1. 2. 2 In the case of container ships and open type ships, additional requirements may apply as detailed in Pt 4, Ch 8 Container Ships.

1. 2. 3 In the case of fast cargo ships, the additional requirements given in Pt 4, Ch 1, 3 Longitudinal strength are to be complied with where applicable.

1. 2. 4 The requirements regarding minimum bow height given in Pt 3, Ch 3, 6 Minimum bow heights, reserve buoyancy and extent of forecastle are to be complied with where applicable.

1. 3 Structural continuity

1. 3. 1 Suitable scarfing arrangements are to be made to ensure continuity of strength and the avoidance of abrupt structural changes.

1. 3. 2 Where longitudinal framing terminates and is replaced by a transverse system, adequate arrangements are to be made to avoid an abrupt changeover. Where a forecastle is fitted extending aft of 0.15*L* from the F.P., longitudinal framing at the upper deck and topsides is generally to be continued forward of the end bulkhead of this superstructure. In bulk carriers and oil tankers (*See* Pt 3, Ch 5, 1.1 Application 1.1.4) the longitudinal framing at the upper deck is to be maintained over the cargo space region and continued over the fore peak region.

1. 3. 3 In container or similar ships having continuous side tanks or double skin construction in way of the cargo spaces, the longitudinal bulkheads are to be continued as far forward as is practicable and are to be suitably tapered at their ends. Where, due to the ship's form, such bulkheads are stepped, suitable scarfing is to be arranged.

1. 3. 4 In bulk carriers (*See* Pt 3, Ch 5, 1.1 Application 1.1.4) the topside tank and double bottom hopper tank structures are to be maintained over the cargo space region, and suitable taper brackets are to be arranged in line with the end of these tank structures in the fore peak region. In addition, in way of the cargo space forward bulkhead, a girder or intercostal bulb plate stiffeners (fitted between and connected to the bulkhead vertical stiffeners), are to be arranged on the forward side in line with the sloped bulkheads of the topside and hopper tanks clear of the taper brackets.

1. 4 Symbols and definitions

1. 4. 1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

L, B, D, T, C_b and V = as defined in Pt 3, Ch 1, 6.1, Principal particulars

k_L, k = higher tensile steel factor, *See* Pt 3, Ch 2, 1.2, Steel

l overall length of stiffening member, in metres, *See* Pt 3, Ch 3, 3.3 Determination of span point

l_e effective length of stiffening member, in metres, *See* Pt 3, Ch 3, 3.3 Determination of span point

s spacing of secondary stiffeners, in mm

t thickness of plating, in mm

I inertia of stiffening member, in cm^4, *See* Pt 3, Ch 3, 3.2, Geometric properties of section

S spacing, or mean spacing, of primary members, in metres

Z section modulus of stiffening member, in cm^3, *See* Pt 3, Ch 3, 3.2, Geometric properties of section

ρ relative density (specific gravity) of liquid carried in a tank and is to be taken not less than 1.025.

1. 4. 2 For the purpose of this Chapter the forward perpendicular, F.P., is defined as the forward limit of the Rule length L.

1. 5 Strengthening of bottom forward

1. 5. 1 The bottom forward of a sea-going ship is to be additionally strengthened, except where the ship is so designed that a minimum draught forward, T_{FB}, of $0.045L$ can be achieved for any ballast or part loaded condition. This draught is to be indicated on the shell expansion plan, the plan showing the internal strengthening, the Loading Manual and loading instrument, where fitted, *See* Pt 3, Ch 4, 8 Loading guidance information.

1. 5. 2 The requirements for the additional strengthening apply to ships where L is greater than 65 m. Where a ship is classed for service in protected waters or extended protected waters, compliance with the requirements of this Section may be modified or waived altogether.

1. 5. 3 The additional strengthening is to extend forward of $0.3L$ from the F.P. over the flat of bottom and adjacent plating with attached stiffeners up to a height of $0.002L$ above the base line or 300 mm whichever is the lesser.

1. 5. 4 The scantling requirements outside the areas defined in Pt 3, Ch 5, 1.5 Strengthening of bottom forward 1.5.3 are to be suitably tapered to maintain adequate continuity of strength in both longitudinal and transverse directions.

1. 5. 5 The requirements for the additional strengthening within the region defined in Pt 3, Ch 5, 1.5 Strengthening of bottom forward 1.5.3 are given in Table 5. 1. 1: Additional strengthening of bottom forward, or may be obtained by direct calculation. Where T_{FB} is less than $0.01L$, the additional strengthening is to be specially considered.

1. 5. 6 Bottom longitudinals are to pass through and be supported by the webs of primary members. The vertical web stiffeners are to be connected to the bottom longitudinals. The cross-sectional area of the connections is to comply with the requirements given in Table 5. 1. 1: Additional strengthening of bottom forward.

1. 5. 7 The scantlings required by this Section must in no case be less than those required by the remaining Sections in Pt 3, Ch 5 Fore End Structure.

1. 5. 8 For minimum draught forward, T_{FB} between $0.01L$ and $0.045L$, the equivalent slamming pressure expressed as a head of water, h_s, is to be obtained from Figure 5. 1. 1: Pressure heads, where h_{max} is calculated from the following expressions:

$$65 < L \leq 169m, h_{max} = 10\sqrt{L}Fm$$

$$169 < L \leq 180\ m, h_{max} = 130Fm$$

$$L > 180m, h_{max} = 130\ Fe^{-0.0125(L-180)0.705}m$$

where

F = $5.95 - 10.5\left(\frac{T_{FB}}{L}\right)^{0.2}$

= and

e = base of natural logarithms, 2.7183

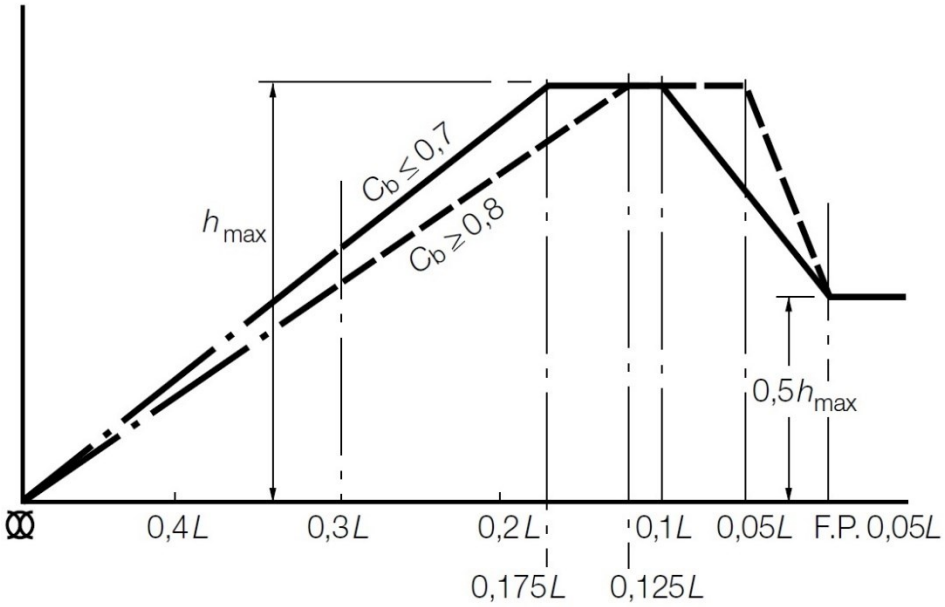
a. The application of the maximum pressure for forward of $0.3L$ from the F.P. is as indicated in Figure 5. 1. 1: Pressure heads. For C_b between 0.70 and 0.80 its position may be obtained by linear interpolation.

b. Where the bottom plating forms the boundary of a double bottom tank, deep tank or double skin tank which is full in all ballast conditions, then for such conditions the head, h_s, may be reduced by 1.25 times the head, in metres, of ballast water to top of tank.

c. For bulk carriers (*See* Pt 3, Ch 5, 1.1 Application 1.1.4) the reduction to the head, h_s, is not to exceed the head, in metres, of ballast water to the top of the hopper tank or 1.25 times the depth, in metres, of the double bottom tank, whichever is the greater.

d. For ballast and part loaded conditions where the draught forward is less than $0.045L$ and the reduction to the head, h_s, has been applied, the ballast tanks are to be filled and a note added to the loading booklet to this effect, *See* Pt 3, Ch 4, 8.2 Loading Manual 8.2.4.d.

Figure 5. 1. 1: Pressure heads



1. 6 Strengthening against bow flare slamming

1. 6. 1 The requirements of this Section apply to all ships except those defined in Pt 4, Ch 2 Ferries, Roll On-Roll Off Ships and Passenger Ships and Pt 4, Ch 8 Container Ships.

1. 6. 2 The side structure in the area forward of $0.075L$ from the F.P. and above the summer load waterline is to be strengthened against bow flare impact pressure. The strengthening is to extend vertically to the uppermost deck level, including the forecastle deck, if fitted, but need not exceed the level of $T + 1.65Hb$ above the base line, where H_b is the minimum bow height, in metres, as derived in Pt 3, Ch 1, 6.1 Principal particulars 6.1.11.

1. 6. 3 The flare angle, α, is the angle between the vertical axis and the tangent of the outer shell measured normal to the shell in a vertical plane, at the point under consideration. The entry angle, β, is the angle between the longitudinal axis and the waterplane tangent measured on the outer shell, at the point under consideration. The flare angle may normally be derived in accordance with Figure 5. 1. 2: Flare angle determination.

Table 5. 1. 1: Additional strengthening of bottom forward

Item	Requirements
(1) Longitudinally framed bottom shell plating (including keel), *See* Notes 1 and 2	$t = 0.003sf\sqrt{h_s k}$

(2) Bottom longitudinals - other than flat bars	$\frac{d_w}{t_w} \leq 55\sqrt{k}$ $\frac{d_w t_w}{100} \geq 0.00033 k h_s s c \left(S - \frac{s}{2000}\right)$ cm^2 $Z \geq 6.8 \times 10^{-6} h_s s k \left[(17.5 l_s)^2 - (0.01 s)^2 + d_w c \left(S - \frac{s}{2000}\right)\right]$ cm^3 $\frac{(A_1 \bar{\tau} + \alpha)}{p} \times 10^{-1} \geq 1$ $A_w \geq 0.84 A_1$	
(3) Bottom longitudinals - flat bars	Will be specially considered	
	Transverse framing	Longitudinal framing
(4) Primary structure in way of single bottoms	(a) Centre girder: Scantlings as required by item (1) in Table 5. 1. 1: Additional strengthening of bottom forward, except that in determining Z in way of a deep tank forward of 0.2L from the F.P. the value of h_5 is to be increased by the following percentages: where $T_{FB} \leq 0.03L_2$, 30 per cent where $T_{FB} \geq 0.04L_2$, 0 per cent The increase in h_5 for intermediate values of T_{FB} to be obtained by interpolation (b) Floors: Scantlings as required by item (2) in Table 5. 1. 1: Additional strengthening of bottom forward, except that in way of dry cargo spaces the minimum face area is to be increased by the following percentages: where $T_{FB} \leq 0.03L_2$, 50 per cent where $T_{FB} \geq 0.04L_2$, 0 per cent	(a) Ships having one or more longitudinal bulkheads: (i) Centre girder Scantlings as required by item (4) in Table 5. 1. 1: Additional strengthening of bottom forward and (iii) (ii) Bottom transverses Maximum spacing As for midships region Scantlings as required by Pt 4, Ch 9, 9 Primary members supporting longitudinal framing or Pt 4, Ch 10, 2 Primary members supporting longitudinal framing (iii) For horizontally stiffened longitudinal bulkheads and girders the depth to thickness ratio of the panel attached to the bottom shell plate is not to exceed $55\sqrt{k}$ (iv) Where $T_{FB,} < 0.025L_2$ the scantlings and arrangements will receive individual consideration

	The increase of minimum face area for intermediate values of T_{FB} is to be obtained by interpolation (c) Side girders: Arrangement and scantlings as required by Pt 3, Ch 5, 5.2 Single bottoms – Transverse framing 5.2.2 and Pt 3, Ch 5, 5.2 Single bottoms – Transverse framing 5.2.3, with the addition of intermediate half-height girders or equivalent fore and aft stiffening	(b) Other ship arrangements will receive individual consideration
(5) Primary structure in way of double bottoms, *See* Note 3	(a) Plate floors: Maximum spacing, every frame Scantlings as required by Pt 4, Ch 1, 8 Double bottom structure (b) Centre and side girders: Maximum spacing, $0.003S_F$ m (c) Intermediate half-height girders to be arranged midway between side girders: Scantlings as required for non watertight side girders by Pt 4, Ch 1, 8 Double bottom structure	(a) Plate floors: Maximum spacing: $0.002s_F$ m for $T_{FB} < 0.04L_2$ $0.003s_F$ m for $T_{FB} \geq 0.04L_2$ but not to exceed that required by item (2) in Table 5. 5. 2: Double bottom construction forward Scantlings as required by Pt 4, Ch 1, 8 Double bottom structure (b) Centre and side girders: Maximum spacing: $0.003s_L$ m for $T_{FB} < 0.04L_2$ $0.004s_L$ m for $T_{FB} > 0.04L_2$ but not to exceed that required by item (4) in Table 5. 5. 2: Double bottom construction forward. Scantlings as required by Pt 4, Ch 1, 8 Double bottom structure
(6) Primary structure in way of double bottoms supported by longitudinal bulkheads	–	The scantlings and arrangements will receive individual consideration on the basis of direct calculations using, if necessary, a suitably defined two-dimensional grillage model, *See* Pt 3, Ch 1, 3 Equivalents
Symbols		

L, T, s, k as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1

c = 1.0 for $S \leq 2.5$ m

= $(0.87 + 0.16S)$ c 1 for $S > 2.5$ m

c_1 = 1.0 for $S \leq 1.0$ m

= $(1.14 - 0.14S)$ for 1.0 m $< S \leq$ 4.0 m

= $\frac{2.32}{s}$ for $S > 4.0$m

d_w = web depth, in mm, which for bulb flats may be taken as 0.9 times the section height

$$f = \left(1.1 - \frac{s}{2500S}\right)$$

= but not greater than 1.0

h_s = equivalent slamming pressure, in metres obtained from Pt 3, Ch 5, 1.5 Strengthening of bottom forward 1.5.8

l_s l_e, in metres, as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1 where in way of a double bottom

= S, in metres, where in way of a single bottom

S = spacing of primary members, in metres

ρ = $9.81h_s s c_1 \left[S - \frac{s}{2000}\right] \times 10^{-3}$kN

s_F = spacing of transverse frames, in mm, for longitudinally framed side and bottom construction s_F may be taken as s_L

s_L = spacing of bottom longitudinals, in mm

t_w = web thickness, in mm

A_f = cross-sectional area of primary member web stiffener, in cm^2

A_{fc} = effective area of primary member web stiffener in way of butted end connection to the longitudinal, in cm^2

A_L = area of weld of lapped connection, in cm^2, calculated as total length of weld, in cm × throat thickness, in cm

A_w = area of weld of lug and web connection to the longitudinal, in cm^2, calculated as total length of weld in cm × throat thickness, in cm

A_1 = effective total cross-sectional area of the lug and web connection to the longitudinal, in cm^2

L_2 = L but need not be taken greater than 215 m

T_{FB} = draught, in metres, at the F.P., as defined in Pt 3, Ch 5, 1.5 Strengthening of bottom forward 1.5.1

a = $A_f \bar{\sigma}$ for the web stiffeners

= $A_{fC} \bar{\sigma}$ for a butted connection to the longitudinals

= $A_L \bar{\tau}$ for a lapped connection

$\bar{\sigma}$ = permissible direct stress, in N/mm^2, given in Table 5. 1. 2: Permissible stresses

$\bar{\tau}$ permissible shear stress, in N/mm^2, given in Table 5. 1. 2: Permissible stresses

Note *1.* If intermediate stiffening is fitted the thickness of the bottom shell plating may be 80 per cent of that required by (1) but is to be not less than the normal taper thickness.

Note *2.* For transverse framing the bottom shell plating is to be specially considered.

Note *3.* Particular care is to be taken to limit the size and number of openings in way of the ends of floors or girders or to fit suitable reinforcement where such openings are essential.

Note *4.* The welding requirements of Pt 3, Ch 10 Welding and Structural Details, and in cargo oil tanks of tankers, the requirements of Pt 4, Ch 9, 10.14 Arrangements at intersections of continuous secondary and primary members or Pt 4, Ch 10, 7.14 Arrangements at intersections of continuous secondary and primary members, are also to be complied with.

1. 6. 4 The equivalent bow flare slamming head, h_S, is to be taken as:

$$h_S = 0.8(0.2 + 1.5\tan\alpha)\left(0.51V\sin\beta\cos\alpha + \frac{\pi}{\sqrt{L}}\delta\right)^2 m$$

where

V = as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1

α = flare angle, in degrees, at the point under consideration

β = entry angle, in degrees, at the point under consideration

δ = $\left(\frac{\pi}{30}Le^{-0.0033L} - 0.5d\right)$ and is not to be taken less than zero

e = base of natural logarithms 2.7183

d = vertical distance, in metres, between the waterline at draught T and the point under consideration.

1. 6. 5 The thickness of the side shell is to be not less than:

$$t = 3.2s_C\sqrt{kh_s}C_R \times 10^{-2}\text{mm}$$

where

s_C = spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in Figure 5. 1. 3: Chord spacing and mean chord spacing for secondary members

h_S = bow flare slamming head, in metres, as defined in Pt 3, Ch 5, 1.6 Strengthening against bow flare slamming 1.6.3

C_R = panel ratio factor

= $\left(\frac{l}{s_c}\right)^{0.41}$ but is not to be taken less than 0.06 or greater than 0.1

l = overall panel length, in metres, measured along a chord between the primary members.

1. 6. 6 The scantlings of secondary stiffeners are not to be less than:

a. Section modulus of secondary stiffeners

$$Z = 3.6s_{CM}kh_sl_e^2 \times 10^{-3}\text{cm}^3$$

b. Web area of secondary stiffeners

$$A = 3.7s_{CM}kh_S(l_e - s_{CM}/2000) \times 10^{-4}\text{cm}^2$$

Where

s_{CM} = mean spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in Figure 5. 1. 3: Chord spacing and mean chord spacing for secondary members

h_S = bow flare slamming head, in metres, as defined in Pt 3, Ch 5, 1.6 Strengthening against bow flare slamming 1.6.3

= Other symbols are as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1.

Table 5. 1. 2: Permissible stresses

Item		Direct stress, $\bar{\sigma}$ in N/mm^2 *See* Note	Shear stress, $\bar{\tau}$ in N/mm^2
Primary member web stiffener on area A_f	(a) Flat bars *See* Note	$\frac{10.3}{k}\left[33-\frac{d}{t\sqrt{k}}\right]$	—
	(b) Bulb plates *See* Note	$\frac{8.6}{k}\left[40-\frac{d}{\left(\frac{100A_f}{d}-\frac{t}{6}\right)\sqrt{k}}\right]$	—
	(c) Inverted angles	$\frac{220}{k}$	—
Primary member web stiffener on area A_{fc}		$\frac{245}{k}$	—
Primary member web stiffener lapped to secondary member on area A_L		—	$\frac{167}{k}$
Lug or web connection on area A_1	Single	—	$\frac{124}{k}$
	Double	—	$\frac{141}{k}$
Symbols			
A_f, A_L, A_1 as defined in Table 5. 1. 1: Additional strengthening of bottom forward d =stiffener depth, in mm k =as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1 t=stiffener web thickness, in mm			
Note $\bar{\sigma}$ to be taken not greater than $\frac{220}{k}$			

1. 6. 7 The scantlings of primary members are not to be less than:

a. Section modulus of primary members

$$Z = 2S_{CM}kh_s l_e^2 \text{cm}^3$$

b. Web area of primary members

$$A = 0.2S_{CM}kh_s l_e \text{cm}^2$$

where

S_{CM} = mean spacing of primary members, in metres, measured along a chord between parallel adjacent members or equivalent supports, as shown in Figure 5. 1. 4: Mean chord spacing for primary members

h_S = bow flare slamming head, in metres, as defined in Pt 3, Ch 5, 1.6 Strengthening against bow flare slamming 1.6.4

= Other symbols are as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1.

1. 6. 8 For primary members with cut-outs for the passage of secondary stiffeners, and which may have web stiffeners connected to the secondary stiffener, buckling checks are to be carried out to ensure that the primary member web plating and web stiffener will not buckle under the design load. The buckling procedure to be followed is given in Table 5. 1. 3: Buckling procedure for primary member web plating and web stiffener. Where the web stiffener is fitted with a bracket, the buckling capability of the web stiffener in way of the cut-out is to take account of the bracket. Where no web stiffener is fitted, the buckling capability of the primary member web plating is to be checked for the total load transmitted to the connection.

1. 6. 9 The structural scantlings required in areas strengthened against bow flare slamming are to be tapered from 0.075L aft of fore perpendicular to meet the normal requirements at 0.15L aft of the fore perpendicular.

1. 6. 10 Where the stiffener web is not perpendicular to the plating, tripping brackets may need to be fitted in order to obtain adequate lateral stability.

1. 6. 11 For stiffeners and primary structure, where the angle between the stiffener web and the plating is less than 70°, the effective section modulus and shear area are to take account of the non-perpendicularity.

1. 6. 12 The side structure scantlings required by this Section must in no case be taken less than those required by the remaining Sections of Pt 3, Ch 5 Fore End Structure.

Steps	Members	
	Primary member web plating	Primary member web stiffener
Determination of the design compressive stress, σ_A, N/mm^2 (kgf/mm^2)	$\sigma_A = \frac{1000P_W}{A_W}$	$\sigma_A = \frac{1000P_S}{A_S}$
Determination of the elastic critical buckling stress, σ_E, in compression, N/mm^2 (kgf/mm^2)	$\sigma_E = \frac{9.87EI_W}{{l_w}^2 A_W}$	$\sigma_E = \frac{9.87EI_S}{{l_s}^2 A_S}$
Determination of the corrected critical buckling stress, σ_{CR}, in compression, N/mm^2 (kgf/mm^2)	$\sigma_{CR} = \sigma_o\left(1 - \frac{\sigma_o}{4\sigma_E}\right)$ where $\sigma_E > \frac{\sigma_o}{2}$ $\sigma_{CR} = \sigma_E$ where $\sigma_E \leq \frac{\sigma_o}{2}$	
Requirement	$\sigma_{CR} \geq \sigma_A$	

Symbols

b_W, b_S , l_W, and l_S are dimensions, in mm, as shown in Figure 5. 1. 5 Dimensions of critical areas of (a) primary member web plating and (b) primary web stiffener

h_S =equivalent bow flare slamming head, in metres, as defined in Pt 3, Ch 5, 1.6 Strengthening against bow flare slamming 1.6.3

s_{CM} =mean spacing of secondary stiffeners, in mm, as defined in Pt 3, Ch 5, 1.6 Strengthening against bow flare slamming 1.6.5

t_W = thickness of primary member web plating, in mm

t_S = thickness of primary member web stiffener, in mm

$A_W = b_W t_W$ mm^2

$A_S = b_S t_S$ mm^2

E =modulus of elasticity, in N/mm^2
=206000 N/mm^2 for steel

$l_W = \frac{b_w {t_w}^3}{12}$ mm^4

$l_S = \frac{b_s {t_s}^3}{12}$ mm^4

P =total load transmitted to the connection
$= 10.06\, S_{CM}\, s_{CM}\, h_s \times 10^{-3}$ kN

P_W =load transmitted through the primary member web plating, in kN
=P–P_S, or by direct calculations

P_S =load transmitted through the primary member web stiffener, in kN (tonne-f), to be determined from Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members 5.2.7.b, or by direct calculations

S_{CM} = mean spacing of primary members, in metres, as defined in Pt 3, Ch 5, 1.6 Strengthening against bow flare slamming 1.6.6

σ_o specified minimum yield stress, in N/mm^2

PART

3

CHAPTER **5** **Fore End Structure**

SECTION **2** **Deck structure**

2. 1 General

2. 1. 1 Where the upper deck is longitudinally framed outside the line of openings in the midship region, this system of framing is to be carried as far forward as possible. In the case of oil tankers (*See* Pt 3, Ch 5, 1.1 Application 1.1.4) longitudinal framing is to extend to at least the forward end of the cargo tank section.

2. 2 Deck plating

2. 2. 1 The thickness of strength/weather deck plating is to comply with the requirements of Table 5. 2. 1: Strength/weather deck plating forward (excluding forecastle deck).

2. 2. 2 The thickness of lower deck plating is to comply with the requirements of Table 5. 2. 2: Lower deck plating forward.

2. 2. 3 The taper thickness of the strength deck stringer plate is to be increased by 20 per cent at the end of a forecastle or bridge where the end bulkhead is situated aft of 0.25L from the F.P. No increase is required where the end bulkhead lies forward of 0.2L from the F.P. The increase at intermediate positions is to be determined by interpolation.

2. 2. 4 The deck plating thickness and supporting structure are to be suitably reinforced in way of the anchor windlass and other deck machinery, and in way of cranes, masts or derrick posts.

2. 2. 5 Where long, wide hatchways are arranged at lower decks, it may be necessary to increase the deck plating thickness to ensure effective support for side framing.

2. 3 Deck stiffening

2. 3. 1 The scantlings of strength/weather deck longitudinals are to comply with the requirements of Table 5. 2. 3: Strength/weather deck longitudinals forward.

2. 3. 2 The scantlings of cargo and accommodation deck longitudinals are to comply with the requirements given in Table 1. 4. 4: Cargo and accommodation deck longitudinals in Pt 4, Ch 1 General Cargo Ships.

2. 3. 3 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and, so far as practicable, direct continuity of longitudinal strength.

2. 3. 4 The scantlings of weather deck beams are to comply with the requirements of Table 5. 2. 4: Weather deck beams forward.

2. 3. 5 The scantlings of lower deck beams are to comply with the requirements of Table 1. 4. 5: Strength/weather, cargo and accommodation deck beams in Pt 4, Ch 1 General Cargo Ships.

Table 5. 2. 1: Strength/weather deck plating forward (excluding forecastle deck)

Symbols	Location	Thickness, in mm
L, D, T, s, S, k, ρ as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1 $C = \left(\frac{D + 2.3 - T}{\text{height of deck above load waterline at F.P.}}\right)$ but is to be taken not greater than 1.0 nor less than 0.9	(1) Forward of $0.075L$ from the F.P.	$t = (6.5 + 0.02L)C\sqrt{\frac{ks_1}{s_b}}$
s_1=s, but to be taken not less than s_b s_b=standard frame spacing as follows: (a) forward of $0.05L$ from the F.P.: $s_b = \left(470 + \frac{L}{0.6}\right)$ mm or 600 mm,	(2) Between $0.075L$ and $0.2L$ from the F.P.	The greater of the following: (a) $t = (5.5 + 0.02L)C\sqrt{\frac{ks_1}{s_b}}$ (b) the taper thickness (*See* Notes 1, 2 and 3) (c) For oil tankers, the thickness is also to be in accordance with Pt 4, Ch 9, 4.3 Deck plating 4.3.3
whichever is the lesser	(3) Aft of $0.2L$ from the F.P.	The taper thickness (*See* Notes 1, 2 and 3) or as (2) (c) whichever is the greater
(b) between $0.05L$ and $0.2L$ from the F.P.:	(4) Inside forecastle extending aft of $0.15L$ from the F.P.	As for a lower deck (*See* Note 4)
$s_b = \left(470 + \frac{L}{0.6}\right)$ mm or 700 mm, whichever is the lesser $f = 1.1 - \frac{S}{2500S}$ but to taken not greater than 1.0 h_4 = tank head, in metres, as defined in Ch 3.5	(5) In way of crown of a tank	$t = 0.004sf\sqrt{\frac{\rho k h_4}{1.025}} + 3.5$ or as in (1) to (4) as applicable, whichever is the greater but not less than: 7.5 mm where $L \geq 90$ m, or 6.5 mm where $L < 90$ m

Note *1*. The taper thickness is to be determined from Table 3. 2. 1: Taper requirements for hull envelope.

Note *2*. For taper area requirements, *See* Table 3. 2. 1: Taper requirements for hull envelope.

Note *3*. For thickness of upper deck plating in way of the cargo and fore peak tanks of oil tankers or ore carriers, *See also* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable.

Note *4*. The exposed deck taper thickness is to extend into a forecastle or bridge for at least one-third of the breadth of the ship from the superstructure end bulkhead.

Note *5*. The taper requirements from Table 3. 2. 1: Taper requirements for hull envelope in Pt 3, Ch 3 Structural Design do not apply to container ships or open ship types, *See* Pt 3, Ch 4, 2.3 Open type ships, where the requirements of Pt 4, Ch 8, 3.2 Longitudinal strength are applicable, nor to fast cargo ships where the requirements of Pt 4, Ch 1, 3 Longitudinal strength are applicable. *See also* Pt 3, Ch 4, 5 Hull bending strength for hull section modulus requirement away from the midship area.

Table 5. 2. 2: Lower deck plating forward

Symbols	Location	Thickness, in mm
L, s, S, k, ρ as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1 b = breadth of increased plating, in mm	(1) Forward of $0.075L$ from the F.P.	$t = 0.01 s_1 \sqrt{k}$ but not less than 6.5 mm
$f = 1.1 - \frac{s}{2500S}$ but is to be taken not greater than 1.0	(2) Aft of $0.075L$ from the F.P., inside line of openings	$t = 0.01 s_1 \sqrt{k}$ but not less than 6.5 mm
h_4=tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading	(3) Aft of $0.075L$ from the F.P., outside line of openings	As determined by a taper line from the midship thickness to the end thickness given by (1)
K_2 = 2.5 mm at bottom tank, or = 3.5 mm at crown of tank s_1 = s, but is to be taken not less than $\left(470 + \frac{L_1}{0.6}\right) mm$	(4) In way of crown or bottom of tank	$t = 0.004 f s \sqrt{\frac{\rho k h_4}{1.025}} + K_2$ or as in (1), (2) or (3) as applicable, whichever is the greater but not less than: = 7.5 mm where $L \geq 90$ m, or = 6.5 mm where $L < 90$ m
A_f = girder face area, in cm^2 L_1 = L, but need not be taken greater than 190 m **Note** *1.* Where the deck loading exceeds 43.2 kN/m^2, the thickness of plating will be specially considered. This is equivalent to a 'tween deck height of 6.1 m in association with the standard stowage rate 1.39 m^3/tonne. **Note** *2.* For minimum thickness of deck plating in oil tankers, *See* Pt 4, Ch 9, 10.2 Compartment minimum thickness.	(5) Plating forming the upper flange of underdeck girders	Clear of cargo hatches $t = \sqrt{\frac{A_f}{1.8k}}$ In way of hatch side girders $t = 1.1\sqrt{\frac{A_f}{1.8k}}$ Minimum breadth b = 760 mm

2. 3. 6 End connections of beams are to be in accordance with the requirements of Pt 3, Ch 10, 3 Secondary member end connections.

2. 4 Deck supporting structure

2. 4. 1 The arrangements and scantlings of supporting structure are generally to be in accordance with the requirements given in Pt 4, Ch 1, 4 Deck structure using the heads given in Pt 3, Ch 3, 5 Design loading for the particular region concerned, except as required by Pt 3, Ch 5, 2.4 Deck supporting structure 2.4.2 to Pt 3, Ch 5, 2.4 Deck supporting structure 2.4.4.

2. 4. 2 The spacings of girders and transverses are generally not to exceed the values given in Table 5. 2. 5: Spacing of girders and transverses under strength/weather decks forward.

2. 4. 3 Primary structure in the topside tanks of bulk carriers is to comply with the requirements of Pt 4, Ch 7, 7 Topside tank structure.

2. 4. 4 Primary structure in the cargo tanks of oil tankers and ore carriers is to be determined from Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable.

2. 5 Deck openings

2. 5. 1 In dry cargo ships the requirements for deck openings given in Pt 4, Ch 1, 4 Deck structure are generally applicable throughout the forward region, except that forward of 0.25L from the F.P.:

a. The radii or dimensions of the corners of main cargo hatchway openings on the strength deck are to be in accordance with the requirements of Pt 4, Ch 1, 4.5 Deck openings. The thickness of the insert plates, where required, is not to be less than 20 per cent greater than the adjacent deck thickness outside the line of openings, with a minimum increase of 3 mm.

b. Insert plates will be required at lower decks in way of any rapid change in hull form to compensate for loss of deck cross-sectional area. Otherwise, insert plates will not normally be required.

c. Compensation and edge reinforcement for openings outside the line of main hatchways will be considered, bearing in mind their position, the deck arrangements and the type of ship concerned.

2. 5. 2 For deck openings in way of the cargo tanks in oil tankers and ore carriers, *See also* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable. For main cargo hatchway openings on bulk carriers and container ships, *See also* Pt 4, Ch 7 Bulk Carriers and Pt 4, Ch 8 Container Ships, as applicable.

Table 5. 2. 3: Strength/weather deck longitudinals forward

Location	Modulus, cm^3	Inertia, cm^4
(1) Forward of 0.075L from the F.P.	The greater of the following: (a) $Z = sk(635h_1 + 0.0078(l_e L_1)^2) \times 10^{-4}$ (b) $Z = 0.0127skh_1 {l^2}_e$	—
(2) At 0.075L from the F.P., for end modulus for taper	The greater of the following: (a) $Z_e = sk(485h_0 + 0.0062(l_{e1} L_1)^2) \times 10^{-4}$ (b) $Z_e = 0.009skh_o {l_{e1}}^2$	—
(3) Aft of 0.075L from the F.P., outside line of openings	As given by (4) or as determined from Table 3. 2. 1: Taper requirements for hull envelope whichever is the greater, *See* Note 1	—
(4) At 0.075L and between 0.075L and 0.12L from the F.P.	The greater of the following: (a) $Z = sk(570h_1 + 0.0072(l_e L_1)^2) \times 10^{-4}$ (b) $Z = 0.0127skh_1 {l_e}^2$	—
(5) Aft of 0.12L from the F.P., inside line of main cargo hatchways openings	The greater of the following: (a) $Z = sk(400h_1 + 0.005(l_e L_1)^2) \times 10^{-4}$ (b) $Z = 0.007skh_1 {l_e}^2$	—
(6) In way of the crown of a tank	As (1) to (5), as applicable, or $Z = \frac{0.0113\rho skh_4 l_e^2}{b}$ whichever is the greater	$I = \frac{2.3}{k} l_e Z$
Symbols		
L, s, k_L, k ρ as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1 b =1.4 for rolled or built sections =1.6 for flat bars d_w =web depth of longitudinal, in mm		

h_o =1.2 m for dry cargo ships

$=\frac{L_1}{56}$ m for oil tankers (*See* Pt 3, Ch 5, 1.1 Application 1.1.4)

h_1 =weather head, in metres, as defined in Pt 3, Ch 3, 5 Design loading for dry cargo ships

$=\frac{L_1}{70}$ m for oil tankers (*See* Pt 3, Ch 5, 1.1 Application 1.1.4)

h_4 =tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

l_e as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1, but is to be taken not less than 1.5 m

l_{e1} is to be taken as the maximum span in metres in the midship cargo tank region for oil tankers (*See* Pt 3, Ch 5, 1.1 Application 1.1.4) and equal to l_e for dry cargo ships

L_1 = L but need not be taken greater than 190 m

Note *1*. For area taper requirements, *See also* Table 3. 2. 1: Taper requirements for hull envelope.

Note *2*. Where weather decks are intended to carry deck cargo and the loading is in excess of 8.5 kN/m^2, the scantlings of longitudinals may be required to be increased to comply with the requirements for location (1) in Table 1. 4. 4: Cargo and accommodation deck longitudinals using the equivalent design head, for specified cargo loadings, for weather decks given in Table 3. 5. 1: Design heads and permissible cargo loadings.

Note *3*. For the scantlings of deck longitudinals forward in way of the cargo tanks of oil tankers (*See* Pt 3, Ch 5, 1.1 Application 1.1.4) or ore carriers, *See also* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable.

4. The thickness of flat bar longitudinals situated outside the line of openings is to be not less than the following:

$$(a)\ t = \frac{d_w}{18\sqrt{k_L}} mm$$

where longitudinal continuous through bulkhead

$$(b)\ t = \frac{d_w}{15\sqrt{k_L}} mm$$

where longitudinal cut at bulkhead

Note *5*. The web depth of longitudinal, d_w, is to be not less than 60 mm.

Note *6*. The taper requirements from Table 3. 2. 1: Taper requirements for hull envelope in Pt 3, Ch 3 Structural Design do not apply to container ships or open ship types, *See* Pt 3, Ch 4, 2.3 Open type ships, where the requirements of Pt 4, Ch 8, 3.2 Longitudinal strength are applicable, nor to fast cargo ships where the requirements of Pt 4, Ch 1, 3 Longitudinal strength are applicable. *See also* Pt 3, Ch 4, 5 Hull bending strength for hull section modulus requirement away from the midship area.

Table 5. 2. 4: Weather deck beams forward

Location	Modulus, cm^3	Inertia, cm^4
(1) Forward of 0.075L from the F.P.	The lesser of the following: $(a) Z = k\left(800K_1TD + 5.4B_1sh_1{l_e}^2\right) \times 10^{-4}$ (b) $Z = 10.8B_1skh_1{l_e}^2 \times 10^{-4}$	—

(2) Between 0.075L and 0.12L from the F.P.	The lesser of the following: $(a) Z = k\left(800K_1TD + K_3B_1sh_1{l_e}^2\right) \times 10^{-4}$ (b) $Z = 2K_3B_1skh_1{l_e}^2 \times 10^{-4}$	—
(3) Aft of 0.12L from the F.P.	As required for location (1) of Table 1. 4. 5: Strength/weather, cargo and accommodation deck beams	—
(4) In way of the crown of a tank	As (1), (2) or (3), as applicable, or $Z = \frac{0.0113\rho k h_4 l_e^2}{b}$ whichever is the greater	$I = \frac{2.3}{k} l_e Z$

Symbols

B, D, T, s, ρ, k as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1

b = 1.4 for rolled or built sections

= 1.6 for flat bars

h_1 = weather head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

l_e as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1, but is to be taken not less than 1.83 m

K_1 = a factor dependent on the number of decks (including a bridge superstructure) at the position of the beam under consideration as follows:

1 deck – 20.0

2 decks – 13.3

3 decks – 10.5

4 decks or more – 9.3

For a forecastle deck, K_1 is to be taken as 13.3

K_3 =a factor dependent on the location of the beam as follows:

Span adjacent to ship's side – 3.6

Elsewhere – 3.3

B_1 = B, but need not be taken greater than 21.5 m

Note *1*. Beams at the upper deck inside superstructures are to have scantlings determined as for a lower deck, *See* Table 1. 4. 5: Strength/weather, cargo and accommodation deck beams.

Note *2*. Where weather decks are intended to carry deck cargo and the loading is in excess of 8.5 kN/m^2, the scantlings of beams are also to comply with the requirements for location (2) in Table 1. 4. 5: Strength/weather, cargo and accommodation deck beams using the equivalent design head, for specified cargo loadings, for weather decks given in Table 3. 5. 1: Design heads and permissible cargo loadings.

Note *3*. The web depth of beams, d_w, is to be not less than 60 mm.

Note *4*. The scantlings of deck beams forward in way of the cargo tanks of oil tankers or ore carriers will be specially considered, *See* Pt 4, Ch 9, 1.4 Class notation and applicable Rules for non-CSR Double Hull Oil Tankers 1.4.12.

Table 5. 2. 5: Spacing of girders and transverses under strength/weather decks forward

Location	Maximum spacing	
	Girders in association with transverse framing system	Transverses in association with longitudinal framing system
(1) Forward of the collision bulkhead	3.7 m	

(2) Between the collision bulkhead and 0.075*L* from the F.P.	3.7 m	2.5 m where $L \leq 100$ m 3.5 m where $L \geq 300$ m Intermediate values by interpolation
(3) In way of a deep tank, forward of 0.2*L* from the F.P.	—	3.0 m where $L \leq 100$ m 4.2 m where $L \geq 300$ m Intermediate values by interpolation
(4) Elsewhere in way of dry cargo spaces or deep tanks, *See* Note 1	—	3.8 m where $L \leq 100$ m $(3.2 + 0.006L)$ m where $L > 100$ m

Note *1.* For the maximum spacing of transverses in the cargo tanks of oil tankers or ore carriers, *See* Pt 4, Ch 9, 9 Primary members supporting longitudinal framing.

Note *2.* For the maximum spacing of transverses in dredgers, *See* Pt 4, Ch 12, 5 Shell envelope framing.

PART

3

CHAPTER **5** **Fore End Structure**

SECTION **3** **Shell envelope plating**

3. 1 General

3. 1. 1 Where the shell is longitudinally framed in the midship region, this system of framing is to be carried as far forward as practicable. In the case of oil tankers (*See* Pt 3, Ch 5, 1.1 Application 1.1.4), longitudinal framing is to extend at least to the forward end of the cargo tanks.

3. 2 Keel

3. 2. 1 The scantlings of bar keels at the fore end are to be the same as in the midship region as required by Pt 4, Ch 1, 5 Shell envelope plating.

3. 2. 2 The thickness and width of plate keels in the forward region are to be the same as required in the midship region for the particular type of ship concerned, *See* Pt 4 Ship Structures (Ship Types).

3. 3 Stem

3. 3. 1 Bar stems may be either steel castings or steel forgings complying with the requirements of Ch 3 Rolled Steel Plates, Strip, Sections and Bars of the Rules for Materials for rolled steel flat bars or Ch 5 Steel Forgings of the Rules for Materials for solid round bars. The scantlings of bar stems are to comply with Table 3. 5. 1: Design heads and permissible cargo loadings.

3. 3. 2 The scantlings of plate stems are to be determined from Table 3. 5. 1: Design heads and permissible cargo loadings. Plate stems are to be supported by horizontal diaphragms positioned in line with the side stringers or perforated flats with intermediate breasthook diaphragms. Diaphragms are to be spaced not more than 1.5 m apart, measured along the stem. Where the stem plate radius is large, a centreline stiffener or web will be required.

3. 4 Bottom shell and bilge

3. 4. 1 The thickness of bottom shell and bilge plating in the forward region for ships not requiring additional strengthening of bottom is to comply with Table 5. 3. 1: Shell plating forward.

3. 4. 2 For thickness of bottom shell and keel when additional bottom strengthening is required, *See* Pt 3, Ch 5, 1.5, Strengthening of bottom forward.

3. 4. 3 Where longitudinals are omitted in way of radiused bilge plating amidships, the plating thickness forward will be considered in relation to the support derived from the hull form and internal stiffening arrangements.

3. 5 Side shell and sheerstrake

3. 5. 1 The thickness of side shell and sheerstrake plating in the forward region is to be not less than the values given in Table 5. 3. 1: Shell plating forward, but may be required to be increased locally on account of high shear forces, in accordance with Pt 3, Ch 4, 6.5, Permissible still water shear force.

3. 5. 2 For transversely framed side shells where panting stringers are omitted, *See* Pt 3, Ch 5, 4.4, Panting stringers in way of transverse framing, the side shell plating in the region concerned is to be increased in thickness by the percentages given below:

a. 15 per cent, where L $\leq$ 150 m
b. 5 per cent, where L $\geq$ 215 m

For intermediate values of *L*, the percentage increase is to be obtained by interpolation.

3. 5. 3 The side shell plating of increased thickness required by Pt 3, Ch 5, 3.5 Side shell and sheerstrake 3.5.2 is to be continued forward past the fore peak or collision bulkhead. In addition, horizontal brackets in line with the fore peak stringers are to be fitted at the aft side of the bulkhead where practicable. The brackets are to be the same thickness as the side shell and are to extend from the bulkhead to the adjacent shell frame and be connected thereto. Transversely the toes of the brackets are to extend past the outboard stiffener of the bulkhead to clear any cut out in the bulkhead stringer.

3. 5. 4 The sheerstrake taper thickness is to be increased by 20 per cent at the ends of a bridge superstructure extending out to the ship's side irrespective of position. Similar strengthening is to be fitted in way of the end of a forecastle if this occurs at a position aft of 0.25*L* from the F.P. No increase is required if the forecastle end bulkhead lies forward of 0.2*L* from the F.P. The increase at intermediate positions of end bulkhead is to be obtained by interpolation.

3. 5. 5 The shell plating may be required to be increased in thickness locally in way of hawse pipes, *See* Pt 3, Ch 13, 8.12 Structural requirements associated with anchoring.

3. 5. 6 The shell plating is to be increased in thickness locally in way of a bulbous bow, *See* Pt 3, Ch 5, 6.5 Bulbous bow 6.5.6.

3. 6 Shell openings

3. 6. 1 In general, compensation will not be required for holes in the sheerstrake which are clear of the gunwale, or for any deck openings situated outside the line of main hatchways and whose depth does not exceed 20 per cent of the depth of the sheerstrake or 380 mm, whichever is the lesser. Openings are not to be cut in a rounded gunwale. Cargo door openings are to have well rounded corners, and the proposed compensation for the door openings will be individually considered.

3. 6. 2 Sea inlet and other openings are to have well rounded corners. The thickness of sea inlet box plating is generally to be the same as the adjacent shell. It is however, to be not less than 12.5 mm, and need not exceed 25 mm.

Table 5. 3. 1: Shell plating forward

Location	Thickness, in mm	Notes *(Part only shown)*
(1) Bottom shell and bilge, *See also* Pt 3, Ch 5, 1.5, Strengthening of bottom forward and Note 5:		**Note** *1*. For ships where $L \leq 70$ m this thickness may be reduced by 1 mm, but it is to be not less than 6 mm.

(a) Forward of $0.075L$ from the F.P.	$t = (6.5 + 0.033L)f_2\sqrt{\frac{ks_1}{s_b}}$ (*See* Note 1)	**Note** *2.* The taper thickness is to be determined from Table 3. 2. 1: Taper requirements for hull envelope
(b) Between $0.075L$ and $0.25L$ from the F.P.,*See* Note 7	As (1)(a) or the taper thickness, whichever is the greater	**Note** *3.* For thickness of shell plating in way of the cargo and fore peak tanks of oil tankers or ore carriers, *See also* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as appropriate.
(c) Aft of $0.25L$ from the F.P., *See* Note 7	The taper thickness, (*See* Note 2)	**Note** *4.* In offshore supply ships the thickness of side shell is to be not less than 9 mm.
(2) Side shell, *See* Notes 4 and 5:		**Note** *5.* For trawlers and fishing vessels *See* Pt 4, Ch 6, 5 Shell envelope plating.
(a) Forward of $0.075L$ from the F.P.	$t = (6.5 + 0.033L)f_2\sqrt{\frac{ks_1}{s_b}}$ (*See* Note 1)	**Note** *6.* For fast cargo ships, *See* Pt 4, Ch 1, 3 Longitudinal strength.
(b) Between $0.075L$ and $0.2L$ from the F.P., *See also* Pt 3, Ch 5, 3.5 Side shell and sheerstrake 3.5.2	As (2)(a) or the taper thickness, whichever is the greater	**Note** *7.* For oil tankers the thickness is also to be in accordance with Pt 4, Ch 9, 4.3 Deck plating 4.3.3.
(c) Aft of $0.2L$ from the F.P.	The taper thickness, (*See* Note 2)	**Note** *8.* The taper requirements from Table 3. 2. 1: Taper requirements for hull envelope in Pt 3, Ch 3 Structural Designdo not apply to container ships or open ship types, *See* Pt 3, Ch 4, 2.3 Open type ships, where the requirements of Pt 4, Ch 8, 3.2 Longitudinal strength are applicable, nor to fast cargo ships where the requirements of Pt 4, Ch 1, 3 Longitudinal strength
(3) Sheerstrake, *See* Notes 4 and 5:		
(a) Forward of $0.075L$ from the F.P.:		
where $\frac{T}{D} > 0.7$	As (2)(a) for side shell	
where $\frac{T}{D} \leq 0.7$	As (4) for a forecastle	
(b) Between $0.075L$ and $0.2L$ from the F.P., *See* Note 7	As (3)(a) or as determined from Table 3. 2. 1: Taper requirements for hull envelope in Chapter 3	

(c) Aft of 0.2*L* from the F.P., *See* Note 7	The taper thickness, (*See* Note 2)	are applicable. *See also* Pt 3, Ch 4, 5 Hull bending strength for hull section modulus requirement away from the midship area.
(4) Forecastle, *See* Notes 4 and 5	$t = (7.0 + 0.02L)f_2\sqrt{\frac{ks_1}{s_b}}$	
(5) Stem, *See* Notes 4 and 5		
(a) Bar stem: below load waterline	A_1 = (1.6*L*-32) cm^2 or *L* cm^2 whichever is the greater	
at stem head	A_2 = 0.75 A_1 cm^2	
(b) Plate stem: below load waterline	t = (5.0+0.083L_2) $\sqrt{k}$ mm	
at stem head	t = as (2)(a) for side shell	

Symbols

L, *B*, *D*, *T*, *s*, *k* as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1

s_1 = *s*, but to be taken as not less than s_b

f_2 = factor to be taken as:

$f_2 = \left(\frac{15}{L/T}\right)^{0.2}$ but need not be taken greater than 1. *L*/*T* is not to be taken greater than 25

s_b = standard frame spacing, in mm, as follows:

Region	Bottom shell s_b	Side shell s_b
Forward of 0.05*L* from the F.P.	$\left(470 + \frac{L}{0.6}\right)$ or 600*	$\left(470 + \frac{L}{0.6}\right)$ or 600*
Between 0.05*L* and 0.2*L* from the F.P.	$\left(470 + \frac{L}{0.6}\right)$ or 700*	$\left(470 + \frac{L}{0.6}\right)$ or 700*
Between 0.2*L* and 0.25*L* from the F.P.	$\left(510 + \frac{L_2}{0.6}\right)$	* whichever is the lesser

A_1 = cross-sectional area of bar stem below load waterline, in cm^2

A_2 = cross-sectional area of bar stem at stem head, in cm^2

L_2 = *L*, but need not be taken greater than 215 m

PART

3

CHAPTER **5** **Fore End Structure**

SECTION **4** **Shell envelope framing**

4. 1 General

4. 1. 1 Requirements are given in this Section for both longitudinal and transverse framing systems. Where longitudinal framing is adopted in the midship region it is to be carried as far forward as practicable. In the case of oil tankers (*See* Pt 3, Ch 5, 1.1 Application 1.1.4), longitudinal framing is to be continued at least to the fore end of the cargo tanks.

4. 1. 2 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and, so far as practicable, direct continuity of longitudinal strength, *See also* Pt 3, Ch 10, 3 Secondary member end connections. Where L exceeds 215 m, the bottom longitudinals are to be continuous in way of both watertight and non-watertight floors, but alternative arrangements will be considered. Higher tensile steel longitudinals within 10 per cent of the ship's depth at the bottom and deck are to be continuous irrespective of the ship length.

4. 1. 3 Stiffeners and brackets on side transverses, where fitted on one side and connected to higher tensile steel longitudinals between the base line and $0.8D$ above the base line, are to have their heels well radiused to reduce stress concentrations. Where a symmetrical arrangement is fitted, i.e. bracket or stiffening on both sides, and it is connected to higher tensile steel longitudinals, the toes of the stiffeners or brackets are to be well radiused. Alternative arrangements will be considered if supported by appropriate direct calculations.

4. 1. 4 Where higher tensile steel side longitudinals pass through transverse bulkheads in the cargo area, well radiused brackets of the same material are to be fitted on both the fore and aft side of the connection between the upper turn of bilge and $0.8D$ above the base line. Particular attention is to be given to ensuring the alignment of these brackets. Alternative arrangements will be considered if supported by appropriate direct calculations.

4. 1. 5 For ships intended to load or unload while aground, *See* Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

4. 2 Shell longitudinals

4. 2. 1 The scantlings of bottom and side shell longitudinals in the forward region are to comply with the requirements given in Pt 3, Ch 5, 4.2 Shell longitudinals 4.2.1. For the scantlings of bottom shell longitudinals where additional bottom strengthening is required, *See* Pt 3, Ch 5, 1.5, Strengthening of bottom forward.

Table 5. 4. 1: Shell framing (longitudinal) forward

Location	Modulus, in cm^3
(1) Side longitudinals in forecastle	$Z = 0.0075skl_e^2(0.6 + 0.167D_1)$

(2) Side longitudinals in way of dry spaces including double skin construction:	
(a) Forward of the collision bulkhead	$Z = 0.007skh_{Tl}l_e^2F_s$ but not to be less than as required by (1)
(b) Between the collision bulkhead and 0. 2L from the F.P.	As (a) above or as required in the midship region for the particular type of ship concerned, whichever is the greater. However, not to be taken less than as required by (1).
(c) Aft of 0.2L from the F.P.	As required in the midship region for the particular type of ship concerned.
(3) Side longitudinals in way of double skin tanks or deep tanks	The greater of the following: Z as from (2) As required by Pt 4, Ch 1, 9 Bulkheads for deep tanks.
(4) Bottom and bilge longitudinals	The greater of the following: As required in the midship region for the particular type of ship concerned. As required by Pt 3, Ch 5, 1.5, Strengthening of bottom forward, strengthening of bottom forward, where applicable.
Symbols	

L, D, T, s, k, as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1

l_e = as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1, but is to be taken not less than 1.5m

L_1 = L but need not be taken greater than 190 m

F_s is a fatigue factor to be taken as follows:

(a) For built sections and rolled angle bars:

F_s = $\frac{1.1}{k}\left[1-\frac{2b_{f1}}{b_f}(1-k)\right]$ at $0.6D_1$ above the base line

= 1.0 at D_1 and above, and F_{sb} at the base line intermediate values by linear interpolation

F_{sb} is a fatigue factor for bottom longitudinals

= $0.5(1+F_s$ at $0.6D_1)$

(b) For flat bars and bulb plates $\frac{b_{f1}}{b_f}$ may be taken as 0.5

where

b_{f1} = the minimum distance, in mm, from the edge of the face plate of the side longitudinal under consideration to the centre of the web plate, *See* Fig. 9.5.1 in Pt 4, Ch 9

b_f = the width of the face plate, in mm, of the side longitudinal under consideration, *See* Fig. 9.5.1 in Pt 4, Ch 9

T_1 = T but not to be taken less than $0.65D_1$

D_1 = $T + H_b$ metres, where H_b is the minimum bow height, in metres, obtained from Pt 3, Ch 1, 6.1 Principal particulars 6.1.11

h_{T1} = $f_w C_w\left(1-\frac{h_6}{D_1-T_1}\right)F_\lambda$ F_λ, in metres, for longitudinals above the waterline at draught T_1 where

$f_w\left(1-\frac{h_6}{D_1-T_1}\right)$ is not to be taken less than 0.7

= $\left[h_6+f_w C_w\left(1-\frac{h_6}{2T_1}\right)\right]F_\lambda$, in metres, for longitudinals below the waterline at draught T_1

where

f_w = 1.0 at $0.2L$ from the F.P. and 1.71 at, and forward of, $0.15L$ from the F.P. Intermediate positions by interpolation

h_6 = vertical distance, in metres, from the waterline at draught T_1, to the longitudinal under consideration

F_λ = 1.0 for $L \leq 200$ m

= $[1.0 + 0.0023(L-200)]$ for $L > 200$ m

C_w = a wave head, in metres $= 7.71\times10^{-2}Le^{-0.0044\,L}$

where

e = base of natural logarithms 2.7183

Note Where struts are fitted midway between transverses in double skin construction, the modulus of the side longitudinals may be reduced by $50k$ per cent from that obtained for locations (2) and (3) as applicable.

4. 2. 2 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and so far as practicable, direct continuity of longitudinal strength, *See also* Pt 3, Ch 10, 3 Secondary member end connections.

4. 3 Shell framing

4. 3. 1 The scantlings of side frames in the forward region are to comply with the requirements given in Pt 3, Ch 5, 4.4 Panting stringers in way of transverse framing 4.4.3.

4. 3. 2 The scantlings of main frames are normally to be based on Rule standard brackets at top and bottom, whilst the scantlings of 'tween deck frames are normally to be based on a Rule standard bracket at the top only.

4. 3. 3 End connections of transverse main and 'tween deck frames are to be in accordance with Pt 3, Ch 10, 3 Secondary member end connections. For bulk carriers the end connections of main frames in cargo holds are to be in accordance with Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.5 to Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.12. Where brackets are omitted at the foot of main frames in cargo spaces, small easing brackets are to be fitted forward of 0.15L from the F.P.

4. 4 Panting stringers in way of transverse framing

4. 4. 1 In lower hold or deep tank spaces panting stringers are generally to be fitted in line with each stringer or flat in the fore peak space and extending back to 0.15L from the F.P. These stringers may be omitted if the shell plating is increased in thickness as required by Pt 3, Ch 5, 3.5 Side shell and sheerstrake 3.5.2. Where the span of the main frames exceeds 9 m, panting stringers are to be fitted irrespective of whether the shell plating is increased in thickness or not. These stringers are to be arranged in line with alternate stringers or flats in the fore peak and are to extend back to 0.2L from the F.P.

4. 4. 2 In 'tween deck spaces in the region forward of 0.15L from the F.P., where the unsupported length of frame exceeds 2.6 m in a lower 'tween deck or 3.0 m in an upper 'tween deck, intermediate panting stringers are generally to be fitted. These stringers may be omitted if the shell plating is increased in thickness as required by Pt 3, Ch 5, 3.5 Side shell and sheerstrake 3.5.2.

4. 4. 3 The scantlings of panting stringers are to be determined from Pt 3, Ch 5, 4.4 Panting stringers in way of transverse framing 4.4.3.

Table 5. 4. 2: Shell framing (transverse) forward

Location	Modulus, in cm^3	Inertia, in cm^4
*(1)*Frames in fore peak spaces and lower 'tween decks over, *See* Note 1	$Z = 9.1skD_1 \times 10^{-3}$	$I = \frac{3.5}{k} S_1 Z$
(2) Frames in upper 'tween decks and forecastles forward of the collision bulkhead, *See* Notes 1, 2 and 8	The greater of the following: $Z = Cskh_{T1}H^2 \times 10^{-3}$ $Z = 9.1skD_1 \times 10^{-3}$	$I = \frac{3.5}{k} HZ$
(3) Main and 'tween deck frames (including forecastle) between the collision bulkhead and 0.15L from the F.P., *See* Notes 1 to 4 and 8	The greater of the following: $Z = Cskh_{T1}H^2 \times 10^{-3}$ Z=9.1skD_1 x 10^{-3}	$I = \frac{3.5}{k} HZ$
*(4)*Main and 'tween deck frames between 0.15L and 0.2L from the F.P. in dry cargo spaces, *See* Notes 1 to 4 and 8	The greater of the following: $Z = Cskh_{T1}H^2 \times 10^{-3}$ $Z = 9.1skD_1 \times 10^{-3}$	$I = \frac{3.2}{k} HZ$
(5) Panting stringers, *See* Note 5	Web depth, d_w, same depth as frames Web thickness, $t = 6 + 0.025L_2$ mm Face area,$A = kS_2(H + 1)$cm^2	
(6) Main and 'tween deck frames elsewhere, *See* Notes 1 to 4	As required in the midship region for the particular type of ship concerned	
Symbols		
L, D, T, s, k as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1		

L_2 = L, but need not be taken greater than 215 m

D_1 = $T + H_b$, in metres, where H_b is defined in Pt 3, Ch 1, 6.1 Principal particulars 6.1.11

D_1 = $T + H_b$, in metres, where H_b is defined in Pt 3, Ch 1, 6.1 Principal particulars 6.1.11

D_2 = D_1, but is to be taken not greater than 16 m, nor less than 6.0 m

H = H_{MF} or H_{TF} as applicable, *See* Note 7

H_{MF} = vertical framing depth, in metres, of main frames as shown in Fig. 5.4.1 but is to be taken not less than 3.5 m, *See* Note 6

H_{TF} = vertical framing depth, in metres, of 'tween deck frames as shown in Fig. 5.4.1 but is to be taken not less than 2.5 m

K_1 = 2.3 for peak tanks

= 1.87 for 'tween decks over peak tanks

S_1 = vertical spacing of peak stringers or height of lower 'tween deck above the peak, in metres, as applicable

S_2 vertical spacing of panting stringers, in metres

C = end connection factor

= 3.4 where two Rule standard brackets fitted

= $3.4\ (1.8 - 0.8(l_a/l))$ where one Rule standard bracket and one reduced bracket is fitted

= $3.4\ (2.15 - 1.15(l_{amean}/l))$ where two reduced brackets are fitted

= 6.1 where one Rule standard bracket is fitted

= $6.1\ (1.2 - 0.2(l_a/l))$ where one reduced bracket is fitted.

= 7.3 where no brackets are fitted

= The requirements for frames where brackets larger than Rule standard are fitted will be specially considered

l = length, in mm, as derived from Pt 3, Ch 10, 3.4 Scantlings of end brackets 3.4.1

l_a = equivalent arm length, in mm, as derived from Pt 3, Ch 10, 3.4 Scantlings of end brackets 3.4.1

l_{amean} = mean equivalent arm length, in mm, for both brackets

T_1 = T but not to be taken less than $0.65D_1$

h_{T1} head, in metres, at mid-length of H

= $f_w C_w \left(1 - \frac{h_6}{D_1 - T}\right) F_\lambda$ in metres for frames where the mid-length of frame is above the waterline, at draught T_1

where $f_w \left(1 - \frac{h_6}{D_1 - T_1}\right)$ is not to be taken less than 0.7

$\left[h_6 + f_w C_w \left(1 - \frac{h_6}{2T_1}\right)\right] F_\lambda$ in metres for frames where the mid-length of frame is below the waterline at draught T_1

where

f_W = 1.0 at $0.2L$ from F.P. and 1.71 at, and forward of, $0.15L$ from F.P. Intermediate positions by interpolation

h_6 = vertical distance, in metres, from the waterline at draught T_1 to the mid-length of H

F_λ 1.0 for $L \leq 200$ m

= $[1.0 + 0.0023\ (L - 200)]$ for $L > 200$ m

C_W = a wave head, in metres

$= 7.71 \times 10^{-2} Le^{-0.0044\,L}$

where

e = base of natural logarithms 2.7183

Note 1. For framing in the fore end of fishing vessels, *See* Pt 4, Ch 6, 6 Shell envelope framing

Note 2. In offshore supply ships the moduli of main and 'tween deck frames are to be 25 per cent greater than given in (2), (3) and (4).

