. 2. 9: Butt welds in pipe less than 750 mm diameter](#).

**Figure 12. 2. 8: Butt welds in plate**

#### Test requirements

- A Visual examination
- B Surface crack detection
- C 100 per cent radiographic examination (see Note 1)
- D Two transverse tensile tests
- E four bend tests
- F Five sets Charpy V-notch impact tests
  - 1 set notched at centre of weld
  - 1 set notched at fusion line (FL)
  - 1 set notched at FL + 2 mm
  - 1 set notched at FL + 5 mm (see Note 2)
  - 1 set notched at FL + 10 mm (if required)
- G One macro specimen including harness survey
- H All weld metal tensile test (if required)

**Note 1** Radiographic examination may be replaced by ultrasonic examination for test assembly thickness of 8 mm or above.

**Note 2** If required by [Figure 12. 2. 11: Locations of V-notch for butt weld of normal heat input \(heat input  \$\leq 50\$  kJ/cm\)](#) and [Figure 12. 2. 12: Locations of V-notch for butt weld of high heat input \(heat input  \$> 50\$  kJ/cm\)](#)

**Figure 12. 2. 9: Butt welds in pipe less than 750 mm diameter**

**Test requirements**

- A Visual examination
- B Surface crack detection
- C 100% radiographic examination (see Note 1)
- D Two transverse tensile tests
- E Four bend tests.
- F Four sets Charpy V-notch impact tests
  - 1 set notched at centre of weld
  - 1 set notched at fusion line (FL)
  - 1 set notched at FL + 2 mm
  - 1 set notched at FL + 5 mm (see Note 2)
- G One macro specimen including hardness survey

**Note 1** Radiographic examination may be replaced by ultrasonic examination for test assembly thickness of 8 mm or above.

**Note 2** If required by [Figure 12. 2. 11: Locations of V-notch for butt weld of normal heat input \(heat input  \$\leq 50\$  kJ/cm\)](#) and [Figure 12. 2. 12: Locations of V-notch for butt weld of high heat input \(heat input  \$> 50\$  kJ/cm\)](#)

2. 7. 2 The longitudinal all weld metal tensile test specimen is to be of circular cross-section as detailed in [Ch 11, 2.1 Dimensions of test specimens 2.1.1](#). Where more than one welding process or type of consumable has been used to make the weld, test specimens are to be removed from each

respective area of the weld. This does not apply to the process or consumables used to make the root or first weld run. During the test, the yield or proof stress, ultimate tensile strength, and elongation to failure are to be recorded.

- 2. 7. 3 Where approved welding consumables have been used, the longitudinal all weld metal tensile test may be omitted. For Type C independent tanks intended for liquefied gases, the all weld tensile test is mandatory for all welding procedure tests.
- 2. 7. 4 The transverse tensile test specimen is to be of full thickness with the dimensions shown in [Ch 11, 2.1 Dimensions of test specimens 2.1.1](#). The tensile strength and fracture locations are to be reported.
- 2. 7. 5 Where the maximum load required to fracture the transverse tensile specimen is likely to exceed the capacity of the tensile testing equipment, several tensile specimens may be removed through the thickness and tested. Specimens are to be prepared such that they overlap in the thickness direction so that the full plate thickness is tested.
- 2. 7. 6 Transverse bend specimens of rectangular section are to be prepared with the weld centred in the middle of the specimen as shown in [Figure 12. 2. 10: Transverse bend test specimens](#). For material of thickness 12 mm or greater, the face and root bends may be substituted by side bend tests. Where there is a significant difference between the strength of the weld and base material, longitudinal bend specimens may be used. The weld reinforcement may be removed by grinding or machining prior to testing and the edges rounded to a radius not exceeding 10 per cent of the specimen thickness. Each specimen is to be bent through an angle of at least 180°. The bend test ratio is to be the lesser of the following:

a. 
$$D_f = \left(\frac{D}{t}\right) + 1$$

or

b. 
$$D_f = 100/E_m \text{ (rounded up to the next whole number)}$$
  

$$= \text{is the bend test ratio}$$

where

$D_f$

$$\left(\frac{D}{t}\right) = \text{is the value from [Table 11. 3. 3: Requirements for butt weld tests \(covered electrodes\)](#), [Table 11. 3. 4: Permitted methods for obtaining low hydrogen grading](#) or [Table 11. 8. 2: Requirements for butt weld tests \(all techniques\)](#) in Chapter 11, as appropriate}$$

$$E_m = \text{is the minimum specified percentage elongation for the test material (based on a proportional gauge length of } 5.65\sqrt{S_0} \text{ )}$$

- 2. 7. 7 Where the weld test is made between different material types, the requirements of [Ch 12, 2.7 Destructive tests for steel butt welds 2.7.8](#) are to be applied to the material with the lower toughness specification.

**Figure 12. 2. 10: Transverse bend test specimens**

2. 7. 8 For hull structural steels, impact test specimens are to be prepared from the locations shown in [Figure 12. 2. 11: Locations of V-notch for butt weld of normal heat input \(heat input  \$\leq 50\$  kJ/cm\)](#) or [Figure 12. 2. 12: Locations of V-notch for butt weld of high heat input \(heat input  \$> 50\$  kJ/cm\)](#), with the notch perpendicular to the plate surface and have the dimensions and proportions in accordance with [Ch 2, 3 Impact tests](#). Where more than one welding process or type of consumable has been used to make the weld, test specimens are also to be removed from these respective parts of the weld. Note that this does not apply to the welding process or consumables used solely to make the root or first weld run. Where the weld thickness exceeds 50 mm, an additional set of impact tests is required from the root area of the weld irrespective of whether different welding process or welding consumables are used as shown in [Figure 12. 2. 11: Locations of V-notch for butt weld of normal heat input \(heat input  \$\leq 50\$  kJ/cm\)](#) and [Figure 12. 2. 12: Locations of V-notch for butt weld of high heat input \(heat input  \$> 50\$  kJ/cm\)](#).

**Figure 12. 2. 11: Locations of V-notch for butt weld of normal heat input (heat input  $\leq 50$  kJ/cm)**

(a)  $t \leq 50$  mm <sup>(1)</sup>

NOTE:

(1) For one side single run welding over 20 mm notch location 'a' is to be added on root side

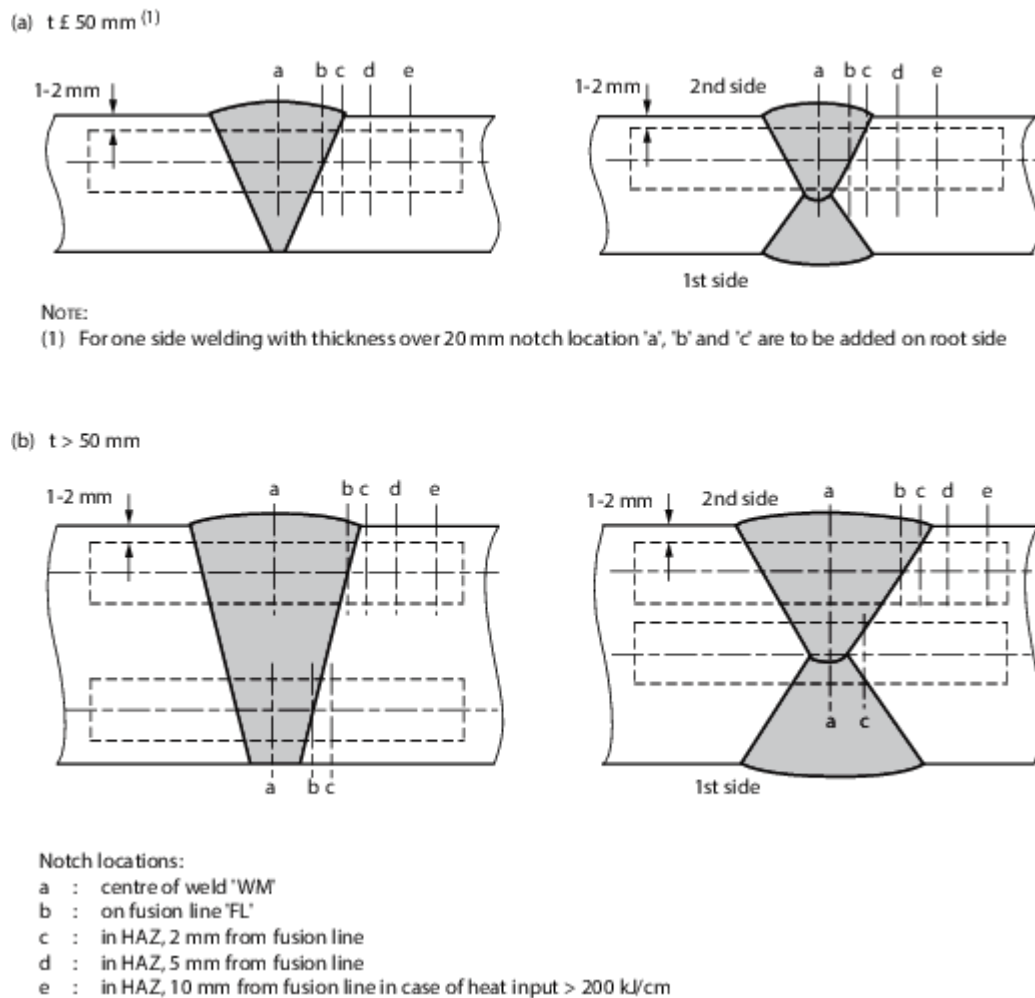

(a)  $t > 50$  mm

Notch locations:

- a : centre of weld 'WM'
- b : on fusion line 'FL'
- c : in HAZ, 2mm from fusion line

**Figure 12. 2. 12: Locations of V-notch for butt weld of high heat input (heat input > 50 kJ/cm)**

2. 7. 9 For offshore structures and pressure vessels, impact test specimens are not required to be notched at the FL + 10 mm location. Where more than one welding process or type of consumable has been used to make the weld, test specimens are to be removed from the respective areas of the weld. This does not apply to the process or consumables used solely to make the root or first weld run.
2. 7. 10 For pressure vessels and tanks employed in transportation of liquefied gases, Charpy impact test locations from the weld and heat affected zone are to be in accordance with [Figure 12. 2. 13: Locations of V-notch tests for butt welds intended for liquefied gas containment systems](#).

**Figure 12. 2. 13: Locations of V-notch tests for butt welds intended for liquefied gas containment systems**

2. 7. 11 At least one macro examination specimen is to be removed from the test plate, near the end where welding started. The specimen is to include the complete cross-section of the weld and the heat affected zone and be prepared and etched to clearly reveal the weld runs and the heat affected zone. Examination is to be performed under a magnification of between x5 and x10.
2. 7. 12 A chemical analysis of the weld metal is to be performed on the macro specimen where approved welding consumables have not been used. The results are to comply with the limits given in the welding consumable specification.
2. 7. 13 A Vickers hardness survey is to be performed on the macro specimen taken from the weld start end of the test assembly in accordance with that shown in [Figure 12. 2. 14: Hardness testing locations for butt welds](#), using a test load not in excess of 10 kg. For each row of indents, there are to be a minimum of 3 individual indentations in the weld metal, the heat affected zones (both sides), the base metal (both sides), and in addition, 2 indentations are required in the grain coarsened heat affected zone, one above and one below the hardness survey row. The recommended distance between indents is 1.0 mm, but the distance between indents should not be less than the minimum specified in ISO 6507/1.

**Figure 12. 2. 14: Hardness testing locations for butt welds**

## 2. 8 Destructive tests for steel fillet welds

2. 8. 1 Fillet weld test assemblies are to be sectioned for destructive testing in accordance with [Figure 12. 2. 3: Fillet weld test assembly in plate](#) and as follows:
  - a. two fracture tests;
  - b. three macro-sections;
  - c. one hardness survey.
2. 8. 2 Two fracture test specimens are to be removed from the test weld and are to be subjected to testing by bending the upright plate onto the through plate to produce fracture, as shown in [Figure 12. 2. 3: Fillet weld test assembly in plate](#).
2. 8. 3 At least three macro examination specimens are to be removed from the test plate. The specimens are to include the complete cross-section of the weld and the heat affected zone and is to be

## 2. 9 Destructive tests for T, K, Y steel nozzle welds

2. 9. 1 Full penetration 'T', 'K' and 'Y' joints for structural applications and nozzle welds for pressure vessels are to be sectioned for testing in accordance with [Figure 12. 2. 16: Location of macro-examination test specimens for T, K and Y joints](#) and tested as detailed below:
- three macro specimens;
  - impact tests from the weld, fusion line and fusion line + 2 (where the material thickness permits);
  - one hardness survey.
- In addition, butt weld tests are to be performed in accordance with [Ch 12, 2.7, Destructive tests for steel butt welds](#), using the same welding conditions, in order to verify acceptable weld and heat affected zone properties.
2. 9. 2 The impact tests are to be removed from the vertical (up) position 'B' in [Figure 12. 2. 16: Location of macro-examination test specimens for T, K and Y joints](#) and tested in accordance with [Ch 12, 2.7 Destructive tests for steel butt welds 2.7.8](#).

**Figure 12. 2. 16: Location of macro-examination test specimens for T, K and Y joints**

2. 9. 3 A Vickers hardness survey is to be performed on the macro-section removed from position 'A' or 'C' in accordance with that shown in [Figure 12. 2. 17: Hardness test locations for T, K and Y joints](#) using a test load not exceeding 10 kg.

Figure 12. 2. 17: Hardness test locations for T, K and Y joints

## 2. 10 Destructive tests for steel pipe branch welds

2. 10. 1 Pipe branch welds may be by either full penetration, partial penetration or fillet welded, depending on the application and the approved plans. Where these types of welded joints are used, tests are to be performed which simulate the construction conditions.
2. 10. 2 The test weld assembly is to simulate the smallest angle between the branch and main pipe and is to be subjected to macro-examination and hardness testing, as follows:
  - a. For a branch weld that is full penetration, testing is to be performed in accordance with the requirements for 'T', 'K' and 'Y' joints in [Ch 12, 2.9 Destructive tests for T, K, Y steel nozzle welds](#).
  - b. For a branch weld that is either a partial penetration or fillet weld, testing is to be in accordance with the requirements for fillet welds in [Ch 12, 2.8 Destructive tests for steel fillet welds](#).

## 2. 11 Destructive tests for weld cladding of steel

2. 11. 1 Where weld cladding or overlay is allowed by [Ch 13 Requirements for Welded Construction](#), and is considered as providing strength to the component to which it is welded, the type and location of test specimens are to be in accordance with [Figure 12. 2. 18: Type and location of test specimens for weld cladding](#), except that micro-sections are not required. Impact tests may be omitted where the base material does not have specified impact properties. The longitudinal tensile and bend tests are to be tested in a similar manner to transverse specimens specified in [Ch 12, 2.7 Destructive tests for steel butt welds 2.7.2](#) and [Ch 12, 2.7., Destructive tests for steel butt welds 2.7.6](#), respectively.

**Figure 12. 2. 18: Type and location of test specimens for weld cladding**

2. 11. 2 Where the weld cladding is not considered as contributing to the strength of the component, but is required for corrosion or wear resistance, the type and location of test specimens are to be in accordance with [Figure 12. 2. 18: Type and location of test specimens for weld cladding](#), except that tensile and impact tests are not required.
2. 11. 3 Where the weld cladding is applied for corrosion resistance, in addition to the above, weld metal analysis is to be performed on one of the micro-sections, on the final weld surface but 2 mm deep. The analysis is to be within the limits specified for the corrosion resistance required.

## 2. 12 Mechanical test acceptance criteria for steels

### 2. 12. 1 Longitudinal all weld metal tensile test:

- a. In general, the longitudinal all weld tensile test is to meet the minimum properties specified in [Table 11. 3. 2: Requirements for deposited metal tests \(covered electrodes\)](#) or [Table 11. 4. 2: Requirements for deposited metal tests \(wire-flux combinations\)](#), as appropriate to the grade of steel and welding process used in the test.
- b. Where the application is such that no consumable approvals are specified in [Ch 11 Approval of Welding Consumables](#), the longitudinal all weld tensile test is to meet the minimum properties specified for the base materials used in the test.
- c. For pressure vessels manufactured from carbon or carbon/manganese steels, the tensile strength from the longitudinal all weld tensile test is not to be less than the minimum specified for the plate material and is not to be more than 145 N/mm<sup>2</sup> above this value, See [Ch 13, 4.8 Mechanical requirements 4.8.3](#).
- d. For tanks intended for liquefied gases, the weld metal strength may be lower than the minimum specified for the base metal provided that the application has design approval. In such cases the strength is not to be less than that specified in the approved design.
- e. For base metal grades with minimum specified yield strength level of 890 and 960 N/mm<sup>2</sup>, the weld metal strength may be lower than the minimum specified for the base metal provided that the application has design approval for the undermatching weld metal. In such cases the weld metal strength is not to be less than that specified in the approved design.

2. 12. 2 **Transverse tensile test:** The tensile strength measured from the transverse tensile test is not to be less than the minimum specified for the base material used in the test. For tanks intended for liquefied gases and for other types of assemblies for base metal grades with minimum specified yield strength level of 890 and 960 N/mm<sup>2</sup>, a lower ultimate tensile may be accepted subject to design approval as in [Ch 12, 2.12 Mechanical test acceptance criteria for steels 2.12.1.d](#) and [Ch 12, 2.12 Mechanical test acceptance criteria for steels 2.12.1.e](#).
2. 12. 3 **Bend tests:**
- In general, bend tests are to exhibit no defects exceeding 3.0 mm measured in any direction across the tension face of the specimen after being bent over the required diameter of former to the appropriate angle.
  - Bend tests for pressure vessel applications are to exhibit no defects exceeding 3.0 mm measured along the specimen or 1.5 mm measured transverse to the specimen axis, after bending.
  - In all cases, premature failure of the bend tests at the edges of the specimen is to not be cause for rejection unless these are associated with a weld defect.
2. 12. 4 **Impact toughness tests:**
- Impact test specimens for hull construction are to be tested at the temperature, and are to achieve the minimum impact energy, as specified in [Table 12. 2. 2: Impact test requirements for butt joints \(t ≤ 50 mm\) See Notes 1 and 2](#) and [Table 12. 2. 3: Impact test requirements for butt joints \(t > 50 mm\) See Notes 1 and 2](#).
  - Impact test specimens for applications other than hull construction are to be tested at the same temperature and achieve the same minimum energy values, as specified for the base materials used in the test.
  - Impact test acceptance criteria are to be in accordance with the above unless the Rules applicable to the particular construction specify more stringent requirements.
  - For quench and tempered steels, the required test temperature and absorbed energy are to be in accordance with that specified for the parent materials. For base metal grades with minimum specified yield strength level of 890 and 960 N/mm<sup>2</sup>, the weld metal absorbed energy may be lower than the minimum specified for the base metal provided that the application has design approval for the undermatching weld metal. In such cases the absorbed energy is not to be less than that specified in the approved design.

**Table 12. 2. 2: Impact test requirements for butt joints (t ≤ 50 mm) See Notes 1 and 2**

| Grade of steel   | Test temperature (°C)<br>See Note 4 | Average energy (J) minimum, See Note 4 |                                    |                             |
|------------------|-------------------------------------|--|------------------------------------|-----------------------------|
|                  |                                     | Manual or semi-automatic welded joints |                                    | Automatically welded joints |

| AH40   | 20   | 50  | 46                             | 46                                    |
| DH40   | 0  | 50  | 46                             | 46                                    |
| EH40   | -20  | 50  | 46                             | 46                                    |
| FH40   | -40  | 50  | 46                             | 46                                    |
| EH47   | -20  | 64  | 64                             | 64                                    |
| <p><b>Note 1.</b> These requirements are to apply to test piece of which butt weld is perpendicular to the rolling direction of the plates.</p> <p><b>Note 2.</b> For the Naval ships, both the test temperature and value of minimum absorbed energy are to be those specified for the parent material.</p> |  |   |                                |                                       |

- 2. 12. 5 **Macro-examination:** The macro-section is to reveal an even weld profile blending smoothly with the base material. The weld dimensions are to be in accordance with the requirements of the pWPS and any defects present are to be assessed against the non-destructive examination acceptance criteria given in [Ch 12, 2.5 Non-destructive examination \(NDE\) 2.5.5](#).
- 2. 12. 6 **Hardness surveys:** The maximum hardness value reported is not to exceed 350 Hv for steels with a specified minimum yield strength up to  $\leq 420$  N/mm<sup>2</sup>, nor exceed 420 Hv for steels with a specified minimum yield strength in the range 420 N/mm<sup>2</sup> to 690 N/mm<sup>2</sup>.
- 2. 12. 7 **Weld fracture or break tests (for pressure vessel test welds):** The faces of the broken fillet weld fracture or weld break test are to be examined for defects and assessed in accordance with the non-destructive acceptance criteria given in ISO 5817 Level B, except for excess convexity and excess throat thickness where Level C will apply.

## 2. 13 Failure to meet requirements (Retests)

- 2. 13. 1 Where a tensile, bend or hardness specimen fails to meet requirements, further test specimens may be removed and tested in accordance with the requirements of [Ch 2, 1.4 Re-testing procedures 1.4.1](#).
- 2. 13. 2 Where an impact specimen fails to meet requirements, a further set of three specimens may be removed and tested in accordance with the requirements of [Ch 2, 1.4 Re-testing procedures 1.4.4](#).
- 2. 13. 3 Where a macro specimen reveals a defect that is planar in nature, the welding procedure test is to be considered as not satisfying the requirements and a new test assembly is required.
- 2. 13. 4 Where a macro specimen does not meet requirements as a result of a volumetric imperfection exceeding the permitted size, two additional specimens may be removed from the same test weld and examined. If either of these macro-sections also fails to satisfy the requirements, the welding procedure is to be considered as not having met the requirements.
- 2. 13. 5 If there is a single hardness value above the maximum values specified, additional hardness tests are to be carried out, either on the reverse of the specimen, or after sufficient grinding of the tested surface. None of the additional hardness values is to exceed the maximum hardness values specified, otherwise the welding procedure is to be considered as not having met the requirements.
- 2. 13. 6 Where there is insufficient material available in the welded test assembly to provide re-test specimens, subject to prior agreement with the Surveyor, a second assembly may be welded using the same conditions as the original test weld.

## 2. 14 Test records

- 2. 14. 1 The procedure qualification record (PQR) is to be prepared by the manufacturer and is to include details of the welding conditions used in the test specified in [Ch 12, 2.2, Welding variables](#) and the results of all the non-destructive examinations and destructive tests, including re-tests.
- 2. 14. 2 Provided that the PQR lists all the relevant variables and there are no inconsistent features and the results satisfy the requirements, the PQR may be endorsed by the Surveyor as satisfying the requirement of the Rules, *See also* [Ch 12, 1.1 General 1.1.4](#).

## 2. 15 Range of approval

- 2. 15. 1 A welding procedure qualification test that has successfully met the requirements may be used for a wider range of applications than those used during the test.
- 2. 15. 2 Changes outside of the ranges specified are to require a new welding procedure test.
- 2. 15. 3 Other ranges of approval from those specified in this Section may be agreed with the Surveyor, provided that they are in accordance with recognised National or International Standards.

2. 15. 4 **Manufacturer.** A welding procedure qualified by a manufacturer is valid for welding in workshops under the same technical and quality management.
2. 15. 5 **Welding process and technique.** The welding process and welding techniques approved are to be those employed during the welding procedure qualification test. Where multiple welding processes are used, these are to be employed in the same order as that used in the welding procedure qualification test. However, it may be acceptable to delete or add a welding process where it has been used solely to make the first weld run in the root of the joint, provided back gouging or grinding of the root weld is specified on the WPS. For multi-process procedures, the welding procedure approval may be carried out with separate welding procedure tests for each welding process.
2. 15. 6 **Welding positions.** Approval for a test made in any position is restricted to that position. To qualify a range of positions, test assemblies are to be welded for the highest heat input position, and the lowest heat input position, and all applicable tests are to be made on those assemblies. The above excludes welding in the vertical position with travel in the downward direction which will always require separate qualification testing and only be acceptable for that position.
2. 15. 7 **Joint types.** A qualification test performed on a butt weld may be considered acceptable for fillet and partial penetration welds, provided the same welding conditions are used. The range of approval depending on the type of joint for butt welds is given in [Table 12. 2. 4: Range of approval for different types of butt joints](#).

**Table 12. 2. 4: Range of approval for different types of butt joints**

| Type of welded joint for test assembly |            |                 |   | Range of approval |
|--|------------|-----------------|---|-------------------|
| Butt welding                           | One side   | With backing    | A | A,C               |
|  |            | Without backing | B | A,B,C,D           |
|  |            |                 |   |                   |
|  | Both sides | With gouging    | C | C                 |
|  |            | Without gouging | D | C,D               |

2. 15. 8 **Range of material types:**
- For normal and higher strength steels, for each strength level, welding procedures are considered applicable to the same and lower toughness grades as that tested. For each toughness grade, welding procedures are considered applicable to the same and two lower strength levels as that tested with the exception of the two-run (T) or high welding heat input (A) techniques where acceptance is limited to the strength level used in the test.
  - A qualification test performed on H47 strength grade steels may be used to weld the steel of the same strength level or grade H40 and all lower toughness grades to that tested.
  - For high strength quenched and tempered steels, for each strength level, welding procedures are considered applicable to the same and lower toughness grades as that tested. For each toughness grade, welding procedures are considered applicable to the same and one lower strength level as that tested. The approval of quenched and tempered steels does not qualify thermo-mechanically rolled steels (TMCP steels) and vice versa.
  - For weldable C and C-Mn steel forgings, welding procedures are applicable to the same and lower strength level as that tested. The approval of quenched and tempered steel forgings does not qualify other delivery conditions and vice versa.
  - For weldable C and C-Mn steel castings, welding procedures are applicable to the same and lower strength level as that tested. The approval of quenched and tempered steel castings does not qualify other delivery conditions and vice versa.

- f. Dissimilar materials. Where a qualification test has been performed using dissimilar materials, acceptance is to be limited to the materials used in the test.

#### 2. 15. 9 Thickness and diameter range:

- For straight butt welds, the material thickness range to be approved is to be based on the thickness of the test piece and the type of weld as shown in [Table 12. 2. 5: Welding procedure thickness approval range - Butt welds](#).
- For butt welds between plates of unequal thickness, the lesser thickness is the ruling dimension.
- For fillet welds and 'T' butt welds, [Table 12. 2. 5: Welding procedure thickness approval range - Butt welds](#) is to be applicable to both the abutting and through member thicknesses. In addition to the requirements of [Table 12. 2. 5: Welding procedure thickness approval range - Butt welds](#), the range of approval of throat thickness 'a' for fillet welds is to be as follows:
  - single run:  $0.75a$  to  $1.5a$
  - multi-run: as for butt welds with multi-run (i.e.  $a=t$ )
- Notwithstanding any of the above, the approval of maximum thickness of base metal for any technique is to be restricted to the thickness of the test assembly if three of the hardness values in the heat affected zone are found to be within 25 Hv of the maximum permitted.
- The material diameter range to be approved is to be based on the diameter of the test piece and type of weld as shown in [Table 12. 2. 6: Diameter range approved](#).

**Table 12. 2. 5: Welding procedure thickness approval range - Butt welds**

| Test thickness,<br><i>See Note 1</i><br>( $t$ in mm)   | Range approved   |   |
|--|--|---|
|  | All multi-run butt welds<br>and all fillet welds<br><i>See Notes 2 and 3</i> | All single-run or two-run<br>(T technique) butt welds |
| $t \leq 3$   | $t$ to $2t$  | $0.7t$ to $1.1t$                                      |
| $3 < t \leq 12$  | $3$ to $2t$  | $0.7t$ to $1.1t$                                      |
| $12 < t \leq 100$  | $0.5t$ to $2t$ ,<br><i>See Note 1</i>  | $0.7t$ to $1.1t$<br><i>See Note 4</i>                 |
| $t > 100$  | $0.5t$ to $1.5t$   | $0.7t$ to $1.1t$<br><i>See Note 4</i>                 |
| <p><b>Note 1.</b> Subject to a maximum limit of 150 mm.</p> <p><b>Note 2.</b> For multi process procedures, the recorded thickness contribution of each process is to be used as a basis for the range of approval of the individual welding process.</p> <p><b>Note 3.</b> For vertical down welding, the test piece thickness, <math>t</math>, is the upper limit of the range of application.</p> <p><b>Note 4.</b> For processes with heat input over 5.0 kJ/mm, the upper limit of the range of approval is to be <math>1.0 t</math>.</p> |  |   |

**Table 12. 2. 6: Diameter range approved**

|  |                             |
|--|-----------------------------|
| <ul style="list-style-type: none"> <li>Diameter used for test,</li> <li><i>See Note 1</i></li> </ul> | Range of diameters approved |
|--|-----------------------------|

|  |  |
|--|--|
| <ul style="list-style-type: none"> <li>• <math>D \leq 25 \text{ mm}</math></li> <li>• <math>D &gt; 25 \text{ mm}</math></li> </ul>   | <ul style="list-style-type: none"> <li>• <math>0.5D \text{ to } 2D</math></li> <li>• <math>&gt; 0.5D</math>, See Note 2</li> </ul> |
| <p><b>Note 1.</b> <math>D</math> is the outside diameter of the pipe or the smallest side dimension of rectangular hollow section.</p> <p><b>Note 2.</b> Lower diameter range limited to 25 mm minimum. <b>Note 3.</b> Qualification given for plates also covers pipes when the outside diameter is greater than 500 mm or when the diameter is greater than 150 mm welded in the Downhand (D) or Horizontal (X) positions.</p> |  |

یک جدول در فایل اصلی هست؟

#### 2. 15. 10 Welding consumables:

- For manual and semi-automatic welding used for the fill and capping weld runs, it may be acceptable to change the brand or trade name of the welding electrode or wire from that used in the test, provided the proposed alternative has the same or higher approval grading and the same flux type (e.g. basic low hydrogen, rutile, etc.) as used in that test.
- For the consumable used to make the root weld of full penetration butt welds made from one side only, no change in the type or trade name of the consumable or backing material is permitted. Alternative backing materials may be used provided they are equivalent to those used for approval. Where the approved backing material is a low hydrogen grade and the steel being welded requires a low hydrogen backing material, testing of the alternative backing material is to confirm compliance with the requirements of [Ch 11, 7 Consumables for use in one-side welding with temporary backing materials](#).
- For processes with heat input over 5 kJ/mm, no change in the type or trade name of the consumable is permitted.

2. 15. 11 **Shielding gas.** For gas shielded welding processes, a change in shielding gas composition from that used in the test will require a new qualification test.

2. 15. 12 **Heat Input.** The upper limit of heat input approved is 25 per cent greater than that used in the test, or 5.5 kJ/mm, whichever is the smaller. With heat input over 5.0 KJ/mm, the upper limit is 10 per cent above that used in the test. In all cases, the lower limit of heat input approved is 25 per cent lower than that used in the test.

2. 15. 13 **Current type.** The current type used during the qualification test is to be the only type approved. Additionally, changes from or to pulsed current require new qualification tests.

2. 15. 14 **Preheat temperature.** The temperature used during the test is to be the minimum approved. Higher temperatures may be specified for production welds up to the maximum interpass temperature. Where hardness tests have been performed that exhibit results near the maximum permitted, an increase in preheat temperature is required when welding material of greater thickness than that used in the test.

2. 15. 15 **Interpass temperature.** The maximum interpass temperature recorded during qualification testing is to be the maximum approved. Lower temperatures may be specified for production welding, but no lower than the minimum preheat temperature.

2. 15. 16 **Post-weld heat treatment.** A qualification test performed with no post weld heat treatment is only acceptable for production welding where no heat treatment is applied. Where the qualification test has included a post weld heat treatment, this is to be applied to all welds made with the welding procedure. The average specified soak temperature may vary by up to 25°C from that tested.

2. 15. 17 **Shop primers.** Welding procedure qualification with shop primers qualifies welds without primer, but not vice versa.

## **2. 16 Welding procedure specification (WPS)**

- 2. 16. 1 A welding procedure specification (WPS) is to be prepared by the manufacturer detailing the welding conditions and techniques to be employed for production welding. The WPS is to be based on the conditions and variables used during the qualification test, and is to include all the ranges of the essential variables specified in [Ch 12, 2.2 Welding variables 2.2.1](#) and [Ch 12, 2.15 Range of approval](#).
- 2. 16. 2 The WPS should reference the procedure qualification record upon which it is based and is to be approved by the Surveyor prior to commencing production welding.

CHAPTER **12 Welding Qualifications**SECTION **3 Specific requirements for stainless steels****3.1 Scope**

- 3.1.1 The requirements of this Section relate to the group of steel materials classed as stainless steels and include austenitic and duplex grades and martensitic grades.
- 3.1.2 In all cases, welding procedure tests are to be performed generally in accordance with Section 2 with the specific requirements specified below.

**3.2 Austenitic stainless steels**

- 3.2.1 The requirements of this Section relate to the group of stainless steel materials that are austenitic at ambient and sub-zero temperatures, (e.g. 304L, 316L types), *See* [Table 3. 7. 1: Chemical composition](#) in [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#).
- 3.2.2 Impact tests are to be performed from specimens removed from the weld metal. Tests in the heat affected zone are not required. The specimens are to achieve the minimum impact energy, as specified in [Table 11. 8. 2: Requirements for butt weld tests \(all techniques\)](#), in [Ch 11 Approval of Welding Consumables](#)
- 3.2.3 Hardness tests are generally not required.
- 3.2.4 For cryogenic or corrosion resistant applications, the ferrite content in the weld cap region is to be measured and is to be in the range 2 to 10 per cent, with the exception of grades S 31254 and N 08904 where the content is to be nominally zero.
- 3.2.5 A qualification test performed on an austenitic grade may be considered acceptable for welding other austenitic steels with the same or lower level of alloying elements and the same or lower tensile strength.
- 3.2.6 A qualification test performed for cryogenic applications may be considered acceptable for chemical applications, but not vice versa.

**3.3 Duplex stainless steels**

- 3.3.1 The requirements of this Section relate to the group of stainless steel materials that have a ferritic-austenitic structure and are usually referred to as duplex or super duplex stainless steels (e.g. S 31803, S 32760).
- 3.3.2 Impact test specimens are to be removed from the weld and heat affected zone in accordance with [Ch 12, 2 Welding procedure qualification tests for steels](#) with the exception that impact test specimens notched at the FL + 10 mm location are not required. The specimens are to be tested at a temperature of –20°C or the minimum design temperature whichever is the lower and exhibit a minimum average energy of 40 J.

- 3.3.3 The corrosion resistance is to be maintained in the welded condition and the following tests are to be performed to demonstrate acceptable resistance, unless agreed otherwise.
- A sample is to be removed from the weld and heat affected zone for micro-structural examination and is to be suitably prepared and etched so that the microstructures of the weld and heat affected zones can be examined at a magnification of x200 or higher. The micro-structure of the weld and heat affected zone is to be examined, the percentage grain boundary carbides and intermetallic precipitates is to be reported.
  - The ferrite content in the un-reheated weld cap and cap HAZ along with the weld root and root HAZ are to be measured and reported. The ferrite content is to be in accordance with [Table 12. 3. 1: Requirements for ferrite content and corrosion tests for duplex stainless steel test welds](#). Where the intended construction is such that the corrosion medium is only in contact with one surface of the weld (i.e. the weld root), the ferrite determination need only be reported in that surface area.
  - Corrosion testing is to be performed on samples removed from the weld such that both the weld and HAZ are included in the test. The critical pitting temperature is to be determined in accordance with ASTM G48 Method C and meet the requirements specified in [Table 12. 3. 1: Requirements for ferrite content and corrosion tests for duplex stainless steel test welds](#). The cap and root surfaces are to be inspected for evidence of pitting and may require probing the surface with a needle. Pitting found on the ends of the specimen in the weld cross-section may be ignored. The use of the weight loss method for corrosion testing may be accepted subject to special consideration.

**Table 12. 3. 1: Requirements for ferrite content and corrosion tests for duplex stainless steel test welds**

| Duplex Stainless Steel Material Grade | Weld and HAZ Ferrite content | Minimum Critical Pitting Temperature (CPT) |
|---------------------------------------|------------------------------|--|
| S 31260                               | 30 to 70%                    | 20°C                                       |
| S 31803                               | 30 to 70%                    | 20°C                                       |
| S 32550                               | 35 to 65%                    | 25°C                                       |
| S 32750                               | 35 to 65%                    | 25°C                                       |
| S 32760                               | 35 to 65%                    | 25°C                                       |

- 3.3.4 Where the test weld is between a grade of carbon steel and duplex stainless steel, the test requirements of [Ch 12, 3.3 Duplex stainless steels 3.3.3.a](#) and [Ch 12, 3.3 Duplex stainless steels 3.3.3.c](#) are not required and the ferrite content of the weld and the duplex heat affected zone are to be reported for information.
- 3.3.5 A qualification test performed on a duplex stainless steel grade may be considered acceptable for welding other duplex grades which have the same or less stringent mechanical or corrosion properties.
- 3.3.6 The range of heat input is not to vary by more than +10 per cent or –25 per cent from that used during testing.

### 3. 4 Martensitic stainless steels

- 3.4.1 The requirements of this Section relate to the group of stainless steel materials that have a martensitic structure at ambient temperatures, See [Table 4. 5. 1: Typical chemical composition for steel propeller castings](#).

- 3. 4. 2 The results of the hardness survey results are to be reported for information purposes only.
- 3. 4. 3 A qualification test is considered acceptable only for the grade of material used in the test.

CHAPTER **12 Welding Qualifications**SECTION **4 Welding procedure tests for non-ferrous alloys****4.1 Requirements for aluminium alloys**

- 4.1.1 The requirements for welding procedure qualification tests for aluminium alloys are to be in accordance with the general requirements of [Ch 12, 2 Welding procedure qualification tests for steels](#) with the following exceptions and specific requirements.
- 4.1.2 Non-destructive examination is to be performed in accordance with [Ch 12, 2.5 Non-destructive examination \(NDE\)](#) and the assessment of results is to be in accordance with [Table 12. 4. 1: Acceptance criteria for surface imperfections of aluminium alloys](#) and [Table 12. 4. 2: Acceptance criteria for internal imperfections of aluminium alloys](#).

**Table 12. 4. 1: Acceptance criteria for surface imperfections of aluminium alloys**

| Surface discontinuity   | Classification according to ISO 6520-1 | Acceptance criteria  |
|---|--|--|
| Crack   | 100                                    | Not permitted  |
| Lack of fusion  | 401                                    | Not permitted  |
| Incomplete root penetration in butt joints welded from one side | 4021                                   | Not permitted  |
| Surface pore  | 2017                                   | $d \leq 0.1s$ or $0.1a$  |
|   |  | max. 1.0 mm  |
| Uniformly distributed porosity ( <i>See Note 1</i> )            | 2012                                   | $\leq 0.5\%$ of area   |
| Clustered porosity  | 2013                                   | Not permitted  |
| Continuous undercut   | 5011                                   | Not permitted  |
| Intermittent undercut   | 5012                                   | $h \leq 0.1t$ or 0.5 mm (whichever is the lesser)                |
| Excess weld metal ( <i>See Note 2</i> )                         | 502                                    | $h \leq 1.5 \text{ mm} + 0.1b$ or 6 mm (whichever is the lesser) |
| Excess penetration  | 504                                    | $h \leq 4 \text{ mm}$  |
| Root concavity ( <i>See Note 2</i> )                            | 515                                    | $h \leq 0.05t$ or 0.5 mm (whichever is the lesser)               |

|  |     |   |
|--|-----|---|
| Linear misalignment ( <i>See</i> Notes 3 and 4)  | 507 | $h \leq 0.2t$ or 2.0 mm (whichever is the lesser) |
| Symbols  |     |   |
| $a$ = nominal throat thickness of a fillet weld<br>$b$ = width of weld reinforcement<br>$d$ = diameter of a gas pore<br>$h$ = height or width of an imperfection<br>$s$ = nominal butt weld thickness<br>$t$ = wall or plate thickness (nominal size)  |     |   |
| <p><b>Note 1.</b> To be in accordance with EN ISO 10042.</p> <p><b>Note 2.</b> A smooth transition is required.</p> <p><b>Note 3.</b> The limits for linear misalignment relate to deviations from the correct position. Unless otherwise specified, the correct position is to be taken when the centrelines coincide.</p> <p><b>Note 4.</b> Dimensional tolerances not specified in these Rules are to be mutually agreed between the manufacturer and the Surveyor.</p> |     |   |

**Table 12. 4. 2: Acceptance criteria for internal imperfections of aluminium alloys**

| Internal discontinuity                              | Classification according to ISO 6520-1 | Acceptance criteria                                       |                    |
|---|--|---|--------------------|
| Crack   | 100                                    | Not permitted   |                    |
| Lack of fusion                                      | 401                                    | Not permitted   |                    |
| Incomplete penetration                              | 402                                    | Not permitted   |                    |
| Single gas pore                                     | 2011                                   | $d \leq 0.2s$ or $0.2a$ or 4 mm (whichever is the lesser) |                    |
| Linear porosity ( <i>See</i> Note 2)                | 2014                                   | Not permitted   |                    |
| Uniformly distributed porosity ( <i>See</i> Note 2) | 2012                                   | $0.5t$ to $3t$  | $\leq 1\%$ of area |
|   |  | $> 3t$ to $12t$   | $\leq 2\%$ of area |
|   |  | $> 12t$ to $30t$  | $\leq 3\%$ of area |
|   |  | $> 30t$   | $\leq 4\%$ of area |
| Clustered porosity ( <i>See</i> Note 1)             | 2013                                   | $dA \leq 15$ mm or $wp$ (whichever is the lesser)         |                    |
| Elongated cavity<br>Wormhole                        | 2015<br>2016                           | $l \leq 0.2s$ or $0.2a$ or 3 mm (whichever is the lesser) |                    |
| Oxide inclusion ( <i>See</i> Note 2)                | 303                                    | $l \leq 0.2s$ or $0.2a$ or 3 mm (whichever is the lesser) |                    |
| Tungsten inclusion                                  | 3041                                   | $l \leq 0.2s$ or $0.2a$ or 3 mm (whichever is the lesser) |                    |

|   |      |   |
|---|------|---|
| Copper inclusion  | 3042 | Not permitted   |
| Multiple imperfections in any cross-section   | —    | The sum of the acceptable individual imperfections in any cross-section is not to exceed $0.2t$ or $0.2a$ (whichever is the lesser) |
| Symbols   |      |   |
| $a$ = nominal throat thickness of a fillet weld<br>$d$ = diameter of a gas pore<br>$h$ = height or width of an imperfection<br>$s$ = nominal butt weld thickness<br>$t$ = wall or plate thickness (nominal size), in mm<br>$wp$ = width of weld or width or height of cross-sectional area<br>$dA$ = diameter of area surrounding gas pores<br>$l$ = length of imperfection in longitudinal direction of weld |      |   |
| <p><b>Note 1.</b> For this acceptance criterion, linear porosity is to be considered as three aligned gas pores in a length of 25 mm.</p> <p><b>Note 2.</b> Porosity is to be determined in accordance with ISO 10042. The requirements for a single gas pore are to be met by all the gas pores within this circle. Systematic clustered porosity is not permitted.</p>                                      |      |   |

4. 1. 3 Acceptance of the mechanical tests is to be in accordance with [Ch 11, 9 Consumables for welding aluminium alloys](#). Welding of the strain hardened and heat treatable aluminium alloys will generally result in a loss of tensile strength in the heat affected zone below that specified for the base materials and the tensile strength acceptance criteria to be applied is that specified for the material in the annealed or 'as fabricated' condition. Minimum values of tensile strength measured on the transverse tensile samples are given in [Table 12. 4. 3: Tensile strength requirements by grade for aluminium alloys](#).

**Table 12. 4. 3: Tensile strength requirements by grade for aluminium alloys**

| Parent material Grade (alloy designation) | Minimum tensile strength (N/mm <sup>2</sup> ) |
|---|---|
| 5754                                      | 190   |
| 5086                                      | 240   |
| 5083                                      | 275   |
| 5383                                      | 290   |
| 5059                                      | 330   |
| 5456                                      | 290   |
| 6005A                                     | 170   |
| 6061                                      | 170   |
| 6082                                      | 170   |

4. 1. 4 Impact tests and hardness surveys are not required for aluminium alloys.
4. 1. 5 Four side bend tests may be used in place of root and face bends where the test thickness exceeds 12 mm, and longitudinal bend tests may be used instead of transverse tests where the test weld is between different grades of alloy. Bend specimens are to be bent round a former in accordance with [Table 11. 9. 1: Requirements for butt weld tests](#) in Chapter 11, with the exception that the 6000 series alloys may be bent round a former with  $D/t = 7$ .
4. 1. 6 The ranges of approval to be applied to the WPS are to be as specified for steel in [Ch 12, 2.15 Range of approval](#) with the following exceptions:
- The welding positions approved are as detailed in [Table 12. 4. 4: Welding procedure approval, welding positions for aluminium alloys](#).
  - The aluminium alloys are grouped into three groups as follows:
    - Group A: aluminium-magnesium alloys, with Mg content  $\leq 3.5$  per cent (alloy 5754).
    - Group B: aluminium-magnesium alloys with 4 per cent  $\leq \text{Mg} \leq 5.6$  per cent (alloys 5059, 5083, 5086, 5383 and 5456).
    - Group C: aluminium-magnesium-silicon alloys (alloys 6005A, 6061 and 6082).

For each group, the qualification made on one alloy qualifies the procedure also for the other alloys in the group, with equal or lower tensile strength after welding. The qualification made on group B alloys qualifies the procedure for Group A alloys also. Approval for the range of material grades is summarised in [Table 12. 4. 5: Welding procedure approval, aluminium material grades approved](#).
  - The qualification of a procedure carried out on a test assembly of thickness  $t$  is valid for the thickness range given in [Table 12. 4. 6: Range of qualification for parent material thickness](#). In the case of butt joints between dissimilar thicknesses,  $t$  is the thickness of the thinner material. In the case of fillet joints between dissimilar thicknesses,  $t$  is the thickness of the thicker material. In addition to the requirements of [Table 12. 4. 6: Range of qualification for parent material thickness](#), the range of the qualification of throat thickness of fillet welds,  $a$ , is given in [Table 12. 4. 7: Range of qualification of throat thickness for fillet welds](#). Where a fillet weld is qualified by a butt weld test, the throat thickness range qualified is to be based on the thickness of the deposited weld metal.
  - The range of shielding gas compositions approved is to be in accordance with [Table 11. 9. 2: Shielding gas compositions](#) in [Ch 11 Approval of Welding Consumables](#).
  - A change in the brand or trade name of the filler metal from that used in the test is acceptable, provided that the proposed consumable has the same or higher strength grading.
  - A change in post-weld heat treatment or ageing is not permitted, except that for the heat treatable alloys, artificial ageing may give approval for prolonged natural ageing.

**Table 12. 4. 4: Welding procedure approval, welding positions for aluminium alloys**

| Test Position   |    | Positions Approved |
|---|----|--------------------|
| Downhand  | D  | D                  |
| Horizontal-vertical   | X  | D, X               |
| Vertical up   | Vu | D, X, Vu           |
| Overhead  | O  | D, X, Vu and O     |
| Note Welding in vertical down (Vd) position is not recommended. |    |                    |

**Table 12. 4. 5: Welding procedure approval, aluminium material grades approved**

| Material used in qualification test  | Material Grades approved |      |      |      |      |
|--|--------------------------|------|------|------|------|
| 5754   | 5754                     |      |      |      |      |
| 5086   | 5086                     | 5754 |      |      |      |
| 5083   | 5083                     | 5086 | 5754 |      |      |
| 5383   | 5383                     | 5083 | 5086 | 5754 |      |
| 5059   | 5059                     | 5383 | 5083 | 5086 | 5754 |
| 5456   | 5456                     | 5383 | 5083 | 5086 | 5754 |
| 6005A  | 6005A                    | 6082 | 6061 |      |      |
| 6082   | 6005A                    | 6082 | 6061 |      |      |
| 6061   | 6005A                    | 6082 | 6061 |      |      |
| <b>Note</b> Approval includes all the different strained and tempered conditions in each case. |                          |      |      |      |      |

**Table 12. 4. 6: Range of qualification for parent material thickness**

| Thickness of test assembly, $t$ (mm) | Range of qualification<br>Multi pass welds | Range of qualification<br>All single-run or two-run<br>(T technique) butt welds |
|--------------------------------------|--|---|
| $t \leq 3$                           | 0.5 to $2t$                                | 0.5 $t$ to 1.1 $t$  |
| $3 < t \leq 20$                      | 3 to $2t$                                  | 0.5 $t$ to 1.1 $t$  |
| $t > 20$                             | $\geq 0.8t$                                | 0.5 $t$ to 1.1 $t$  |

**Table 12. 4. 7: Range of qualification of throat thickness for fillet welds**

| Throat thickness of test piece, $a$ (mm) | Range of qualification |
|--|------------------------|
| $a < 10$                                 | 0.75 $a$ to 1.5 $a$    |
| $a \geq 10$                              | $\geq 7.5$             |

## 4. 2 Requirements for copper alloys

4. 2. 1 The requirements for welding procedure qualification tests for copper alloys are to be in accordance with the requirements for steel as given in [Ch 12, 2 Welding procedure qualification tests for steels](#) with the following exceptions and additions.
4. 2. 2 Impact tests on copper alloys are not required.
4. 2. 3 Hardness tests are not required for seawater service.
4. 2. 4 For the welding of cast copper alloys for propellers, the minimum tensile strength from the transverse tensile test is to be in accordance with [Table 12. 4. 8: Minimum transverse tensile strengths for welded copper alloy propellers](#).

**Table 12. 4. 8: Minimum transverse tensile strengths for welded copper alloy propellers**

| Alloy designation | Minimum tensile strength (N/mm <sup>2</sup> ) |
|-------------------|---|
| CU 1              | 370   |
| CU 2              | 410   |
| CU 3              | 500   |
| CU 4              | 550   |

4. 2. 5 Bend tests are to be performed over a diameter of former as detailed in [Table 12. 4. 9: Former diameters for bend testing of copper alloy welds](#).

**Table 12. 4. 9: Former diameters for bend testing of copper alloy welds**

| Alloy designation<br>(See <a href="#">Ch 9 Copper Alloys</a> )  | Former diameter ( $D/t$ ) |
|---|---------------------------|
| Cast propellers:  |                           |
| CU1   | 4                         |
| CU2   | 4                         |

| CU4   | 6, See Note               |
| Other short freezing range castings:  |                           |
| Copper-Nickel 90/10   | 4                         |
| Copper-Nickel 70/30   | 4                         |
| Aluminium bronze  | 6                         |
| Wrought alloys (tubes and pipes):   |                           |
| Copper-phosphorus   | 3                         |
| Aluminium-brass   | 3                         |
| 90/10 Copper-nickel-iron  | 3                         |
| 70/30 Copper-nickel-iron  | 3                         |
| <b>Note</b> Where the qualification tests for these alloys are subjected to post-weld heat treatment the former diameter may be increased to $D/t = 10$ . |                           |

4. 2. 6 The range of approval to be applied to the WPS is to be as specified in [Ch 12, 2.15 Range of approval](#) with the exception of the material grades which are detailed in [Table 12. 4. 10: Range of approval for copper alloy material grades](#).

**Table 12. 4. 10: Range of approval for copper alloy material grades**

| Category  | Alloy grade used in the qualification test   | Alloy grades approved                        |
|---|--|--|
| Propellers  | CU1  | CU1  |
|   | CU2  | CU1 and CU2                                  |
|   | CU3  | CU1, CU2 and CU3                             |
|   | CU4  | CU4 <i>See</i> Note 1                        |
| Tubes/pipes   | 90/10 Copper - Nickel-Iron                   | 90/10 Copper -Nickel-Iron                    |
|   | 70/30 Copper - Nickel-Iron                   | 70/30 Copper -Nickel-Iron and                |
|   |  | 90/10 Copper -Nickel-Iron                    |
| Tubes/pipes<br><i>See</i> Note 2  | Copper-Phosphorus deoxidised - arsenical     | Copper-Phosphorus deoxidised - arsenical     |
|   | Copper-Phosphorus deoxidised - non arsenical | Copper-Phosphorus deoxidised - non arsenical |
|   | Aluminium-brass                              | Aluminium-brass                              |
| <p><b>Note 1.</b> Where a CU3 type welding consumable has been used for the qualification test, the range of approval may also include welding of CU3.</p> <p><b>Note 2.</b> These grades have limited weldability and approval to weld is subject to the materials satisfying the requirements of <a href="#">Table 9. 3. 1: Chemical composition of principal elements only</a> in Chapter 9.</p> |  |  |

**CHAPTER 12 Welding Qualifications****SECTION 5 Welder qualification tests****5.1 Scope**

- 5.1.1 The requirements of this Section relate to qualification of welders involved in welded construction and repair associated with ships, or other marine structures, and products or components intended for use on or in these structures.
- 5.1.2 The requirements relate to fusion welding processes that are designated as manual, semi-automatic or partly mechanised. Special consideration will be given to other welding processes adapted from these requirements.
- 5.1.3 The qualification test and approval range of welding operators for fully mechanised and automatic welding processes are to be carried out with reference to ISO 14732 or equivalent.
- 5.1.4 Prior to commencing production welding, the welder is to have performed a qualification test that satisfies these requirements. It is the responsibility of the manufacturer to ensure that the welder possesses the required level of skill for the work to be undertaken.
- 5.1.5 The qualification of welders is to be documented by the manufacturer and the records are to be available for review by the Surveyor.
- 5.1.6 Welder qualification tests made in accordance with EN, ISO, JIS, ASME or AWS may be considered for acceptance provided that, as a minimum, they are equivalent to, and meet the technical intent of these Rules to the satisfaction of the Surveyor.

**5.2 Welder qualification test assemblies**

- 5.2.1 The welding of the welder qualification test assembly is to simulate, as far as practicable, the conditions to be experienced in production and be witnessed by the Surveyor. The test is to be carried out on a test assembly piece and not by way of production welding.
- 5.2.2 The test is to simulate, as far as practicable, the welding techniques and practices to be encountered during production welding. The test assembly is to be designed to test the skill of the welder and have the shape and dimensions appropriate to the range of approval required.
- 5.2.3 The inspection length of the test weld is to be such as to permit the removal of all the necessary test specimens and for plate tests, but in no case is to be less than 250 mm. The test assembly is to be set in one of the positions as shown in [Figure 12.2.4: Plate butt weld test positions](#) to [Figure 12.2.7: Pipe fillet weld test positions](#) appropriate to the welding positions to be approved.
- 5.2.4 A welding procedure specification (WPS) is required for the execution of the qualification test and is to include the information specified in [Ch 12, 2.2 Welding variables 2.2.1](#), as a minimum.
- 5.2.5 The test assembly is to be marked with a unique identification and the inspection length is to be identified prior commencing welding. For pipe welds, the whole circumference is to be considered as the inspection length.

- 5.2.6 During welding of the test assembly, the welding time is to be similar to that expected under production conditions. For manual or semi-automatic processes, at least one stop and re-start in the root and in the top surface layer is to be included in the inspection length and marked for future inspection.
- 5.2.7 During welding of the test assembly, minor imperfections may be removed by the welder by any method that is used in production, except on the surface layer.
- 5.2.8 The Surveyor may stop the test if the welding conditions are not correct or if there is any doubt about the competence of the welder to achieve the required standard.

### 5.3 Examination and testing

- 5.3.1 Each completed test weld is to be examined and tested in accordance with the requirements of [Table 12.5.1: Welder qualification test requirements](#). All examinations and tests are to be witnessed by the Surveyor.

**Table 12.5.1: Welder qualification test requirements**

| Examination type        | Butt welds                      | Fillet welds             | Pipe branch welds        | Butt tack welds | Fillet tack welds |
|-------------------------|---------------------------------|--------------------------|--------------------------|-----------------|-------------------|
| Visual                  | 100%                            | 100%                     | 100%                     | 100%            | 100%              |
| Surface crack detection | See Note 1                      | 100%                     | 100%                     | Not required    | Not required      |
| Radiography             | 100% See Notes 2 and 6          | Not required             | Not required             | Not required    | Not required      |
| Bend tests              | 4 required<br>See Notes 3 and 6 | Not required             | Not required             | Not required    | Not required      |
| Fracture tests          | Not required                    | 1 required<br>See Note 4 | Not required             | 1 required      | 1 required        |
| Macro                   | Not required                    | 1 required<br>See Note 4 | 4 required<br>See Note 5 | Not required    | Not required      |

**Note 1.** Surface crack detection examination may be required by the Surveyor in order to clarify the acceptability of any weld feature.

**Note 2.** Radiography may be replaced by ultrasonic examination for carbon and low alloy steels where the thickness exceeds 8 mm.

**Note 3.** Bend tests are required for gas metal arc welding (GMAW) with solid wire or metal cored wire and oxy-acetylene welding.

**Note 4.** The fracture test may be replaced with 4 macro sections equally spaced along the inspection length.

**Note 5.** Macro-sections are to be separated by 90° measured around the abutting pipe member.

**Note 6.** Radiography and bend tests are required for tests in aluminium alloys.

- 5.3.2 Visual examination is to be performed in the as welded state prior to any other assessment.
- 5.3.3 For plate butt welds, fracture testing may be used in place of radiography.
- 5.3.4 Where a backing strip has been used, it is to be retained for non-destructive examinations, but is to be removed prior to performing any bend or fracture tests.
- 5.3.5 Where fracture tests are required, they are to sample as much of the inspection length as practicable and the test assembly may be cut into several test specimens to achieve this. Testing is to be performed as shown in [Figure 12.5.1: Preparation and fracture testing of test specimens for a fillet weld in plate](#) or [Figure 12.5.2: Preparation and fracture testing of test specimens for a butt weld in plate](#).