Note 3. In way of the cargo tanks of oil tankers or ore carriers, the scantlings of frames are also to comply with the requirements for frames in the midship region of such ships, *See* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable.

Note 4. In bulk carriers the scantlings of frames are also to comply with the requirements of Pt 4, Ch 7, 6 Shell envelope framing in which the requirements of Table 7.6.1 location (1) are to be multiplied by the following factor: Between $0.15L$ and $0.2L$ from the F.P., $C_1 = (0.018D_2 + 0.82)$, but not to be taken less than 1.0 .Between collision bulkhead and $0.15L$ from the F.P.$C_1 = (0.021D_2 + 0.96)$.

Note 5. Panting stringers are not required in tugs less than 46 m in length, *See* Pt 4, Ch 3, 4 Panting and strengthening of bottom forward.

Note 6. Where the frames are supported by fully effective horizontal stringers, these may be considered as decks for the purpose of determining H_{MF}.

Note 7. Where frames are inclined at more than 15° to the vertical, H_{MF} or H_{TF} is to be measured along a chord between span points of the frame.

Note 8. Except for main frames the modulus for these members need not exceed that derived from (1) using H_{TF} in place of S_1.

4. 5 Primary structure at sides

4. 5. 1 For the arrangement of primary structure in peak tanks and deep tanks forward, *See also* Pt 3, Ch 5, 6 Fore peak structure and Pt 3, Ch 5, 7 Forward deep tank structure.

4. 5. 2 The spacing of side transverses and web frames is generally not to exceed the values given in Table 5. 4. 3: Spacing of side transverses and web frames forward.

Table 5. 4. 3: Spacing of side transverses and web frames forward

Location	Maximum spacing	
	Web frames in association with transverse framing system	Side transverses in association with longitudinal framing system
(1) Forward of the collision bulkhead	5 frame spaces	2.5 m where L ≤ 100m 3.5 m where L ≥ 300 Intermediate values by interpolation
(2) In way of a forward deep tank adjacent to the collision bulkhead	5 frame spaces	3.0 m where L ≤ 100m 4.2 m where L ≥ 300m

		Intermediate values by interpolation
(3) Elsewhere in way of dry cargo spaces or deep tanks	*See* Note 1	3.8 m where L ≤ 100m (0.006L + 3.2) m where L > 100m
(4) In way of the cargo tanks of oil tankers, chemical tankers or ore or oil carriers	—	3.6 m where L≤ 180 m 0.02L where L > 180 m
Note 1. In 'tween decks above deep tanks situated adjacent to the collision bulkhead, web frames are to be fitted in line with those in the tanks. **Note** 2. For the maximum spacing of transverses in dredgers, *See* Pt 4, Ch 12, 5 Shell envelope framing		

4. 5. 3 The scantlings of side transverses supporting longitudinal framing and stringers and webs supporting transverse framing in the forward region are to be determined from Table 5. 4. 4: Primary structure forward.

Table 5. 4. 4: Primary structure forward

Item and location	Modulus, in cm^3	Inertia, in cm^4
Longitudinal framing system		
(1) Side transverses in dry spaces forward of 0.2*L* from the F.P., *See* Note 5:		—
Holds 'tween decks	$Z = 10kSh_{T1}{l_e}^2$ $Z = C_2kSTH_{TF}\sqrt{D}$	
(2) Side transverses in peak and deep tanks forward of 0.2*L* from the F.P., *See* Notes 1 and 4:		$I=\frac{2.5}{k}l_eZ$
where no struts fitted where struts fitted	$Z = 14.1\rho kSh_4{l_e}^2\gamma$ or as (1) above, whichever is the greater As in Pt 4, Ch 9, 9 Primary members supporting longitudinal framing	
(3) Side transverses in dry spaces and deep tanks aft of 0.2*L* from the F.P.	As in Pt 4, Ch 1, 6 Shell envelope framing, *See* Notes 1 and 2	
Transverse framing system		

(4) Side stringers supported by webs in dry spaces forward of 0.2L from the F.P., *See* Note 3 or as (4) above, whichever is the greater	$Z = 7.75kSh_{T1}{l_e}^2$	—
(5) Side stringers supported by webs in peak or deep tanks forward of 0.2L from the F.P., *See* Notes 1 and 3	$Z = 11.7\rho kSh_4{l_e}^2$ or as (4) above, whichever is the greater	$I=\frac{2.5}{k}l_eZ$
(6) Web frames supporting side stringers forward of 0.2L from the F.P., *See* Notes 1, 2 and 3	Z to be determined from the calculations based on the following assumptions: Fixed ends Point loadings from stringers Head γh_4 or γh_{T1} as applicable Bending stress $\frac{93.2}{k}N/mm^2$ Shear stress $\frac{83.4}{k}N/mm^2$	In deep tanks $I=\frac{2.5}{k}l_eZ$
(7) Web frames in 'tween decks, not supporting side stringers, forward of 0.2L from the F.P.	$Z = C_3kSTH_{TF}\sqrt{D}$	—
(8) Side stringers and web frames in dry spaces and deep tanks aft of 0.2L from the F.P.	As in Pt 4, Ch 1, 6 Shell envelope framing, *See* Notes 1 and 2	
Symbols		
D, T, S, l_e, k, ρ as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1		

B_f = bow fullness factor determined from Fig 5.4.3 to be taken as 1.0 for framing members located at and abaft 0.2L from the forward perpendicular

h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

h_{T1} = head, in metres, at mid-length of span

= $f_w C_w \left(1 - \frac{h_6}{D_1 - T_1}\right) F_\lambda$, in metres, where the mid-length of span is above the waterline at draught T_1

Where $f_w \left(1 - \frac{h_6}{D_1 - T_1}\right)$ is not to be taken less than 0.7

= $\left[h_6 + f_w C_w \left(1 - \frac{h_6}{2T_1}\right)\right] F_\lambda$, in metres, where the mid-length of span is below the waterline at draught T_1

where

f_W = 1.0 at 0.2L from F.P. and 1.71 at, and forward of, 0.15L from F.P. Intermediate positions by interpolation

h_6 = vertical distance, in metres, from the waterline at draught T_1 to the mid-length of span

F_λ = 1.0 for L $\leq$ 200 m

= [1.0 + 0.0023 (L − 200)] for L > 200 m

C_W = a wave head, in metres

= $7.71 \times 10^{-2} L e^{-0.0044L}$

where

e = base of natural logarithms 2.7183

D_1 = T+H_b, in metres, where H_b is defined in Pt 3, Ch 1, 6.1 Principal particulars 6.1.11

T_1 = T but not to be taken less than 0.65D_1

C_2, C_3 = factors obtained from Figure 5. 4. 2: Framing factors for primary members

H_{TF} = vertical height of `tween decks, in metres, as shown in Pt 3, Ch 5, 4.5 Primary structure at sides 4.5.4

γ is to be measured at the mid-span of the member as follows:

γ_1 = 1.0 at base line

γ_2 bow fullness factor (B_f) at 0.6D above base

γ_3 $\left(\frac{B_f - 1}{2}\right)$ + 1.0 at depth D above base

Intermediate values are to be determined by interpolation.

Minimum value = 1.0

Note *1.* In way of the cargo tanks, fore peak tanks and dry spaces of oil tankers or ore carriers the scantlings of primary structure are to comply with the requirements of Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as appropriate.

Note *2.* For bulk carriers *See* Pt 4, Ch 7, 6.2, Transverse stiffening.

Note *3.* For stringers and webs in fore peaks or deep tanks, *See also* Pt 3, Ch 5, 6.3, Side structure − Transverse framing and Pt 3, Ch 5, 7.3, Side structure − Transverse framing.

Note *4.* In the fore peak, the breadth S should be measured along the line of shell. The effective length l_e of the vertical webs should be measured along the line of shell from horizontal flat to horizontal flat, except that it may be taken to the underside of a transverse or strut where fitted.
Note *5.* The web depth of side transverses forward of 0.2L from the F.P. is to be not less than 2.5 times the depth of the longitudinals supported. The web depth of stringers forward of 0.2L is to be not less than 2.2 times the depth of the frames supported.
Note *6.* For the primary structure at sides in dredgers with restricted service notations, *See* Table 12. 5. 2: Primary supporting structure at sides.

4. 5. 4 The web thickness, stiffening arrangements and end connections of primary supporting members are to be in accordance with the requirements of Pt 3, Ch 10, 4 Construction details for primary members.

Figure 5. 4. 1: Framing depths for transverse frames

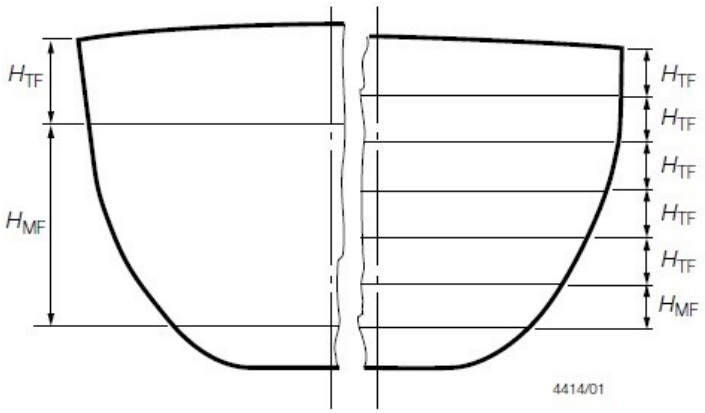

Figure 5. 4. 2: Framing factors for primary members

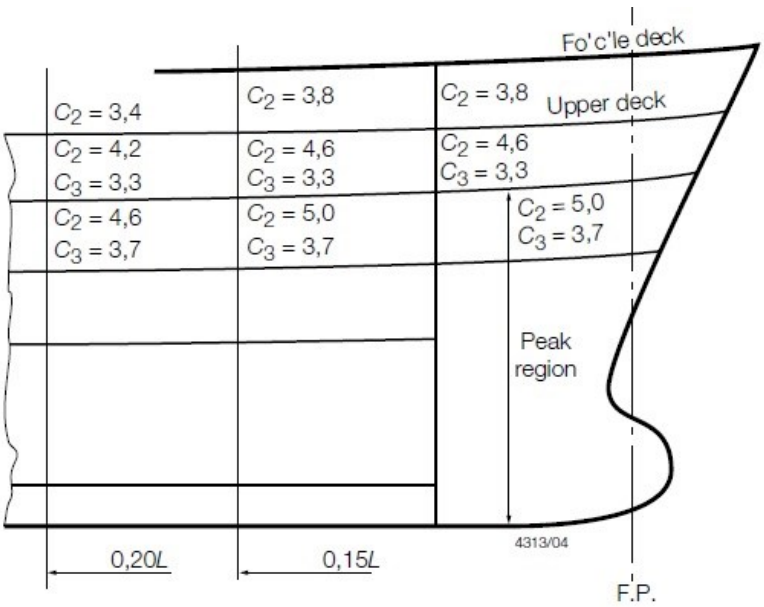

Figure 5. 4. 3: Illustration of bow fullness factor determination

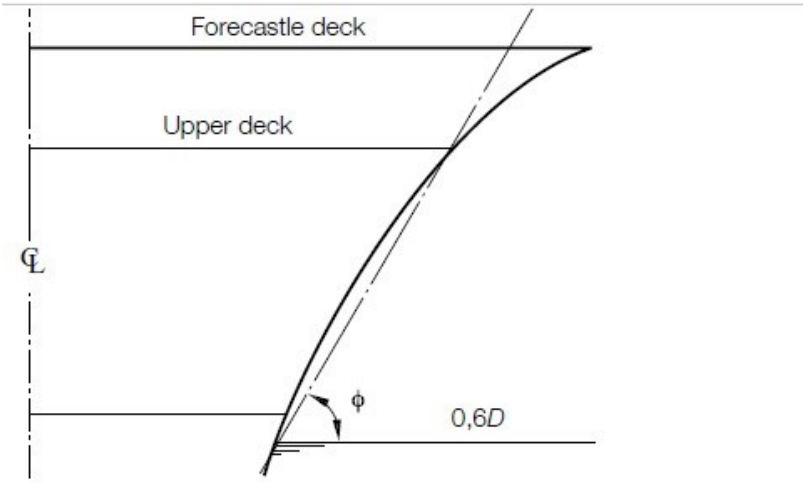


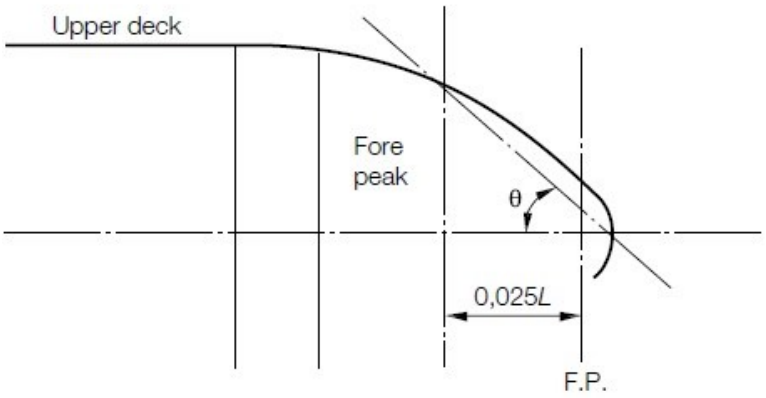
(a)

Conditions for ϕ

1. ϕ to be deduced at 0,025*L* aft of fore perpendicular

2. Aft of fore peak tank ϕ to be deduced at section being considered

3. For ships with a bulbous bow the angle ϕ is to be measured from the narrowest point of the bow between 0,6*D* from base and upper deck



(b)

Bow fullness factor
$B_f = 2,45 \cos \phi \tan \theta$
but not to be taken less than 1,0

PART

3

CHAPTER **5** **Fore End Structure**

SECTION **5** **Single and double bottom structure**

5. 1 General

5. 1. 1 For dry cargo ships exceeding 120 m in length and for all ships which have the notation `strengthened for heavy cargoes', longitudinal framing is, in general, to be adopted (*See also* Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers and Pt 4, Ch 10 Single Hull Oil Tankers).

5. 1. 2 For ships requiring additional strengthening of bottom forward the requirements given in 1.5 are also to be complied with, as applicable.

5. 1. 3 For ships having the notation `strengthened for heavy cargoes' the requirements of Pt 4, Ch 7, 8 Double bottom structure are also to be complied with, as applicable.

5. 1. 4 For ships intended to load or unload while aground, *See* Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

5. 1. 5 Provision is to be made for the free passage of water and/or air from all parts of single or double bottoms to bilge or tank suctions, account being taken of the pumping rates required.

5. 1. 6 For passenger ships, *See* Pt 4, Ch 2, 6 Double bottom.

5. 2 Single bottoms – Transverse framing

5. 2. 1 In fore peak spaces, for ships of full form the floors are to be supported by a centreline girder or a centreline wash bulkhead. In other cases the centreline girder is to be carried as far forward as practicable. The arrangement and scantlings of the floors and centreline girder are to be sufficient to give adequate stiffness to the structure, but are to be not less than required by Table 5. 5. 1: Single bottom construction forward. The floor panels and the upper edges of the floors and centreline girder are to be suitably stiffened.

Table 5. 5. 1: Single bottom construction forward

Item	Parameter	Requirement
Transverse framing system		
(1) Centre girder:		The greater of the following:
(a) In fore peak tank, or deep tank, forward of 0.2L from the F.P.	Modulus	$Z = 8.5\mathrm{kSh}_5 le^2$ cm^3, or $Z = 9.75\rho kSh_4 le^2$ cm^3
	Inertia	$I = \frac{2.5}{k} l_e Z$ cm^4

	Web thickness	$t = t_w$ as in Pt 3, Ch 10, 4.4 Geometric properties and proportions
(b) In dry spaces		Forward of $0.075L$ from the F.P., $t = (\sqrt{Lk} + 0.5)$ mm or 6 mm, whichever is the greater.
	Web thickness	Between $0.075L$ and $0.3L$ from the F.P. the thickness may taper from the midship thickness to the end thickness above
	Web depth and face area	As in Pt 4, Ch 1, 7 Single bottom structure
(2) Floors:		
(a) In fore peak tank, or deep tank, forward of $0.2L$ from the F.P.	Maximum spacing	Every frame
	Web depth (at centreline)	$\mathrm{df} = (83\mathrm{D} + 150)\mathrm{mm}$ or 1400 mm, whichever is the lesser
	Web thickness	$t = (6.0 + 0.025L_2)\sqrt{\frac{S_2}{800}}\,\mathrm{mm}$
	Minimum face plate area in deep tank	$A_f = 0.85\mathrm{kBcm}^2$
(b) In dry cargo spaces	Maximum spacing	Every frame
	Scantlings	As in Pt 4, Ch 1, 7.2 Girders and floors
(3) Intercostal side girders:		
(a) In deep tank, forward of $0.2L$ from the F.P.	Maximum spacing	$0.003s_F$ m
	Web depth	As floors
	Web thickness	$t = t_w$ as in Pt 3, Ch 10, 4.4 Geometric properties and proportions
	Minimum face plate area	Suitable stiffener
(b) In dry cargo spaces	Maximum spacing	$0.003s_F$ m
	Scantlings	As in Pt 4, Ch 1, 7 Single bottom structure
Longitudinal framing system		
(4) Centre girder:		
(a) In deep tanks forward of $0.2L$ from the F.P.	Scantlings	As in Pt 4, Ch 9, 9 Primary members supporting longitudinal framing
(b) In dry spaces	Scantlings	To be specially considered
(5) Bottom transverses:		

(a) In deep tanks forward of 0.2*L* from the F.P., *See* Note 4	Maximum spacing	3.0 m for $L \leq 100$ m 4.2 m for $L \geq 300$ m Spacing at intermediate lengths by interpolation
	Scantlings	As in Pt 4, Ch 9, 9 Primary members supporting longitudinal framing
(b) In dry spaces	Scantlings	To be specially considered
(6) Intercostal side girders	Scantlings	To be specially considered

Symbols

L, *B*, *D*, *S*, l_e, *k*, ρ as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1

h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

h_5 = distance, in metres, from mid-point of span to the following positions:

forward of 0.15*L* from the F.P., 3 m above the deck height obtained from Pt 3, Ch 1, 6.1 Principal particulars 6.1.11

at 0.2*L* from the F.P. the upper deck at side

between 0.15*L* and 0.2*L* from the F.P., by interpolation between (a) and (b)

s_F = transverse frame spacing, in mm

s_2 = spacing of stiffener, in mm, but to be taken not less than 800 mm

L_2 = *L* but need not be taken greater than 215 m

Note *1*. For single bottom construction in way of the cargo tanks of oil tankers, *See* Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers and Pt 4, Ch 10 Single Hull Oil Tankers

Note *2*. For minimum thickness of structure within cargo tanks and fore peak tanks in oil tankers, *See* Pt 4, Ch 9, 10.2 Compartment minimum thickness and Pt 4, Ch 10, 7.2 Compartment minimum thickness.

Note *3*. For single bottom construction in dredgers, *See* Pt 4, Ch 12, 6 Bottom structure.

Note *4*. For ships having one or more longitudinal bulkheads the maximum spacing may be increased but is not to exceed that for the midship region.

5. 2. 2 In deep tanks forward of 0.2*L* from the F.P. floors are to be supported by a primary centreline girder or centreline bulkhead together with intercostal side girders. In the case of an oil tanker (*See* Pt 3, Ch 5, 1.1 Application 1.1.4) or similar ship having longitudinal bulkheads port and starboard, these may be extended to the fore end of the deep tank in lieu of a centreline bulkhead. The arrangement and scantlings of centreline girder, floors and side girders are to be determined from Table 5. 5. 1: Single bottom construction forward, but in way of web frames the depth of the floor and size of the face bar are to be not less than those of the web frame. In general, floors are not to be flanged.

5. 2. 3 In way of dry cargo spaces forward, the arrangement and scantlings of transversely framed single bottoms areto be generally as required in the midship region as given in Pt 4, Ch 1, 7 Single bottom structure, except as required by Table 5. 5. 1: Single bottom construction forward. The girders forward are to scarf into the normal girder arrangement in the midship region. In ships having considerable rise of floor towards the fore end, the depth of the floors may be required to be increased or the top edge sloped upwards towards the outboard end. In general, floors are not to be flanged.

5. 3 Single bottoms – Longitudinal framing

5. 3. 1 In deep tanks forward of 0.2L from the F.P., bottom transverses are to be supported by a primary centreline girder or a centreline bulkhead. In addition, an intercostal side girder is generally to be fitted port and starboard. In the case of an oil tanker (*See* Pt 3, Ch 5, 1.1 Application 1.1.4) or similar ship having longitudinal bulkheads port and starboard, these may be extended to the fore end of the deep tank in lieu of a primary centreline support and intercostal girders. The spacing of bottom transverses and scantlings of the centreline girder, bottom transverses and side girders are to be as required by Table 5. 5. 1: Single bottom construction forward.

5. 3. 2 The requirements for longitudinally framed single bottoms in way of dry cargo spaces will be specially considered.

5. 4 Double bottoms

5. 4. 1 The minimum depth of centre girder forward is generally to be the same as that required in the midship region by Pt 4 Ship Structures (Ship Types) for the particular type of ship concerned, but in ships with considerable rise of floor, a greater depth may be required at the fore end to provide adequate access throughout the double bottom tank.

5. 4. 2 Where the height of the double bottom varies, this variation is generally to be made gradual by sloping the inner bottom over an adequate longitudinal extent. Knuckles in the plating are to be arranged close to plate floors. Otherwise, suitable scarfing arrangements are to be made.

5. 4. 3 The arrangement and scantlings of girders, floors and inner bottom plating and the section modulus of inner bottom stiffening are to be determined from Table 5. 5. 2: Double bottom construction forward. In other respects the structural arrangements are to be as detailed in Pt 4 Ship Structures (Ship Types) for the particular type of ship concerned.

5. 4. 4 For double bottom construction in way of the cargo tanks of oil tankers or ore carriers, *See also* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as appropriate.

Table 5. 5. 2: Double bottom construction forward

Item and parameter	Requirements	
	Transverse framing	Longitudinal framing
(1) Centre girder: *(a)* Thickness forward of 0.075L from the F.P. *(b)* Thickness between 0.075L and 0.3L from the F.P.	$t = (0.008d_{DB} + 2)\sqrt{k}\ mm$ As determined by a taper line from the midship thickness given in Pt 4, Ch 1, 8 Double bottom structure to the end thickness as for (1) (a)	
(2) Plate floors: *(a)* Maximum spacing forward of 0.2L from the F.P. *(b)* Maximum spacing aft of 0.2L from the F.P. *(c)* Scantlings	0.002s_F m As for midship region As in Pt 4, Ch 1, 8 Double bottom structure	2.5 m As for midship region (*See* Note 5) As in Pt 4, Ch 1, 8 Double bottom structure

(3) Watertight floors and bracket floors	As in Pt 4, Ch 1, 8 Double bottom structure	As in Pt 4, Ch 1, 8 Double bottom structure
(4) Side girders, *See* Note 1:		
(a) Maximum spacing forward of 0.2*L* from the F.P.	$0.003s_F$ m	$0.004s_L$ or 3.7 m whichever is the lesser
(b) Maximum spacing aft of 0.2*L* from the F.P.	As for midship region	As for midship region, *See* Note 5
(c) Scantlings	As in Pt 4, Ch 1, 8 Double bottom structure	As in Pt 4, Ch 1, 8 Double bottom structure
(5) Inner bottom plating, *See* Note 2:		
(a) Thickness at or forward of 0.075*L* from the F.P.	$t = \left(0.00127(s + 660)\sqrt[4]{k^2LT}\right)$ mm or 6.5 mm, whichever is the greater, *See* Notes 3, 4 and 5	
(b) Thickness between 0.075*L* and 0.3*L* from the F.P.	As determined by a taper line from the midship thickness given in Pt 4, Ch 1, 8 Double bottom structure to the end thickness as for (5) (a), but not less than 6.5 mm, *See* Notes 3, 4 and 5	
(c) In way of deep tanks or holds used for the carriage of water ballast or where the double bottom tank is common with a wing ballast tank.	$t = \left(0.004sf\sqrt{\frac{\rho k h_4}{1.025}} + 2.5\right)$ mm or 6.5 mm, whichever is the greater	
(6) nner bottom longitudinals	As in Pt 4, Ch 1, 8 Double bottom structure, *See* Notes 2 and 5	

Symbols

L, T, S, s, k, ρ = as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1

d_{DB} = minimum depth of centre girder as required by Pt 4, Ch 1, 8 Double bottom structure

f = $1.1 - \frac{s}{2500S}$ but to be taken not greater than 1.0

h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

s_F = transverse frame spacing, in mm

s_L = spacing of bottom longitudinals, in mm

Note *1*. The girders forward of 0.2*L* are to be suitably scarfed into the midship girder arrangement.

Note *2*. For double bottom construction in way of the cargo tanks of oil tankers or ore carriers, *See also* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as appropriate.

Note *3*. In way of hatches the tank top taper thickness is to be increased by 2 mm if no ceiling is fitted, but is to be taken not less than 7.5 mm.

Note *4*. Where cargo is to be regularly discharged by grabs the tank top taper thickness is to be increased by 5.0 mm if no ceiling is fitted, or by 3.0 mm where ceiling is fitted.

Note *5*. For ships having the notation `strengthened for heavy cargoes', the requirements of Pt 4, Ch 7, 8 Double bottom structure are also to be complied with.

PART

3

CHAPTER **5** **Fore End Structure**

SECTION **6** **Fore peak structure**

6. 1 General

6. 1. 1 The requirements given in this Section apply to the arrangement of primary structure supporting the peak side framing and bulbous bow, the arrangement and scantlings of wash bulkheads and perforated flats, and the scantlings of collision bulkheads.

6. 1. 2 In ships of very full form it is recommended that transverse framing and side transverses supporting longitudinal framing, together with attached floors and beams, be inclined at an angle to the centreline of ship so that the frames or transverses lie as near normal to the shell plating as possible.

6. 2 Bottom structure

6. 2. 1 The bottom of the peak space is generally to be transversely framed with arrangements and scantlings as detailed in Pt 3, Ch 5, 5.2 Single bottoms − Transverse framing 5.2.1. Longitudinally framed bottom structure will be specially considered.

6. 3 Side structure − Transverse framing

6. 3. 1 Above the floors, transverse side framing is to be supported by one of the following arrangements:

a. Side stringers spaced about 2.0 m apart and supported by struts fitted at alternate frames. The struts are to be bracketed to the frames and where the span is long, supported at the centreline by a complete or partial wash bulkhead or equally effective structure. Intermediate frames are to be bracketed to the stringer plates.

b. Side stringers spaced about 2.0 m apart and supported by web frames. The upper ends of the web frames are to be supported under the tank top by suitable deep beams or buttresses which should generally form a ring structure.

c. Perforated flats spaced not more than 2.5 m apart. The area of perforations in each flat is to be not less than 10 per cent of the total area of the flat. The plating is to be suitably framed in way of openings.

d. A combination of the above arrangements.

6. 3. 2 Where the depth of the peak space exceeds 10 m, a perforated flat is to be arranged at about mid-depth.

6. 3. 3 Where the length of the space exceeds 10 m and the side framing is supported as required by Pt 3, Ch 5, 6.3,, Side structure − Transverse framing 6.3.1 or Pt 3, Ch 5, 6.3 Side structure − Transverse framing 6.3.1.c, additional transverse strengthening in the form of transverse wash bulkheads or web frames is to be provided.

6. 3. 4 The scantlings of side stringers supported by struts, and also of the struts and their brackets, are to be determined from Table 5. 6. 1: Fore peak structure.

Table 5. 6. 1: Fore peak structure

Item	Parameter	Requirement
(1) Unflanged stringers supported by panting beams at alternate frames	Web thickness	$t = (6.0 + 0.025L_2)\sqrt{\frac{S_1}{600}}$ mm
	Web depth	$d_w = (400 + 3.3L)\frac{S_1}{2.0}$ mm
(2) Struts	Cross-sectional area	$A = (2.5B_1 - 0.04L_2)k$ cm^2
	Least inertia	$I = S_1 S_2 h_5 l^2{}_e$ cm^4
(3) Brackets supporting stringers and beams	Thickness	$t = (6.0 + 0.025L_2)\sqrt{\frac{S_1}{600}}$ mm
	Arm length	$l_e = \frac{150A}{t}$ mm in way of struts $l_e = 0.5d_w$ mm at intermediate frames
(4) Perforated flats and wash bulkheads (excluding lowest strake of plating) *See* Notes 1, 2 and 3	Plating thickness	$t = (6.0 + 0.015L)\sqrt{\frac{S_2}{800}}$ mm
	Stiffener modulus	$Z = \frac{0.0057skh_6 l^2{}_e}{b}$ cm^3
(5) Diaphragms in bulbous bows and lowest strake of wash bulkhead	Plating thickness	$t = (6.0 + 0.025L_2)\sqrt{\frac{S_2}{800}}$ mm
Symbols		

L, B, S, s, k = as defined in Pt 3, Ch 5, 1.4 Symbols and definitions 1.4.1

b = 1.4 for rolled or built sections

= 1.6 for flat bars

h_5 = vertical distance, in metres, from the stringer to a position 3 m above the deck height obtained from Pt 3, Ch 1, 6.1 Principal particulars 6.1.11

b = 1.4 for rolled or built sections

= 1.6 for flat bars

h_5 = vertical distance, in metres, from the stringer to a position 3 m above the deck height obtained from Pt 3, Ch 1, 6.1 Principal particulars 6.1.11

h_6 = vertical distance, in metres, from mid-depth of tank to top of tank

l_e = effective length of stiffening member, in metres, *See* Table 1. 9. 1: Watertight and deep tank bulkhead scantlings and Table 1. 9. 3: Bulkhead end constraint factors in Pt 4, Ch 1

s_1 = spacing of peak frames, in mm, but to be taken not less than 600 mm

s_2 = spacing of stiffeners, in mm, but to be taken not less than 800 mm

B_1 = B, but need not be taken greater than 32 m

L_2 = L, but need not be taken greater than 215 m

S_1 = vertical spacing or mean spacing of stringers, in metres

S_2 = horizontal spacing of struts, in metres

Note *1*. For oil tankers, *See also* Pt 4, Ch 9, 10.7 Application of stiffening requirements

Note *2*. For horizontal flats supporting vertical webs in the fore peak tank, the thickness of the flat in way of the web is to comply with Table 9. 7. 1: Transverse oiltight bulkhead scantlings.

Note *3*. For minimum thickness within fore peak tanks of oil tankers, *See also* Pt 4, Ch 9, 10.2 Compartment minimum thickness.

6. 3. 5 The scantlings of side stringers supported by web frames, and also of the web frames, are to be determined from Pt 3, Ch 5, 4.5, Primary structure at sides.

6. 3. 6 The scantlings of perforated flats are to be determined from Table 5. 6. 1: Fore peak structure.

6. 4 Side structure – Longitudinal framing

6. 4. 1 The spacing and scantlings of side transverses supporting longitudinal framing are to be as required by Pt 3, Ch 5, 4.5, Primary structure at sides.

6. 4. 2 Where the depth of a tank exceeds 10 m, side transverses are generally to be supported by one or more perforated flats or an arrangement of struts.

6. 4. 3 Suitable transverses or deep beams are to be arranged at the top of the tank and at perforated flats to provide end rigidity to the side transverses.

6. 5 Bulbous bow

6. 5. 1 Where a bulbous bow is fitted, the structural arrangements are to be such that the bulb is adequately supported and integrated into the fore peak structure.

6. 5. 2 At the fore end of the bulb the structure is generally to be supported by horizontal diaphragm plates spaced about 1.0 m apart in conjunction with a deep centreline web.

6. 5. 3 In general, vertical transverse diaphragm plates are to be arranged in way of the transition from the peak framing to the bulb framing.

6. 5. 4 In way of a wide bulb, additional strengthening in the form of a centreline wash bulkhead is generally to be fitted.

6. 5. 5 In way of a long bulb, additional strengthening in the form of transverse wash bulkheads or substantial web frames spaced about five frame spaces apart are generally to be fitted.

6. 5. 6 The shell plating is to be increased in thickness at the fore end of the bulb and in other areas likely to be damaged by the anchors and chain cables. The increased plate thickness is to be the same as that required for plated stems by Pt 3, Ch 5, 3.3 Stem 3.3.2.

6. 6 Wash bulkhead

6. 6. 1 Where a fore peak space is used as a tank and the breadth of the tank at its widest point exceeds 0.5*B*, a complete or partial centreline wash bulkhead is to be fitted.

6. 6. 2 Wash bulkheads are to have an area of perforations not less than five per cent nor more than 10 per cent of the area of the bulkhead. The plating is to be suitably stiffened in way of openings.

6. 6. 3 The scantlings of wash bulkheads are to be determined from Table 5. 6. 1: Fore peak structure. Stiffeners are to be bracketed at top and bottom.

6. 7 Collision bulkhead

6. 7. 1 The position and height of the collision bulkhead are to be in accordance with the requirements of Pt 3, Ch 3, 4 Bulkhead requirements.

6. 7. 2 The scantlings are to comply with the requirements of Pt 4, Ch 1, 9 Bulkheads except that the thickness of plating and modulus of stiffeners are to be not less than 12 per cent greater and 25 per cent greater, respectively, than would be required for a dry space. If the collision bulkhead forms the boundary of a cargo tank or cofferdam in an oil tanker or ore carrier the minimum thickness requirements of Pt 4, Ch 9, 10 Construction details and minimum thickness are also to be complied with.

6. 7. 3 Doors, manholes, permanent access openings or ventilation ducts are not to be cut in the collision bulkhead below the freeboard deck, *See also* Pt 5, Ch 13, 3 Drainage of compartments, other than machinery spaces. The number of openings in collision bulkheads above the freeboard deck is to be kept to a minimum compatible with the design and proper working of the ship. All such openings are to be fitted with means of closing to weathertight standards.

PART

3

CHAPTER **5** **Fore End Structure**

SECTION **7** **Forward deep tank structure**

7. 1 General

7. 1. 1 The requirements given in this Section apply to the arrangement of primary structure supporting the side framing, the arrangement and scantlings of wash bulkheads and perforated flats, and the scantlings of boundary bulkheads in way of deep tanks situated forward of 0.2*L* from the F.P.

7. 1. 2 For deep tanks situated aft of this position, *See* Pt 4, Ch 1, 9 Bulkheads.

7. 2 Bottom structure

7. 2. 1 The bottom structure is to comply with the requirements given in Pt 3, Ch 5, 5.2 Single bottoms – Transverse framing 5.2.2, Pt 3, Ch 5, 5.3 Single bottoms – Longitudinal framing 5.3.1 and Pt 3, Ch 5, 5.4 Double bottoms, as applicable.

7. 3 Side structure – Transverse framing

7. 3. 1 Above the floors, transverse framing is to be supported by one of the following arrangements:

a. Side stringers spaced not more than 5 m apart and supported by web frames. The upper ends of the web frames are to be supported under the tank top by suitable deep beams or buttresses which should generally form a ring system.

b. Side stringers spaced not more than 5 m apart and spanning from bulkhead to bulkhead. The ends of these stringers are to be connected to horizontal stringers on the transverse bulkheads to form a ring system.

c. In the case of narrow tanks, perforated flats spaced not more than 5 m apart. The area of perforations is to be not less than 10 per cent of the area of the flat, and the plating is to be suitably stiffened in way of openings.

7. 3. 2 Where the side framing is supported as required by Pt 3, Ch 5, 7.3,, Side structure – Transverse framing 7.3.1 and the depth of the tank exceeds 16 m, the web frames are to be supported by one of the following:

a. One or more side stringers spanning from bulkhead to bulkhead.

b. One or more perforated flats having deep beams or transverses in way of the web frames.

c. One or more cross ties.

7. 3. 3 Where the side framing is supported as required by Pt 3, Ch 5, 7.3 Side structure – Transverse framing 7.3.1.c and the length of the tank exceeds 14 m, additional transverse strengthening in the form of transverse wash bulkheads or web frames is to be provided.

7. 3. 4 The scantlings of stringers and web frames as required by Pt 3, Ch 5, 7.3,, Side structure – Transverse framing 7.3.1 are to be determined from Pt 3, Ch 5, 4.5, Primary structure at sides.

7. 3. 5 The scantlings of side stringers supporting framing as required by Pt 3, Ch 5, 7.3 Side structure – Transverse framing 7.3.1.b are to be determined from Item (5) in Table 5. 4. 4: Primary structure forward.

7. 3. 6 The scantlings of side stringers supporting web frames as required by Pt 3, Ch 5, 7.3, Side structure – Transverse framing 7.3.2 are to be determined from Item (6) in Table 5. 4. 4: Primary structure forward.

7. 3. 7 The scantlings of perforated flats as required by Pt 3, Ch 5, 7.3 Side structure – Transverse framing 7.3.1.c or Pt 3, Ch 5, 7.3 Side structure – Transverse framing 7.3.2.b are to be determined from Table 5. 6. 1: Fore peak structure.

7. 3. 8 The scantlings of cross ties are to be determined as for cross ties in the cargo tanks of oil tankers, *See* Pt 4, Ch 9, 9 Primary members supporting longitudinal framing . Where the span between the side shell and longitudinal bulkhead exceeds 0.3*B*, additional fore and aft or vertical support for the struts may be required.

7. 4 Side structure – Longitudinal framing

7. 4. 1 The spacing and scantlings of side transverses supporting longitudinal framing are to be as required by Pt 3, Ch 5, 4.5, Primary structure at sides.

7. 4. 2 Where the depth of the tank exceeds 16 m, the side transverses are to be supported as required by Pt 3, Ch 5, 7.3, Side structure – Transverse framing 7.3.2.

7. 5 Wash bulkheads

7. 5. 1 Where the breadth of the tank at its widest point exceeds 0.5*B*, a centreline wash bulkhead is generally to be fitted. If the maximum breadth of tank exceeds 0.7*B*, it is recommended that the centreline bulkhead be made intact. In the case of an oil tanker or similar ship having longitudinal bulkheads port and starboard, these may be extended to the fore end of the deep tank in lieu of a centreline bulkhead.

7. 5. 2 Wash bulkheads are to have an area of perforations not less than 5 per cent nor more than 10 per cent of the area of the bulkhead. The plating is to be suitably stiffened in way of openings.

7. 5. 3 The scantlings of wash bulkheads are generally to be as required by Table 5. 6. 1: Fore peak structure, but *See also* Pt 3, Ch 5, 7.5 Wash bulkheads 7.5.4 to Pt 3, Ch 5, 7.5 Wash bulkheads 7.5.6. Stiffeners are to be bracketed at top and bottom.

7. 5. 4 The thickness of longitudinal bulkheads may be required to be increased to ensure compliance with the shear strength requirements of Pt 3, Ch 4, 6 Hull shear strength. In the case of a centreline or perforated wing bulkhead, the proportion of the total shear force absorbed by the bulkhead will be specially considered.

7. 5. 5 The thickness of plating of wash bulkheads may also be required to be increased to take account of shear buckling.

7. 5. 6 Where longitudinal wash bulkheads support bottom transverses, the lower section of the bulkhead is to be kept free of non-essential openings for a depth equal to 1.75 times the depth of the transverses, and the plating thickness may be required to be increased to meet local buckling requirements.

7. 6 Transverse boundary bulkheads

7. 6. 1 The transverse bulkheads forming the forward and after boundaries of the tank are generally to comply with the requirements of Pt 4, Ch 1, 9 Bulkheads, except that when the after bulkhead forms the boundary of a cargo tank or cofferdam in an oil tanker or ore carrier, the minimum

thickness requirements of Pt 4, Ch 9, 10 Construction details and minimum thickness are also to be complied with.

CHAPTER **6** **Aft End Structure**

SECTION **1** **General**

1. 1 Application

1. 1. 1 This Chapter applies to all types of ship covered by Pt 4 Ship Structures (Ship Types), except where specifically stated otherwise.

1. 1. 2 The requirements given are those specific to aft ends and relate to structure situated in the region aft of 0.3*L* from the after perpendicular.

1. 1. 3 Requirements for cargo space structure within this region not dealt with in this Chapter are to be as detailed in the relevant Chapter of Pt 4 Ship Structures (Ship Types) for the particular ship type.

1. 1. 4 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation. *See* Pt 1, Ch 2, 2.3 Class notations (hull).

1. 2 Structural configuration

1. 2. 1 The Rules provide for both longitudinal and transverse framing systems.

1. 2. 2 In the case of container ships and open type ships additional requirements may apply as detailed in Pt 4, Ch 8 Container Ships.

1. 3 Structural continuity

1. 3. 1 Suitable scarfing arrangements are to be made to ensure continuity of strength and the avoidance of abrupt structural changes.

1. 3. 2 Where longitudinal framing terminates and is replaced by a transverse system, adequate arrangements are to be made to avoid an abrupt changeover. Where a poop is fitted extending forward of 0.15*L* from the A.P., longitudinal framing at the upper deck and topsides is generally to be continued aft of the forward bulkhead of this superstructure. In bulk carriers and oil tankers (*See* Pt 3, Ch 6, 1.1 Application 1.1.4) the longitudinal framing at the upper deck is to be maintained over the cargo space region and continued over the aft end region.

1. 3. 3 In oil tankers (*See* Pt 3, Ch 6, 1.1 Application 1.1.4) with machinery aft, continuity of the longitudinal bulkheads is to be maintained as far as is practicable into the machinery space, and suitable taper brackets are to be fitted at their ends.

1. 3. 4 In bulk carriers (*See* Pt 3, Ch 6, 1.1 Application 1.1.4) with machinery aft, continuity of the topside tank and double bottom hopper tank structure is to be maintained over the cargo space region and as far as is practicable continued into the machinery space, and suitable taper brackets are to be arranged at their ends. Also a vertical taper bracket in line with the vertical strake of the topside tank is to be fitted at the forward side of the aft bulkhead of the cargo space region. Where the topside tank and double bottom hopper tank structures terminate at the cargo space aft bulkhead, the vertical strake of the topside tank is to be arranged with an integral taper bracket and continued

through the bulkhead into the machinery space for a distance of 0.2*B*, and the ends of the hopper and topside structures are to be arranged with suitable taper brackets. In addition, in way of the cargo space aft bulkhead, a girder or intercostal bulb plate stiffeners (fitted between and connected to the bulkhead vertical stiffeners), are to be arranged on the aft side in line with the sloped bulkheads of the topside and hopper tanks clear of the taper brackets.

1. 3. 5 In container or similar ships having continuous side tanks or double skin construction in way of the cargo spaces, the longitudinal bulkheads are to be continued as far aft as is practicable and are to be suitably tapered at their ends. Where, due to the ship's form, such bulkheads are stepped, suitable scarfing is to be arranged.

1. 4 Symbols and definitions

1. 4. 1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

L, B, D, T = *L, B, D, T* = as defined in Pt 3, Ch 1, 6.1, Principal particulars

k_L, k = higher tensile steel factor as defined in Pt 3, Ch 2, 1.2, Steel

l = overall length of stiffening member, in metres, *See* Pt 3, Ch 3, 3.3 Determination of span point

l_e = effective length of stiffening member, in metres, *See* Pt 3, Ch 3, 3.3 Determination of span point

s = spacing of secondary stiffeners, in mm

t = thickness of plating, in mm

S = spacing, or mean spacing, of primary members, in metres

Z = section modulus of stiffening member, in cm^3, *See* Pt 3, Ch 3, 3.2, Geometric properties of section

P = relative density (specific gravity) of liquid carried in a tank and is to be taken not less than 1.025

I = inertia of stiffening member, in cm^4, *See* Pt 3, Ch 3, 3.2, Geometric properties of section.

1. 4. 2 For the purpose of this Chapter, the after perpendicular, A.P., is defined as the after limit of the Rule length *L*.

PART

3

CHAPTER 6 **Aft End Structure**

SECTION 2 **Deck structure**

2. 1 General

2. 1. 1 Where the upper deck is longitudinally framed outside the line of openings in the midship region, this system of framing is to be carried as far aft as possible. *See also* Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers.

2. 2 Deck plating

2. 2. 1 The thickness of strength/weather deck plating is to comply with the requirements of Table 6. 2. 1: Strength/weather deck plating aft (excluding poop deck).

2. 2. 2 The thickness of lower deck plating is to comply with the requirements of Table 6. 2. 2: Lower deck plating aft.

2. 2. 3 The taper thickness of the strength deck stringer plate is to be increased by 20 per cent at the ends of a poop or bridge where the end bulkhead is situated forward of 0.25L from the A.P. No increase is required where the end bulkhead lies aft of 0.2L from the A.P. The increase at intermediate positions is to be determined by interpolation.

2. 2. 4 The deck plating thickness and supporting structure are to be suitably reinforced in way of deck machinery, and in way of cranes, masts or derrick posts.

2. 2. 5 Where long, wide hatchways are arranged at lower decks it may be necessary to increase the deck plating thickness to ensure effective support for side framing.

2. 3 Deck stiffening

2. 3. 1 The scantlings of strength/weather deck longitudinals are to comply with the requirements of Table 6. 2. 3: Strength/weather deck longitudinals aft.

2. 3. 2 The scantlings of cargo and accommodation deck longitudinals are to comply with the requirements given in Table 1. 4. 4: Cargo and accommodation deck longitudinals.

2. 3. 3 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and so far as practicable, direct continuity of longitudinal strength.

2. 3. 4 The scantlings of weather deck beams are to comply with the midship requirements for the particular ship type.

2. 3. 5 The scantlings of lower deck beams are to comply with the requirements of Table 1. 4. 5: Strength/weather, cargo and accommodation deck beams in Pt 4, Ch 1 General Cargo Ships.

2. 3. 6 End connections of beams are to be in accordance with the requirements of Pt 3, Ch 10, 3 Secondary member end connections.

Table 6. 2. 1: Strength/weather deck plating aft (excluding poop deck)

Symbols	Location	Thickness, in mm
L, s, S, k, ρ as defined in Pt 3, Ch 6, 1.4 Symbols and definitions 1.4.1 $f = 1.1 - \frac{s}{2500S}$ but is to be taken not greater than 1.0	*(1)* Aft of $0.075L$ from the A.P.	$t = (5.5 + 0.02L)\sqrt{\frac{ks_1}{s_b}}$
h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading s_b = standard frame spacing as follows:	*(2)* Between $0.075L$ and $0.15L$ from the A.P.	The greater of the following: a. $t = (5.5 + 0.02L)\sqrt{\frac{ks_1}{s_b}}$ b. the taper thickness, *See* Notes 1, 2 and 3 c. for oil tankers, the thickness is also to be in accordance with Pt 4, Ch 9, 4.3 Deck plating 4.3.3
Aft of $0.15L$ from the A.P.: $s_b = \left(510 + \frac{L}{0.6}\right)$ mm or 850 mm,	*(3)* Forward of $0.15L$ from the A.P.	The taper thickness, *See* Notes 1, 2 and 3, or as (2)(c) whichever is the greater
whichever is the lesser $s_1 = s$, but is to be taken not less than s_b	*(4)* Inside poop extending forward of $0.15L$	As for a lower deck, *See* Note 4
	(5) In way of the crown of a tank	$t = 0.004sf\sqrt{\frac{rkh_4}{1.025}} + 3.5$ or (1) to (4) as applicable, whichever is the greater but not less than 7.5 mm where $L \geq 90$ m, or 6.5 mm where $L < 90$ m

Note *1*. The taper thickness is to be determined from Table 3. 2. 1: Taper requirements for hull envelope in Chapter 3.

Note *2*. For taper area requirements, *See* Table 3. 2. 1: Taper requirements for hull envelope in Chapter 3.

Note *3*. For thickness of upper deck plating in way of the cargo tanks of oil tankers or ore carriers, *See also* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers.

Note *4*. The exposed weather deck taper thickness is to extend into a poop or bridge for at least one-third of the breadth of the ship from the superstructure end bulkhead.

Note *5*. The taper requirements from Table 3. 2. 1: Taper requirements for hull envelope in Pt 3, Ch 3 Structural Designdo not apply to container ships or open ship types, *See* Pt 3, Ch 4, 2.3 Open type ships, where the requirements of Pt 4, Ch 8, 3.2 Longitudinal strength are applicable, nor to fast cargo ships where the requirements of Pt 4, Ch 1, 3 Longitudinal strength are applicable. *See also* Pt 3, Ch 4, 5 Hull bending strength for hull section modulus requirement away from the midship area.

Table 6. 2. 2: Lower deck plating aft

Symbols	Location	Thickness, in mm
L, s, S, k, ρ as defined in Pt 3, Ch 6, 1.4 Symbols and definitions 1.4.1	*(1)* Aft of $0.075L$ from the A.P.	$t = 0.01s_1\sqrt{k}$ but not less than 6.5 mm

b = breadth of increased plating, in mm f = $f = 1.1 - \frac{s}{2500S}$ but is to be taken not greater than 1.0 h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading K_2 = 2.5 mm at bottom of tank or 3.5 mm at crown of tank s_1 = s, but is to be taken not less than $\left(470 + \frac{L_1}{0.6}\right)$ mm	*(2)* Forward of $0.075L$ from the A.P., inside line of openings	$t = 0.01 s_1 \sqrt{k}$ but not less than 6.5 mm
	(3) Forward of $0.075L$ from the A.P., outside line of openings	As determined by a taper line from the midship thickness to the end thickness given by (1)
	(4) In way of the crown or bottom of a tank	$t = 0.004sf\sqrt{\frac{rkh_4}{1.025}} + K_2$ or (1), (2) or (3) as applicable, whichever is the greater but not less than 7.5 mm where $L \geq 90$ m, or 6.5 mm where $L < 90$ m
A_f = girder face area, in cm^2 L_1 = L, but need not be taken greater than 190 mm	*(5)* Plating forming upper flange of underdeck girders	Clear of cargo hatches $t = \sqrt{\frac{A_f}{1.8k}}$ In way of hatch side girders $t = 1.1\sqrt{\frac{A_f}{1.8k}}$
Note Where the deck loading exceeds 43.2 kN/m^2, the thickness of plating will be specially considered. This is equivalent to a 'tween deck height of 6.1 m in association with the standard stowage rate of 1.39 m^3/tonne.		Minimum b = 760 mm breadth

Table 6. 2. 3: Strength/weather deck longitudinals aft

ocation	Modulus, in cm^3	Inertia, in cm^4
(1) Aft of $0.075L$ from the A.P.	The greater of the following: $Z = sk(400h_1 + 0.005(l_e L_1)^2) \times 10^{-4}$ $Z = 0.0074skh_1 l^2 e$	—
(2) Forward of $0.075L$ from the A.P., inside line of openings	As (1)	—
(3) Forward of $0.075L$ from the A.P., outside line of openings	As determined from Table 3. 2. 1: Taper requirements for hull envelope in Chapter 3, *See* Note 1 For oil tankers (*See* Pt 3, Ch 6, 1.1 Application 1.1.4) and dry cargo ships the end modulus for taper at $0.075L$ from the A.P. is to be derived from Table 5. 2. 3: Strength/weather deck longitudinals forward item (2)	—

(4) In way of the crown of a tank	$Z = \frac{0.0113rskh_4l_e^2}{b}$ or as (1) to (3) as applicable, whichever is the greater	$l = \frac{2.3}{k} l_e Z$
Symbols		
L, s, k_L, k, ρ as defined in Pt 3, Ch 6, 1.4 Symbols and definitions 1.4.1		
b = 1.4 for rolled or built sections = 1.6 for flat bars		
d_w = web depth of longitudinal, in mm h_1 = weather head, in metres, as defined in Pt 3, Ch 3, 5 Design loading h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading l_e = as defined in Pt 3, Ch 6, 1.4 Symbols and definitions 1.4.1, but is to be taken not less than 1.5 m L_1 = L but need not be taken greater than 190 m		
Note *1.* For taper area requirements, *See* Table 3. 2. 1: Taper requirements for hull envelope in Chapter 3. **Note** *2.* Where weather decks are intended to carry deck cargo and the loading is in excess of 8.5 kN/m^2 the scantlings of longitudinals are also to comply with the requirements for location (1) in Table 1. 4. 4: Cargo and accommodation deck longitudinals using the equivalent design head, for specified cargo loadings, for weather decks given in Table 3. 5. 1: Design heads and permissible cargo loadings. **Note** *3.* For the scantlings of deck longitudinals aft in way of the cargo tanks of oil tankers (*See* Pt 3, Ch 6, 1.1 Application 1.1.4) or ore carriers, *See also* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers as applicable. **Note** *4.* The thickness of flat bar longitudinals, situated outside the line of openings is to be not less than the following: **Note** *(a)* $t = \frac{d_w}{18\sqrt{k_L}} mm$ mm where longitudinal continuous through bulkhead **Note** *(b)* $t = \frac{d_w}{15\sqrt{k_L}} mm$ mm where longitudinal cut at bulkhead **Note** *5.* The web depth of longitudinal, d_w, to be not less than 60 mm. **Note** *6.* The taper requirements from Table 3. 2. 1: Taper requirements for hull envelope in Pt 3, Ch 3 Structural Designdo not apply to container ships or open ship types, *See* Pt 3, Ch 4, 2.3 Open type ships, where the requirements of Pt 4, Ch 8, 3.2 Longitudinal strength are applicable, nor to fast cargo ships where the requirements of Pt 4, Ch 1, 3 Longitudinal strength are applicable. *See also* Pt 3, Ch 4, 5 Hull bending strength for hull section modulus requirement away from the midship area.		

2. 4 Deck supporting structure

2. 4. 1 The arrangements and scantlings of supporting structure are generally to be in accordance with the requirements given in Pt 4, Ch 1, 4 Deck structure except as required by Pt 3, Ch 6, 2.4 Deck supporting structure 2.4.2 to Pt 3, Ch 6, 2.4 Deck supporting structure 2.4.4.

2. 4. 2 At upper and lower decks above the after peak, deep beams are generally to be fitted in way of web frames. Deck girders are generally to be spaced not more than 3.0 m apart.

2. 4. 3 Primary structure in the topside tanks of bulk carriers is to comply with the requirements of Pt 4, Ch 7, 7 Topside tank structure.

2. 4. 4 Primary structure in the cargo tanks of oil tankers, or ore carriers, is to be determined from Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable.

2. 5 Deck openings

2. 5. 1 In dry cargo ships, the requirements for deck openings given in Pt 4, Ch 1, 4 Deck structure are generally applicable throughout the aft region except that aft of 0.25*L* from the A.P.:

a. The radii or dimensions of the corners of main cargo hatchway openings of the strength deck are to be in accordance with the requirements of Pt 4, Ch 1, 4.5 Deck openings. The thickness of the insert plates, where required, is not to be less than 20 per cent greater than the adjacent deck thickness outside the line of openings, with a minimum increase of 3 mm.

b. Insert plates will be required at lower decks in way of any rapid change in hull form to compensate for loss of deck cross-sectional area. Otherwise, insert plates will not normally be required.

c. Compensation and edge reinforcement for openings outside the line of main hatchways will be considered, bearing in mind their position, the deck arrangements and the type of ship concerned.

2. 5. 2 For deck openings in way of cargo tanks in oil tankers and ore carriers, *See also* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable. For main cargo hatchway openings on bulk carriers and container ships, *See also* Pt 4, Ch 7 Bulk Carriers and Pt 4, Ch 8 Container Ships, as applicable.

PART

3

CHAPTER **6** **Aft End Structure**

SECTION **3** **Shell envelope plating**

3. 1 General

3. 1. 1 Where the shell is longitudinally framed in the midship region, this system of framing is to be carried as far aft as practicable.

3. 2 Keel

3. 2. 1 The scantlings of bar keels at the aft end are to be the same as in the midship region as required by Pt 4, Ch 1, 5 Shell envelope plating.

3. 2. 2 The thickness and width of plate keels in the aft region are to be the same as required in the midship region for the particular type of ship concerned, *See* Pt 4 Ship Structures (Ship Types).

3. 3 Bottom shell and bilge

3. 3. 1 The thickness of bottom shell and bilge plating in the aft region is to comply with the requirements of Table 6. 3. 1: Shell plating aft .

3. 3. 2 Where the bottom is transversely framed and there are large flat areas of shell plating, the buckling stability of the plating will be specially considered, and increased plate thickness or additional stiffening may be required, *See also* Pt 3, Ch 6, 5.2 Single bottoms − Transverse framing 5.2.3.

3. 3. 3 Where longitudinals are omitted in way of radiused bilge plating amidships, the plating thickness aft will be considered in relation to the support derived from the hull form and internal stiffening arrangements.

3. 4 Side shell and sheerstrake

3. 4. 1 The thickness of side shell and sheerstrake plating in the aft region is to be not less than the values given in Table 6. 3. 1: Shell plating aft, but may be required to be increased locally on account of high shear forces, in accordance with Pt 3, Ch 4, 6.5, Permissible still water shear force.

3. 4. 2 Increased shell plate thickness may be required where the panting stringers required by Pt 3, Ch 6, 4.4 Panting stringers in way of transverse framing 4.4.1 are omitted. The extent and amount of the increase will be specially considered.

3. 4. 3 The thickness of shell plating is to be increased locally in way of the sternframe, propeller brackets or rudder horn. The increased plate thickness is to be not less than 50 per cent greater than the basic shell end thickness.

3. 4. 4 The sheerstrake thickness is to be increased by 20 per cent at the ends of a bridge superstructure extending out to the ship's side, irrespective of position. Similar strengthening is to be fitted in way of the end of a poop if this occurs at a position forward of 0.25*L* from the A.P. No increase is

required if the poop end bulkhead lies aft of 0.2L from the A.P. The increase at intermediate positions of end bulkhead is to be obtained by interpolation.

3. 5 Shell openings

3. 5. 1 In general, compensation will not be required for holes in the sheerstrake which are clear of the gunwale, or for any deck openings situated outside the line of main hatchways and whose depth does not exceed 20 per cent of the depth of the sheerstrake or 380 mm, whichever is the lesser. Openings are not to be cut in a rounded gunwale. Cargo door openings are to have well rounded corners, and the proposed compensation for the door openings will be individually considered.

Table 6. 3. 1: Shell plating aft

Location	Thickness, in mm	NOTES
(1) Bottom shell and bilge, *See* Notes 4 and 5:		**Note** *1.* For ships where $L \leq 70$ m this thickness may be reduced by 1 mm, but it is to be not less than 6 mm. **Note** *2.* The taper thickness is to be determined from Table 3. 2. 1: Taper requirements for hull envelope, *See* Note 7. **Note** *3.* For thickness of shell plating in way of the cargo tanks of oil tankers or ore carriers, *See also* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable. **Note** *4.* In offshore supply ships the thickness of side shell is to be not less than 9 mm. **Note** *5.* For trawlers and fishing vessels *See* Pt 4, Ch 6, 5 Shell envelope plating. **Note** *6.* For oil tankers the thickness is also to be in accordance with Pt 4, Ch 9, 4.3 Deck plating 4.3.3 **Note** *7.* The taper requirements from Table 3. 2. 1: Taper requirements for hull envelope in Pt 3, Ch 3 Structural Design do not apply to container ships or open ship types, *See* Pt 3, Ch 4, 2.3 Open type ships, where the requirements of Pt 4, Ch 8, 3.2 Longitudinal strength are applicable, nor to fast cargo ships where the requirements of Pt 4, Ch 1, 3 Longitudinal strength are applicable. *See also* Pt 3, Ch 4, 5 Hull bending strength for hull section modulus requirement away from the midship area.
(a) Aft of 0.075L from the A.P.	$t = (6.5 + 0.033L)f_2\sqrt{\frac{ks_1}{s_b}}$ (*See* Note 1)	
(b) Between 0.075L and 0.15L from the A.P., *See* Note 6	As (1)(a) or the taper thickness, whichever is the greater, *See* Note 2

where $\frac{T}{D} \leq 0.7$	As (4) for a poop	
(b) Between 0.075L and 0.15L from the A.P., *See* Note 6	As (3)(a) or as determined from Table 3. 2. 1: Taper requirements for hull envelope	

(c) Forward of $0.15L$ from the A.P., *See* Note 6	The taper thickness, *See* Note 2	
(4) Poop, *See* Notes 4 and 5	$t = (6.5 + 0.017L)f_2\sqrt{\frac{ks_1}{s_b}}$	

Symbols

L, B, D, T, s, k as defined in Pt 3, Ch 6, 1.4 Symbols and definitions 1.4.1

f_2 = factor to be taken as: این مطالب درون rull نیست

$f_2 = \left(\frac{15}{L/T}\right)^{0.2}$ but need not be taken greater than 1. L/T is not to be taken greater than 25.

s_1 = s but to be taken as not less than s_b

s_b = standard frame spacing, in mm, as follows:

Region	Bottom shell s_b		Side shell s_b
Aft of $0.05L$ from the A.P.	$\left(470 + \frac{L}{0.6}\right)$ or 600*	$\left(470 + \frac{L}{0.6}\right)$ or 600*	below the deck next above the load waterline
		or $\left(470 + \frac{L}{0.6}\right)$ or 700*	above the deck next above the load waterline
Between $0.05L$ and $0.15L$ from the A.P.	$\left(510 + \frac{L}{0.6}\right)$ or 850*	$\left(510 + \frac{L}{0.6}\right)$ or 850*	

*whichever is the lesser

3. 5. 2 Sea inlet and other openings are to have well rounded corners and so far as possible, should be kept clear of the bilge radius. The thickness of sea inlet box plating is generally to be the same as the adjacent shell. It is not, however, to be less than 12.5 mm, and need not exceed 25 mm.

PART

3

CHAPTER **6** **Aft End Structure**

SECTION **4** **Shell envelope framing**

4. 1 General

4. 1. 1 Requirements are given in this Section for both longitudinal and transverse framing systems. Where longitudinal framing is adopted in the midship region, it is to be carried as far aft as practicable.

4. 1. 2 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and, so far as practicable, direct continuity of longitudinal strength, *See also* Pt 3, Ch 10, 3 Secondary member end connections. Where L exceeds 215 m, the bottom longitudinals are to be continuous in way of both watertight and non-watertight floors, but alternative arrangements will be considered. Higher tensile steel longitudinals within 10 per cent of the ship's depth at the bottom and deck are to be continuous irrespective of the ship length.