**Figure 12. 5. 1: Preparation and fracture testing of test specimens for a fillet weld in plate**

4607/41

**Figure 12. 5. 2: Preparation and fracture testing of test specimens for a butt weld in plate**

4607/40

5. 3. 6 For butt weld tests in aluminium alloys both radiography and bend tests are required.
5. 3. 7 When bend tests are required, 2 root and 2 face bends are to be tested and where the test thickness exceeds 12 mm, these may be substituted by 4 side bends specimens. The diameter of former to be used is to be in accordance with that specified for welding procedure qualification testing given in [Ch 12, 2.7 Destructive tests for steel butt welds 2.7.6.a.](#)
5. 3. 8 Where macro examination is required, the specimen is to be polished and etched to reveal the weld runs and heat affected zones, and be examined at a magnification between x5 and x10.

## 5. 4 Acceptance criteria

- 5. 4. 1 The acceptance criteria are to be in accordance with [Ch 12, 2.5 Non-destructive examination \(NDE\) 2.5.5](#).
- 5. 4. 2 Fracture tests and macro-sections are to be assessed in accordance with the non-destructive examination acceptance criteria.
- 5. 4. 3 Bend tests are considered acceptable if after bending through an angle of at least 180°, there are no defects on the tension side of the specimen greater than 3 mm in any direction.

## 5. 5 Failure to meet requirements

- 5. 5. 1 Where a macro-section fails to meet requirements, one additional specimen may be removed from the test assembly and examined.
- 5. 5. 2 Where a bend or fracture test specimen fails to meet requirements, two additional specimens may be prepared from the same test assembly. If there is insufficient material, the welder may be permitted to weld an additional assembly to the same WPS, at the discretion of the Surveyor.
- 5. 5. 3 Where any of the additional test specimens fails to satisfy the requirements, the test will be considered as not meeting the requirements.
- 5. 5. 4 Where a test fails to comply with the acceptance criteria, the welder may be permitted to weld a second test piece. If this does not meet requirements, the welder is to be considered as not being capable of achieving the requirements.

## 5. 6 Range of approval

- 5. 6. 1 Upon successful completion of all the necessary examinations and tests, the welder is to be considered qualified. The essential variables and the range of welding conditions for which the welder is considered approved are specified in the following paragraphs.
- 5. 6. 2 Welding variables such as preheat, interpass temperature, heat input and current type are not considered welder qualification variables. However, if the WPS used for testing specify these, they are to be included in the test and the welder is expected to follow the specific instructions.
- 5. 6. 3 Where the WPS used for the welder qualification test specifies post-weld heat treatment, this need not be applied to the test weld unless bend tests are required and the material exhibits low ductility in the as welded condition.
- 5. 6. 4 The qualification test performed by a manufacturer is only applicable to workshops under the same technical control and quality system as that used for the test.
- 5. 6. 5 The welding process used in the qualification test is the process approved. However, it is possible for the welder to use more than one process in the test and the range of approval that may be applied to each will be within the limits of the essential variables appropriate to the part of the test where each welding process was used.
- 5. 6. 6 A change from welding with solid wire to metal cored wire or vice versa is allowed. A change from or to welding with flux cored wire requires a new qualification test.
- 5. 6. 7 For gas tungsten arc welding in which the wire is added manually, welding with a filler wire qualifies welding without filler wire but not vice versa.
- 5. 6. 8 Material types are to be grouped as shown in [Table 12. 5. 2: Welder qualification materials groupings](#) for welder qualifications. A qualification test performed on one material from a group will permit welding of all other materials within the same group. In addition, qualification on one group of materials may confer approval to weld other groups as shown in [Table 12. 5. 3: Welder qualification, range of approval for material groups](#).

**Table 12. 5. 2: Welder qualification materials groupings**

| Material group | Material description   | Typical ACS Grades                | Rules for Material references   |
|----------------|--|-----------------------------------|---|
| WQ 01          | Low carbon unalloyed,  | A, B, D and E                     | <a href="#">Ch 3, 2 Normal strength steels for ship and other structural applications</a>   |

| WQ 32   | WQ 30  | WQ 31                  | WQ 32                  | WQ 33 |
| WQ 33   | WQ 30  | WQ 31                  | WQ 32                  | WQ 33 |
| WQ 34   | WQ 34  | WQ 35                  |                        |       |
| WQ 35   | WQ 34  | WQ 35                  |                        |       |
| WQ 36   | WQ 36  |                        |                        |       |
| <b>Note</b> Provided an austenitic welding consumable compatible with material group WQ 11 is used. |        |                        |                        |       |

5. 6. 9 A qualification test performed on one thickness will confer approval to weld other thicknesses as specified in [Table 12. 5. 4: Welder qualification, range of approval for material thickness](#). Where welding is required between materials of different thickness, the reference thickness for approval purposes is to be the lesser thickness.

**Table 12. 5. 4: Welder qualification, range of approval for material thickness**

| Material type   | Test piece thickness (mm) | Range approved, <i>See Note</i> (mm) |
|---|---------------------------|--------------------------------------|
| Steel and copper alloys   | $t < 3$                   | $t$ to $2t$                          |
|   | $3 \leq t < 12$           | 3.0 to $2t$                          |
|   | $t \geq 12$               | $\geq 3.0$                           |
| Aluminium alloys  | $t \leq 6$                | $0.5 t$ to $2t$                      |
|   | $t > 6$                   | $\geq 6$                             |
| <b>Note</b> For oxy-acetylene welding the maximum thickness is limited to $1.5 t$ . |                           |                                      |

5. 6. 10 A qualification test performed on plate confers approval to weld on pipes having an outside diameter greater than 500 mm in a fixed position (*See* [Table 12. 5. 5: Welder qualification, diameter range of approval for pipes and hollow sections](#) and [Table 12. 5. 7: Welding position ranges for welder qualification](#)).

**Table 12. 5. 5: Welder qualification, diameter range of approval for pipes and hollow sections**

| Material type   | Test piece diameter (mm) | Range approved (mm)         |
|---|--------------------------|-----------------------------|
| Steel and copper alloys   | $D \leq 25$              | $D$ to $2D$                 |
|   | $25 < D \leq 150$        | $0.5D$ to $2D$ , See Note 1 |
|   | $D > 150$                | $\geq 0.5D$                 |
|   | Plate, See Note 2        | $\geq 500$                  |
| Aluminium alloys  | $D \leq 125$             | $0.25D$ to $2D$             |
|   | $D > 125$                | $\geq 0.5D$                 |
|   | Plate, See Note 2        | $\geq 500$                  |
| <p><b>Note 1.</b> Subject to 25 mm minimum diameter.</p> <p><b>Note 2.</b> Plate qualification will approve welding on pipes greater than 150 mm diameter when the pipe is rotated.</p> |                          |                             |

5. 6. 11 qualification test performed using a specific diameter of pipe will give approval to weld other diameters as shown in [Table 12. 5. 5: Welder qualification, diameter range of approval for pipes and hollow sections](#). For branch welds, the diameter upon which approval is based is to be the branch member.
5. 6. 12 A qualification test performed on a butt weld may be considered as giving approval for fillet welds. Where a welder is employed to perform fillet welding only, a fillet welding qualification test is required. For welding T joints with full or partial penetration a butt welding qualification is required.
5. 6. 13 A qualification test performed on one type of weld joint will give approval to weld other types of weld joint as shown in [Table 12. 5. 6: Range of welded joints for welder qualification](#).

**Table 12. 5. 6: Range of welded joints for welder qualification**

| Type of welded joint for test assembly |            |                 |   | Range of approval |  |
|--|------------|-----------------|---|-------------------|--|
| Butt welding                           | One side   | With backing    | A | A, C, E, F        |  |
|  |            | Without backing | B | A, B, C, D, E, F  |  |
|  | Both sides | With gouging    | C | A, C, E, F        |  |
|  |            | Without gouging | D | A, C, D, E, F     |  |
| Fillet weld                            |            | Multi-run       | E | E, F              |  |
|  |            | Single-run      | F | F                 |  |

**Table 12. 5. 7: Welding position ranges for welder qualification**

| Test weld conditions |               | Positions qualified |             |                  |             |
|----------------------|---------------|---------------------|-------------|------------------|-------------|
| Type of weld         | Test position | Plate               |             | Pipe, See Note 1 |             |
|                      |               | Butt weld           | Fillet weld | Butt weld        | Fillet weld |

|  |  |                |             |                |             |
|--|--|----------------|-------------|----------------|-------------|
| Plate butt,<br><i>See Note 5</i>   | D  | D              | D           | D              | D           |

|  | X  | –              | D, X        | –              | D, X        |
|  | D+Vu+O <i>See</i><br>Note 3                                  | –              | D, X, Vu, O | –              | D, X, Vu, O |
|  | D+Vu+O <i>See</i><br>Note 3                                  | –              | Vd          | –              | Vd          |
| <p><b>Note 1.</b> Pipe D position means pipe in horizontal position and rotated, <i>See</i> <a href="#">Figure 12. 2. 5: Pipe butt weld test positions</a> and <a href="#">Figure 12. 2. 7: Pipe fillet weld test positions</a>.</p> <p><b>Note 2.</b> Vd position not usually recommended for pipe welds less than 500 mm diameter.</p> <p><b>Note 3.</b> Pipe fixed with axis in the horizontal position (e.g. ASME 5G).</p> <p><b>Note 4.</b> Pipe fixed with axis at 45° to the horizontal (e.g. ASME 6G).</p> <p><b>Note 5.</b> Plate qualification tests confers approval to weld pipes with diameter greater than 500 mm.</p> |  |                |             |                |             |

5. 6. 14 A qualification test performed in one position will give approval to weld in other positions as shown in [Table 12. 5. 7: Welding position ranges for welder qualification](#).
5. 6. 15 For manual metal arc welding with covered electrodes, a qualification test performed using an electrode with one type of coating will only be approved for welding with that type of coating. However, a qualification test performed using a basic low hydrogen type coating will confer approval to use electrodes with rutile coatings.
5. 6. 16 For gas shielded welding processes that use a single component shielding gas, no change to the gas composition is permitted from that tested. Where the test has used a two component shielding gas, a change in the ratio of component gases is permitted, provided that one of the components is not reduced to zero. Where the test has used a three component shielding gas, changes are permitted in the ratio of component gases and the gas with the smallest ratio may be reduced to zero, provided this does not change the shielding gas from an active one to an inert one or vice versa. In addition, where a change in shielding gas composition requires a different welding method or technique to be employed, a new qualification test will be required.
5. 6. 17 A change of welding flux from that used for the test is permitted.
5. 6. 18 A qualification for butt or fillet welding qualifies welding of tacks.
5. 6. 19 Where a welder is employed in the welding of tack welds only and which are not incorporated into the final weld, a test assembly in accordance with [Figure 12. 5. 3: Dimensions and types of test assembly for butt tack welding](#) or [Figure 12. 5. 4: Dimensions and types of test assembly for fillet tack welding](#) may be prepared as an alternative to full butt or fillet weld qualification.

**Figure 12. 5. 3: Dimensions and types of test assembly for butt tack welding**

**Figure 12. 5. 4: Dimensions and types of test assembly for fillet tack welding**

## 5. 7 Welders qualification certification

5. 7. 1 All the relevant conditions used during the test are to be entered on the welder's qualification certificate along with the permitted range of approval.
5. 7. 2 If the Surveyor is satisfied that the welder has demonstrated the appropriate level of skill and all tests are satisfactory, the Surveyor will endorse the certificate verifying that the details contained on it are correct and that the test welds were prepared, welded and tested in accordance with the specified Rules, Codes or Standards.
5. 7. 3 The welder is considered to be approved for an initial validity period of 2 or 3 years depending upon the chosen method of validation which is to be stated on the welder's certificate at time of issue. The welder is considered to have retained the qualification during this period subject to the manufacturer confirming every 6 months that the welder has met the following conditions:
  - a. The welder has been engaged with a reasonable continuity on welding work within the current range of approval. An interruption for a period of no longer than six months is permitted.
  - b. The welder's work shall generally be in accordance with the technical conditions under which approval test is carried out.
  - c. There shall be no specific reason to question the welder's skill and knowledge.
5. 7. 4 The Surveyor shall extend the validity of the approval by one of the following methods:
  - a. Re-test the welder every 3 years.
  - b. After 2 years, two welds made within the previous six months are to be subject to radiographic inspection or ultrasonic inspection or destructively tested and the result recorded. Welding shall reproduce all initial test conditions except for thickness. Subject to satisfactory examination or testing the qualification is revalidated for a further 2 years. The Surveyor will signify acceptance of the extension to the validity by endorsing the certificate.
5. 7. 5 Where there is any reason to question the welder's ability, or there is a lack of continuity in the use of the welding process, or insufficient recorded evidence of acceptable weld performance, the welder is to perform a new qualification test.
5. 7. 6 Where the manufacturer has existing welders that have previously performed qualification tests, these may be considered for acceptance provided they satisfy the above requirements and the tests have been performed in the presence of an independent examiner that is acceptable to the Society.

- 5.7.7 Notwithstanding the above, the Surveyor may at any time request a review of a welder's qualification records. If there is any reason for doubt concerning the skill of the welder, the Surveyor may withdraw the qualification and require a re-qualification test to be performed.

CHAPTER **12 Welding Qualifications**

SECTION **6 Qualification of friction stir welding of aluminium alloys**

## **6. 1 Scope**

- 6. 1. 1 The requirements of this Section relate to the Friction Stir Welding (FSW) of aluminium alloys. These requirements include requirements for verification of welding equipment, welding procedures, qualification of welding procedures and qualification of welding operators.

## **6. 2 Welding equipment**

- 6. 2. 1 Welding equipment (e.g. welding machines and FSW tools) is to be capable of producing welds that meet the specified acceptance levels.
- 6. 2. 2 Welding equipment is to be maintained in a good condition and is to be repaired or adjusted when necessary.
- 6. 2. 3 After installation of new or refurbished equipment, appropriate tests are to be performed to verify that the equipment functions correctly.

## **6. 3 Weld procedures**

- 6. 3. 1 This Section defines the requirements for welding procedures to be applied for FSW of aluminium alloys.
- 6. 3. 2 Manufacturers are to prepare a preliminary welding procedure specification (pWPS) defining procedures for how FSW is to be conducted.
- 6. 3. 3 A pWPS is to comply with the requirements of ISO 25239-4.
- 6. 3. 4 Qualification of a pWPS is achieved by conducting weld procedure qualification tests in accordance with ISO 25239-4. Minimum acceptance criteria for destructive tests are to be in accordance with these Rules. Reporting of the qualification tests are to be in accordance with ISO 25239-4.
- 6. 3. 5 Provided that the procedure qualification record lists all the relevant variables and there are no inconsistent features and the results satisfy the requirements, the procedure qualification record may be endorsed by the Surveyor as satisfying the requirement of the Rules.
- 6. 3. 6 A welding procedure specification (WPS) is to be prepared after the procedure qualification test report has been endorsed by the Surveyor.
- 6. 3. 7 For welding procedure specifications, the range of approval is to be limited as follows:
  - a. **Manufacturer.** A welding procedure qualified by a manufacturer is valid for welding in workshops under the same technical and quality management.

- b. **Range of material type.** Approval is restricted to the specific aluminium grade and supply condition used in the qualification test.
- c. **Thickness.** Approval is restricted to the thickness of the test piece in the qualification test.
- d. **Joint types.** The joint types approved are to be those from the welding procedure qualification test only.
- e. **Welding tool.** Approval is restricted to the specific design of welding tool employed during the qualification test.
- f. **Other.** A range of approval for any other variables will be subject to special consideration.

## **6. 4 Qualification of welding operators**

- 6. 4. 1 Welding operators are to be qualified in accordance with ISO 25239-3.
- 6. 4. 2 Welding operators are to be suitably trained and will be required to demonstrate a knowledge of FSW and have a working knowledge of the welding installation. Knowledge of the FSW process may be demonstrated by exams passed during the training period. Demonstration of a working knowledge of the welding installation will be subject to the Surveyor's satisfaction.
- 6. 4. 3 Qualification of welding operators is to be by welding tests as specified in ISO 25239-3 or by conducting weld procedure qualification tests.
- 6. 4. 4 Upon successful completion of all necessary examination and tests, the welding operator is to be considered qualified. The range of qualification is to be as specified in ISO 25239-3.
- 6. 4. 5 A certificate of qualification is to be issued in accordance with ISO 25239-3.

PART

# 2

CHAPTER **13 Requirements for Welded Construction**

SECTION **1 General welding requirements**

## **1.1 Scope**

- 1.1.1 This Chapter specifies requirements for fabrication and welding during construction and repair of ships or other marine structures, and their associated pressure vessels, machinery, equipment, components and products intended for use in these structures.
- 1.1.2 The requirements for fabrication and welding during construction and repair of tanks intended for transport or storage of liquefied gases are located in the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk*, or the *Rules and Regulations for the Classification of Offshore Units*, as appropriate.
- 1.1.3 The requirements relate to fusion welding. Special consideration will be given to the use of other welding processes based on these requirements.
- 1.1.4 It is the responsibility of the manufacturer to ensure compliance with all aspects of these Rules and inform the Surveyor of any deviations that have occurred. All deviations are to be recorded as non-compliances along with the corrective actions taken and failure to do this is considered to render the fabrication to be in non-compliance with the Rules.
- 1.1.5 Welded constructions that comply with National or International specifications may be accepted to the satisfaction of the surveyor, provided that these specifications give reasonable equivalence to the requirements of this Chapter.
- 1.1.6 All welded construction is to be to the satisfaction of the Surveyor.

## **1.2 Design**

- 1.2.1 Prior to commencing any work, the component to be manufactured is to be subjected to design review and approval in accordance with the Rule requirements.
- 1.2.2 The material characteristics that are affected by welding, particularly the loss of strength (e.g. in precipitation or strain hardened aluminium alloys) are to be considered in the design. The weld joints in such materials are to be arranged such that they are in areas of lower stress.

## **1.3 Materials**

- 1.3.1 Materials used in welded construction are to be manufactured at works approved by ACS. The use of materials from alternative sources will be subject to agreement of the Surveyor and satisfactory verification testing.
- 1.3.2 Materials are to be supplied and certified in accordance with the requirements of [Ch 1 General Requirements](#) to [Ch 10 Equipment for Mooring and Anchoring](#) of these Rules.

- 1. 3. 3 Materials used in welded construction are to be readily weldable and are to have proven weldability, unless requirements are agreed with ACS in advance.
- 1. 3. 4 Where the construction details are such that materials are subject to through thickness strains, consideration is to be given to using material with specified through thickness properties as specified in [Ch 3, 8 Plates with specified through thickness properties](#).
- 1. 3. 5 When ordering materials for construction, consideration is to be taken of the possible degradation of properties during fabrication or post-weld heat treatment. Where these materials are used, consideration is to be given to additional test requirements being specified to the supplier.
- 1. 3. 6 The identity of materials is to be established by way of markings etc, during fabrication, so that traceability to the original manufacturer's certificate is maintained.
- 1. 3. 7 Pre-fabrication shop primers may be applied prior to welding, provided that they are of an approved type and have been tested to demonstrate that they have no deleterious effects on the completed weld.
- 1. 3. 8 Where it is proposed to weld forgings and/or castings, full details of the joint details, welding procedures and post-weld heat treatments are to be submitted for consideration.

## **1. 4 Requirements for manufacture and workmanship**

- 1. 4. 1 The welding workshops are to be assessed by the Surveyor for their capability to produce work of the required quality in accordance with the requirements specified for the type of construction, See [Ch 13, 2 Specific requirements for ship hull structure and machinery](#) to [Ch 13, 5 Specific requirements for pressure piping](#)
- 1. 4. 2 Where structural components are to be assembled and welded in works sub-contracted by the builder, the Surveyor is to inspect the sub-contractor's works to ensure that compliance with the requirements of this Chapter is achieved.
- 1. 4. 3 The manufacturer is to provide a system of regular supervision of all welding, by suitably qualified and experienced personnel.
- 1. 4. 4 Welding is to be performed in covered workshops as far as practicable. Where this is not possible, provision is to be made in the welding area to give adequate protection from wind, rain and cold, etc.
- 1. 4. 5 Where required, arrangements are to be such as to permit adequate ventilation and access for preheating, and for the satisfactory completion of all welding operations.
- 1. 4. 6 The location of welding connections and sequences of welding are to be arranged to minimise distortion and the build up of residual stresses. Welded joints are to be so arranged as to facilitate the use of downhand welding wherever possible.
- 1. 4. 7 In the case of repairs to existing structures or components, care is to be exercised when attaching fit-up aids by welding to ensure that the base materials in way of the attachments are of weldable quality.
- 1. 4. 8 In order to prevent cross-contamination of different material types, the welding of carbon steel materials is to be in areas segregated from that used for either austenitic or non-ferrous materials, See [Ch 13, 7 Austenitic and duplex stainless steel – Specific requirements](#).

## **1. 5 Cutting of materials**

- 1. 5. 1 Materials may be cut to the required dimensions by thermal means, shearing or machining in accordance with the manufacturing drawings or specifications.

- 1. 5. 2 Cold shearing is not to be used on materials in excess of 25 mm thick. Where used, the cut edges that are to remain un-welded are to be cut back by machining or grinding for a minimum distance of 3 mm.
- 1. 5. 3 Material, which has been thermally cut, is to be free from excessive oxides, scale and notches.
- 1. 5. 4 All cut edges are to be examined to ensure freedom from material and/or cutting defects. Visual examination may be supplemented by other techniques.
- 1. 5. 5 Thermal cutting of alloy and high carbon steels may require the application of preheat, and special examination of these cut edges will be required to ensure no cracking. In these cases, the cut edge is to be machined or ground back a distance of at least 2 mm, unless it has been demonstrated that the cutting process has not damaged the material.
- 1. 5. 6 Any material damaged in the process of cutting is to be removed by machining, grinding or chipping back to sound metal. Weld repair may only be performed with the agreement of the Surveyor.

## **1. 6 Forming and bending**

- 1. 6. 1 Plates, pipes, etc. may be formed to the required shape by any process which does not impair the quality of the material.
- 1. 6. 2 Where hot forming is employed the manufacturer is required to demonstrate that the forming procedure is compliant with a recognised National or International Standard or shall demonstrate by appropriate qualification tests that the material properties remain acceptable in the 'as formed' condition.
- 1. 6. 3 Materials that are cold formed, such that the permanent strain exceeds 10 per cent, or formed to a diameter to thickness ratio less than 10, are to be subjected to a subsequent softening heat treatment in accordance with the material manufacturers recommendations, unless it is demonstrated by testing that the material properties are acceptable in the 'as formed' condition.
- 1. 6. 4 As far as practicable, forming is to be performed by the application of steady continuous loading using a machine designed for that purpose. The use of hammering, in either the hot or cold condition is not to be employed.
- 1. 6. 5 Material may be welded prior to forming or bending, provided that it can be demonstrated that the weld mechanical properties are not impaired by the forming operation. All welds subjected to bending are to be inspected on completion to ensure freedom from surface breaking defects.

## **1. 7 Assembly and preparation for welding**

- 1. 7. 1 Excessive force is not to be used in fairing and closing the work. Where excessive root gaps exist between surfaces or edges to be joined, corrective measures are to be adopted.
- 1. 7. 2 Provision is to be made for retaining correct alignment during welding operations in accordance with the approved manufacturing specifications and welding procedures.
- 1. 7. 3 Tack welds are to be avoided as far as practicable. When used, tack welds are to be of the same quality as the finished welds, made in accordance with approved welding procedures, and where they are to be retained as part of the finished weld, they are to be clean and free from defects.
- 1. 7. 4 Generally, tack welds are not to be applied in lengths of less than 30 mm for mild steel grades and aluminium alloys, and 50 mm for higher tensile steel grades. Smaller tack welds may be accepted for steels, provided that the carbon equivalent of the materials being welded is not greater than 0.36 per cent.

- 1. 7. 5 Where deep penetration welding is used (See [Ch 13, 2.4 Construction and workmanship 2.4.6](#)), welding procedure tests are to demonstrate that the specified degree of penetration is achieved in way of tack welds left in place.
- 1. 7. 6 Where temporary bridge pieces or strong-backs are used, they are to be of similar materials to the base materials and welded in accordance with approved welding procedures.
- 1. 7. 7 Any fit-up aids and tack welds, where welded to clad materials, are to be attached to the base material and not to the cladding.
- 1. 7. 8 Surfaces of all parts to be welded, are to be clean, dry and free from rust, grease, debris and other forms of contamination.
- 1. 7. 9 When misalignment of structural members either side of bulkheads, decks etc. exceeds the agreed tolerance, the misaligned item is to be released, realigned and rewelded in accordance with an approved procedure.

## **1. 8 Welding equipment and welding consumables**

- 1. 8. 1 Welding plant and equipment is to be suitable for the purpose intended and properly maintained, taking into account relevant safety precautions.
- 1. 8. 2 Suitable means of measuring the welding parameters (i.e. current, voltage and travel speed) are to be available. Electrical meters are to be properly maintained and have current calibrations.
- 1. 8. 3 Welding consumables are to be suitable for the type of joint and grade of material to be welded, and in general, are to be ACS Approved in accordance with [Ch 11 Approval of Welding Consumables](#).
- 1. 8. 4 Special care is to be taken in the distribution, storage and handling of all welding consumables. They are to be kept in heated dry storage areas with a relatively uniform temperature in accordance with the consumable manufacturer's recommendations. Condensation on the metal surface (e.g. wire electrodes and studs) during storage and use is to be avoided.
- 1. 8. 5 Prior to use, welding consumables are to be dried and/or baked in accordance with the consumable manufacturer's recommendations.
- 1. 8. 6 Satisfactory storage and handling facilities for consumables are to be provided close to working areas and the condition of welding consumables are to be subject to regular inspections.

## **1. 9 Welding procedure and welder qualifications**

- 1. 9. 1 Welding procedures are to be developed by the manufacturer for all welding, include weld repairs, and are to be capable of achieving the mechanical property requirements and non-destructive examination quality appropriate to the work being undertaken.
- 1. 9. 2 Welding procedures are to be established for the welding of all joints and are to be qualified by testing in accordance with [Ch 12 Welding Qualifications](#). The welding procedures are to give details of the welding process, type of consumable, joint preparation, welding position and filler metals to be used.
- 1. 9. 3 The proposed welding procedures are to be approved by the Surveyor prior to construction.
- 1. 9. 4 All welders and welding operators are to be qualified in accordance with the requirements of [Ch 12 Welding Qualifications](#). Qualification records to demonstrate that welding personnel have the skills to achieve the required standard of workmanship are to be available to the Surveyor.

## **1. 10 Welding during construction**

1. 10. 1 Materials to be assembled for welding are to be retained in position by suitable means such that the root gaps and alignment are in accordance with the approved manufacturing specifications and welding procedures.
1. 10. 2 Surfaces of all parts to be welded, are to be clean, dry and reasonably free from rust, scale and grease.
1. 10. 3 Pre-heat is to be applied, as specified in the approved welding procedure, for a distance of at least 75 mm from the joint preparation edges. The method of application and temperature control are to be such as to maintain the required level throughout the welding operation.
1. 10. 4 When the ambient temperature is 0°C or less, or where moisture resides on the surfaces to be welded, due care is to be taken to pre-heat the joint to a minimum of 20°C, unless a higher pre-heat temperature is specified.
1. 10. 5 Where tack welds are to be removed from the root of the weld joint, this is to be carried out such that the surrounding material and joint preparation is not damaged.
1. 10. 6 The welding arc is to be struck on the parent metal which forms part of the weld joint or on previously deposited weld metal.
1. 10. 7 Where the welding process used is slag forming (e.g. manual metal arc, submerged arc, etc.) each run of deposit is to be cleaned and free from slag before the next run is applied.
1. 10. 8 Full penetration welds are to be made from both sides of the joint as far as practicable. Prior to welding the second side, the weld root is to be cleaned, in accordance with the requirements of the approved welding procedure, to ensure freedom from defects. When air-arc gouging is used, care is to be taken to ensure that the ensuing groove is slag and oxide free and has a profile suitable for welding.
1. 10. 9 Where welding from one side only, care is to be exercised to ensure the root gap is in accordance with the approved welding procedure and the root is properly fused.
1. 10. 10 Particular care is to be exercised in welding in the vertical position with direction of travel downward (Vd) to avoid welding defects. The use of solid wire gas metal arc (GMAW) process in the vertical down position is to be avoided.
1. 10. 11 Welding is to proceed systematically with each welded joint being completed in correct sequence without undue interruption.
1. 10. 12 After welding has been stopped for any reason, care is to be taken in restarting to ensure that the previously deposited weld metal is thoroughly cleaned of slag and debris, and preheat has been re-established.
1. 10. 13 Care is to be taken to avoid stress concentrations such as sharp corners or abrupt changes of section, and completed welds are to have an even contour, blending smoothly with the base materials. The weld shape and size is to be in accordance with that specified in the approved drawings or specifications.
1. 10. 14 Welded temporary attachments used to aid construction are to be removed carefully by grinding, cutting or chipping. The surface of the material is to be finished smooth by grinding followed by crack detection.
1. 10. 15 Where fabricated and welded components require to be machined, all major welding operations are to be completed prior to final machining.
1. 10. 16 Welding to parts which are subjected to rotating fatigue (e.g. shafts) is not generally permitted.
1. 10. 17 Welding onto parts that have been hardened for wear resistance or strength (e.g. gear teeth) is not permitted.

1. 10. 18 Where welding of clad ferritic steel plates is to be undertaken, the clad materials are to be ground back from the prepared edge by at least 10 mm. In general, the ferritic materials are to be welded prior to welding of the cladding material.

## **1. 11 Non-destructive examination of welds**

1. 11. 1 Non-destructive examinations are to be made in accordance with a definitive written procedure prepared and endorsed by a person qualified according to a Nationally Recognised Scheme with a grade equivalent to Level III qualification of ISO 9712, SNT-TC-1A or ASNT Central Certification Program (ACCP). As a minimum, the procedure will identify personnel qualification levels, NDE datum and identification system, extent of testing, methods to be applied with technique sheets, acceptance criteria and reporting requirements. These procedures are to be reviewed by the Surveyor. See [Ch 1, 5 Non-destructive examination](#).
1. 11. 2 Non-destructive examinations are to be undertaken by personnel qualified according to a Nationally Recognised Scheme with a grade equivalent to Level II qualification of ISO 9712, SNT-TC-1A or ASNT Central Certification Program (ACCP). Operators qualified to Level I of the above schemes (or equivalent recognised by ACS) may be engaged in testing under the supervision of personnel qualified to Level II or III (or equivalent recognised by ACS). Personnel qualifications are to be verified by certification.
1. 11. 3 Effective arrangements are to be provided by the manufacturer for the inspection of finished welds to ensure that all welding, and where necessary, all post-weld heat treatment, has been satisfactorily completed.
1. 11. 4 Welds are to be clean and free from paint at the time of visual inspection unless specified otherwise in the following Sections.
1. 11. 5 The weld surface finish is to ensure accurate and reliable detection of defects. Where the weld surface is irregular or has other features likely to interfere with the interpretation of non-destructive examination, the weld is to be ground or machined.
1. 11. 6 Prior to inspection, welded temporary attachments and lifting eyes used to aid construction are to be removed carefully by grinding, cutting or chipping or other approved means. The surface of the material is to be finished smooth by grinding followed by crack detection. Any defects caused in the removal process are to be repaired and re-inspected.
1. 11. 7 For welds in steels with specified yield strength up to 400 N/mm<sup>2</sup>, and with carbon equivalent less than or equal to 0.41 per cent, NDE may be performed as soon as the test assembly has cooled to ambient temperature. For other steels, NDE is to be delayed for a period of at least 48 hours after the test assembly has cooled to ambient temperature.
1. 11. 8 Non-destructive examinations are to be performed in accordance with the requirements of the Rules. Examinations are to be in accordance with agreed written procedures prepared by the manufacturer or ship builder.
1. 11. 9 The Surveyor may request additional inspections where there is reason to question the quality of workmanship, or where the weld is part of a complicated fabrication where there is high restraint or high residual stresses.
1. 11. 10 Welds are to be examined after completion of any post-weld heat treatment.
1. 11. 11 Where weld defects are discovered, the full extent is to be ascertained by applying additional non-destructive examinations where required. Unacceptable defects are to be completely removed and, where necessary, weld repaired in accordance with the relevant Sections of this Chapter. The repairs are to be re-inspected using the same technique as the original inspection.
1. 11. 12 Results of non-destructive examinations are to be recorded and evaluated by the constructor on a continual basis in order that the quality of welding can be monitored. These records are to be available to the Surveyor.

1. 11. 13 The constructor is to be responsible for the review, interpretation, evaluation and acceptance of the results of NDE. Reports stating compliance or otherwise with the criteria established in the inspection procedure are to be issued. Reports are to comply, as a minimum, with the requirements of [Ch 1, 5 Non-destructive examination](#).
1. 11. 14 The extent of applied non-destructive examination is to be increased when warranted by the analysis of previous results.
1. 11. 15 Ultrasonic testing of welds in austenitic and duplex stainless steels requires specific procedures, appropriately qualified personnel and suitable equipment including angle-compression wave and creep wave probes, in addition to the above requirements.

## **1. 12 Routine weld tests**

1. 12. 1 Routine or production weld tests may be specified as a means of monitoring the quality of the welded joints. This type of quality control test is generally specified for pressure vessel and LNG construction but may be used for other types of welded fabrication.
1. 12. 2 Routine weld tests may be requested by the Surveyor where there is reason to doubt the quality of workmanship.
1. 12. 3 Where routine weld tests have been agreed, they are to be performed in accordance with the general requirements for the type of construction, See [Ch 13, 3 Specific requirements for fabricated steel sections](#) and [Ch 13, 4 Specific requirements for fusion welded pressure vessels](#).

## **1. 13 Rectification of material defects**

1. 13. 1 Repair of defects found in base materials is not to be carried out without the prior approval of the Surveyor.
1. 13. 2 In general, surface defects in the material may be removed by grinding, chipping, etc. provided the remaining material thickness is not reduced below the minimum thickness tolerance, and the area is ground to blend in smoothly with the surrounding material.
1. 13. 3 Confirmation that the defect has been removed is required by performing visual examination, augmented by either magnetic particle or dye penetrant examination techniques.
1. 13. 4 Surface defects, which cannot be repaired by the above method, may be repaired by welding where permitted by [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#) to [Ch 9 Copper Alloys](#). Such repairs are to be performed in accordance with the requirements of this Section and those specified in [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#) to [Ch 9 Copper Alloys](#).
1. 13. 5 Any defects in the structure resulting from the removal of temporary attachments are to be prepared, efficiently welded and ground smooth so as to achieve a defect free repair.

## **1. 14 Rectification of distortion**

1. 14. 1 Fairing, by linear or spot heating, to correct distortions due to welding, may be carried out. In order to ensure that the properties of the material are not adversely affected, approved procedures are to be utilised. On completion of such processes, visual examination of all heat affected areas in the vicinity is to be carried out to ensure freedom from cracking.
1. 14. 2 When misalignment of members exceeds the agreed tolerance, the misaligned item is to be cut apart, realigned and re-welded in accordance with an approved procedure.

## **1. 15 Rectification of welds defects**

1. 15. 1 Where repairs are extensive the manufacturer is to investigate the reason for the defects and take the necessary actions to prevent recurrence. In addition, consideration is to be given to the sequence of repairs and to providing temporary supports to prevent misalignment or collapse.
1. 15. 2 Cracks are to be reported to the Surveyor and the cause established prior to undertaking weld repairs.
1. 15. 3 Defects may be removed by grinding, chipping or thermal gouging. Where thermal gouging is used, the repair groove is to be subsequently ground clean to remove oxides and debris. The groove is to have a profile suitable for welding.
1. 15. 4 Prior to commencing repair welding, it is to be confirmed that no defect exists on the prepared surface by performing visual examination, augmented by either magnetic particle or dye penetrant examination techniques.
1. 15. 5 Repair welding is to be performed using approved welding procedures.
1. 15. 6 Completed repairs are to be re-examined by the non-destructive examination method(s) that detected the original defect and are to confirm that the original defect has been removed.
1. 15. 7 Where the component or structure has been subjected to post-weld heat treatment prior to weld repair, this is to be repeated after completion of all repair welding.
1. 15. 8 Where non-destructive examination reveals that the original defect has not been successfully removed, one more repair attempt may be performed.
1. 15. 9 The manufacturer is to monitor the quality of welding and maintain records of welding repairs and take the necessary corrective actions where repair rates are outside normal limits.

## **1. 16 Post-weld heat treatment**

1. 16. 1 On completion of welding, post-weld heat treatment may be required depending on the type of welded construction, the material type and thickness as specified by the relevant Parts or Sections of the Rules.
1. 16. 2 In general, heat treatment after welding is to be a stress relief treatment in order to reduce residual stresses introduced by welding and is generally applicable to ferritic steels. Where other types of heat treatment (e.g. normalising, solution annealing) are proposed, demonstration of acceptable mechanical properties of the weldment are to be confirmed by a welding procedure test which includes a simulated heat treatment.
1. 16. 3 Parts are to be properly prepared for heat treatment. Machined surfaces (e.g. flange faces, screw threads, etc.) are to be protected against scaling and sufficient temporary supports provided to prevent distortion or collapse of the structure.
1. 16. 4 Details of the heat treatment to be applied, soaking time and temperature, heating and cooling rates, etc. are to be submitted for review prior to commencing.
1. 16. 5 Post-weld heat treatment is to be carried out in a purpose built furnace which is efficiently maintained. In special cases, where the configuration of the component is such that thermal stresses during heating and cooling can be minimised, local post-weld heat treatment may be used. This would not normally apply to the complex geometry of cast materials during manufacture within the foundry environment.
1. 16. 6 In all cases, the heat treatment facilities and arrangements are to be capable of controlling the temperature throughout the heat treatment cycle and adequate means of measuring and recording the component temperature are to be provided. Thermocouples are to be attached so they are in contact with the component.

- 1. 16. 7 Unless specified otherwise, stress relief heat treatment is to be carried out by means of controlled heating from 300°C, to the soak temperature, holding within the prescribed soaking temperature range for the time specified (usually 1 hour per 25 mm of weld thickness) followed by controlled cooling to below 300°C.
- 1. 16. 8 Where post-weld stress relief is specified for welded constructions that contain joints between different materials (e.g. ferritic to austenitic steels), the details of the materials, welding procedures and heat treatment cycle to be applied are to be submitted for special consideration and approval.
- 1. 16. 9 Non-destructive examination of welds is to be performed after completion of any heat treatment.

## **1. 17 Certification**

- 1. 17. 1 Products or components are not to be considered complete until all the requirements of the construction specification have been met and all activities have been completed.
- 1. 17. 2 Upon completion of the works, the manufacturer is to provide documentation which indicates that:
  - a. All welds are complete and there are no outstanding repairs.
  - b. The appropriate post-weld heat treatments have been performed.
  - c. Appropriate destructive tests have been performed.
  - d. Proof testing of welds has been performed.
- 1. 17. 3 Before the test certificates or shipping statements are signed by the Surveyor, the manufacturer is required to provide a written declaration stating that the product is in accordance with the requirements of [Ch 13, 1.17 Certification](#) 1.17.2.

CHAPTER **13 Requirements for Welded Construction**SECTION **2 Specific requirements for ship hull structure and machinery****2. 1 Scope**

- 2. 1. 1 The requirements of this Section apply to the construction of ships, including hull structure, superstructure and deckhouses, components forming part of the ship structure and its machinery (excluding pressure equipment and piping, *See [Ch 13, 4 Specific requirements for fusion welded pressure vessels](#)*). These requirements are in addition to the general welding requirements specified in [Ch 13, 1 General welding requirements](#).
- 2. 1. 2 The shipyard and manufacturer's works are to be assessed to give assurance that they have the facilities, equipment, personnel and quality control procedures to produce work of the required quality.

**2. 2 Welding consumables**

- 2. 2. 1 Welding consumables used for hull construction are to be approved in accordance with [Ch 11 Approval of Welding Consumables](#) and are to be suitable for the type of joint and grade of material to be welded.
- 2. 2. 2 Steel welding consumable approvals, up to and including Grade Y40, and Y47, are considered acceptable for hull construction in line with [Table 11. 1. 1: Welding consumable grades appropriate to structural and low temperature service steel grades](#) in Chapter 11, [Ch 12, 2.2 Welding variables 2.2.2](#) and the following:
  - a. Consumables up to Grade Y are acceptable for welding steels up to 3 strength levels below that for which the approval applies, e.g. a consumable with approval grading 3Y is acceptable for welding EH36, EH32 and EH27S higher tensile ship steels and grade E normal strength ship steel.
  - b. Consumables for Grade Y40 are acceptable for welding steels up to two strength levels below that for which the approval applies. Consumables for Grade Y47 are acceptable for welding steels up to one strength level below that for which the approval applies.
  - c. Consumables with an approved impact toughness grading are acceptable for welding steels with lower specified impact properties subject to (a) above, e.g. a consumable with approval grading 3Y is acceptable for welding EH, DH and AH materials.
  - d. For welding steels of different grades or different strength levels, the welding consumables may be of a type suitable for the lesser grade or strength being connected. The use of a higher grade of welding consumable may be required at discontinuities or other points of stress concentration.
- 2. 2. 3 In general, the use of preheating and hydrogen controlled welding consumables for welding of ship steels up to strength grade H40 is to be in accordance with [Table 13. 2. 1: Preheat and](#)

[consumable requirements for welding of carbon and carbon manganese steels up to strength grade H40](#). The carbon equivalent is to be calculated from the ladle analysis using the formula given below:

$$\text{Carbon equivalent} = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15}$$

Preheat and the use of low hydrogen controlled consumables will be required for welding of steel grades higher than Grade H40.

**Table 13. 2. 1: Preheat and consumable requirements for welding of carbon and carbon manganese steels up to strength grade H40**

| Carbon equivalent $C_{eq}$   | Preheat                                | Hydrogen controlled consumables |
|--|--|---------------------------------|
| $C_{eq}$ equal to or less than 0.41%   | Not required                           | Not required, <i>See</i> Note 3 |
| $C_{eq}$ above 0.41 but not exceeding 0.45%  | Not required, <i>See</i> Notes 1 and 2 | Required                        |
| $C_{eq}$ greater than 0.45%  | Required                               | Required                        |
| <p><b>Note 1.</b> Preheat may need to be applied in order to meet the maximum hardness values specified in <a href="#">Ch 12, 2.12 Mechanical test acceptance criteria for steels 2.12.6</a>.</p> <p><b>Note 2.</b> Under conditions of high restraint or low ambient temperature preheat may need to be applied.</p> <p><b>Note 3.</b> Hydrogen controlled consumables may need to be considered for welding of</p> <p>(a) Thicker materials (i.e. &gt; 35 mm).</p> <p>(b) Higher strength materials.</p> <p>(c) Welds subject to high restraint.</p> |  |                                 |

2. 2. 4 All aluminium alloy welding consumables are to be approved in accordance with [Ch 11 Approval of Welding Consumables](#) and are suitable for welding the grades of material as shown in [Table 13. 2. 2: Welding of aluminium alloys - Consumable requirements](#).

**Table 13. 2. 2: Welding of aluminium alloys - Consumable requirements**

| Consumable approval grade | Base material alloy grade |
|---------------------------|---------------------------|
| RA or WA                  | 5754                      |
| RB or WB                  | 5086, 5754                |
| RC or WC                  | 5083, 5086, 5754          |
| RD or WD                  | 6005A, 6061, 6082         |

2. 2. 5 All austenitic stainless steel and duplex stainless steel welding consumables are to be approved in accordance with the [Ch 11 Approval of Welding Consumables](#) and are suitable for welding the grades of material as shown in [Table 13. 2. 3: Welding of austenitic stainless and duplex stainless steels - Consumable requirements](#).

**Table 13. 2. 3: Welding of austenitic stainless and duplex stainless steels - Consumable requirements**

|  |   |
|--|---|
| Consumable approval grade  | Suitable for welding material alloy grades              |
| Austenitic stainless steels  |   |
| 321  | 321   |
| 347  | 347 and 321   |
| Austenitic stainless steel – Low carbon  |   |
| 304L ( <i>See Note 3</i> )   | 304L  |
| 304LN ( <i>See Note 3</i> )  | 304LN and 304L  |
| 316L   | 316L and 304L   |
| 316LN  | 316LN, 316L, 304LN and 304L                             |
| 317L   | 317L, 316LN, 316L, 304LN and 304L                       |
| 317LN  | 317LN, 317L, 316LN, 316L, 304LN and 304L                |
| Super austenitic stainless steels, <i>See Note 2</i>   |   |
| S31254   | S31254 and N08904                                       |
| N08904   | N08904  |
| Duplex stainless steels, <i>See Note 1</i>   |   |
| S31260   | S31260 and S31803                                       |
| S31803   | S31803  |
| S32550   | S32550  |
| S32750   | S32750 and S32550                                       |
| S32760   | S32760, S32550, S31260 and S31803                       |
| Stainless steels welded to carbon steels   |   |
| SS/CMn   | Carbon steel to all steels in Sections 1, 2 and 3       |
| Duplex/CMn   | Carbon steel to all duplex stainless steel in Section 4 |
| <p><b>Note 1.</b> The use of a different welding consumable grade from that of the base material may require demonstration of acceptable corrosion properties.</p> <p><b>Note 2.</b> May be used for welding low carbon austenitic grades provided measures are taken to prevent solidification cracking from occurring.</p> <p><b>Note 3.</b> These are ACS Grades and do not correspond to any National or International Standards/Grades.</p> |   |

## 2. 3 Welding procedure and welder qualifications

2. 3. 1 Welding procedures and welder qualifications are to be tested and approved in accordance with the requirements of [Ch 12 Welding Qualifications](#).

## 2. 4 Construction and workmanship

- 2. 4. 1 Weld preparations and openings may be formed by thermal cutting, machining or chipping. Chipped surfaces that will not be subsequently covered by weld metal are to be ground smooth.
- 2. 4. 2 Prior to welding, the alignment of plates and stiffeners forming part of the hull structure is to be in accordance with the tolerances specified in the relevant part of the Rules.
- 2. 4. 3 When welding from one side only, care is to be exercised to ensure the root gap and fit up are in accordance with the approved welding procedure and the root is properly fused.
- 2. 4. 4 Where it is proposed to use permanent backing strips, the intended locations and welding procedures are to be submitted for consideration.
- 2. 4. 5 Temporary backing strips may be used provided they are in accordance with approved welding procedures and are subsequently removed on completion of welding.
- 2. 4. 6 The outer surfaces of completed welds are to blend smoothly with the base materials and provide a smooth transition and gradual change of section.
- 2. 4. 7 Weld joints in parts of oil engine structures that are stressed by the main gas or inertia loads are to be designed as continuous full penetration welds. They are to be arranged so that welds do not intersect, and that welding can be effected without difficulty.
- 2. 4. 8 When modifications or repairs have been made which result in openings having to be closed by welded inserts, particular care is to be given to the fit of the insert and the welding sequence. The welding is also to be subject to non-destructive examination.
- 2. 4. 9 Where welding of aluminium alloy is employed, the following additional requirements are to be complied with so far as they are applicable:
  - a. Welding is to be performed by fusion welding using inert gas or tungsten inert gas process or by the friction stir welding process. Where it is proposed to use other welding processes, details are to be submitted for approval.
  - b. The weld joint surfaces should be scratch brushed, preferably immediately before welding, in order to remove oxide or adhering films of dirt, filings, etc.

## 2. 5 Butt welds

- 2. 5. 1 Where the ship hull is constructed of plates of different thicknesses, the thicker plates are to be chamfered in accordance with the approved plans. In all cases the chamfer is not to exceed a slope of 1 in 3 so that the plates are of equal thickness at the weld seam. Alternatively, if so desired, the width of the weld may be included as part of the smooth taper to the thicker plate provided the difference in thickness is not greater than 3 mm.
- 2. 5. 2 Where stiffening members are attached by continuous fillet welds and cross completely finished butt or seam welds, these are to be made flush in way of the fillet weld. Similarly for butt welds in webs of stiffening members, the butt weld is to be complete and generally made flush with the stiffening member before the fillet weld is made. Where these conditions cannot be complied with, a scallop is to be arranged in the web of the stiffening member, *See [Figure 13. 2. 1: Weld dimensions and types](#)*. Scallops are to be of such a size and in such a position that a satisfactory weld can be made.

**Figure 13. 2. 1: Weld dimensions and types**

## 2. 6 Lap connections

2. 6. 1 Overlaps are generally not to be used to connect plates which may be subjected to high tensile or compressive loading and alternative arrangements are to be considered. However, where plate overlaps are adopted, the width of the overlap is not to exceed four times, nor be less than three times the thickness of the thinner plate and the joints are to be positioned to allow adequate access for completion of sound welds. The faying surfaces of lap joints are to be in close contact and both edges of the overlap are to have continuous fillet welds.

## 2. 7 Closing plates

2. 7. 1 For the connection of plating to internal webs, where access for welding is not practicable, the closing plating is to be attached by continuous full penetration welds or by slot fillet welds to face plates fitted to the webs. Slots are to have a minimum length of 90 mm and a minimum width of twice the plating thickness, with well rounded ends. Slots cut in plating are to be smooth and clean and are to be spaced not more than 230 mm apart, centre to centre. Slots are not to be filled with welding.
2. 7. 2 For the attachment of rudder shell plating to the internal stiffening of the rudder, slots are to have a minimum length of 75 mm and, in general, a minimum width of twice the side plating thickness. The ends of the slots are to be rounded and the space between them is not to exceed 150 mm.

## 2. 8 Stud welding

2. 8. 1 Where permanent or temporary studs are to be attached by welding to main structural parts in areas subject to high stress, the proposed location of the studs and the welding procedures adopted are to be approved.

## 2. 9 Fillet welds

2. 9. 1 T-connections are generally to be made by fillet welds on both sides of the abutting plate, the dimensions and spacing of which are shown in [Figure 13. 2. 1: Weld dimensions and types](#). Where the connection is highly stressed, deep penetration or full penetration welding may be required. Where full penetration welding is required, the abutting plate may be required to be bevelled.
2. 9. 2 Where an approved deep penetration procedure is used, the fillet leg length calculated may be reduced by 15 per cent provided that the manufacturer is able to meet the following requirements:
- Use of a welding consumable approved for deep penetration welding in accordance with [Ch 11 Approval of Welding Consumables](#) for either the 'p' or 'T' techniques.
  - Demonstrations by way of production weld testing that the minimum required penetration depths (i.e. throat thicknesses) are maintained. This is to be documented on a monthly basis by the manufacturer and be available to the Surveyor.
2. 9. 3 The calculated fillet leg length may be reduced by 20 per cent, provided that in addition to the requirements of [Ch 13, 2.9 Fillet welds 2.9.2.a](#) and [Ch 13, 2.9 Fillet welds 2.9.2.b](#), the manufacturer is able to consistently meet the following additional requirements:
- The documentation required in [Ch 13, 2.9 Fillet welds 2.9.2.b](#) is to be completed and made available to the Surveyor upon request on a weekly basis.
  - Suitable process selection confirmed by satisfactory welding procedure tests covering both minimum and maximum root gaps.
2. 9. 4 Where intermittent welding is used, the welding is to be made continuous in way of brackets, lugs and scallops and at orthogonal connections with other members.

## 2. 10 Post-weld heat treatment

2. 10. 1 This section determines the requirements for post-weld stress relief heat treatment when applied to ship structure and associated machinery.
2. 10. 2 Post-weld stress relief heat treatment is applied to improve resistance to brittle fracture or fatigue performance. It is to be applied when the thickness limits stated in [Table 13. 2. 4: Post-weld stress relief heat treatment thickness limits](#) are exceeded.

**Table 13. 2. 4: Post-weld stress relief heat treatment thickness limits**

| Typical Application | Load Conditions<br>(See Note 1) | Material Grade<br>(See Note 2)  | Material Thickness Limit<br>(mm) (See Note 3) |
|---------------------|---------------------------------|---|---|
| Ship structure      | Fatigue non-critical / critical | Normal strength (A - E),<br>Higher strength (H27S - H40,<br>[Excluding EH47]) | 150   |
| Ship structure      | Fatigue non-critical / critical | Higher strength (EH47)  | 100   |

|  |                      |                           |                                  |
|--|----------------------|---------------------------|----------------------------------|
| Machinery  | Fatigue non-critical | High strength (H42 - H69) | 140                              |
| Machinery  | Fatigue critical     | High strength (H42 - H46) | 100                              |
| Machinery  | Fatigue critical     | High strength (H50 - H69) | 65                               |
| Ship structure / Machinery   | Any                  | Other material grades     | Subject to special consideration |
| <p><b>Note 1.</b> Fatigue analysis shall be approved by design appraisal according to relevant rules for each application.</p> <p>a. Fatigue non-critical – Design assessment confirms that there are cyclic stresses but the fatigue life is reasonably greater than the design fatigue life and it is anticipated that fatigue crack initiation and propagation are unlikely to occur.</p> <p>b. Fatigue critical – Design assessment confirms that there are cyclic stresses and the estimated fatigue life meets the design requirements but it is not significantly higher. It is anticipated that fatigue crack initiation and propagation are likely to occur.</p> <p><b>Note 2.</b> Where steel grades based on national and international standards are specially agreed for construction, they are to be procured from ACS approved works which hold current approval for the ACS equivalent grade and the same delivery condition as the steel to be procured.</p> <p><b>Note 3.</b> For all applications where material thickness is greater than 65 mm (or greater than 100 mm for EH47), 100 per cent surface and volumetric non-destructive examination of welds is required.</p> |                      |                           |                                  |

2. 10. 3 Post-weld heat treatment is to be applied to the following types of welded construction:
- Welding of steel castings where the thickness of the casting at the weld exceeds 30 mm, except where castings are directly welded to the hull structure.
  - Engine bedplates except for engine types where the bedplate as a whole is not subjected to direct loading from the cylinder pressure. For these types, only the transverse girder assemblies need to be stress relieved.
  - Welding of gear wheels.
  - Welding of gear cases associated with main or auxiliary engines, *See [Pt 5 Main and Auxiliary Machinery](#)*.
2. 10. 4 Consideration is to be given to applying post-weld heat treatment for all thicknesses of complicated weld joints where there are high stress concentrations.
2. 10. 5 Where required, heat treatment is to be performed in accordance with the requirements specified in [Ch 13, 1.16 Post-weld heat treatment](#) and [Table 13.4. 3: Post-weld soak temperatures and times](#).
2. 10. 6 Special consideration may be given to omit the required post-weld heat treatment. Evaluation is to be based on critical engineering assessment involving fracture mechanics testing and proposals are to be submitted which include full details of the application, materials, welding procedures, inspection procedures, design temperature and stresses, fatigue loads and cycles. Evidence will be required to demonstrate that the inspection techniques and procedures to be employed are able to detect flaws to the sizes and tolerances (of length, through-wall height and through-wall position), as determined from the fracture mechanics (and or fatigue) calculations. Alternative procedures for the omission of post weld heat treatment will be subject to special consideration.

## 2. 11 Tolerances

2. 11. 1 Tolerances after welding are to be in accordance with the relevant Part of the Rules.
2. 11. 2 Distortion which has resulted from welding may be corrected by spot heating in accordance with [Ch 13, 1.14 Rectification of distortion](#).

## 2. 12 Non-destructive examination of welds

2. 12. 1 All finished welds are to be sound and free from cracks and substantially free from lack of fusion, incomplete penetration, porosity and slag. The surfaces of welds are to be reasonably smooth and substantially free from undercut and overlap. Care is to be taken to ensure that the specified dimensions of welds have been achieved and that both excessive reinforcement and under-fill of welds is avoided.
2. 12. 2 Welds forming part of the hull and superstructure may be coated with a thin layer of protective primer prior to inspection provided it does not interfere with inspection and is removed, if required by the Surveyor, for closer interpretation of possible defective areas.
2. 12. 3 All welds are to be visually inspected by personnel designated by the builder. Visual inspection of all welds may be supplemented by other non-destructive examination techniques in cases of unclear interpretation, as considered necessary. The acceptance criteria for visual testing are given in [Table 13. 2. 5: Acceptance criteria for visual testing, magnetic particle and liquid penetrant testing](#).

**Table 13. 2. 5: Acceptance criteria for visual testing, magnetic particle and liquid penetrant testing**

| Surface discontinuity  | Classification according to ISO 6520-1 | Acceptance criteria for visual testing  |
|--|--|---|
| Crack  | 100                                    | Not accepted  |
| Lack of fusion   | 401                                    | Not accepted  |
| Incomplete root penetration in butt joints welded from one side  | 4021                                   | Not accepted  |
| Surface pore   | 2017                                   | Single pore diameter $d \leq 0.25t$ , for butt welds, with maximum diameter 3 mm, <i>See Note 1</i> $d \leq 0.25a$ , for fillet welds, with maximum diameter 3 mm, <i>See Note 12.5d</i> as minimum distance to adjacent pore |
| Undercut in butt welds   | 501                                    | Depth $\leq 0.5$ mm, whatever the length<br>Depth $\leq 0.8$ mm, with a maximum continuous length of 90 mm, <i>See Note 2</i>   |
| Undercut in fillet welds   | 501                                    | Depth $\leq 0.8$ mm, whatever the length  |
| <p><b>Note 1.</b> <math>t</math> is the plate thickness of the thinnest plate, and <math>a</math> is the throat of the fillet weld.</p> <p><b>Note 2.</b> Adjacent undercuts separated by a distance shorter than the shortest undercut are to be regarded as a single continuous undercut</p> |  |   |

2. 12. 4 In addition to visual inspection, welded joints are to be examined using any one or a combination of ultrasonic, radiographic, magnetic particle, eddy current, dye penetrant or other acceptable methods appropriate to the configuration of the weld.
2. 12. 5 The method to be used for the volumetric examinations of welds is the responsibility of the builder. Radiography is generally preferred for the examination of butt welds of 8 mm thickness or less. Ultrasonic testing is acceptable for welds of 8 mm thickness or greater and is to be used for the examination of full penetration tee butt or cruciform welds or joints of similar configuration. Advanced ultrasonic techniques, such as Phased Array Ultrasonic Testing (PAUT), may be used as a volumetric testing method in lieu of radiography or manual ultrasonic testing. If these methods are used, the thickness limitations for manual ultrasonic testing apply.
2. 12. 6 The acceptance criteria for radiographic testing are given in [Table 13. 2. 6: Acceptance criteria for radiographic testing](#), and those for ultrasonic testing in [Table 13. 2. 7: Acceptance criteria for ultrasonic testing](#).