4. 1. 3 Stiffeners and brackets on side transverses, where fitted on one side and connected to higher tensile steel longitudinals between the base line and 0.8D above the base line, are to have their heels well radiused to reduce stress concentrations. Where a symmetrical arrangement is fitted, i.e. bracket or stiffening on both sides, and it is connected to higher tensile steel longitudinals, the toes of the stiffeners or brackets are to be well radiused. Alternative arrangements will be considered if supported by appropriate direct calculations.

4. 1. 4 Where higher tensile steel side longitudinals pass through transverse bulkheads in the cargo area, well radiused brackets of the same material are to be fitted on both the fore and aft side of the connection between the upper turn of bilge and 0.8D above the base line. Particular attention is to be given to ensuring the alignment of these brackets. Alternative arrangements will be considered if supported by appropriate direct calculations.

4. 1. 5 For ships intended to load or unload while aground, *See* Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

4. 2 Shell longitudinals

4. 2. 1 The scantlings of bottom and side shell longitudinals in the aft region are to comply with the requirements given in Table 6. 4. 1: Shell framing (longitudinal) aft.

4. 3 Shell framing

4. 3. 1 The scantlings of side frames in the aft region are to comply with the requirements given in Table 6. 4. 2: Shell framing (transverse) aft.

Table 6. 4. 1: Shell framing (longitudinal) aft

Location	Modulus, in cm^3

(1) Side longitudinals in poop	$Z = 0.0065\text{skl}e^2(0.6 + 0.167D_2)$
(2) Side longitudinals in way of dry spaces including double skin construction:	
(a) Aft of the after peak bulkhead	$Z = 0.0085skh_{Tl}l_e^2F_s$ but not to be less than as required by (1)
(b) Between the after peak bulkhead and $0.2L$ from the A.P.	$Z = 0.007skh_{Tl}l_e^2F_s$ or as required in the midship region for the particular type of ship concerned, whichever is the greater
(c) Forward of $0.2L$ from the A.P.	As required in the midship region for the particular type of ship concerned
(3) Side longitudinals in way of double skin tanks or deep tanks	The greater of the following: *(a)* Z as from (2) *(b)* As required by Pt 4, Ch 1, 9 Bulkheads for deep tanks
(4) Bottom and bilge longitudinals	As required in the midship region for the particular type of ship concerned

Symbols

L, D, T, s, k, as defined in Pt 3, Ch 6, 1.4 Symbols and definitions 1.4.1

l_e as defined in Pt 3, Ch 6, 1.4 Symbols and definitions 1.4.1, but is to be taken not less than 1.5m

D_2=D_1 but need not be taken greater than 20 m

L_1=L but need not be taken greater than 190 m

F_s is a fatigue factor to be taken as follows:

(a) For built sections and rolled angle bars

$F_s = \frac{1.1}{k}\left[1 - \frac{2b_{f1}}{b_f}(1-k)\right]$ at $0.6D_1$ above the base line

= 1.0 at D_1 and above, and F_{sb} at the base line intermediate values by linear interpolation

F_{sb} is a fatigue factor for bottom longitudinals

$=0.5(1 + F_s \text{ at } 0.6D_1)$

(b) For flat bars and bulb plates $\frac{b_{f1}}{b_f}$ may be taken as 0.5

where

b_{f1}=the minimum distance, in mm, from the edge of the face plate of the side longitudinal under consideration to the centre of the web plate, *See* Figure 9. 5. 1: Definition of b f and b f1

b_f = the width of the face plate, in mm, of the side longitudinal under consideration, *See* Figure 9. 5. 1: Definition of b f and b f1

D_1=D but need not exceed $T + H_b$, in metres, where H_b is the minimum bow height, in metres, obtained from Pt 3, Ch 1, 6.1 Principal particulars 6.1.11
T_1=T but not to be taken less than $0.65D_1$
h_{T1}=$f_w C_w \left(1 - \frac{h_6}{D_1 - T}\right) F_\lambda$, in metres, for longitudinals above the waterline at draught T_1 where $f_w \left(1 - \frac{h_6}{D_1 - T_1}\right)$ is not to be less than 0.7 =$\left[h_6 + f_w C_w \left(1 - \frac{h_6}{2T_1}\right)\right] F_\lambda$, in metres, for longitudinals below the waterline at draught T_1
where f_w=1.0 at 0.2L from A.P. and 1.32 at and aft of aft peak bulkhead. Intermediate positions by interpolation.
h_6=vertical distance, in metres, from the waterline at draught T_1, to the longitudinal under consideration
C_w = a wave head, in metres = $7.71 \times 10^{-2} L e^{-0.0044\,L}$
where e=base of natural logarithm 2.7183
$F_\lambda = 1.0$ for$L \leq 200$ m $= [1.0 + 0.0023(L - 200)]$ for $L > 200$ m
Note *1.* Where struts are fitted midway between transverses in double skin construction, the modulus of the side longitudinals may be reduced by 50k per cent from that obtained for locations (2) and (3) as applicable.
Note *2.* For modulus and area of side longitudinals in way of a machinery space, *See* Pt 3, Ch 7, 3.1 Secondary stiffening.

Table 6. 4. 2: Shell framing (transverse) aft

Location	Modulus, in cm^3	Inertia, in cm^4
(1) Frames in after peak spaces and lower 'tween decks over	$Z = 1.85skTD_2S_1 \times 10^{-3}$	$I = \frac{3.2}{k} S_1 Z$
(2) Frames in upper 'tween decks and poops aft of the after peak bulkhead, *See* Notes 1, 2 and 6	The greater of the following: $Z = Cskh_{T1}H^2 \times 10^{-3}$ $Z = 9.1skD_1 \times 10^{-3}$	$I = \frac{3.2}{k} HZ$
(3) Main and 'tween deck frames (including poop) between the after peak bulkhead and 0.2L from the A.P., *See* Notes 1, 2 and 3	The greater of the following: $Z = Cskh_{T1}H^2 \times 10^{-3}$ $Z = 9.1skD_1 \times 10^{-3}$	$I = \frac{3.2}{k} HZ$
(4) Main and 'tween deck frames elsewhere, *See* Notes 1, 2 and 3	As required in the midship region for the particular type of ship concerned	
(5) Panting stringers, *See* Note 4	Web depth, d_w, same depth as frames Web thickness, t=t_W as in Pt 3, Ch 10, 4.4 Geometric properties and proportions Face area, $A = kS_2(H + 1)$cm^2	
Symbols		

L, D, T, s, k as defined in Pt 3, Ch 6, 1.4 Symbols and definitions 1.4.1
D_1=D but need not exceed $T+H_b$, in metres, where H_b is the minimum bow height, in metres, obtained from Pt 3, Ch 1, 6.1 Principal particulars 6.1.11
D_2=D_1 but is to be taken not greater than 16 m nor less than 6 m
H=H_{MF} or H_{TF} as applicable, *See* Note 3
H_{MF}=vertical framing depth, in metres, of main frames as shown in Figure 6. 4. 1: Framing depths but is not to be taken less than 3.5 m, *See* Note 5
H_{TF}=vertical framing depth, in metres, of 'tween deck frames as shown in Figure 6. 4. 1: Framing depths, but is not to be taken less than 2.5 m
S_1=vertical spacing of peak stringers or height of lower 'tween deck above the peak, in metres, as applicable
S_2=vertical spacing of panting stringers, in metres
C=end connection factor =3.4 where two Rule standard brackets fitted =3.4 $(1.8-0.8\,(l_a/l))$ where one Rule standard bracket and one reduced bracket fitted =3.4 $(2.15-1.15(l_{amean}/l))$ where two reduced brackets fitted =6.1 where one Rule standard bracket fitted =6.1 $(1.2-0.2(l_a/l))$where one reduced bracket fitted =7.3 where no brackets fitted
The requirements for frames where brackets larger than Rule standard are fitted will be specially considered
l=length, in mm, as derived from Pt 3, Ch 10, 3.4 Scantlings of end brackets 3.4.1
l_a =equivalent arm length, in mm, as derived from Pt 3, Ch 10, 3.4 Scantlings of end brackets 3.4.1
l_{amean} =mean equivalent arm length, in mm, for both brackets
T_1=T but not to be taken less than $0.65D_1$
h_{T1}=head, in metres, at mid-length of H =$f_w C_w \left(1-\frac{h_6}{D_1-T}\right) F_\lambda$, in metres for frames where the mid-length of frame is above the waterline, at draught T_1 $f_w \left(1-\frac{h_6}{D_1-T_1}\right)$ is not to be taken less than 0.7 =$\left[h_6+f_w C_w \left(1-\frac{h_6}{2T_1}\right)\right] F_\lambda$, in metres for frames where the mid-length of frame is below the waterline at draught T_1
where f_W=1.0 at 0.2L from A.P. and 1.32 at and aft of aft peak bulkhead Intermediate positions by interpolation.
h_6= vertical distance in metres from the waterline at draught T_1 to the mid-length of H
$F_\lambda = 1.0$ for $L \leq 200$ m =$[1.0+0.0023(L-200)]$ for $L > 200$ m
C_w = a wave head in metres $= 7.71 \times 10^{-2} Le^{-0.0044L}$

where e=base of natural logarithm 2.7183

Note *1.* In fishing vessels the modulus of main and 'tween deck frames need not be greater than 80% of that given in (2).

Note *2.* In offshore supply ships the moduli of main and 'tween deck frames are to be 25 % greater than those given in (2), (3) and (4).

Note *3.* Where frames are inclined at more than 15° to the vertical, H_{MF} or H_{TF} is to be measured along a chord between span points of the frame.

Note *4.* Panting stringers are not required in tugs less than 46 m in length, *See* Pt 4, Ch 3, 4 Panting and strengthening of bottom forward.

Note *5.* Where the frames are supported by fully effective horizontal stringers, these may be considered as decks for the purpose of determining H_{MF}.

Note *6.* Except for main frames the modulus for these members need not exceed that derived from (1) using H_{TF} in place of S_1.

4. 3. 2 The scantlings of main frames are normally to be based on Rule standard brackets at top and bottom, whilst the scantlings of 'tween deck frames are normally to be based on a Rule standard bracket at the top only.

4. 3. 3 End connections of transverse main and 'tween deck frames are to be in accordance with Pt 3, Ch 10, 3 Secondary member end connections. For bulk carriers (*See* Pt 3, Ch 6, 1.1 Application 1.1.4), the end connections of main frames in cargo holds are to be in accordance with Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.5 to Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.12.

4. 4 Panting stringers in way of transverse framing

4. 4. 1 In deep 'tween decks above the after peak space, panting stringers having scantlings as given in Table 6. 4. 2: Shell framing (transverse) aft or increased shell plate thickness may be required, *See also* Pt 3, Ch 6, 3.4 Side shell and sheerstrake 3.4.2.

Figure 6. 4. 1: Framing depths

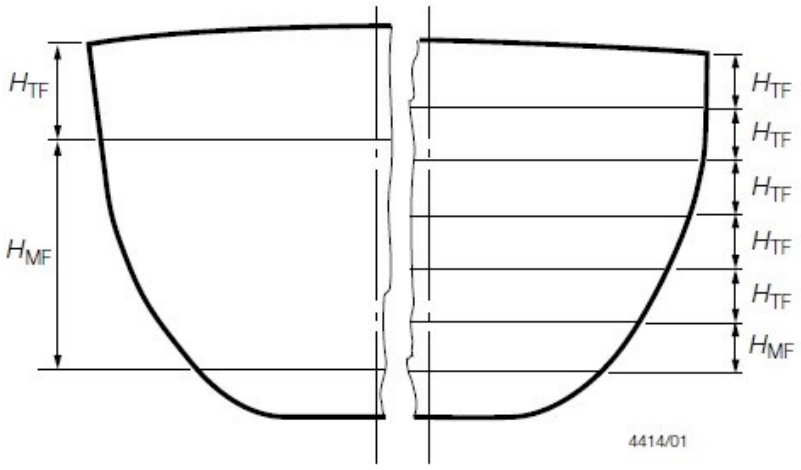

Figure 6. 4. 2: Framing factors

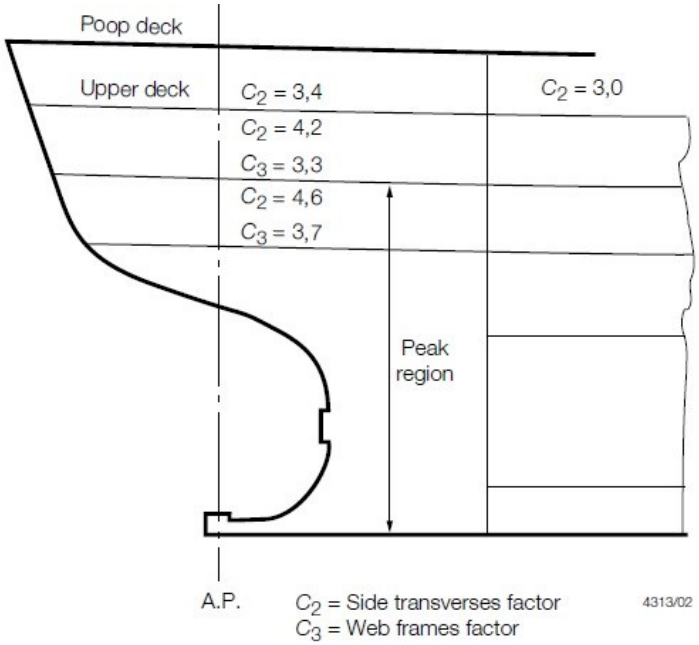

4. 5 Primary structure at sides

4. 5. 1 Where the 'tween decks above an after peak space are transversely framed, web frames are to be fitted. Their spacing is generally not to exceed the values given in Table 6. 4. 3: Spacing of side transverses and web frames aft, and their scantlings are to be determined from Table 6. 4. 4: Primary structure aft.

4. 5. 2 Where longitudinal framing is arranged, the spacing of transverses is generally not to exceed the values given in Table 6. 4. 3: Spacing of side transverses and web frames aft, and their scantlings are to be determined from Table 6. 4. 4: Primary structure aft.

4. 5. 3 Where the shape of the after sections is such that there are large sloped flat areas, particularly in the vicinity of the propellers, additional primary supports for the secondary stiffening may be required. Their extent and scantlings will be specially considered.

4. 5. 4 The web thickness, stiffening arrangements and connections of primary supporting members are to be in accordance with the requirements of Pt 3, Ch 10, 4 Construction details for primary members.

Table 6. 4. 3: Spacing of side transverses and web frames aft

Location	Maximum spacing	
	Web frames in association with transverse framing system	Side transverses in association with longitudinal framing system
(1) Aft of the after peak bulkhead	4 frame spaces	2.5 m where $L \leq 100$ m 3.5 m where $L \geq 300$ m Intermediate values by interpolation

(2) Elsewhere in way of dry cargo spaces or deep tanks, *See* Note	—	3.8 m where $L \leq 100$ m $(0.006L+3.2)$ m where $L>100$ m
(3) In way of cargo tanks of oil tankers, chemical tankers or ore or oil carriers	—	3.6 m where $L \leq 180$ m $0.02L$ where $L > 180$ m
Note For the maximum spacing of transverses in dredgers, *See* Pt 4, Ch 12, 5 Shell envelope framing.		

Table 6. 4. 4: Primary structure aft

Item and location	Modulus, in cm^3	Inertia, in cm^4
Longitudinal framing system		
(1) Side transverses in dry spaces aft of the after peak bulkhead, *See* Note 4: *(a)* Lower space *(b)* 'Tween deck	 $Z = 10kSh_{T1}{l_e}^2$ $Z = C_2kSTH_{TF}\sqrt{D}$	—

C_2, C_3=factors obtained from Figure 6. 4. 2: Framing factors

h_4=tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

h_{T1}=head, in metres, at mid-length of span

$=f_w C_w \left(1 - \frac{h_6}{D_1 - T_1}\right) F_\lambda$, in metres where the mid-length of span is above the waterline at draught T_1

where $f_w \left(1 - \frac{h_6}{D_1 - T_1}\right)$ is not to be taken less than 0.7

$=\left[h_6 + f_w C_w \left(1 - \frac{h_6}{2T_1}\right)\right] F_\lambda$, in metres where the mid-length of span is below the waterline at draught T_1

where

f_W=1.0 at 0.2*L* from A.P. and 1.32 at and aft of aft peak bulkhead. Intermediate positions by interpolation

h_6=vertical distance, in metres, from the waterline at draught T_1 to the mid-length of span

$F_\lambda = 1.0$ for $L \leq 200$ m

$= [1.0 + 0.023 (L - 200)]$ for $L > 200$ m

C_W=a wave head, in metres

$= 7.71 \times 10^{-2} L e^{-0.0044L}$

=where e=base of natural logarithms 2.7183

D_1=*D* but need not be taken greater than $T+H_b$, in metres, where H_b is the minimum bow height, in metres, obtained fromPt 3, Ch 1, 6.1 Principal particulars 6.1.11

T_1=*T* but not to be taken less than $0.65D_1$

H_{TF}=vertical height of `tween decks, in metres, as shown in Figure 6. 4. 1: Framing depths

Note *1.* In way of the cargo tanks or fuel oil tanks of oil tankers or ore carriers, the scantlings of primary structure are to comply with the requirements of Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as appropriate.

Note *2.* For bulk carriers, *See* Pt 4, Ch 7, 6 Shell envelope framing

Note *3.* For stringers and webs in after peaks, *See also* Pt 3, Ch 6, 6.2 Side structure – Transverse framing.

Note *4.* The web depth of side transverses aft of the after peak bulkhead is to be not less than 2.5 times the depth of the longitudinals supported. The web depth of stringers is to be not less than 2.2 times the depth of frames supported.

PART

3

CHAPTER 6 **Aft End Structure**

SECTION 5 **Single and double bottom structure**

5. 1 General

5. 1. 1 For dry cargo ships exceeding 120 m in length, and for all ships which are strengthened for heavy cargoes, longitudinal framing is, in general, to be adopted, *See also* Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers.

5. 1. 2 For ships having the notation `strengthened for heavy cargoes', the requirements of Pt 4, Ch 7, 8 Double bottom structure are also to be complied with, as applicable.

5. 1. 3 For ships intended to load or unload while aground, *See* Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

5. 1. 4 Provision is to be made for the free passage of water and/or air from all parts of single or double bottoms to the bilge or tank suctions, account being taken of the pumping rates required.

5. 1. 5 For passenger ships, *See* Pt 4, Ch 2, 6 Double bottom.

5. 2 Single bottoms – Transverse framing

5. 2. 1 In after peak spaces, floors are to be arranged at every frame. For details and scantlings, *See* Pt 3, Ch 6, 6.1 Bottom structure.

5. 2. 2 In way of dry cargo spaces aft, the arrangement and scantlings of transversely framed single bottoms are to be generally as required in the midship region, as given in Pt 4, Ch 1, 7 Single bottom structure, except that the thickness of the centreline girder may be tapered from the midship thickness at $0.3L$ from the A.P. to $t = \left(\sqrt{Lk} + 0.5\right)$mm or 6 mm, whichever is the greater, at $0.075L$ from the A.P. In ships having considerable rise of floor towards the aft end, the depth of the floors may be required to be increased.

5. 2. 3 Where the shape of the after sections is such that there are large flat areas of shell plating, additional stiffening and/or increased shell plate thickness may be required, *See* Pt 3, Ch 6, 3.3 Bottom shell and bilge. The extent of this stiffening will be specially considered.

5. 3 Single bottoms – Longitudinal framing

5. 3. 1 The scantlings and arrangement of longitudinally framed single bottoms in way of dry cargo spaces will be specially considered.

5. 4 Double bottoms

5. 4. 1 The minimum depth of centre girder aft is generally to be the same as that required in the midship region by Pt 4 Ship Structures (Ship Types) for the particular type of ship concerned, but in ships

with considerable rise of floor a greater depth may be required at the aft end to provide adequate access throughout the double bottom tank.

5. 4. 2 Where the height of the double bottom varies, this variation is generally to be made gradual by sloping the inner bottom over an adequate longitudinal extent. Knuckles in the plating are to be arranged close to plate floors. Otherwise, suitable scarfing arrangements are to be made.

5. 4. 3 For dry cargo ships, the arrangement and scantlings of girders, floors, inner bottom plating and inner bottom stiffening in the aft end region are to be determined from Pt 4, Ch 1, 8 Double bottom structure.

5. 4. 4 For double bottom construction in way of the cargo tanks of oil tankers or ore carriers, *See also* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as appropriate.

PART

3

CHAPTER **6** **Aft End Structure**

SECTION **6** **After peak structure**

6. 1 Bottom structure

6. 1. 1 Floors are to be arranged at every frame space and are to be carried to a suitable height, and at least to above the sterntube, where fitted. They are to have a thickness as determined from Table 6. 6. 1: After peak structure and are to be adequately stiffened. In way of a propeller post, rudder post or rudder horn, the floors are generally to be carried to the top of the space and are to be increased in thickness. The extent and amount of the increase will be specially considered, account being taken of the arrangements proposed.

6. 2 Side structure – Transverse framing

6. 2. 1 Above the floors, transverse side framing is to be supported by one of the following arrangements:

a. Side stringers spaced not more than 2.5 m apart and supported by web frames. The upper ends of the web frames are to be supported under the tank top by suitable deep beams to form a ring structure.

b. Perforated flats spaced not more than 2.5 m apart. The area of perforations in each flat is to be not less than 10 per cent of the total area of the flat.

c. A combination of the above arrangements.

6. 2. 2 The scantlings of side stringers supported by web frames, and also of the web frames are to be determined from Pt 3, Ch 6, 4.5 Primary structure at sides.

6. 2. 3 The scantlings of perforated flats are to be determined from Table 6. 6. 1: After peak structure. Stiffeners are to be fitted at every frame.

6. 3 Side structure – Longitudinal framing

6. 3. 1 The spacing and scantlings of side transverses supporting longitudinal framing are to be as required by Pt 3, Ch 6, 4.5 Primary structure at sides.

6. 3. 2 Suitable transverses or deep beams are to be arranged at the top of the tank to provide end rigidity to the side transverses.

Table 6. 6. 1: After peak structure

Item	Parameter	Requirement
(1) Floors	Thickness	$t = (7.5 + 0.025L_2)\sqrt{\frac{S_2}{800}}$ mm

(2) Perforated flats and wash bulkheads	Thickness *See* Note	$t = (7.5 + 0.015L)\sqrt{\frac{S_2}{800}}$ mm
	Stiffener modulus	$Z = \frac{0.0057skh_6l_e^2}{b}$ cm^2
Symbols		
$=L$, s, l_e, k as defined in Pt 3, Ch 6, 1.4 Symbols and definitions 1.4.1		
b=1.4 for rolled or built sections =1.6 for flat bars		
h_6=vertical distance from middle of effective length of stiffener to top of tank, in metres		
s_2=spacing of stiffeners, in mm, but is to be taken not less than 800 mm		
L_2=L but need not be taken greater than 215 m		
Note The thickness for perforated flats and wash bulkheads may be reduced by 1 mm for ships of 40 m and under with no reduction for ships of 90 m and above. Reduction for intermediate lengths to be by linear interpolation.		

6. 4 Wash bulkheads

6. 4. 1 A centreline wash bulkhead is to be arranged in the upper part of the after peak space and counter or cruiser stern. Where the overhang is very large, or the breadth of the space at the widest point exceeds 20 m, additional wash bulkheads may be required port and starboard.

6. 4. 2 Wash bulkheads are to have an area of perforations not less than 5 per cent nor more than 10 per cent of the area of the bulkhead. The plating is to be suitably stiffened in way of openings, and the arrangement of openings is to be such as to maintain adequate shear rigidity.

6. 4. 3 The scantlings of wash bulkheads are to be determined from Table 6. 6. 1: After peak structure, and stiffeners are to be fitted at every frame and bracketed top and bottom. The plating thickness may be required to be increased locally in way of the upper part of the sternframe or the rudder horn.

6. 5 After peak bulkhead

6. 5. 1 The position and height of the after peak bulkhead are to be in accordance with the requirements of Pt 3, Ch 3, 4 Bulkhead requirements.

6. 5. 2 The scantlings of the after peak bulkhead and of the flat forming the top of the peak space are to be determined from Pt 4, Ch 1, 9 Bulkheads, but the plating thickness is to be increased locally in way of the sterntube gland.

PART

3

CHAPTER **6** **Aft End Structure**

SECTION **7** **Sternframes and appendages**

7. 1 General

7. 1. 1 Sternframes, rudder horns, boss end brackets and shaft brackets may be constructed of cast or forged steel, or may be fabricated from plate.

7. 1. 2 In castings, sudden changes of section or possible constrictions to the flow of metal during casting are to be avoided. All fillets are to have adequate radii, which should, in general, be not less than 50 to 75 mm, depending on the size of the casting.

7. 1. 3 Cast sternframes, rudder horns, shaft brackets and solepieces are to be manufactured from special grade material. Cast bossings can be manufactured from normal grade material, *See* Ch 4, 2 Castings for ship and other structural applications of the Rules for Materials.

7. 1. 4 Sternframes, rudder horns, shaft brackets, etc. are to be effectively integrated into the ship's structure, and their design is to be such as to facilitate this.

7. 2 Sternframes

7. 2. 1 The scantlings of sternframes are to be determined from Table 6. 7. 1: Sternframes. In the case of very large ships, the scantlings and arrangements may be required to be verified by direct calculations.

Table 6. 7. 1: Sternframes

tem	Parameter	Requirement		
(1) Propeller posts *See* Notes 1 and 2		Cast steel, *See* Figure 6. 7. 5: Propeller posts	Forged steel, *See* Figure 6. 7. 5: Propeller posts	Fabricated mild steel,*See* Figure 6. 7. 5: Propeller posts
	l	$165\sqrt{T}$ mm	-	$200\sqrt{T}$ mm

	δ_b	-	$6.25T + 19)$ mm or $0.225\delta_{PL2}$ mm whichever is the greater	-
	δ_{PL1}, δ_{PL2} bearing pressure and pintle clearance	-	As for rudder pintles (*See* Table 13. 2. 12: Pintle requirements in Chapter 13)	-
Symbols				
L, T as defined in Pt 3, Ch 6, 1.4 Symbols and definitions 1.4.1 b=length of the rudder post or axle, in m, as defined in Figure 6. 7. 10: Solepieces K_2=rudder profile coefficient, as given by Table 13. 2. 2: Rudder profiles in *Chapter 13*				

n=number of bolts in palm coupling

r_b=mean distance of bolt centres from centre of palm, in mm

t_b=finished thickness of boss, in mm

A=cross-sectional area of forged steel propeller post, in cm^2

A_R= rudder area, in m^2

k_R=rudder coefficient, as given by Table 6. 7. 7: Rudder coefficient kR

V_0=maximum service speed, in knots, with the ship in the loaded condition

Z_T=section modulus against transverse bending, in cm^3

δ_b=diameter of coupling bolts, in mm

δ_{TS}=diameter of tail shaft, in mm

Note *1.* Where scantlings and proportions of the propeller post differ from those shown in Item (1), the section modulus about the longitudinal axis of the proposed section normal to the post is to be equivalent to that with Rule scantlings. t is to be not less than $8\sqrt{T}$ (minimum of 19 mm for cast steel sternframes) or as required by Pt 3, Ch 6, 3.4 Side shell and sheerstrake 3.4.2, whichever is the greater.

Note *2.* On sternframes without solepieces, the modulus of the post below the propeller boss, about the longitudinal axis may be gradually reduced to not less than 85% of that required by Note 1, subject to the same thickness limitations.

Note *3.* In fabricated sternframes the connection of the propeller post to the boss is to be by full penetration welds.

Note *4.* If more than six bolts are fitted, the arrangements are to provide equivalent strength.

7. 2. 2 Fabricated and cast propeller posts and rudder posts of twin screw ships are to be strengthened at intervals by webs. In way of the upper part of the sternframe arch, these webs are to line up with the floors.

7. 2. 3 Rudder posts and propeller posts are to be connected to floors of increased thickness, *See* Pt 3, Ch 6, 6.1 Bottom structure.

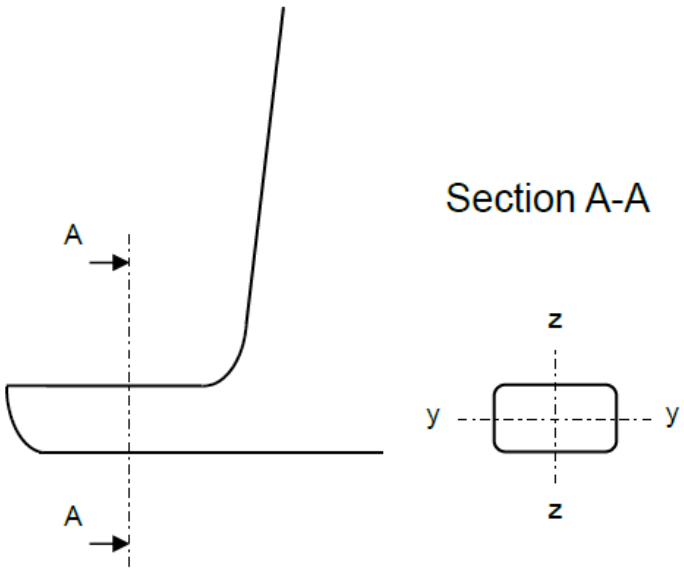
Table 6. 7. 2: Permissible stresses for sole pieces

Mode	Permissible stress
(1) Equivalent stress	$115/K_0$ N/mm^2
Symbols	
σ_e=equivalent stress $=\sqrt{\sigma_b^2 + 3\tau_T^2}$ N/mm^2	
σ_b=bending stress $=\frac{M_B}{Z_T}$	
τ_T=shear stress $=\frac{B_1}{A_S}$	

M_B=bending moment, in Nm, at the section considered $=B_1x$
B_1=supporting force, in N, in pintle bearing $=0.5P_L$
P_L=rudder force, in N, as calculated in Ch 13.2
x=distance, in metres, from centre of rudder stock to section under consideration
Z_T=*See* Table 6. 7. 1: Sternframes (4)
A_s=sectional area, in mm^2, of solepiece

7. 3 Sole pieces

Figure 6. 7. 1: Solepiece



7. 3. 1 The scantlings of sole pieces are to be not less than those required by Table 6. 7. 3: Sole pieces scantlings:

Table 6. 7. 3: Sole pieces scantlings

Item, *See* Figure 6. 7. 10: Solepieces	Minimum requirements
Section modulus about the vertical (z)-axis, Z_z	$Z_z = \frac{M_b k}{80}$ cm^3
Section modulus about the transverse (y)-axis, Z_y	$Z_y = 0.5Z_z$ cm^3
Section area, A_s	$A_s = \frac{B_1 k}{48}$ mm^3
Symbols	

M_b= bending moment, in Nm, at the section considered

$=B_1 x$

x =distance, in m, from centre of rudder stock to section under consideration

k=as defined in Table 13. 2. 1: Rudder material factor, k

B_1= supporting force in the pintle bearing, in N

= 0.5 CR

C_R= as defined in Pt 3, Ch 13, 2 Rudders

Note 1. For dredging and reclamation craft classed 'A1 protected waters service', the scantlings of an 'open' type solepiece are to be such that:

a. $Z_z = 0.625 Z_z$

b. The cross-sectional area is not less than 18 cm^2

c. The depth is not less than two-thirds of the width at any point.

Note 2. In fabricated solepieces, transverse webs are to be fitted spaced not more than 760 mm apart. Where the breadth of the solepiece exceeds 900 mm, a centreline vertical web is also to be fitted.

Note 3. Solepieces supporting fixed or movable nozzles will be specially considered, *See* Pt 3, Ch 13, 3 Fixed and steering nozzles

7. 3. 2 The solepiece is to be dimensioned such that the stresses do not exceed the permissible stresses given in Table 6. 7. 4: Permissible stresses for solepieces.

Table 6. 7. 4: Permissible stresses for solepieces

Mode	Permissible stress
(1) Equivalent stress	$\frac{115}{k}$ N/mm^2
Symbols	

σ_e=equivalent stress

$=\sqrt{\sigma_b^2 + 3\tau_T^2}$ N/mm^2

σ_b=bending stress

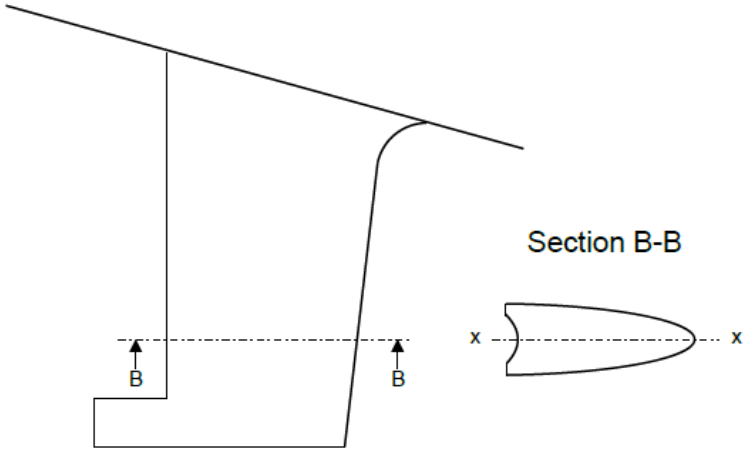
τ_T=shear stress

$=\frac{B_1}{A_s}$ N/mm^2

k=as defined in Table 13. 2. 1: Rudder material factor, k

7. 4 Rudder horns

Figure 6. 7. 2: Rudder horn



7. 4. 1 Rudder horns are to be effectively integrated into the main hull structure.

7. 4. 2 The rudder horn side plating should be carried through the ship's bottom shell plating and aligned with primary members. Brackets or stringers are to be fitted on the inside of the rudder horn to align with the ship's adjoining bottom shell plating, *See* Figure 6. 7. 3: Rudder horn integration.

7. 4. 3 A number of transverse webs of the rudder horn should be carried through the ship's bottom shell up to the inner bottom or bottom deck. These rudder horn transverse webs should be fitted in line with strengthened plate floors.

7. 4. 4 Where practicable the rudder horn should be connected to the ship's centreline bulkhead.

7. 4. 5 Scallops in way of the connection between the rudder horn transverse webs and the ship's adjoining bottom shell plating are to be avoided.

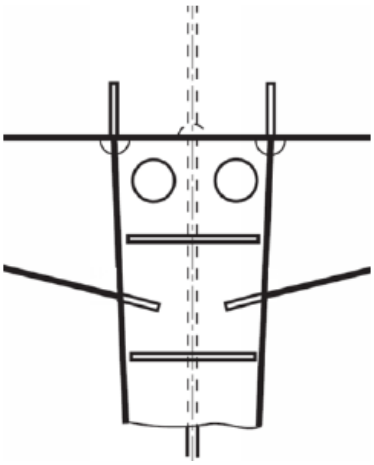
7. 4. 6 The weld at the connection between the rudder horn plating and the ship's bottom shell is to be full penetration. The welding radius is to be as large as practicable and may be obtained by grinding.

7. 4. 7 When the connection between the rudder horn and the hull structure is designed as a curved transition into the hull plating, special consideration is to be given to the effectiveness of the rudder horn plate bending and to the stresses in the transverse web plates.

7. 4. 8 The ship's bottom shell plating is to be increased in thickness in way of the rudder horn. Where the horn plating is radiused into the shell plating, the radius at the shell connection is to be not less than:

$$r = (150 + 0.8L)\text{mm}$$

Figure 6. 7. 3: Rudder horn integration



7. 4. 9 The bending moments and shear forces are to be determined by direct calculations.

7. 4. 10 The scantlings of the rudder horn are to be not less than those required by Table 6. 7. 5: Rudder horn scantlings:

Table 6. 7. 5: Rudder horn scantlings

Item, *See* Figure 6. 7. 2: Rudder horn	Minimum requirement
Section modulus about the horizontal (x)-axis, Z_x	$Z_x = \frac{M_b k}{67}$ cm^3
Rudder horn plating	$t = 2.4\sqrt{Lk}\ mm$
Symbols	
M_b = bending moment, in Nm, at the section considered. k = as defined in Table 13. 2. 1: Rudder material factor, k	

7. 4. 11 The rudder horn is to be dimensioned such that the stresses do not exceed the permissible stresses given in Table 6. 7. 6: Permissible stresses for rudder horns.

Table 6. 7. 6: Permissible stresses for rudder horns

Mode	Permissible stress
(1) Shear stress	$\frac{48}{k}$ N/mm^2
(2) Equivalent stress	$\frac{120}{k}$ N/mm^2
Symbols	

σ_e = equivalent stress

$= \sqrt{\sigma_b^2 + 3(\tau^2 + \tau_T^2)}$ N/mm²

σ_b = bending stress

$= \frac{M_b}{Z_x}$ N/mm²

τ = shear stress

$= \frac{B_1}{A_h}$ N/mm²

B_1 = supporting force in the pintle bearing, in N

A_h = effective shear area, of rudder horn in y-direction, in mm²

τ_T = torsional stress

$= \frac{M_T 10^3}{2A_T t_h}$ N/mm²

M_T = torsional moment at the section considered, in Nm

A_T = area in the horizontal section enclosed by the rudder horn, in mm²

t_h = plate thickness of rudder horn, in mm

k = as defined in Table 13. 2. 1: Rudder material factor, k

5	0.85Kδ	1.275Kδ	0.12δ	0.03δ	0.85Kδ	0.85Kδ

6	0.75Kδ	1.125Kδ	0.12δ	0.03δ	0.75Kδ	0.75Kδ
Minimum value	0.10δ	0.15δ	t_R	—	3 and 4 blades, 0.20δ 5 and 6 blades, 0.16δ	0.15δ

Symbols

L as defined in Pt 3, Ch 6, 1.4 Symbols and definitions 1.4.1

C_b=moulded block coefficient at load draught

$$K = \left(0.1 + \frac{L}{3050}\right)\left(\frac{3.48C_bP}{L^2} + 0.3\right)$$

$$= \left(K = \left(0.1 + \frac{L}{3050}\right)\left(\frac{2.56C_bP}{L^2} + 0.3\right)\right)$$

t_R=thickness of rudder, in metres, measured at $0.7R_P$ above the shaft centreline

P=designed power on one shaft, in kW (shp)

R_P=propeller radius, in metres

δ=propeller diameter, in metres

Note The above recommended minimum clearances also apply to semi-spade type rudders.

7. 5 Rudder trunks

7. 5. 1 Rudder trunks extending above or below the stern frame are to be constructed of steel of a weldable quality with a carbon content not exceeding 0.23 per cent on ladle analysis or a carbon equivalent (CEQ) not exceeding 0.41 per cent.

7. 5. 2 Plating materials for rudder trunks are in general not to be of lower grades than those corresponding to Class II as defined in Table 2. 2. 2: Steel grades.

7. 5. 3 The weld at the connection between the rudder trunk and the shell or the bottom of the skeg is to be full penetration.

7. 5. 4 The fillet shoulder radius, r, of webs connected to the rudder trunk *See* Figure 6. 7. 4: Rudder trunk fillet shoulder radii, are to be as large as practicable and are in no case to be less than:

r = 60 mm when $\sigma_b \geq \frac{40}{k}$ N/mm^2

r = the greater of 0.1d_c, and 30 mm when $\sigma_b < \frac{40}{k}$ N/mm^2

Where

d_c = rudder stock diameter as defined in Table 13. 2. 4: Rudder stock diameter

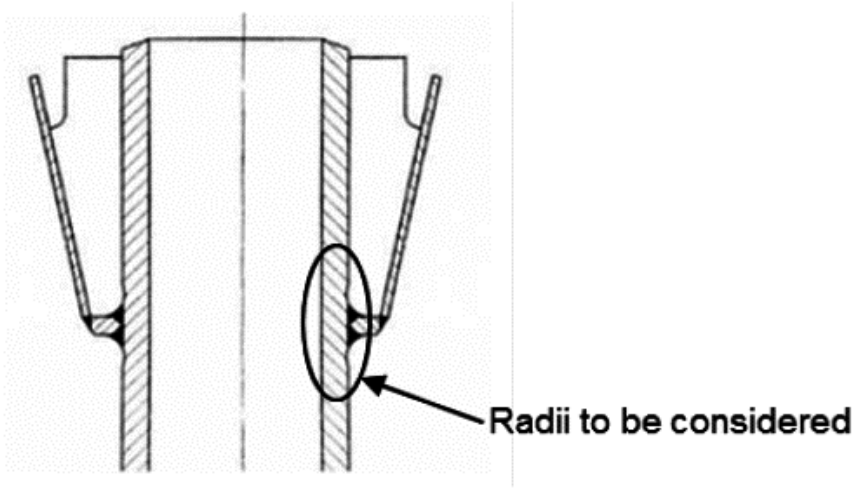
σ_b = bending stress in the rudder trunk, in N/mm^2

k = as defined in Table 13. 2. 1: Rudder material factor, k

The radius may be obtained by grinding. If disk grinding is carried out, score marks are to be avoided in the direction of the weld. The radius is to be checked with a template for accuracy. At least four profiles are to be checked. A report is to be submitted to the Surveyor.

7. 5. 5 Rudder trunks comprising of materials other than steel will be specially considered.

Figure 6. 7. 4: Rudder trunk fillet shoulder radii



7. 5. 6 Where the rudder stock is arranged in such a way that it will impose forces on the rudder trunk, the scantlings of the trunk are to be as follows:

a. the equivalent stress due to bending and shear is not exceed 0.35σ,

b. the bending stress of fabricated rudder trunks is to be less than $\frac{80}{k}$ N/mm^2

Where

σ_b = bending stress in the rudder trunk, in N/mm^2

k = as defined in Table 13. 2. 1: Rudder material factor, k but is not to be taken less than 0.7

σ = minimum specified yield stress, in N/mm^2.

For calculation of bending stress, the span to be considered is the distance between the mid-height of the lower rudder stock bearing and the point where the trunk is clamped into the shell or the bottom of the skeg.

7. 6 Shaft bossing

7. 6. 1 Where the propeller shafting is enclosed in bossings extending back to the bearings supporting the propellers, the aft end of the bossings and the bearings are to be supported by substantially constructed boss end castings or fabrications. These are to be designed to transmit the loading from the shafting efficiently into the ship's internal structure.

7. 6. 2 The length of the shaft bracket boss, l_b, is to be sufficient to support the length of the required bearing. In general, l_b is not to be less than $4d_t$, where d_t is the Rule diameter of the screwshaft, in mm, *See* Pt 5, Ch 6, 3 Design. Proposals for a reduction in the required length of the shaft bracket boss will be considered in conjunction with details of the bearing material, allowable bearing operating pressure and installation arrangements. However, in no case is l_b to be less than the greater of:

a. $2d_t$; or

b. that recommended by the bearing manufacturer; or

c. that required to accommodate the aftermost bearing and to allow the proper connection of the shaft bracket .

7. 6. 3 Where the shaft and the shaft bracket boss are of the same material, the thickness of the shaft bracket boss is not to be less than $d_t/4$. Where the shaft and the shaft bracket boss are of dissimilar materials, the thickness of the boss, t_b, is to be not less than:

$$t_b = 0.75 d_t \left(f_1^{1/3} - 0.667 \right) \text{mm}$$

Note In no case is t_b to be taken as less than 12 mm

Where

d_t = Rule diameter of the screwshaft in way of boss, in the appropriate screwshaft material, in mm, *See* Pt 5, Ch 6, 3 Design:

f_1 = s_S/s_B but not less than 0.825

s_S = ultimate tensile strength of the shaft material, in N/mm^2.

s_B = ultimate tensile strength of the boss material, in N/mm^2.

7. 6. 4 Cast steel supports are to be suitably radiused where they enter the main hull to line up with the boss plating radius. Where the hull sections are narrow, the two arms are generally to be connected to each other within the ship. The arms are to be strengthened at intervals by webs.

7. 6. 5 Fabricated supports are to be carefully designed to avoid or reduce the effect of hard spots. Continuity of the arms into the ship is to be maintained, and they are to be attached to substantial floor plates or other structure. The connection of the arms to the bearing boss is to be by full penetration welding.

7. 6. 6 The scantlings of supports will be specially considered. In the case of certain high powered ships, direct calculations may be required.

7. 6. 7 The boss plating is generally to be radiused into the shell plating and supported at the aft end by diaphragms at every frame. These diaphragms are to be suitably stiffened and connected to floors or a suitable arrangement of main and deep web frames. At the forward end, the main frames may be shaped to fit the bossing, but deep webs are generally to be fitted not more than four frame spaces apart.

7. 6. 8 The region where the shafting enters the ship, and the bearing in way, are to be adequately supported by floors or deep webs.

Figure 6. 7. 5: Propeller posts

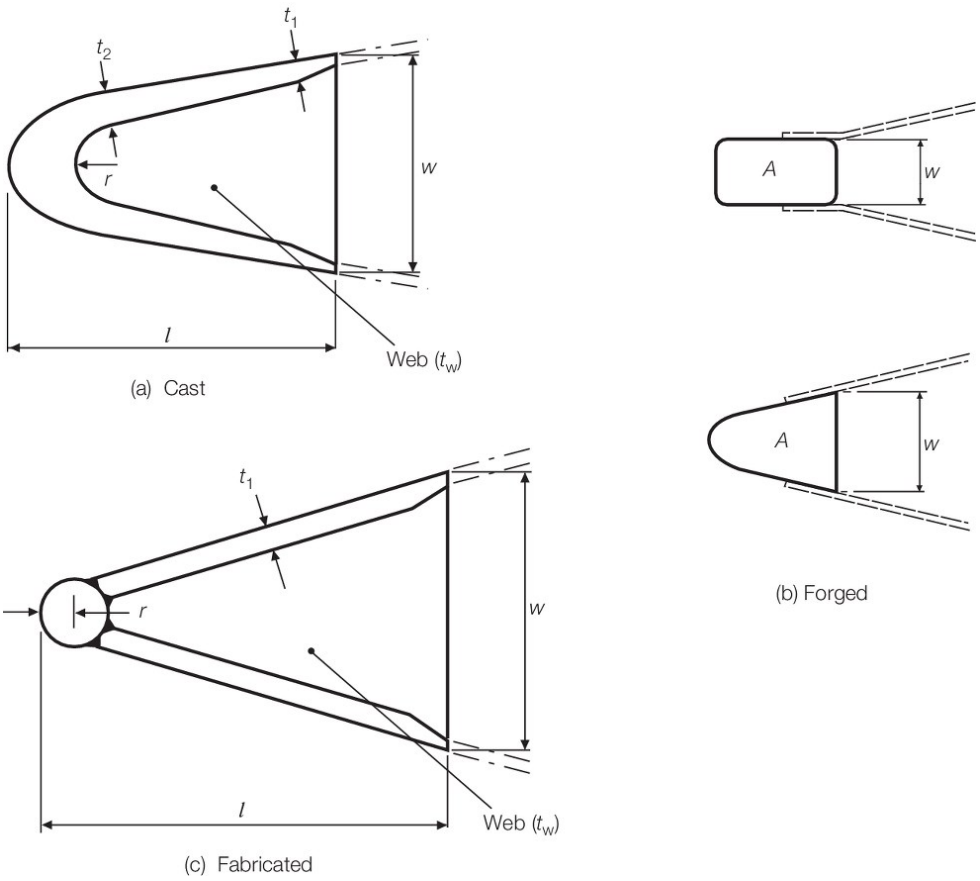


Figure 6. 7. 6: Propeller boss

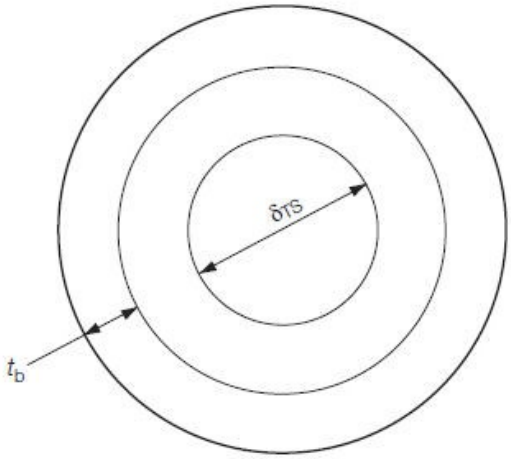

7. 7 Shaft brackets

7. 7. 1 The scantlings of the arms of shaft brackets, generally based on a breadth to thickness ratio of about five, are to be determined in accordance with Pt 3, Ch 6, 7.8 Double arm shaft brackets ('A' – brackets) 7.8.2.

7. 7. 2 Where the propeller shafting is exposed to the sea for some distance clear of the main hull, it is generally to be supported adjacent to the propeller by independent brackets having two arms. In very small ships, the use of single arm brackets will be specially considered.

7. 7. 3 Fabricated brackets are to be designed to avoid or reduce the effect of hard spots and ensure a satisfactory connection to the hull structure. The connection of the arms to the bearing boss is to be by full penetration welding.

7. 7. 4 Where bracket arms are carried through the shell plating, they are to be attached to floors or girders of increased thickness. The shell plating is to be increased in thickness and connected to the arms by full penetration welding.

7. 7. 5 In the case of certain high powered ships, direct calculations may be required and scantlings of shaft brackets will be specially considered.

7. 7. 6 The region where the shafting enters the ship, and the bearing in way, is to be adequately supported by floors or deep webs.

Figure 6. 7. 7: Rudder axle

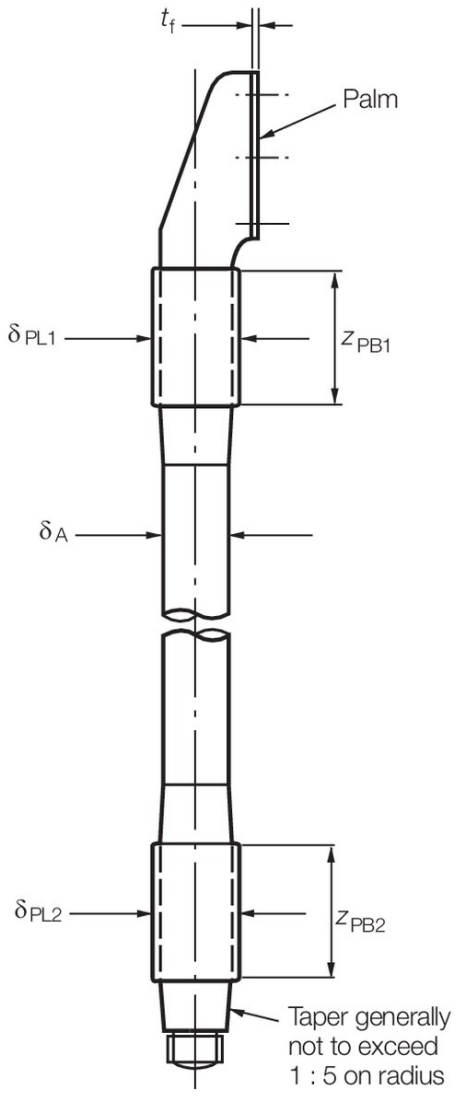

Figure 6. 7. 8: Rudder post for twin screw ships

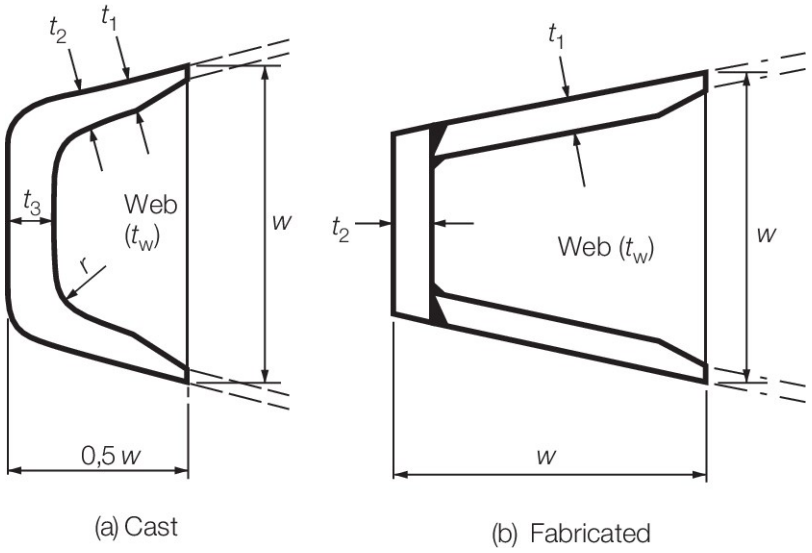


7. 8 Double arm shaft brackets ('A' – brackets)

7. 8. 1 The angle between the arms for double arm shaft brackets is generally to be not less than 50°. Proposals for the angle between the arms to be less than 50° will be specially considered with supporting calculations to be submitted by the designers.

7. 8. 2 The arms of double arm shaft brackets are to have a section modulus, Z_{xx}, of not less than that determined from the formula:

$$Z_{xx} = 0.45n^3 \text{ cm}^3$$

Where

n = the minimum thickness, in cm, of a hydrofoil section obtained from:

$$n = d_{up}\sqrt{\left(\frac{f}{2000}\right)\left(1+\sqrt{\left(1+\left(\frac{0.0112}{f}\right)\left(\frac{a_d}{d_{up}}\right)^2\right)}\right)} \text{ cm}$$

ad = the length of the longer strut, in mm, *See* Figure 6. 7. 9: Double arm shaft bracket

dup = the Rule diameter for an unprotected screwshaft, in mm, or by the applicable Ice Class Rules, *See* Pt 8, Ch 2, 7.8 Screwshafts, obtained from:.

$$d_{up} = 128\sqrt[3]{P/R}$$

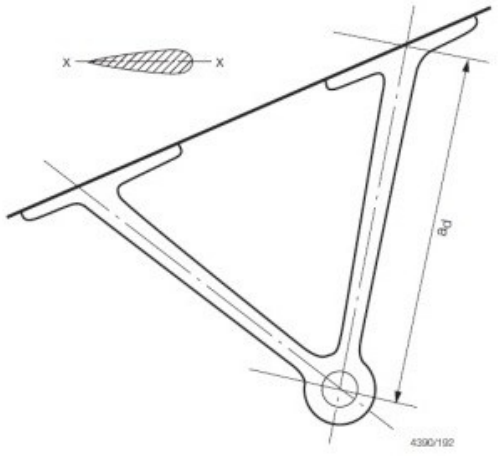
P = shaft power, in kW as defined in Pt 5, Ch 1, 3.3 Power ratings

R revolutions per minute, as defined in Pt 5, Ch 1, 3.3 Power ratings

$f = 400/\sigma_u$

σu = ultimate tensile strength of arm material, in N/mm2.

Figure 6. 7. 9: Double arm shaft bracket



7. 9 Propeller hull clearances

7. 9. 1 Recommended minimum clearances between the propeller and the sternframe, rudder or hull are given in Table 6. 7. 8: Recommended propeller/hull clearances. These are the minimum distances considered desirable in order to expect reasonable levels of propeller excited vibration. Attention is drawn to the importance of the local hull form characteristics, shaft power, water flow characteristics into the propeller disc and cavitation when considering the recommended clearances.

CHAPTER **7** **Machinery Spaces**

SECTION **1** **General**

1. 1 Application

1. 1. 1 This Chapter applies to all ship types detailed in Pt 4 Ship Structures (Ship Types). Only requirements particular to machinery spaces, including protected machinery casings and engine seatings, are given. For other scantlings and arrangement requirements, *See* the relevant Chapter in Pt 4 Ship Structures (Ship Types) for the particular ship type concerned.

1. 1. 2 Requirements are given for machinery spaces situated as follows:

a. In the midship region.
b. In the aft end region but with a cargo compartment between it and the after peak bulkhead.
c. In the aft end region where the after peak bulkhead forms the aft end of the machinery space.

1. 1. 3 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation. *See* Pt 1, Ch 2, 2.3 Class notations (hull).

1. 2 Structural configuration

1. 2. 1 Requirements are given for ships constructed using either a transverse framing system or a longitudinal framing system, or a combination of the two.

1. 2. 2 For midship machinery spaces, where the shell and decks (outside line of openings) are longitudinally framed in way of adjacent cargo spaces, this system of framing is also to be adopted in the machinery space.

1. 2. 3 For machinery spaces situated aft, where the longitudinal framing terminates and is replaced by transverse framing, a suitable scarfing arrangement of the longitudinal framing is to be arranged, *See also* Pt 3, Ch 6, 1 General.

1. 2. 4 The maximum spacing, S_{max}, of transverses in longitudinally framed machinery spaces is not to exceed the following:

a. where $L \leq 100$ m, $S_{max} = 3.8$ m
b. where $L > 100$ m, $S_{max} = (0.006L + 3.2)$ m

In addition, the spacing in way of a machinery space situated adjacent to the after peak is not to exceed five transverse frame spaces.

1. 3 Structural continuity

1. 3. 1 Suitable scarfing arrangements are to be made to ensure continuity of strength and the avoidance of abrupt discontinuities where structure which contributes to the main longitudinal strength of the ship is omitted in way of a machinery space.

1. 3. 2 In cargo ships, suitable taper brackets are, in general, to be arranged in way of deck ends.

1. 3. 3 In oil tankers and bulk carriers with machinery aft (*See* Pt 3, Ch 6, 1.1 Application 1.1.3), continuity of the longitudinal bulkheads and topside tank structure is to be maintained as far as possible into the machinery space with suitable taper brackets at the end.

1. 3. 4 In container or similar ships having side tanks or double skin construction in way of the cargo spaces, the longitudinal bulkheads are generally to be carried through the machinery space where this is situated amidships or separated from the after peak by a cargo compartment. Where the machinery space is situated adjacent to the after peak, the longitudinal bulkheads are to be continued as far aft as possible and suitably tapered at their ends.

1. 4 Symbols and definitions

1. 4. 1 For symbols not defined in this Chapter, *See* Pt 4, Ch 1 General Cargo Ships. L, B, D and T are defined in Pt 3, Ch 1, 6.1, Principal particulars. Other symbols are defined in the appropriate Sections.

PART

3

CHAPTER **7** **Machinery Spaces**

SECTION **2** **Deck structure**

2. 1 Strength deck – Plating

2. 1. 1 The corners of machinery space openings are to be of suitable shape and design to minimise stress concentrations.

2. 1. 2 In the case of oil tankers (*See* Pt 3, Ch 6, 1.1 Application 1.1.3), or other ships having small deck openings amidships and machinery aft, where the width of machinery openings exceeds $\frac{B}{2}$ and the opening extends forward beyond a point $\frac{B}{3}$ aft of the poop front, the thickness of deck plating may be required to be increased locally.

2. 2 Strength deck – Primary structure

2. 2. 1 Where a transverse framing system is adopted, deck beams are to be supported by a suitable arrangement of longitudinal girders in association with pillars or pillar bulkheads. Deep beams are to be arranged in way of the ends of engine casings and also in line with web frames where fitted.

2. 2. 2 Where a longitudinal framing system is adopted, deck longitudinals are to be supported by transverses in association with pillars or pillar bulkheads. For the maximum spacing of transverses, *See* Pt 3, Ch 7, 1.2 Structural configuration 1.2.4. Deck transverses are to be in line with side transverses or web frames.

2. 2. 3 Machinery casings are to be supported by a suitable arrangement of deep beams or transverses and longitudinal girders in association with pillars or pillar bulkheads. In way of particularly large machinery casing openings, cross ties may be required, and these are to be arranged in line with deep beams or transverses.

2. 3 Lower decks

2. 3. 1 The scantlings of lower decks or flats are generally to be as detailed in Pt 3, Ch 5, 2 Deck structure, Pt 3, Ch 6, 2 Deck structure or Pt 4, Ch 1, 4 Deck structure, as appropriate. However, in way of concentrated loads such as those from boiler bearers or heavy auxiliary machinery, etc. the scantlings of deck structure will be specially considered, taking account of the actual loading.

2. 3. 2 In way of machinery openings, etc. particularly towards the aft end, decks or flats are to have sufficient strength where they are intended as effective supports for side framing, webs or transverses. Web frames and side transverses are to be supported by deep beams or deck transverses.

PART

3

CHAPTER **7** **Machinery Spaces**

SECTION **3** **Side shell structure**

3. 1 Secondary stiffening

3. 1. 1 Transverse frames are generally to have scantlings determined as required by Pt 4, Ch 1, 6 Shell envelope framing for cargo spaces, except that where, in a machinery space situated in the midship region, it is desired to omit web frames as permitted by Pt 3, Ch 7, 3.2 Primary structure - Transverse framing 3.2.3, the section modulus of the ordinary main or 'tween deck frames is to be increased by 50 per cent, up to the level of the lowest deck above the load waterline. Where fully effective stringers supported by web frames are fitted, the stringers may be considered as decks for the purpose of calculating the modulus of the frames.

3. 1. 2 Longitudinal framing is generally to have scantlings determined as required by Pt 4, Ch 1, 6 Shell envelope framing for machinery spaces in the midship region, and by Table 6. 4. 1: Shell framing (longitudinal) aft Location 2(b) in Chapter 6 for machinery spaces clear of and aft of the midship region.

3. 2 Primary structure - Transverse framing

3. 2. 1 Where the space is situated in the aft end region, web frames are to be fitted, spaced in general not more than five frame spaces apart, extending from the tank top to the upper deck and having scantlings as required by Table 7. 3. 1: Primary structure in machinery spaces. However, consideration will be given to a spacing of web frames at not more than seven transverse frame spaces apart, in association with substantially increased ordinary frames to satisfy the overall modulus and inertia requirements. The web frames are to be connected at top and bottom to members of adequate stiffness and supported at lower decks by deep beams. If the span of ordinary frames below the lowest deck or flat exceeds 6.5 m, one or more fully effective side stringers are to be fitted to support the frames. These are to have scantlings as required by Table 7. 3. 1: Primary structure in machinery spaces. Stringers are to be efficiently bracketed to bulkheads, and their connection to the web frames is to be such as to provide adequate continuity of face material.

3. 2. 2 As an alternative to the fully effective stringers required by Pt 3, Ch 7, 3.2 Primary structure - Transverse framing 3.2.1, an arrangement of light stringers spaced about 2.5 m apart may be accepted. These stringers are to have scantlings not less than those required in the panting region forward, *See* Pt 3, Ch 5, 4.4 Panting stringers in way of transverse framing.