**Table 13. 2. 6: Acceptance criteria for radiographic testing**

| Discontinuity                  | Classification according to ISO 6520-1 | Acceptance criteria for radiographic testing, <i>See</i> Note 1  |
|--------------------------------|--|--|
| Crack                          | 100                                    | Not accepted   |
| Lack of fusion                 | 401                                    | Continuous maximum length $t/2$ or 25 mm, whichever is the less, <i>See</i> Note 2<br>Intermittent cumulative length maximum $t$ or 50 mm, whichever is less, <i>See</i> Note 3  |
| Lack of root fusion            | 4013                                   | Not accepted in butt joints welded from one side   |
| Incomplete root penetration    | 4021                                   | Not accepted in butt joint welded from one side<br>Continuous maximum length $t/2$ or 25 mm, whichever is lesser, <i>See</i> Note 2<br>Intermittent cumulative maximum length $t$ or 50 mm, whichever is less, <i>See</i> Note 3 |
| Slag inclusion                 | 301                                    | Continuous maximum length $t$ or 50 mm, whichever is less, <i>See</i> Note 2<br>Intermittent cumulative length maximum $2t$ or 100 mm, whichever is less, <i>See</i> Notes 3 and 4   |
| Gas pore                       | 2011                                   | maximum dimension for a single pore:<br>$d \leq 0.2t$ , max. 4.0 mm <i>See</i> Note 5  |
| Uniformly distributed porosity | 2012                                   | Maximum dimension of the area of imperfections:<br>For single run welds: $\leq 1.5\%$<br>For multi-run welds: $\leq 3\%$ <i>See</i> Notes 6 and 7  |
| Clustered (localised) porosity | 2013                                   | Maximum dimension of the summation of the projected area of the imperfection: $\leq 8\%$ <i>See</i> Notes 6 and 7  |
| Elongated cavity               | 2015                                   | $h \leq 0.3t$ , max. 3.0 mm<br>$l \leq t$ , max. 50 mm <i>See</i> Notes 8 and 9  |
| Wormholes                      | 2016                                   | $h \leq 0.3t$ , max. 3.0 mm<br>$l \leq t$ , max. 50 mm <i>See</i> Notes 8 and 9  |

|   |      |   |
|---|------|---|
| Metallic inclusions other than copper   | 304  | $h \leq 0.3t$ , max. 3.0 mm <i>See</i> Note 8 |
| Copper inclusions   | 3042 | Not permitted                                 |
| <p><b>Note 1.</b> <math>t</math> is the thickness of the thinnest plate.</p> <p><b>Note 2.</b> Two adjacent individual discontinuities of length <math>l_d^1</math> and <math>l_d^2</math> situated on a line and where the distance <math>l_a</math> between them is shorter than the shortest discontinuity are to be regarded as a continuous discontinuity of length <math>l_d^1 + l_d + l_d^2</math></p> <p><b>Note 3.</b> Sum of the length of individual continuous discontinuities.</p> <p><b>Note 4.</b> Parallel inclusions not separated by more than 3 times the width of the largest inclusion are to be regarded as one continuous discontinuity.</p> <p><b>Note 5.</b> <math>d</math> is the diameter of the gas pore.</p> <p><b>Note 6.</b> The limits for the maximum single gas pore within this group still apply.</p> <p><b>Note 7.</b> Further reference to porosity limits may be obtained in ISO 5817:2007.</p> <p><b>Note 8.</b> <math>h</math> is the width of the imperfection.</p> <p><b>Note 9.</b> <math>l</math> is the length of the imperfection.</p> |      |   |

**Table 13. 2. 7: Acceptance criteria for ultrasonic testing**

|  |   |
|--|---|
| Echo height  | Acceptance criteria for ultrasonic testing, <i>See</i> Note |
| Greater than 100% of DAC curve   | Maximum length $t/2$ or 25 mm, whichever is less            |
| Greater than 50% of DAC curve, but less than 100% of DAC curve   | Maximum length $t$ or 50 mm, whichever is less              |
| <p>Indications evaluated to be cracks are unacceptable regardless of echo height;<br/>Indications evaluated to be lack of penetration or lack of root fusion in joints welded from one side are unacceptable regardless of echo height.</p>  |   |
| <p><b>Note</b> Two adjacent individual discontinuities of length <math>L1</math> and <math>L2</math> situated on a line and where the distance <math>L</math> between them is shorter than the shortest discontinuity are to be regarded as a continuous discontinuity of length <math>L1 + L + L2</math>.</p> |   |

2. 12. 7 Checkpoints examined at the pre-assembly stage are to include ultrasonic testing on examples of the stop/start points of automatic welding and magnetic particle inspection of weld ends.
2. 12. 8 Checkpoints examined at the assembly stage are generally to be selected from those welds intended to be examined as part of the agreed quality control programme to be applied by the builder. The locations and number of checkpoints are to be approved by the Surveyor.
2. 12. 9 Where components of the structure are subcontracted for fabrication, the same inspection regime is to be applied as if the item had been constructed within the main contractor's works. In these cases, particular attention is to be given to highly loaded fabrications (such as stabiliser fin boxes) forming an integral part of the hull envelope.
2. 12. 10 Particular attention is to be paid to highly stressed items. Magnetic particle inspection is to be used at ends of fillet welds, T-joints, joints or crossings in main structural members and at stern frame connections.
2. 12. 11 Special attention is to be given to the examination of plating in way of lifting eye plate positions to ensure freedom from cracks. This examination is not restricted to the positions where eye plates have been removed, but includes the positions where lifting eye plates are permanent fixtures.
2. 12. 12 Checkpoints for volumetric examination are to be selected so that a representative sample of welding is examined.

- 2. 12. 13 Typical locations for volumetric examination and number of checkpoints to be taken are given in the relevant Sections of the Rules. A list of the proposed items to be examined is to be submitted for approval.
- 2. 12. 14 For the hull structure of refrigerated spaces, and of ships designed to operate in low air temperatures, the extent of non-destructive examination will be specially considered. For non-destructive examination of gas ships *See the Rules for the carriage for Liquefied Gases*.
- 2. 12. 15 For all ship types, the builder is to carry out random non-destructive examination at the request of the Surveyor.
- 2. 12. 16 Results of non-destructive examinations made during construction are to be recorded and evaluated by the builder on a continual basis in order that the quality of welding can be monitored. These records are to be available to the Surveyor.
- 2. 12. 17 The extent of applied non-destructive examinations is to be increased when warranted by the analysis of previous results.

## 2. 13 Weld repairs

- 2. 13. 1 The full extent of any weld defect is to be ascertained by applying additional non-destructive examination where required. Unacceptable defects are to be completely removed and, where necessary, re-welded and re-examined in accordance with the requirements of [Ch 13, 1.15 Rectification of welds defects](#).
- 2. 13. 2 During the assembly of large components, root gaps in excess of those specified in the approved welding procedure may be rectified by welding.
- 2. 13. 3 Rectification of wide root gaps in butt welds, up to a maximum gap of 16 mm, may be performed provided that the length of these areas is small in relation to the whole weld length. Repairs may be executed by applying weld buttering layers to one edge of the weld joint, followed by machining or grinding to return the root opening to the required dimensions. The weld buttering and filling of the joint are to be in accordance with welding procedures qualified in accordance with [Ch 12 Welding Qualifications](#).
- 2. 13. 4 For sub-assemblies, rectification of wide root gaps may be performed using a backing strip, provided that it is removed on completion of the welding.
- 2. 13. 5 Rectification of wide root gaps in fillet welds may be carried out as follows:
  - a. where the root gap,  $g$ , is in excess of 3 mm, but not greater than 5 mm, the fillet leg length,  $z$ , may be increased by  $g - 2.0$  mm;
  - b. where the root gap is in excess of 5 mm, the joint detail may be changed into a full penetration weld.
- 2. 13. 6 Where repair welds are made using small weld beads, suitable precautions (including preheat) are to be taken to avoid high hardness and possible cold cracking.

## 2. 14 Welding afloat with water backing

- 2. 14. 1 Welding afloat with water backing is not recommended due to the additional precautions required during survey and therefore, is generally not permitted. However consideration may be given to welding afloat with water backing after specific ACS approval has been obtained by the yard or fabricator prior to such welding being carried out. Such approval will only be given once all of the following conditions are satisfied:
  - a. The welding procedure qualification tests are carried out on steel plates with water backing and the water is maintained at the flow rate and minimum water temperature anticipated during fabrication.

- b. The carbon equivalent of the steel plates used in the welding procedure qualification tests are to be greater than 0.41 per cent based on the IIW formula. Where it can be shown that all hull steel plates and new sections will have a carbon equivalent value below this figure, steel plates with the maximum carbon equivalent value may be used for the welding procedure qualification tests.
  - c. Welding procedure qualification tests are carried out without preheat.
  - d. The thickness of steel plate used in the welding procedure qualification test is the minimum hull plate thickness to be used during fabrication.
  - e. The maximum measured hardness on the completed welding procedure qualification assembly is less than or equal to 350 HV10. Following fabrication welding, 10 per cent of welds are to be hardness tested in way of heataffected zones at weld starts to confirm compliance with the 350 HV10 limit.
  - f. The heat input used in the welding qualification test is the minimum permitted heat input during fabrication.
  - g. Only low hydrogen welding consumables (H5) are used.
  - h. In addition to normal non-destructive testing for welds, 10 per cent of the welds are additionally subject to magnetic particle inspection 48 hours after welding is complete.
  - i. The welding procedure qualification tests for the repair of welds carried out afloat with water backing are to be carried out on test pieces that have previously been welded afloat and also meet the requirements above.
2. 14. 2 For new construction, conversion or permanent repairs, wet underwater welding is not permitted.

CHAPTER **13 Requirements for Welded Construction**SECTION **3 Specific requirements for fabricated steel sections****3. 1 Scope**

- 3. 1. 1 Fabricated steel sections are items used in place of rolled sections and as such will not be regarded as subassemblies. Products regarded as sub-assemblies are subject to requirements of welded construction specified in [Ch 13, 2 Specific requirements for ship hull structure and machinery](#).
- 3. 1. 2 The requirements for structural steel sections are based on these being manufactured from flat products by automatic welding and intended for use in the construction of ships and other marine structures.
- 3. 1. 3 Fabricated steel sections are to be manufactured in accordance with the requirements of this Section and the general requirements of [Ch 13, 1 General welding requirements](#).
- 3. 1. 4 In all cases, sections are to be manufactured at works, which have been assessed and approved in accordance with *Materials and Qualification Procedures for Ships, Book J, MQPS Procedure 12-1*.

**3. 2 Dimensions and tolerances**

- 3. 2. 1 Products are to conform dimensionally to the provisions of an acceptable National or International Standard.
- 3. 2. 2 The minimum throat thickness of fillet welds is to be determined from:
 
$$\text{Throat thickness} = 0.34t \text{ but not to be taken as less than 3 mm}$$

where

$$t = \text{plate thickness of the thinner member to be joined (generally the web).}$$
- 3. 2. 3 Where a welding procedure using deep penetration welding is used (See [Ch 11 Approval of Welding Consumables](#), 'p' and 'T' welding techniques) the minimum leg length required will be specially considered provided the requirements of [Ch 13, 2.9, Fillet welds 2.9.2](#) are complied with.
- 3. 2. 4 Unless agreed otherwise, the leg length of the weld is to be not less than 1.4 times the specified throat thickness.

### 3. 3 Identification of products

3. 3. 1 Every finished item is to be clearly marked by the manufacturer in at least one place with the following particulars:
- The manufacturer's name or trade mark.
  - Identification mark for the grade of steel.
  - Identification number and/or initials which will enable the full history of the item to be traced.
  - Where required by the purchaser, the order number or other identification mark.
  - The letters 'ACS'.
  - The Surveyor's personal stamp.
- The above particulars, but excluding the manufacturer's name or trade mark where this is embossed on finished products, are to be encircled with paint or otherwise marked so as to be easily recognisable.
3. 3. 2 In the event of any material bearing ACS's brand failing to comply with the test requirements, the brand is to be removed or unmistakably defaced, *See also* [Ch 1, 4.7 Rectification of defective material](#).

### 3. 4 Manufacture and workmanship

3. 4. 1 For cut edges that are to remain unwelded, it is to be demonstrated that the plate preparation procedures used are able to achieve edges that are free from cracks or other deleterious imperfections.
3. 4. 2 Where assembly jigs and devices are used to bring the web into contact with the flanges and hold these in place during welding, means are to be provided to ensure that the degree of contact is maintained until welding is complete.
3. 4. 3 Welding procedures are to be established for the welding of all joints including weld repairs and are to be approved in accordance with [Ch 12 Welding Qualifications](#). Welders are to be approved in accordance with [Ch 12 Welding Qualifications](#), and qualification records are to be available to the Surveyor.
3. 4. 4 The welding consumables used are to be approved in accordance with [Ch 11 Approval of Welding Consumables](#) and are to be suitable for the type of joint and grade of steel as described in [Ch 13, 2.2 Welding consumables](#). For joining steel of different tensile strengths, the consumables are to be suitable for the tensile strength of the component considered in the determination of weld size.
3. 4. 5 The application of pre-heat and the use of low hydrogen welding consumables are to be in accordance with the requirements of [Ch 13, 2.2 Welding consumables](#).
3. 4. 6 Welding is to be double continuous fillet welding or full penetration welding as specified in the approved plans.
3. 4. 7 Where deep penetration welding is used, the requirements of [Ch 13, 2.9, Fillet welds 2.9.2](#) are to be complied with.

### 3. 5 Non-destructive examination

3. 5. 1 Surface inspection and verification of dimensions are the responsibility of the manufacturer and are to be carried out on all materials prior to despatch. Acceptance by the Surveyor of material later found to be defective does not absolve the manufacturer from this responsibility.
3. 5. 2 The Surveyor will carry out checks to ensure that the weld size and profile are in accordance with the manufacturing specification and the manufacturer's Quality Control Procedures.
3. 5. 3 The manufacturer is to examine the welds by magnetic particle or dye penetrant methods. The length examined is to be 200 mm at each end, for each length cut for delivery.

- 3. 5. 4 If cracks are revealed, these are to be reported to the Surveyor and the whole of the length is to be examined by magnetic particle or dye penetrant methods. Corrective action in respect of the manufacturing process, and repairs are to be as indicated in the manufacturers' Quality Control Manual.
- 3. 5. 5 The weld defect is not to exceed the acceptance levels given in [Table 13. 2. 5: Acceptance criteria for visual testing, magnetic particle and liquid penetrant testing](#).

### **3. 6 Routine weld tests**

- 3. 6. 1 One production batch test is required for every 500 m of fabricated section manufactured, or fraction thereof. From each batch test, two samples are to be removed, one from near the beginning of the production run and one from near the end. From each of these test samples one macro specimen and one fracture test specimen are to be taken.
- 3. 6. 2 The macro specimens are to be prepared and etched to demonstrate freedom from unacceptable defects and that the weld penetration is in accordance with the manufacturing specification. The fracture specimens are to be broken, one for each side of the fillet welds and the fractured surfaces examined for compliance with the requirements of [Table 13. 2. 6: Acceptance criteria for radiographic testing](#).
- 3. 6. 3 Where the welding procedure used has employed the deep penetration technique, the amount of root penetration is to be measured on the macro specimen and is not to be less than that demonstrated during welding procedure approval testing.
- 3. 6. 4 For the purposes of this Section, a batch is to consist of products of only one size and grade of material.

### **3. 7 Certification and records**

- 3. 7. 1 Each test certificate is to include the following particulars:
  - a. Purchaser's name and order number.
  - b. Where known, the contract number for which the material is intended.
  - c. Address to which material is despatched.
  - d. Description and dimensions of the product.
  - e. Specification or grade of the steel.
  - f. Identification number and/or initials.
  - g. Cast number and chemical composition of ladle samples of constituent plates.
  - h. Mechanical test results of constituent plates.
  - i. Condition of supply when other than as-rolled.
  - j. Make and brand of welding consumables.
- 3. 7. 2 Test certificates or shipping statements may be signed by the Surveyor, provided the documentation requirements of [Ch 13, 1.17, Certification](#) are satisfied. The following form of declaration will be accepted if stamped or printed on each test certificate or shipping statement with the name of the works and signed by an authorised representative of the manufacturer: 'We hereby certify that the material has been made by an approved procedure in accordance with the [Pt 2 Rules for the Manufacture, Testing and Certification of Materials](#).
- 3. 7. 3 The manufacturer is to maintain records by which sources of material can be identified together with the results of all inspections and tests.

CHAPTER **13 Requirements for Welded Construction**SECTION **4 Specific requirements for fusion welded pressure vessels****4. 1 Scope**

- 4. 1. 1 The requirements of this Section apply to fusion welded pressure vessels and process equipment, heating and steam raising boilers, and steam or gas turbine rotors and cylinders and are in addition to those requirements referred to in [Ch 13, 1 General welding requirements](#).
- 4. 1. 2 The allocation of pressure vessel Class is determined from the design criteria in [Pt 5, Ch 10 Steam Raising Plant and Associated Pressure Vessels](#) and [Pt 5, Ch 11 Other Pressure Vessels](#) of the *Rules and Regulations for the Classification of Ships*. Prior to commencing construction, the design of the vessel is to be approved. Construction requirements for turbine rotors and cylinders are to be in accordance with Class 2/1, unless a higher Class is specified in the approved plans.
- 4. 1. 3 Pressure vessels will be accepted only if manufactured by firms equipped and competent to undertake the quality of welding work required for the Class of vessel proposed. The manufacturer's works are to be approved in accordance with the requirements specified in *Materials and Qualification Procedures for Ships, Book A, Procedure MQPS 0-4*.
- 4. 1. 4 The term 'fusion weld', for the purpose of these requirements, is applicable to welded joints made by manual, semi-automatic, or automatic electric arc welding processes. Special consideration will be given to the proposed use of other fusion welding processes.

**4. 2 Cutting and forming of shells and heads**

- 4. 2. 1 Cut or chipped surfaces which will not be subsequently covered by weld metal are to be ground smooth.
- 4. 2. 2 Shell plates and heads are to be formed to the correct contour up to the extreme edge of the plate.
- 4. 2. 3 Vessels manufactured from carbon or carbon manganese steel plates (See [Table 13. 4. 1: Impact test requirements](#) in [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#), grades 360AR to 510FG), which have been hot formed or locally heated for forming, are to be re-heat treated in accordance with the original supplied condition on completion of this operation. Vessels formed from plates supplied in the as-rolled condition are to be heat treated in accordance with the material manufacturer's recommendations.
- 4. 2. 4 Subsequent heat treatment will not be required where steels are supplied in the as-rolled, normalised or normalised and controlled rolled condition, or hot forming is carried out entirely at a temperature within the normalising range.
- 4. 2. 5 For alloy steel vessels where hot forming is employed (See [Table 13. 4. 1: Impact test requirements](#) in [Ch 3 Rolled Steel Plates, Strip, Sections and Bars](#), 13Cr Mo 45 etc.), the plates are to be heat treated on completion in accordance with the material manufacturer's recommendations.

**Table 13. 4. 1: Impact test requirements**

| Pressure vessel Class  | Minimum design temperature | Plate material thickness $t$   | Impact test temperature  |
|--|----------------------------|--------------------------------|--|
| Class 1<br><i>See Note</i>   | –10°C or above             | All                            | 5°C below the minimum design temperature or 20°C, whichever is the lower |
|  |                            | $t \leq 20$ mm                 | 5°C below the minimum design temperature                                 |
| All Classes  | Below –10°C                | $20 \text{ mm} < t \leq 40$ mm | 10°C below the minimum design temperature                                |
|  |                            | Over 40 mm                     | Subject to special consideration   |
| <b>Note</b> Impact testing is not required for Classes 2/1, 2/2 and 3. |                            |                                |  |

4. 2. 6 Where plates are cold formed, subsequent heat treatment is to be performed where the internal radius is less than 10 times the plate thickness. For carbon and carbonmanganese steels this heat treatment may be a stress relief heat treatment.
4. 2. 7 In all cases where hot forming is employed, and for cold forming to a radius less than 10 times the thickness, the manufacturer is required to demonstrate that the forming process and subsequent heat treatments result in acceptable properties.

### 4. 3 Fitting of shell plates and attachments

4. 3. 1 The location of welded joints is to be such as to avoid intersecting butt welds in the vessel shell plates. The attachment of nozzles and openings in the vessels are to be arranged to avoid main shell weld seams.
4. 3. 2 The surfaces of the plates at the longitudinal or circumferential seams are not to be out of alignment with each other, at any point, by more than 10 per cent of the plate thickness. In no case is the misalignment to exceed 3 mm for longitudinal seams, or 4 mm for circumferential seams.
4. 3. 3 Where a vessel is constructed of plates of different thicknesses (tube plate and wrapper plate), the plates are to be so arranged that their centrelines form a continuous circle.
4. 3. 4 For longitudinal seams, the thicker plate is to be equally chamfered inside and outside by machining over a circumferential distance not less than twice the difference in thickness, so that the plates are of equal thickness at the longitudinal weld seam. For the circumferential seam, the thickest plate is to be similarly prepared over the same distance longitudinally.
4. 3. 5 For the circumferential seam, where the difference in the thickness is the same throughout the circumference, the thicker plate is to be reduced in thickness by machining to a taper for a distance not less than four times the offset, so that the two plates are of equal thickness at the weld joint. A parallel portion may be provided between the end of the taper and the weld edge preparation; alternatively, if so desired, the width of the weld may be included as part of the smooth taper to the thicker plate.
4. 3. 6 All attachments (lugs, brackets, reinforcing plates, etc.) are to conform to the shape of the surface to which they are attached.

## 4. 4 Welding

- 4. 4. 1 Welding procedures are to be established for all welds joining pressure containing parts and for welds made directly onto pressure containing parts. Welding procedures are to be based on qualification tests performed in accordance with [Ch 12 Welding Qualifications](#).
- 4. 4. 2 In all cases where tack welds, in the root of the weld seam, are used to retain plates or parts in position prior to welding, they are to be removed in the process of welding the seam.
- 4. 4. 3 Steel backing strips may be used for the circumferential seams of Class 2/1, Class 2/2 and Class 3 pressure vessels and are to be the same nominal composition as the plates to be welded.
- 4. 4. 4 Fillet welds are to be made to ensure proper fusion and penetration at the root of the fillet. At least two layers of weld metal are to be deposited at each weld affixing branch pipes, flanges and seatings.
- 4. 4. 5 The outer surface of completed welds is to be at least flush with the surface of the plates joined, and any weld reinforcement is to provide a smooth transition and gradual change of section with the plate surface.
- 4. 4. 6 Where attachment of lugs, brackets, branches, manhole frames, reinforcement plates and other members are to be made to the main pressure shell by welding, this is to be to the same standard as required for the main vessel shell construction.
- 4. 4. 7 The main weld seams and all welded attachments made to pressure containing parts are to be completed prior to post weld heat treatment.
- 4. 4. 8 The finish of welds attaching pressure parts and non-pressure parts to the main pressure shell is to be such as to allow satisfactory examination of the welds. In the case of Class 1 and Class 2/1 pressure vessels, these welds are to be ground smooth, if necessary, to provide a suitable finish for examination.

## 4. 5 General requirements for routine weld production tests

- 4. 5. 1 Routine weld production tests are specified as a means of monitoring the quality of the welded joints and are required for pressure vessel Classes 1, 2/1 and 2/2.
- 4. 5. 2 Routine production test plates are required during the manufacture of vessels and as part of the initial approval test programme for Class 1 vessel manufacturers, refer to *MQPS 0-4*.
- 4. 5. 3 Routine production weld tests are not required for Class 3 pressure vessels unless there are doubts about the weld quality where check tests may be requested by the Surveyor.
- 4. 5. 4 Routine production test plates are not required for circumferential seams of cylindrical pressure vessels. Spherical vessels are to have one test plate prepared having a welded joint which is a simulation of the circumferential seams.
- 4. 5. 5 Routine production weld tests may be requested by the Surveyor where there is reason to doubt the quality of workmanship.

## 4. 6 Production test plate assembly requirements

- 4. 6. 1 Two test plates and one complete test assembly, of sufficient dimensions to provide all the required mechanical test specimens is to be prepared for each vessel and is to be welded as a continuation and simulation of the longitudinal weld joint.
- 4. 6. 2 For Class 2/2 vessels, where a large number are made concurrently at the same works using the same welding procedure and the plate thicknesses do not vary by more than 5 mm, one test may be performed for each 37 m of longitudinal plus circumferential weld seam. In these cases the thickness of the test plate is to be equal to the thickest shell plate used in the construction.

- 4. 6. 3 Where the vessel size or design results in a small number of longitudinal weld seams, one test assembly may be prepared for testing provided that the welding details are the same for each seam.
- 4. 6. 4 Test plate materials are to be the same grade, thickness and supply condition and from the same cast as that of the vessel shell. The test assembly is to be welded at the same time as the vessel weld to which it relates and is to be supported so that distortion during welding is minimised.
- 4. 6. 5 As far as practicable, welding is to be performed by different welders where there is a requirement for several routine tests to be welded.
- 4. 6. 6 The test assembly may be detached from the vessel weld only after the Surveyor has performed a visual examination and has added his mark or stamp. Straightening of test welds prior to mechanical testing is not permitted.
- 4. 6. 7 Where the pressure vessel is required to be subjected to post-weld heat treatment, the test weld is to be heat treated, after welding, in accordance with the same requirements. This may be performed separately from the vessel.

#### **4. 7 Inspection and testing**

- 4. 7. 1 The test weld is to be subjected to the same type of non-destructive examination and acceptance criteria as specified for the weld seam to which the test relates. Nondestructive examination is to be performed prior to removing specimens for mechanical testing, but after any post-weld heat treatment.
- 4. 7. 2 The test weld is to be sectioned to remove the number and type of test specimens for mechanical testing as given in 4.8.

#### **4. 8 Mechanical requirements**

- 4. 8. 1 The routine production test assembly is to be machined to provide the following test specimens:
  - a. Tensile.
  - b. Bend.
  - c. Hardness.
  - d. Impact (See [Table 13. 4. 1: Impact test requirements](#)).
  - e. Macrograph and hardness survey of full weld section.
- 4. 8. 2 One set of specimens for mechanical testing are to be removed, as shown in [Figure 13. 4. 1: Routine weld test - Test specimens for Class 1 and Class 2/1](#) or [Figure 13. 4. 2: Routine weld tests - Test specimens for Class 2/2 and Class 3](#) as appropriate for the Class of approval. Impact tests are to be removed and tested where required by [Table 13. 4. 1: Impact test requirements](#).

**Figure 13. 4. 1: Routine weld test - Test specimens for Class 1 and Class 2/1**

1. All weld metal tensile test specimen.
  2. Bend test specimens.
  3. Tensile test for joints.
  4. Macro-test specimen.
  5. Charpy V-notch impact.
- (For all Class 1 pressure vessels and other Classes of pressure vessels where the minimum design temperature is below  $-10^{\circ}\text{C}$ ).

Figure 13. 4. 2: Routine weld tests - Test specimens for Class 2/2 and Class 3

Note 1. Tensile test for joints.

Note 2. Bend test specimens.

Note 3. Nicked bend test specimen.

Note 4. Charpy V-notch impact test specimens (if required by [Table 13. 4. 1: Impact test requirements](#)).

4. 8. 3 **Longitudinal tensile test for weld metal.** An all-weld metal longitudinal tensile test is required. For thicknesses in excess of 20 mm, where more than one welding process or type of consumable has been used to complete the joint, additional longitudinal tests are required from the respective area of the weld. This does not apply to the welding process or consumables used solely to deposit the root weld. Specimens are to be tested in accordance with the following requirements:
- The diameter and gauge length of the test specimen is to be in accordance with [Ch 11, 2.1 Dimensions of test specimens 2.1.1](#).
  - For carbon and carbon-manganese steels the tensile strength of the weld metal is to be not less than the minimum specified for the plate material and not more than 145 N/mm<sup>2</sup> above this value. The percentage elongation,  $A$ , is to be not less than that given by:  

$$A = (980 - R) / 21.6$$
but not less than 80 per cent of the minimum elongation specified for the plate

where  $R$  is the tensile strength, in N/mm<sup>2</sup>, obtained from the all weld metal tensile tests.

- c. For other materials the tensile strength and percentage elongation is not to be less than that specified for the base materials welded.

4. 8. 4 **Transverse tensile test for joint.** Transverse tensile test specimens are to be removed and tested in accordance with the following requirements:

- a. One reduced section tensile test specimen is to be cut transversely to the weld to the dimensions shown in [Ch 11, 2.1 Dimensions of test specimens 2.1.1](#) and the weld reinforcement is to be removed.
- b. In general, where the plate thickness exceeds 30 mm, or where the capacity of the tensile test machine prevents full thickness tests, each tensile test may be made up of several reduced section specimens, provided that the whole thickness of the weld is subjected to testing.
- c. The tensile strength obtained is to be not less than the minimum specified tensile strength for the plate material, and the location of the fracture is to be reported.

4. 8. 5 **Transverse bend test.** The bend test specimens are to be removed and tested in accordance with the following requirements:

- a. Two bend test specimens of rectangular section are to be cut transversely to the weld, one bent with the outer surface of the weld in tension (face bend), and the other with the inner surface in tension (root bend).
- b. The specimen dimensions are to be in accordance with [Ch 2 Testing Procedures for Metallic Materials](#).
- c. Each specimen is to be mounted on roller supports with the centre of the weld midway between the supports. The former is to have a diameter specified in [Ch 12, 2.7., Destructive tests for steel butt welds 2.7.6](#) depending on the material being welded.
- d. After bending through an angle of at least 180° there is to be no crack or defect exceeding 1.5 mm measured across the specimen or 3 mm measured along the specimen. Premature failure at the edges of the specimen is not to be cause for rejection, unless this is associated with a weld defect.

4. 8. 6 **Macro-specimen and hardness survey.** A macro examination specimen is to be removed from the test assembly near the end where welding started. The specimen is to include the complete cross-section of the weld and the heat affected zone. The specimen is to be prepared and examined in accordance with the following requirements:

- a. The cross-section of the specimen is to be ground, polished and etched to clearly reveal the weld runs, and the heat affected zones.
- b. The specimen is to show an even weld profile that blends smoothly with the base material and have satisfactory penetration and fusion, and an absence of significant inclusions or other defects.
- c. Where there is doubt in the condition of the weld as shown by macro-etching, the area concerned is to be microscopically examined.
- d. For carbon, carbon manganese and low alloy steels, a Vickers hardness survey is to be performed on the macro-specimen using either a 5 kg or 10 kg load. Testing is to include the base material, the weld and the heat affected zone. Hardness scans on the crosssection are to be performed as specified in [Figure 12. 2. 14: Hardness testing locations for butt welds](#) in Chapter 12. The maximum recorded hardness is to not exceed 350 Hv.

4. 8. 7 **Charpy V-notch impact test.** Charpy V notch impact test specimens are to be prepared and tested as required by [Table 13. 4. 1: Impact test requirements](#) and in accordance with the following requirements:

- a. The dimensions and tolerances of the specimens are to be in accordance with [Ch 2 Testing Procedures for Metallic Materials](#).

- b. Charpy V-notch impact specimens are to be removed with the notch perpendicular to the plate surface.
  - c. Specimens are to be removed for testing from the weld centreline and the heat affected zone (fusion line and fusion line + 2 mm locations) detailed in [Figure 12. 2. 11: Locations of V-notch for butt weld of normal heat input \(heat input ≤ 50 kJ/cm\)](#) or [Figure 12. 2. 12: Locations of V-notch for butt weld of high heat input \(heat input > 50 kJ/cm\)](#) in Chapter 12, as appropriate. Heat affected zone impact tests may be omitted where the minimum design temperature is above +20°C.
  - d. For thicknesses in excess of 20 mm, where more than one welding process or type of consumable has been used to complete the joint, impact tests are required from the respective areas of the weld. This does not apply to the welding process or consumables used solely to deposit the root weld.
  - e. The average energy of a set of three specimens is not to be less than 27 J or the minimum specified for the base material, whichever is the higher. The minimum energy for each individual specimen is to meet the requirements of [Ch 1, 4.5 Mechanical tests 4.5.2](#).
4. 8. 8 **Nick break bend tests.** A nick bend or fracture test specimen is to be a minimum of 100 mm long measured along the weld direction and is to be tested in accordance with and meet the requirements of the following:
- a. The specimen is to have a slot cut into each side along the centreline of the weld and perpendicular to the plate surface.
  - b. The specimen is to be bent along the weld centreline until fracture occurs and the fracture faces are to be examined for defects. The weld is to be sound, with no evidence of cracking or lack of fusion or penetration and be substantially free from slag inclusions and porosity.

## 4. 9 Failure to meet requirements

4. 9. 1 Where any test specimen fails to meet the requirements, additional specimens may be removed and re-tested in accordance with [Ch 2, 1.4, Re-testing procedures](#).
4. 9. 2 Where a routine weld test fails to meet requirements, the welds to which it relates will be considered as not having met the requirements. The reason for the failure is to be established, and the manufacturer is to take such steps as necessary to either
- a. Remove the affected welds and have them re-welded, or
  - b. Demonstrate that the affected production welds have acceptable properties.

## 4. 10 Post-weld heat treatment

4. 10. 1 Fusion welded pressure vessels, where indicated in [Table 13. 4. 2: Post-weld heat treatment requirements](#), are to be heat treated on completion of the welding of the seams and of all attachments to the shell and ends, and before the hydraulic test is carried out.

**Table 13. 4. 2: Post-weld heat treatment requirements**

| Type of steel  | Plate thickness above which post-weld heat treatment (PWHT) is required |                        |
|--|---|------------------------|
|  | Steam raising plant   | Other pressure vessels |
| Carbon and carbon/manganese steels without low temperature impact values | 20 mm   | 30 mm                  |
| Carbon and carbon/manganese steels with low temperature impact values    | 20 mm   | 40 mm                  |

|                    |                                  |                 |
|--------------------|----------------------------------|-----------------|
| 1Cr ½Mo            | All thicknesses                  | All thicknesses |
| 2¼Cr 1Mo           | All thicknesses                  | All thicknesses |
| ½Cr ½Mo ¼V         | All thicknesses                  | All thicknesses |
| Other alloy steels | Subject to special consideration |                 |

4. 10. 2 Tubes which have been expanded into headers or drums may be seal welded without further post-weld heat treatment.
4. 10. 3 Steam and gas turbine cylinders and rotors are to be subjected to post-weld heat treatment irrespective of thickness.
4. 10. 4 Where the weld attaches parts of different thicknesses, the thickness to be used when applying the requirements for post-weld heat treatment is to be either the thinner of the two plates for butt welded connections, or the thickness of the shell for welds to flanges, tubeplates and similar connections.
4. 10. 5 Care is to be exercised to provide drilled holes in double reinforcing plates and other closed spaces prior to heat treatment.

#### 4. 11 Basic requirements for post-weld heat treatment of fusion welded pressure vessels

4. 11. 1 Recommended soaking temperatures and soak durations for post-weld heat treatment are given in [Table 13. 4. 3: Post-weld soak temperatures and times](#) for different materials. Where other materials are used for pressure vessel construction, full details of the proposed heat treatment are to be submitted for consideration.

**Table 13. 4. 3: Post-weld soak temperatures and times**

| Material type  | Soak temperature (°C) | Soak period                                      |
|--|-----------------------|--|
| Carbon and carbon/manganese grades   | 580–620°              | 1 hour per 25 mm of thickness, minimum 1 hour    |
| 1Cr ½Mo  | 620–660°              | 1 hour per 25 mm of thickness, minimum of 1 hour |
| 2¼Cr 1Mo   | 650–690°              | 1 hour per 25 mm of thickness, minimum of 1 hour |
| ½Cr ½Mo ¼V   | 670–720°              | 1 hour per 25 mm of thickness, minimum of 1 hour |
| <b>Note</b> For materials supplied in the tempered condition, the post-weld heat treatment temperature is to be lower than the material tempering temperature. |                       |  |

4. 11. 2 Where pressure vessels are of dimensions that the whole length cannot be accommodated in the furnace at one time, the pressure vessels may be heated in sections, provided that sufficient overlap is allowed to ensure the heat treatment of the entire length of the longitudinal seam.

4. 11. 3 Where materials other than those detailed in [Table 13. 4. 3: Post-weld soak temperatures and times](#) are used or where it is proposed to adopt special methods of heat treatment, full particulars are to be submitted for consideration. In such cases, it may be necessary to carry out tests to show the effect of the proposed heat treatment.

#### 4. 12 Non-Destructive Examination of welds

4. 12. 1 Non-Destructive Examinations (NDE) of pressure vessel welds are to be carried out in accordance with a nationally recognised code or standard.
4. 12. 2 NDE is not to be applied until an interval of at least 48 hours has elapsed since the completion of welding.
4. 12. 3 NDE Personnel are to be qualified to an appropriate level of a nationally recognised certification scheme.
4. 12. 4 Qualification schemes are to include assessments of practical ability for Levels I and II individuals. These examinations are to be made on representative test pieces containing relevant defects.

#### 4. 13 Extent of NDE for Class 1 pressure vessels

4. 13. 1 All butt welded seams in drums, shells, headers and test plates, together with tubes or nozzles with outside diameter greater than 170 mm, are subject to 100 per cent volumetric and surface crack detection inspections.
4. 13. 2 For circumferential butt welds in extruded connections, tubes, headers and other tubular parts with an outside diameter of 170 mm or less, at least 10 per cent of the total number of welds is to be subjected to volumetric examination and surface crack detection inspections.
4. 13. 3 Full penetration tube sheet to shell welds are to be subjected to 10 per cent volumetric examination and 10 per cent surface inspection, prior to the installation of the tubes.
4. 13. 4 In addition to the acceptance limits stated in [Table 13. 2. 5: Acceptance criteria for visual testing, magnetic particle and liquid penetrant testing](#) to [Table 13. 2. 7: Acceptance criteria for ultrasonic testing](#), no cracks, lack of fusion, or lack of penetration is permitted.
4. 13. 5 When an unacceptable indication is detected, the full length of the weld is to be subjected to 100 per cent examination by the same method, testing conditions and acceptance criteria.
4. 13. 6 The NDE requirements of [Ch 13, 1.11 Non-destructive examination of welds](#) are to be complied with.

#### 4. 14 Extent of NDE for Class 2/1 pressure vessels

4. 14. 1 For Class 2/1 pressure vessels, volumetric and surface crack detection inspections are to be applied at selected regions of each main seam. At least 10 per cent of each main seam is to be examined together with the full length of each welded test plate. When an unacceptable indication is detected, at least two additional check points in the seam are to be selected by the surveyor for examination using the same inspection method. Where further unacceptable defects are found either:
- the whole length of weld represented is to be cut out and re-welded and re-examined as if it was a new weld with the test plates being similarly treated, or
  - the whole length of the weld represented is to be reexamined using the same inspection methods.

- 4. 14. 2 Butt welds in furnaces, combustion chambers and other pressure parts for fired pressure vessels under external pressure, are to be subject to spot volumetric examination. The minimum length for each check point is to be 300 mm.
- 4. 14. 3 The extent of NDE for turbine cylinders and rotors is to be agreed with the Surveyor.
- 4. 14. 4 The requirements of [Ch 13, 4.13 Extent of NDE for Class 1 pressure vessels 4.13.3](#), [Ch 13, 4.13 Extent of NDE for Class 1 pressure vessels 4.13.4](#) and [Ch 13, 4.13 Extent of NDE for Class 1 pressure vessels 4.13.5](#) apply to Class 2/1 pressure vessels.

#### **4. 15 NDE Method**

- 4. 15. 1 Volumetric examinations may be made by radiography. For welds of nominal thickness greater than or equal to 8 mm, the examinations may be by ultrasonic testing. The preferred method for surface crack detection in ferrous metals is magnetic particle inspection. The preferred method for nonmagnetic materials is liquid penetrant inspection.

#### **4. 16 valuation and reports**

- 4. 16. 1 The manufacturer is to be responsible for the review, interpretation, evaluation and acceptance of the results of NDE. Reports stating compliance, or non-compliance, with the criteria established in the inspection procedure are to be issued. Reports are to comply, as a minimum, with the requirements of [Ch 1, 5 Non-destructive examination](#).

#### **4. 17 Repair to welds**

- 4. 17. 1 Where non-destructive examinations reveal unacceptable defects in the welded seams, they are to be repaired in accordance with [Ch 13, 1.15 Rectification of welds defects](#) and are to be shown by further non-destructive examinations to have been eliminated.
- 4. 17. 2 In the case where spot radiography has revealed unacceptable defects, the requirements of [Ch 13, 4.14 Extent of NDE for Class 2/1 pressure vessels 4.14.1](#) apply.
- 4. 17. 3 Where post-weld heat treatment is required in accordance with [Ch 13, 4.10 Post-weld heat treatment](#), weld repairs to the vessel or cylindrical shell or parts attaching to the shell are to be subjected to a subsequent heat treatment in accordance with [Ch 13, 4.10 Post-weld heat treatment](#).
- 4. 17. 4 In the event of unsuccessful weld repair of a defect, only one more repair attempt may be made of the same defect. Any subsequent repairs may require the re-repair excavation to be enlarged to remove the original repair heat affected zone.

CHAPTER **13 Requirements for Welded Construction**SECTION **5 Specific requirements for pressure piping****5.1 Scope**

- 5.1.1 Fabrication of piping is to be carried out in accordance with the requirements of this Section and the general requirements given in [Ch 13, 1 General welding requirements](#), unless more stringent requirements have been specified.
- 5.1.2 Piping systems are to be constructed in accordance with the approved plans and specifications.
- 5.1.3 Fabricated piping will be accepted only if manufactured by firms that have demonstrated that they have the facilities and equipment and are competent to undertake the quality of welding required for the Class of pipework proposed.

**5.2 Manufacture and workmanship**

- 5.2.1 Pipe welding may be performed using manual, semi-automatic or fully automatic electric arc processes. The use of oxy-acetylene welding will be limited to Class 3 piping in carbon steel or carbon/manganese material that is not for carrying flammable fluids and limited to butt joints in pipes not exceeding 100 mm diameter or 9.5 mm thickness.
- 5.2.2 Welding of piping, including attachment welds directly to pressure retaining parts is to be performed in accordance with approved welding procedures that have been qualified in accordance with [Ch 12 Welding Qualifications](#).
- 5.2.3 Where the work involves a significant number of branch connections, tests will be required to demonstrate that the type of joint(s) and welding techniques employed are capable of achieving the required quality.
- 5.2.4 Where pressure piping is assembled and butt welded in situ, the piping is to be arranged well clear of adjacent structures to allow sufficient access for preheating, welding, heat-treatment and non-destructive examination of the joints.
- 5.2.5 Alignment of pipe butt welds is to be in accordance with [Table 13. 5. 1: Pipe butt weld alignment tolerances](#) unless more stringent requirements have been agreed. Where fusible inserts are used, the alignment is to be within 0.5 mm in all cases.

**Table 13. 5. 1: Pipe butt weld alignment tolerances**

| Pipe size  | Maximum permitted misalignment                 |
|--|--|
| $D < 150 \text{ mm}$ and $t \leq 6 \text{ mm}$   | 1.0 mm or 25% of $t$ , whichever is the lesser |
| $D < 300 \text{ mm}$ and $t \leq 9.5 \text{ mm}$ | 1.5 mm or 25% of $t$ , whichever is the lesser |
| $D \geq 300$ and $t > 9.5 \text{ mm}$            | 2.0 mm or 25% of $t$ , whichever is the lesser |

where  
 $D$  = pipe internal diameter  
 $t$  = pipe wall thickness

- 5.2.6 The number of welds is to be kept to a minimum. The minimum separation between welds, measured toe-to-toe, is to be not be less than 75 mm. Where it is not possible to achieve this, adjacent welds are to be subjected to surface crack detection NDE.
- 5.2.7 Welding consumables and fusible root inserts, where used, are to be suitable for the materials being joined.
- 5.2.8 Acceptable methods of flange attachment are to be used, See [Figure 12. 2. 2: Typical welded-on flanges](#) in [Pt 5, Ch 12 Piping Design Requirements](#) of the Rules for Ships. Where backing rings are used with flange type (a) they are to fit closely to the bore of the pipe and be removed after welding. The rings are to be made of the same material as the pipes. The use of flange types (b) and (c) with alloy steel pipes is limited to pipes up to and including 168.3 mm outside diameter.
- 5.2.9 Where socket welded fittings are employed, the diametrical clearance between the outside diameter of the pipe and the base of the fitting is not to exceed 0.8 mm, and a gap of approximately 1.5 mm is to be provided between the end of the pipe and the internal step at the bottom of the socket.
- 5.2.10 For welding of carbon, carbon/manganese and low alloy steels, the preheat to be applied will be dependent on the material grade, thickness and hydrogen grading of the welding consumable in accordance with [Table 13. 5. 2: Welding preheat levels for piping](#), unless welding procedure testing indicates that a higher level is required.

**Table 13. 5. 2: Welding preheat levels for piping**

| Material Grade                       | Thickness, $t$ (mm)<br><i>See Note 4</i> | Minimum preheat temperature<br>(°C) <i>See Note 1</i> |                                      |
|--------------------------------------|--|---|--------------------------------------|
|                                      |  | Non-low H <sub>2</sub>                                | Low H <sub>2</sub> <i>See Note 2</i> |
| Carbon and carbon /manganese grades: | $t \leq 15$                              | 50  | 10                                   |
| 320 and 360                          | $t \geq 15$                              | 100   | 50                                   |
| Carbon and carbon /manganese grades: | $t \leq 15$                              | 75  | 20                                   |
| 410, 460 and 490                     | $t \geq 15$                              | 150   | 100                                  |
| 1Cr ½Mo                              | $t < 13$                                 |   | 100                                  |
|                                      | $t \geq 13$                              | <i>See Note 3</i>                                     | 150                                  |
| 2¼Cr 1Mo                             | $t < 13$                                 | <i>See Note 3</i>                                     | 150                                  |
|                                      | $t \geq 13$                              |   | 200                                  |
| ½Cr ½Mo ¼V                           | $t < 13$                                 | <i>See Note 3</i>                                     | 150                                  |
|                                      | $t \geq 13$                              |   | 200                                  |

**Note 1.** Where the ambient temperature is 0°C or below, pre-warming of the weld joint is required in all cases.

**Note 2.** Low hydrogen process or consumables are those that have been tested and have achieved a grading of H15 or better (See [Ch 11 Approval of Welding Consumables](#)).

**Note 3.** Low hydrogen welding process is required for these materials.

**Note 4.**  $t$  = the thickness of the thinner member for butt welds, and the thicker member for fillet and branch welds.

- 5. 2. 11 Welding without filler metal is generally not permitted for welding of duplex stainless steel materials.
- 5. 2. 12 All welds in high pressure, high temperature pipelines are to have a smooth surface finish and even contour; and where necessary, made smooth by grinding.
- 5. 2. 13 Check tests of the quality of the welding are to be carried out periodically.

### 5. 3 Heat treatment after bending of pipes

- 5. 3. 1 After forming or bending of pipes, the heat treatments specified in this Section are to be applied unless the pipe material manufacturer specifies or recommends other requirements.
- 5. 3. 2 Generally, hot forming is to be carried out within the normalising temperature range. When carried out within this temperature range, no subsequent heat treatment is required for carbon and carbon/manganese steels. For alloy steels, 1Cr ½Mo, 2¼Cr 1Mo and ½Cr ½Mo ¼V, a subsequent stress relieving heat treatment in accordance with [Ch 13, 1.16 Post-weld heat treatment](#) at the temperatures and times specified in [Table 13. 5. 4: Post-weld heat treatment requirements for piping](#) is required, irrespective of material thickness.

**Table 13. 5. 3: Heat treatment after bending of pipes**

| Type of steel   | Heat treatment required  |
|---|--|
| Carbon and carbon/manganese:<br>Grades 320, 360, 410, 460 and 490 | Normalise at 880 to 940°C  |
| 1Cr ½Mo   | Normalise at 900 to 940°C,<br>followed by tempering at 640<br>to 720°C |
| 2¼Cr 1Mo  | Normalise at 900 to 960°C,<br>followed by tempering at 650<br>to 780°C |
| ½Cr ½Mo ¼V  | Normalise at 930 to 980°C,<br>followed by tempering at 670<br>to 720°C |
| Other alloy steels  | Subject to special<br>consideration                                    |

- 5. 3. 3 When hot forming is performed outside the normalising temperature range, a subsequent heat treatment in accordance with [Table 13. 5. 3: Heat treatment after bending of pipes](#) is required.
- 5. 3. 4 After cold forming to a radius (measured at the centreline of the pipe) of less than four times the outside diameter, heat treatment in accordance with [Table 13. 5. 3: Heat treatment after bending of pipes](#) is required.

5. 3. 5 Bending procedures and subsequent heat treatment for other alloy steels will be subject to special consideration.

## 5. 4 Post-weld heat treatment

5. 4. 1 Post-weld heat treatment is to be carried out in accordance with the general requirements specified in [Ch 13, 1.16 Post-weld heat treatment](#) and [Ch 13, 4.10 Post-weld heat treatment](#).
5. 4. 2 The thickness limits, the recommended soaking temperatures and periods, for application of post-weld heat treatment are given in [Table 13. 5. 4: Post-weld heat treatment requirements for piping](#).

**Table 13. 5. 4: Post-weld heat treatment requirements for piping**

| Material Grade   | Thickness for which post-weld heat treatment is required | Soak temperature (°C) <i>See Note 2</i> | Soak period  |
|--|--|---|--|
| Carbon and carbon/manganese grades: 320, 360, 410, 460, 490  | Over 30 mm   | 580–620°C                               | 1 hour per 25 mm of thickness, 320, 360, 410, 460, 490 minimum of 1 hour |
| 1Cr ½Mo  | Over 8 mm  | 620–660°C                               | 1 hour per 25 mm of thickness, minimum of 1 hour                         |
| 2¼Cr 1Mo   | All  | 650–690°C                               | 1 hour per 25 mm of thickness, minimum of 1 hour                         |
| ½Cr ½Mo ¼V   | All, <i>See Note 1</i>                                   | 670–720°C                               | 1 hour per 25 mm of thickness, minimum of 1 hour                         |
| <p><b>Note 1.</b> Heat treatment may be omitted for thicknesses up to 8 mm and diameters not exceeding 100mm and minimum service temperature 450°C provided that welding procedure tests have demonstrated acceptable properties in the as welded condition.</p> <p><b>Note 2.</b> For materials supplied in the tempered condition, the post weld heat treatment temperature is to be at least 20°C less than the material tempering temperature.</p> |  |   |  |

5. 4. 3 Where the use of oxy-acetylene welding is proposed, due consideration is to be given to the need for normalising and tempering after such welding.

## 5. 5 Non-destructive examination

5. 5. 1 Non-destructive examination of pipe welds is to be carried out in accordance with the general requirements of [Ch 13, 1.11 Non-destructive examination of welds](#) and the following.
5. 5. 2 Butt welds in Class 1 pipes with an outside diameter greater or equal to 75 mm are to be subject to 100 per cent volumetric and visual inspections. Consideration is to be given to the extent and method of testing applied to butt welds in Class 1 pipes with an outside diameter less than 75 mm.
5. 5. 3 Butt welds in Class II pipes are to be subjected to at least 10 per cent random volumetric inspections when the outside diameter is 100 mm and greater.
5. 5. 4 NDE for Class II pipes with a diameter less than 100 mm is to be at the discretion of the Surveyor.
5. 5. 5 Non-destructive examination procedures, methods and the evaluation of reports are to be in accordance with [Ch 13, 4.15 NDE Method](#) and [Ch 13, 4.16 Evaluation and reports](#).
5. 5. 6 Fillet welds on flange pipe connections of Class I pipes are to be examined by surface crack detection methods.

5. 5. 7 Weld acceptance criteria shall be in accordance with [Ch 13, 4.13, Extent of NDE for Class 1 pressure vessels](#).

## 5. 6 Repairs to pipe welds

5. 6. 1 Where non-destructive examinations reveal unacceptable defects in a weld, the defects are to be removed and repaired in accordance with [Ch 13, 1.15 Rectification of welds defects](#). Completed repairs are to be shown by further non-destructive examination to have eliminated the defects.
5. 6. 2 For pipes with diameter less than 88 mm and where unacceptable defects have been found during nondestructive examination, consideration is to be given to cutting the weld out completely, re-making the weld preparation and re-welding as a new joint (because of the difficulty of making small repairs).
5. 6. 3 Where repeated weld repairs have to be made to a weld, only two such attempts are to be permitted, thereafter the weld is to be cut apart and removed, and re-welded as a new joint.
5. 6. 4 Where piping requires post-weld heat treatment weld, repairs to the pressure retaining parts are to be subjected to a subsequent heat treatment. Similarly, where welding is conducted after pressure testing, a further pressure test is to be required unless specific exemption has been agreed.

PART

# 2

CHAPTER **13 Requirements for Welded Construction**

SECTION **6 Repair of existing ships by welding**

## **6. 1 Scope**

- 6. 1. 1 This Section specifies requirements for repairs made by welding after introduction into service. This Section includes defects to hull structures, machinery, equipment and components. It also includes replacement of structure due to damage or corrosion. These requirements are in addition to those specified in the preceding Sections of this Chapter.
- 6. 1. 2 These requirements apply unless the original builder or manufacturer has specified alternative requirements.

## **6. 2 Materials used for repairs**

- 6. 2. 1 Permanent materials used in the repair are to be in accordance with [Ch 13, 1.3 Materials](#).
- 6. 2. 2 Prior to commencing any welding, the material grades present in the original structure in way of the repair are to be determined. Where the materials cannot be identified from the ship records, test samples may be removed for chemical analysis and mechanical testing in order to determine the material grades.
- 6. 2. 3 Temporary materials that are to be welded to the main structure to assist in executing the repairs, but removed on completion, are to be of weldable quality.

## **6. 3 Workmanship**

- 6. 3. 1 A repair method is to be established by the shipyard or repair yard and is to be agreed by the Surveyor prior to commencing any repair work.
- 6. 3. 2 The removal of crack-like defects is to be confirmed by visual examination and surface crack detection NDE. This may be augmented by ultrasonic examination where several defects are reported at different depths at the same location.
- 6. 3. 3 The weld joint or groove shape used for the repair is to have a profile suitable for welding.
- 6. 3. 4 The weld area is to be carefully cleaned, in particular, where the material surface has been painted or has been subjected to an oily or greasy environment.

## **6. 4 Non-destructive examination**

- 6. 4. 1 On completion of welding and any post-weld heat treatment, repair welds are to be subjected to the type and extent of NDE and assessed in accordance with the acceptance criteria specified for the original construction.

- 6. 4. 2 Where the original construction specification did not specify NDE, the completed welds are to be, as a minimum, subject to visual examination. Consideration of other NDE techniques is to take due cognisance of the location or the repair within the vessel.
- 6. 4. 3 Where spot NDE is applied and defects are found, the extent of NDE is to be increased to include an equal amount of weld length. Where this reveals unacceptable defects, either the whole weld will be rejected or the extent of inspection increased to 100 per cent examination.
- 6. 4. 4 The acceptance criteria to be applied are to generally be in accordance with the original build specification. Where conflict of requirements exist, the NDE acceptance limits for welding procedure tests specified in [Ch 12, 2.5 Non-destructive examination \(NDE\) 2.5.5](#) may be used as a minimum requirement.

## **6. 5 Repairs to welds defects**

- 6. 5. 1 Where NDE reveals unacceptable defects, these are to be repaired in accordance with [Ch 13, 1.15 Rectification of welds defects](#).

**CHAPTER 13 Requirements for Welded Construction****SECTION 7 Austenitic and duplex stainless steel – Specific requirements****7.1 Scope**

- 7.1.1 This Section specifies requirements for the fabrication and welding of austenitic and duplex stainless steels, and is in addition to those detailed above.
- 7.1.2 Fabrication and welding of these materials is to be in designated areas which are separated from those used for other materials, such as carbon steels and copper alloys. Where work is performed in the same workshop as other materials, adequate barriers or screening are to be provided to prevent cross-contamination of different material types.
- 7.1.3 All tools and equipment used are to be suitable for use on stainless steel materials. The use of tools or equipment made of carbon steel materials is to be avoided. It is permissible to use carbon steel tools provided that the surfaces that come into contact with the austenitic and duplex stainless materials are protected with an austenitic or nickel base alloy.

**7.2 Design**

- 7.2.1 Care is to be exercised in the weld design to prevent crevice corrosion from occurring, particularly where austenitic materials are used. In this respect fillet welds and partial penetration welds are to be continuous and welded on both sides of the joint.

**7.3 Forming and bending**

- 7.3.1 Materials that are cold formed, such that the total strain exceeds 15 per cent (i.e. where the formed diameter to thickness ratio is less than 6:1) are to be subjected to a subsequent softening heat treatment in accordance with the material manufacturers recommendations, unless it is demonstrated by testing that the material properties are acceptable in the 'as formed' condition.
- 7.3.2 Materials may be hot formed provided that a subsequent softening heat treatment is carried out. The forming process and the subsequent heat treatment are to be in accordance with the material manufacturer's recommendations.

**7.4 Fabrication and welding**

- 7.4.1 Welding may be performed using shielded manual arc welding (SMAW), gas tungsten arc welding (GTAW), MIG/MAG welding (GMAW), flux cored arc welding (FCAW), plasma arc welding (PAW) and submerged arc welding (SAW). The use of other welding processes will be subject to special consideration and will require submission of the process details, consumables and the weld properties achieved.