3. 2. 3 Where the machinery space is situated in the midship region, it is recommended that web frames be fitted in the engine-room, spaced not more than five frame spaces apart and extending from the tank top to the level of the lowest deck above the load waterline. The scantlings of these webs are to be such that the combined section modulus of the web frame and the main or 'tween deck frames is 50 per cent greater than that required for normal transverse framing. These webs may be omitted if the section modulus of the transverse frames is increased as required by Pt 3, Ch 7, 3.1 Secondary stiffening 3.1.1.

3. 2. 4 If an effective side stringer supporting the side frames is fitted, then its scantlings and those of the supporting web frames are to be determined from Table 7. 3. 1: Primary structure in machinery spaces.

3. 3 Primary structure - Longitudinal framing

3. 3. 1 Where the machinery space is longitudinally framed, side transverses are to be fitted having scantlings as required by Table 7. 3. 1: Primary structure in machinery spaces. For the maximum spacing of transverses, *See* Pt 3, Ch 7, 1.2 Structural configuration 1.2.4. Transverses are to be connected at top and bottom to members of adequate stiffness and supported at lower decks by transverses or deep beams.

Table 7. 3. 1: Primary structure in machinery spaces

Symbols	Item and position	Scantlings	
		Section modulus, in cm^3	Min. web depth d_w, in mm
L, D and T are as defined in Pt 3, Ch 1, 6.1, Principal particulars h =load head, in metres, measured from mid-point of span to upper deck at side amidships k=higher tensile and steel factor, *See* Pt 3, Ch 2, 1.2, Steel l_e=effective length of stiffening member, in metres, *See* Pt 3, Ch 3, 3.3 Determination of span point s=spacing of floors and longitudinals, in mm C=2.2 for a lower 'tween deck or 2.0 for an upper 'tween deck S=spacing or mean spacing of primary supporting members, in metres	TRANSVERSE FRAMING SYSTEM Aft end region: Web frames below lowest deck and not supporting effective stringers	$Z = 5kShl_e^2$	2.5×depth of adjacent main frames
	Web frames above lowest deck	$Z = 1.68CkTSl_e\sqrt{D}$	
	Any region: Fully effective stringers	$Z = 7.75kShl_e^2$	2.5×depth of adjacent main frames
	Web frames below lowest deck supporting effective stringers	Determined from calculation based on following assumptions: (a) Fixed ends (b) Point loadings (c) Head to upper deck at side (d) Bending stress 93.2 N/mm^2 (e) Shear stress 83.4 N/mm^2	
	LONGITUDINAL FRAMING SYSTEM Side transverses below lowest deck Side transverses above lowest deck	$Z = 10kShl_e^2$ $Z = 2.1CkTSl_e\sqrt{D}$	2.5 × depth of longitudinals

CHAPTER 7 **Machinery Spaces**

SECTION 4 **Double and single bottom structure**

4. 1 Double bottom structure

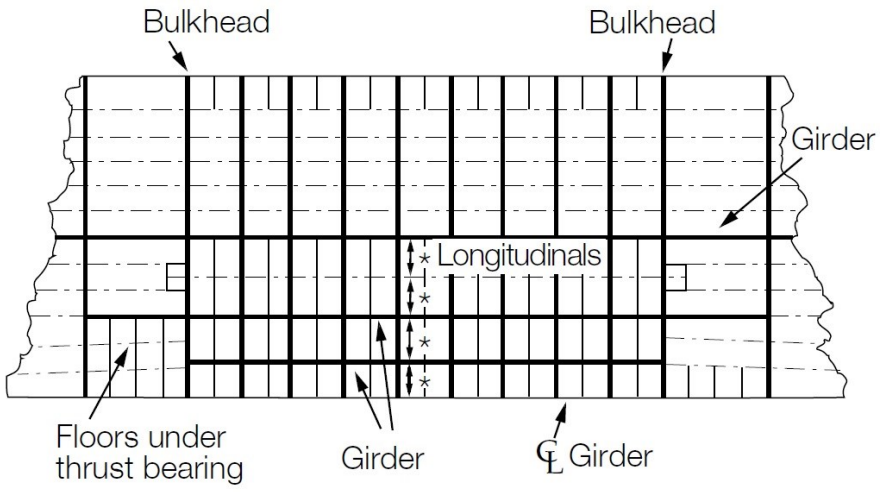
4. 1. 1 The minimum depth of the centre girder and its thickness are to be at least the same as required in way of cargo space amidships, *See* Pt 4, Ch 1, 8 Double bottom structure. A greater depth is recommended in way of large engine-rooms when the variation in draught between light and load conditions is considerable. For passenger ships, *See* Pt 4, Ch 2, 6 Double bottom.

4. 1. 2 In machinery spaces situated adjacent to the after peak, the double bottom is to be transversely framed. Elsewhere transverse or longitudinal framing may be adopted, but *See also* Pt 4, Ch 1, 8 Double bottom structure.

4. 1. 3 Where the double bottom is transversely framed, plate floors are to be fitted at every frame in the engine-room. In way of boilers, plate floors are to be fitted under the boiler bearers, and elsewhere as required by Pt 4, Ch 1, 8 Double bottom structure.

4. 1. 4 Where the double bottom is longitudinally framed, plate floors are to be fitted at every frame under the main engines and thrust bearing. Outboard of the engine seating, floors may be fitted at alternate frames, *See* Figure 7. 4. 1: Engine-room with longitudinal framing.

Figure 7. 4. 1: Engine-room with longitudinal framing



*Maximum spacing = 1,5 x normal spacing of longitudinals

4. 1. 5 The scantlings of floors clear of the main engine seatings, are generally to be as required in way of cargo spaces, *See* Pt 4, Ch 1, 8 Double bottom structure. In way of engine seatings, the floors are to be increased in thickness, *See* Pt 3, Ch 7, 6.2 Seats for engines 6.2.1.

4. 1. 6 Sufficient fore and aft girders are to be arranged in way of the main machinery to effectively distribute its weight and to ensure adequate rigidity of the structure. In midship machinery spaces these girders are to extend for the full length of the space and are to be carried aft to support the foremost shaft tunnel bearing. This extension beyond the after bulkhead of the engine-room is to be for at least three transverse frame spaces, aft of which the girders are to scarf into the structure. Forward of the engine-room bulkhead, the girders are to be tapered off over three frame spaces and effectively scarfed into the structure. In machinery spaces situated at the aft end the girders are to be carried as far aft as practicable and the ends effectively supported by web frames or transverses. For recommended scantlings of engine girders, *See* Pt 3, Ch 7, 6.2 Seats for engines 6.2.1.

4. 1. 7 Outboard of the engines, side girders are to be arranged, where practicable, to line up with the side girders in adjacent cargo spaces. These are to have scantlings as required by Pt 4, Ch 1, 8 Double bottom structure.

4. 1. 8 Where the double bottom is longitudinally framed and transverse floors are fitted in way of the engine seatings as required by Pt 3, Ch 7, 4.1 Double bottom structure 4.1.4, no additional longitudinal stiffening is required in way of the engines other than the main engine girders, provided that the spacing of girders does not exceed 1.5 times the normal spacing of longitudinals. Where this spacing of girders is exceeded, shell longitudinals are to be fitted. These are to scarf into the longitudinal framing clear of the machinery spaces. The scantlings of the longitudinals are to be determined as required by Pt 4, Ch 1, 6 Shell envelope framing using a minimum span of 1.3 m, *See* Figure 7. 4. 1: Engine-room with longitudinal framing.

4. 1. 9 The thickness, t, of inner bottom plating in engine-rooms, clear of the engine seatings, is to be not less than:

$$t = 0.0015\sqrt[4]{LTk^2}(s + 660)\text{mm}$$

and not less than 7.0 mm (symbols as defined in Table 7. 3. 1: Primary structure in machinery spaces). This thickness will be required to be increased in way of engine seatings integral with the tank top, *See* Pt 3, Ch 7, 6.2 Seats for engines 6.2.1.

4. 1. 10 Where the height of inner bottom in the machinery spaces differs from that in adjacent spaces, continuity of longitudinal material is to be maintained by sloping the inner bottom over an adequate longitudinal extent. The knuckles in the plating are to be arranged close to plate floors.

4. 2 Single bottom structure

4. 2. 1 In way of machinery spaces situated amidships the minimum depth of floors is to be at least 10 per cent greater than that required elsewhere in general cargo ships, *See* Pt 4, Ch 1, 7 Single bottom structure. If the top of the floors is recessed in way of the engines, the depth of the floors in way of the recess should generally be not less than that required by Pt 4, Ch 1, 7 Single bottom structure, but this will be specially considered in each case in relation to the arrangements proposed.

4. 2. 2 In way of machinery spaces situated aft, or where there is considerable rise of floor, the depth of the floors will be specially considered.

4. 2. 3 Clear of the engine seatings the thickness and face plate area of the floor webs are to be 1.0 mm and 10 per cent greater, respectively, than the requirements for general cargo ships as given in Pt 4, Ch 1, 7 Single bottom structure. The floors are not to be flanged.

4. 2. 4 Sufficient fore and aft girders are to be arranged in way of machinery to effectively distribute its weight and ensure adequate rigidity of the structure. In midship machinery spaces these girders are to extend for the full length of the space and are to be carried aft to support the foremost shaft tunnel bearing and forward to scarf into the structure. In machinery spaces situated at the aft end, the girders are to be carried as far aft as practicable and the ends effectively supported by web frames or transverses. For scantlings of engine girders, *See* Pt 3, Ch 7, 6.2 Seats for engines 6.2.1.

4. 2. 5 Outboard of the engines, side girders are to be arranged having scantlings as required by Pt 4, Ch 1, 7 Single bottom structure and these are to be scarfed into the side girders in adjacent spaces.

PART

3

CHAPTER **7** **Machinery Spaces**

SECTION **5** **Machinery casings and fuel oil bunkers**

5. 1 Machinery casings

5. 1. 1 The scantlings and arrangements of exposed casings protecting machinery openings are to be in accordance with Pt 3, Ch 8, 2 Scantlings of erections other than forecastles.

5. 1. 2 The minimum scantlings of protected casings are to be in accordance with Table 7. 5. 1: Protected machinery casings.

Table 7. 5. 1: Protected machinery casings

Item	Minimum scantlings
Plating: In way of cargo hold spaces In way of accommodation spaces	 $t = 6.5\sqrt{k}$ mm $t = 5.0\sqrt{k}$ mm
Stiffeners	$Z = 0.008 l_e s k$ cm^3
Symbols	
k = higher tensile steel factor, *See* Pt 3, Ch 2, 1.2, Steel l_e= effective length of stiffening member, in metres, *See* Pt 3, Ch 3, 3.3 Determination of span point s = spacing of stiffeners, in mm t = thickness, in mm Z = section modulus of stiffening member, in cm^3, *See* Pt 3, Ch 3, 3.2 Geometric properties of section	
Note In no case is the depth of the stiffener to be less than 60 mm.	

5. 1. 3 Where casing stiffeners carry loads from deck transverses, girders, etc. or where they are in line with pillars below, they are to be suitably increased, *See also* Pt 4, Ch 1, 4 Deck structure.

5. 1. 4 Where casing sides act as girders supporting decks over, care is to be taken that access openings do not seriously weaken the structure. Openings are to be effectively framed and reinforced if found necessary. Particular attention is to be paid to stiffening where the casing supports the funnel or exhaust uptakes.

5. 2 Fuel oil bunkers

5. 2. 1 Fuel oil bunkers situated within the machinery space are generally to comply with the requirements given in Pt 4, Ch 1 General Cargo Ships or Pt 3, Ch 9 Special Features, as appropriate.

PART

3

CHAPTER **7** **Machinery Spaces**

SECTION **6** **Engine seatings**

6. 1 General

6. 1. 1 Main engines and thrust bearings are to be effectively secured to the hull structure by seatings of adequate scantlings to resist the various gravitational, thrust, torque, dynamic and vibratory forces which may be imposed on them.

6. 1. 2 For initial guidance, recommended scantlings for engine seatings are given in Pt 3, Ch 7, 6.2 Seats for engines 6.2.1.

6. 1. 3 In the case of higher power engines or turbine installations the seatings should generally be integral with the double bottom structure. The tank top plating in way of the engine foundation plate or the turbine gear case and the thrust bearing should be substantially increased in thickness, *See* Figure 7. 6. 1: Engine seatings, Type 1.

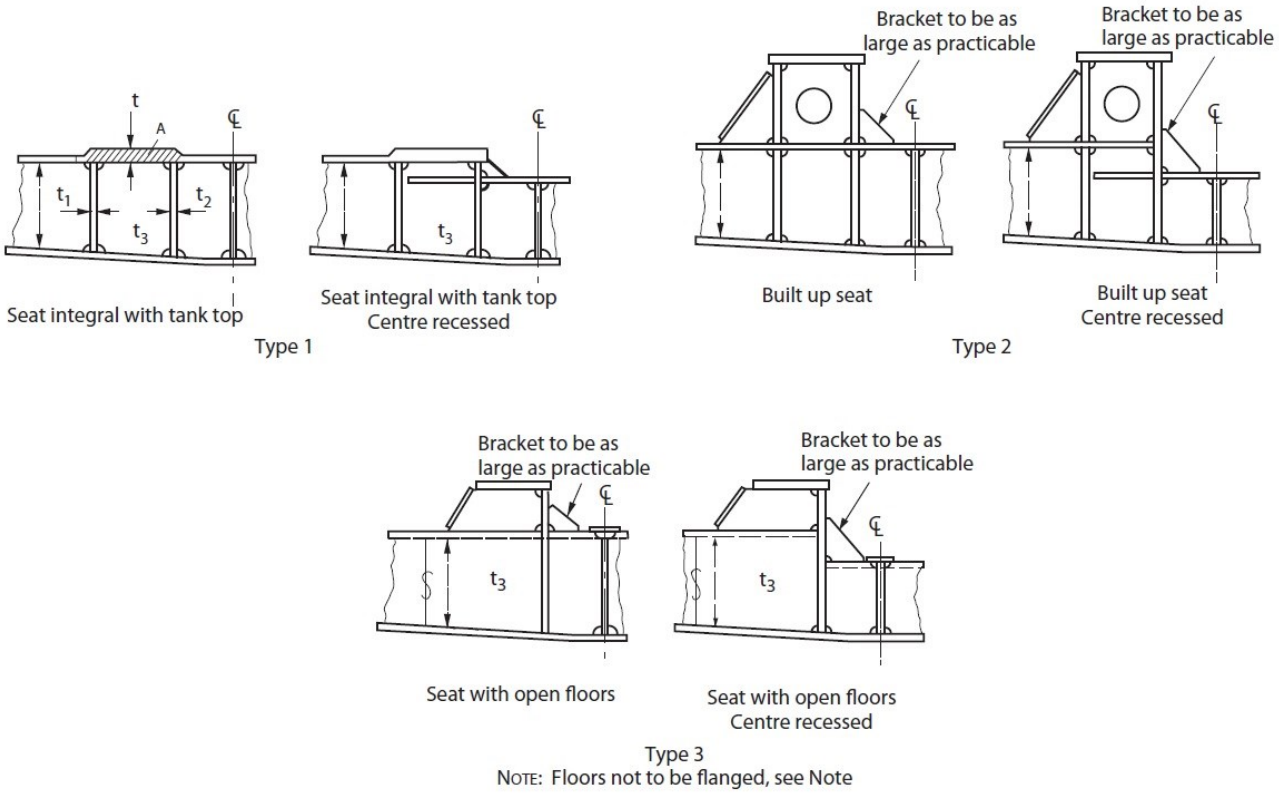
6. 1. 4 If the main machinery is supported on seatings of Type 2 as shown in Figure 7. 6. 1: Engine seatings, these are to be so designed that they distribute the forces from the engine as uniformly as possible into the supporting structure. Longitudinal members supporting the seating are to be arranged in line with girders in the double bottom, and adequate transverse stiffening is to be arranged in line with floors, *See* Figure 7. 6. 1: Engine seatings, Type 2.

6. 1. 5 In ships having open floors in the machinery space the seatings are generally to be arranged above the level of the top of floors and securely bracketed to them, *See* Figure 7. 6. 1: Engine seatings, Type 3.

6. 2 Seats for engines

6. 2. 1 In determining the scantlings of seats for engines, consideration is to be given to the general rigidity of the engine itself and to its design characteristics in regard to out of balance forces. As a general guide to designers, recommended scantlings are given in Table 7. 6. 1: Seats for engines - Recommended scantlings.

Figure 7. 6. 1: Engine seatings



Note *See* Pt 3, Ch 7, 4.2 Single bottom structure 4.2.3

Table 7. 6. 1: Seats for engines - Recommended scantlings

Symbols	Item	Scantlings of one seat
L as defined in Pt 3, Ch 1, 6.1, Principal particulars f=engine factor $=\frac{P}{Rl}$ t=minimum thickness of top plate, in mm	Top plate	$A = (120 + 44.2f + 4.07f^2)\text{cm}^2$
t_1, t_2=main engine girder thicknesses, in mm t_3=floor plate thickness under seating, in mm, *See also* Figure 7. 6. 1: Engine seatings A=area of top plate for one side of seat, in cm^2		Minimum thickness: (a) Where two girders fitted $t = (19 + 3.4f)$ mm (b) Where one girder fitted $t = (25 + 3.4f)$ mm
	Girders (both inside and above double bottom where fitted)	Number:

where *l*=effective length of engine foundation plate, in metres, required for bolting the engine to the seating. =The thrust and gearcase seating is to be considered as a separate item *P*=power of one engine at maximum service speed, in kW (bhp)		Generally two but a single girder can be accepted where all the following apply: (a) $f < 1.84$ (b) $P < 5900$ kW (c) $L < 100$ m
R=rev/min of engine at maximum service speed		Total thickness: (a) Where two girders are fitted $t_1 + t_2 = (28 + 4.08f)$ mm (b) Where one girder is fitted $t_1 = (15 + 4.08f)$ mm
	Floors (between girders or under seat where a single girder is fitted)	Thickness: $t_3 = (10 + 1.5f)$ mm

6. 3 Seats for turbines

6. 3. 1 Seats are to be so designed as to provide effective support for the turbines and ensure their proper alignment with the gearing, and (where applicable) allow for thermal expansion of the casings. In general, the seats are not to be arranged in way of breaks or recesses in the double bottom.

6. 4 Seats for boilers

6. 4. 1 Boiler bearers are to be of substantial construction and efficiently supported by transverse and horizontal brackets. These should generally be arranged in line with plate floors and girders in a double bottom or with suitable deep beams or transverses and girders at boiler flats. Suitable allowance is to be made in the design of the supporting structure for the variation in loading due to thermal expansion effects, *See also* Pt 5, Ch 14, 2 Fuel oil - General requirements.

6. 5 Seats for auxiliary machinery

6. 5. 1 Auxiliary machinery is to be secured on seatings, of adequate scantlings, so arranged as to distribute the loadings evenly into the supporting structure.

CHAPTER 8 Superstructures, Deckhouses and Bulwarks

SECTION 1 General

1. 1 Application

1. 1. 1 This Chapter applies to all types of ships detailed in Pt 4 Ship Structures (Ship Types), except for deckhouses situated on forecastles of offshore supply ships, which are dealt with separately in Pt 4, Ch 4 Offshore Support Vessels.

1. 1. 2 The scantlings of exposed bulkheads and decks of superstructures and deckhouses are generally to comply with the following requirements, but increased scantlings may be required where the structure is subjected to loading additional to Rule. Where there is no access from inside the house to below the freeboard deck, or where a bulkhead is in a particularly sheltered location, the scantlings may be specially considered.

1. 1. 3 The term `erection' is used in this Section to include both superstructures and deckhouses.

1. 1. 4 For requirements relating to companionways, doors, accesses and skylights, *See* Pt 3, Ch 11 Closing Arrangements for Shell, Deck and Bulkheads.

1. 1. 5 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation. *See* Pt 1, Ch 2, 2.3 Class notations (hull).

1. 2 Symbols

1. 2. 1 The following symbols and definitions are applicable to this Chapter, unless otherwise stated:

L, B, T and C_b	=	as defined in Pt 3, Ch 1, 6.1, Principal particulars
b	=	breadth of deckhouse, at the positions under consideration, in metres
k	=	higher tensile steel factor, *See* Pt 3, Ch 2, 1.2, Steel
l_e	=	effective length, in metres, of the stiffening member, deck beam or longitudinal measured between span points, *See* Pt 3, Ch 3, 3.3 Determination of span point
l_s	=	span, in metres, of stiffeners, and is to be taken as the 'tween deck or house height but in no case as less than 2.0 m
s	=	spacing of stiffeners, beams or longitudinals, in mm
s_b	=	standard spacing, in mm, of stiffeners, beams or longitudinals, and is to be taken as:

(a) for 0.05L from the ends:

s_b = 610 mm or that required by (b), whichever is the lesser

= (b) elsewhere:

s_b = $470 + 1.67L_2$ mm

= but forward of $0.2L$ from the forward perpendicular s_b is not to exceed 700 mm

B_1 = actual breadth of ship, at the section under consideration, measured at the weather deck, in metres

D = moulded depth of ship, in metres, to the uppermost continuous deck or the deck next above a height of $1.6T$ from the base line amidships, whichever is the lesser

L_2 = length of ship, in metres, but is not to be taken greater than 250 m or less than 50 m

L_3 = length of ship, in metres, but is not to be taken greater than 300 m

X = distance, in metres, between the after perpendicular and the bulkhead under consideration. When determining the scantlings of deckhouse sides, the deckhouse is to be subdivided into parts of approximately equal length not exceeding $0.15L$ each, and X is to be measured to the mid-length of each part

α = a coefficient given in Table 8. 1. 1: Values of α

β = $1.0 + \left(\frac{\left(\frac{X}{L} - 0.45\right)}{(C_b + 0.2)}\right)^2 f$ or $\frac{X}{L} \leq 0.45$

= $1.0 + 1.5\left(\frac{\left(\frac{X}{L} - 0.45\right)}{(C_b + 0.2)}\right)^2 f$ or $\frac{X}{L} > 0.45$

= C_b is to be taken as not less than 0.6 nor greater than 0.8. Where the aft end of an erection is forward of amidships, the value of C_b used in determining β for the aft end bulkhead need be taken as not less than 0.8

γ = vertical distance, in metres, from the summer load waterline to the mid-point of span of the bulkhead stiffener, or the mid-point of the plate panel, as appropriate

δ = 1.0 for exposed machinery casings and houses protecting openings to pump-rooms

= $\left(0.3 + 0.7\frac{b}{B_1}\right)$elsewhere, but in no case to be taken less than 0.475

λ = a coefficient given in Table 8. 1. 2: Values of λ

1. 3 Definition of tiers

1. 3. 1 The lowest, or first tier, is normally that which is directly situated on the deck to which *D* is measured. The second tier is the next tier above the lowest tier and so on.

Table 8. 1. 1: Values of α

Position		α
Lowest tier	- unprotected front	$2.0 + 0.0083\mathrm{L}_3$
Second tier	- unprotected front	$1.0 + 0.0083\mathrm{L}_3$
Third tier and above	- unprotected front	$0.5 + 0.0067\mathrm{L}_3$
All tiers	- protected fronts	
All tiers	- sides	
All tiers	- aft end where aft of amidships	$0.7 + 0.001\mathrm{L}_3 - 0.8\frac{X}{L}$
All tiers	- aft end where forward of amidships	$0.5 + 0.001\mathrm{L}_3 - 0.4\frac{X}{L}$

Table 8. 1. 2: Values of λ

Length *L*	λ	Expression for λ
metres		$\mathrm{L} \leq 150$ m $\lambda = (\frac{L}{10}e^{-\frac{L}{300}}) - (1 - (\frac{L}{150})^2)$
20	0.89	
30	1.76	
40	2.57	
50	3.34	
60	4.07	
70	4.76	
80	5.41	
90	6.03	
110	7.16	
130	8.18	
150	9.10	
150	9.10	$150\text{ m} \leq \mathrm{L} \leq 300\text{ m}\ \lambda = \frac{L}{10}e^{-\frac{L}{300}}$
170	9.65	
190	10.08	
210	10.43	
230	10.69	
250	10.86	
270	10.98	

290	11.03	
300	11.03	
300 and above	11.03	$L \geq 300$ m $\lambda = 11.03$

1. 3. 2 Where the freeboard corresponding to the required summer moulded draught for the ship can be obtained by considering the ship to have a virtual moulded depth at least one standard superstructure height less than the Rule depth, *D*, measured to the uppermost continuous deck, proposals to treat the first tier erection as a second tier, and so on, will be specially considered. The standard height of superstructure is the height defined in the *International Convention on Load Lines, 1966*.

1. 4 Design pressure head

1. 4. 1 The design pressure head, *h*, to be used in the determination of erection scantlings is to be taken as:

$$h = \alpha\delta(\beta\lambda - \gamma) \text{ m}$$

1. 4. 2 In no case is the design pressure head to be taken as less than the following:

a. Lowest tier of unprotected fronts:
minimum $h = 2.5 + 0.01L_2$ m

b. All other locations:
minimum $h = 1.25 + 0.005L_2$ m.

PART

3

CHAPTER 8 **Superstructures, Deckhouses and Bulwarks**

SECTION 2 **Scantlings of erections other than forecastles**

2. 1 Thickness of bulkhead and side plating

2. 1. 1 The thickness, *t*, of plating of the fronts, sides and aft ends of all erections, other than the sides of superstructures where these are an extension of the side shell, is to be not less than:

$$t = 0.003s\sqrt{kh}\ \text{mm}$$

but in no case is the thickness to be less than:

a. for the lowest tier:

$t = (5.0 + 0.01L_3)\sqrt{k}$ mm

b. for the upper tiers:

$t = (4.0 + 0.01L_3)\sqrt{k}$ mm but not less than 5.0 mm

2. 1. 2 The thickness of sides of poops and bridges is to be as required by Pt 3, Ch 6, 3 Shell envelope plating or Pt 4, Ch 1, 5 Shell envelope plating, as appropriate.

2. 2 Stiffeners and their connections

2. 2. 1 The modulus of stiffeners, *Z,* on front, side and end bulkheads of all erections, other than sides of superstructures, is to be not less than:

$$Z = 0.0035hsl_s^2k\ \text{cm}^3$$

2. 2. 2 The section modulus of side frames of poops and bridges is to comply with the requirements of Pt 3, Ch 6, 4 Shell envelope framing or Pt 4, Ch 1, 6 Shell envelope framing, as appropriate.

2. 2. 3 The end connections of stiffeners are to be as given in Table 8. 2. 1: Stiffener end connections.

2. 3 Deck plating

2. 3. 1 The requirements of Pt 3, Ch 8, 2.3, Deck plating need not apply to effective superstructure decks of passenger ships and ferries where direct calculations have been carried out in accordance with the SDA procedure relevant to the ship type.

2. 3. 2 The thickness of erection deck plating is to be not less than that required by Table 8. 2. 2: Thickness of deck plating.

2. 3. 3 When decks are fitted with approved sheathing, the thicknesses derived from Table 8. 2. 2: Thickness of deck plating may be reduced by 10 per cent for a 50 mm sheathing thickness, or 5 per cent for 25.5 mm, with intermediate values in proportion. The steel deck is to be coated with a suitable material in order to prevent corrosive action, and the sheathing or composition is to be effectively secured to the deck, *See also* Pt 6, Ch 4 Fire Protection, Detection and Extinction Requirements. Inside deckhouses the thickness may be reduced by a further 10 per cent.

Table 8. 2. 1: Stiffener end connections

Position	Attachment at top and bottom
1. Front stiffeners of lower tiers and of upper tiers when L is 160 m or greater	*See* Pt 3, Ch 10 Welding and Structural Details
2. Front stiffeners of upper tiers when L is less than 160 m	May be unattached
3. Side stiffeners of lower tiers where two or more tiers are fitted	Bracketed, unless stiffener modulus is increased by 20 per cent and ends are welded to the deck all round
4. Side stiffeners if only one tier is fitted, and aft end stiffeners of after deckhouses on deck to which D is measured	*See* Pt 3, Ch 10 Welding and Structural Details
5. Side stiffeners of upper tiers when L is 160 m or greater	*See* Pt 3, Ch 10 Welding and Structural Details
6. Side stiffeners of upper tiers when L is less than 160 m	May be unattached
7. Aft end stiffeners except as covered by item 4	May be unattached
8. Exposed machinery and pump-room casings - Front stiffeners on amidship casings and all stiffeners on aft end casings which are situated on the deck to which D is measured	Bracketed
9. All other stiffeners on exposed machinery and pump-room casings	6.5 cm^2 of weld

Table 8. 2. 2: Thickness of deck plating

	Thickness of deck plating, in mm		
Position	$L \leq 100$ m		$L > 100$ m
Top of first tier erection	$(5.5 + 0.02L)\sqrt{\frac{ks}{s_b}}$		$7.5\sqrt{\frac{ks}{s_b}}$
Top of second tier erection	$(5.0 + 0.02L)\sqrt{\frac{ks}{s_b}}$		$7.0\sqrt{\frac{ks}{s_b}}$
Top of third tier and above	$(4.5 + 0.02L)\sqrt{\frac{ks}{s_b}}$	but not less than 5.0 mm	$6.5\sqrt{\frac{ks}{s_b}}$

2. 4 Deck longitudinals and beams

2. 4. 1 The requirements of Pt 3, Ch 8, 2.4, Deck longitudinals and beams need not apply to effective superstructure decks of passenger ships and ferries where direct calculations have been carried out in accordance with the SDA procedure relevant to the ship type.

2. 4. 2 The section modulus of superstructure deck longitudinals and beams is to be in accordance with the requirements for location (2) in Table 1. 4. 4: Cargo and accommodation deck longitudinals

and location (3) in Pt 4, Ch 1 General Cargo Ships, using design heads not less than those specified in Table 3.5.1 in Chapter 3 for superstructure decks.

2. 4. 3 Transverse deck beams in deckhouses and deck longitudinals other than as in Pt 3, Ch 8, 2.7 Erections contributing to hull strength are to have a section modulus, Z, not less than:

$Z = 0.0048\ h_2\ sle^2k\ cm^3$, but in no case less than:

$Z = 0.025 sm^3$

and the value of h_2, the load head, is to be taken as not less than:

on first tier decks	0.9 m
on second tier decks	0.6 m
on third tier decks and above	0.45 m

2. 5 Deck girders and transverses

2. 5. 1 The section modulus of deck girders and transverses is to be in accordance with the requirements for location (1) in Table 1. 4. 6: Deck girders, transverses and hatch beams inPt 4, Ch 1 General Cargo Ships, using design heads not less than those specified in Table 3. 5. 1: Design heads and permissible cargo loadings for superstructure decks.

2. 6 Strengthening at ends and sides of erections

2. 6. 1 Web frames or partial bulkheads are to be fitted within poops and bridges that have large deckhouses or other erections above.

2. 6. 2 Web frames or equivalent strengthening are also to be arranged to support the sides and ends of large deckhouses.

2. 6. 3 These web frames should be spaced about 9 m apart and are to be arranged, where practicable, in line with watertight bulkheads below. Webs are also to be arranged in way of large openings, boats, davits and other points of high loading.

2. 6. 4 Arrangements are to be made to minimise the effect of discontinuities in erections. All openings cut in the sides are to be substantially framed and have well rounded corners. Continuous coamings or girders are to be fitted below and above doors and similar openings. House tops are to be strengthened in way of davits. Special care is to be taken to minimise the size and number of openings in the side bulkheads in the region of the ends of erections within $0.5L$ amidships. Account is to be taken of the high vertical shear loading which can occur in these areas.

2. 6. 5 Adequate support under the ends of erections is to be provided in the form of webs, pillars, diaphragms or bulkheads in conjunction with reinforced deck beams. At the corners of houses and in way of supporting structures, attention is to be given to the connection to the deck, and inserts or equivalent arrangements are generally to be fitted especially for erections that are effective in resisting vertical hull girder bending as defined in Pt 3, Ch 3, 4.2 Collision bulkhead.

2. 6. 6 The side plating of bridges having a length of $0.15L$ or greater is to be increased in thickness by 25 per cent at the ends of the structure, and is to be tapered into the upper deck sheerstrake. This plating is to be efficiently stiffened at the upper edge and supported by web plates not more than 1.5 m from the end bulkhead. Proposals for alternative arrangements, including the use of higher tensile steel, will be individually considered.

2. 7 Erections contributing to hull strength

2. 7. 1 Where a long superstructure or deckhouse is fitted, extending at least $0.15L$, the scantlings of the first tier deck plating and longitudinals may be required to be increased, *See also* Pt 3, Ch 3, 3.4, Calculation of hull section modulus and Pt 3, Ch 4, 2.3 Open type ships.

2. 8 Unusual designs

2. 8. 1 Where superstructures or deckhouses are of unusual design, the strength is to be not less than that required by this Chapter for a conventional design.

3

CHAPTER 8 **Superstructures, Deckhouses and Bulwarks**

SECTION 3 **Aluminium erections**

3. 1 Scantlings

3. 1. 1 Where an aluminium alloy complying with Ch 8 Aluminium Alloys of the Rules for Materials (Part 2) is used in the construction of erections, the scantlings of these erections are to be increased (relative to those required for steel construction) by the percentages given in Table 8. 3. 1: Percentage increase of scantlings.

Table 8. 3. 1: Percentage increase of scantlings

Item	Percentage increase
Fronts, sides, aft ends, unsheathed deck plating	20
Decks sheathed in accordance with Pt 3, Ch 8, 2.3 Deck plating 2.3.3	10
Deck sheathed with wood, and on which the plating is fixed to the wood sheathing at the centre of each beam space	Nil
Stiffeners and beams	70
Scantlings of small isolated houses	Nil

3. 1. 2 The thickness, t, of aluminium alloy members is to be not less than:

$$t = 2.5 + 0.022 d_w \text{ mm need not exceed } 10 \text{ mm}$$

where

d_w = depth of the section, in mm

$$I = 5.25 Z l_e \text{ cm}^4$$

Where l_e is the effective length of the member in metres, as defined in Pt 3, Ch 8, 1.2 Symbols 1.2.1, and Z is the section modulus of the stiffener and attached plating calculated using the formulae in Pt 3, Ch 8, 2.2 Stiffeners and their connections 2.2.1 and Pt 3, Ch 8, 2.4 Deck longitudinals and beams 2.4.3, as applicable, taking k as 1.

3. 2 Bimetallic joints

3. 2. 1 Where aluminium erections are arranged above a steel hull, details of the arrangements in way of the bimetallic connections are to be submitted.

PART

3

CHAPTER **8** **Superstructures, Deckhouses and Bulwarks**

SECTION **4** **Forecastles**

4. 1 Construction

4. 1. 1 Side plating and framing of forecastles are to comply with the requirements of Pt 3, Ch 5, 3 Shell envelope plating and Pt 3, Ch 5, 4 Shell envelope framing respectively. The end plating and its stiffening are to comply with the requirements of Pt 3, Ch 8, 2.1 Thickness of bulkhead and side plating 2.1.1 and Pt 3, Ch 8, 2.2 Stiffeners and their connections 2.2.1 respectively.

4. 1. 2 The bow height and the extent of the forecastle are to comply with the requirements of Pt 3, Ch 3, 6 Minimum bow heights, reserve buoyancy and extent of forecastle.

4. 1. 3 The thickness, t, of forecastle deck plating is to be not less than:

$$t = (6 + 0.017L)\sqrt{\frac{k_s}{s_b}}\,\text{mm}$$

4. 1. 4 Deck longitudinals and beams are to comply with Pt 3, Ch 5, 2.3 Deck stiffening, using a head of 1.8 m forward of $0.075L$ and 1.5 m between $0.12L$ and $0.075L$.

4. 1. 5 Girders, transverses and pillars are to be in accordance with Pt 3, Ch 5, 2.4 Deck supporting structure, and the depth of the girder or transverse is to be not less than twice that of the beam or longitudinal supported.

PART

3

CHAPTER 8 **Superstructures, Deckhouses and Bulwarks**

SECTION 5 **Bulwarks, guard rails and other means for the protection of crew**

5. 1 General requirements

5. 1. 1 Bulwarks or guard rails are to be provided around all exposed decks. Bulwarks or guard rails are to be not less than 1.0 m in height measured above sheathing, and are to be constructed as required by this Section. Consideration will be given to cases where this height would interfere with the normal operation of the ship.

5. 1. 2 The freeing arrangements in bulwarks are to be in accordance with Pt 3, Ch 8, 5.3, Freeing arrangements.

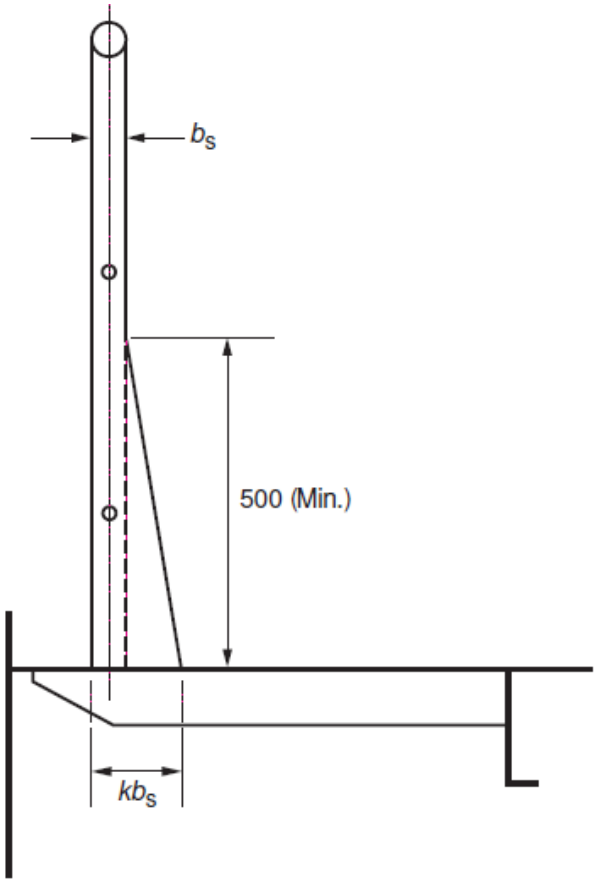
5. 1. 3 Guard rails fitted on superstructure and freeboards decks are to have at least three courses. The opening below the lowest course of guard rails is not to exceed 230 mm. The other courses are to be spaced not more than 380 mm apart. In the case of ships with rounded gunwales, the guard rail supports are to be placed on the flat of the deck. In other locations, guard rails with at least two courses are to be fitted.

5. 1. 4 Guard rails are to be fitted with fixed, removable or hinged stanchions fitted no more than 1.5 m apart. Removable or hinged stanchions shall be capable of being locked in the upright position.

5. 1. 5 At least every third stanchion is to be supported by a stay. In lieu of this, flat steel stanchions shall be of increased breadth as given in Figure 8. 5. 1: Support of stanchions

5. 1. 6 , and aligned with a member below deck unless the deck plating thickness exceeds 20 mm. Guard rail stanchions of increased breadth are to be welded to the deck with double continuous fillet weld with a minimum leg size of 7 mm or in compliance with a standard recognised by ACS.

Figure 8. 5. 1: Support of stanchions



In lieu of at least every third stanchion supported by stay, alternatively:

(a) at least every third stanchion shall be of increased breadth: $kb_S = 2{,}9b_S$

(b) at least every second stanchion shall be of increased breadth: $kb_S = 2{,}4b_S$

(c) every stanchion shall be of increased breadth: $kb_S = 1{,}9b_S$

where

b_S breadth of normal stanchion as specified in an appropriate standard recognised by LR

Stanchions with increased breadth are to be aligned with members below deck, minimum 100 x 12 flat bar welded to deck by double continuous fillet weld. Stanchions with increased breadth need not be aligned with under deck structure for deck plating exceeding 20 mm.

5. 1. 7 Where necessary for the normal operation of the ship, steel wire ropes may be accepted in lieu of guard rails. Wires are to be made taut by means of turnbuckles. Chains are only permitted in short lengths in way of access openings.

5. 1. 8 Satisfactory means, in the form of guard rails, life-lines, handrails, gangways, underdeck passageways or other equivalent arrangements, are to be provided for the protection of the crew in getting to and from their quarters, the machinery space and all other parts used in the necessary work of the ship in accordance with Table 8. 5. 1: 1 Protection of crew.

5. 1. 9 Where gangways on a trunk are provided by means of a stringer plate fitted outboard of the trunk side bulkheads (port and starboard), each gangway is to be a solid plate, effectively stayed and supported, with a clear walkway at least 450 mm wide, at or near the top of the coaming, with guard rails complying with Pt 3, Ch 8, 5.1 General requirements and hatch cover securing appliances accessible from the gangway.

5. 1. 10 Where permitted by the National Authority, gangways or walkways may be omitted on ships engaged on protected or extended protected water service. However, life-lines are to be provided on tankers and flush deck ships, or where the cargo hatch coamings are less than 600 mm high.

5. 1. 11 For a Type 'A' ship with freeboards assigned greater than, or equal to, Type 'B', a life−line may be provided in lieu of a walkway.

5. 2 Bulwark construction

5. 2. 1 Plate bulwarks are to be stiffened by a strong rail section and supported by stays from the deck. The spacing of these stays forward of 0.07*L* from the forward perpendicular is to be not more than 1.2 m on Type `A', Type `B-60' and Type `B-100' ships (as defined in Pt 3, Ch 11, 1.1, Application), and not more than 1.83 m on other Types. Elsewhere, bulwark stays are to be not more then 1.83 m apart. Where bulwarks are cut to form a gangway or other opening, stays of increased strength are to be fitted at the ends of the openings. Bulwarks are to be adequately strengthened in way of eyeplates for cargo gear, and in way of mooring pipes the plating is to be doubled or increased in thickness and adequately stiffened.

5. 2. 2 Bulwarks should not be cut for gangway or other openings near the breaks of superstructures, and are also to be arranged to ensure their freedom from main structural stresses. *See* shell plating in appropriate Chapters.

5. 2. 3 The section modulus, *Z,* at the bottom of the bulwark stay is to be not less than:

$$Z = (33.0 + 0.44L)\, h^2\, s\ cm^3$$

Where

h = height of bulwark from the top of the deck plating to the top of the rail, in metres

s = spacing of the stays, in metres, in accordance with Pt 3, Ch 8, 5.2 Bulwark construction 5.2.1

L = length of ship, in metres (as defined in Pt 3, Ch 1, 6.1, Principal particulars), but to be not greater than 100 m.

5. 2. 4 In the calculation of the section modulus, only the material connected to the deck is to be included. The bulb or flange of the stay may be taken into account where connected to the deck, and where, at the ends of the ship, the bulwark plating is connected to the sheerstrake, a width of plating not exceeding 600 mm may also be included. The free edge of the stay is to be stiffened.

5. 2. 5 Bulwark stays are to be supported by, or to be in line with, suitable underdeck stiffening, which is to be connected by double continuous fillet welds in way of the bulwark stay connection.

5. 2. 6 It should be noted that the above requirements do not allow for any loading from deck cargoes.

5. 3 Freeing arrangements

5. 3. 1 The requirements of Pt 3, Ch 8, 5.3,, Freeing arrangements 5.3.2 to Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.11 apply to ships of Type `B'. Additional requirements applicable to ships of Type `A', Type `B-100' and Type `B-60' are indicated in Pt 3, Ch 8, 5.3 Freeing arrangements

5.3.18 and Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.20. The ship Types are as defined in Pt 3, Ch 11, 1.1, Application.

5. 3. 2 Where bulwarks on the weather portions of freeboard or superstructure decks form wells, ample provision is to be made for rapidly freeing the decks of large quantities of water by means of freeing ports, and also for draining them.

5. 3. 3 The minimum freeing area on each side of the ship, for each well on the freeboard deck or raised quarterdeck, where the sheer in the well is not less than the standard sheer required by the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988* , is to be derived from the following formula:

a. where the length, *l*, of the bulwark in the well is 20 m or less:
area required $= 0.7 + 0.035/\mathrm{m}^2$

b. where the length, *l*, exceeds 20 m:
area required $= 0.07/\mathrm{m}^2$

l need not be taken greater than $0.7L_L$, where L_L is the length of the ship as defined in Pt 3, Ch 1, 6.1, Principal particulars.

5. 3. 4 If the average height of the bulwark exceeds 1.2 m or is less than 0.9 m, the freeing area is to be increased or decreased, respectively, by 0.004 m^2 per metre of length of well for each 0.1 m increase or decrease in height respectively.

5. 3. 5 The minimum freeing area for each well on a first tier superstructure is to be half the area calculated from Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.3.

5. 3. 6 Two-thirds of the freeing port area required is to be provided in the half of the well nearest to the lowest point of the sheer curve.

5. 3. 7 When the deck has little or no sheer, the freeing area is to be spread along the length of the well.

Symbols

A_f = the minimum summer freeboard calculated as Type A ship regardless of type freeboard actually assigned

H_s = the standard height of superstructure as defined in *International Convention on Load Lines*, Regulation 33

Acceptable arrangements:

Acceptable arrangements referred to in the Table are defined as follows:

a A well lighted and ventilated under-deck passageway (clear opening 0.8 m wide, 2 m high) as close as practicable to the freeboard deck, connecting and providing access to the locations in question.

b A permanent and efficiently constructed gangway fitted at or above the level of the superstructure deck on or as near as practicable to the centreline of the ship, providing a continuous platform at least 0.6 m in width and a non-slip surface, with guard rails extending on each side throughout its length. Guard-rails shall be at least 1 m high with courses as required in Pt 3, Ch 8, 5.1, General requirements, and supported by stanchions spaced not more than 1.5 m; a foot-stop shall be provided.

c A permanent walkway at least 0.6 m in width fitted at freeboard deck level consisting of two rows of guard-rails with stanchions spaced not more than 3 m. The number of courses of rails and their spacing are to be as required by Pt 3, Ch 8, 5.1, General requirements. On Type B ships, hatchway coamings not less than 0.6 m in height may be regarded as forming one side of the walkway, provided that between the hatchways two rows of guard rails are fitted.

d A 10 mm minimum thickness diameter wire rope life-line supported by stanchions about 10 m apart, or a single hand rail or wire rope attached to hatch coamings, continued and adequately supported between hatchways.
e A permanent and efficiently constructed gangway fitted at or above the level of the superstructure deck on or as near as practicable to the centreline of the ship: • located so as not to hinder easy access across the working areas of the deck; • providing a continuous platform at least 1.0 m in width; • constructed of fire resistant and non-slip material; • fitted with guard rails extending on each side throughout its length; guard rails should be at least 1.0 m high with courses as required by Regulation 25(3) and supported by stanchions spaced not more than 1.5 m; • provided with a foot stop on each side; • having openings, with ladders where appropriate, to and from the deck. Openings should not be more than 40 m apart; • having shelters of substantial construction set in way of the gangway at intervals not exceeding 45 m if the length of the exposed deck to be traversed exceeds 70 m. Every such shelter should be capable of accommodating at least one person and be so constructed as to afford weather protection on the forward port and starboard sides.
f A permanent and efficiently constructed walkway fitted at freeboard deck level on or as near as practicable to the centre line of the ship having the same specifications as those for a permanent gangway listed in (e) except for foot-stops. On Type B ships (certified for the carriage of liquids in bulk), with a combined height of hatch coaming and fitted hatch cover of together not less than 1 m in height the hatchway coamings may be regarded as forming one side of the walkway, provided that between the hatchways two rows of guard rails are fitted.
Alternative transverse locations for c, d and f: (1) At or near centreline of ship; or fitted on hatchways at or near centreline of ship. (2) Fitted on each side of the ship. (3) Fitted on one side of the ship, provision being made for fitting on either side. (4) Fitted on one side of the ship only. (5) Fitted on each side of hatchways as near to the centreline as practicable.
Note *1.* In all cases where wire ropes are fitted, adequate devices are to be provided to ensure their tautness. **Note** *2.* Wire ropes may only be accepted in lieu of guard rails in special circumstances and then only in limited lengths. **Note** *3.* Lengths of chain may only be accepted in lieu of guard rails if fitted between two fixed stanchions. **Note** *4.* Where stanchions are fitted, every third stanchion is to be supported by a bracket or stay. **Note** *5.* Removable or hinged stanchions shall be capable of being locked in the upright position. **Note** *6.* A means of passage over obstructions, if any, such as pipes or other fittings of a permanent nature, should be provided. **Note** *7.* Generally, the width of the gangway or deck-level walkway should not exceed 1.5 m.

5. 3. 8 In ships with no sheer the freeing area as calculated from Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.3 is to be increased by 50 per cent. Where the sheer is less than the standard, the percentage is to be obtained by linear interpolation.

5. 3. 9 Where the length of the well is less than 10 m, or where a deckhouse occupies most of the length, the freeing port area will be specially considered but in general need not exceed 10 per cent of the bulwark area.

5. 3. 10 Where it is not practical to provide sufficient freeing port area in the bulwark, particularly in small ships, credit can be given for bollard and fairlead openings where these extend to the deck.

5. 3. 11 Where a ship fitted with bulwarks has a continuous trunk, or hatch side coamings that are continuous, or substantially continuous, the minimum freeing area is to be not less than 20 per cent of the total bulwark area where the width of trunk or hatchway is 0.4*B* or less, and not less than 10 per cent of the total bulwark area when the width of the trunk or hatch is 0.75*B* or greater. The freeing area required for an intermediate width of trunk or hatch is to be obtained by linear interpolation.

5. 3. 12 Where the trunk referred to in Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.11 or its equivalent is included in the calculation of freeboard, open rails are to be fitted for at least 50 per cent of the length of the exposed part of the weather deck. Alternatively, if a continuous bulwark is fitted, the minimum freeing area is to be at least 33 per cent of the bulwark area. The freeing area is to be placed in the lower part of the bulwark.

5. 3. 13 Where a deckhouse has a breadth less than 80 per cent of the beam of the ship, or the width of the side passageways exceeds 1.5 m, the arrangement is considered as one well. Where a deckhouse has a breadth equal to or more than 80 per cent of the beam of the ship, or the width of the side passageways does not exceed 1.5 m, or when a screen bulkhead is fitted across the full breadth of the ship, this arrangement is considered as two wells, before and abaft the deckhouse.

5. 3. 14 Suitable provision is also to be made for the rapid freeing of water from recesses formed by superstructures, deckhouses and deck cargo arrangements, etc. in which water may be shipped and trapped. Deck gear, particularly on fishing vessels, is not to be stowed in such a manner as to obstruct unduly the flow of water to freeing ports.

5. 3. 15 The lower edges of freeing ports are to be as near to the deck as practicable, and should not be more than 100 mm above the deck.

5. 3. 16 Where freeing ports are more than 230 mm high, vertical bars spaced 230 mm apart may be accepted as an alternative to a horizontal rail to limit the height of the freeing port.

5. 3. 17 Where shutters are fitted, the pins or bearings are to be of a non−corrodible material, with ample clearance to prevent jamming. The hinges are to be within the upper third of the port. Shutters are not to be fitted with securing appliances.

5. 3. 18 Ships of Type `A' and Type `B-100' are to have open rails for at least half the length of the exposed part of the weather deck. Alternatively, if a continuous bulwark is fitted, the minimum freeing area is to be at least 33 per cent of the total area of the bulwark. The freeing area is to be placed in the lower part of the bulwark.

5. 3. 19 Where superstructures are connected by trunks, open rails are to be fitted for the whole length of the exposed part of the freeboard deck.

5. 3. 20 Ships of Type `B-60' are to have a minimum freeing area of at least 25 per cent of the total area of the bulwark. The freeing area is to be placed in the lower part of the bulwark.

5. 3. 21 Gutter bars greater than 300 mm in height fitted on the weather decks of tankers are to be treated as bulwarks and freeing ports arranged as required by this Section. Closures for use during loading and discharge operations are to be arranged in such a way that jamming cannot occur while at sea.

5. 3. 22 In ships having superstructures which are open at either or both ends to wells formed by bulwarks on the open deck, adequate provision for freeing the open spaces are to be provided as follows:

The freeing port area, A_w for the open well:

$$A_w = (0.07l_w + A_c)(S_c)(\frac{0.5h_s}{h_w})$$

The freeing port area, A_s for the open superstructure:

$$A_s = (0.07l_t)(S_c)\left(\frac{b_o}{l_t}\left(1 - \left(\frac{l_w}{l_t}\right)^2\right)\right)(\frac{0.5h_s}{h_w})$$

Where

l_w = the length of the open deck enclosed by bulwarks, in metres

l_s = the length of the common space within the open superstructure, in metres

l_t = $l_w + l_s$ but if 20 m or less then the freeing area is to be calculated in accordance with Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.3

S_c = sheer correction factor, maximum 1.5 as defined in Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.8

b_o = breadth of openings in the end bulkhead of the enclosed superstructure, in metres

h_w = distance of the well deck above the freeboard deck, in metres

h_s = one standard superstructure height, *See* Pt 3, Ch 8, 1.3 Definition of tiers 1.3.2

h_b = actual height of the bulwark, in metres

= bulwark height correction factor taken as;

= 0 for bulwarks between 0.9 and 1.2 m in height

= $l_w(\frac{(h_b-1.2)}{0.1})(0.004)\text{m}^2$ for bulwarks of height greater than 1.2 m, and

= $l_w(\frac{(h_b-1.9)}{0.1})(0.004)m^2$ for bulwarks of height less than 0.9 m.

To adjust the freeing port area for the distance of the well deck above the freeboard deck, for decks located more than $0.5h_s$ above the freeboard deck, multiply by the factor 0.5 (h_s/h_w).

5. 4 Free flow area

5. 4. 1 The effectiveness of the freeing port area in bulwarks of vessels not fitted with a continuous deck obstruction, depends on the free flow across the deck.

5. 4. 2 The free flow area is the net total longitudinal area of the transverse passageways or gaps between hatchways and superstructures or deckhouses, due account being made for any obstructions such as equipment or other fittings. The height of passageways or gaps used in the calculation of the area is the height of the bulwark.

5. 4. 3 The provision of freeing area in bulwarks should be related to the net free flow area as follows:

a. If the free flow area is equal to, or greater than the freeing port area calculated from Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.11 when the hatchway coamings are continuous, then the minimum freeing area calculated from Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.3 is sufficient.

b. If the free flow area is less than the freeing port area calculated from Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.3, then the minimum freeing area is to be that calculated from Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.11.

c. If the free flow area is less than the freeing port area derived from (a) but greater than that derived from Pt 3, Ch 8, 5.4 Free flow area 5.4.3.b, the minimum freeing area, F, in the bulwark is to be obtained from the following formula:

$$F = F_1 + F_2 - f_e \text{m}^2$$

Where

f_p	total net area of passages and gaps between hatchways, superstructures and deckhouses (the free flow area)
F_1	minimum area from Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.3
F_2	minimum area from Pt 3, Ch 8, 5.3 Freeing arrangements 5.3.11

5. 5 Special requirements for tugs and offshore supply ships

5. 5. 1 In tugs and offshore supply ships where there is a recess at the after end of the forecastle for the towing winch, the freeing port area in way of the recess is to be calculated as follows:

B	=	breadth of ship
b	=	breadth of recess
L	=	length of well
l	=	mean length of recess
a	=	freeing area for well length L

Freeing port area in way of recess:

$$\text{A} = a\frac{l}{L}$$

Reduction due to breadth of recess:

$$A_1 = A\frac{b}{B}$$

Reduce A_1 by 25 per cent for winch area:

$$A_2 = 0.75A_1$$

= required freeing port area each side in way of the recess

Where the winch is enclosed in a non-weathertight compartment freeing ports are not required but adequate drainage by means of scuppers is to be provided.

CHAPTER **9** **Special Features**

SECTION **1** **General**

1. 1 Application

1. 1. 1 The requirements of this Chapter are to be taken in conjunction with the Chapters of Pt 3 Ship Structures (General) and Pt 4 Ship Structures (Ship Types) applicable to the particular ship type.

1. 2 Symbols

1. 2. 1 The following symbols and definitions are applicable to this Chapter:

k	=	higher tensile steel factor, *See* Pt 3, Ch 2, 1.2, Steel
l	=	overall length, of the stiffening member, in metres
l_e	=	effective length, in metres, of the stiffening member, measured between span points, *See* Pt 3, Ch 3, 3.3 Determination of span point
s	=	spacing, of stiffeners, in mm
B	=	moulded breadth of ship, in metres, *See* Pt 3, Ch 1, 6.1, Principal particulars
L		length of ship, in metres, *See* Pt 3, Ch 1, 6.1, Principal particulars
Z		section modulus of the stiffening member, in cm^3, *See* Pt 3, Ch 3, 3.2 Geometric properties of section

1. 2. 2 Other symbols are defined in the appropriate Section.

PART

3

CHAPTER **9** **Special Features**

SECTION **2** **Timber deck cargoes**

2. 1 Application

2. 1. 1 Where the ship carries timber as deck cargo and the notation 'timber deck cargoes' is to be assigned, the requirements of this Section are to be complied along with relevant parts of non-mandatory IMO Resolution A.1048(27) *2011 TDC Code – Code of Safe Practice for Ships Carrying Timber Deck Cargoes, 2011 – Resolution A.1048(27)*, irrespective of being assigned timber load line or not.

2. 1. 2 In all other cases, compliance with the relevant parts of this Section or the *2011 TDC Code – Code of Safe Practice for Ships Carrying Timber Deck Cargoes, 2011 – Resolution A.1048(27)* shall be as required by the flag state; the flag state may make the *2011 TDC Code – Code of Safe Practice for Ships Carrying Timber Deck Cargoes, 2011 – Resolution A.1048(27)* a mandatory requirement

- For ships on their register that carry timber deck cargoes; or
- For foreign ships in their ports when acting as a port state.

2. 1. 3 Attention is drawn to the International Load Line Convention, 1966, and its 1988 Protocol, with respect to requirements for ships assigned a timber loadline.

2. 2 Symbols and definitions

2. 2. 1 The term `timber deck cargo' means a cargo of timber carried on an uncovered part of the freeboard or superstructure deck. The term does not include wood pulp or similar cargo.

2. 2. 2 The symbols used in this Section are defined as follows:

C =mean stowage rate, in m^3/tonne, of the timber deck cargo, making allowance for normal battens, etc.

h = the height, in metres, to which the timber deck cargo is to be stowed, measured vertically from the deck or hatch cover as applicable.

2. 2. 3 Other symbols are defined in Pt 3, Ch 9, 1.2 Symbols.

2. 3 General

2. 3. 1 Attention is drawn to the requirements of the *International Convention for the Safety of Life at Sea, 1974, Chapter VI*, as amended, the *International Load Line Convention, 1966,* concerning timber deck cargoes, and its 1988 Protocol, and to National Regulations.

2. 3. 2 Timber deck cargoes are to be loaded, stowed and secured throughout the voyage, in accordance with the Cargo Securing Manual prepared in compliance with the *2011 TDC Code – Code of Safe Practice for Ships Carrying Timber Deck Cargoes, 2011 – Resolution A.1048(27)* and the requirements specified in this Section. The Cargo Securing Manual is to be approved by the Flag

Administration as required by *Chapter VI - Carriage of cargoes and oil fuels*, and a copy is to be placed on board.

2. 3. 3 Each cargo securing arrangement for timber deck cargoes detailed in the ship's Cargo Securing Manual is to be documented by a lashing plan that shows the following:

a. maximum cargo weight for which the arrangement is designed;
b. maximum stowage height;
c. required number and strength of blocking devices, lashings, uprights and loose gear, as applicable;
d. required pre-tension in lashings;
e. other cargo properties of importance for the securing arrangement, such as friction, rigidity of timber packages;
f. illustrations of all securing items that might be used;
g. any restrictions regarding maximum accelerations, weather criteria, restricted sea areas and for non-winter conditions only;
h. the walkway/life-line arrangements; and
i. lashing and stowage arrangements, which are to be in accordance with Pt 3, Ch 9, 2.6, Lashings and Pt 3, Ch 9, 2.7 Stowage .

2. 3. 4 All timber deck cargoes must be compactly stowed, lashed and secured. Friction alone is not deemed sufficient and such methods are not endorsed by Asia Classification Society. Loop lashing is recommended where applicable as one of the safest practices for securing timber deck cargoes.

2. 3. 5 Timber freeboards cannot be used where wood pulp is being carried as the deck cargo. Packaged timber (timber which has been prelashed) may be carried on deck with the ship at its timber freeboards.

2. 3. 6 Type `B−60' ships may have timber freeboards assigned based on ordinary Type `B' freeboards.

2. 3. 7 Timber freeboards are not appropriate for ships which are assigned freeboards from a second deck. However, where the maximum geometric upper deck draught is restricted, a restricted timber draught may be assigned.

2. 3. 8 It is the Master's responsibility to ensure loose gear (e.g. uprights, wire lashings and life-lines) are supplied and fitted onboard in accordance with the approved timber deck cargo loading and lashing plan when the ship is carrying timber deck cargoes. However, it is not a requirement that loose gear remains permanently on board a ship assigned timber freeboards.

2. 4 Arrangements

2. 4. 1 Double bottom tanks within the midship half-length are to have adequate longitudinal subdivision.

2. 4. 2 A forecastle of at least standard height of a superstructure, defined by Regulation 33 of the International Load Line Convention, as amended, and of length at least 0.07*L* is to be fitted. In addition, in ships of less than 100 m in length, a poop of at least standard height, or a raised quarterdeck with a deckhouse or strong steel hood of at least the same total height, is to be fitted.

2. 5 Uprights

2. 5. 1 Uprights designed in accordance with the *2011 TDC Code – Code of Safe Practice for Ships Carrying Timber Deck Cargoes, 2011 – Resolution A.1048(27)* should be used when required by the nature, height or character of the timber deck cargo, as outlined in the *2011 TDC Code – Code of Safe Practice for Ships Carrying Timber Deck Cargoes, 2011 – Resolution A.1048(27)*. Where timber uprights are used, it is the responsibility of the Master to use timber of a type and grade proven satisfactory for the purpose.

2. 5. 2 Uprights are to be used for all timber deck cargoes with the exception that, where only packaged timber is to be carried, uprights may be omitted, depending on racking strength and not including uprights or stoppers (low uprights) situated either side of hatch covers.