- 7. 4. 2 Misalignment may be corrected by the application of steady even force (e.g. using hydraulic or screw-type clamps). Hammering or heating is not permitted.
- 7. 4. 3 For full penetration welds, a backing or shielding gas is to be provided to prevent oxidation of the root weld. The backing gas is to be maintained until completion of, at least, the root and first fill layer. The backing gas may be omitted where the weld is back gouged or ground to remove the root weld.
- 7. 4. 4 Shielding and backing gases are to be an inert type of high purity and oxygen free.
- 7. 4. 5 For welding of Duplex stainless, the use of backing gases that contain up to 2 per cent nitrogen is permitted.
- 7. 4. 6 Welding of duplex stainless steels without filler metal is generally not permitted.
- 7. 4. 7 Degreasing agents, acid solutions, washing water etc. used for cleaning and any marking crayons and paints used are to be free of chlorides.

## **7. 5 Repairs**

- 7. 5. 1 Correction of distortion by the application of heat is not permitted.

## PART

# 2

## CHAPTER 13 Requirements for Welded Construction

### SECTION 8 Specific requirements for welded aluminium

#### 8.1 Scope

- 8.1.1 This Section specifies requirements for the fabrication and welding of aluminium alloys, and is in addition to those detailed in this Chapter.
- 8.1.2 Fabrication and welding of these materials is to be in designated areas which are separated from those used for other materials, such as carbon steels, stainless steels and copper alloys. Where work is performed in the same workshop as other materials, adequate barriers or screening are to be provided to prevent cross-contamination of different material types.
- 8.1.3 All tools and equipment used are to be suitable for use on aluminium alloy materials. The use of tools made of carbon steel materials is to be avoided where possible.

#### 8.2 Forming and bending

- 8.2.1 Aluminium alloys are to be subject to cold forming and cold bending only.

#### 8.3 Fabrication and welding

- 8.3.1 Welding may be performed using gas tungsten arc welding (GTAW) or metal inert gas welding (GMAW), MIG/MAG welding (GMAW), or variants thereof. The use of other welding processes such as friction stir welding (FSW) will be subject to special consideration and will require submission of the process details, consumables and the weld properties achieved.
- 8.3.2 A comparison of the mechanical properties for selected welded and unwelded alloys is given in [Table 13.8.1: Minimum mechanical properties for aluminium alloys](#).

**Table 13.8.1: Minimum mechanical properties for aluminium alloys**

| Alloy | Condition | 0.2% proof stress, N/mm <sup>2</sup> |                        |          | Ultimate tensile strength, N/mm <sup>2</sup> |
|-------|-----------|--------------------------------------|------------------------|----------|--|
|       |           | Unwelded                             | Welded<br>(See Note 4) | Unwelded | Welded<br>(See Note 4)                       |
| 5083  | O/H111    | 125                                  | 125                    | 275      | 275  |
| 5083  | H112      | 125                                  | 125                    | 275      | 275  |
| 5083  | H116/H321 | 215                                  | 125                    | 305      | 275  |
| 5383  | O/H111    | 145                                  | 145                    | 290      | 290  |

|                       |           |                                |     |     |                              |     |
|-----------------------|-----------|--------------------------------|-----|-----|------------------------------|-----|
| 5383                  | H116/H321 | 220                            |     | 145 | 305                          | 290 |
| 5086                  | O/H111    | 100                            |     | 95  | 240                          | 240 |
| 5086                  | H112      | 125 ( <i>See Note 2</i> )      |     | 95  | 250<br>( <i>See Note 2</i> ) | 240 |
| 5086                  | H116/H321 | 195                            |     | 95  | 275                          | 240 |
| 5059                  | O/H111    | 160                            |     | 160 | 330                          | 330 |
| 5059                  | H116/H321 | 260                            |     | 160 | 360                          | 300 |
| 5456                  | O         | 125                            |     | 125 | 285                          | 285 |
| 5456                  | H116      | 200 ( <i>See Note 5</i> )      |     | 125 | 290<br>( <i>See Note 5</i> ) | 285 |
| 5456                  | H321      | 215 ( <i>See Note 5</i> )      |     | 125 | 305<br>( <i>See Note 5</i> ) | 285 |
| 5754                  | O/H111    | 80                             |     | 80  | 190                          | 190 |
| 6005A                 | T5/T6     | Extruded:<br>Open<br>Profile   | 215 | 100 | 260                          | 160 |
| ( <i>See Note 1</i> ) |           | Extruded:<br>Closed<br>Profile | 215 | 100 | 250                          | 160 |
| 6061                  | T5/T6     | Rolled                         | 240 | 125 | 290                          | 160 |
| ( <i>See Note 1</i> ) |           | Extruded:<br>Open<br>Profile   | 240 | 125 | 260                          | 160 |
|                       |           | Extruded:<br>Closed<br>Profile | 205 | 125 | 245                          | 160 |
| 6082                  | T5/T6     | Rolled                         | 240 | 125 | 280                          | 190 |
|                       |           | Extruded:<br>Open<br>Profile   | 260 | 125 | 310                          | 190 |
|                       |           | Extruded:<br>Closed<br>Profile | 240 | 125 | 290                          | 190 |

**Note 1.** These alloys are not normally acceptable for application in direct contact with sea-water.

**Note 2.** See also [Table 8. 1. 4: Minimum mechanical properties for acceptance purposes of selected extruded aluminium alloy products](#) or [Table 8. 1. 3: Minimum mechanical properties for acceptance purposes of selected rolled aluminium alloy products](#) in Chapter 8.

**Note 3.** The mechanical properties to be used to determine scantlings in other types and grades of aluminium alloy manufactured to National or proprietary Standards and specifications are to be individually agreed with ACS, See also [Ch 8, 1.1 Scope 1.1.5](#).

**Note 4.** Where detail structural analysis is carried out, 'unwelded' stress values may be used away from heat affected zones and weld lines, See also [Pt 3, Ch 2, 1.3 Aluminium 1.3.3](#) of the Rules for Ships.

**Note 5.** For thickness less than 12.5 mm, the minimum unwelded 0.2% proof stress is to be taken as 230 N/mm<sup>2</sup> and the minimum tensile strength is to be taken as 315 N/mm<sup>2</sup>.

8. 3. 3 Misalignment may be corrected by the application of steady even force (e.g. using hydraulic or screw-type clamps). Hammering or heating is not permitted.
8. 3. 4 Correction of distortion by the application of heat is not permitted.

## 8. 4 Non-destructive examination

8. 4. 1 The requirements of [Ch 13, 1.11 Non-destructive examination of welds](#) and [Ch 13, 2.12, Non-destructive examination of welds](#) apply; however, acceptance criteria applicable to aluminium are to be in accordance with [Table 13. 8. 2: Acceptance criteria for surface imperfections of aluminium](#) and [Table 13. 8. 3: Acceptance criteria for internal imperfections of aluminium](#).

**Table 13. 8. 2: Acceptance criteria for surface imperfections of aluminium**

| Surface discontinuity   | Classification according to ISO 6520-1 | Acceptance criteria   |
|---|--|---|
| Crack   | 100                                    | Not permitted   |
| Lack of fusion  | 401                                    | Not permitted   |
| Incomplete root penetration in butt joints welded from one side | 4021                                   | Not permitted   |
| Surface pore  | 2017                                   | $d \leq 0.3s$ or $0.3a$ or 1.5 mm (whichever is the lesser)       |
| Linear porosity (See Note 1)                                    | 2014                                   | Not permitted   |
| Uniformly distributed porosity (See Note 2)                     | 2018                                   | $\leq 1\%$ of area  |
| Clustered porosity  | 2013                                   | Not permitted   |
| Continuous undercut   | 5011                                   | $h \leq 0.1t$ or 0.5 mm (whichever is the lesser)                 |
| Intermittent undercut   | 5012                                   | $h \leq 0.1t$ or 1.0 mm (whichever is the lesser)                 |
| Excess weld metal (See Note 3)                                  | 502                                    | $h \leq 1.5 \text{ mm} + 0.15b$ or 8 mm (whichever is the lesser) |
| Excess penetration  | 504                                    | $h \leq 4 \text{ mm}$   |

|  |     |   |
|--|-----|---|
| Root concavity ( <i>See</i> Note 3)  | 515 | $h \leq 0.1t$ or 1 mm (whichever is the lesser)   |
| Linear misalignment ( <i>See</i> Notes 4 and 5)  | 507 | $h \leq 0.1t$ or 1.0 mm (whichever is the lesser) |
| Angular misalignment   | 508 | ( <i>See</i> Note 6)                              |
| Symbols  |     |   |
| <p><math>a</math> = nominal throat thickness of a fillet weld</p> <p><math>b</math> = width of weld reinforcement</p> <p><math>d</math> = diameter of a gas pore</p> <p><math>h</math> = height or width of an imperfection</p> <p><math>s</math> = nominal butt weld thickness</p> <p><math>t</math> = wall or plate thickness (nominal size)</p>   |     |   |
| <p><b>Note 1.</b> For these acceptance criteria, linear porosity is to be considered as three aligned gas pores in a length of 25 mm.</p> <p><b>Note 2.</b> To be in accordance with EN ISO 10042.</p> <p><b>Note 3.</b> A smooth transition is required.</p> <p><b>Note 4.</b> Linear misalignment is to be a maximum of 0.5 mm in highly stressed areas. For other areas, the linear misalignment is to be a maximum of 1.0 mm locally, where the sum of the length of imperfection is not more than 10% of the weld length.</p> <p><b>Note 5.</b> The limits for linear misalignment relate to deviations from the correct position. Unless otherwise specified, the correct position is that when the centrelines coincide.</p> <p><b>Note 6.</b> Angular misalignment shall be mutually agreed between the designer and the fabricator.</p> |     |   |

**Table 13. 8. 3: Acceptance criteria for internal imperfections of aluminium**

| Internal discontinuity                              | Classification according to ISO 6520-1 | Acceptance criteria ( <i>See</i> Note 1)                  |
|---|--|---|
| Crack   | 100                                    | Not permitted   |
| Lack of fusion                                      | 401                                    | Not permitted   |
| Incomplete penetration                              | 402                                    | Not permitted   |
| Single gas pore                                     | 2017                                   | $d \leq 0.3s$ or $0.3a$ or 5 mm (whichever is the lesser) |
| Linear porosity                                     | 2014                                   | Assess as lack of fusion                                  |
| Uniformly distributed porosity ( <i>See</i> Note 1) | 2021                                   | $0.5 < t < 3$ mm $\leq 2\%$ of area                       |
|   |  | $3 < t < 12$ mm $\leq 4\%$ of area                        |
|   |  | $12 < t < 30$ mm $\leq 6\%$ of area                       |
|   |  | $t > 30$ mm $\leq 8\%$ of area                            |
| Clustered porosity ( <i>See</i> Note 1)             | 2013                                   | $dA \leq 20$ mm or $wp$ (whichever is the lesser)         |

|   |      |   |
|---|------|---|
| Elongated cavity  | 2015 | $l \leq 0.3s$ or $0.3a$ or 4 mm (whichever is the lesser)   |
| Wormhole  | 2016 |   |
| Oxide inclusion (See Note 2)  | 303  | $l \leq 0.5s$ or $0.5a$ or 5 mm (whichever is the lesser)   |
| Tungsten inclusion  | 3041 | $l \leq 0.3s$ or $0.3a$ or 4 mm (whichever is the lesser)   |
| Copper inclusion  | 3042 | Not permitted   |
| Multiple imperfections in any cross-section   | —    | The sum of the acceptable individual imperfections in any cross-section is not to exceed $0.3t$ or $0.3a$ (whichever is the lesser) |
| Symbols   |      |   |
| <p><math>a</math> = nominal throat thickness of a fillet weld</p> <p><math>b</math> = width of weld reinforcement</p> <p><math>d</math> = diameter of a gas pore</p> <p><math>h</math> = height or width of an imperfection</p> <p><math>s</math> = nominal butt weld thickness</p> <p><math>t</math> = wall or plate thickness (nominal size)</p> <p><math>wp</math> = width of weld or width or height of cross-sectional area</p> <p><math>dA</math> = diameter of area surrounding gas pores</p> <p><math>l</math> = length of imperfection in longitudinal direction of weld</p> |      |   |
| <p><b>Note 1.</b> Porosity is to be determined in accordance with ISO 10042. The requirements for a single gas pore are to be met by all the gas pores within this circle. Systematic clustered porosity is not permitted.</p> <p><b>Note 2.</b> If several oxide inclusions <math>l_1, l_2, l_3, \dots</math> exist in one cross-section, then they are summed: <math>l = l_1 + l_2 + l_3 + \dots + l_n</math>.</p>  |      |   |

8. 4. 2 Alternative NDE acceptance criteria will be subject to special consideration provided that they are equivalent to these requirements.

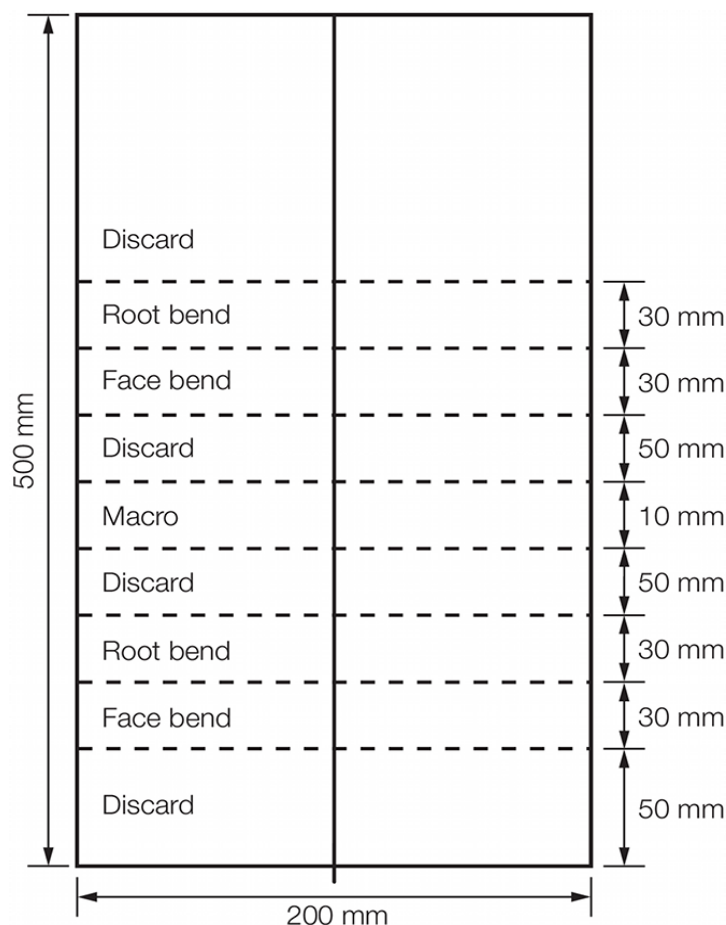

**CHAPTER 13 Requirements for Welded Construction****SECTION 9 Friction stir welding requirements for aluminium alloys****9. 1 Scope**

- 9. 1. 1 The requirements of this Section apply to the application of FSW during construction.
- 9. 1. 2 Prior to welding, the friction stir welding equipment is to have been demonstrated as being suitable for use.
- 9. 1. 3 Qualified welding procedures that have been approved by ACS are required. Procedures to ISO 25239-4 that are endorsed by another Classification Society may be accepted if they are to the satisfaction of the attending Surveyor.
- 9. 1. 4 Welding operators are to be qualified to ISO 25239-3 standard. Where qualifications have been certified by another Classification Society, acceptance of the qualifications will be subject to document review and demonstration of knowledge of the FSW process and function of the FSW installation.

**9. 2 Production quality control**

- 9. 2. 1 The general requirements for quality control are specified in ISO 25239-5.
- 9. 2. 2 Unless otherwise specified in relevant parts of the Rules, the following production tests will be required.
- 9. 2. 3 production test is required when there is a change in procedure, a change in tooling, after equipment repairs or modifications, after deviation from optimum parameters are detected, when defects are identified by non-destructive testing, after continuous welding of every 100 m length during a single shift and with a maximum interval between procedure tests of 8 hours. For butt welds the production tests are to consist of 100 per cent visual examination, two face bend tests, two root bend tests and one macro section. For thicknesses exceeding 12 mm, sets of face and bend tests may be replaced by side bend tests. For test assembly, See [Figure 13. 9. 1: Production test assembly for Friction Stir Welds](#). The production tests for other joint geometry are to be agreed between the Surveyor and the fabricator.

**Figure 13. 9. 1: Production test assembly for Friction Stir Welds**

9. 2. 4 As an automated process, all essential variables are to be recorded by the FSW system. The welding operator is responsible for ensuring that the system continues to produce welds that are in compliance with the qualified procedure. Surveyors are to be informed when the system exceeds the operating parameters. Surveyors are periodically to review the welding records.
9. 2. 5 Production welds are to be subject to 100 per cent visual examination by the fabricator and be subject to random checking by the Surveyor.
9. 2. 6 Surface and volumetric NDE testing is to be conducted on production welds at a frequency of two per welded panel or one every 100 m of weld, whichever is the greater.
9. 2. 7 Assessment of imperfections is to be in accordance with ISO 25239-5 Annex A and the requirements of [Table 13. 8. 3: Acceptance criteria for internal imperfections of aluminium](#).

### 9. 3 Repair

9. 3. 1 All defective welds are to be reported to the Surveyor.
9. 3. 2 The manufacturer is to have an approved procedure for the repair of defective welds.
9. 3. 3 Weld repairs are to be conducted by qualified welders or welding operators in accordance with qualified weld procedures. Welding procedures and welders/operators are to be qualified in accordance with the requirements of [Ch 12 Welding Qualifications](#) as appropriate to the welding process used for the weld repair.
9. 3. 4 All repairs are to be subject to 100 per cent visual, surface and volumetric NDE.

**CHAPTER 14 Plastics Materials and other Non-Metallic Materials****SECTION 1 General requirements****1.1 Scope**

- 1.1.1 Provision is made in this Chapter for the manufacture and testing of plastic pipes, together with approval requirements for base materials used in the construction or repair of composite vessels, other marine structures, piping and any associated machinery components and fittings which are to be certified or are intended for classification.
- 1.1.2 These materials and products are to be manufactured and surveyed in accordance with the general requirements of [Ch 14, 1 General requirements](#), [Ch 14, 2 Tests on polymers, resins, reinforcements and associated materials](#) and [Ch 14, 3 Testing procedures](#) of this Chapter; and ACS's *Materials and Qualification Procedures for Ships (MQPS) Book K*, See [Ch 1, 2.2 ACS Approval – General 2.2.2](#), which, in addition to the test programme, also details the procedures for application for approval of manufacturers and products and details of the information to be supplied by the manufacturer.
- 1.1.3 For base materials, the manufacturer's works do not require approval by Asia Classification Society (hereinafter referred as 'ACS'), however the Quality Control procedures must be acceptable in accordance with the appropriate Section of this Chapter.
- 1.1.4 Where a requirement exists for the material to be approved, the test requirements and information to be submitted for approval of polymers, resins, reinforcements and associated materials are defined in [Ch 14, 2 Tests on polymers, resins, reinforcements and associated materials](#) and [Ch 14, 3 Testing procedures](#).
- 1.1.5 Specific material requirements relating to the design and manufacture of plastic pipes and fittings are indicated in [Ch 14, 4 Plastic pipes and fittings](#), with the material requirements for hull structures contained in [Ch 14, 5 Control of material quality for composite construction](#).
- 1.1.6 For Builders constructing composite vessels, [Ch 14, 5 Control of material quality for composite construction](#) provides the minimum material control requirements for acceptance of the works by ACS.
- 1.1.7 For the purposes of these Rules a 'plastics material' is regarded as an organic substance which may be thermosetting or thermoplastic and which, in its finished state, may contain reinforcements or additives.
- 1.1.8 Materials not listed in [Ch 14, 2.1 Scope 2.1.1](#) may be considered for approval on a case-by-case basis. The approved test results will be listed on the issued certificate. Subject to satisfactory service experience and validation of approval, the material may be entered in [Ch 14, 2.1 Scope 2.1.1](#) of the Rules.

## 1. 2 Information on material quality and application

1. 2. 1 Where plastics products are to be classed or certified, the manufacturer is to provide the material producer with such information as is essential to ensure that the base materials to be used are in accordance with the approval requirements and the product specification. This information is to include any survey requirements for the materials.

## 1. 3 Manufacture

1. 3. 1 Plastics products are to be made at works which have been approved (or accepted) for the type of product being supplied using base materials that have been approved.
1. 3. 2 Base materials are to be approved in accordance with the requirements of [Ch 14, 2 Tests on polymers, resins, reinforcements and associated materials](#) and [Ch 14, 3 Testing procedures](#).
1. 3. 3 In order that a works can be approved (or accepted), the manufacturer is required to demonstrate to the satisfaction of ACS that the necessary manufacturing and testing facilities are available and are supervised by qualified personnel. A specified programme of tests is to be carried out under the supervision of the Surveyors, and the results are to be to the satisfaction of ACS. When a manufacturer has more than one works, the approval (or acceptance) is only valid for the individual works which carried out the test programme.
1. 3. 4 In order to maintain approval, the manufacturer is required to confirm in writing that there have been no changes in the formulation or production process for the material in question and that the site of manufacture remains unchanged.

## 1. 4 Survey procedure

1. 4. 1 The Surveyors are to be allowed access to all relevant parts of the works and are to be provided with the necessary facilities and information to enable them to verify that manufacture is being carried out in accordance with the approved procedure. Facilities are also to be provided for the selection of test material, the witnessing of specified tests and the examination of materials, as required by the Rules.
1. 4. 2 Prior to the provision of test material for acceptance, manufacturers are to provide the Surveyors with details of the order, specification and any special conditions additional to the Rule requirements.
1. 4. 3 Before final acceptance, all test materials are to be confirmed as typical of the manufactured product and be submitted to the specified tests and examinations under conditions acceptable to the Surveyors. The results are to comply with the specification and any Rule requirements and are to be to the satisfaction of the Surveyors.
1. 4. 4 These specified tests and examinations are to be carried out prior to the despatch of finished products from the manufacturer's works.
1. 4. 5 In the event of any material proving unsatisfactory, during subsequent working, machining or fabrication, it is to be rejected, notwithstanding any previous certification.

## 1. 5 Alternative survey procedure

1. 5. 1 Where materials are manufactured in quantity by semi-continuous or continuous processes under closely controlled conditions, an alternative system for testing and inspection may be adopted, subject to the agreement of the Surveyors.
1. 5. 2 In order to be considered for approval, manufacturers are to comply with the requirements of [Ch 1, 2, Approval and survey requirements](#).

## 1. 6 Post-cure heating

1. 6. 1 Post-cure heating is to be carried out in properly constructed ovens which are efficiently maintained and have adequate means for control and recording of temperature. The oven is to be such as to allow the whole item to be uniformly heated to the necessary temperature. In the case of very large components which require post-cure heating, alternative methods will be specially considered.

## 1. 7 Test material

1. 7. 1 Sufficient material is to be provided for the preparation of the test specimens detailed in the specific requirements. It is, however, in the interests of manufacturers to provide additional material for any re-tests which may be necessary, as insufficient or unacceptable test material may be a cause for rejection.
1. 7. 2 Where test materials, (either base materials or product sample materials) are selected by the Surveyor or a person nominated by ACS, these are to be suitably identified by markings which are to be maintained during the preparation of the test specimens.
1. 7. 3 All base material samples for testing are to be prepared under conditions that are as close as possible to those under which the product is to be manufactured. Where this is not possible, a suitable procedure is to be agreed with the Surveyor.
1. 7. 4 During production, check test samples are to be provided as requested by the Surveyor.
1. 7. 5 Should the taking of these samples prove impossible, model samples are to be prepared concurrently with production. The procedure for the preparation of these samples is to be agreed with the Surveyor.
1. 7. 6 The dimensions, number and orientation of test specimens are to be in accordance with the requirements of a National or International Standard acceptable to ACS.

## 1. 8 Re-test procedure

1. 8. 1 Where test material fails to meet the specified requirement, two additional tests of the same type may be made at the discretion of the Surveyor.
1. 8. 2 Where an individual test result in a group (minimum five) deviates from the mean by more than two standard deviations in either the higher or lower direction, the result is to be excluded and a re-test made. Excluded results of tests are to be reported with confirmation that they have been excluded. Only one exclusion is acceptable in any group of tests.

## 1. 9 Visual and non-destructive examination

1. 9. 1 Prior to the final acceptance, surface inspection, verification of dimensions and non-destructive examination are to be carried out in accordance with the requirements detailed in [Ch 14, 3 Testing procedures](#), [Ch 14, 4 Plastic pipes and fittings](#) and [Ch 14, 5 Control of material quality for composite construction](#) of this Chapter.
1. 9. 2 When there is visible evidence to doubt the soundness of any material or component, such as flaws or suspicious surface marks, it is to be the responsibility of the manufacturer to prove the quality of the material by any suitable method.

## **1. 10 Rectification of defective material**

1. 10. 1 Small surface blemishes may be removed by mechanical means provided that, after such treatment, the dimensions are acceptable, the area is proved free from structural defects and the rectification has been completed to the satisfaction of the Surveyor.
1. 10. 2 Repair procedures for larger defects are to be agreed with ACS prior to implementation.

## **1. 11 Identification of products and base materials**

1. 11. 1 The manufacturer of approved materials is to identify each batch with a unique number.
1. 11. 2 The manufacturer of plastics products is to adopt a system of identification which will enable all finished products to be traced to the original batches of base materials. Surveyors are to be given full facilities for tracing any component or material when required.
1. 11. 3 When any item has been identified by the personal mark of a Surveyor, or deputy, this is not to be removed until an acceptable new identification mark has been made by a Surveyor. Failure to comply with this condition will render the item liable to rejection.
1. 11. 4 Before any pipe or fitting is finally accepted it is to be clearly marked by the manufacturer in at least one place with the particulars detailed in the appropriate specific requirements as given in [Ch 14, 4 Plastic pipes and fittings](#).
1. 11. 5 Where a number of identical items are securely fastened together in bundles, the manufacturer need only brand the top item of each bundle. Alternatively, a durable label giving the required particulars may be attached to each bundle.

## **1. 12 Certification**

1. 12. 1 Certification of the finished product is to be in accordance with the requirements of the appropriate Sections.

**CHAPTER 14    Plastics Materials and other Non-Metallic Materials****SECTION 2    Tests on polymers, resins, reinforcements and associated materials****2. 1    Scope**

2. 1. 1    This Section gives the tests and data required by ACS for materials approval and/or inspection purposes on the following:
- a.    Thermoplastic polymers.
  - b.    Thermosetting resins.
  - c.    Reinforcements.
  - d.    Reinforced thermoplastic polymers.
  - e.    Reinforced thermosetting resins.
  - f.    Core materials.
    - i.    End-grain balsa.
    - ii.   Rigid foams.
    - iii. Synthetic felt type materials.
  - g.    Machinery chocking compounds.
  - h.    Rudder and pintle bearings.
  - i.    Sterntube bearings.
  - j.    Plywoods.
  - k.    Adhesive and sealant materials.
  - l.    Repair compounds.

**2. 2    Thermoplastic polymers**

2. 2. 1    The following data is to be provided by the manufacturer for each thermoplastic polymer:
- a.    Melting point.
  - b.    Melt flow index.
  - c.    Density.
  - d.    Bulk density.
  - e.    Filler content, where applicable.
  - f.    Pigment content, where applicable.
  - g.    Colour.
2. 2. 2    Samples for testing are to be prepared by moulding or extrusion under the polymer manufacturer's recommended conditions.
- a.    The following tests are to be carried out on these samples:
  - b.    Tensile stress at yield and break.

- c. Modulus of elasticity in tension.
- d. Tensile strain at yield and break.
- e. Compressive stress at yield and break.
- f. Compressive modulus.
- g. Temperature of deflection under load.
- h. Determination of water absorption.

2. 2. 3 The following tests are to be carried out on these samples:

- a. Tensile stress at yield and break.
- b. Modulus of elasticity in tension.
- c. Tensile strain at yield and break.
- d. Compressive stress at yield and break.
- e. Compressive modulus.
- f. Temperature of deflection under load.
- g. Determination of water absorption.

## 2. 3 Thermosetting resins

2. 3. 1 The data listed in [Table 14. 2. 1: Data requirements for thermosetting resins](#) is to be provided by the manufacturer for each thermosetting resin.