2. 5. 3 The spacing of the uprights is to be suitable for the length and character of the timber to be carried but is not to exceed 3 m.

2. 5. 4 Each upright is to extend above the top of the cargo and be fitted with a strap or bracket support at the top of the bulwark to hold it upright whilst loading.

2. 5. 5 Strong permanent bulwarks, or efficient rails of specially strong construction, are to be fitted. They are acceptable as supports for uprights, provided they have adequate strength, and substantial sockets are built for each upright.

2. 5. 6 Deck sockets, along with locking pin, are to be of adequate strength to hold the uprights in place. They are to be efficiently connected to the hull structure to transfer the loads. They are not to be less than 100 mm in depth with drainage provided. A locking pin or wedge is to be provided to prevent the upright lifting out of the socket.

2. 6 Lashings

2. 6. 1 The timber deck cargo is to be secured along its length by appropriate top-over lashings or loop lashings of adequate strength.

2. 6. 2 The spacing of lashings is to be such that lashings are positioned as close as practicable to the ends of each continuous timber deck stow.

2. 6. 3 In order to achieve a more secure stowage of logs when stowed on deck, hog wires are to be utilised. Such hog wires shall be installed in the following manner so as to obtain as even a tension as possible throughout, thus producing an inboard pull on the respective uprights:

a. At approximately three quarters of the height of the stow, the hog wire should be rove through a pad eye attached to the uprights at this level so as to run transversely, connecting the respective port and starboard uprights. The hog lashing wire should not be too tight when laid, so that it becomes taut, when overstowed with other logs.

b. A second hog wire may be applied in a similar manner, if the height of the hatch cover is less than 2 m. Such second hog wire should be installed approximately 1 m above the hatch covers.

2. 6. 4 Where only packaged timber is to be carried, and uprights are omitted, *See* Pt 3, Ch 9, 2.5 Uprights 2.5.2, lashings are to be spaced not more than 1.5 m apart.

2. 6. 5 Eye plates used for lashing are to be of substantial construction and adequate strength. They are to be effectively connected to the hull structure, and placed at intervals appropriate for the lashing arrangement. The distance from a superstructure or deckhouse end bulkhead to the first eye plate and lashing is to be not more than 2 m.

2. 6. 6 Open hooks, which may loosen if the lashing becomes slack, are not to be used in securing arrangements for timber deck cargoes, and web lashing is not to be used in combination with chain or wire lashing.

2. 6. 7 Slip hooks or other appropriate methods may be used for quick and safe adjustment of lashings. Pelican hooks, when used, are to be moused.

2. 6. 8 Corner protectors are to be used to prevent lashings from cutting into the cargo and to protect lashings from damage at sharp corners.

2. 6. 9 Lashings and fittings must have adequate strength for the proposed timber loading and must not:

a. Have a breaking strength of less than 133 kN;

b. Elongate more than 5 per cent at 80 per cent of the breaking strength and;

c. Show any permanent deformation at less than 40 percent of the breaking strength.

2. 6. 10 Every lashing is to be provided with a tightening device or system, situated so that it can be safely and efficiently operated when required. The magnitude of the components of the resolved load produced by the tightening device or system is not to be less than:

a. 27 kN in the horizontal direction; and
b. 16 kN in the vertical direction.

2. 6. 11 Once the lashings are secured, the tightening device or system is to have not less than half the tightening capacity available for further use.

2. 6. 12 If wire rope clips are used to make a joint in a wire lashing, the following conditions are to be observed to avoid a significant reduction in strength:

a. at least three rope clips are to be utilised to make a wire joint, where the total number and size of the rope clips utilised are to be in proportion to the diameter of the wire rope used. The rope clips are to be spaced not less than 150 mm apart;
b. the saddle portion of the clip is to be applied to the live load segment; and
c. rope clips are to be initially tightened so that they visibly compress the wire rope and are subsequently to be re-tightened after the lashing has been stressed.

2. 6. 13 Bulldog grips are only suitable for a standard wire rope of right-hand lay having six strands. Such grips are not to be used for wire rope of left-hand lay or different construction.

2. 6. 14 Where loose or packaged sawn wood is carried, Pt 3, Ch 9, 2.6 Lashings 2.6.15 to 2.6.18, and in case of logs, poles, cants or similar cargo, Pt 3, Ch 9, 2.6 Lashings 2.6.19 to Pt 3, Ch 9, 2.6 Lashings 2.6.20, are to be complied with.

2. 6. 15 Subject to Pt 3, Ch 9, 2.6 Lashings 2.6.16, the maximum spacing of the lashings referred to above should be determined by the maximum height of the timber deck cargo in the vicinity of the lashings:

a. for a height of 2.5 m and below, the maximum spacing is to be not more than 3 m;
b. for heights of above 2.5 m, the spacing is to be not more than 1.5 m;
c. on the foremost and aft-most sections of the deck cargo, the distance between the lashings in accordance with (a) and (b) are to be halved.

2. 6. 16 As far as practicable, long and sturdy packages should be stowed in the outer rows of the stow, and the packages stowed at the upper outboard edge should be secured by at least two lashings each.

2. 6. 17 When the outboard packages of the timber deck cargo are in lengths of less than 3.6 m, the spacing of the lashings should be reduced as necessary, or other suitable provisions made to suit the length of timber.

2. 6. 18 Rounded angle pieces of suitable material and design are to be used along the upper outboard edge of the stow to bear the stress and permit free reeving of the lashings.

2. 6. 19 Round wood deck cargo should be supported by uprights and secured throughout its length by independent top-over or loop lashings spaced not more than 1.5 m apart.

2. 6. 20 In addition to Pt 3, Ch 9, 2.6 Lashings 2.6.19, round wood timber deck cargo, stowed over and above hatches, is to be further secured by a system of athwartship lashings (*See* Pt 3, Ch 9, 2.6 Lashings 2.6.3) connecting respective port and starboard uprights.

2. 7 Stowage

2. 7. 1 The stowage arrangements are to be detailed within the lashing plan, *See* Pt 3, Ch 9, 2.3 General 2.3.3.

2. 7. 2 Timber deck cargoes are to extend over at least the entire available length, which is the total length of the well or wells between superstructures. Where there is no limiting superstructure at the after end, the timber is to extend at least to the after end of the aftermost hatchway.

2. 7. 3 The timber deck cargo is to extend athwartships as close as possible to the ship's side, due allowance being made for obstructions, provided any gap thus created at the side of the ship does not exceed a mean of four per cent of the breadth.

2. 7. 4 The timber is to be stowed as solidly as possible to at least the standard height of a superstructure other than a raised quarter deck. It is not to interfere in any way with the safe navigation and necessary work of the ship.

2. 7. 5 On a ship within a seasonal winter zone in winter, the height of the deck cargo above the deck exposed to weather must not exceed one third of the extreme breadth of the ship.

2. 7. 6 Cargo which overhangs hatch coamings or other structures in the longitudinal direction by more than a third of their individual or packed length is to be supported at the outer end by other cargo stowed on deck or by structure of adequate strength.

2. 8 Safety arrangements

2. 8. 1 If there is no convenient passage on or below the deck of the ship, a walkway is to be provided over the timber deck cargo. This walkway is either to be:

a. At, or near, the centreline of the ship, consisting of two sets of guard wires, spaced 1 m apart, each with more than three courses of wire. The opening below the lowest course is not to exceed 230 mm; the remaining courses are to be spaced not more than 380 mm apart to a height of at least 1 m above the timber deck cargo. The guard wires are to be secured to stanchions. The stanchions are to be not more than 3 m apart, and these are to be secured to the timber cargo by spikes, or other equivalent means.

b. Alternatively, where uprights are used, guard wires, spaced vertically not more than 330 mm apart, are to be secured to the uprights along the length of the timber deck cargo on both port and starboard sides to a height of not less than 1 m above the cargo. A wire life-line is also to be fitted at the centreline of the ship, adequately supported by stanchions spaced not more than 10 m apart.
A safe walking surface, not less than 600 mm in width, is to be fitted over the cargo and effectively secured to the top of it in line with the walkway or adjacent to the life-line. All lines are to be taut using tightening devices.

2. 8. 2 Safe access is to be provided to the top of the timber deck cargo by means of properly constructed ladders, steps or ramps fitted with guard lines or handrails.

2. 8. 3 All openings in the weather deck are to be capable of being properly closed and secured tight. Ventilators, air pipes and other fittings enclosing openings are to be efficiently protected against damage.

2. 8. 4 Access hatches, vents, air pipes, fire hydrants, hoses, valve operating positions, sounding pipes and other essential equipment are to be clearly marked and left accessible.

2. 9 Longitudinal strength

2. 9. 1 The proposed timber deck loading conditions are to be taken into account in the longitudinal strength calculations *See* Pt 3, Ch 4 Longitudinal Strength, and details are to be included in the ship's Loading Manual.

2. 10 Deck loading and scantlings

2. 10. 1 Adequate deck strength is to be ensured, when the proposed timber deck cargoes will impose a mean cargo loading in excess of 8.5 kN/m^2 on the weather deck.

2. 10. 2 In general, the stowage rate, C, of timber deck cargoes is to be taken as:

a. for round timber and logs:
$C = 2.1\ \mathrm{m}^3/\ \text{tonne}$
b. for packaged sawn timber:
$C = 1.45\ \mathrm{m}^3/\ \text{tonne}$.

These values are based on the total volume occupied by the cargo, including normal battens, etc. measured from bulwark to bulwark, and deck, or hatch cover, to top of cargo.

2. 10. 3 Where it is proposed to store timber more densely than that corresponding to the above values, the appropriate value of C is to be used.

2. 10. 4 The load height, h, of the cargo at any position is to be determined from the overall heights of cargo stowage as supplied by the Shipbuilder. Where the height of cargo varies, a mean effective load height is to be adopted. Attention is drawn to the limitation on height of cargo contained in the Load Lines Conventions where these apply.

2. 10. 5 A scantling correction factor, K, is to be determined from $K = \frac{h}{1.08C}$, and the hull scantlings are to be increased as follows:

a. **Deck longitudinals.** The section modulus is to be multiplied by the factor $0.5(1+K)$.
b. **Deck beams.** The load head contained in the expression for section modulus is to be multiplied by K, and the section modulus determined using the increased value.
c. **Deck girders and transverses.** The section modulus is to be multiplied by the factor K.
d. **Pillars and deck supporting structure.** The design load is to be multiplied by the factor K, and scantlings determined using the increased value.
e. **Side structure.** The arrangement and scantlings of side structure are to be considered, and increased scantlings of framing may be required.

2. 11 Scantlings of hatch covers

2. 11. 1 The scantlings of primary supporting members and secondary stiffeners are to comply with Pt 3, Ch 11, 2.3 Load model 2.3.4 for distributed cargo load pL using $\mathrm{pC} = \mathrm{h}/\mathrm{C}$.

2. 11. 2 The hatch cover securing and support arrangements, stoppers, etc. and coamings are to be suitably reinforced to take account of increased loading from timber deck cargoes, *See* Pt 3, Ch 11, 4.2, Steel covers − Clamped and gasketed.

2. 12 Direct calculations

2. 12. 1 As an alternative to the above, the scantlings of the deck and side structure, and of hatch covers, may be assessed using direct calculations based on the proposed loading of the ship.

2. 12. 2 In the case of hatch covers, the stress and deflection criteria given in Pt 3, Ch 11, 2.4, Allowable stress and deflection corresponding to a uniformly distributed weather load are not to be exceeded.

PART

3

CHAPTER **9** **Special Features**

SECTION **3** **Decks loaded by wheeled vehicles**

3. 1 General

3. 1. 1 Where it is proposed either to stow wheeled vehicles on the deck or to use wheeled vehicles for cargo handling, the deck and supporting structure are to be designed on the basis of the maximum loading to which they may be subjected in service. Where applicable, the hatch covers are to be similarly designed. In no case, however, are the scantlings to be less than would be required as a weather or cargo deck or hatch cover, as applicable.

3. 1. 2 The vehicles, types and axle loads, for which the vehicle carrying decks including, where applicable, hatch covers have been approved, are to be stated in the Loading Manual and be contained in a notice displayed on each deck.

3. 2 Symbols

3. 2. 1 The symbols used in this Section are defined in Pt 3, Ch 9, 1.2 Symbols and in the appropriate sub-Section.

3. 3 Loading

3. 3. 1 Details of the deck loading resulting from the proposed stowage or operation of vehicles are to be supplied by the Shipbuilder. These details are to include the wheel load, axle and wheel spacing, tyre print dimensions and type of tyre for the vehicles.

3. 3. 2 For design purposes, where wheeled vehicles are to be used for cargo handling, the deck is to be taken as loaded with a normal head cargo, except in way of the vehicle.

3. 4 Deck plating

3. 4. 1 The deck plate thickness, t, is to be not less than:

$$t = t_1 + t_c \text{mm}$$

Where

t_c = wear and wastage allowance determined from Table 9. 3. 2: Wear and wastage allowance

= $t_1 = \dfrac{\alpha s}{1000\sqrt{k}} \text{mm}$

P_1 = corrected patch load obtained from Table 9. 3. 1: Deck plate thickness calculation

α = thickness coefficient obtained from Figure 9. 3. 1: Tyre print chart

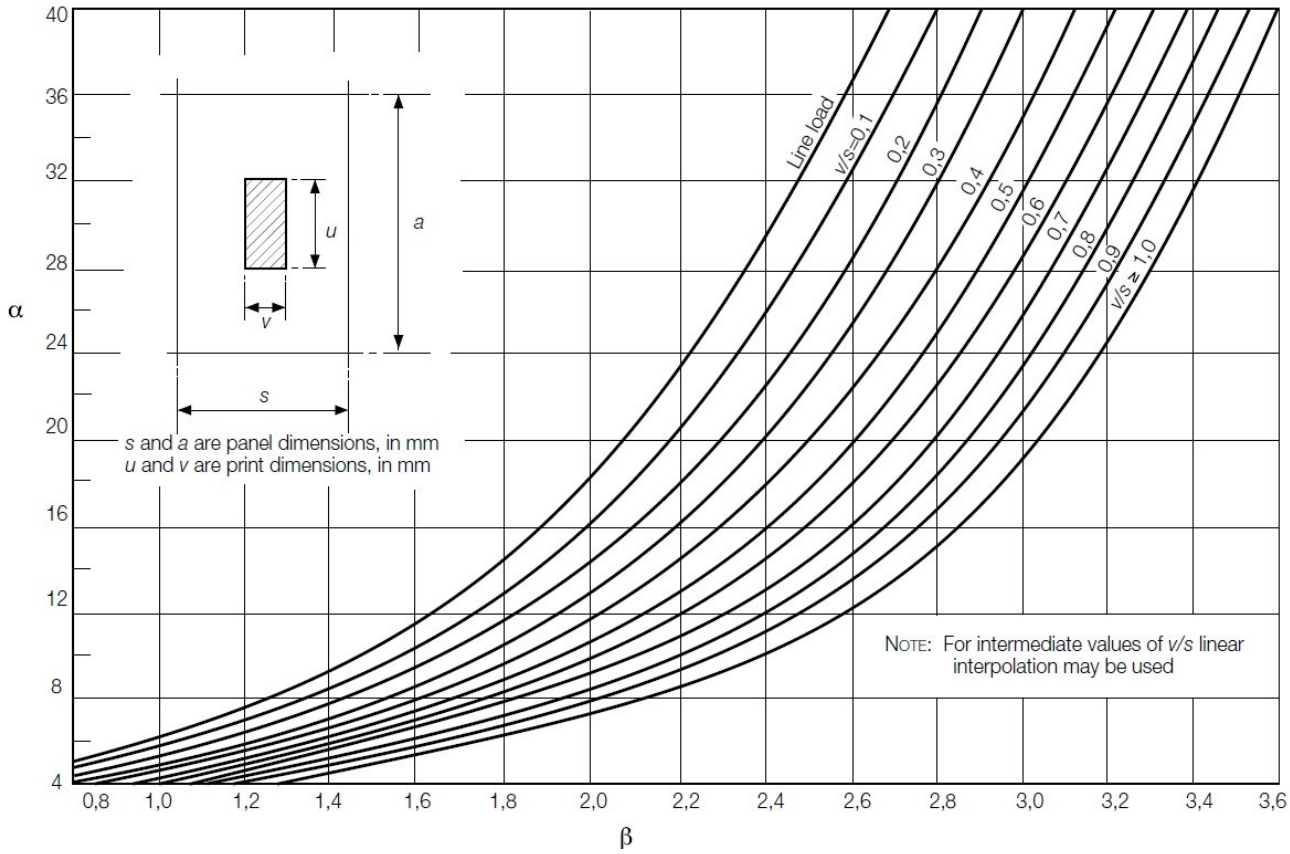
β = tyre print coefficient used in Figure 9. 3. 1: Tyre print chart

$$= \log_{10}\left(\frac{P_1 k^2}{s^2} \times 10^7\right)$$

Table 9. 3. 1: Deck plate thickness calculation

Symbols	Expression	
a, s, u, and v as defined in Figure 9. 3. 1: Tyre print chart	$P_1 = \varphi_1\varphi_2\varphi_3\lambda P$ W	
n=tyre connection factor, *See* Table 9. 3. 3: Tyre correction factor, n	$\varphi_1 = \frac{2v_1 + 1.1s}{u_1 + 1.1s}$	$v_1 = v$, but ≤ s $u_1 = u$, but ≤ a
P_w=load, in tonnes, on the tyre print. For closely spaced wheels the shaded area shown in Figure 9. 3. 1: Tyre print chart may be taken as the combined print P_1=corrected patch load, in tonnes	$\varphi_2 = 1.0$ $= \frac{1}{1.3 - \frac{0.3}{s}(a-u)}$ $= 0.77\frac{a}{u}$	for $u \le (a - s)$ for $a > u > (a - s)$ for $u > a$
λ=dynamic magnification factor φ1=patch aspect ratio correction factor	$\varphi_3 = 1.0$ $= 0.6\frac{S}{v} + 0.4$ $= 1.2\frac{S}{v}$	for $v < s$ for $1.5 > \frac{v}{s} \ge 1.0$ for $\frac{v}{s} \ge 1.5$
φ2=panel aspect ratio correction factor φ3=wide patch load factor	$\lambda = 1.25$ for harbour conditions $= (1 + 0.7n)$ for sea-going conditions	

Figure 9. 3. 1: Tyre print chart



3. 4. 2 Where transversely framed decks contribute to the hull girder strength, or where secondary stiffening is fitted perpendicular to the direction of vehicle lanes, the thickness, t, derived from Pt 3, Ch 9, 3.4 Deck plating 3.4.1 is to be increased by 1.0 mm.

3. 4. 3 Where decks are designed for the exclusive carriage of unladen wheeled vehicles, the deck plate thickness, t, may be reduced as follows:

$$t = (t_1 - 0.75) + t_c \text{ mm}$$

3. 4. 4 Where it is proposed to carry tracked vehicles, the patch dimensions may be taken as the track print dimensions and P_w is to be taken as half the total weight of the vehicle. The wear and wastage allowance from Table 9. 3. 2: Wear and wastage allowance is to be increased by 0.5 mm. Deck fittings in way of vehicle lanes are to be recessed.

Table 9. 3. 2: Wear and wastage allowance

Location	t_c, in mm
Strength deck, weather decks, decks forming crown of tank, inner bottom	1.5
Internal decks elsewhere	0.75

3. 4. 5 If wheeled vehicles are to be used on insulated decks or tank tops, consideration will be given to the permissible loading in association with the insulation arrangements and the plating thickness.

Table 9. 3. 3: Tyre correction factor, n

Number of wheels in idealised patch	Pneumatic tyres	Solid rubber tyres	Steel or solid tyres
1	0.6	0.8	1.0
2 or more	0.75	0.9	1.0

3. 5 Deck longitudinals and beams

3. 5. 1 The section modulus, Z, of deck beams or longitudinals is to be not less than that required for a weather or cargo deck as appropriate, nor less than the following:

a. For general purpose cargo decks where fork lift trucks are to be used:
$Z = (0.375K_1Pl_e + 0.00125\ K_2hsl_e^2k^k\ cm^3$.

b. For permanent vehicle decks in association with a value of h which need not exceed 2.5 m:
h =normal load height on the deck, in metres
P =total weight , in tonnes, of the vehicle divided by the number of axles. Where distribution of weight is not uniform, P is to be taken as the maximum axle load. For fork lift trucks the total weight is to be applied to one axle

c. $Z = (0.536K_1Pl_e + 0.00125\ K_2hsl_e^2)^k cm^3$
=where the values of K_1 and K_2 are given in Table 9. 3. 4: Values of K2 and K2.

d. For decks designed for the carriage of wheeled vehicles only that required to satisfy the most severe arrangement of print wheel loads on the stiffener in association with a bending stress of $\frac{100}{k} N/mm^2$ assuming 100 per cent end fixity.

Table 9. 3. 4: Values of K_2 and K_2

Wheel spacing* / Beam span	K_1	K_2
0.1	15.4	1.89
0.2	14.6	1.84
0.3	13.35	1.730
0.4		1.55
	11.8	
0.5 and greater	10.1	1.30
* Outer wheel to outer wheel on axles with multiple wheel arrangements		

3. 6 Deck girders and transverses

3. 6. 1 Where the load on deck girders and transverses is uniformly distributed, the section modulus is to be not less than:

$$Z = 4.75bhl_e^2k\ cm^3$$

Where

h = is defined in Pt 3, Ch 9, 3.5 Deck longitudinals and beams 3.5.1

b = mean width of plating supported by a deck girder or transverse, in metres

3. 6. 2 Where the member supports point loads, with or without the addition of uniformly distributed load, the section modulus is to be based on a stress of $\frac{123.6}{k}\ N/mm^2$, assuming 100 per cent end fixity.

3. 6. 3 Where it is proposed to carry tracked vehicles, the total weight of the vehicle is to be taken when determining the section modulus of the transverse at the top of a ramp or at other changes of gradient.

3. 7 Direct calculations

3. 7. 1 As an alternative to the above, permissible deck loads may be determined by direct calculation. The assumed loadings in these calculations are to include suitable allowance for weather, generally 2.16 kN/m^2 (0.22 tonne-f/m^2), where applicable.

3. 8 Hatch covers

3. 8. 1 Where wheeled vehicles are to be used, the hatch cover plating is to be not less in thickness than that required by Pt 3, Ch 9, 3.4, Deck plating, and the modulus of the stiffeners is to be not less than:

$$Z = (K_3 P l_e + 0.00167 K_4 h s l_e^2)^k$$

Where

= where the values of K_3 and K_4 are given in Table 9. 3. 5: Values of K3 and K4 and P and h are defined in Pt 3, Ch 9, 3.5 Deck longitudinals and beams 3.5.1.

In no case, however, are the scantlings of plating and stiffeners to be less than would be required as a weather or cargo deck hatch cover, as applicable.

Table 9. 3. 5: Values of K_3 and K_4

Wheel spacing* / Stiffener span	K_3	K_4
0.1	11.96	2.32
0.2	10.69	1.89
0.3	9.58	1.55
0.4	8.46	1.28
0.5	7.46	1.07
0.6	6.51	0.91
0.7	5.55	0.73
0.8	4.23	0.36
0.9	2.38	0.11

* Outer wheel to outer wheel on axles with multiple wheel arrangements

3. 8. 2 Where unusual arrangements of hatch cover stiffening are proposed, the scantlings may be determined by direct calculations using a two-dimensional grillage idealisation, and the parameters given in Table 11. 2. 3: Effective breadth em of plating of primary supporting members in Pt 3, Ch 11 Closing Arrangements for Shell, Deck and Bulkheads.

3. 9 Train decks

3. 9. 1 Decks for the transport of railway rolling stock on fixed rails will be specially considered.

3. 10 Heavy and special loads

3. 10. 1 Where heavy or special loads, such as machinery transporters, are proposed to be carried, the scantlings and arrangements of the deck structure will be individually considered.

3. 11 Securing arrangements

3. 11. 1 Details of the connections to the hull of vehicle securing arrangements are to be submitted for approval.

PART

3

CHAPTER **9** **Special Features**

SECTION **4** **Movable decks**

4. 1 Classification

4. 1. 1 Movable vehicle decks hoisted by means of a hydraulic or electrical winch, or lifted by a mechanical lift on board the ship, are to comply with Ch 6 Ro-Ro Access Equipment of *ACS Guideline for Lifting Appliances in a Marine Environment*.

4. 1. 2 Movable decks other than described in Pt 3, Ch 9, 4.1 Classification 4.1.1, and which are subjected to general cargo loading, are to comply with the requirements of this Section.

4. 2 Symbols

4. 2. 1 The symbols used in this Section are defined in Pt 3, Ch 9, 1.2 Symbols and in the appropriate sub-Section.

4. 3 Arrangements and design

4. 3. 1 Movable decks are generally to be constructed as pontoons comprising a web structure with top decking. Other forms of construction will be individually considered.

4. 3. 2 These requirements assume that the pontoons are to be constructed of steel. Other materials will be considered on the basis of equivalent strength.

4. 3. 3 Positive means of control are to be provided to secure decks in the lowered position.

4. 3. 4 The decks are to be efficiently supported, and hinges, pillars, chains or other means (or a combination of these) are to be designed on the basis of the imposed loads. Where supporting chains and fittings are required, they are to have a factor of safety of at least two on the proof load.

4. 3. 5 Plans showing the proposed scantlings and arrangements of the system are to be submitted.

4. 3. 6 Where it is proposed to stow the pontoons on deck, when not in use, details of the proposals for racks, fittings, etc. are to be submitted for consideration.

4. 4 Loading

4. 4. 1 Design loading for general cargo is to be specified on the plans, together with details of fork lift trucks where appropriate, and submitted for consideration.

4. 5 Pontoon deck plating

4. 5. 1 Where the pontoon is constructed of steel decking with stiffening webs, the deck plate thickness, t, is to be not less than that required by Pt 3, Ch 9, 3.4, Deck plating.

4. 5. 2 The plate thickness, t, for aluminium pontoons is to be not less than:

$$t = (1.4t_1 + 0.75)\text{mm}$$

where t_1 is the mild steel thickness as determined from Pt 3, Ch 9, 3.4, Deck plating.
For aluminium pontoons designed for the exclusive carriage of unladen wheeled vehicles:

$$t = 1.4t_1 \text{ mm}$$

4. 5. 3 Where it is proposed to use plywood decking, the arrangement and thickness will be considered. Plywood alone, is not, generally, to be used for axle loads in excess of 7.8 kN.

4. 5. 4 Attention is drawn to National fire regulations which in certain cases may ban the use of plywood and certain other materials in `special category spaces' on passenger ships.

4. 6 Pontoon webs and stiffeners

4. 6. 1 The section modulus of webs and stiffening of steel pontoons is to be not less than:

Z = $(0.375K_1Pl_e + 0.00125K_2hsl_e^2)^k$ cm^3

= for general-purpose cargo decks where fork lift trucks may be used where the values of K_1 and K_2 are given in Table 9. 4. 1: Values of K1 and K2, and

= for general-purpose cargo decks where fork lift trucks may be used where the values of K_1 and K_2 are given in Table 9. 4. 1: Values of K1 and K2, and

h = load height of cargo on the deck, where this is proposed to be carried, in metres.

p = the total fork lift truck load, in tonnes, is to be applied to one axle.

Table 9. 4. 1: Values of K_1 and K_2

Wheel spacing* / Beam span	K_1	K_2
0.1	15.4	1.89
0.2	14.6	1.845
0.3	13.35	1.730
0.4	11.8	1.55
0.5 and greater	10.1	1.30
* Outer wheel to outer wheel on axles with multiple wheel arrangements		

4. 6. 2 The section modulus of webs and stiffening of aluminium pontoons is to be not less than that defined in Pt 3, Ch 9, 4.6 Pontoon webs and stiffeners 4.6.1 replacing k by k_a where k_a is defined in Pt 3, Ch 2, 1 Materials of construction.

4. 6. 3 Where plywood decking is proposed, or in other arrangements where the decking is not integral with the stiffening webs, the arrangement of the grillage of webs is to be such as to provide the required strength.

4. 7 Deflection

4. 7. 1 Where wheeled vehicles are to be used, the supporting arrangements are to be such that the movement at the edge of one pontoon relative to the next does not exceed 50 mm during loading or unloading operations.

4. 8 Direct calculations

4. 8. 1 As an alternative to Pt 3, Ch 9, 4.3 Arrangements and design to Pt 3, Ch 9, 4.7 Deflection, the structure may be designed on the basis of a direct calculation using a grillage idealisation. The method adopted and the stress levels proposed for the material of construction are to be submitted for consideration.

PART

3

CHAPTER **9** **Special Features**

SECTION **5** **Helicopter landing areas**

5. 1 General

5. 1. 1 Attention is drawn to the requirements and guidance of National and other Authorities concerning the construction of helicopter landing platforms and the operation of helicopters as they affect the ship. These include SOLAS *Regulation 18 - Helicopter facilities* and *Reg.III/28* as applicable. as well as the *International Chamber of Shipping (ICS) Guide to Helicopter/Ship Operations* and the *International Aeronautical Search and Rescue Manual (IAMSAR)* and *CAP437 Standards for Offshore Helicopter Landing Areas*.

5. 1. 2 Where the requirements of this Section have been adhered to for a designated helicopter landing platform or other deck area and fire-fighting appliances and other equipment necessary for the safe operation of helicopters are provided, the ship will be eligible for the special features notation **Helideck**. *See also* SOLAS *Regulation 18 - Helicopter facilities*.

5. 1. 3 Where the requirements of this Section have been complied with for an area on a ship designated for occasional or emergency landing of helicopters, the ship will be eligible for the special features notation **Occasional Helicopter Landing Area**, *See* SOLAS *Regulation 18 - Helicopter facilities*.

5. 1. 4 The structure is to be designed to accommodate the largest helicopter type which it is intended to use.

5. 1. 5 Plans are to be submitted showing the proposed scantlings and arrangements of the structure. The type, size, weight and footprint of helicopters to be used are also to be indicated. Details of the helicopter types to be used are to be included in the Loading Manual (*See* Pt 3, Ch 4, 8.2, Loading Manual)

5. 1. 6 Where the landing area forms part of a weather or erection deck, the scantlings are to be not less than those required for decks in the same position.

5. 2 Symbols

5. 2. 1 The symbols in this Section are defined in Pt 3, Ch 9, 1.2 Symbols and in the appropriate sub-Section.

5. 3 Arrangements

5. 3. 1 The landing area is to be sufficiently large to allow for the landing and manoeuvring of the helicopter, and is to be approached by a clear landing and take-off sector complying in extent with the applicable Regulations, International Standards, or to the satisfaction of the National Authority.

5. 3. 2 The landing area is to be free of any projections above the level of the deck. Projections in the zone surrounding the landing area are to be kept below the heights permitted by the Regulations, International Standards, or to the satisfaction of the National Authority.

5. 3. 3 Suitable arrangements are to be made to minimise the risk of personnel or machinery sliding off the landing area. A non-slip surface and anchoring devices are to be provided.

5. 3. 4 Engine uptake arrangements are to be sited such that exhaust gases cannot be drawn into helicopter engine intakes during helicopter take off or landing operations.

5. 4 Landing area plating

5. 4. 1 The deck plate thickness, t, within the landing area is to be not less than:

$$t = t_1 + 1.5 \text{ mm}$$

Where

t_1 = $\frac{\alpha s}{1000\sqrt{k}}$ mm

α = thickness coefficient obtained from Figure 9. 3. 1: Tyre print chart

β = tyre print coefficient used in Figure 9. 3. 1: Tyre print chart

= $\log_{10}\left(\frac{P_1 k^2}{s^2} \times 10^7\right)$

The plating is to be designed for the emergency landing case taking:

P_1 = $2.5\varphi_1\varphi_2\varphi_3 f_Y P_w$ tonnes

in which φ_1, φ_2, φ_3 are to be determined from Table 9. 3. 1: Deck plate thickness calculation

f = 1.15 for landing decks over manned spaces, e.g. deckhouses, bridges, control rooms, etc.

= 1.0 elsewhere

P_h = the maximum all-up weight of the helicopter, in tonnes

P_w = landing load on the tyre print in tonnes; for helicopters with a single main rotor, P_w is to be taken as P_h divided equally between the two main undercarriage wheels for helicopters with tandem main rotors, P_w is to be taken as P_h distributed between all main undercarriage wheels in proportion to the static loads they carry For helicopters fitted with landing gear consisting of skids, P_w is to be taken as P_h distributed in accordance with the actual load distribution given by the airframe manufacturer. If this is unknown, P_w is to be taken as $1/6P_h$ for each of the two forward contact points and $1/3P_h$ for each of the two aft contact points. The load may be assumed to act as a 300 mm x 10 mm line load at each end of each skid when applying Figure 9. 3. 1: Tyre print chart.

γ = a location factor given in Table 9. 5. 1: Location factor

For wheeled undercarriages, the tyre print dimensions specified by the manufacturer are to be used for the calculation. Where these are unknown, it may be assumed that the print area is 300 x 300 mm and this assumption is to be indicated on the submitted plan.
For skids and tyres with an asymmetric print, the print is to be considered oriented both parallel and perpendicular to the longest edge of the plate panel and the greatest corresponding value of α, taken from Figure 9. 3. 1: Tyre print chart.

Table 9. 5. 1: Location factor

Location	γ	
On decks forming part of the hull girder		
(a) within 0.4*L* amidships	0.71	Values for intermediate locations are to be determined by interpolation
(b) at the F.P. or A.P.	0.6	Values for intermediate locations are to be determined by interpolation
Elsewhere	0.6	

5. 4. 2 The plate thickness for aluminium decks is to be not less than:

$$t = 1.4t_1 + 1.5 \text{ mm}$$

where t_1 is the mild steel thickness as determined from Pt 3, Ch 9, 5.4 Landing area plating 5.4.1.

5. 5 Deck stiffening and supporting structure

5. 5. 1 The helicopter deck stiffening and the supporting structure for helicopter platforms are to be designed for the load cases given in Table 9. 5. 2: Design load cases for deck stiffening and supporting structure in association with the permissible stresses given in Table 9. 5. 3: Permissible stresses for deck stiffening and supporting structure. The helicopter is to be positioned so as to produce the most severe loading condition for each structural member under consideration.

5. 5. 2 The minimum moment of inertia, *I*, of aluminium secondary structure stiffening is to be not less than:

$$I = \frac{5.25}{k_a} Z l_e \text{ cm}^4$$

where *Z* is the required section modulus of the aluminium stiffener and attached plating and k_a as defined in Pt 3, Ch 9, 4.6 Pontoon webs and stiffeners 4.6.2.

5. 5. 3 Where a grillage arrangement is adopted for the platform stiffening, it is recommended that direct calculation procedures be used.

5. 6 Bimetallic connections

5. 6. 1 Where aluminium alloy platforms are connected to steel structures, details of the arrangements in way of the bimetallic connections are to be submitted.

Table 9. 5. 2: Design load cases for deck stiffening and supporting structure

	Loads	
Loadcase	Landing area	Supporting structure (*See* Note 1)

	UDL, in kN/m^2	Helicopter patch load (*See* Note 2)	Self weight	Horizontal load (*See* Note 2)
(1) Overall distributed loading	2	—	—	—
(2) Helicopter emergency landing	0.5	$2.5P_w f$	W_h	$0.5P_h$
(3) Normal usage	0.5	$1.5P_w$	W_h	$0.5P_h + 0.5W_h$

Symbols

P_h and P_w as defined in Pt 3, Ch 9, 5.4 Landing area plating 5.4.1

UDL=Uniformly distributed vertical load over entire landing area

W_h=structural self-weight of helicopter platform

Note *1*. For the design of the supporting structure for helicopter platforms, applicable self weight and horizontal loads are to be added to the landing area loads.

Note *2*. The helicopter is to be so positioned as to produce the most severe loading condition for each structural member under consideration.

Table 9. 5. 3: Permissible stresses for deck stiffening and supporting structure

	Permissible stresses, in N/mm^2			
Loadcase (*See* Table 9. 5. 2: Design load cases for deck stiffening and supporting structure)	Deck secondary structure (beams, longitudinals) (*See* Notes 1 and 2)	Primary structure (transverses, girders, pillars, trusses)		All structure
	Bending		Combined bending and axial	Shear
(1) Overall distributed load	$\frac{147}{k}$	$\frac{147}{k}$	$0.6\sigma_c$	
(2) Helicopter emergency landing	$\frac{245}{k}$	$\frac{220.5}{k}$	$0.9\sigma_c$	$\frac{\text{Bending}}{\sqrt{3}}$
(3) Normal usage	$\frac{176}{k}$	$\frac{147}{k}$	$0.6\sigma_c$	

Symbols

k =a material factor:

=as defined in Pt 3, Ch 9, 1.2 Symbols for steel members

=k_a as defined in Pt 3, Ch 9, 4.6 Pontoon webs and stiffeners 4.6.2 for aluminium alloy members

σ_c=yield stress, 0.2% proof stress or compressive buckling stress, in N/mm^2, whichever is the lesser

Note *1.* For strength deck longitudinals and girders, the permissible bending stresses are to be reduced as follows:

Note *(a)* within 0.4*L* of amidships - by 30%

Note *(b)* at the F.P. or A.P. - by 0%

Values at intermediate locations are to be determined by interpolation between (a) and (b).

Note *2.* When determining bending stresses in secondary structure, for compliance with the above permissible stresses, 100% end fixity may be assumed.

PART

3

CHAPTER **9** **Special Features**

SECTION **6** **Lifting appliances and support arrangements**

6. 1 General

6. 1. 1 Masts, derrick posts, crane pedestals and similar supporting structures are classification items, and the scantlings and arrangements are to comply with ACS's requirements whether or not ACS is also requested to issue the Register of Ships' Cargo Gear and Lifting Appliances.

6. 1. 2 Where the lifting appliance is considered to be an essential feature of a classed vessel, the special feature class notation **LA** or **LA** will, in general, be mandatory.

6. 1. 3 Elsewhere, classification of lifting appliances is optional and may be assigned at the request of the Owner on compliance with the appropriate requirements.

6. 1. 4 Certain movable support structures and lifting appliances on special purpose vessels which are considered an essential feature of the vessel are to be included in the classification of the vessel.

6. 1. 5 Proposals to class lifting appliances on unclassed ships will be specially considered.

6. 2 Masts, derrick posts and crane pedestals

6. 2. 1 The scantlings of masts and derrick posts, intended to support derrick booms, conveyor arms and similar loads, and of crane pedestals, are to comply with the requirements of ACS's *Code for Lifting Appliances in a Marine Environment,* (hereinafter referred to as LAME).

6. 2. 2 In addition to the information and plans requested in ACS's LAME the following details are to be submitted:

a. Details of masthouses or other supports for the masts, derrick posts or crane pedestals, together with details of the attachments to the hull structure.

b. Details of any reinforcement or additional supporting material fitted to the hull structure in way of the mast, derrick post or crane pedestal.

6. 3 Support Structure for masts, derrick posts and lifting appliance pedestals

6. 3. 1 The requirements of Pt 3, Ch 9, 6.3 Support Structure for masts, derrick posts and lifting appliance pedestals 6.3.2 and Pt 3, Ch 9, 6.3 Support Structure for masts, derrick posts and lifting appliance pedestals 6.3.3 are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation, *See* Pt 1, Ch 2, 2.3 Class notations (hull).

6. 3. 2 Masts, derrick posts and crane pedestals are to be efficiently supported and, in general, are to be carried through the deck and satisfactorily scarfed into a transverse hold or 'tween deck bulkhead. Alternatively, the masts, derrick posts or crane pedestals may be carried into a mast house, in

which case the mast house is to be of substantial construction. Proposals for other support arrangements will be specially considered.

6. 3. 3 Deck plating and underdeck structure are to be reinforced under masts, derrick posts or crane pedestals and, where the deck is penetrated, the deck plating is to be suitably increased locally.

6. 3. 4 The deck plating and underdeck stiffening in way of a lifting appliance are to be assessed using the same criteria used to assess the lifting appliance pedestal with due consideration given to the material grade.

6. 3. 5 Insert plates are to be incorporated in the deck plating in way of lifting appliance foundations where considered necessary to limit deflection and reduce stress concentrations. The thickness of the insert plates is to be as required by the designer's calculations but in no case is to be taken as less than 1.5 times the thickness of the adjacent attached plating.

6. 3. 6 Where fitted, all inserts are to have well radiused corners and be suitably edge prepared prior to welding. The connection between the insert plate and the adjacent deck plating is to be full penetration. All other welding in way of the insert plate is generally to be double continuous and full penetration in way of critical locations. Tapers are to be not less than three to one.

6. 4 Lifting appliances

6. 4. 1 Vessels or offshore units fitted with lifting appliances built in accordance with ACS's LAME in respect of structural and machinery requirements will be eligible to be assigned Special Features class notations as listed in Table 9. 6. 1: Special features class notations associated with lifting appliances. This notation will be retained so long as the appliances are found upon examination at the prescribed surveys to be maintained in accordance with ACS's requirements.

Table 9. 6. 1: Special features class notations associated with lifting appliances

Lifting appliance	Special features class notation	Remarks
Cargo gear, Derricks, derrick cranes or cranes on ships	**CG**	*Optional notation*. Indicates that the vessel's cargo gear is included in class.
Cranes on offshore units, offshore installations and offshore support vessels	**OC**	*Optional notation*. Indicates that the installation's, unit's or vessel's main deck cranes are included in class.
Pipe laying system	**PLS**	*Optional notation*. Indicates that the pipe laying system is included in class.
Personnel transfer system (Walk-to-Work)	**W2W**	*Optional notation*. Indicates that the personnel transfer system is included in class.
Lifts and ramps on vessels	**CL** **PL** **CR**	*Optional notations*. Indicate that the vessel's cargo lifts (**CL**), passenger lifts (**PL**) or cargo ramps (**CR**) are included in class.

Lifting appliances forming an essential feature of the vessel, e.g. cranes on crane barges or pontoons, lifting arrangements for diving on diving support vessels, etc.	**LA**	*Mandatory notation*. Indicates that the lifting appliance is included in class.
Lifting appliances forming an essential feature of the vessel where the appliance(s) has been classed by a recognised classification society other than ACS and later transferred into class with ACS.	**LA**	*Mandatory notation*. Indicates that the lifting appliance is classed and that initial requirements for the appliance were that of another recognised classification society

6. 5 Support structure for life-saving appliances

6. 5. 1 The support structure for life-saving appliance davits and cranes is to be assessed on the basis of the maximum safe working load assigned and the ultimate strength of the materials used for construction.

6. 5. 2 The following load cases are to be considered as appropriate:

a. Vertical forces acting on deck;
b. Overturning moment;
c. Slewing moment.

6. 5. 3 The load cases given in Pt 3, Ch 9, 6.5 Support structure for life-saving appliances 6.5.2 are to be calculated based on the maximum safe working load of the davit and the requirements of the *LSA Code - International Life-Saving Appliance Code – Resolution MSC.48(66)* , *Chapter VI - Launching and Embarkation Appliances*, 6.1.1 General requirements. Each load case is to also consider the self-weight of the davit.

6. 5. 4 Both outboard and inboard load cases are to be considered together with intermediate positions as appropriate.

6. 5. 5 Support structure for appliances used for both life-saving and general shipboard operations are to be considered for both of these aspects.

6. 5. 6 The maximum permissible bending stress is to be taken as the lesser of:

a. $\sigma_a = \frac{\sigma_U}{4.5} N/mm^2$

b. $\sigma_a = \frac{\sigma_o}{2.2} N/mm^2$

Where

σ_U = Ultimate tensile strength of material, in N/mm^2

σ_o = specified minimum yield stress or 0.2 per cent proof stress, in N/mm^2

6. 5. 7 The maximum permissible shear stress is to be taken as the lesser of:

$$\tau_a = \frac{\sigma_U}{7.8} N/mm^2$$

$$\tau_a = \frac{\sigma_o}{3.8} N/mm^2$$

σ_U and σ_o are defined in Pt 3, Ch 9, 6.5 Support structure for life-saving appliances 6.5.6.

6. 6 Walk-to-Work (W2W)

6. 6. 1 This notation applies to ships designed, constructed and equipped to include personal transfer, e.g. by a motion compensated gangway or similar feature.

6. 6. 2 The transfer equipment is to be certified by ACS against appropriate code relevant for the equipment, i.e. ACS's *Code for Lifting Appliances in a Marine Environment,* as applicable or an alternative code deemed applicable by ACS.

6. 6. 3 Attention is drawn to the requirements of the Flag Administration concerning the transfer system.

6. 6. 4 Information and details of the local strengthening in way of the transfer system are to be submitted to ACS for approval.

6. 6. 5 When considering loads, all expected directions of operation are to be taken into account. The foundation for the transfer system is to be designed in accordance with ACS's *Code for Lifting Appliances in a Marine Environment,* Ch 4, 5.1 General 5.1.6.

6. 6. 6 Where required by primary or additional bridge functions associated with offshore support the primary conning position in the navigation bridge is to permit adequate monitoring of personal transfer from the aft deck of the ship. Means of ensuring this visibility are to be provided.

6. 6. 7 The fields of vision at the fore stations for ship handling and work on the aft deck are to be sufficient to enable operators to supervise pernal transfer in all defined operational conditions, *See* ACS Ship Control Centre Guidance for further details.

6. 7 Ramp supporting structure

6. 7. 1 The support structure (including hinges) in way of the interface between a ramp and the ship is to be assessed in accordance with the appropriate criteria given in Ch 6, 2 Loading and design criteria *of the Code for Lifting Appliances in a Marine Environment*.

6. 7. 2 The loads that the ramp supporting structure will be subjected to are to be submitted by the designer or Shipbuilder. These loads are to be calculated in accordance with Ch 6, 2 Loading and design criteria of the *Code for Lifting Appliances in a Marine Environment*. Load cases calculated in accordance with alternative standards can be accepted subject to agreement with ACS.

6. 7. 3 Loads already existing in the supporting structure (other than those from the ramp) are to be superimposed if applicable.

6. 7. 4 Ramps forming part of the watertight integrity of the hull are also to be assessed in accordance with the applicable scantling requirements.

PART

3

CHAPTER **9** **Special Features**

SECTION **7** **Bottom strengthening for loading and unloading aground**

7. 1 Application

7. 1. 1 Where a ship of length, L, less than 90 m has the bottom structure additionally strengthened for loading and unloading aground in accordance with Table 9. 7. 1: Bottom strengthening for loading and unloading aground, it will be eligible for the special features notation `bottom strengthened for loading and unloading aground'. Ships of length, L, 90 m or more intended for this service will receive individual consideration.

7. 1. 2 For dredgers intended to operate aground, the requirements of Pt 4, Ch 12 Dredging and Reclamation Craft are to be applied.

Table 9. 7. 1: Bottom strengthening for loading and unloading aground

Item	Requirement	
The following requirements are to be applied to the bottom structure upon which the ship is likely to be supported whilst aground		
(1) Bottom shell and keel plating	Thickness to be increased by 20% over the minimum requirements given in Part 4 for the particular type of ship with a minimum of 8 mm	
(2) Bottom longitudinals in way of single bottoms	For dry cargo ships, as required in way of double bottoms, *See* item (3) For oil tankers, scantlings as required by Table 9. 5. 1: Values of F1 in Pt 4, Ch 9 in taking $c_1 = 1.0$	
(3) Bottom longitudinals in way of double bottoms, *See* Note 1	For dry cargo ships, scantlings as required by Table 1. 6. 1: Shell framing (longitudinal) in Pt 4, Ch 1 in taking $c_1 = 1.0$	
(4) Bilge longitudinals (where fitted)	Scantlings to be the same as bottom longitudinals	
	Transverse framing	Longitudinal framing
(5) Primary stiffening in way of single bottoms, *See* Notes 2 and 3	*(a)* Floors to be fitted at every frame with vertical stiffeners spaced, in general, not more than 1.25 m apart (b) One side girder is to be fitted on each side of the centreline in addition to the requirements of Pt 4, Ch 1, 7 Single bottom structure and intermediate 150 x 10 bulb plate longitudinals or equivalent fitted	*(a)* The arrangements and scantlings will receive individual consideration depending on the structural arrangements of the particular ship type *(b)* The spacing of transverse or floors is, in general, not to exceed 1.85 m

(6) Primary stiffening in way of double bottoms, *See* Notes 1, 2 and 3	(a) Plate floors are to be fitted at every frame and vertical stiffening arranged to give panel widths, in general, not exceeding 1.25 m One side girder is to be fitted on each side of the centreline in addition to the requirements of Pt 4, Ch 1, 8 Double bottom structure and intermediate 150 x 10 bulb plate longitudinals or equivalent fitted	(a) The spacing of floors is, in general, not to exceed 1.85 m (b) One side girder is to be fitted on each side of the centreline in addition to the requirements of Pt 4, Ch 1, 8 Double bottom structure

Note *1*. For oil tankers, to be specially considered.

Note *2*. The scantlings of floors, girders and transverses are to be determined from Pt 4 Ship Structures (Ship Types), for the particular ship type.

Note *3*. The number and sizes of holes in floors, girders and transverses are to be kept to a minimum; *See* Pt 4, Ch 1, 8 Double bottom structure and Pt 4, Ch 9, 6 Inner hull, inner bottom and longitudinal oiltight bulkheads.

PART

3

CHAPTER 9 **Special Features**

SECTION 8 **Strengthening for regular discharge by heavy grabs**

8. 1 Application

8. 1. 1 For bulk carriers where cargoes are regularly discharged by heavy grabs and the thickness of the plating of the hold inner bottom, hopper and transverse bulkhead bottom stool is increased in accordance with the requirements of this Section, the ship will, at the Owner's option, be assigned the notation `strengthened for regular discharge by heavy grabs'.

8. 1. 2 It should be noted that damage to the plating cannot be excluded even when complying with these requirements and can result from the mishandling of the grabs during the discharge of cargo.

8. 1. 3 The grab weight given in Pt 3, Ch 9, 8.2 Inner bottom plating 8.2.1 does not preclude the use of heavier grabs. It is intended as an indication to the Builders, Owners and operators of the increased risk of local damage and the possibility of accelerated diminution of the plating thickness if grabs heavier than this are used regularly to discharge cargo.

8. 1. 4 The maximum unladen weight of the grab is to be recorded in the Loading Manual, *See also* Pt 3, Ch 4, 8.2 Loading Manual 8.2.4.e.

8. 1. 5 The requirements in this Section are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation. *See* Pt 1, Ch 2, 2.3 Class notations (hull).

8. 2 Inner bottom plating

8. 2. 1 The thickness of the inner bottom plating in the holds is to be not less than required by the greater of the following:

a. $t = \frac{\left(\log_{10}\left(1.775P\left(\frac{k}{s}\right)^2\right)+5.7633\right)s-344.5}{40.875\sqrt{k}} + 1.5\text{mm}$

b. t =the Rule required thickness, in mm in accordance with Pt 4, Ch 7, 8 Double bottom structure for the intended class notation.

Where

P = specified unladen grab weight for the hold, in tonnes, and is not to be taken as less than 25 tonnes

s = spacing of inner bottom longitudinals, in mm

k = higher tensile steel factor as defined in Pt 3, Ch 2, 1.2, Steel

8. 3 Hopper side tank sloped bulkhead plating

8. 3. 1 The thickness of the sloped bulkhead plating adjacent to the inner bottom knuckle is to be as required by Pt 3, Ch 9, 8.2 Inner bottom plating 8.2.1 but based on the actual spacing of stiffeners. The plating of increased thickness is to extend for a minimum distance corresponding to a vertical height of 1.5 m above the line of the inner bottom. Outboard of the plating of increased thickness, the thickness of the adjacent strakes is to be tapered to the Rule thickness for plating, as required by Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening 8.4.1, at the top corner of the tank, *See also* Pt 4, Ch 7, 9.2 Sloped bulkhead plating 9.2.3 where, in addition, the `strengthened for heavy cargo notation' is desired.

8. 4 Transverse bulkhead plating

8. 4. 1 The thickness of the bulkhead or stool plating adjacent to the inner bottom is to be as required by Pt 3, Ch 9, 8.2 Inner bottom plating 8.2.1 but based on the actual spacing of the bulkhead or stool stiffeners. The plating of increased thickness is to extend for a minimum distance corresponding to a vertical height of 1.5 m above the line of the inner bottom.

PART

3

CHAPTER **9** **Special Features**

SECTION **9** **Strengthening for machinery on deck**

9. 1 Application

9. 1. 1 Where it is intended to install machinery on deck, the requirements of this Section are to be complied with and the notation '**Machinery on deck**' will be assigned.

9. 1. 2 Where the concentrated loads calculated in accordance with Pt 3, Ch 9, 9.2, Loading are less than the specified deck design load required by Table 3. 5. 1: Design heads and permissible cargo loadings or where the ship has been assigned a '**Heavy deck loads**' notation and the machinery loading is less than the assigned heavy deck cargo loading, then the requirements of this Section need not be applied and the notation will not be assigned.

9. 1. 3 The requirements of this Section do not apply to lifting appliances, anchoring and mooring equipment, or towing equipment.

9. 2 Loading

9. 2. 1 The motions of the ship and the wind loading are to be considered in deriving the loads acting on the ship.

9. 2. 2 The design accelerations are to be calculated in accordance with Pt 3, Ch 9, 9.2 Loading 9.2.3 and applied as considered necessary. Other means of deriving the design accelerations such as direct calculation or model testing will be specially considered.

9. 2. 3 The following formulae are given as guidance for the components of acceleration due to ship motions and apply to ships with a length exceeding 50 metres and where the speed is such that the ship is operating within the displacement mode basedon normal ship service speed.

Vertical acceleration due to heave, pitch and roll motions:

$$a_z = \pm\sqrt{a_{\text{heave}}^2 + a_{\text{pitch}}^2 + a_{\text{rollz}}^2}$$

Transverse acceleration due to sway, yaw and roll motions:

$$a_y = \pm\sqrt{a_{\text{sway}}^2 + a_{\text{yaw}}^2 + a_{\text{rolly}}^2}$$

Longitudinal acceleration due to surge motions:

$$a_x = \pm a_0\sqrt{0.06 + A^2 - 0.25\text{A}}$$

Where

$$A = f_{\text{HS}} f_{\text{st}} \left(0.7 - \frac{L}{1200} + \frac{5(z-T)}{L}\right)\left(\frac{0.6}{C_b}\right)$$

a_x, a_y and a_z=are the maximum dimensionless accelerations (i.e. relative to the acceleration of gravity) in their respective directions and are considered as acting separately for calculation purposes.

a_x = is measured positive in the forward direction. Includes the component due to static weight in the longitudinal direction due to pitching.

a_y = is measured positive in the transverse direction to port. Includes the component due to static weight in the transverse direction due to rolling.

a_z = is measured positive in the downwards direction, i.e. adds to g. Does not include the component due to static weight.

a_0, a_{heave}, a_{pitch}, a_{sway}, a_{yaw}, a_{rolly}, $a_{(rollz)}$, f_{st} and A are defined in Table 9. 9. 1: Ship motions.

f_{HS} = is taken as 1 for unrestricted sea going service.

T, L and C_b=are defined in Pt 3, Ch 1, 6.1, Principal particulars

z = is the vertical distance, in metres, from the keel line to the position or centre of gravity of the item being considered.

Table 9. 9. 1: Ship motions

Motion		Acceleration
Heave		$a_{heaxe} = a_0$
Pitch		$a_{pitch} = a_0\left(5.3 - \frac{45}{L}\right)\left(\frac{x - LCG}{L}\right)\left(\frac{0.6}{C_b}\right)^{0.75}$
Sway		$a_{sway} = 0.78a_0$
Yaw		$a_{yaw} = a_0 1.6\left(\frac{x - LCG}{L}\right)$
Roll	Acceleration due to Roll Vertical direction	$a_{rollz} = a_0\frac{0.6yK^{1.5}}{B}$
Roll	Acceleration due to Roll Transverse direction	$a_{rolly} = a_0\sqrt{K}\left(1 + 0.6K\left(\frac{z - T}{B}\right)\right)$
		$a_0 = f_{HS}f_{st}\left(\frac{0.2V_a}{\sqrt{L}} + \frac{34 - \left(\frac{600}{L}\right)}{L}\right)$
Relative vertical motion		$H_{rm} = C_{w.min}\left(1 + \frac{k_r}{(C_b + 0.2)}\left(\frac{x}{L} - x_m\right)^2\right)$
Symbols		
f_{st}=correction factor for long term (10^{-8}) acceleration value to average of the highest 1/100 acceleration values =0.8		$F_n = \frac{0.515V_a}{\sqrt{gL}}$

C_w=a wave head, in metres $= 7.71 \times 10^{-2} L e^{-0.0044L}$ but L is not to be taken greater than 227 $C_{w.min} = \frac{C_w}{k_m}\sqrt{\frac{2.25}{k_r}}$ $k_m = 1 + \frac{k_r(0.5-x_m)^2}{(C_b+0.2)}$ x_m=0.45-0.6F_n but x_m is not to be taken less than 0.2 k_r= 2.25 $V_a = \frac{2}{3}V$ V is maximum service speed in knots	K $= 13\frac{GM}{B}$ but is not to be taken less than 1 GM=is the metacentric height in metres f_{HS}=is defined in Pt 3, Ch 9, 9.2 Loading 9.2.3 L, T, B and C_b =are defined in Pt 3, Ch 1, 6.1, Principal particulars x=is the longitudinal position of the location under consideration measured from the aft end of L LCG=is the longitudinal centre of gravity of the ship measured in metres from the aft end of L
Note *1* Heave motion is measured positive upwards. **Note** *2* Pitch motion is measured positive bow downwards. **Note** *3* Sway motion is measured positive to port. **Note** *4* Yaw motion is measured positive bow to port. **Note** *5* Roll motion is measured positive port side upwards.	

9. 2. 4 The wind force is to be calculated in accordance with the requirements of Pt 3, Ch 9, 9.2 Loading 9.2.4 and Pt 3, Ch 9, 9.2 Loading 9.2.5. The wind force acting in the most onerous direction for the case being considered is to be applied.

9. 2. 5 The wind pressure, p, acting on the structure is given by:

$$p = \frac{V^2}{1630} \text{kN/m}^2$$

Where

V = wind speed, in m/s; to be taken as 63 m/s.

9. 2. 6 The wind force, F_w, acting on the structure is given by:

$$F_w = ApC_f \quad \text{kN}$$

Where

A = the effective area of the structure concerned, i.e. the solid area projected on to a plane perpendicular to the wind direction, in m2

p = the wind pressure as defined in Pt 3, Ch 9, 9.2 Loading 9.2.5

C_f = the force coefficient in the direction of the wind, as defined in Table 9. 9. 2: Force coefficient Cf

Table 9. 9. 2: Force coefficient Cf

Type	Description		Aerodynamic slenderness l/b or l/D					
			5	10	20	30	40	50
Individual members	Rolled sections, rectangles, hollow sections, flat plates, box sections with b or d less than 0.5 m		1.30	1.35	1.60	1.65	1.70	1.80
	Circular sections, where	$DV_s < 6\ m^2/s$	0.75	0.80	0.90	0.95	1.00	1.10
		$DV_s \geq 6\ m^2/s$	0.60	0.65	0.70	0.70	0.75	0.80
	Box sections with b or d greater than 0.5 m	b/d ≥2.00	1.55	1.75	1.95	2.10	2.20	
		1.00	1.40	1.55	1.75	1.85	1.90

		0.25	0.80	0.90	0.90	1.00	1.00	
Single lattice frames	Flat sided sections		1.70					
	Circular sections, where	$DV_s < 6\ m^2/s$	1.20					
		$DV_s \geq 6\ m^2/s$	0.80					
Plated structure	Plated structures on solid base (air flow beneath structure prevented)		1.10					
Symbols								
l=length of member D=diameter of circular section V_s=wind speed, in m/s b=breadth of box section, in metres d=depth of box section, in metres								

9. 3 Support structure for machinery on deck

9. 3. 1 The deck plating and underdeck structure are to be reinforced under machinery. Acceptable stress levels are as follows:

$$\sigma \leq 0.75\sigma_{ref}$$

$$\tau \leq 0.47\sigma_{ref}$$

$$\sigma_e \leq 0.85\ \sigma_{ref}$$

Where

σ = normal stress, in N/mm^2

τ = shear stress, in N/mm^2

σ_e = equivalent stress, in N/mm^2

σ_{ref} = reference stress of the material, in N/mm^2

$= \frac{235}{k_L}$

k_L = as defined in Table 2. 1. 1: Values of kL

9. 3. 2 Insert plates are to be incorporated in the deck plating in way of machinery foundations where considered necessary to limit deflection and reduce stress concentrations. The thickness of the insert plates is to be as required by the designer's calculations but in no case is to be taken as less than 1.5 times the thickness of the adjacent attached plating.

9. 3. 3 Where fitted, all inserts are to have well radiused corners and be suitably edge prepared prior to welding. The connection between the insert plate and the adjacent deck plating is to be full penetration. All other welding in way of the insert plate is generally to be double continuous and full penetration in way of critical locations. Tapers are to be not less than three to one.

CHAPTER 10 Welding and Structural Details

SECTION 1 General

1. 1 Application

1. 1. 1 This Chapter is applicable to all ship types and components.

1. 1. 2 Requirements are given in this Chapter for the following:

a. Welding-connection details, defined practices and sequence, consumables and equipment, procedures, workmanship and inspection.

b. End connection scantlings and constructional details for longitudinals, beams, frames and bulkhead stiffeners.

c. Primary member proportions, stiffening and construction details.

Additional requirements for primary structure of tankers and similar ships are given in Pt 4, Ch 9, 6 Inner hull, inner bottom and longitudinal oiltight bulkheads.

1. 1. 3 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a CSR notation (*See* Pt 1, Ch 2, 2.3 Class notations (hull)) with the exception of Pt 3, Ch 10, 2.5 Welding equipment which are to be complied with.

1. 2 Symbols

1. 2. 1 Symbols are defined as necessary in each Section.

1. 2. 2 The Notation **ESP** serves to identify the ships as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements and Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements, *See also* Pt 1, Ch 2, 2 Character of classification and class notations.

PART

3

CHAPTER **10 Welding and Structural Details**

SECTION **2 Welding**

2. 1 General

2. 1. 1 The plans to be submitted for approval are to indicate clearly details of the welded connections of main structural members, including the type and size of welds. This requirement includes welded connections to steel castings.

The information to be submitted should include the following:

a. Whether weld sizes given are throat thicknesses or leg lengths.
b. Grades and thicknesses of materials to be welded.
c. Location, types of joints and angles of abutting members.
d. Reference to welding procedures to be used.
e. Sequence of welding of assemblies and joining up of assemblies.

2. 1. 2 Unless otherwise indicated, all welding is to be in accordance with the requirements of Ch 13 Requirements for Welded Construction of the Rules for Materials.

2. 2 Fillet welds

2. 2. 1 The throat thickness of fillet welds is to be determined from:

$$\text{Throat thickness} = t_p \times \text{weld factor} \times \frac{d}{s}$$

Where

d = the distance between start positions of successive weld fillet, in mm

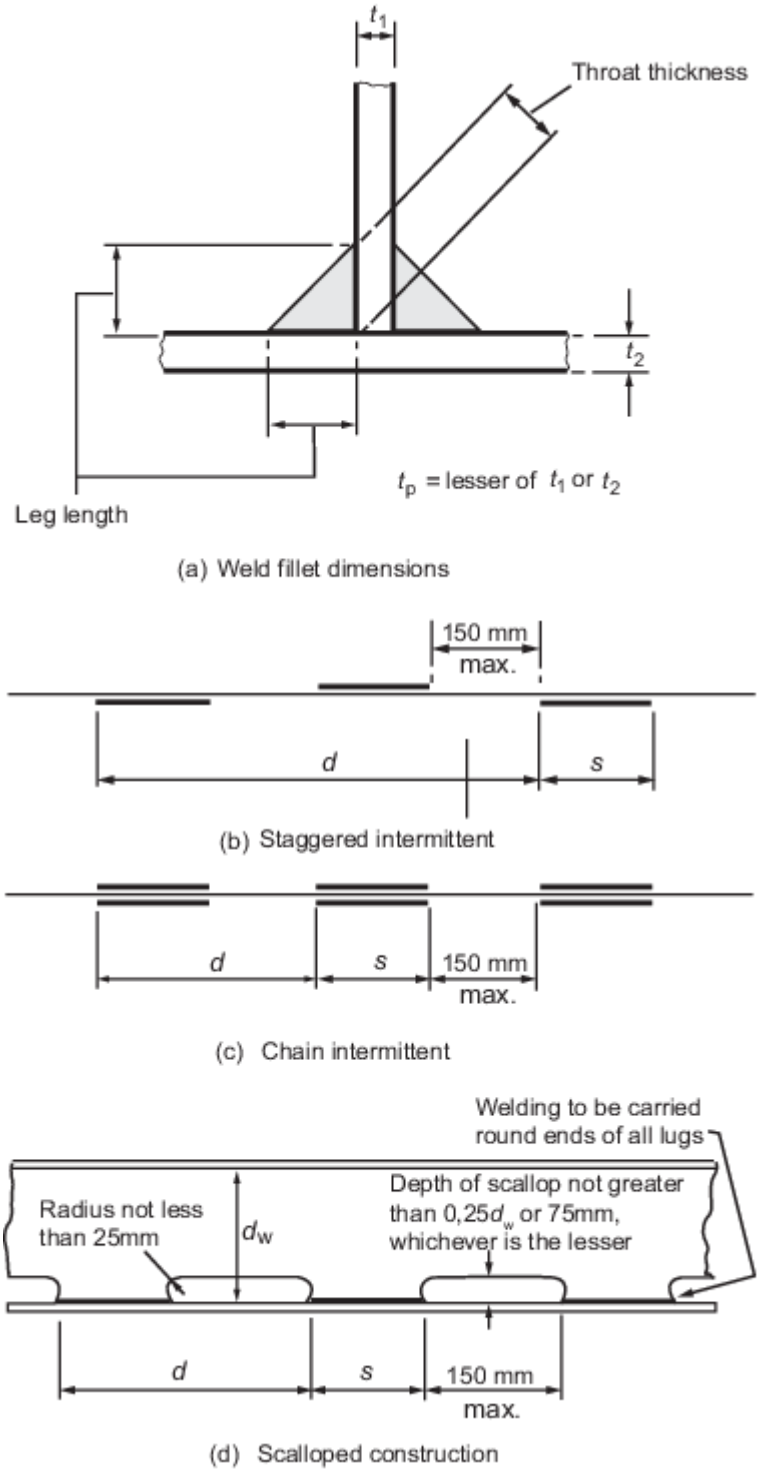
s = the length, in mm, of correctly proportioned weld fillet, clear of end craters, and is to be not less than 75 mm

t_p = plate thickness, on which weld fillet size is based, in mm

See also Figure 10. 2. 1: Weld dimensions and types

Weld factors are given in Table 10. 2. 1: Weld factors, Table 10. 2. 3: Connections of primary structure and Table 10. 2. 4: Secondary member end connection welds.

Figure 10. 2. 1: Weld dimensions and types



2. 2. 2 Where double continuous fillet welding is proposed, the throat thickness is to be determined taking $(\frac{d}{s})$ equal to 1.0.

2. 2. 3 The leg length of the weld is to be not less than $\sqrt{2}$ times the specified throat thickness.

2. 2. 4 The plate thickness, t_p, to be used in the above calculation is generally to be that of the thinner of the two parts being joined. Where the difference in thickness is considerable, the size of fillet will be considered.

2. 2. 5 Where the thickness of the abutting member of the connection (e.g. the web of a stiffener) is greater than 15 mm and exceeds the thickness of the table member (e.g. plating), the welding is to be double continuous and the throat thickness of the weld is to be not less than the greatest of the following:

a. 0.21 x thickness of the table member. The table member thickness used need not exceed 25mm.
b. 0.21 (0.27 in tanks) x half the thickness of the abutting member.
c. As required by Table 10. 2. 2: Throat thickness limits.

2. 2. 6 Except as permitted by Pt 3, Ch 10, 2.2 Fillet welds 2.2.5, the throat thickness of the weld is not to be outside the limits specified in Table 10. 2. 2: Throat thickness limits.

Table 10. 2. 1: Weld factors

Item		Weld factor	Remarks
(1)	General application:		except as required below
	Watertight plate boundaries	0.34	
	Non-tight plate boundaries	0.13	
	Longitudinals, frames, beams, and other secondary members to shell, deck or bulkhead plating	0.10	
		0.13	in tanks
		0.21	in way of end connections
	Panel stiffeners, etc.	0.10	
	Overlap welds generally	0.27	
	Longitudinals of the flat-bar type to plating		*See* Note 5
(2)	Bottom construction in way of holds or tanks:		
	Non-tight centre girder: to keel	0.27	
	to inner bottom	0.21	no scallops
		0.21	in way of 0.2 × span at ends
	Non-tight boundaries of floors, girders and brackets	0.27	in way of brackets at lower end of main frame
	Watertight bottom girders	0.34	
	Connection of girder to inner bottom in way of longitudinal bulkheads supported on inner bottom	0.44	

	Inner bottom longitudinals or reverse frames	0.13	under holds strengthened for heavy cargoes Weld size based on floor thickness
	Connection of floors to inner bottom in way of plane bulkheads, bulkhead stools, or corrugated and double plate bulkheads supported on inner bottom. The supporting floors are to be continuously welded to the inner bottom	0.44	Weld material compatible with floor material *See* Note 4
(3)	Hull framing; Webs of web frames and stringers: to shell to face plate Tank side brackets to shell and inner bottom	 0.16 0.13 0.34	
(4)	Decks and supporting structure: Strength deck plating to shell		as shown in Table 10. 2. 5: Weld connection of strength deck plating to sheerstrake but alternative proposals will be considered
	Other decks to shell and bulkheads (except where forming tank boundaries)	0.21	generally continuous
	Webs of cantilevers to deck and to shell in way of root bracket	0.44	
	Webs of cantilevers to face plate	0.21	
	Pillars: fabricated	0.10	
	end connections	0.34	*See* Note 1
	end connections (tubular)	full penetration	
	Girder web connections and brackets in way of pillar heads and heels	0.21	continuous
(5)	Bulkheads and tank construction, *See also* Pt 4, Ch 7, 10 Bulkheads: Plane, double plate and corrugated watertight bulkhead boundary at bottom, bilge, inner bottom, deck and connection to shelf plate, where fitted	0.44	weld size to be based on thickness of bulkhead plating weld material to be compatible with bulkhead plating material

	Shelf plate connection to stool	0.44	weld size to be based on thickness of stool at junction with shelf plate. Weld material to be compatible with stool material
	Plane, double plate and corrugated bulkhead boundaries in way of deep tanks, holds in bulk carriers (*See* Pt 3, Ch 10, 1.1 Application 1.1.3) which are floodable for the sea-going ballast condition or for the carriage of oil cargoes (Holds in bulk carriers (*See* Pt 3, Ch 10, 1.1 Application 1.1.3) which are partially flooded for harbour conditions will be specially considered):		
	- Boundary at bottom, bilge, inner bottom and deck	0.44	
	- Connection of stool and bulkhead to lower stool shelf plating	full penetration	
	- Connection of stool and bulkhead plating to upper stool shelf plate	0.44	
	- Connection of bulkhead plating to hopper and topside tanks	0.44	
	- Connection of bulkhead plating to side shell	0.34	
	Secondary members where acting as pillars	0.13	
	Non-watertight pillar bulkhead boundaries	0.13	
	Perforated flats and wash bulkhead boundaries	0.10	
(6)	Structure in cargo oil tanks of tankers (*See* Pt 3, Ch 10, 1.1 Application 1.1.3):		
	Bottom longitudinals to shell	0.21	for forward of 0.3*L*
	Longitudinal of flat-bar type to plating		*See* Pt 3, Ch 10, 2.2 Fillet welds 2.2.5
	Connections between primary structural members	0.44	at bottom
		0.34	at deck
	Oiltight bulkhead boundaries:		
	longitudinal bulkhead	0.44	*See* Note 2
	transverse bulkhead	0.44	at bottom, *See* Note 3
		0.34	at deck, sides and longitudinal bulkhead
	Vertical corrugations to an inner bottom	full penetration	
	Non-tight bulkhead boundaries to plating	0.21	
(7)	Structure in cargo tanks of chemical tankers:		
	Tank boundary bulkheads:		

Type 1 ship		full penetration	
Type 2 ship			
	longitudinal bulkheads	0.44	*See* Note 2
	transverse bulkhead	0.44	
Type 3 ship			
	longitudinal bulkheads	0.44	*See* Note 2
	transverse bulkheads	0.44	at bottom *See* Note 3
	transverse bulkheads at deck, sides and longitudinal bulkhead	0.34	
(8) Structure in hoppers of hopper dredgers, etc.:			
Bulkhead boundary connections		0.44	at bottom and bilge
		0.34	at deck and coamings
Cross members to bulkheads and keels		0.44	
Pillar end connections		0.34	
Hopper door hinges		full penetration	generally
(9) Structure in machinery space:			
Centre girder to keel and inner bottom		0.27	
Floors to centre girder in way of engine, thrust and boiler bearers		0.27	
Floors and girders to shell and inner bottom		0.21	
Main engine foundation girders:			
	to top plate	deep penetration	edge to be prepared with maximum root $0.33t_p$ deep penetration generally
	to hull structure	to depend on design	
Floors to main engine foundation girders		0.27	
Brackets, etc. to main engine foundation girders		0.21	
Transverse and longitudinal framing to shell		0.13	
(10) Construction in 0.25L forward:			
Floors and girders to shell and inner bottom		0.21	
Bottom longitudinals to shell		0.13	
Transverse and longitudinal side framing to shell		0.13	

Tank side brackets to frame and inner bottom	0.34	
Panting stringers to shell and frames	0.34	
Fore peak construction:		
all internal structure	0.13	unless a greater weld factor is required
(11) After peak construction:		
All internal structure and stiffeners on after peak bulkhead	0.21	unless a greater weld factor is required
(12) Superstructure and deckhouses:		
Connection of external bulkheads to deck	0.34	1st and 2nd tier erections elsewhere
	0.21	
Internal bulkheads	0.13	
(13) Hatchways and closing arrangements:		
Hatchways coamings to deck	0.34	0.44 at corners
Hatch cover rest bar	0.16	
Hatch coaming stays to coaming	0.13	
Hatch coamings stays to deck	0.21	
Cleats and fittings	0.44	full penetration welding may be required
Primary and secondary stiffening of hatch covers	0.10	0.13 for tank covers and where covers strengthened for loads over
(14) Steering control systems:		
Rudder:		
Fabricated mainpiece and mainplace to side plates and webs	0.44	
Slot welds inside plates	0.44	
Remaining construction	0.21	
Fixed and steering nozzles:		
Main structure	0.44	
Elsewhere	0.21	
Fabricated housing and structure of thruster units, stabilisers, etc.:		
Main structure	0.44	
Elsewhere	0.21	
(15) Miscellaneous fittings and equipment:		

Rings for manhole type covers, to deck or bulkhead	0.34	
Frames of shell and weathertight bulkhead doors	0.34	
Stiffening of doors	0.21	
Ventilator, air pipe, etc. coamings to deck	0.34	Load Line Positions 1 and 2
	0.21	elsewhere
Ventilator, etc. fittings	0.21	
Scuppers and discharges, to deck	0.44	
Masts, derrick posts, crane pedestals, etc. to deck	0.44	full penetration welding may be required
Deck machinery seats to deck	0.21	generally
Mooring equipment seats	0.21	generally, but increased or full penetration welding may be required
Bulwark stays to deck	0.21	
Bulwark attachment to deck	0.34	
Guard rails, stanchions, etc. to deck	0.34	
Bilge keel ground bars to shell	0.34	Continuous fillet weld, minimum throat thickness 4 mm
Bilge keels to ground bars	0.21	Light continuous fillet weld, minimum throat thickness 3 mm
Fabricated anchors	full penetration	

Note *1.* Where pillars are fitted inside tanks or under watertight flats, the end connection is to be such that the tensile stress in the weld does not exceed 108 N/mm^2.

Note *2.* t_p need not be taken greater than the thickness determined from item 1(a) or 1(b) and Notes, as appropriate, of Table 9. 6. 1: Inner hull and longitudinal oiltight bulkhead scantlings in Pt 4, Ch 9 Double Hull Oil Tankers, but in no case is the weld throat thickness to be less than 0.34 x actual plate thickness.

Note *3.* t_p need not be taken greater than the Rule thickness determined from Table 9. 7. 1: Transverse oiltight bulkhead scantlings of Pt 4, Ch 9 Double Hull Oil Tankers for stiffener spacing of 760 mm, but in no case is the weld throat thickness to be less than 0.34 × actual plate thickness.

Note *4.* In way of bulkhead stools in ballast holds of bulk carriers or in tanks at longitudinal girder/transverse floor intersection, cut-outs are to be omitted and full penetration welding is to be applied to both floor and girder for a distance of 150 mm on either side of intersection.

Note *5.* The throat thickness of the weld is to be determined by Pt 3, Ch 10, 2.2 Fillet welds 2.2.5. For longitudinals within *D*/4 of the strength deck and with a thickness less than 100 mm, the throat thickness need not exceed 5.5 mm.

2. 2. 7 Double continuous fillet welding is to be adopted in the following locations, and may be used elsewhere if desired:

a. Boundaries of weathertight decks and erections, including hatch coamings, companionways and other openings.
b. Boundaries of tanks and watertight compartments.
c. All structure in the after peak and the after peak bulkhead stiffeners.
d. All welding inside tanks intended for chemicals or edible liquid cargoes.
e. All lap welds in tanks.
f. Primary and secondary members to bottom shell in the 0.3L forward.
g. Primary and secondary members to plating in way of end connections, and end brackets to plating in the case of lap connections.
h. Where Pt 3, Ch 10, 2.2 Fillet welds 2.2.5 applies.
i. All water ballast tanks.
j. Other connections or attachments, where considered necessary, and in particular the attachment of minor fittings to higher tensile steel plating.

2. 2. 8 Where intermittent welding is used, the welding is to be made double continuous in way of brackets, lugs and scallops and at the orthogonal connections with other members.

2. 2. 9 As an alternative to intermittent welding, single sided welding may be used. Only mechanised single sided welding is acceptable although manual single sided welding may be used at non-critical locations e.g. deck house stiffeners. Where single sided welding is used, the welding is to be made double continuous in way of brackets, lugs and scallops and at the orthogonal connections with other members.

2. 2. 10 Where structural members pass through the boundary of a tank, and leakage into the adjacent space could be hazardous or undesirable, full penetration welding is to be adopted for the members for at least 150 mm on each side of the boundary. Alternatively a small scallop of suitable shape may be cut in the member close to the boundary outside the compartment, and carefully welded all round.

2. 3 Welding of primary structure

2. 3. 1 Weld factors for the connections of primary structure are given in Table 10. 2. 3: Connections of primary structure.

Table 10. 2. 2: Throat thickness limits

Item	Throat thickness, in mm	
	Minimum	Maximum
(1) Double continuous welding	$0.21t_p$	$0.44t_p$
(2) Intermittent welding	$0.27t_p$	$0.44t_p$ or 4.5
(3) All welds, overriding minimum:		
(a) Plate thickness $t_p \leq 7.5$ mm		
Hand or automatic welding	3.0	—
Automatic deep penetration welding	3.0	—
(b) Plate thickness $t_p > 7.5$ mm		
Hand or automatic welding	3.25	—

Automatic deep penetration welding	3.0	—

Note *1*. In all cases, the limiting value is to be taken as the greatest of the applicable values given above.

Note *2*. Where t_p exceeds 25 mm, the limiting values may be calculated using a notional thickness equal to 0.4 (t_p+25) mm.

Note *3*. The maximum throat thicknesses shown are intended only as a design limit for the approval of fillet welded joints. Any welding in excess of these limits is to be to the Surveyor's satisfaction.

2. 3. 2 The weld connection to shell, deck or bulkhead is to take account of the material lost in the notch where longitudinals or stiffeners pass through the member. Where the width of notch exceeds 15 per cent of the stiffener spacing, the weld factor is to be multiplied by:

$$\frac{0.85 \times \text{stiffener spacing}}{\text{length of web plating between notches}}$$

2. 3. 3 Where direct calculation procedures have been adopted, the weld factors for the 0.2 x overall length at the ends of the members will be considered in relation to the calculated loads.

2. 3. 4 The throat thickness limits given in Table 10. 2. 2: Throat thickness limits are to be complied with.

2. 4 Welding of primary and secondary member end connections

2. 4. 1 Welding of end connections of primary members is to be such that the area of welding is not less than the cross-sectional area of the member, and the weld factor is to be not less than 0.34 in tanks or 0.27 elsewhere.

2. 4. 2 The welding of secondary member end connections is to be not less than as required by Table 10. 2. 4: Secondary member end connection welds. Where two requirements are given the greater is to be complied with.

2. 4. 3 The area of weld, A_w, is to be applied to each arm of the bracket or lapped connection.

Table 10. 2. 3: Connections of primary structure

Primary member face area, in cm^2			Weld factor			
Exceeding	Not exceeding	Position(1)	In tanks		In dry spaces	
			To face plate	To plating	To face plate	To plating
	30.0	At ends	0.21	0.27	0.21	0.21
		Remainder	0.10	0.16	0.10	0.13
30.0	65.0	At ends	0.21	0.34	0.21	0.21
		Remainder	0.13	0.27	0.13	0.16
65.0	95.0	At ends	0.34	0.44(3)	0.21	0.27
		Remainder	0.27(2)	0.34	0.16	0.21
95.0	130.0	At ends	0.34	0.44(3)	0.27	0.34
		Remainder	0.27(2)	0.34	0.21	0.27
130.0		At ends	0.44	0.44(3)	0.34	0.44(3)
		Remainder	0.34	0.34	0.27	0.34

Note *1.* The weld factors `at ends' are to be applied for 0.2 x the overall length of the member from each end, but at least beyond the toes of the member end brackets. On vertical webs the increased welding may be omitted at the top, but is to extend at least 0.3 x overall length from the bottom.

Note *2.* Weld factor 0.34 in cargo oil tanks.

Note *3.* Where the web plate thickness is increased locally, the weld size may be based on the thickness clear of the increase, but is to be not less than 0.34 x the increased thickness.

Note *4.* In tankers over 122 m in length, the weld factor of the connection of bottom transverses to shell, and of side transverses to shell and vertical webs to longitudinal and transverse bulkheads all in the lower half depth, is to be not less than 0.34.

Note *5.* The final throat thickness of the weld fillet to be not less than $0.34t_p$ in cargo oil tanks.

Table 10. 2. 4: Secondary member end connection welds

Connection	Weld area, A_w, in cm^2	Weld factor
(1) Stiffener welded direct to plating	$0.25A_s$ or 6.5 cm^2 whichever is the greater	0.34
(2) Bracketless connection of stiffeners or stiffener lapped to bracket or bracket lapped to stiffener:		
(a) in dry space	$1.2\sqrt{Z}$	0.27
(b) in tank	$1.4\sqrt{Z}$	0.34
(c) main frame to tank side bracket in $0.15L$ forward	as (a) or (b)	0.34
(3) Bracket welded to face of stiffener and bracket connection to plating	—	0.34
(4) Stiffener to plating for 0.1 x span at ends, or in way of end bracket if that be greater	—	0.34

Symbols

A_s = cross sectional area of the stiffener, in cm^2

A_w = the area of the weld, in cm^2, and is calculated as total length of weld, in cm, x throat thickness, in cm

Z = the section modulus, in cm^2, of the stiffener on which the scantlings of the bracket are based, *See* Pt 3, Ch 10, 3 Secondary member end connections

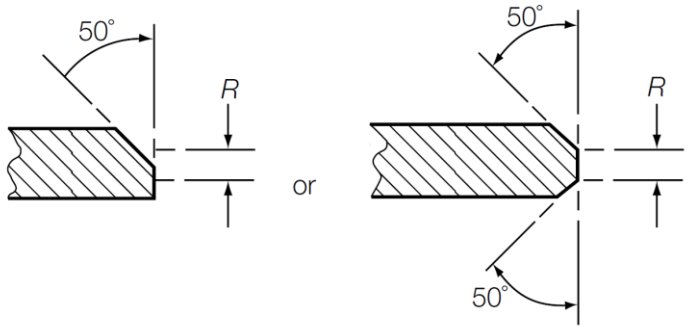
Note For maximum and minimum weld fillet sizes, *See* Table 10. 2. 2: Throat thickness limits

Table 10. 2. 5: Weld connection of strength deck plating to sheerstrake

Item	Stringer plate thickness, mm	Weld type

1	$t \leq 15$	Double continuous fillet weld with a weld factor of 0.44
2	$15 < t \leq 20$	Single vee preparation to provide included angle of 50° with root R $\leq \frac{1}{3}t$ in conjunction with a continuous fillet weld having a weld factor of 0.39; or Double vee preparation to provide included angles of 50° with root R $\leq \frac{1}{3}t$
3	$t > 20$	Double vee preparation to provided included angles of 50° with root R $\leq \frac{1}{3}t$ but not to exceed 10 mm

Where t = thickness of stringer plate, in mm



Single vee preparation Double vee preparation

Note *1.* Welding procedure, including joint preparation, is to be specified. Procedure is to be qualified and approved for individual Builders.

Note *2. See also* Pt 3, Ch 10, 2.2 Fillet welds 2.2.10:

Note *3.* For thickness *t* in excess of 20 mm the stringer plate may be bevelled to achieve a reduced thickness at the weld connection. The length of the bevel is in general to be based on a taper not exceeding 1 in 3 and the reduced thickness is in general to be not less than 0.65 times the thickness of stringer plate or 20 mm, whichever is the greater.

Note *4.* Alternative connections will be considered.

2. 4. 4 Where a longitudinal strength member is cut at a primary support and the continuity of strength is provided by brackets, the area of weld is to be not less than the cross-sectional area of the member.

2. 4. 5 Where the secondary member passes through, and is supported by, the web of a primary member, the weld connection is to be in accordance with the following:

a. In strengthening of bottom forward region:

Comply with the requirements of Pt 3, Ch 5, 1.5 Strengthening of bottom forward.

b. Elsewhere:

Comply with the requirements of Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members.

2. 4. 6 The throat thickness limits given in Table 10. 2. 2: Throat thickness limits are to be complied with.

2. 5 Welding equipment

2. 5. 1 Welding plant and equipment are to be in accordance with the requirements specified in Ch 13, 1.8 Welding equipment and welding consumables of the Rules for Materials.

2. 6 Welding consumables and equipment

2. 6. 1 Welding consumables used and associated equipment is to be in accordance with the requirements specified in Ch 13, 1.8 Welding equipment and welding consumables of the Rules for Materials.

2. 7 Welding procedures and welder qualifications

2. 7. 1 Welding procedures are to be established for the welding of all joints in accordance with the requirements specified in Ch 13, 1.9 Welding procedure and welder qualifications of the Rules for Materials.

2. 7. 2 All welding procedures are to be tested and qualified in accordance with the requirements of Ch 12 Welding Qualifications of the Rules for Materials and are to be approved by the Surveyor prior to construction.

2. 7. 3 Welders and welding operators are to be proficient in the type of work to be undertaken and are to be qualified in accordance with the requirements specified in Ch 12 Welding Qualifications of the Rules for Materials.

2. 8 Workmanship and shipyard practice

2. 8. 1 A sufficient number of skilled supervisors is to be provided to ensure an effective and systematic control at all stages of welding operations.

2. 9 Inspection of welds

2. 9. 1 Effective arrangements are to be provided by the Shipbuilder for the inspection of finished welds to ensure that all welding has been satisfactorily completed.

2. 9. 2 All finished welds are to be subjected to non-destructive examination by personnel designated by the Builder in accordance with the requirements specified in Ch 13, 2.12 Non-destructive examination of welds of the Rules for Materials.

2. 9. 3 In addition to the requirements of Pt 3, Ch 10, 2.9 Inspection of welds 2.9.2, a number of checkpoints are to be examined by volumetric examination as detailed in Pt 3, Ch 10, 2.9 Inspection of welds 2.9.4 to Pt 3, Ch 10, 2.9 Inspection of welds 2.9.9.

2. 9. 4 Typical locations and number of checkpoints to be taken are shown in Table 10. 2. 6: Checkpoint locations. Critical locations as identified by *ACSPlus FDA Guidelines* (*See* Pt 3, Ch 16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships) are also to be considered. A plan of the proposed checkpoint locations is to be submitted for approval.

Table 10. 2. 6: Checkpoint locations

Item	Location	Checkpoints
Intersections of butts and seams of fabrication and section welds	Throughout:	
	(a) hull envelope, shell envelope and deck structure plating:	
	at highly stressed areas, *See* Note 1	all
	remainder	1 in 2

	(b) longitudinal and transverse bulkheads	1 in 2
	(c) inner bottom and hopper plating:	1 in 2
SDA/FDA	At critical locations identified by SDA or FDA, *See* Note 2	all
Butt welds in plating	Throughout	1 m in 25 m, *See* Notes 3 and 4
Seam welds in plating	Throughout	1 m in 100 m
Butt welds in longitudinals	Hull envelope within 0.4*L* amidships	1 in 10 welds, *See* Note 5
	Hull envelope outside 0.4*L* amidships	1 in 20 welds
Bilge keel butt welds	Within 0.4*L* amidships	all
	Remainder	1 in 3
Structural items when made with full penetration welding as follows:	Throughout	
connection of stool and bulkhead to lower stool shelf plating		1 m in 20 m
vertical corrugations to an inner bottom		1 m in 20 m
hopper knuckles		1 m in 10 m
sheerstrake to deck stringer		1 m in 20 m
hatchways coaming to deck		1 m in 40 m
	Hatchway ends within 0.4*L* amidships	all
	Hatchway ends outside 0.4*L* amidships	1 in 2
	Remainder	1 in 40 m

Note *1.* Typically those at sheerstrake, deck stringer, keel strake and turn of bilge.

Note *2.* SDA signifies the *ACSPlus Structural Design Assessment Guidelines*, FDA signifies the *ACSPlus Fatigue Design Assessment Guidelines*.

Note *3.* Checkpoints in butt welds and seam welds are in addition to those at intersections.

Note *4.* Welds at inserts used to close openings in hull envelope plating are to be checked by non-destructive examination.

Note *5.* Particular attention is to be given to repair rates in butt welds in longitudinals. Additional welds are to be tested if defects such as lack of fusion or incomplete penetration are observed in more than 10 per cent of the welds examined.

2. 9. 5 Checkpoints are not to be identified on the ship's structural components prior to the welding taking place. Special treatment is not to be given at these locations except critical locations as identified by *ACSPlus FDA Guidelines*.

2. 9. 6 For ultrasonic examination the length of each checkpoint is to be 0.5 m and for radiographic examination the length is to be a minimum of 0.3 m. At weld intersections, examination is to be in both weld directions.

2. 9. 7 The Builder is to provide the Surveyor with all the NDE reports of the checkpoints. These reports are to be available for the Surveyor to review within a short time after inspection, normally considered to be within 10 working days of the examination being carried out. Where welds are repaired the NDE report is to include details of examination of both the defective weld and of the re-weld.

2. 9. 8 Where the Surveyor notes that a checkpoint has been repaired without record of the original defect, the shipyard is to carry out additional examinations on additional lengths of weld. These lengths are to be adjacent to and on both sides of the defective checkpoint. These additional examinations are to be carried out in the presence of the Surveyor and reported in accordance with Pt 3, Ch 10, 2.9 Inspection of welds 2.9.7.

2. 9. 9 Where checkpoints are found to contain continuous or semi-continuous defects, additional lengths of weld adjacent to and on both sides of the defective length are to be subject to further volumetric examination. The NDE reports are to be submitted in accordance with Pt 3, Ch 10, 2.9 Inspection of welds 2.9.7.

2. 9. 10 The following non-destructive examination is to be carried out on ships to be assigned the class notation '**Chemical tanker**':

a. All crossings of butts and seams of cargo tank bulkhead plating which are welded in assembly areas or on the berth.
b. Where cargo tank boundary welding is completed in assembly areas or on the berth, a minimum of 10 per cent of the total weld length is to be crack detected.
c. Where side and bottom longitudinal framing and longitudinal stiffeners terminate at transverse bulkheads, a minimum of 10 per cent of the bulkhead boundary connections is to be crack detected in addition to the requirement given in Pt 3, Ch 10, 2.9 Inspection of welds 2.9.10.b.
d. Where longitudinal framing and longitudinal bulkhead stiffeners are continuous through transverse bulkheads, 30 per cent each of the bottom and shipside boundaries and 20 per cent of the longitudinal bulkhead boundaries are to be crack detected in addition to the requirement given in Pt 3, Ch 10, 2.9 Inspection of welds 2.9.10.b.
e. Where transverse framing members are continuous through the cargo tank boundary, a minimum of 10 per cent of boundary connections is to be crack detected.

PART

3

CHAPTER **10 Welding and Structural Details**

SECTION **3 Secondary member end connections**

3. 1 General

3. 1. 1 Secondary members, that is longitudinals, beams, frames and bulkhead stiffeners forming part of the hull structure, are generally to be connected at their ends in accordance with the requirements of this Section. Where it is desired to adopt bracketless connections, the proposed arrangements will be individually considered.

3. 1. 2 Where end connections are fitted in accordance with these requirements, they may be taken into account in determining the effective span of the member.

3. 1. 3 Where the section modulus of the secondary member on which the bracket is based (*See* Pt 3, Ch 10, 3.3 Basis for calculation 3.3.2) exceeds 2000 cm^3, the scantlings of the connection will be considered.

3. 2 Symbols

3. 2. 1 The symbols used in this Section are defined as follows:

a, b = the actual lengths of the two arms of the bracket, in mm, measured from the plating to the toe of the bracket

b_f = the breadth of the flange, in mm

t = the thickness of the bracket, in mm

Z = the section modulus of the secondary member, in cm3.

3. 3 Basis for calculation

3. 3. 1 Where a longitudinal strength member is cut at a primary support and the continuity of strength is provided by brackets, the scantlings of the brackets are to be such that their section modulus and effective cross-sectional area are not less than those of the member. Care is to be taken to ensure correct alignment of the brackets on each side of the primary member.

3. 3. 2 In other cases the scantlings of the bracket are to be based on the modulus as follows:

a. Bracket connecting stiffener to primary member:
modulus of the stiffener.

b. Bracket at the head of a main transverse frame where frame terminates:
modulus of the frame.
Brackets connecting lower deck beams or longitudinals to the main frame in the forward.15L:
modulus of the frame.

c. Elsewhere: the lesser modulus of the members being connected by the bracket.

3. 3. 3 Typical arrangements of stiffener end brackets are shown diagrammatically in Figure 10. 3. 1: Diagrammatic arrangements of stiffener end brackets.

3. 4 Scantlings of end brackets

3. 4. 1 The lengths, *a* and *b*, of the arms are to be measured from the plating to the toe of the bracket and are to be such that:

a. a + b ≥ 2.0l
b. a ≥ 0.8l
c. b ≥ 0.8l

Where

$$I = 90\left(2\sqrt{\frac{Z}{14+\sqrt{Z}}}-1\right)\text{mm}$$

but in no case is *l* to be taken as less than twice the web depth of the stiffener on which the bracket scantlings are to be based.

The scantlings of main frames are normally to be based on these standard brackets at top and bottom, while the scantlings of `tween deck frames are normally to be based on a standard bracket at the top only. Where the actual arm lengths fitted, a_1 and b_1(in mm) are smaller than Rule size, or bracket is omitted, an equivalent arm length, l_a, for the calculation of end connection factor, *See* Table 1. 6. 3: Shell framing (transverse), is to be derived from:

d. $l_a = \frac{(a_1+b_1)}{2}$
e. $a_1 \geq 0.8l_a$
f. $b_1 \geq 0.8l_a$
g. $l_a = 0$, where:
  i. bracket is omitted from the upper or lower ends of the frame, or
  ii. lower frame bracket at bilge is at same level as the inner bottom, or
  iii. lower frame is welded directly to the inner bottom.

3. 4. 2 The length of arm of tank side and hopper side brackets is to be not less than 20 per cent greater than that required above.

3. 4. 3 The thickness of the bracket is to be not less than as required by Table 10. 3. 1: Thickness of brackets.

3. 4. 4 The free edge of the bracket is to be stiffened where any of the following apply:

a. The section modulus, *Z*, exceeds 2000 cm^3.
b. The length of free edge exceeds 50*t* mm.
c. The bracket is fitted at the lower end of main transverse side framing.

3. 4. 5 Where a flange is fitted, its breadth is to be not less than:

$$b_f = 40\left(1+\frac{Z}{1000}\right)\text{mm}$$

= but not less than 50 mm

3. 4. 6 Where the edge is stiffened by a welded face flat, the cross-sectional area of the face flat is to be not less than:

a. $0.009b_ft$ cm^2 for offset edge stiffening.
b. $0.014b_ft$ cm^2 for symmetrically placed stiffening.

Figure 10. 3. 1: Diagrammatic arrangements of stiffener end brackets

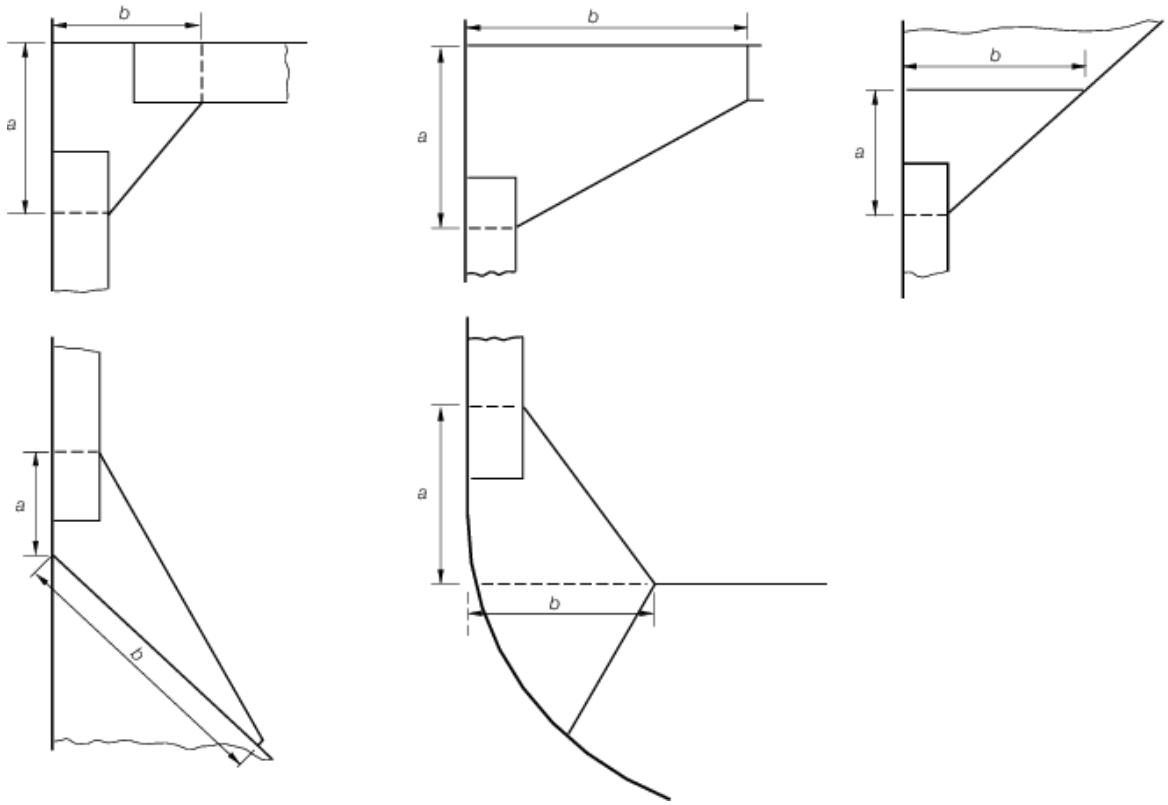


Table 10. 3. 1: Thickness of brackets

Bracket	Thickness, in mm	Limits	
		Minimum	Maximum
With edge stiffened:			
(a) in dry spaces	$3.5 + 0.25\sqrt{Z}$	6.5	12.5
(b) in tanks	$4.5 + 0.25\sqrt{Z}$	7.5 *See* Note	13.5
Unstiffened brackets:		7.5	–
(a) in dry spaces	$5.5 + \frac{Z}{55} - \left(\frac{Z}{168}\right)^{1.3}$		
(b) in tanks	$6.5 + \frac{Z}{55} - \left(\frac{Z}{168}\right)^{1.3}$	8.5 *See* Note	–
Note In the cargo tank region of tankers, the minimum thickness is to be not less than the compartment minimum thickness, *See* Pt 4, Ch 9, 10 Construction details and minimum thickness.			

3. 4. 7 Where the stiffening member is lapped on to the bracket, the length of overlap is to be adequate to provide for the required area of welding. In general, the length of overlap should be not less than $10\sqrt{Z}\,mm$, or the depth of stiffener, whichever is the greater.

3. 4. 8 Where the free edge of the bracket is hollowed out, it is to be stiffened or increased in size to ensure that the modulus of the bracket through the throat is not less than that of the required straight edged bracket.

3. 5 Arrangements and details

3. 5. 1 The arrangement of the connection between the stiffener and the bracket is to be such that at no point in the connection is the modulus reduced to less than that of the stiffener with associated plating.

3. 5. 2 The design of end connections and their supporting structure is to be such as to provide adequate resistance to rotation and displacement of the joint.

3. 5. 3 For arrangements where end brackets are not perpendicular to the adjacent plating the strength of the brackets, in terms of lateral stability, may need to be specially considered.

PART

3

CHAPTER **10 Welding and Structural Details**

SECTION **4 Construction details for primary members**

4. 1 General

4. 1. 1 The requirements for section modulus and inertia (if applicable) of primary members are given in the appropriate Chapter. This Section includes the requirements for proportions, stiffening and construction details for primary members in dry spaces and in tanks of all ship types other than tankers.

4. 1. 2 The requirements for construction details for the primary structure of tankers are given in Pt 4, Ch 9, 10 Construction details and minimum thickness.

4. 1. 3 The requirements of this Section may be modified where direct calculation procedures are adopted to analyse the stress distribution in the primary structure.

4. 2 Symbols

4. 2. 1 The symbols used in this Section are defined as follows:

d_w = depth of member web, in mm

k_L, k = higher tensile steel factor, *See* Pt 3, Ch 2, 1.2, Steel

t_w = thickness of member web, in mm

A_f = area of member face plate or flange, in cm^2

F_D = local scantlings reduction factor as defined in Pt 3, Ch 4, 5.6 Permissible hull vertical bending stresses

S_w = spacing of stiffeners on member web, or depth of unstiffened web, in mm.

4. 3 Arrangements

4. 3. 1 Primary members are to be so arranged as to ensure effective continuity of strength, and abrupt changes of depth or section are to be avoided. Where members abut on both sides of a bulkhead, or on other members, arrangements are to be made to ensure that they are in alignment. Primary members in tanks are to form a continuous line of support and wherever possible, a complete ring system.

4. 3. 2 The members are to have adequate lateral stability and web stiffening and the structure is to be arranged to minimise hard spots and other sources of stress concentration. Openings are to have well rounded corners and smooth edges and are to be located having regard to the stress distribution and buckling strength of the panel.

4. 3. 3 Primary members are to be provided with adequate end fixity by end brackets or equivalent structure. The design of end connections and their supporting structure is to be such as to provide adequate resistance to rotation and displacement of the joint and effective distribution of the load from the member.

4. 3. 4 Where the primary member is supported by structure which provides only a low degree of restraint against rotation, the member is generally to be extended for at least two frame spaces, or equivalent, beyond the point of support before being tapered.

4. 3. 5 Where primary members are subject to concentrated loads, particularly if these are out of line with the member web, additional strengthening may be required.

4. 4 Geometric properties and proportions

4. 4. 1 The geometric properties of the members are to be calculated in association with an effective width of attached plating determined in accordance with Pt 3, Ch 3, 3.2 Geometric properties of section.

4. 4. 2 The minimum thickness or area of material in each component part of the primary member is given in Table 10. 4. 1: Minimum thickness of primary members.

4. 4. 3 Primary members constructed of higher tensile steel are to comply with Table 10. 4. 1: Minimum thickness of primary members.

Table 10. 4. 1: Minimum thickness of primary members

Item	Requirement
(1) Member web plate*See* Note	t_w=0.01Sw but not less than 7 mm in dry spaces and not less than 8 mm in tanks
(2) Member face plate	A_f not to exceed $\frac{d_w t_w}{150} cm^2$
(3) Deck plating forming the upper flange of underdeck girders	Plate thickness not less than $\sqrt{\frac{A_f}{1.8k}}$ mm and 10 per cent greater for hatch side girders Width of plate not less than 700 mm
(4) Primary members in cargo oil tanks in tankers	As required by Pt 4, Ch 9, 10 Construction details and minimum thickness
NOTE For primary members having a web depth exceeding 1500 mm, the arrangement of stiffeners will be individually considered, and stiffening parallel to the member face plate may be required.	

4. 5 Web stability

4. 5. 1 Primary members are to be supported by tripping brackets. The tripping brackets supporting asymmetrical sections are to be spaced no more than two secondary frames apart. The tripping brackets supporting symmetrical sections are to be spaced no more than four secondary frames apart.

4. 5. 2 Tripping brackets are also to be fitted at the toes of end brackets and in way of heavy or concentrated loads such as the heels of pillars.

4. 5. 3 Where the ratio of unsupported width of face plate (or flange) to its thickness exceeds 16:1, the tripping brackets are to be connected to the face plate and on members of symmetrical section, the brackets are to be fitted on both sides of the web.

4. 5. 4 Intermediate secondary members may be welded directly to the web or connected by lugs.

4. 5. 5 Where the depth of web of a longitudinal girder at the strength deck within $0.4L$ amidships exceeds:

a. $55t_w$ for mild steel members

b. $55t_w\sqrt{\frac{k_L}{F_D}}$ for higher tensile steel members

additional longitudinal web stiffeners are to be fitted at a spacing not exceeding the value given in (a) or (b) as appropriate, with a maximum of $65t_w\sqrt{k_L}$ for higher tensile steel members. In cases where this spacing is exceeded, the web thickness is, in general, to be suitably increased.

4. 5. 6 The arm length of unstiffened end brackets is not to exceed $100t_w$. Stiffeners parallel to the bracket face plate are to be fitted where necessary to ensure that this limit is not exceeded.

4. 5. 7 Web stiffeners may be flat bars of thickness t_w and depth $0.1d_w$, or 50 mm, whichever is the greater. Alternative sections of equivalent moment of inertia may be adopted.

4. 6 Openings in the web

4. 6. 1 Where openings are cut in the web, the depth of opening is not to exceed 25 per cent of the web depth, and the opening is to be so located that the edges are not less than 40 per cent of the web depth from the face plate. The length of opening is not to exceed the web depth or 60 per cent of the secondary member spacing, whichever is the greater, and the ends of the openings are to be equidistant from the corners of cut-outs for secondary members. Where larger openings are proposed, the arrangements and compensation required will be considered.

4. 6. 2 Openings are to have smooth edges and well rounded corners.

4. 6. 3 Cut-outs for the passage of secondary members are to be designed to minimise the creation of stress concentrations. The breadth of cut-out is to be kept as small as practicable and the top edge is to be rounded, or the corner radii made as large as practicable. The extent of direct connection of the web plating, or the scantlings of lugs or collars, is to be sufficient for the load to be transmitted from the secondary member.

4. 7 End connections

4. 7. 1 End connections of primary members are generally to comply with the requirements of Pt 3, Ch 10, 3 Secondary member end connections, taking Z as the section modulus of the primary member.

4. 7. 2 The thickness of the bracket is to be not less than that of the primary member web. The free edge of the bracket is to be stiffened.

4. 7. 3 Where a deck girder or transverse is connected to a vertical member on the shell or bulkhead, the scantlings of the latter may be required to be increased to provide adequate stiffness to resist rotation of the joint.

4. 7. 4 Where a member is continued over a point of support, such as a pillar or pillar bulkhead stiffener, the design of the end connection is to be such as to ensure the effective distribution of the load into the support. Proposals to fit brackets of reduced scantlings, or alternative arrangements, will be considered.

4. 7. 5 Connections between primary members forming a ring system are to minimise stress concentrations at the junctions. Integral brackets are generally to be radiused or well rounded at

their toes. The arm length of the bracket, measured from the face of the member, is to be not less than the depth of the smaller member forming the connection.

PART

3

CHAPTER **10 Welding and Structural Details**

SECTION **5 Structural details**

5. 1 Continuity and alignment

5. 1. 1 The arrangement of material is to be such as will ensure structural continuity. Abrupt changes of shape or section, sharp corners and points of stress concentration are to be avoided.

5. 1. 2 Where members abut on both sides of a bulkhead or similar structure, care is to be taken to ensure good alignment.

5. 1. 3 Pillars and pillar bulkheads are to be fitted in the same vertical line wherever possible, and elsewhere arrangements are to be made to transmit the out of line forces satisfactorily. The load at head and heel of pillars is to be effectively distributed and arrangements are to be made to ensure the adequacy and lateral stability of the supporting members.

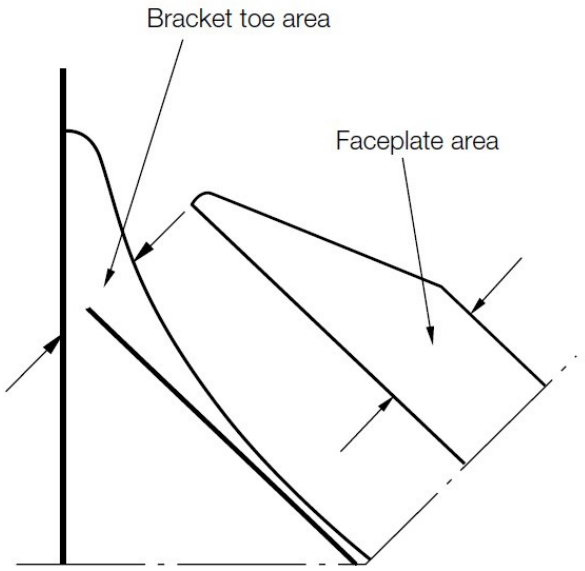
5. 1. 4 Continuity is to be maintained where primary members intersect and where the members are of the same depth, a suitable gusset plate is to be fitted.

5. 1. 5 End connections of structural members are to provide adequate end fixity and effective distribution of the load into the supporting structure.

5. 1. 6 The toes of brackets, etc. should not land on unstiffened panels of plating. Special care should be taken to avoid notch effects at the toes of brackets, by making the toe concave or otherwise tapering it off.

5. 1. 7 Where primary and/or secondary members are constructed of higher tensile steel, particular attention is to be paid to the design of the end bracket toes in order to minimise stress concentrations. Sniped face plates which are welded onto the edge of primary member brackets are to be carried well around the radiused bracket toe and are to incorporate a taper not exceeding 1 in 3. Where sniped face plates are welded adjacent to the edge of primary member brackets, adequate cross sectional area is to be provided through the bracket toe at the end of the snipe. In general, this area measured perpendicular to the face plate, is to be not less than 60 per cent of the full cross-sectional area of the face plate, *See* Figure 10. 5. 1: Bracket toe construction. *See also* Pt 4, Ch 1, 4.3 Deck stiffening, Pt 4, Ch 1, 6.1, General, Pt 4, Ch 9, 5.7 Connections of longitudinals and Pt 4, Ch 9, 10.13 Brackets connecting primary members.

Figure 10. 5. 1: Bracket toe construction



5. 2 Arrangements at intersections of continuous secondary and primary members

5. 2. 1 Cut-outs for the passage of secondary members through the web of primary members, and the related collaring arrangements, are to be designed to minimise stress concentrations around the perimeter of the opening and in the attached hull envelope or bulkhead plating. The critical shear buckling stress of the panel in which the cut-out is made is to be investigated. Cut-outs for longitudinals will be required to have double lugs in areas of high stress, e.g. in way of cross tie ends and floors under bulkhead stools in ore and ballast holds.

5. 2. 2 Cut-outs are to have smooth edges, and the corner radii are to be as large as practicable, with a minimum of 20 per cent of the breadth of the cut-out or 25 mm, whichever is the greater. It is recommended that the web plate connection to the hull envelope or bulkhead should end in a smooth tapered `soft toe'. Recommended shapes of cut-out are shown in Figure 10. 5. 3: Cut-outs and connections, but consideration will be given to other shapes on the basis of maintaining equivalent strength and minimizing stress concentration. Consideration is to be given to the provision of adequate drainage and unimpeded flow of air and water when designing the cut-outs and connection details.

5. 2. 3 Asymmetrical secondary members are to be connected on the heel side to the primary member web plate. Additional connection by lugs on the opposite side may be required.

5. 2. 4 Symmetrical secondary members are to be connected by lugs on one or both sides, as necessary.

5. 2. 5 The cross-sectional areas of the connections are to be determined from the proportion of load transmitted through each component in association with its appropriate permissible stress.

5. 2. 6 The total load P, transmitted to the primary member is to be derived in accordance with Table 10. 5. 1: Total load transmitted to connection of secondary members.

5. 2. 7 This load is to be apportioned between the connections as follows:

a. Transmitted through the collar arrangement:

$$P_1 = P\left(\frac{s_1}{S_w} + \frac{A_1}{4C_f A_f + A_1}\right)$$

where A_1 is derived in accordance with Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members 5.2.8 and $\frac{s_1}{s_w}$ is not to be taken as greater than 0.25

The collar load factor, C_f, is to be derived as follows:

Symmetrical secondary members

$$C_f = 1.85 \quad \text{for } A_f \leq 18$$

$$C_f = 1.85 - 0.0341\,(A_f - 18) \quad \text{for } 18 < A_f \leq 40$$

$$C_f = 1.1 - 0.01\,(A_f - 40) \quad \text{for } A_f > 40$$

Asymmetrical secondary members

$$C_f = 0.68 + 0.0224\,\frac{b_1}{A_f}$$

Where

A_f = the area, in cm^2, of the primary member web stiffener in way of the connection including backing bracket, where fitted (*See* Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members 5.2.10)

b_1 = the length of lug or direct connection, in mm, as shown in Figure 10. 5. 3: Cut-outs and connections. Where the lug or direct connections differ in length a mean value of b_1 is to be used.

b. Transmitted through the primary member web stiffener:
$P_2 = P - P_1 kN$

c. Where the web stiffener is not connected to the secondary member, P_1 is to be taken equal to P.

Table 10. 5. 1: Total load transmitted to connection of secondary members

Ship type	Head, h_1, in metres	Total load, P, transmitted to connection
(1) Oil tankers, bulk chemical tankers and combination carriers, *See* Pt 3, Ch 10, 1.1 Application 1.1.3	h_1 = load height, in metres, derived in accordance with the following provisions, but to be taken as not less than $\frac{L_1}{56}$ or $(0.01L_1 + 0.7)$ m whichever is the greater	
	For shell framing members:	
	(a) With mid-point of span at base line, $h_1 = 0.8D_2$	
	(b) With mid-point of span at a distance $0.6D_2$ above base line, $h_1 = fD_2B_f$	
	(c) With mid-point of span intermediate between (a) and (b). The value of h_1 is to be obtained by linear interpolation between values from (a) and (b).	(a) In general $P = 11.77(S_{yx} - s_1/2)s_1h_1$kN
	(d) With mid-point of span higher than $0.6D_2$ above base line.	(b) For wash bulkheads
	The value of h_1 is to be obtained by linear interpolation between the values from (b) and the values at the following points:	$P = 10.06(S_w - s_1/2)s_1h_1$kN

	(i) For framing members located at and abaft 0.2L from the forward perpendicular (*See*)	Zero value at the level of the deck edge amidships	
	(ii) For framing members forward of cargo tank region (*See* Fig. 10.5.2(b))	Value of $f\,D_2(B_f\text{-}1)$ at the level 3 m above the minimum bow height determined from the Load Lines Convention	
	(iii) Intermediate values between locations (i) and (ii) are to be determined by linear interpolation		
	For secondary stiffening members of transverse and longitudinal bulkheads, and inner hull an inner bottom of double hull tankers, *See* Pt 3, Ch 10, 1.1 Application 1.1.3:		
	h_1 = distance from the mid-point of span to top of tank but need not exceed $0.8D_2$		
	Side and bottom shell longitudinals		
(2) Other ship types for which oil tanker (*See* Pt 3, Ch 10, 1.1 Application 1.1.3) requirements are not applicable	As for (1) except as follows: (a) h_1 to be derived in accordance with (1) above but to be taken as not less than $\frac{L_1}{56}$ m for type `B-60' and the greater of $\frac{L_1}{70}$, or 1.20 m for Type 'B' ships	$P = 10.06(S_w - s_1/2)s_1h_1$kN
	(b) h_1 for item (1)(d)(ii) above to extend forward of 0.15L from the forward perpendicular		
(3) Other ship types for which oil tanker (*See* Pt 3, Ch 10, 1.1 Application 1.1.3) requirements are not applicable (continued)	Internal tank boundaries (a) Topside tank longitudinals h_1 = distance from the longitudinal under consideration to the highest point of the tank with the ship inclined 30° either way, or = the greater of the distance from the longitudinal under consideration to the top of the tank, or half the distance to the top of the overflow, or = 1.5 m = whichever is the greatest	$P = 10.06(S_w - s_1/2)s_1h_1$kN
	(b) Inner bottom and hopper longitudinals	$P = 9.81(S_{yX} - s_1/2)s_1h_1/C$kN
		= but not to be taken less than the load derived from (b)(iv), (b)(v), (b)(vi) or (c) where applicable
	(i) For cargo ships and bulk carriers (*See* Pt 3, Ch 10, 1.1 Application 1.1.3) without the notation 'strengthened for heavy cargoes' h_1=1.39T	
	(ii) For cargo ships and bulk carriers (*See* Pt 3, Ch 10, 1.1 Application 1.1.3) with the notation 'strengthened for heavy cargoes' h_1=H	
	(iii) For longitudinal bulkheads of ore carriers $h_1=HK_c$	
	(iv) For bulk carriers (*See* Pt 3, Ch 10, 1.1 Application 1.1.3) where the topside wing tank is interconnected with hopper side and double bottom tanks h_1 = the distance from the longitudinal under consideration to the top of the topside tank with the ship inclined 25° either way	$P = 10.06(S_w - s_1/2)s_1h_1$kN

	(v) For bulk carriers (*See* Pt 3, Ch 10, 1.1 Application 1.1.3) in way of ballast hold h_1 = the distance from the longitudinal under consideration to the top of the hatchway coaming	$P = 10.06(S_w - s_1/2)s_1h_1$kN
	(vi) For cargo ships and bulk carriers (*See* Pt 3, Ch 10, 1.1 Application 1.1.3) with double hull where tank at side interconnected with double bottom h_1=H	$P = 10.06(S_w - s_1/2)s_1h_1$kN
	(c) Longitudinals of inner hull of double hull cargo ships and bulk carriers (*See* Pt 3, Ch 10, 1.1 Application 1.1.3)	$P = 10.06(S_w - s_1/2)s_1h_1$kN
	h_1 = the distance from the longitudinal under consideration to the top of the tank, or half the distance to the top of the overflow, whichever is the greater	

B_f = bow fullness factor determined from Figure 10. 5. 4: Arrangement with offset stiffener factor determination in Chapter 5 to be considered. To be taken as 1 for framing members located at and abaft 0.2L from the forward perpendicular

f = load height factor at level 0.6D above base line, *See* Table 10. 5. 2: Load height factor, f

h_1 = load height, in metres, *See also*

C = stowage rate, in m^3 /tonne, as defined in Pt 3, Ch 3, 5.2, Symbols. For cargo ships without the notation 'strengthened for heavy cargoes', the value to be used is 1.39 m^3/tonne. For cargo ships and bulk carriers (*See* Pt 3, Ch 10, 1.1 Application 1.1.3) with the notation 'strengthened for heavy cargoes', the actual stowage rate is to be used, but the value is not to be taken greater than 0.865 m^3/tonne

H = height from inner bottom at position under consideration, to deck at side amidships, in metres, for inner bottom longitudinals

= height from the longitudinal under consideration to the underside of the topside tank sloped bulkhead, in metres, for hopper longitudinals

S_w = spacing of primary members, in metres

s_1 = spacing of secondary members, in metres

T = the summer draught, in metres, measured from top of keel

D_2 = D in metres, but need not be taken greater than 1.6T

L_1 = L but need not be taken as greater than 190 m

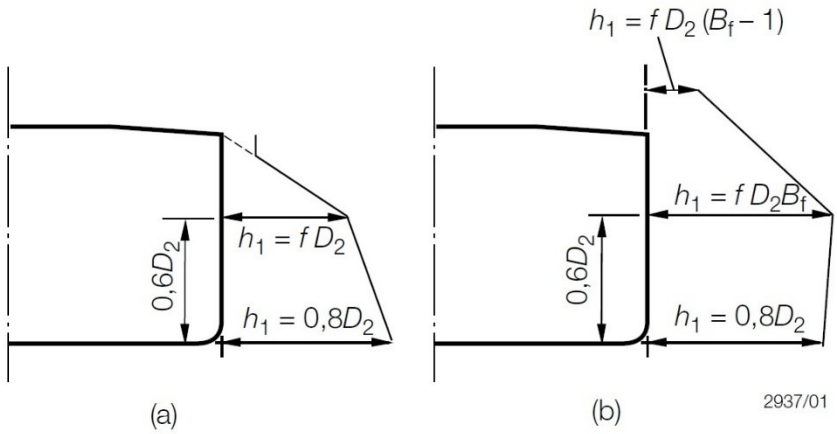
K_c = as defined in Table 11. 7. 1: Longitudinal and transverse bulkhead scantlings for ore loading in Pt 4, Ch 11 Ore Carriers

Table 10. 5. 2: Load height factor, *f*

	Ship depth, D metres					
	≤17.5	20	22.5	25	27.5	30
(1) (a) For oil tankers, bulk chemical tankers and combination carriers (*See* Pt 3, Ch 10, 1.1 Application 1.1.3), tank boundaries wholly within parallel mid-body	0.6	0.6	0.582	0.556	0.535	0.517
(b) For other ship types, at an abaft of 0.2L from the forward perpendicular						
(2) (a) For oil tankers, bulk chemical tankers and combination carriers (*See* Pt 3, Ch 10, 1.1 Application 1.1.3), tank boundaries wholly or partially outside parallel mid-body	0.7	0.685	0.685	0.628	0.6	0.577
(b) For other ship types, forward of 0.15L from the forward perpendicular						

Note Intermediate values to be obtained by linear interpolation

Figure 10. 5. 2: Load height diagrams for framing members (a) at and abaft 0.2*L* from the forward perpendicular and (b) forward of cargo tank region for oil tankers, bulk chemical tankers and combination carriers (*See* Pt 3, Ch 10, 1.1 Application 1.1.3) and forward of 0.15*L* from the forward perpendicular for other ship types



5. 2. 8 The effective cross-sectional area A_1 of the collar arrangements is to be taken as the sum of cross-sectional areas of the components of the connection as follows:

a. Direct connection:
$A_1 = 0.01 b_l t_w \text{cm}^2$

b. Lug connection:
$A_1 = 0.01 f_1 b_l t_l \text{cm}^2$

Where

f_1 = 1.0 for symmetrical secondary member connections

= $\frac{140}{W_l}$ but not greater than 1.0, for asymmetrical secondary member connections.

t_w = thickness of primary member web, in mm

t_2 = thickness, in mm, of lug connection, and is to be taken not greater than the thickness of the adjacent primary member web plate

w = overall width of the cut-out, in mm

w_2 = width for cut-out asymmetrical to secondary member web, in mm

See Figure 10. 5. 3: Cut-outs and connections

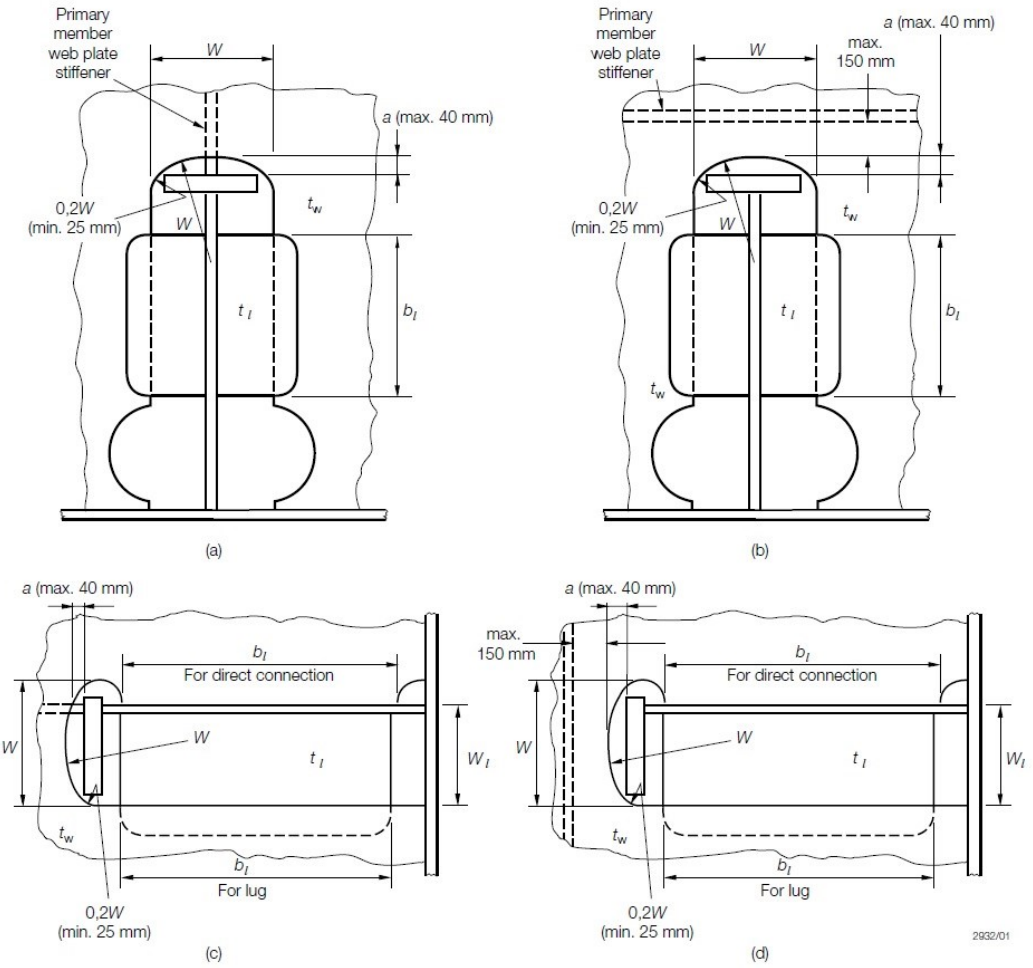
5. 2. 9 The values of A_f and A_1 are to be such that the stresses given in Table 10. 5. 3: Permissible stresses are not exceeded.