**Table 14. 2. 1: Data requirements for thermosetting resins**

| Data  | Type of resin                            |                |                                |
|---|--|----------------|--------------------------------|
|   | Polyester<br>(See Note 3 for vinylester) | Epoxide        | Phenolic                       |
| Specific gravity of liquid resin  | required                                 | required       | required                       |
| Viscosity   | required                                 | required       | required                       |
| Gel time  | required                                 | required       | not applicable                 |
| Appearance  | required                                 | required       | required                       |
| Mineral content (See Note 1)  | required                                 | required       | not applicable<br>(See Note 2) |
| Volatile content  | required                                 | not applicable | not applicable                 |
| Acid value  | required                                 | not applicable | not applicable                 |
| Epoxide content   | not applicable                           | required       | not applicable                 |
| Free phenol   | not applicable                           | not applicable | required                       |
| Free formaldehyde   | not applicable                           | not applicable | required                       |
| <p><b>Note 1.</b> This is to be the total filler in the system, including thixotrope, filler, pigments, etc. and is to be expressed in parts by weight per hundred parts of pure resin.</p> <p><b>Note 2.</b> If the resin is pre-filled, the mineral content is required.</p> <p><b>Note 3.</b> Vinylesters are to be treated as equivalent to polyesters.</p> |  |                |                                |

2. 3. 2 Cast samples are to be prepared in accordance with the manufacturer's recommendations and are to be cured and post-cured in a manner consistent with the intended use. The curing system used and the ratio of curing agent (or catalyst) to resin are to be recorded. Where post-cure conditions

equivalent to ambient-cure conditions apply, See [Ch 14, 3.2 Preparation of test samples 3.2.2](#) and [Ch 14, 3.2 Preparation of test samples 3.2.3](#).

2. 3. 3 The following are to be determined using these samples:
  - a. Tensile strength (stress at maximum load) and stress at break.
  - b. Tensile strain at maximum load.
  - c. Tensile secant modulus at 0.5 per cent and 0.25 per cent strain respectively.
  - d. Temperature of deflection under load.
  - e. Barcol hardness.
  - f. Determination of water absorption.
  - g. Volume shrinkage after cure.
  - h. Specific gravity of cast resin.
2. 3. 4 In addition, for gel coat resins the stress at break and modulus of elasticity in flexure are to be determined.
2. 3. 5 Where resins which have been modified by the addition of waxes or polymers, for example 'low styrene emission or air inhibited' materials, it is to be confirmed that the use of such resins will not result in poor interlaminar adhesion when interruptions to the laminating process occur. The test procedure is to be as follows:
  - a. A conventional room temperature curing catalyst/ accelerator system is to be used with the resin for laminate preparation.
  - b. A laminate of 25 to 35 per cent glass content in mass is to be prepared using two plies of 450g/m<sup>2</sup> chopped strand mat. The laminate is to be prepared at ambient temperature (18° to 21°C). The laminate is to be allowed to stand for a minimum of four days but no longer than 6 days at ambient temperature.
  - c. A further two plies of 450g/m<sup>2</sup> chopped strand mat are to be laminated onto the exposed surface and cured at ambient temperature for 24 hours. The finished laminate is then to be post-cured at 40°C for 16 hours. The finished laminate is to have a glass content of 25 to 35 per cent.
  - d. After cooling, the apparent interlaminar shear strength of the laminate is to be determined in accordance with ISO 14130; the minimum value is given in [Ch 14, 5.11 Minimum tested requirements for material approval 5.11.4](#). Before testing the samples shall be conditioned at 23°C and relative humidity of 50 per cent for a period of 88 hours before testing.
  - e. If the tests are undertaken at the resin manufacturer's own laboratory, the individual test values are to be reported and the broken test specimens retained for examination by ACS.

Alternative test procedures will be considered with prior agreement.

## 2. 4 Reinforcements

2. 4. 1 The following data is to be provided, where applicable, for each type of reinforcement:
  - a. Reinforcement type.
  - b. Fibre type for each direction.
  - c. Fibre tex value.
  - d. Fibre finish and/or treatment.
  - e. Yarn count in each direction.
  - f. Width of manufactured reinforcement.
  - g. Weight per unit area of manufactured reinforcement.
  - h. Weight per linear metre of manufactured reinforcement.
  - i. Compatibility (e.g. suitable for polyesters, epoxides, etc.).
  - j. Constructional stitching – details of yarn, specific gravity, type, frequency and direction.
  - k. Weave type.
  - l. Binder type and content.

m. Density of the fibre material.

2. 4. 2 Tests of the mechanical properties are to be made on laminate samples containing the reinforcement and prepared as follows:
- an approved resin of suitable type is to be used;
  - a minimum of three layers of the reinforcement is to be laid with parallel ply to give a laminate not less than 4 mm thick;
  - the weights of resin and reinforcement used are to be recorded together with the measured thickness of the laminate, including the measured weight per unit area of the reinforcement used;
  - for glass reinforcements, the glass/resin ratios, by weight, as shown in [Table 14. 2. 2: Glass fraction by weight for different reinforcement types](#) are to be used;
  - for reinforcement type other than glass, a fibre volume fraction, as shown in [Table 14. 2. 3: Content by volume for different reinforcement types](#), is to be used.

**Table 14. 2. 2: Glass fraction by weight for different reinforcement types**

| Reinforcement type   | Glass fraction nominal values |
|--|-------------------------------|
| Unidirectional   | 0.60                          |
| Chopped strand mat   | 0.30                          |
| Woven roving   | 0.50                          |
| Woven cloth  | 0.50                          |
| Composite roving ( <i>See Note</i> )   | 0.45                          |
| Gun rovings  | 0.33                          |
| ±45° stitched parallel plied roving  | 0.50                          |
| Triaxial parallel plied roving   | 0.50                          |
| Quadriaxial parallel plied roving  | 0.50                          |
| <b>Note</b> Continuous fibre reinforcement with attached chopped strand mat. |                               |

2. 4. 3 Rovings intended for filament winding are to be tested as unidirectional rovings.

**Table 14. 2. 3: Content by volume for different reinforcement types**

| Reinforcement type                   | Content by volume nominal values |
|--------------------------------------|----------------------------------|
| Unidirectional                       | 0.41                             |
| Chopped strand mat                   | 0.17                             |
| Woven roving                         | 0.32                             |
| Woven cloth                          | 0.32                             |
| Composite roving ( <i>See Note</i> ) | 0.28                             |
| Gun rovings                          | 0.19                             |
| ±45° stitched parallel plied roving  | 0.32                             |

|  |      |
|--|------|
| Triaxial parallel plied roving   | 0.32 |
| Quadriaxial parallel plied roving  | 0.32 |
| <p><b>Note</b> The volume content may be converted to weight fractions by use of the formula:</p> $W_F = V_F D_F / (D_F V_F + D_R V_R)$ <p>where</p> <ul style="list-style-type: none"> <li>• <math>W_F</math> = fibre fraction by weight</li> <li>• <math>D_F</math> = density of fibre</li> <li>• <math>D_R</math> = density of cured resin</li> </ul> <p><math>V_F</math> = fibre fraction by volume<br/> <math>V_R</math> = resin fraction by volume</p> |      |

2. 4. 4 The following tests as defined in [Ch 14, 3 Testing procedures](#) are to be made on the samples:
- Tensile strength (stress at maximum load).
  - Tensile strain at break.
  - Tensile secant modulus at 0.5 per cent and 0.25 per cent strain respectively.
  - Compressive strength (stress at maximum load).
  - Compressive modulus.
  - Flexural strength (stress at maximum load).
  - Modulus of elasticity in flexure.
  - Apparent interlaminar shear.
  - Fibre content.
  - Determination of water absorption.
2. 4. 5 The laminate is to be tested in air in the directions indicated by [Table 14. 2. 4: Fibre orientations in reinforced test specimens](#).

**Table 14. 2. 4: Fibre orientations in reinforced test specimens**

| Type of reinforcement  | Test orientations     |
|--|-----------------------|
| Unidirectional   | 0°                    |
| Chopped strand mat<br>Gun roving   | any direction         |
| Woven roving<br>Woven cloth<br>Composite roving                                  | 0° and 90°            |
| ± 45° parallel plied roving<br>Triaxial plied roving<br>Quadriaxial plied roving | 0°, 45°, 90° and -45° |

2. 4. 6 Additionally, tests in [Ch 14, 2.4 Reinforcements 2.4.4](#)(c) and (f) are to be repeated, in one direction only, after immersion in fresh water at 35°C for 28 days with the exception of [Ch 14, 2.4 Reinforcements 2.4.4.j](#).

## 2. 5 Reinforced thermoplastic polymers

2. 5. 1 Thermoplastic polymers intended for use with reinforcements are to be tested in accordance with [Ch 14, 2.2 Thermoplastic polymers 2.2.1](#) to [Ch 14, 2.2 Thermoplastic polymers 2.2.3](#).

2. 5. 2 A laminate is to be prepared using the polymer and an approved reinforcement in accordance with a manufacturing specification. The laminate is to be tested in accordance with the appropriate requirements of [Ch 14, 2.4 Reinforcements 2.4.4](#). Testing may be confined to one direction only.

## **2. 6 Reinforced thermosetting resins**

2. 6. 1 Thermosetting resins intended for use with reinforcements are to be tested in accordance with [Ch 14, 2.3 Thermosetting resins 2.3.1](#) to [Ch 14, 2.3 Thermosetting resins 2.3.4](#).
2. 6. 2 No further tests are required for gel coat resins.
2. 6. 3 For laminating resins, a laminate is to be prepared using the resin and an approved reinforcement as follows:
- For polyester resins, chopped strand mat.
  - For epoxide resins, a balanced woven roving.
  - For phenolic resins, a balanced woven material.
2. 6. 4 The laminate is to be tested in accordance with procedures outlined in MQPS Book K procedure 14-1 and [Ch 14, 2.4 Reinforcements 2.4.4](#) in one fibre direction only.

## **2. 7 Core materials**

2. 7. 1 **General requirements.** The following data is to be provided for each type of core material:
- Type of material.
  - Density.
  - Description (block, scrim mounted, grooved).
  - Thickness and tolerance.
  - Sheet/block dimensions.
  - Surface treatment.
2. 7. 2 Manufacturers are required to provide a full application procedure for use of the product.

## **2. 8 Specific requirements for end-grain balsa**

2. 8. 1 The supplier is to provide a signed statement that the balsa (*ochroma lozopus*) is cut to end-grain, is of good quality, being free from unsound or loose knots, holes, splits, rot, pith and corcho, and that it has been treated against fungal and insect attack, shortly after felling, followed by homogenisation, sterilisation and kiln drying to an average moisture content of no more than 12 per cent.
2. 8. 2 The following tests are to be carried out on the virgin material, both parallel to and perpendicular to the grain:
- Compressive strength (stress at maximum load).
  - Compressive modulus of elasticity.
  - Tensile strength (stress at maximum load).
- The density of the virgin material is also to be tested.
2. 8. 3 Where the balsa is mounted on a carrier material (e.g. scrim), any adhesive used is to be of a type compatible with the proposed resin system.
2. 8. 4 Core shear properties are to be determined according to the requirements of [Ch 14, 3.8 Structural core materials 3.8.1](#).

## 2. 9 Specific requirements for rigid foams (PVC, Polyurethane and other types)

- 2. 9. 1 The foam is to be of the closed cell type and compatible with the proposed resin system (e.g. polyester, epoxide etc.).
- 2. 9. 2 Foams are to be of uniform cell structure.
- 2. 9. 3 Data is to be provided on the dimensional stability of the foam by measurement of the shrinkage.
- 2. 9. 4 The following test data is to be submitted for each type of foam:
  - a. Density.
  - b. Tensile strength (stress at maximum load).
  - c. Tensile modulus of elasticity.
  - d. Compressive strength (stress at maximum load).
  - e. Compressive modulus of elasticity.
- 2. 9. 5 Core shear properties are to be determined according to the requirements of [Ch 14, 3.8 Structural core materials 3.8.1](#).
- 2. 9. 6 Additionally, the compressive properties (See [Ch 14, 2.9 Specific requirements for rigid foams \(PVC, Polyurethane and other types\) 2.9.4.d](#) and [Ch 14, 2.9 Specific requirements for rigid foams \(PVC, Polyurethane and other types\) 2.9.4.e](#)) are to be determined at a minimum of five points over the temperature range ambient to maximum recommended service or 70°C, whichever is the greater.

## 2. 10 Synthetic felt type materials with or without microspheres

- 2. 10. 1 For materials of this type, the following data is required in addition to the requirements of [Ch 14, 2.7 Core materials 2.7.1](#):
  - a. Fibre type.
  - b. Width.
  - c. Width of finished material.
  - d. Weight per unit area of the manufactured material.
  - e. Weight per linear metre of the manufactured material.
  - f. Compatibility.
  - g. Details of the method of combining.
- 2. 10. 2 A laminate of the material is to be prepared using a suitable approved resin under conditions recommended by the manufacturer.
- 2. 10. 3 The following properties are to be determined:
  - a. Tensile strength (stress at maximum load).
  - b. Tensile strain at break.
  - c. Modulus of elasticity in tension or secant modulus at 0.25 per cent and 0.5 per cent strain.
  - d. Compressive strength (stress at maximum load).
  - e. Compressive modulus.
  - f. Flexural strength (stress at maximum load).
  - g. Modulus of elasticity in flexure.
  - h. Fibre content.
  - i. Water absorption.
- 2. 10. 4 In the case of anisotropic materials (e.g. where combined with other reinforcements) the tests listed in [Ch 14, 2.10 Synthetic felt type materials with or without microspheres 2.10.3](#) are to be conducted in the 0°, 90° directions and in any other reinforcement direction.

2. 10. 5 Additionally, the tests listed in [Ch 14, 2.10 Synthetic felt type materials with or without microspheres 2.10.3](#) are to be repeated after immersion in fresh water at 35°C for 28 days. For anisotropic materials, the requirement is for this test to be carried out in one direction only.
2. 10. 6 The shear properties (of the resin filled system) are to be determined according to [Ch 14, 3.8 Structural core materials 3.8.1](#).

## **2. 11 Machinery chocking compounds (resin chocks)**

2. 11. 1 Thermosetting materials for filling the space between the base of machinery and its foundation where the maintenance of accurate alignment is necessary are to be approved by ACS before use.
2. 11. 2 Approval will be considered by ACS for use under the following service conditions:
- Loading of 3.5 N/mm<sup>2</sup> (max) for a temperature not exceeding 60°C.
  - Loading of 2.5 N/mm<sup>2</sup> (max) for a temperature not exceeding 80°C.
  - Other loading conditions.
2. 11. 3 The exotherm temperature, defined as the maximum temperature achieved by the reacting resin under conditions equivalent to those of intended use, is to be determined according to a procedure approved by ACS.
2. 11. 4 The following properties are to be determined on chock material cured at the measured exotherm temperature:
- a. The impact resistance (Izod).
  - b. Hardness.
  - c. Compressive strength (stress at maximum load) and modulus of elasticity.
  - d. Water absorption.
  - e. Oil absorption.
  - f. Heat deflection temperature.
  - g. Compressive creep is to be measured according to [Ch 14, 3.9 Machinery chocking compounds 3.9.4](#).
  - h. Curing linear shrinkage.
  - i. Flammability.
2. 11. 5 The chocking compound approval is contingent on the material achieving the minimum exotherm value as specified when used on an installation under practical conditions.
2. 11. 6 Where the resin chock is to be used for installation of sterntubes and sternbushes in addition to the requirements of [Ch 14, 2.11 Machinery chocking compounds \(resin chocks\) 2.11.4](#), the tensile strength and modulus of elasticity in tension are to be measured.
2. 11. 7 The manufacturer's installation procedure is required to be documented and is to be to the satisfaction of ACS.
2. 11. 8 Resin chock materials are to be tested in accordance with [Ch 14, 3.9, Machinery chocking compounds](#) and are to meet the requirements of [Ch 14, 5.14, Synthetic chocking compounds](#).

## **2. 12 Rudder and pintle bearings**

2. 12. 1 Materials used for rudder and pintle bearings are to be approved by ACS before use.
2. 12. 2 Initial approval is to be based on a review of the following physical properties of the material:
- a. Compressive strength (stress at maximum load) and modulus of elasticity.
  - b. Tensile strength (stress at maximum load) and modulus of elasticity.
  - c. Shear strength (stress at maximum load).
  - d. Impact strength.

- e. Swelling in oil and in water.
- f. Hardness.
- 2. 12. 3 Additionally, friction data is to be provided under both wet and dry conditions.
- 2. 12. 4 Furthermore, the installation instructions (especially recommended clearances) are to be reviewed by ACS prior to provisional approval being given.
- 2. 12. 5 If the above data is satisfactory, the material will be provisionally approved until sufficient service experience has been gained.

## **2. 13 Sterntube bearings**

- 2. 13. 1 Materials used for sterntube bearings are to be approved by ACS before use.
- 2. 13. 2 Approval is to be based on a review of the physical properties as given by [Ch 14, 2.12 Rudder and pintle bearings 2.12.2.](#)
- 2. 13. 3 Friction data is to be provided under the lubrication system(s) proposed for the material(s).

## **2. 14 Plywoods**

- 2. 14. 1 All plywoods are to be approved to BS 1088 or equivalent National or International Standard in accordance with ACS's Type Approval Procedure.
- 2. 14. 2 For structural applications in the marine environment, a minimum timber rating of moderate durability according to BS 1088-1 and BS 1088-2 is required.
- 2. 14. 3 Enhancement of durability by use of preservatives is permitted, subject to each veneer layer being treated with a recognised preservative.
- 2. 14. 4 Where Okoume, as specified by BS 1088 is involved, (i.e. non-durable timber classification) this may only be used for marine structures subject to the specific application being acceptable to ACS.

## **2. 15 Adhesive and sealant materials**

- 2. 15. 1 Materials of these types are to be accepted by ACS before use.
- 2. 15. 2 The requirements for acceptance are dependent on the nature of the application.
- 2. 15. 3 In the first instance, the manufacturer is to submit full details of the product, procedure for method of use (including surface preparation) and the intended application. After review of these details, ACS will provide a specific test schedule for confirmation of the material's properties.
- 2. 15. 4 Any acceptance granted will be limited to specific applications and will be contingent on the instructions for use being adhered to.

## **2. 16 Repair compounds**

- 2. 16. 1 Materials used for repairs are to be accepted by ACS before use.
- 2. 16. 2 For acceptance purposes, the manufacturer is to submit full product details and user instructions, listing the types of repair for which the system is to be used together with details of any installer accreditation schemes.
- 2. 16. 3 Dependent on the proposed uses, ACS may require testing in accordance with a specified test programme.
- 2. 16. 4 Materials will not be accepted for the following uses unless specific evidence of their suitability is provided:

|                |           |   |
|----------------|-----------|---|
| <b>PART</b>    | <b>2</b>  | <b>Rules for the Manufacture, Testing and Certification of Materials</b>  |
| <b>CHAPTER</b> | <b>14</b> | <b>Plastics Materials and other Non-Metallic Materials</b>                |
| <b>SECTION</b> | <b>2</b>  | <b>Tests on polymers, resins, reinforcements and associated materials</b> |

---

- a. Any component in rubbing contact.
  - b. Any component subject to dynamic cyclic loading.
  - c. Any pressure part in contact with gas or vapour.
  - d. Any pressure part in contact with liquid above 0.35 MPa.
  - e. Any component where operating temperature exceeds 90°C.
- All uses of materials of these types are subject to the discretion of the Surveyor.

CHAPTER **14** **Plastics Materials and other Non-Metallic Materials**

SECTION **3** **Testing procedures**

**3. 1 General**

- 3. 1. 1 This Section gives details of the test methods to be used for base materials and on finished plastics products such as fibre reinforced plastics (FRP) piping and any testing required in the construction of composite vessels.
- 3. 1. 2 In general, testing is to be carried out by a competent independent test house which, at the discretion of ACS, may or may not require witnessing by the Surveyor.
- 3. 1. 3 Alternatively, testing may be carried out by the manufacturer subject to these tests being witnessed by the Surveyor.
- 3. 1. 4 All testing is to be carried out by competent personnel.
- 3. 1. 5 Unless specified otherwise, testing is to be carried out in accordance with a recognised ISO standard, where one exists, and all test programmes are to have written procedures.
- 3. 1. 6 Alternatively, testing may be carried out in accordance with a National Standard provided that it conforms closely to an appropriate ISO standard and subject to prior agreement with the Surveyor.
- 3. 1. 7 Mechanical properties are to be established using suitable testing machines of approved types. The machines and other test equipment are to be maintained in a satisfactory and accurate condition and are to be recalibrated at approximately annual intervals. Calibration is to be undertaken by a nationally recognised authority or other organisation of standing and is to be to the satisfaction of the Surveyor. A record of all calibrations is to be kept available in the test house. The accuracy of test machines is to be within  $\pm$  one per cent.

**3. 2 Preparation of test samples**

- 3. 2. 1 Thermoplastic samples are to be prepared in accordance with the manufacturer's recommendations for moulding. For finished products, samples are to be taken from the product during production in accordance with the manufacturer's quality plan, but where this is impractical, separate test samples are to be prepared in a manner identical with that of the product.
- 3. 2. 2 Samples of thermosetting resins are to be prepared using the curing system recommended by the manufacturer and identical with that used for the finished product.
- 3. 2. 3 The post curing conditions for samples of thermosetting resins are to be as recommended by the manufacturer and identical with those used for the finished product. Where the samples are made for the general approval of a resin, the post curing conditions are to be those in which the resin is intended to be used.

- 3. 2. 4 Where curing of the product is intended to take place at room temperature, the sample is to be allowed to cure at room temperature (18 to 21°C) for 24 hours followed by a post-cure at 40°C for 16 hours.
- 3. 2. 5 Where a reinforcement is to be used, the ratio of reinforcement to resin or polymer is to be nominally the same as that of the finished product or in accordance with [Table 14. 2. 2: Glass fraction by weight for different reinforcement types](#) or [Table 14. 2. 3: Content by volume for different reinforcement types](#).
- 3. 2. 6 Where laminates are prepared specifically for approval test purposes, the reinforcement is to be laid parallel plied.

### 3. 3 Preparation of test specimens

- 3. 3. 1 The test specimen is to be prepared in accordance with the appropriate ISO standard and the requirements of this Section.
- 3. 3. 2 Precautions are to be taken during machining to ensure that the temperature rise in the specimen is kept to a minimum.

### 3. 4 Testing

- 3. 4. 1 Strain measurement is to be made by the use of a suitable extensometer or strain gauge.
- 3. 4. 2 The rate of strain is to be in accordance with the appropriate ISO standard.
- 3. 4. 3 The number of test specimens from each sample to be tested is to be in accordance with the ISO standard. For mechanical testing this is five.

### 3. 5 Discarding of test specimens

- 3. 5. 1 If a test specimen fails because of faulty preparation or incorrect operation of the testing machine, it is to be discarded and replaced by a new specimen.
- 3. 5. 2 In addition, if the deviation of one result in a group of five exceeds the mean by more than two standard deviations, that result is to be discarded and one further specimen tested, See [Ch 14, 1.8 Re-test procedure 1.8.1](#) and [Ch 14, 1.8 Re-test procedure 1.8.2](#).

### 3. 6 Reporting of results

- 3. 6. 1 All load/displacement graphs and tabulated results are to be reported, including mean values and the calculated standard deviation.
- 3. 6. 2 Additionally, full details of the sample and specimen preparation are to be provided including (where applicable):
  - a. Catalyst/accelerator or curing agent types and mix ratio.
  - b. Weights of resins, and/or reinforcements used.
  - c. Casting/laminate dimensions.
  - d. Number of layers of reinforcement used.
  - e. Curing/post-curing conditions.

### 3. 7 Tests for specific materials

- 3. 7. 1 The data requirements in [Ch 14, 2.2, Thermoplastic polymers](#) and [Ch 14, 2.3, Thermosetting resins](#) for thermoplastic or thermosetting resins or polymers are to be determined in accordance with suitable National or International Standards.

3. 7. 2 Recognised Standards to which specimens of unreinforced thermoplastic resins are to be tested are listed in [Table 14. 3. 1: Tests for unreinforced thermoplastic resins](#).

**Table 14. 3. 1: Tests for unreinforced thermoplastic resins**

| Test   | Standard  |   |
|--|-----------|---|
| Tensile properties   | ISO 527-2 | Test speed=5mm/min<br>Specimen 1A or 1B   |
| Flexural properties  | ISO 178   | Test speed = $\frac{Thickness}{2}$ mm/min |
| Water absorption   | ISO 62    | Method 1                                  |
| Temperature of deflection under load   | ISO 75-2  | Method A                                  |
| Compressive properties   | ISO 604   | Test speed - as for ductile materials     |
| <p><b>Note 1.</b> Water absorption - result to be expressed as milligrams.</p> <p><b>Note 2.</b> Tensile modulus values are to be determined using an extensometer which may be removed for strain to failure.</p> |           |   |

3. 7. 3 Test standards for unreinforced cast thermosetting resins are given in [Table 14. 3. 2: Tests on unreinforced cast thermoset resin specimens](#).

**Table 14. 3. 2: Tests on unreinforced cast thermoset resin specimens**

| Test  | Standard  |  |
|---|-----------|--|
| Tensile properties  | ISO 527-2 | Test speed = 5 mm/min<br>Specimen 1A or 1B |
| Flexural properties   | ISO 178   | Test speed = $\frac{Thickness}{2}$ mm/min  |
| Water absorption  | ISO 62    | Method 1                                   |
| Temperature of deflection under load  | ISO 75-2  | Method A                                   |
| Compressive properties  | ISO 604   | Test speed = 1 mm/min                      |
| <p><b>Note 1.</b> ISO 62:2008 - where resins are intended for use under ambient conditions to avoid additional post-curing, the requirement in ISO 62:2008 for pre-drying the test specimen at 50°C is to be omitted. The test result is to be expressed as mg of water.</p> <p><b>Note 2.</b> ISO 527-2:1993 - tensile properties are to be measured using extensometry.</p> |           |  |

3. 7. 4 The Standards to which laminate specimens of any type are to be tested are listed in [Table 14. 3. 3: Tests on laminate specimens](#).

**Table 14. 3. 3: Tests on laminate specimens**

| Test                | Standard  |   |
|---------------------|-----------|---|
| Tensile properties  | ISO 527-4 | Test speed = 2 mm/min<br>Specimen types II or III |
| Flexural properties | ISO 14125 | Test speed = $\frac{Thickness}{2}$ mm/min         |

|   |           |                       |
|---|-----------|-----------------------|
|   |           | Method A              |
| Compressive properties  | ISO 604   | Test speed = 1 mm/min |
| Interlaminar shear  | ISO 14130 |                       |
| Water absorption  | ISO 62    | Method 1              |
| Glass content   | ISO 1172  |                       |
| <p><b>Note 1.</b> ISO 62:2008 - where resins are intended for use under ambient conditions to avoid additional post-curing, the requirement in ISO 62:2008 for pre-drying the test specimen at 50°C is to be omitted. The test result is to be expressed as mg of water.</p> <p><b>Note 2.</b> ISO 527-4:1997 - tensile properties are to be measured using extensometry.</p> <p><b>Note 3.</b> Tensile modulus values are to be determined using an extensometer which may be removed for strain to failure.</p> |           |                       |

### 3. 8 Structural core materials

3. 8. 1 Initially, the core shear strength and modulus are to be determined by ISO 1922 or ASTM C273/C273M. Test sandwich panels are then to be prepared and subjected to four-point flexural tests to determine the apparent shear properties according to ASTM C393/C393M (short beam) at two representative thicknesses (i.e. 15 mm and 30 mm). Testing is to be carried out at ambient temperature and at 70°C. The following requirements are to be observed:
- Each skin is to be identical and have a thickness not greater than 21 per cent of the nominal core thickness. For hand laid constructions, each skin is to comprise a lightweight chopped strand mat reinforcement (300 g/m<sup>2</sup>) consolidated at a glass content, by weight, of 0.3 against the core, plus the required number of woven reinforcements consolidated, using an isophthalic polyester resin, to give a minimum glass content, by weight, of 0.5.
  - The method of construction of the sandwich laminate is to reflect the core material manufacturer's instructions for use, i.e. application of bonding paste, surface primer or any other recommended system.
  - Where vacuum bagging techniques or equivalent systems are used, these will be subject to individual consideration.
  - All resins and reinforcements are to hold current ACS approval.
  - Curing conditions are to be in accordance with [Ch 14, 3.2 Preparation of test samples 3.2.3](#) and [Ch 14, 3.2 Preparation of test samples 3.2.4](#).
  - The dimensions of the test samples should be based on the requirements of ASTM C393 Paragraph 5.1, and the ratio parameters as indicated in ASTM C393 Paragraph 5.2, using a proportional limit stress ( $F$ ) for the woven roving skins of 130 N/mm<sup>2</sup> and a span ( $a_2$ ) of not less than 400 mm.
3. 8. 2 For each type of test sample, the following data are to be reported, together with the submission of a representative test sample showing the mode of failure for each density of core material:
- Skin and core thickness, and core type and density.
  - Resin/catalyst/accelerator ratio.
  - Skin construction, including types and weight of reinforcements, resin(s), etc.
  - Details of production method and curing conditions (temperature and times).
  - Where additional preparation of the foam is involved, for example the use of primers or bonding pastes, full details are to be provided.
  - Actual span between base supports for each type of test sample.

3. 8. 3 The following requirements apply to end-grain balsa:
- The data requirements of [Ch 14, 2.7 Core materials 2.7.1](#) are to be provided, where applicable, according to suitable National or International Standards.