5. 2. 10 Where a bracket is fitted to the primary member web plate in addition to a connected stiffener it is to be arranged on the opposite side to, and in alignment with the stiffener. The arm length of the bracket is to be not less than the depth of the stiffener, and its cross-sectional area through the throat of the bracket is to be included in the calculation of A_f.

5. 2. 11 In general where the primary member stiffener is connected to the secondary member it is to be aligned with the web of the secondary member, except where the face plate of the latter is offset and abutted to the web, in which case the stiffener connection is to be lapped. Lapped connections of primary member stiffeners to mild steel bulb plate or rolled angle secondary members may also be permitted. Where such lapped connections are fitted, particular care is to be taken to ensure

that the primary member stiffener wrap around weld connection is free from undercut and notches, *See also* Pt 3, Ch 10, 2.9, Inspection of welds.

Figure 10. 5. 3: Cut-outs and connections



5. 2. 12 Fabricated longitudinals having the face plate welded to the underside of the web, leaving the edge of the web exposed, are not recommended for side shell and longitudinal bulkhead longitudinals. Where it is proposed to fit such sections, a symmetrical arrangement of connection to transverse members is to be incorporated. This can be achieved by fitting backing brackets on the opposite side of the transverse web or bulkhead. The primary member stiffener and backing brackets are to be lapped to the longitudinal web, *See* Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members 5.2.11.

5. 2. 13 For ship types for which oil tanker (*See* Pt 3, Ch 10, 1.1 Application 1.1.3) requirements are not applicable, the collar arrangement is to satisfy the requirements of Pt 3, Ch 10, 5.2,, Arrangements at intersections of continuous secondary and primary members 5.2.1 to Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members 5.2.12 inclusive. In addition the weld area of the connections is to be not less than the following:

a. Connection of primary member stiffener to the secondary member:

A_w = 0.25 A_f or 6.5 cm^2, whichever is the greater, corresponding to a weld factor of 0.34 for the throat thickness

b. Connection of secondary member to the web of the primary member:

Where

A = $0.5\sqrt{Z}$ corresponding to a weld factor of 0.34 in tanks or 0.27 in dry spaces for the throat thickness

A = weld area, in cm^2, and is calculated as total length of weld, in cm, multiplied by throat thickness, in cm

A_f = cross-sectional area of the primary member web stiffener, in cm^2, in way of connection

Z = the section modulus, in cm^3, of the secondary member.

Table 10. 5. 3: Permissible stresses

Item		Direct stress, in N/mm² (*See* Notes 1 and 2)		Shear stress, in N/mm² (*See* Note 1)	
		Oil tankers	Other ship types for which oil tanker requirements are not applicable	Oil tankers and ship types where primary member stiffener unconnected	Other ship types for which oil tanker requirements are not applicable
Primary member web plate stiffener within distance *a* of end *See* Figure 10. 5. 3: Cut-outs and connections		147.2	157	—	—
Welding of primary member web plate stiffener to secondary member	Butted	98.1 (double continuous fillet) 147.2 (automatic deep penetration)	117.7 (double continuous fillet) 157 (automatic deep penetration)	— —	— —
	Lapped	—	—	83.4 *See* Note 2	98.1 *See* Note 2
Lug or collar plate and weld	Single	—	—	68.6	98.1
	Double	—	—	83.4 *See* Note 3	

Note 1. The welding requirements of Pt 3, Ch 10, 2 Welding, and where applicable Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members 5.2.13 are also to be complied with, *See* Pt 3, Ch 10, 1.1 Application 1.1.3.

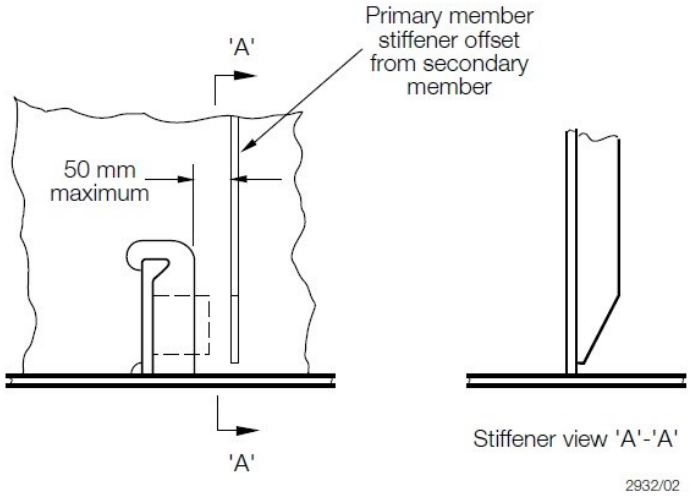
Note 2. Where longitudinals are of higher tensile steel having a yield stress of 315 kg/mm² or more, these stresses are to be divided by the factor 1.2 for application to side longitudinals above $0.3D_2$ from the base-line. For definition of D_2 *See* Table 10. 5. 1: Total load transmitted to connection of secondary members.

Note 3. When the permissible shear stress is applied in the assessment for the notation **Strengthened to carry cargoes which may liquefy (IMSBC Group A)**, the permissible shear stress shall be divided by *k*, *See* Pt 3, Ch 2, 1.2 Steel 1.2.3, i.e. $^{83.4}/_{k}$ N/mm².

5. 2. 14 Where the stiffeners of the double bottom floors, and the hopper primary members are unconnected to the secondary members and offset from them (*See* Figure 10. 5. 4: Arrangement with offset stiffener) the collar arrangement is to satisfy the requirements of Pt 3, Ch 10, 5.2,, Arrangements at intersections of continuous secondary and primary members 5.2.1 to Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members 5.2.13 inclusive.

In addition, the fillet welds attaching the lugs to the secondary members are to be based on a weld factor of 0.44 for the throat thickness. To facilitate access for welding the offset stiffeners are to be located 50 mm from the slot edge furthest from the web of the secondary member. The ends of the offset stiffeners are to be suitably tapered and softened.

Figure 10. 5. 4: Arrangement with offset stiffener



5. 2. 15 Alternative arrangements will be considered on the basis of their ability to transmit load with equivalent effectiveness. Details of the calculations made and testing procedures are to be submitted.

5. 3 Openings

5. 3. 1 Manholes, lightening holes and other cut-outs are to be avoided in way of concentrated loads and areas of high shear. In particular, manholes and similar openings are not to be cut in vertical or horizontal diaphragm plates in narrow cofferdams or double plate bulkheads within one-third of their length from either end, nor in floors or double bottom girders close to their span ends, or below the heels of pillars, unless the stresses in the plating and the panel buckling characteristics have been calculated and found satisfactory.

5. 3. 2 Manholes, lightening holes and other openings are to be suitably framed and stiffened where necessary.

5. 3. 3 Air and drain holes, notches and scallops are to be kept at least 200 mm clear of the toes of end brackets and other areas of high stress. Openings are to be well rounded with smooth edges. Details of scalloped construction are shown in Figure 10. 2. 1: Weld dimensions and types. Closely spaced scallops are not permitted in higher tensile steel members. Widely spaced air or drain holes may be accepted, provided that they are of elliptical shape, or equivalent, to minimise stress concentration and are, in general, cut clear of the weld connection.

5. 4 Sheerstrake and bulwarks

5. 4. 1 Where an angled gunwale is fitted, the top edge of the sheerstrake is to be kept free of all notches and isolated welded fittings. Bulwarks are not to be welded to the top of the sheerstrake within the 0.5L amidships.

5. 4. 2 Where a rounded gunwale is adopted, the welding of fairlead stools and other fittings to this plate is to be kept to the minimum, and the design of the fittings is to be such as to minimise stress concentration.

5. 4. 3 Arrangements are to ensure a smooth transition from rounded gunwale to angled gunwale towards the ends of the ship.

5. 4. 4 At the ends of superstructures where the side plating is extended and tapered to align with the bulwark plating, the transition plating is to be suitably stiffened and supported. Where freeing ports or other openings are essential in this plate, they are to be suitably framed and kept well clear of the free edge.

5. 5 Fittings and attachments, general

5. 5. 1 The quality of welding and general workmanship of fittings and attachments as given in Pt 3, Ch 10, 5.6, Bilge keels and ground bars and Pt 3, Ch 10, 5.7 Other fittings and attachments are to be equivalent to that of the main hull structure. Visual examination of all welds is to be supplemented by non-destructive testing as considered necessary by the Surveyor.

5. 6 Bilge keels and ground bars

5. 6. 1 It is recommended that bilge keels should not be fitted in the forward 0.3L region on ships intended to navigate in severe ice conditions.

5. 6. 2 Bilge keels are to be attached to a continuous ground bar as shown in Figure 10. 5. 5: Bilge keel construction. Butt welds in shell plating, ground bar and bilge keels are to be staggered.

5. 6. 3 The minimum thickness of the ground bar is to be equal to the thickness of the bilge strake or 14 mm, whichever is the lesser.

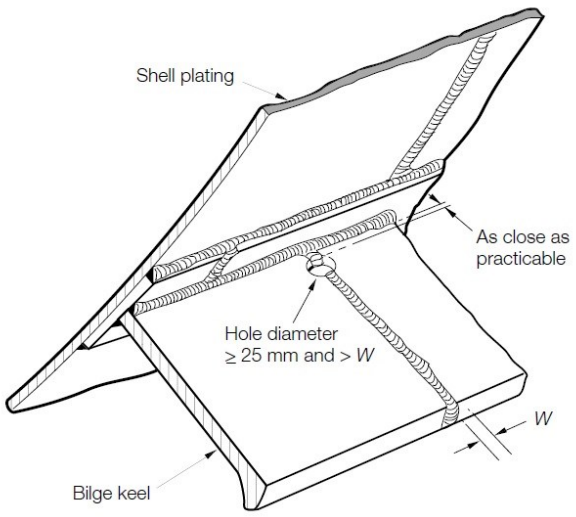
5. 6. 4 The material class, grade and quality of the ground bar are to be in accordance with Table 2. 2. 1: Material classes and grades.

5. 6. 5 The ground bar is to be connected to the shell with a continuous fillet weld and the bilge keel to the ground bar with a light continuous fillet weld.

5. 6. 6 Direct connection between ground bar butt welds and shell plating, and between bilge keel butt welds and ground bar is to be avoided.

5. 6. 7 The design of single web bilge keels is to ensure that failure to the web occurs before failure of the ground bar. In general, this may be achieved by ensuring the web thickness of bilge keels does not exceed that of the ground bar.

Figure 10. 5. 5: Bilge keel construction



5. 6. 8 The end details of bilge keels and intermittent bilge keels, where adopted, are to be as shown in Figure 10. 5. 6: Bilge keel end design.

5. 6. 9 The ground bar and bilge keel ends are to be tapered or rounded. Where the ends are tapered, the tapers are to be gradual with ratios of at least 3:1, *See* Figure 10. 5. 6: Bilge keel end design. Where the ends are rounded, details are to be as shown in Figure 10. 5. 6: Bilge keel end design. Cut-outs on the bilge keel web within zone 'A' (*See* Figure 10. 5. 6: Bilge keel end design) are not permitted.

5. 6. 10 The end of the bilge keel web is to be between 50 mm and 100 mm from the end of the ground bar, *See* Figure 10. 5. 6: Bilge keel end design.

5. 6. 11 An internal transverse support is to be positioned as close as possible to halfway between the end of the bilge keel web and the end of the ground bar, *See* Figure 10. 5. 6: Bilge keel end design.

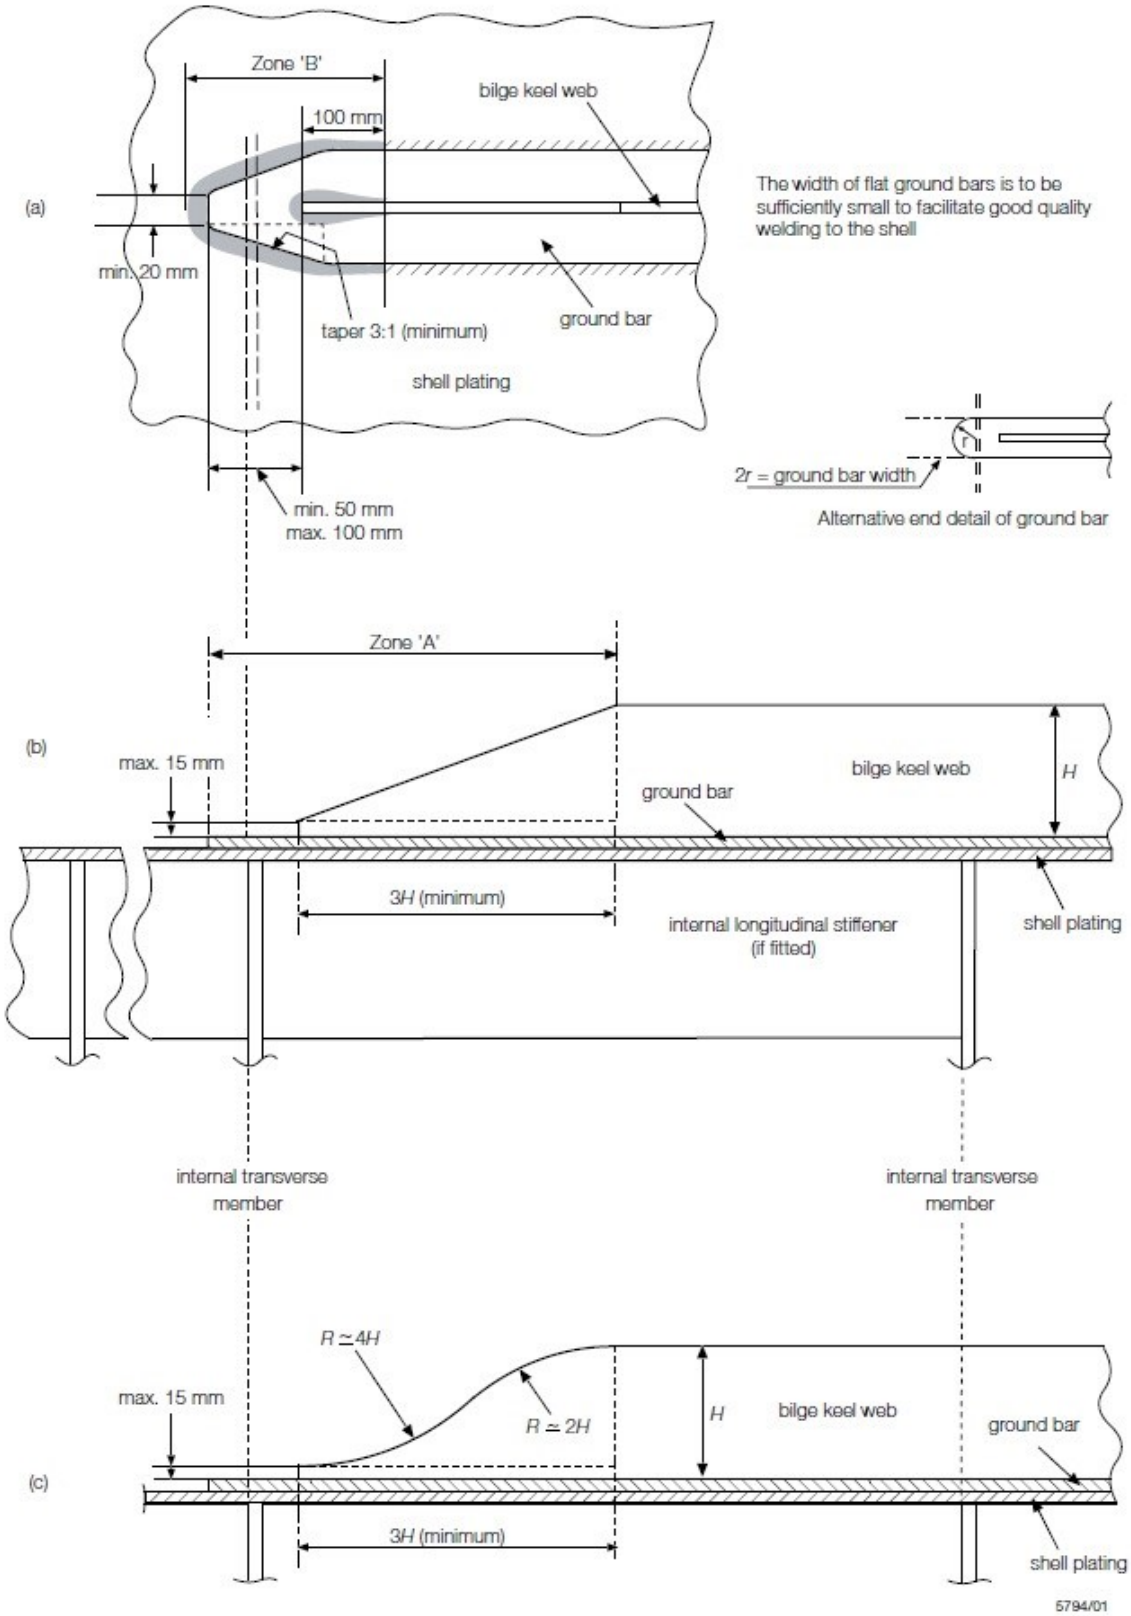
5. 6. 12 Where an internal longitudinal stiffener is fitted in line with the bilge keel web, the longitudinal stiffener is to extend to at least the nearest transverse member outside zone 'A', *See* Figure 10. 5. 6: Bilge keel end design. In this case, the requirement of Pt 3, Ch 10, 5.6 Bilge keels and ground bars 5.6.10 does not apply.

5. 6. 13 For ships over 65 m in length, holes are to be drilled in the bilge keel butt welds. The size and position of these holes are to be as illustrated in Figure 10. 5. 5: Bilge keel construction. Where the butt weld has been subject to non-destructive examination the stop hole may be omitted.

5. 6. 14 Bilge keels of a different design from that shown in Figure 10. 5. 5: Bilge keel construction and Figure 10. 5. 6: Bilge keel end design will be specially considered.

5. 6. 15 Within zone 'B', (*See* Figure 10. 5. 6: Bilge keel end design), welds at the end of the ground bar and bilge plating, and at the end of the bilge keel web and ground bar, are to have weld factors of 0.44 and 0.34 respectively. These welds are to be ground and to blend smoothly with the base materials.

Figure 10. 5. 6: Bilge keel end design



5. 6. 16 A plan of the bilge keels is to be submitted for approval of material grades, welded connections and detail design.

5. 7 Other fittings and attachments

5. 7. 1 Gutterway bars at the upper deck are to be so arranged that the effect of main hull stresses on them is minimised.

5. 7. 2 Minor attachments, such as pipe clips, staging lugs and supports, are generally to be kept clear of toes of end brackets, corners of openings and similar areas of high stress. Where connected to asymmetrical stiffeners, the attachments may be in line with the web providing the fillet weld leg length is clear of the offset face plate or flange edge. Where this cannot be achieved the attachments are to be connected to the web, and in the case of flanged stiffeners they are to be kept at least 25 mm clear of the flange edge. On symmetrical stiffeners, they may be connected to the web or to the centreline of the face plate in line with the web.

5. 7. 3 Where necessary in the construction of the ship, lifting lugs may be welded to the hull plating but they are not to be slotted through. Where they are subsequently removed, this is to be done by flame or mechanical cutting close to the plate surface, and the remaining material and welding ground off. After removal the area is to be carefully examined to ensure freedom from cracks or other defects in the plate surface.

CHAPTER 11 **Closing Arrangements for Shell, Deck and Bulkheads**

SECTION 1 **General**

1. 1 Application

1. 1. 1 This Chapter applies to all ship types detailed in Pt 4 Ship Structures (Ship Types), unless otherwise stated, with the exception of Sections 1 to 5 which are not applicable to Bulk Carriers with a **CSR** notation and Section Pt 3, Ch 11, 6.1, Small hatchways on exposed decks which is not applicable to Bulk Carriers and Oil Tankers with a **CSR** notation, *See* Pt 1, Ch 2, 2.3 Class notations (hull). Additional provisions regarding access arrangements for oil tankers and chemical carriers are contained in Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers and the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk,* (hereinafter referred to as the Rules for Ships for Liquid Chemicals), respectively.

1. 1. 2 Requirements are given for steel and wooden hatch covers, securing arrangements, tarpaulins, coamings and side shell doors for main openings, also closing arrangements for other miscellaneous openings.

1. 1. 3 Where relevant, the contents of this Chapter conform with the requirements of the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988* . Attention should, however, be given to any additional Statutory Requirements of the National Authority of the country in which the ship is to be registered and to the relevant regulations of the *SOLAS - International Convention for the Safety of Life at Sea* and applicable amendments.

1. 1. 4 For the purpose of this Chapter the basic types of ships are those defined in the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988* namely:

Type `A'	Ships designed solely for the carriage of liquid cargoes.
Type `B'	Cargo ships, other than Type `A', with steel weathertight hatch covers.
Type `B-100'	Cargo ships of type `B' with reduced freeboards on account of their ability to survive a stipulated damage.
Type `B-60'	Cargo ships of type `B' with reduced freeboards on account of their ability to survive a stipulated damage.
Type `B +'	Cargo ships with increased freeboard on account of hatch cover arrangements.

1. 1. 5 The type of hatch covers on the weather decks of the basic ship types defined in Pt 3, Ch 11, 1.1 Application 1.1.4 are detailed below and may be used in the types of ships as indicated in Table 11. 1. 1: Covers associated with ship types:

a. Steel plated cargo hatch covers stiffened by webs or stiffeners and secured by clamping devices. Weathertightness to be achieved by means of gaskets. Hatch covers used for holds containing liquid cargoes are included in this category.
b. Steel plated cargo hatch pontoon covers having interior webs and stiffeners extending for the full width of the hatchway. A pontoon cover is defined as a portable cover, secured weathertight by tarpaulins and battening devices.
c. Hatch covers of wood or steel used in conjunction with portable beams. Weathertightness to be obtained by tarpaulins.
d. Access hatch covers for cargo oil tanks and adjacent spaces. The hatch covers are to be of steel and gasketed.
e. Access hatch covers other than (d). For Type `A', Type `B-100' and Type `B-60' ships, the covers are to be of steel, and weathertightness is to be achieved by means of gaskets.

Table 11. 1. 1: Covers associated with ship types

Type of cover	Type of ship				
	'A'	'B-100'	'B-60'	'B'	'B+'
(a)	–	X	X	X	X
(b)	–	–	–	X	X
(c)	–	–	–	–	X
(d)	X	X	X	Not applicable	
(e)	X	X	X	X	X

1. 1. 6 The positions of hatches on weather decks are defined in Pt 3, Ch 1, 6.6 Position 1 and Position 2.

1. 1. 7 'Tween deck hatch covers may be any of the types defined in Pt 3, Ch 11, 1.1,, Application 1.1.5, but need not be weathertight unless fitted to deep tanks or water ballast holds or compartments, in which case the covers are to be of type (a) and oiltight or watertight as appropriate.

1. 1. 8 The scantlings specified in the following Sections are applicable to covers of mild steel or higher tensile steel. Where other materials are used, equivalent scantlings are to be provided. The scantlings apply basically to rectangular covers, with the stiffening members arranged primarily in one direction and carrying a uniformly distributed load. The covers are assumed to be simply supported. Where covers are stiffened by a grillage formation, and also where point loads are applied to any type of cover, the scantlings are to be determined from direct calculations.

1. 1. 9 In the case of flush hatch covers or of covers on coamings of lesser height than required by Pt 3, Ch 11, 5.1 General 5.1.1, their scantlings, the securing and sealing arrangements and the drainage of gutterways will be specially considered.

1. 1. 10 The scantlings of hatch covers need to be increased only if the loading exceeds that given in Pt 3, Ch 11, 2.3, Load model. The scantlings of the surrounding deck structure are to be sufficient to support this loading. Heavier loading may be permitted only if the scantlings of the cover are capable of withstanding this increased loading, satisfying the stress and deflection criteria given in this Chapter. The deck structure is also to be capable of withstanding this increased loading.

1. 1. 11 Where timber cargo is to be carried on the hatch covers the requirements of Pt 3, Ch 9, 2.11 Scantlings of hatch covers are to be satisfied in addition to the requirements of this Chapter.

1. 1. 12 Where hatchways are trunked through one or more 'tween decks, and hatchway beams and covers are dispensed with at the intermediate decks, the hatchway beams, coamings and covers immediately below the trunk are to be adequately strengthened. Plans are to be submitted for approval.

1. 1. 13 The net plate thickness, t_{net}, is the calculated minimum thickness of the plating and stiffeners. The required thickness is the net thickness plus a corrosion addition, t_c, given in Table 11. 1. 2: Corrosion addition tc.

Table 11. 1. 2: Corrosion addition t_c

Application	Structure	t_c, in mm
Weather deck hatches of container ships, car carriers, paper carriers, passenger vessels	Hatch covers	1.0
	Hatch coamings	1.0
Weather deck hatches of all other ship types except bulk carriers, ore carriers and combination carriers, *See* Pt 4, Ch 7, 12.1 General 12.1.2	Hatch covers in general	2.0
	Weather exposed plating and bottom plating of double skin hatch covers	1.5
	Internal structure of double skin hatch covers and closed box girders	1.0
	Hatch coamings	1.5
Weather deck hatches of all other ship types except bulk carriers, ore carriers and combination carriers, *See* Pt 4, Ch 7, 12.1 General 12.1.2	Coaming stays and stiffeners	1.5
'Tween deck hatches	Hatch covers in general	1.0

PART

3

CHAPTER 11 **Closing Arrangements for Shell, Deck and Bulkheads**

SECTION 2 **Steel hatch covers**

2. 1 General

2. 1. 1 The requirements of Pt 3, Ch 11, 2 Steel hatch covers are not applicable to hatch covers of bulk carriers, ore carriers and combination carriers.

2. 1. 2 The requirements of Pt 3, Ch 11, 2 Steel hatch covers are applicable to hatch covers and coamings made of steel. Hatch covers of alternative materials and innovative design will be specially considered.

2. 1. 3 The strength requirements in Pt 3, Ch 11, 2.1 General to Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners are applicable to hatch covers and closing arrangements of stiffened plate construction. The strength requirements are applicable to exposed weather deck hatch covers and 'tween deck hatch covers, unless otherwise stated.

2. 1. 4 Sub-Sections Pt 3, Ch 11, 2.1 General to Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners are not applicable to portable covers secured weathertight by tarpaulins and battening devices, or pontoon covers, *See* Pt 3, Ch 11, 2.17, Pontoon covers.

2. 1. 5 Unless otherwise stated, the thicknesses referred to in the following Sections are net thicknesses. The net thicknesses are the member thicknesses necessary to obtain the minimum net scantlings required in this Section. The required gross thicknesses are obtained by adding corrosion additions, t_c, given in Table 11. 1. 2: Corrosion addition tc. Strength calculations using grillage analysis or FEM are to be performed with net scantlings.

2. 1. 6 Material class I is to be applied for top plate, bottom plate and primary supporting members.

2. 1. 7 The strength and closing arrangements of hatch covers are to comply with Pt 4, Ch 7, 12 Steel hatch covers in addition to the requirements in this Chapter when hatch covers are subjected to internal ballast or oil cargo pressure.

2. 1. 8 Hatch covers are to comply with Pt 4, Ch 8, 11 Hatch covers in addition to the requirements in this Chapter when containers are carried on covers.

2. 2 Stiffener arrangement

2. 2. 1 The primary supporting members and secondary stiffeners of hatch covers are to be continuous over the breadth and length of hatch covers, as far as practical. When this is impractical, sniped end connections are not to be used and appropriate arrangements are to be adopted to ensure sufficient load-carrying capacity.

2. 2. 2 The spacing of primary supporting members parallel to the direction of secondary stiffeners is not to exceed one third of the span of primary supporting members. When strength calculation is carried out by FE analysis using plane strain or shell elements, this requirement can be waived.

2. 2. 3 Secondary stiffeners of hatch coamings are to be continuous over the breadth and length of hatch coamings.

2. 2. 4 Supporting members in way of cut-outs are to have sufficient shear area.

2. 3 Load model

2. 3. 1 The structural assessment of hatch covers is to be carried out using the design loads defined in this Section. The following symbols and definitions are applicable to this Section:

x = longitudinal co-ordinate measured from the AP to mid point of assessed structural member

T_{fb} = draught, in metres, corresponding to the assigned summer load line

h_N = standard superstructure height in metres

= $1.05 + 0.01L_L, 1.8 \leq h_N \leq 2.3$

Where

L_L = load line length, as defined in Pt 3, Ch 1, 6.1 Principal particulars 6.1.8.

2. 3. 2 The vertical weather design pressure, p_H, in kN/m^2, on the hatch cover panels is to be taken from Table 11. 2. 1: Design pressure pH of weather deck hatches. When cargo is carried on the cover, cargo loads according to Pt 3, Ch 11, 2.3 Load model 2.3.4, Pt 3, Ch 11, 2.3 Load model 2.3.5 and Pt 4, Ch 8, 11.2, Direct calculations are to be considered. The vertical weather design load needs not to be combined with the cargo load. For 'tween deck hatch covers not exposed to weather load, the structural assessment is to be carried out using the cargo loads defined in Pt 3, Ch 11, 2.3 Load model 2.3.4 and Pt 3, Ch 11, 2.3 Load model 2.3.5. Covers carrying wheeled vehicles are also to comply with Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles and where it is proposed to provide a helicopter landing area, covers are also to comply with Pt 3, Ch 9, 5 Helicopter landing areas. Where an increased freeboard is assigned, the design load for hatch covers according to Table 11. 2. 1: Design pressure pH of weather deck hatches on the actual freeboard deck may be as required for a superstructure deck, provided the summer freeboard is such that the resulting draught will not be greater than that corresponding to the minimum freeboard calculated from an assumed freeboard deck situated at a distance at least equal to the standard superstructure height, h_N, below the actual freeboard deck, *See* Figure 11. 2. 2: Positions 1 and 2 for an increased freeboard.

Table 11. 2. 1: Design pressure p_H of weather deck hatches

Position (*See* Note)	p_H, in kN/m^2	
1	$\frac{x}{L_L} \leq 0.75$	$0.75 < \frac{x}{L_L} \leq 1.0$
	for 24 m $\leq L_L \leq$ 100 m	
	$\frac{g}{76}(1.5L_L + 116)$	on freeboard deck $\frac{g}{76}\left[(4.28L_L + 28)\frac{x}{L_L} - 1.71L_L + 95\right]$
		upon exposed superstructure decks located at least one superstructure standard height above the freeboard deck $\frac{g}{76}(1.15L_L + 116)$
	for $L_L >$ 100 m	

	3.5g	on freeboard deck for type B ships according to ICLL $g\left[(0.0296L_1 + 3.04)\frac{x}{L_L} - 0.0222L_1 + 1.22\right]$
		on freeboard deck for ships with less freeboard than type B according to ICLL $g\left[(0.1452L_1 - 8.52)\frac{x}{L_L} - 0.1089L_1 + 9.89\right]$ L_1=L_L but not more than 340 m

2. 3. 3 The horizontal weather design pressure, in kN/m^2, for determining the scantlings of outer edge girders (skirt plates) of weather deck hatch covers and of hatch coamings is:

Note The horizontal weather design pressure need not be included in the direct strength calculation of the hatch cover, unless it is utilised for the design of substructures of horizontal support according to Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.10.

p_A = $ac(bc_c, f - z)\text{kN/m}^2$

f = $\frac{L}{25} + 4.1$ for L < 90 m

= $10.75 - \left(\frac{300-L}{100}\right)^{1.5}$ for 90 m ≤ L < 300 m

= 10.75 for 300 m ≤ L < 350 m

= $10.75 - \left(\frac{L-350}{100}\right)^{1.5}$ for 350 m ≤ L ≤ 500 m

c_L = $\sqrt{\frac{L}{90}}$ for $L < 90\text{m}$

= 1

a = 1 for unprotected front coamings and hatch cover skirt plates

= 1

= $20 + \frac{L_1}{12}$ for unprotected front coamings and hatch cover skirt plates

a = $10 + \frac{L_1}{12}$ for unprotected front coamings and hatch cover skirt plates, where the distance from the actual freeboard deck to the summer load line exceeds the minimum non-corrected tabular freeboard according to ICLL by at least one standard superstructure height h_N

a = $5 + \frac{L_1}{15}$ for side and protected front coamings and hatch cover skirt plates

a = $= 7 + \frac{L_1}{100} - 8\frac{x'}{L}$ for aft ends of coamings and aft hatch cover skirt plates abaft amidships

a = $5 + \frac{L_1}{100} - 4\frac{x'}{L}$ for aft ends of coamings and aft hatch cover skirt plates forward of amidships

L_1 = L, need not be taken greater than 300 m

b = $$1.0 + \left(\frac{\frac{x'}{L} - 0.45}{C_b + 0.2}\right)^2 \text{ for } \left(\frac{x'}{L}\right) < 0.45$$

b = $$1.0 + 1.5\left(\frac{\frac{x'}{L} - 0.45}{C_b + 0.2}\right)^2 \text{ for } \left(\frac{x'}{L}\right) < 0.45$$

= $0.6 \leq Cb \leq 0.8$, when determining scantlings of aft ends of coamings and aft hatch cover skirt plates forward of amidships, C_b need not be taken less than 0.8

C_b = block coefficient, as defined in Pt 3, Ch 1, 6.1 Principal particulars 6.1.6

x’ = distance, in metres, between the transverse coaming or hatch cover skirt plate considered and aft end of the length L. When determining side coamings or side hatch cover skirt plates, the side is to be subdivided into parts of approximately equal length, not exceeding $0.15L$ each, and x’ is to be taken as the distance between aft end of the length L and the centre of each part considered

z = vertical distance in metres from the summer load line to the mid point of stiffener span, or to the middle of the plate field

c = $0.3 + 0.7\frac{b'}{B'}$

b' = breadth of coaming in metres at the position considered

B' = actual maximum breadth of ship in metres on the exposed weather deck at the position considered b'/B' is not to be taken less than 0.25

The design pressure p_A is not to be taken less than the minimum values given in Table 11. 2. 2: Minimum design load, pAmin.

Table 11. 2. 2: Minimum design load, p_{Amin}

L	p_{Amin}, kN/m^2	
	For unprotected fronts	Elsewhere
≤ 50	30	15

> 50	$25+\frac{L}{10}$	$12.5+\frac{L}{20}$
< 250		
≥ 250	50	25

2. 3. 4 The pressure on hatch covers due to distributed cargo loads p_L, in kN/m2, resulting from heave and pitch (i.e. ship in upright condition), is to be determined according to the following formula:

$$p_L = p_c(1+a_v)\text{kN/m}^2$$

Where

p_c = uniform cargo load, in kN/m^2

Note For 'tween deck hatch covers, p_c is not to be taken less than 7.07 H_{td} kN/m^2, *See* Pt 3, Ch 3, 5.2 Symbols 5.2.1, Table 3. 5. 1: Design heads and permissible cargo loadings and Figure 3. 5. 1: Heads for 'tween decks for 'tween decks. A design load less than this will be specially considered.

a_v = vertical acceleration addition as follows:

$a_v = Fm$

$F = 0.11\frac{V_0}{\sqrt{L}}$

$m = m_0 - 5(m_0-1)\frac{x}{L}$ for $0 \le \frac{x}{L} \le 0.2$

$= 1.0$ for $0.2 \le \frac{x}{L} \le 0.7$

$= 1+\frac{m_0+1}{0.3}\left(\frac{x}{L}-0.7\right)$ for $0.7 < \frac{x}{L} \le 1.0$

$m_0 = 1.5+F$

v_0 = Maximum speed at summer load line draught, v_0 is not to be taken less than $\sqrt{L}$, in knots.

2. 3. 5 The point load due to a concentrated force, P, in kN resulting from heave and pitch is to be determined as follows:

$P = P_S(1+a_v)\text{kN}$

P_S = single force, in kN.

2. 3. 6 Container loads as defined in Pt 4, Ch 8, 11.2 Direct calculations 11.2.4 are to be applied where containers are stowed on the hatch cover.

2. 3. 7 In addition to the loads defined in this Section, hatch covers are loaded in the ship's transverse direction by forces due to elastic deformations of the ship's hull. Hatch covers may be required to be designed such that the sum of stresses does not exceed the permissible values given in Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1.

2. 4 Allowable stress and deflection

2. 4. 1 The equivalent stress, σ_v, in steel hatch cover structures related to the net thickness shall not exceed $0.8\sigma_o$, where σ_o is the minimum yield stress, in N/mm^2, of the material. For design loads according to Pt 3, Ch 11, 2.3 Load model 2.3.3 to Pt 3, Ch 11, 2.3 Load model 2.3.7 and Pt 4, Ch 8, 11.2,

Direct calculations, the equivalent stress, σ_v, related to the net thickness shall not exceed $0.9\sigma_o$ when the stresses are assessed by means of FEM.

For grillage analysis, the equivalent stress may be taken as follows:

σ_v = $\sqrt{\sigma^2 + 3\tau^2}$, in N/mm^2

σ = normal stress in N/mm^2

τ = shear stress in N/mm^2

For FEM calculations, the equivalent stress may be taken as follows:

σ_v = $\sqrt{\sigma_x^2 - \sigma_x\sigma_y + \sigma_{y^2} + 3\tau^2}$, N/mm^2

σ_x = normal stress, in N/mm^2, in x-direction

σ_y = normal stress, in N/mm^2, in y-direction

τ = shear stress, in N/mm^2, in the x-y plane

Indices x and y are coordinates of a two-dimensional Cartesian system in the plane of the considered structural element.

In the case of FEM calculations using shell or plane strain elements, the stresses are to be read from the centre of the individual element. It is to be recognised that in particular at flanges of unsymmetrical girders, the evaluation of stress from the element centre may lead to non-conservative results. Thus, a sufficiently fine mesh is to be applied in these cases. Where shell elements are used, the stresses are to be evaluated at the mid plane of the element.

Stress concentrations are to be considered by examining design details or FE analysis. FEM calculations are to be carried out in accordance with the ACSPlus procedure *Assessment of Steel Hatch Covers using Finite Element Analysis*.

2. 4. 2 The vertical deflection of primary supporting members due to the vertical weather design load according to Pt 3, Ch 11, 2.3 Load model 2.3.2, is to be not more than $0.0056l_g$ where l_g is the greatest span of primary supporting members.

Note Where hatch covers are arranged for carrying containers and mixed stowage is allowed, i.e. a 40'-container stowed on top of two 20'-containers, particular attention should be paid to the deflections of hatch covers. Furthermore the possible contact of deflected hatch covers with in-hold cargo has to be avoided.

For 'tween deck hatch covers not exposed to the vertical weather design load according to Pt 3, Ch 11, 2.3 Load model 2.3.2, the vertical deflection of primary supporting members due to the cargo loads according to Pt 3, Ch 11, 2.3 Load model 2.3.4, Pt 3, Ch 11, 2.3 Load model 2.3.5 and Pt 4, Ch 8, 11.2, Direct calculations is to be not more than $0.007l_g$ where l_g is the greatest span of primary supporting members.

2. 5 Local net plate thickness

2. 5. 1 The local net plate thickness, t, in mm, of the hatch cover top plating is not to be less than:

$$t = F_p 0.0158 s \sqrt{\frac{p}{0.95\sigma_o}}$$

and to be not less than 1 per cent of the spacing of the stiffener or 6 mm, whichever is greater

F_p = factor for combined membrane and bending response

= 1.5 in general

$= \quad 1.9\frac{\sigma}{\sigma_a}.\ \text{for}\ \frac{\sigma}{\sigma_a} \geq 0.8$

for the attached plate flange of primary supporting members

s = stiffener spacing, in mm

p = pressure p_H and p_L, in kN/m^2, as defined in Pt 3, Ch 11, 2.3, Load model

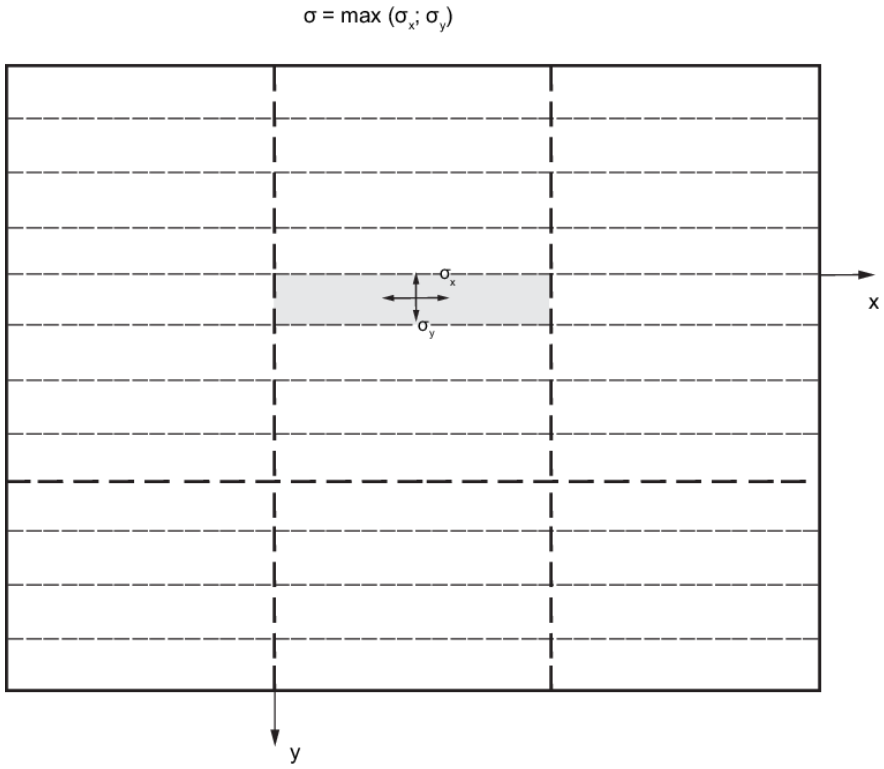
σ = maximum normal stress, in N/mm^2, of hatch cover top plating, determined according to Figure 11. 2. 3: Determination of normal stress of the hatch cover plating

σ_a = $0.8\sigma_o$, in N/mm^2

σ_0 = minimum yield stress, in N/mm^2, of the material

For flange plates under compression, sufficient buckling strength according to Pt 3, Ch 11, 2.11, Buckling strength of hatch cover structures is to be demonstrated.

Figure 11. 2. 3: Determination of normal stress of the hatch cover plating



2. 6 Local plate thickness of hatch covers for wheel loading and helicopter landing

2. 6. 1 The local gross plate thickness of hatch covers for wheel loading is to comply with Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles.

2. 6. 2 The local gross plate thickness of hatch covers for helicopter landing is to comply with Pt 3, Ch 9, 5 Helicopter landing areas.

2. 7 Lower plating of double skin hatch covers and box girders

2. 7. 1 The thickness to fulfil the strength requirements is to be obtained from the calculation according to Pt 3, Ch 11, 2.10, Strength calculations under consideration of permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1. When the lower plating is taken into account as a strength member of the hatch cover, the net thickness, in mm, of lower plating is to be taken not less than 5 mm. When project cargo is intended to be carried on a hatch cover, the net thickness must not be less than:

t = $0.0065s$, in mm

s = stiffener spacing, in mm.

Note Project cargo means especially large or bulky cargo lashed to the hatch cover. Examples are parts of cranes or wind power stations, turbines, etc. Cargoes that can be considered as uniformly distributed over the hatch cover, e.g. timber, pipes or steel coils, need not be considered as project cargo.

When the lower plating is not considered as a strength member of the hatch cover, the thickness of the lower plating is to be specially considered.

2. 8 Net scantling of secondary stiffeners

2. 8. 1 The net section modulus, Z, and net shear area, A_s, of uniformly loaded hatch cover stiffeners constrained at both ends is not to be less than:

Z = $\frac{104psl^2}{\sigma_0}$ in cm^3 for design load according to Pt 3, Ch 11, 2.3 Load model 2.3.2

Z = $\frac{93psl^2}{\sigma_0}$ in cm^3 for design load according to Pt 3, Ch 11, 2.3 Load model 2.3.4

A_s = $\frac{10.8psl}{\sigma_o}$, in cm^2 for design load according to Pt 3, Ch 11, 2.3 Load model 2.3.2

A_s = $A_s = \frac{9.6psl}{\sigma_o}$, in cm^2 for design load according to Pt 3, Ch 11, 2.3 Load model 2.3.4

Where

l = secondary stiffener span, in metres, to be taken as the spacing, in metres, of primary supporting members or the distance between a primary supporting member and the edge support, as applicable

s = secondary stiffener spacing, in mm

p = pressure p_H and p_L, in kN/m^2, as defined in Pt 3, Ch 11, 2.3 Load model 2.3.2 and Pt 3, Ch 11, 2.3 Load model 2.3.4 respectively.

σ_o = minimum yield stress, in N/mm^2, of the material, *See* Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1

For secondary stiffeners of lower plating of double skin hatch covers, requirements mentioned above are not applicable due to the absence of lateral loads.

The net thickness, in mm, of the stiffener web, except of u-beams/trapeze stiffeners, is to be taken not less than 4 mm.

2. 8. 2 The net section modulus of the secondary stiffeners is to be determined, based on an attached plate width assumed equal to the stiffener spacing.

2. 8. 3 For flat bar secondary stiffeners and buckling stiffeners, the ratio h/t_w is to be not greater than $15k^{0.5}$

Where

h = height of the stiffener

t_w = net thickness of the stiffener

k = $235/\sigma_o$.

2. 8. 4 Stiffeners parallel to primary supporting members and arranged within the effective breadth according to Pt 3, Ch 11, 2.10, Strength calculations must be continuous when crossing primary supporting members and may be considered when calculating the cross-sectional properties of primary supporting members. It is to be verified that the combined stress of those stiffeners, induced by the bending of primary supporting members and lateral pressures, does not exceed the permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1. The requirements of this paragraph are not applied to stiffeners of lower plating of double skin hatch covers if the lower plating is not considered as strength member.

2. 8. 5 For hatch cover stiffeners under compression, sufficient safety against lateral and torsional buckling according to Pt 3, Ch 11, 2.15 Lateral buckling of secondary stiffeners and Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners is to be verified.

2. 8. 6 For hatch covers subject to wheel loading or point loads, stiffener scantlings are to be determined under consideration of the permissible stresses according to Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles or Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1, as applicable.

2. 8. 7 For hatch covers subject to helicopter landing, stiffener gross scantlings are to comply with Pt 3, Ch 9, 5 Helicopter landing areas.

2. 9 Net scantling of primary supporting members

2. 9. 1 Scantlings of primary supporting members are obtained from calculations according to Pt 3, Ch 11, 2.10, Strength calculations, under consideration of permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1.

2. 9. 2 For all components of primary supporting members, sufficient safety against buckling must be verified according to Pt 3, Ch 11, 2.11, Buckling strength of hatch cover structures to Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners. For biaxial compressed flange plates, this is to be verified within the effective widths according to Pt 3, Ch 11, 2.14 Effective width of top and lower hatch cover plating 2.14.1.

2. 9. 3 The net thickness, t, in mm, of webs of primary supporting members is not to be less than:

a. $0.0065s$, in mm
b. 5 mm

Where

s = stiffener spacing, in mm.

2. 9. 4 Scantlings of edge girders (skirt plates) are obtained from the calculations according to Pt 3, Ch 11, 2.10, Strength calculations, under consideration of permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1.

2. 9. 5 The net thickness, t, in mm, of the outer edge girders exposed to wash of sea is not to be less than the largest of the following values:

a. $0.0158s\sqrt{\frac{p_A}{0.95\sigma_o}}$

b. $0.0085s$ mm
c. 5 mm

Where

p_A = horizontal pressure, as defined in Pt 3, Ch 11, 2.3 Load model 2.3.3

s = stiffener spacing, in mm.

2. 9. 6 The stiffness of edge girders is to be sufficient to maintain adequate sealing pressure between securing devices. The moment of inertia, in cm^4, of edge girders is not to be less than:

$I = 6q\, s\, s_{SD}^4$

q = packing line pressure, in N/mm, minimum 5 N/mm

s_{SD} = spacing, in metres, of securing devices.

2. 10 Strength calculations

2. 10. 1 Strength calculation for hatch covers may be carried out by using either grillage analysis or FEM. Double skin hatch covers or hatch covers with box girders are to be assessed using FEM, *See* Pt 3, Ch 11, 2.10 Strength calculations 2.10.3. *See also* Pt 3, Ch 11, 2.7 Lower plating of double skin hatch covers and box girders for requirement of lower plqting of double skin hatch covers and box girders.

2. 10. 2 The effective cross-sectional properties for calculation by grillage analysis are to be determined considering the effective breadth. Cross-sectional areas of secondary stiffeners parallel to the primary supporting member under consideration within the effective breadth can be included, *See* Figure 11. 2. 5: Stiffening parallel to web of primary supporting member. The effective breadth of plating, e_m, of primary supporting members is to be determined according to Table 11. 2. 3: Effective breadth em of plating of primary supporting members, considering the type of loading. Special calculations may be required for determining the effective breadth of one-sided or non-symmetrical flanges. The effective cross-sectional area of plates is not to be less than the cross-sectional area of the face-plate. For flange plates under compression with secondary stiffeners perpendicular to the web of the primary supporting member, the effective width is to be determined according to Pt 3, Ch 11, 2.14 Effective width of top and lower hatch cover plating 2.14.1.

Table 11. 2. 3: Effective breadth e_m of plating of primary supporting members

l/e	0	1	2	3	4	5	6	7	≥8
e_{m1}/e	0	0.36	0.64	0.82	0.91	0.96	0.98	1.00	1.00
e_{m2}/e	0	0.20	0.37	0.52	0.65	0.75	0.84	0.89	0.90

Symbols	
e_{m1}	is to be applied where primary supporting members are loaded by uniformly distributed loads or else by no fewer than six equally spaced single loads
e_{m2}	is to be applied where primary supporting members are loaded by three or fewer single loads. Intermediate values may be obtained by direct interpolation
l	length of zero-points of bending moment curve: $l = l_0$ for simply supported primary supporting members

	$l = 0.6l_0$for primary supporting members with both ends constrained
where	
l_0	is the unsupported length of the primary supporting member
e	width of plating supported, measured from centre to centre of the adjacent unsupported fields

2. 10. 3 FEM calculations are to be done in accordance with the ACSPlus SDA Procedure, *Assessment of Steel Hatch Covers Using Finite Element Analysis*.

2. 11 Buckling strength of hatch cover structures

2. 11. 1 For hatch cover structures, sufficient buckling strength is to be demonstrated.

a = length of the longer side of a single plate field, in mm

b = breadth of the shorter side of a single plate field, in mm

α = aspect ratio of single plate field

= a/b

n = number of single plate field breadths within the partial or total plate field

t = net plate thickness, in mm

σ_x = membrane stress, in N/mm^2, in x-direction

σ_y = membrane stress, in N/mm^2, in y-direction

τ = shear stress, in N/mm^2, in the x-y plane

E = modulus of elasticity, in N/mm^2, of the material

= 2.06 x 10^5 N/mm^2 for steel

σ_o = minimum yield stress, in N/mm^2, of the material.

Compressive and shear stresses are to be taken positive, tension stresses are to be taken negative. If stresses in the x- and y-direction already contain the Poisson effect (calculated using FEM), the following modified stress values may be used. Both stresses σ_x * and σ_y * are to be compressive stresses, in order to apply the stress reduction according to the following formulae.

$$\sigma_x = \frac{\left(\sigma_x^* - 0.3\sigma_y^*\right)}{0.91}$$

$$\sigma_y = \frac{\left(\sigma_y^* - 0.3\sigma_x^*\right)}{0.91}$$

σ_x^*, σ_y^* = stresses containing the Poisson effect where compressive stress fulfils the condition

$\sigma_y{}^* < 0.3\sigma_x^*$, then $\sigma_y = 0$ and $\sigma_x = \sigma_x^*$

where compressive stress fulfils the condition

$\sigma_x^* < 0.3\sigma_y{}^*$, then $\sigma_x = 0$ and $\sigma_y = \sigma_x *$

F_1 = correction factor for boundary condition at the longitudinal stiffeners according to Table 11. 2. 4: Correction factor F1

σ_e = reference stress, in N/mm^2, taken equal to

= $$0.9E\left(\frac{t}{b}\right)^2$$

ψ = edge stress ratio taken equal to

= $$\frac{\sigma_2}{\sigma_1}$$

Where

σ_1 = maximum compressive stress

σ_2 = minimum compressive stress or tension stress

S = safety factor (based on net scantling approach), taken equal to

= 1.25 for hatch covers when subjected to the vertical weather design load according to Pt 3, Ch 11, 2.3 Load model 2.3.2

= 1.10 for hatch covers when subjected to loads according to Pt 3, Ch 11, 2.3 Load model 2.3.3 and Pt 4, Ch 8, 11.2, Direct calculations

λ = reference degree of slenderness, taken equal to:

= $$\sqrt{\frac{\sigma_0}{K\sigma_e}}$$

K = buckling factor according to Table 11. 2. 6: Buckling and reduction factors for plane elementary plate panels.

Table 11. 2. 4: Correction factor F_1

Stiffeners sniped at both ends	1.00	
Guidance values, *See* Note 1, where both ends are effectively connected to adjacent structures	1.05	for flat bars
	1.10	for bulb sections
	1.21	for angle and tee-sections
	1.30	for u-type sections, *See* Note 2, and girders of high rigidity
An average value of F_1, is to be used for plate panels having different edge stiffeners		
Note *1.* Exact values may be determined by direct calculations. **Note** *2.* A higher value, but not greater than 2.0, may be taken if it is verified by a buckling strength check of the partial plate field using non-linear FEA. The calculations are to be submitted to LR for approval.		

Table 11. 2. 5: Coefficients e_1, e_2, e_3 and factor B

Exponents e_1 to e_3 and factor B	Plate panel

e_1	$1 + \kappa_x^4$
e_2	$1 + \kappa_y{}^4$
e_3	$1 + \kappa_x \kappa_y \kappa_\tau^2$
B σ_x and σ_y positive (compression stress)	$(\kappa_x \kappa_y)^5$
B σ_x or σ_y negative (tension stress)	1

2. 11. 2 Proof is to be provided that the following condition is complied with for the single plate field a b:

$$\left(\frac{|\sigma_x|S}{\kappa_x \sigma_o}\right)^{e1} + \left(\frac{|\sigma_y|S}{\kappa_y \sigma_o}\right)^{e2} - B\left(\frac{\sigma_x \sigma_y S^2}{{\sigma_o}^2}\right) + \left(\frac{|\tau|S\sqrt{3}}{\kappa_t \sigma_o}\right)^{e3} \leq 1.0$$

The first two terms and the last term of the above condition shall not exceed 1.0.

The reduction factors κ_x, κ_y and κ_τ are given in Table 11. 2. 6: Buckling and reduction factors for plane elementary plate panels.

Where $\sigma_x \leq 0$ (tension stress), $\kappa_x = 1.0$.

Where $\sigma_y \leq 0$ (tension stress), $\kappa_y = 1.0$.

The exponents e_1, e_2 and e_3 as well as the factor B are to be taken as given by Table 11. 2. 5: Coefficients e1, e2, e3 and factor B.

Table 11. 2. 6: Buckling and reduction factors for plane elementary plate panels

Buckling load case	Edge stress ratio ψ	Asp. ratio $a = \frac{a}{b}$	Buckling factor K	Reduction factor κ
1 	$1 \geq \psi \geq 0$	$\alpha \geq 1$	$K = \frac{8.4}{\psi + 1.1}$	$\kappa_x = 1$ for $\lambda \leq \lambda_c$
	$0 > \psi > -1$		$K = 7.63 - \psi\,(6.26 - 10\psi)$	$\kappa_X = c\left(\frac{1}{\lambda} - \frac{0.22}{\lambda^2}\right)$ for $\lambda > \lambda_c$
	$\psi \leq -1$		$K = 5.975\,(1 - \psi)^2$	$c = (1.25 - 0.12\psi) \leq 1.25$ $\lambda_c = \frac{c}{2}\left(1 + \sqrt{1 - \frac{0.88}{c}}\right)$
2	$1 \geq \psi \geq 0$	$\alpha \geq 1$	$K = F_1\left(1 + \frac{1}{\alpha^2}\right)^2 \frac{2.1}{(\psi + 1.1)}$	$\kappa_y = c\left(\frac{1}{\lambda} - \frac{R + F^2(H - R)}{\lambda^2}\right)$

				$c = (1.25 - 0.12\psi) \leq 1.25$
				$R = \lambda\left(1 - \frac{\lambda}{c}\right)$ for $\lambda < \lambda_C$

Explanations for boundary conditions		----------	plate edge free plate edge simply supported	

2. 12 Webs and flanges of primary supporting members

2. 12. 1 For non-stiffened webs and flanges of primary supporting members, sufficient buckling strength, as for the hatch cover top and lower plating, is to be demonstrated according to Pt 3, Ch 11, 2.11 Buckling strength of hatch cover structures 2.11.2.

2. 13 Longitudinal and transverse secondary stiffeners

2. 13. 1 It is to be demonstrated that the continuous longitudinal and transverse stiffeners of partial and total plate fields comply with the conditions set out in Pt 3, Ch 11, 2.15 Lateral buckling of secondary stiffeners and Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners. For u-type stiffeners, the verification of torsional buckling strength according to Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners can be omitted. Single-sided welding is not permitted for secondary stiffeners except for u-type stiffeners.

2. 14 Effective width of top and lower hatch cover plating

2. 14. 1 For demonstration of buckling strength according to Pt 3, Ch 11, 2.15 Lateral buckling of secondary stiffeners and Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners, the effective width of plating may be determined by the following formulae:

b_m = κ_x b for longitudinal stiffeners

a_m = κ_y a for transverse stiffeners

See also Figure 11. 2. 4: General arrangement of panel.

The effective width of plating is not to be taken greater than the value obtained from Pt 3, Ch 11, 2.10 Strength calculations 2.10.2.

The effective width e'_m of stiffened flange plates of primary supporting members may be determined as follows:

(a) Stiffening parallel to web of primary supporting member:

- $b < e_m$

e'_m = $n\ b_m$

n = integer number of stiffener spacings b inside the effective breadth e_m according to Pt 3, Ch 11, 2.10 Strength calculations 2.10.2

= $\text{int}\left(\frac{e_m}{b}\right)$

(b) Stiffening perpendicular to web of primary supporting member:

- $a \geq e_m$

e'_m = $n_{am} < e_m$

n = $2.7\frac{e_m}{a} \leq l$

e = width of plating supported according to Pt 3, Ch 11, 2.10 Strength calculations 2.10.2

For $b \geq e_m$ or $a < e_m$, respectively, b and a are to be exchanged.

a_m and b_m for flange plates are in general to be determined for $\psi = 1$.

Scantlings of plates and stiffeners are in general to be determined according to the maximum stresses $\sigma_x(y)$ at webs of primary supporting member and stiffeners, respectively. For stiffeners with spacing b under compression arranged parallel to primary supporting members, no value less than $0.25\sigma_o$ shall be inserted for $\sigma_x(y=b)$.

The stress distribution between two primary supporting members can be obtained by the following formula:

$$\sigma_x(y) = \sigma_{xl}\left\{1 - \frac{y}{e}\left[3 + c_1 - 4c_2 - 2\frac{y}{e}(1 + c_1 - 2c_2)\right]\right\}$$

Where

c_1 = $\frac{\sigma_{x2}}{\sigma_{x1}}\ 0 \leq c_1 \leq 1$

c_2 = $\frac{1.5}{e}(e_{m1}'' + e_{m2}'') - 0.5$

e_{m1}" = proportionate effective breadth e_{m1} or proportionate effective width e_{m1}' of primary supporting member 1 within the distance e, as appropriate

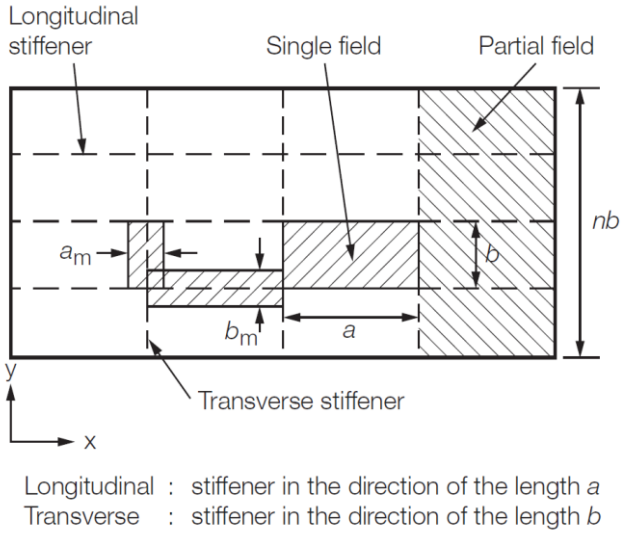
e_{m2}" = proportionate effective breadth e_{m2} or proportionate effective width e_{m2}' of primary supporting member 2 within the distance e, as appropriate

σ_{x1}, σ_{x2} = normal stresses in flange plates of adjacent primary supporting member 1 and 2 with spacing e, based on cross-sectional properties considering the effective breadth or effective width, as appropriate

y = distance of considered location from primary supporting member 1

Shear stress distribution in the flange plates may be assumed linearly.

Figure 11. 2. 4: General arrangement of panel



Longitudinal : stiffener in the direction of the length *a*
Transverse : stiffener in the direction of the length *b*

Figure 11. 2. 5: Stiffening parallel to web of primary supporting member

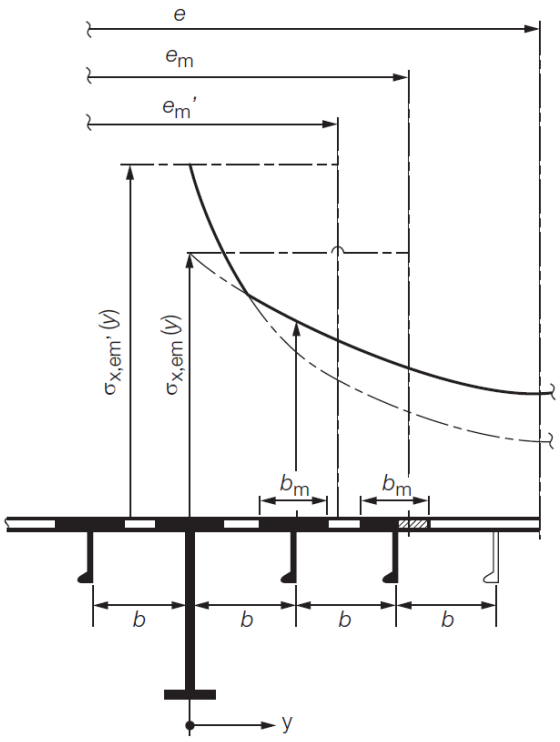


Figure 11. 2. 6: Stiffening perpendicular to web of primary supporting member

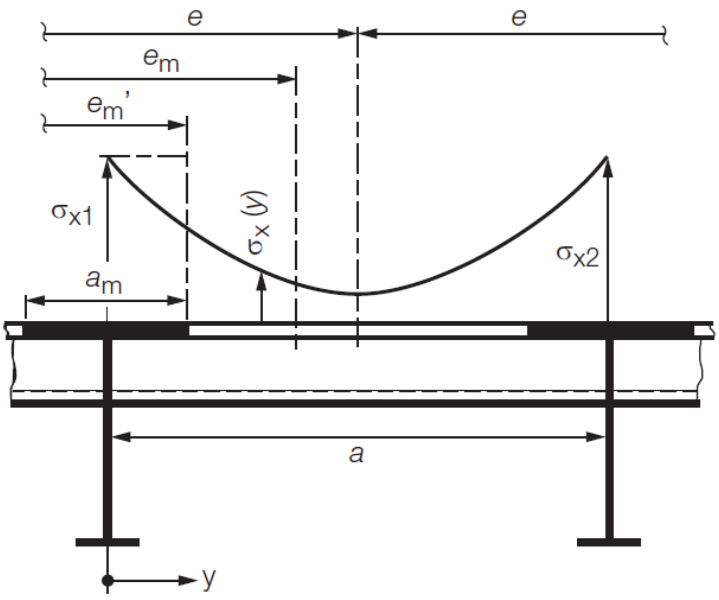

2. 15 Lateral buckling of secondary stiffeners

2. 15. 1 The secondary stiffeners are to comply with the following criteria:

$$\frac{\sigma_a + \sigma_b}{\sigma_o} S \leq 1$$

Where

σ_a = uniformly distributed compressive stress, in N/mm^2, in the direction of the stiffener axis

σ_a = σ_x for longitudinal stiffeners

σ_a = σ_y for transverse stiffeners

σ_b = bending stress, in N/mm^2, in the stiffener

$$= \frac{M_0 + M_1}{Z_{st} \times 10^3}$$

M_0 = bending moment, in Nmm, due to the deformation w of stiffener, taken equal to:

$$M_0 = F_{Ki} \frac{p_z w}{c_f - p_z} \text{ with } (c_f - p_z) > 0$$

M_1 = bending moment, in Nmm, due to the lateral load p equal to:

M_1 = $\frac{pba^2}{24\times10^3}$ for longitudinal stiffeners

M_1 = $\frac{pa(nb)^2}{8c_s\times10^3}$ for transverse stiffeners

- n is to be taken equal to 1 for ordinary transverse stiffeners

Where

p = lateral load, in kN/m^2

F_{Ki} = ideal buckling force, in N, of the stiffener

F_{Kix} = $\frac{\pi^2}{a^2} E I_X \times 10^4$ for longitudinal stiffeners

F_{Kiy} = $\frac{\pi^2}{(nb)^2} E I_y \times 10^4$ for transverse stiffeners

l_x, l_y = net moments of inertia, in cm^4, of the longitudinal or transverse stiffener, including effective width of attached plating according to Pt 3, Ch 11, 2.14 Effective width of top and lower hatch cover plating 2.14.1. I_x and I_y are to comply with the following criteria:

$$I_x \geq \frac{bt^3}{12 \times 10^4}$$

$$I_y \geq \frac{at^3}{12 \times 10^4}$$

p_z = nominal lateral load, in N/mm^2, of the stiffener due to σ_x, σ_y and τ

p_{zx} = $\frac{t}{b}\left(\sigma_{xl}\left(\frac{\pi b}{a}\right)^2 + 2c_y\sigma_y + \sqrt{2}\tau_1\right)$ for longitudinal stiffeners

p_{zy} = $\frac{t}{a}\left(2c_x\sigma_{x1} + \sigma_y\left(\frac{\pi a}{nb}\right)^2\left(1 + \frac{A_y}{at}\right) + \sqrt{2}\tau_1\right)$ for transverse stiffeners

σ_{xl} = $\sigma_x\left(1 + \frac{A_x}{bt}\right)$

c_x, c_y = factor taking into account the stresses perpendicular to the stiffener's axis and distributed variably along the stiffener's length

= $0.5\ (1\ +\ \psi)$ for $0\ \leq\ \psi\ \leq\ 1$

= $\frac{0.5}{1-\psi}$ for $\psi < 0$

A_x, A_y = net sectional area, in mm^2, of the longitudinal or transverse stiffener, respectively, without attached plating

τ_1 = $\left[\tau - t\sqrt{\sigma_o E\left(\frac{m_1}{a^2} + \frac{m_2}{b^2}\right)}\right] \geq 0$

- for longitudinal stiffeners:
- $\frac{a}{b} \geq 2.0\ : m_1 = 1.47 m_2 = 0.49$
- $\frac{a}{b} < 2.0\ : m_1 = 1.96 m_2 = 0.37$
- for transverse stiffeners:
- $\frac{a}{nb} \geq 0.5\ : m_1 = 0.37 m_2 = \frac{1.96}{n^2}$
- $\frac{a}{nb} < 0.5\ : m_1 = 0.49 m_2 = \frac{1.47}{n^2}$

w = w_0+w_1

w_0 = assumed imperfection, in mm

- $w_{0x} \leq min\left(\frac{a}{250}, \frac{b}{250}, 10\right)$

- $w_{0y} \leq min\left(\frac{a}{250}, \frac{nb}{250}, 10\right)$

NOTE
For stiffeners sniped at both ends, w_0 must not be taken less than the distance from the mid point of plating to the neutral axis of the profile, including effective width of plating.

w_1 = deformation of stiffener, in mm, at midpoint of stiffener span due to lateral load p

In the case of uniformly distributed load, the following values for w_1 may be used:

w_1 = $\frac{pba^4}{384\times10^7 EI_x}$ for longitudinal stiffeners

w_1 = $\frac{5ap(nb)^4}{384\times10^7 EI_y c^2{}_s}$ for transverse stiffeners

c_f = elastic support provided by the stiffener, in N/mm^2

a. For longitudinal stiffeners:

$$c_{fx} = F_{Kix}\frac{\pi^2}{a^2}\left(1 + c_{px}\right)$$

$$c_{px} = \frac{1}{1 + \frac{0.91\left(\frac{12\times10^4 I_x}{t^3 b} - 1\right)}{c_{xa}}}$$

$$c_{xa} = \left(\frac{a}{2b} + \frac{2b}{a}\right)^2 \text{ for a } \geq \text{ 2b}$$

$$c_{xa} = \left(1 + \left(\frac{a}{2b}\right)^2\right)^2 \text{ for a } < \text{ 2b}$$

b. For transverse stiffeners:

$$c_{fy} = c_s F_{Kiy}\frac{\pi^2}{(nb)^2}\left(1 + c_{py}\right)$$

$$c_{py} = \frac{1}{1 + \frac{0.91\left(\frac{12\times10^4 I_y}{t^3 a} - 1\right)}{c_{ya}}}$$

$$c_{ya} = \left(\frac{nb}{2a} + \frac{2a}{nb}\right)^2 \text{ for n b } \geq \text{ 2a}$$

$$c_{ya} = \left(1 + \left(\frac{nb}{2a}\right)^2\right)^2 \text{ for n b } < \text{ 2a}$$

c_s = factor accounting for the boundary conditions of the transverse stiffener

= 1.0 for simply supported stiffeners

= 2.0 for partially constrained stiffeners

Z_{st} = net section modulus of stiffener (longitudinal or transverse), in cm^3, including effective width of plating according to Pt 3, Ch 11, 2.14 Effective width of top and lower hatch cover plating 2.14.1.

If no lateral load p is acting, the bending stress σ_b is to be calculated at the mid point of the stiffener span for that fibre which results in the largest stress value. If a lateral load p is acting, the stress calculation is to be carried out for both fibres of the stiffener's cross-sectional area (if necessary for the biaxial stress field at the plating side).

2. 16 Torsional buckling of secondary stiffeners

2. 16. 1 The longitudinal secondary stiffeners are to comply with the following criteria:

$$\frac{\sigma_X S}{\kappa_T \sigma_o} \leq 1.0$$

Where

κ_T = coefficient taken equal to:

κ_T = 1.0 for $\lambda_T \leq 0.2$

κ_T = $\frac{1}{\varphi + \sqrt{\varphi^2 - \lambda_T^2}}$ for $\lambda_T > 0.2$

Φ = $0.5(1 + 0.21(\lambda_T - 0.2) + \lambda T^2)$

λ_T = reference degree of slenderness taken equal to:

λ_T = $\sqrt{\frac{\sigma_F}{\sigma_{KiT}}}$

σ_{KiT} = $\frac{E}{I_p}\left(\frac{\pi^2 I_\omega 10^2}{a^2}\varepsilon + 0.385 I_T\right)$, in N/mm^2

For I_p, I_T, I_ω, *See* Figure 11. 2. 7: Dimensions of stiffenerand

l_p = net polar moment of inertia of the stiffener, in cm^4, related to the point *C*

l_T = net St.Venant's moment of inertia of the stiffener, in cm^4

l_w = et sectorial moment of inertia of the stiffener, in cm^6, related to the point *C*

ε = egree of fixation taken equal to:

ε = $1 + 10^{-3}\sqrt{\frac{a^4}{\frac{3}{4}\pi^4 I_\omega \left(\frac{b}{t^3} + \frac{4h_w}{3t^3{}_w}\right)}}$

h_w = web height, in mm

t_w = net web thickness, in mm

b_f = flange breadth, in mm

t_f = net flange thickness, in mm

A_w = net web area equal to: $A_W = h_W t_{yl}$

A_f = net flange area equal to: $A_f = b_f t_f$

e_f = $h_w + \frac{t_f}{2}$, *in mm*

b = stiffener spacing, in mm

t = local net plate thickness of the attached plate, in mm.

Figure 11. 2. 7: Dimensions of stiffener

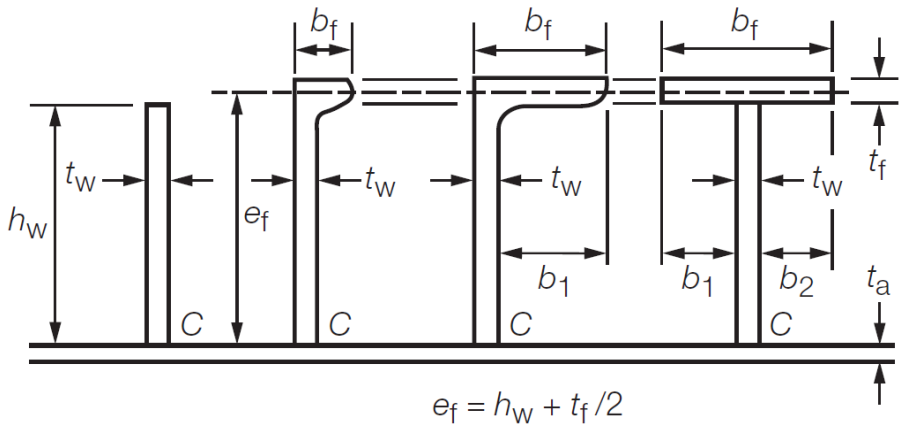

Table 11. 2. 7: Moments of inertia

Section	I_P	I_T	I_ω
Flat bar	$\frac{{h_w}^3 t_w}{3 \times 10^4}$	$\frac{h_w {t_w}^3}{3 \times 10^4}\left(1 - 0.63\frac{t_w}{h_w}\right)$	$\frac{{h_w}^3 {t_w}^3}{36 \times 10^6}$
Sections with bulb or flange	$\left(\frac{A_w {h_w}^2}{3} + A_f e_f^2\right) 10^{-4}$	$\frac{h_w {t_w}^3}{3 \times 10^4}\left(1 - 0.63\frac{t_w}{h_w}\right) + \frac{b_f {t_f}^3}{3 \times 10^4}\left(1 - 0.63\frac{t_f}{b_f}\right)$	for bulb and angle sections: $\frac{A_f^2 e_f^2 b_f^2}{12 \times 10^6}\left(\frac{A_f + 2.6A_w}{A_f + A_w}\right)$ for tee sections: $\frac{b_f^3 t_f^2 e_f^2}{12 \times 10^6}$

2. 16. 2 For transverse secondary stiffeners loaded by compressive stresses and which are not supported by longitudinal stiffeners, sufficient torsional buckling strength is to be demonstrated analogously in accordance with this sub-Section.

2. 17 Pontoon covers

2. 17. 1 The structural assessment of pontoon covers, as defined in Pt 3, Ch 11, 1.1 Application 1.1.5.b, is to be carried out by direct calculations, which are to be submitted for approval, using the minimum design pressures acting on the hatch covers defined in Table 11. 2. 8: Pontoon cover minimum design pressures. The permissible stress, deflection and buckling criteria are given in Table 11. 2. 10: Steel pontoon cover permissible stress, deflection and buckling criteria.

Table 11. 2. 8: Pontoon cover minimum design pressures

For ships of 100 m in length and above:
(a) Position 1 hatch covers located in the forward quarter of the ship's length shall be designed for wave pressures at the forward perpendicular, calculated from the following equation: Minimum design pressure, $p = 49.05 + 9.81(L_H - 100)a$ in kN/m^2 where L_H is L for ships of not more than 340 m but not less than 100 m in length and equal to 340 m for ships of more than 340 m in length: ***a*** = 0.0074 for Type B freeboard ships = 0.0363 Ships assigned reduced freeboard

The pressure, p, is to be reduced linearly to 34.3 kN/m^2 at the end of the forward quarter's length, as shown in Table 11. 2. 9: Summary of pontoon cover minimum design pressures

The design pressure used for each hatch cover panel shall be that determined at its mid point location:

(b) All other position 1 hatch covers shall be designed to 34.3 kN/m^2

(c) Position 2 hatch covers shall be designed to 25.5 kN/m^2

(d) Where a position 1 hatchway is located at least one superstructure standard height higher than the freeboard deck, it may be designed to 34.3 kN/m^2

For ships 24 m in length:

(a) Position 1 hatch covers located in the forward quarter of the ship's length shall be designed for wave pressures of 23.8 kN/m^2 at the forward perpendicular and reduced linearly to 19.6 kN/m^2 at the end of the forward quarter's length, as shown in Table 11. 2. 9: Summary of pontoon cover minimum design pressures. The design pressure used for each hatch cover panel shall be that determined at its mid point location

(b) All other position 1 hatch covers shall be designed to 19.6 kN/m^2

(c) Position 2 hatch covers shall be designed to 14.7 kN/m^2

(d) Where a position 1 hatchway is located at least one superstructure standard height higher than the freeboard deck, it may be designed to 19.6 t/m^2

For ships between 24 m and 100 m in length, and for positions between FP and 0.25L, wave pressures shall be obtained by linear interpolation of the values shown in Table 11. 2. 9: Summary of pontoon cover minimum design pressures

Table 11. 2. 9: Summary of pontoon cover minimum design pressures

Deck location	Longitudinal position		
	FP	0.25L	Aft of 0.25L
L>100 m			
Freeboard deck	Equation given in Table 11. 2. 8: Pontoon cover minimum design pressures	34.3 kN/m^2	34.3 kN/m^2
Superstructure deck	34.3 kN/m^2		25.5 kN/m^2
	L =100 m		
Freeboard deck	49.05 kN/m^2	34.3 kN/m^2	34.3 kN/m^2
Superstructure deck	34.3 kN/m^2		25.5 kN/m^2
	L=24 m		
Freeboard deck	23.84 kN/m^2	19.6 kN/m^2	19.6 kN/m^2
Superstructure deck	19.6 kN/m^2		14.7 kN/m^2

Table 11. 2. 10: Steel pontoon cover permissible stress, deflection and buckling criteria

Location	Permissible bending stress, N/mm^2	Permissible shear stress, N/mm^2	Permissible deflection metres
Weather deck – Positions 1 and 2	0.68 σ_o	0.39 σ_o	0.0044 l_0

Buckling requirements

Symbols

b = length of panel (longer panel dimension), in mm, in transverse direction, *See* Figure 11. 2. 8: Cover with stiffening fitted normal to the axis of primary bending

s = spacing of webs and stiffeners (shorter panel dimension), in mm

t = thickness of plating, in mm

σ_{ac} = corrected critical buckling stress, in N/mm^2

σ_b = the compressive bending stress, in N/mm^2, in the steel cover plating, calculated by taking the cover as a loaded beam simply supported at its ends

σ_c = critical buckling stress of panel, in N/mm^2

σ_o = yield stress of cover plating material, in N/mm^2

σ_c = $18.6R_c\left(\frac{t}{b}\right)^2 \times 10^4 \text{N/mm}^2$

σ_{ac} = $\sigma_o\left(1-\frac{\sigma_o}{4\sigma_c}\right)\text{N/mm}^2$

(a) Where primary bending stress acts on longer panel edge b, *See* Figure 11. 2. 8: Cover with stiffening fitted normal to the axis of primary bending:

$$\frac{\sigma_c}{\sigma_b}\left(\text{or}\frac{\sigma_{ac}}{\sigma_b}\right) \geq 1.3 \quad \text{where } R_c = \left(\frac{s}{b}+\frac{b}{s}\right)^2$$

Where primary bending stress acts on shorter panel edge s:

$$\frac{\sigma_c}{\sigma_b}\left(\text{or}\frac{\sigma_{ac}}{\sigma_b}\right) \geq 1.2 \quad \text{where } R_c = 4\left(\frac{b^2}{s^2}\right)$$

If $\sigma_c > 0.5\ \sigma_o$, then corrected value σ_{ac} is used

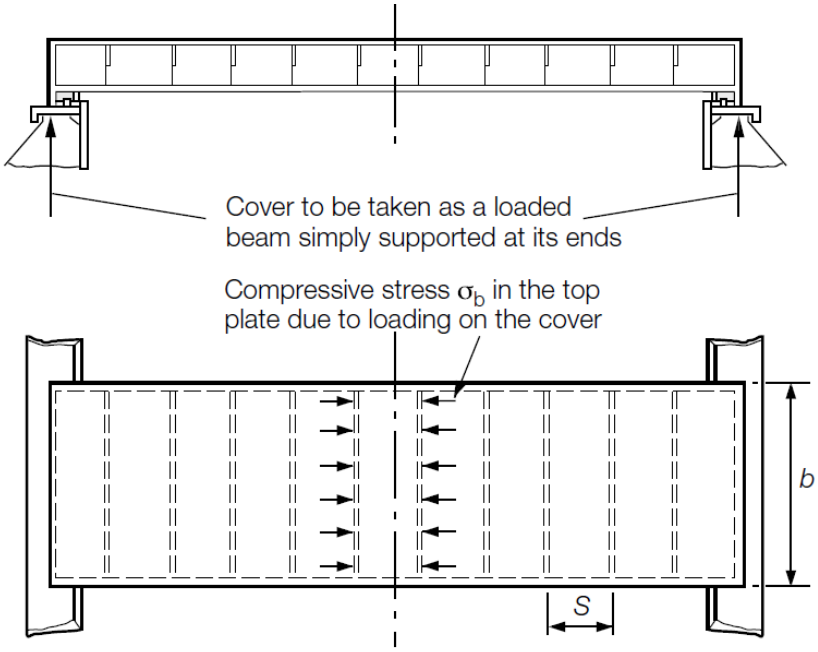
It is recommended that $\frac{b}{s} < 5.0$

(b) Where covers are stiffened in two directions by a grillage formation, buckling checks are to be carried out as per (a) above for bending stresses acting on both the longer and shorter edges of the panel

For the derivation of the section modulus for primary members, an effective width of plating to achieve a balanced section is to be adopted

However, a greater width of plating in accordance with Pt 3, Ch 3, 3.2 Geometric properties of section may be adopted where this is suitably stiffened in the directions being considered from the buckling aspect

Figure 11. 2. 8: Cover with stiffening fitted normal to the axis of primary bending



2. 17. 2 The gross thickness of the plating of steel pontoon covers is to be not less than the greater of:

a. $t = 0.01s$ mm

b. $t = 6.0$ mm as required by Table 11. 2. 8: Pontoon cover minimum design pressures

Where

s = stiffener spacing in mm

t = thickness as required by Pt 3, Ch 11, 2.17 Pontoon covers 2.17.1.

2. 17. 3 The gross scantlings of steel pontoon cover primary and secondary webs or stiffeners are to be not less than would be required to satisfy the requirements of Table 11. 2. 11: Steel pontoon cover webs and stiffeners. Alternatively, scantlings may be determined by direct calculations, which are to be submitted for approval. In no case are the stresses and deflections given in Table 11. 2. 10: Steel pontoon cover permissible stress, deflection and buckling criteria to be exceeded.

Table 11. 2. 11: Steel pontoon cover webs and stiffeners

Symbols	Primary and secondary stiffening requirements

A_s = shear area, in cm^2

K = higher tensile steel factor, *See* Pt 3, Ch 2, 1.2, Steel

K_1 = 1281

I_0 = moment of inertia at mid-span, in cm^4

I_1 moment of inertia at supports, in cm_4

C_1 = 696

where

$$I_1 > 0.05I_0$$

l_0 = unsupported span, in metres, measured as shown in Figure 11. 2. 9: Diagrammatic profile of web or stiffener or portable beam

l_1 = proportion of the span, in metres, measured as shown in Figure 11. 2. 9: Diagrammatic profile of web or stiffener or portable beam. The depth and face area over the remainder of the span is assumed to be constant

p = minimum design pressure, in kN/m^2, acting on the hatch covers as defined in Table 11. 2. 8: Pontoon cover minimum design pressures

Z_0 = section modulus at mid-span, in cm^3

Z_1 = section modulus at supports, in cm^3

$$C_H = 1 + \frac{8\alpha^3{}_H(1-\beta_H)}{0.2+3\sqrt{\beta_H}}$$

$$K_H = 1 + \frac{3.2\alpha_H - \gamma_H - 0.8}{7.0\gamma_H + 0.4}$$

but not less than 1.0. To be specially considered when discontinuities in area of face material occur

$$\alpha_H = \frac{l_1}{l_0}, \quad \beta_H = \frac{I_1}{I_0}, \gamma_H = \frac{Z_1}{Z_0}$$

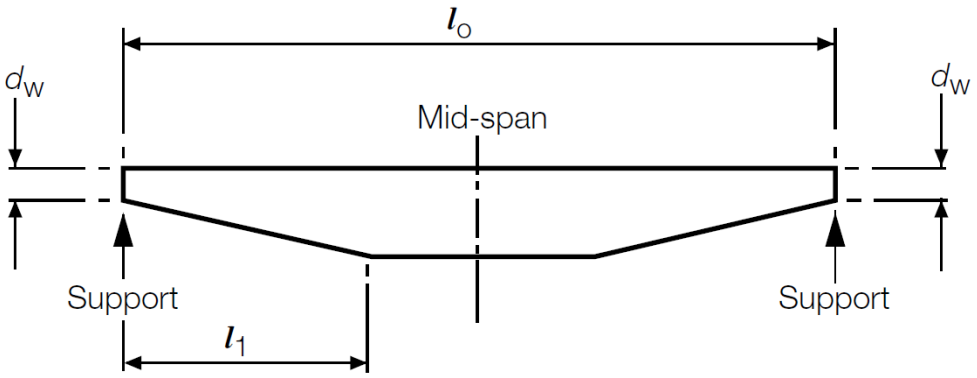
$$Z_0 = \frac{psl^2{}_0 k_H k}{k_1}\,cm^3$$

$$I_0 = \frac{psl^3{}_0 C_H}{C_1}\,cm^4$$

$$A_s = \frac{0.01282psl_0}{\sigma_0}\,cm^2$$

Note Where the ends of the secondary panel stiffeners are effectively bracketed or continuous, the values of modulus and inertia of the secondary panel stiffeners may be reduced respectively by 33% and 80%.

Figure 11. 2. 9: Diagrammatic profile of web or stiffener or portable beam



PART

3

CHAPTER 11 **Closing Arrangements for Shell, Deck and Bulkheads**

SECTION 3 **Hatch beams and wood covers**

3. 1 Portable hatch beams

3. 1. 1 The section modulus and moment of inertia of portable web plate beams stiffened at their upper and lower edges by continuous flat bars are to satisfy the requirements of Pt 3, Ch 11, 2.17, Pontoon covers for pontoon covers. Alternatively, direct calculations may be used, provided the requirements of Pt 3, Ch 11, 2.17, Pontoon covers for pontoon covers are complied with.

3. 1. 2 The ends of web plates are to be doubled, or inserts fitted for at least 180 mm along length of web.

3. 1. 3 At beams which carry the ends of wood or steel hatch covers, a vertical 50 mm flat is to be arranged on the upper face plate. The width of bearing surface for hatch covers is to be not less than 65 mm.

3. 1. 4 Carriers or sockets, or other suitable arrangements, of suitable construction are to provide means for the efficient fitting and securing of portable hatch beams. The width of bearing surface is to be not less than 75 mm.

3. 1. 5 Sliding hatch beams are to be provided with an efficient device for locking them in their correct fore and aft positions when the hatchway is closed.

3. 2 Wood covers

3. 2. 1 Wood covers are to have a finished thickness of not less than 60 mm in association with an unsupported span of not more than 1.5 m. Where the 'tween deck height measured vertically on the centreline of the ship from ‘tween deck to underside of the hatch cover stiffeners on deck above, exceeds 2.6 m, the thickness of the wood covers is to be increased at the rate of 16.5 per cent per metre excess in 'tween deck height.

3. 2. 2 The ends of all wood hatch covers are to be protected by encircling galvanised steel bands, about 65 mm wide and 33 mm thick, efficiently secured.

PART

3

CHAPTER 11 **Closing Arrangements for Shell, Deck and Bulkheads**

SECTION 4 **Hatch cover securing arrangements and tarpaulins**

4. 1 Cargo oil tank and adjacent spaces

4. 1. 1 For access hatchways to cargo oil tanks and adjacent spaces, *See* Pt 3, Ch 11, 7 Tanker access arrangements and closing appliances.

4. 2 Steel covers – Clamped and gasketed

4. 2. 1 These requirements, unless stated otherwise, apply to steel hatch covers in Positions 1 and 2 fitted with gaskets and securing devices and situated above dry cargo holds.

4. 2. 2 Where steel hatch covers are fitted to hatch openings on weather decks, the arrangements are to be such that weathertightness can be maintained. A sufficient number of securing devices is to be provided at each side of the hatch cover, considering the requirements of Pt 3, Ch 11, 2.9 Net scantling of primary supporting members 2.9.4 to Pt 3, Ch 11, 2.9 Net scantling of primary supporting members 2.9.6. This applies also to hatch covers consisting of several parts.

4. 2. 3 The weight of the covers and weather loading may be transmitted to the ship's structure by means of continuous steel to steel contact of the cover skirt plate with the ship's structure in association with a maximum bearing pressure of 200 kgf/cm^2. Alternatively the weight may be transmitted by means of defined bearing pads. For covers loaded by containers or other cargo, the total load together with inertial forces generated by the ship's motion, are to be transmitted by means of defined bearing pads only.

4. 2. 4 For the design of the securing devices against shifting, the horizontal mass forces $F_h = m \cdot a$ are to be calculated with the following accelerations:

a_x = 0.2 g in longitudinal direction

a_y = 0.5 g in transverse direction

m = sum of mass of cargo lashed on the hatch cover and mass of hatch cover.

The accelerations in longitudinal direction and in transverse direction do not need to be considered as acting simultaneously.

4. 2. 5 For the transmission of the support forces resulting from the load cases specified in Pt 3, Ch 11, 2.3, Load model and of the horizontal mass forces specified in Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.4, hatch cover supports are to be provided, which are to be designed such that the nominal surface pressures do not, in general, exceed the following values:

$p_{n\,max}$ = dp_n, in N/mm^2

d = 3.75 – 0.015L

d_{max} = 3.0

d_{min} = 1.0 in general

= 2.0 for partial loading conditions, *See* Pt 4, Ch 8, 11.2 Direct calculations 11.2.5

p_n = *See* Table 11. 4. 1: Permissible nominal surface pressure pn

For metallic supporting surfaces not subjected to relative displacements, the nominal surface pressure applies:

$p_{n\,max}$ = $3p_n$, in N/mm^2

When the maker of vertical hatch cover support material can provide proof that the material is sufficient for the increased surface pressure, not only statically but under dynamic conditions including relative motion for an adequate number of cycles, permissible nominal surface pressure may be specially considered. In this case, realistic long-term distribution of spectra for vertical loads and relative horizontal motion is to be required to be considered.

The supports are to be designed such that the permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1 are not exceeded.

Table 11. 4. 1: Permissible nominal surface pressure p_n

Support material	p_n in N/mm^2 when loaded by	
	Vertical force	Horizontal force (on stoppers)
Hull structural steel	25	40
Hardened steel	35	50
Lower friction materials	50	—

4. 2. 6 Drawings of hatch cover supports which specify the permitted maximum pressure, given by the material manufacturer, must be submitted.

4. 2. 7 Where large relative displacements of the supporting surfaces of hatch cover supports are to be expected, the use of material having low wear and frictional properties is recommended.

4. 2. 8 The substructures of the hatch cover supports must be of such a design that a uniform pressure distribution is achieved. Irrespective of the arrangement of stoppers, the supports must be able to transmit the following force P_h in the longitudinal and transverse direction:

$$P_h = \mu \frac{P_v}{\sqrt{d}}$$

Where

P_v = vertical supporting force

μ = frictional coefficient

= 0.5 in general

For non-metallic, low-friction support materials on steel, the friction coefficient may be reduced, but is not to be less than 0.35. The substructures are to be designed such that the permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1 are not exceeded.

4. 2. 9 For substructures and adjacent structures of supports subjected to horizontal forces P_h, as defined in Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.8, the fatigue strength is to be considered.

4. 2. 10 Hatch covers are to be sufficiently secured against horizontal shifting. Stoppers are to be provided for hatch covers on which cargo is carried. The greater of the loads resulting from Pt 3, Ch 11, 2.3 Load model 2.3.3 and Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.4 is to be applied for the dimensioning of the stoppers and their substructures. The permissible stress in stoppers and their substructures in the cover and in the coamings is to be determined according to Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1. In addition, the provisions in Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.5 are to be observed.

4. 2. 11 The sealing is to be obtained by a continuous gasket of relatively soft elastic material compressed to achieve the necessary weathertightness. Similar sealing is to be arranged between cross-joint elements. Where fitted, compression flat bars or angles are to be well rounded where in contact with the gasket and are to be made of a corrosion-restraint material or suitably protected against corrosion.

4. 2. 12 Special consideration is to be given to the gasket and securing arrangements in ships with large relative movements between cover and ship structure or between cover elements. The relative horizontal and vertical deflections are to be calculated and submitted with the hatch cover plans. Where applicable, deflections due to thermal effects and internal pressure loads are also to be included.

4. 2. 13 The suitability of the gasket material and the securing adhesive is the responsibility of the Builder and Owner. When selecting such material, consideration is to be given to its suitability for the environmental conditions likely to be experienced by the ship and its compatibility with the cargo carried. The material and form of gasket selected is to be considered in conjunction with the type of cover, the securing arrangement and the expected relative movement between cover and ship structure. The gasket is to be effectively secured to the cover.

4. 2. 14 Drainage is to be arranged inside the line of gasket by means of a gutter bar or vertical extension of the hatch side and end coaming; drain openings are to be provided at appropriate positions on the drain channels. This requirement need not be complied with for special ships carrying container cargoes when the requirements of Pt 4, Ch 8, 11 Hatch coversare satisfied.

4. 2. 15 Where the arrangement includes continuous steel to steel contact between hatch cover and coaming or between hatch cover and ship structure or at cross-joints, drainage on both sides of the gasket is to be provided.

4. 2. 16 Drain openings are to be arranged at the ends of drain channels and are to be provided with non-return valves for preventing ingress of water from outside.

The following requirements are to be complied with:

a. If manufactured from steel, the minimum drain pipe wall thickness is to be not less than 4.5 mm.
b. If not manufactured from steel, details of the drain, including the material specification, method of manufacture and details of any tests carried out, are to be submitted for consideration.
c. The drains are to be securely attached to the hatch coaming and adequately protected if in an exposed position.
d. When the drain is fitted to a hold also designed to carry liquids, a shut-off valve is to be incorporated into the assembly.
e. Drain openings in hatch coamings are to be arranged with sufficient distance to areas of stress concentration (e.g. hatch corners, transitions to crane posts).

4. 2. 17 Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced alongside the coamings. The securing devices are not to have a vertical clearance but are to be pre-tensioned when the cover is in the closed position. The devices are also to be arranged

in close proximity horizontally to the gasket. Arrangement and spacing are to be determined with due attention to the effectiveness for weathertightness, depending upon the type and the size of the hatch cover, as well as on the stiffness of the cover edges between the securing devices. A minimum of two securing devices for each side of a panel are to be fitted. The securing devices should be arranged as close to the panel corners as is practicable.

4. 2. 18 Between cover and coaming and at cross-joints, a gasket pressure sufficient to obtain weathertightness is to be maintained by the securing devices. This pressure is to be specified. Securing devices of a design other than rod or bolts will be specially considered, *See* Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.26.

4. 2. 19 The net sectional area of each securing device is to be not less than:

$$A = \frac{1.4 S_1 W_1}{50 f} \text{ cm}^2$$

Where

f = $\left(\frac{\sigma_c}{235}\right)^e$

S_1 = spacing between securing devices, in metres, not to exceed 6 m and not to be taken less than 2 m

W_1 = the gasket loading per unit length, in N/cm, but not less than 50 N/cm

σ_c = specified minimum upper yield stress in N/mm^2 of the steel used for cleats or securing devices, to be taken not greater than 70 per cent of the ultimate tensile strength

^{e} = 0.75 for $\sigma_c \geq 235$

= 1.0 for $\sigma_c < 235$.

4. 2. 20 Rods or bolts are to have a gross diameter not less than 19 mm for hatchways exceeding 5 m^2 in area.

4. 2. 21 In order to ensure compression between gasket and compression bar along the full length, the cover edge stiffness is to be examined. The inertia of the cover edge is to be not less than:

I_E = $0.6 W_1 S_1^4$ cm^4

where W_1 and S_1 are as defined in Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.12.

4. 2. 22 Securing devices are to be constructed of reliable design and securely attached to the hatchway coamings, decks or covers. Individual securing devices on each cover are to have approximately the same stiffness characteristics.

4. 2. 23 Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

4. 2. 24 Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

4. 2. 25 The cross-joints of multi-panel covers are to be arranged with wedges, or locators (male and female) to retain the hatch covers in the correct sealing position, the number and spacing is to be arranged to suit the size and type of cover, gasket arrangements and stiffness of cover edges at cross-joints. Means are also to be provided to prevent excessive relative vertical deflections between loaded and unloaded panels. The arrangement of the gasket retaining angle and the compression bar at the cross-joints is to be such that the gasket compression is maintained between loaded and unloaded panels.

4. 2. 26 In addition to the requirements given above, all hatch covers, especially those carrying deck cargo are to be effectively secured against horizontal shifting due to the horizontal forces arising from the ship motions.

4. 2. 27 To prevent damage to hatch covers and ship structure, the location of stoppers is to be compatible with the relative movements between hatch covers and ship structure. The number should be as small as practically possible.

4. 2. 28 Towards the ends of the ship, vertical acceleration forces may exceed gravity forces. The resulting lifting forces must therefore be also considered when dimensioning the securing devices. Also lifting forces from cargo secured on the hatch cover during rolling are to be taken into account.

4. 2. 29 Hatch coamings and supporting structure are to be adequately stiffened to accommodate the loading from hatch covers and cargo carried thereon.

4. 2. 30 Upon completion of installation of hatch covers, a hose test with a pressure of water as specified in Table 1. 9. 1: Testing requirements in Chapter 1 is to be carried out. Alternative methods of tightness testing will be considered. This does not apply to covers with reduced securing arrangements as specified in Pt 4, Ch 8, 11 Hatch covers.

4. 2. 31 All hatch covers are to be tested to prove satisfactory operation.

4. 2. 32 It is recommended that ships with steel hatch covers are supplied with an operation and maintenance manual including:

a. opening and closing instructions;
b. maintenance requirements and specifications for packings, securing devices and operating items;
c. cleaning instructions for the drainage system;
d. corrosion prevention instructions;
e. list of spare parts.

4. 2. 33 The spacing and size of securing devices in hatch covers for holds which may be flooded and used for ballast tanks and holds in OBO, ore or oil and similar types of ship are to correspond to the reaction forces at the cover edges found by calculation. The loading is to be as required by Pt 4, Ch 7, 12.4 Load model 12.4.1.c.

The permissible stress in the securing devices is not to exceed the following:

$\sigma_e = 0.9 \times 235 f \mathrm{N/mm^2}$

= Where

f = material factor as defined in Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed 4.2.19

σ = bending stress in $\mathrm{N/mm^2}$

σ_e = equivalent stress, in $\mathrm{N/mm^2}$

= $\sqrt{(\sigma^2 + 3\tau^2)}$

τ = shear stress in $\mathrm{N/mm^2}$

4. 2. 34 On tank hatch covers in 'tween decks the maximum spacing of cleats is to be 600 mm, but cleats are to be arranged as close to the corners as practicable.

4. 2. 35 Steel hatch covers with special sealing arrangements, insulated covers, flush hatch covers, and covers having coamings less than required by Pt 3, Ch 11, 5.1, General, will be specially considered.

4. 2. 36 The material and weld specifications of stoppers and securing devices are to be shown in the drawings of the hatch covers.

4. 2. 37 Securing devices of special design in which significant bending or shear stresses occur may be designed as anti-lifting devices according to Pt 4, Ch 8, 11.2 Direct calculations 11.2.6. The packing line pressure, as defined in Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.12, multiplied by the spacing between securing devices, as defined in Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.12, is to be applied as design load.

4. 3 Portable covers − Tarpaulins and battening devices

4. 3. 1 At least two layers of tarpaulin in good condition are to be provided for each hatchway in Positions 1 and 2.

4. 3. 2 Tarpaulins are to be free from jute, waterproof and of ample strength. The minimum mass of the material before treatment is to be 0.65 kg/m^2 if the material is to be tarred, 0.60 kg/m^2 if to be chemically dressed, or 0.55 kg/m^2 if to be dressed with black oil. A certificate to this effect is to be supplied by the makers of the tarpaulins. Special consideration will be given to the use of synthetic materials for tarpaulins.

4. 3. 3 Cleats are to be of an approved pattern, at least 65 mm wide, with edges so rounded as to minimise damage to the wedges, and are to be spaced not more than 600 mm from centre to centre: the first and last cleats along each side or end are to be not more than 150 mm from the hatch corners. Cleats should be so set as to fit the taper of the wedges.

4. 3. 4 Battens and wedges shall be efficient and in good condition. Wedges are to be of tough wood, generally not more than 200 mm in length and 50 mm in width. They should have a taper of not more than 1 in 6 and should not be less than 13 mm at the point.

4. 3. 5 For all hatchways in Positions 1 and 2, steel bars or other equivalent means are to be provided in order to secure each section of hatch covers efficiently and independently after the tarpaulins are battened down. Hatch covers of more than 1.5 m in length are to be secured by at least two such securing appliances. Where hatchway covers extend over intermediate supports, steel bars or their equivalent are to be fitted at each end of each section of covers. At all other hatchways in exposed positions on weather decks, ring bolts or other fittings suitable for lashings are to be provided.

4. 4 Packing material

4. 4. 1 Packing material is to be suitable for all expected service conditions of the ship and is to be compatible with the cargoes to be transported. The packing material is to be selected with regard to dimensions and elasticity in such a way that expected deformations can be carried. Forces are to be carried by the steel structure only.

4. 4. 2 Packing material is to be compressed so as to give the necessary tightness effect for all expected operating conditions. Special consideration will be given to the packing arrangement in ships with large relative movements between hatch covers and coamings or between hatch cover sections.

PART

3

CHAPTER 11 **Closing Arrangements for Shell, Deck and Bulkheads**

SECTION 5 **Hatch coamings**

5. 1 General

5. 1. 1 The height of coamings above the upper surface of the deck, measured above sheathing if fitted, for hatchways closed by portable covers secured weathertight by tarpaulins and battening devices, is to be not less than:

- 600 mm at Position 1,
- 450 mm at Position 2.

5. 1. 2 Where hatches in locations above Position 2 are included in the consideration of intact and damage stability or are in critical locations above Position 2, then the height of hatch coamings is to be specially considered.

5. 1. 3 The height of coamings of hatchways situated in Positions 1 and 2 closed by steel covers fitted with gaskets and clamping devices are to be as specified in Pt 3, Ch 11, 5.1 General 5.1.1, but may be reduced, or the coamings may be omitted entirely, if the safety of the ship is not thereby impaired in any sea condition. Special attention will be given in such cases to the scantlings of the covers, to their gasketing and securing arrangements and to the drainage of recesses in the deck. The agreement of the National Authority concerned will also be required.

5. 1. 4 The height of coamings may be required to be increased on ships of Type `B-100' or Type `B-60' where this is shown to be necessary by the floatability calculations required by the *International Convention on Load Lines, 1966.*

5. 2 Construction

5. 2. 1 Vertical cargo hatch coamings 600 mm or more in height are to be stiffened on their upper edges by a horizontal bulb flat or equivalent which is to be not less than 180 mm in width for ships where L is greater than 75 m. Additional support is to be afforded by fitting brackets or stays from the bulb flat to the deck at intervals of not more than 3 m. Each bracket or stay is to be aligned with suitable underdeck stiffeners and is to have a softened nose.

5. 2. 2 Vertical coamings less than 600 mm in height are to be stiffened at their upper edge by a substantial rolled or fabricated section. Additional support is to be arranged as required by Pt 3, Ch 11, 5.2 Construction 5.2.2.

5. 2. 3 Cargo hatchways on other decks, in positions not specified in Pt 3, Ch 1, 6.6 Position 1 and Position 2, are to be suitably framed.

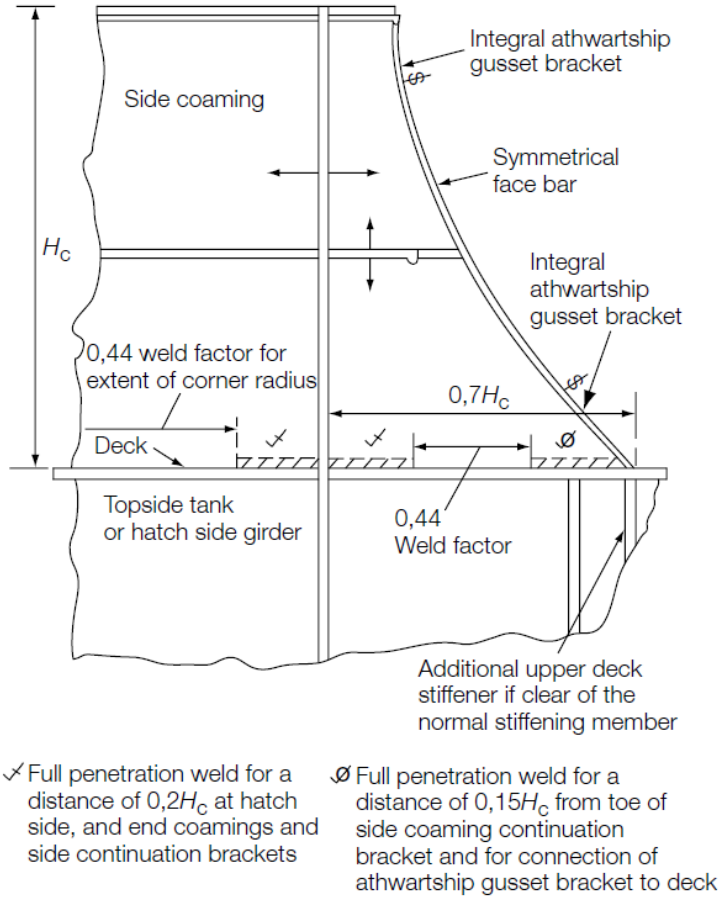
5. 2. 4 The scantlings and arrangements of hatch coamings acting as girders will be specially considered. The coamings are to be arranged with intermediate continuous horizontal stiffeners supported by the bracket stays.

5. 2. 5 Sloped cargo hatch coamings will be specially considered. In general, the sloped coaming arrangement is to be restricted to the hatch side coamings with vertical coamings at the ends. The sloped coaming is not to have a knuckle and the angle to the vertical is not to exceed 30°. The scantlings are to be in accordance with Pt 3, Ch 11, 5.2 Construction 5.2.1, Pt 3, Ch 11, 5.2 Construction 5.2.2 and Pt 3, Ch 11, 5.3 Strength criteria, except that the end coamings are to be increased by 20 per cent for a distance of $0.15b$ from the side coamings where b is the width of the hatchway at the deck. Particular care is to be taken where the proposed loadings exceed those given in Pt 3, Ch 11, 2.3, Load model and Pt 3, Ch 3, 5 Design loading, and where the coamings are not in alignment with the topside tank vertical strake in bulk carriers.

5. 2. 6 A radiused coaming plate at the corner junction of the longitudinal and transverse cargo hatch coamings is acceptable for ships where $L \leq 90$ m and the heights of coamings are not in excess of that specified in Pt 3, Ch 11, 5.1 General 5.1.1. Where $L > 90$ m the corner junctions are to be rectangular and arranged with continuation brackets as required by Pt 3, Ch 11, 5.2 Construction 5.2.8.

5. 2. 7 The deck plating is to extend inside the coamings and the side coamings are to be extended in the form of tapered brackets. A recommended arrangement is shown in Figure 11. 5. 1: Coaming continuation bracket - Recommended arrangement. Continuation brackets are also to be arranged athwartships in line with the hatch end coamings and the under deck transverse. In bulk carriers the athwartship brackets, in conjunction with the hatch end beams should be arranged to achieve a satisfactory overlap with the top side tank transverses. In cases where the hatch end beam is formed by the transverse bulkhead top stool the horizontal knuckle of the stool should be arranged well clear of the topside tank knuckle line.

Figure 11. 5. 1: Coaming continuation bracket - Recommended arrangement



5. 2. 8 In bulk carriers where the hatch side coaming does not align with the topside tank vertical strake the arrangement and scantlings will be specially considered. In general, suitable underdeck girders and cantilever brackets are to be arranged taking into consideration the hatch cover loading. The underdeck girders are to continue beyond the hatch end for a distance of $2H_c$ mm. Alternative arrangements incorporating bulkhead top stool structure or cross-deck structure will be considered.

5. 2. 9 Extension brackets or rails arranged approximately in line with the cargo hatch side coamings and intended for the stowage of steel covers are not to be welded to a deckhouse, masthouse or to each other unless they form part of the longitudinal strength members.

5. 2. 10 The arrangement and scantlings of continuous hatchway coamings on the strength deck will be specially considered. The material of the coamings is to comply with Table 2. 2. 1: Material classes and grades and Table 2. 2. 2: Steel grades in Pt 3, Ch 2 Materials and is to be of the same strength level as the deck plating. Discontinuous coamings of length greater than $0.09L$ are also to satisfy this requirement.

5. 2. 11 Where containers are carried on multi-panel hatch covers, the hatch coaming in way of the loaded panel will be required to be reinforced to resist the lateral loads imposed on the coaming due to rolling of the ship. Thrust blocks are to be fitted on the coaming rest bar to prevent the covers from moving. Where one-piece hatch covers are fitted with locating devices, the coamings are to be reinforced in way of the locators.

5. 2. 12 Cut outs in the top of hatch coamings are to be avoided. Where these are necessary for the securing devices they are to be circular or elliptical in shape. Also any local reinforcements should be given a tapered transition in the longitudinal direction with a taper the rate of which should not exceed 1 in 3. Cut-outs and drain holes are to be avoided in the hatch side coaming continuation brackets. Where these are necessary the size, shape and position will be specially considered.

5. 2. 13 Material for hatch coamings is to be steel, according to the requirements for ship's hull. Alternative materials will be subject to special consideration.

5. 2. 14 Secondary stiffeners of hatch coamings are to be continuous over the breadth and length of hatch coamings.

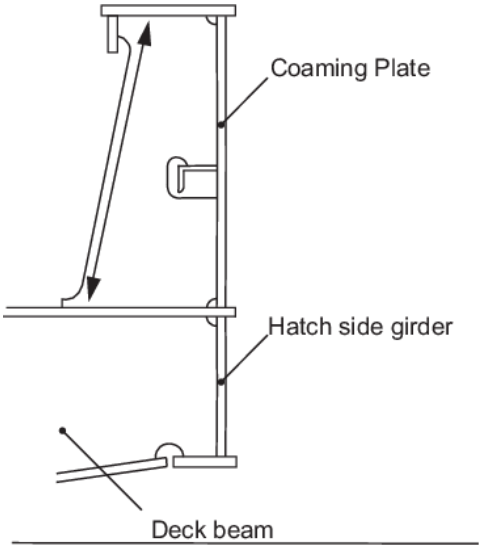
5. 2. 15 Longitudinal hatch coamings with a length exceeding $0.1L$ m are to be provided with tapered brackets or equivalent transitions and a corresponding substructure at both ends. At the end of the brackets they are to be connected to the deck by full penetration welds of minimum 300 mm in length.

5. 2. 16 Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions. Structures under deck are to be checked against the load transmitted by coaming stays.

5. 2. 17 On ships carrying cargo on deck, such as timber, coal or coke, coaming stays are to be spaced not more than 1.5 m apart.

5. 2. 18 Coaming plates are to extend to the lower edge of the deck beams; they or hatch side girders are to be fitted that extend to the lower edge of the deck beams. Extended coaming plates and hatch side girders are to be flanged or fitted with face bars or half-round bars. Figure 11. 5. 2: Example of hatch side girder and Figure 11. 5. 3: Example of coaming stays give examples.

Figure 11. 5. 2: Example of hatch side girder



5. 3 Strength criteria

5. 3. 1 The strength requirements in this Section are applicable to hatch coamings of stiffened plate construction.

5. 3. 2 The local net plate thickness of weather deck hatch coamings is not to be less than the larger of the following values:

$$t = 0.0142s\sqrt{\frac{P_A}{0.95\sigma_0}}\ in\ mm$$

$$t_{min} = 6 + \frac{L_1}{100}\ in\ mm$$

Where

s = stiffener spacing, in mm

L_1 = L need not be taken greater than 300 metres

p_A = pressure, in kN/m^2, as defined in Pt 3, Ch 11, 2.3 Load model 2.3.3

= Longitudinal strength aspects are to be observed.

5. 3. 3 Secondary stiffeners of coamings must be continuous at the coaming stays. For stiffeners with both ends constrained, the elastic net section modulus Z in cm^3 and net shear area A_s in cm^2, calculated on the basis of net thickness, are not to be less than:

$$Z = \frac{0.083}{\sigma_0} s l^2 p_A cm^3$$

$$A_s = \frac{0.01 s l p_A}{\sigma_0} cm^2$$

Where

l = secondary stiffener span, in metres, to be taken as the spacing of coaming stays

s = stiffener spacing in mm

p_A = pressure, in kN/m^2, as defined in Pt 3, Ch 11, 2.3 Load model 2.3.3.

5. 3. 4 For sniped stiffeners at coaming corners, section modulus and shear area at the fixed support are to be increased by 35 per cent. The gross thickness of the coaming plate at the sniped stiffener end is not to be less than:

$$t = 19.6\sqrt{\frac{0.001sp_A(l - 0.0005s)}{\sigma_o}} \text{ in mm}$$

Where

p_A = pressure, in kN/m^2, as defined in Pt 3, Ch 11, 2.3 Load model 2.3.3.

5. 3. 5 Coaming stays are to be designed for the loads transmitted through them, and permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1.

5. 3. 6 At the connection with deck, the net section modulus Z, in cm^3, and the gross thickness t_w, in mm, of the coaming stays designed as beams with flange (examples 1 and 2 are shown in Figure 11. 5. 3: Example of coaming stays) are to be taken not less than:

$$Z = \frac{526}{\sigma_o} e h_s{}^2 p_A \text{ in cm}^3$$

and

$$t_w = \frac{2}{\sigma_o}\frac{e h_s p_A}{h_w} + t_c \text{ in mm}$$

where e = spacing of coaming stays, in metres

h_s = height of coaming stays, in metres

h_w = web height of coaming stay at its lower end, in metres

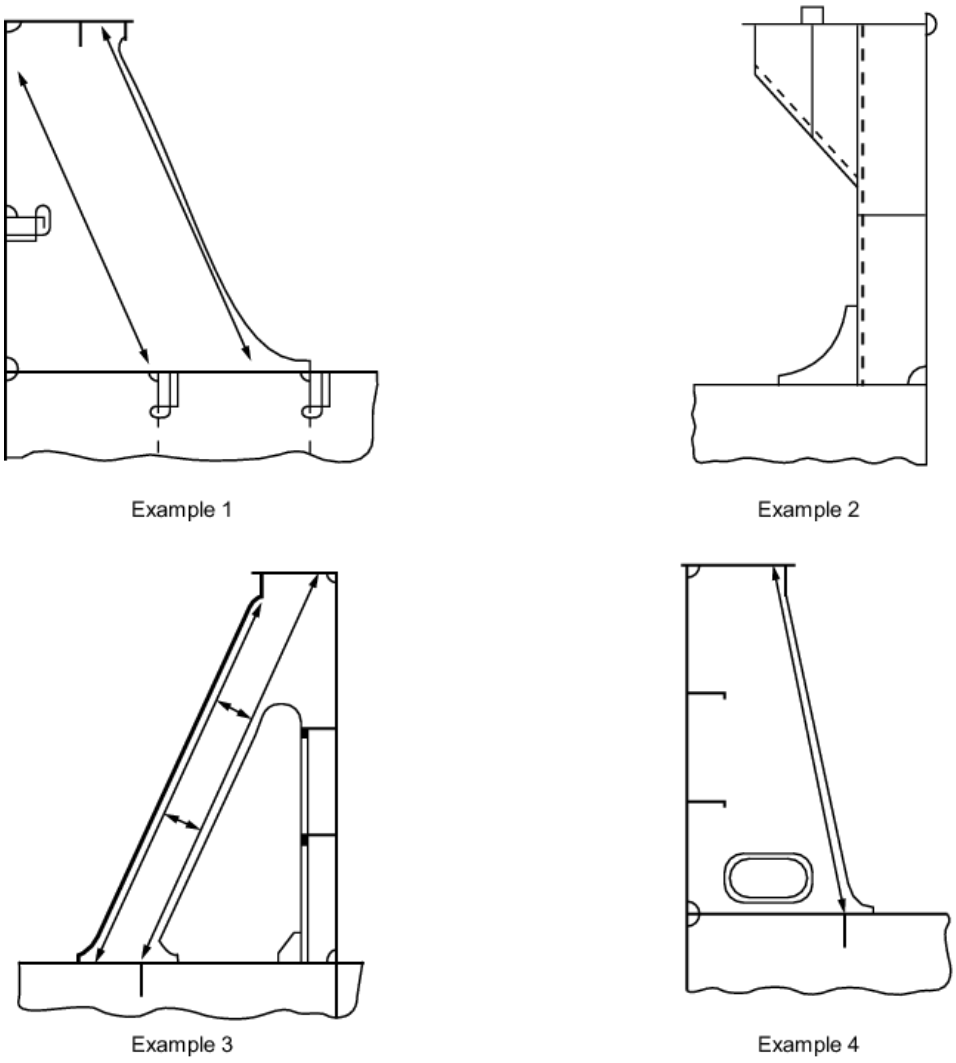
t_c = corrosion addition, in mm, according to Table 11. 1. 2: Corrosion addition tc

p_A = pressure, in kN/m^2, as defined in Pt 3, Ch 11, 2.3 Load model 2.3.3.

σ_o = minimum yield stress, in N/mm^2.

5. 3. 7 For other designs of coaming stays, such as those shown in examples 3 and 4 in Figure 11. 5. 3: Example of coaming stays, the stresses are to be determined through FEM. The calculated stresses are to comply with the permissible stresses according to Pt 3, Ch 11, 2.6 Local plate thickness of hatch covers for wheel loading and helicopter landing.

Figure 11. 5. 3: Example of coaming stays



5. 3. 8 Coaming stays are to be supported by appropriate substructures. Face-plates may be included in the calculation only if an appropriate substructure is provided and welding ensures an adequate joint.

5. 3. 9 Webs of coaming stays are to be connected to the deck by fillet welds on both sides with a throat thickness of $a = 0.44t_w$.

5. 3. 10 For coaming stays which transfer friction forces at hatch cover supports, fatigue strength is to be considered, *See* Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.5 to Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.8.

5. 3. 11 Hatch coamings which are part of the longitudinal hull structure are to be designed according to the requirements for longitudinal strength in Pt 3, Ch 4 Longitudinal Strength.

5. 3. 12 For structural members welded to coamings and for cut-outs in the top of coamings, sufficient fatigue strength is to be verified.

5. 4 Rest bars in hatchways

5. 4. 1 Rest bars are to provide at least 65 mm bearing surface and are to be aligned if required to suit the slope of the hatches.

5. 5 Loading in excess of Rule requirements

5. 5. 1 For weather deck hatch side coamings forming part of a hatch side girder subjected to loading exceeding that defined in Pt 3, Ch 11, 2.3, Load model, *See* Pt 4, Ch 1, 4 Deck structure.

PART

3

CHAPTER 11 **Closing Arrangements for Shell, Deck and Bulkheads**

SECTION 6 **Miscellaneous openings**

6. 1 Small hatchways on exposed decks

6. 1. 1 Hatches which:

- are designed for access to spaces below the deck;
- are capable of being closed weathertight or watertight, as applicable;
- have an opening 2.5 m^2 or less;
- are located on the exposed deck over the forward 0.25*L* of the ship's rule length;
- are on a ship of sea-going service of length 80 m or more, where the height of the exposed deck in way of the hatch is less than 0.1*L* or 22 m above the summer load waterline, whichever is the lesser;

are to comply with the requirements of Pt 3, Ch 11, 6.6, Small hatchways on exposed fore decks. All other small hatchways or access openings in the positions defined in Pt 3, Ch 11, 1.1 Application 1.1.6 are to comply with the following requirements.

6. 1. 2 The number and size of hatchways and other access openings are to be kept to the minimum consistent with the satisfactory operation of the ship.

6. 1. 3 The height of coamings is to be in accordance with Pt 3, Ch 11, 5.1 General 5.1.1. Lower heights may be considered in relation to operational requirements and the nature of the spaces to which access is given.

6. 1. 4 Rope hatches may be accepted with reduced coamings, but generally not less than 380 mm, provided they are well secured and closed before the ship leaves port. A suitable notice is to be displayed at the hatch stating that it is to be closed whilst the ship is at sea.

6. 1. 5 The thickness of the coamings is to be not less than the Rule minimum thickness for the deck inside line of openings for that position, or 11 mm, whichever is the lesser. Stiffening of the coaming is to be appropriate to its length and height.

6. 1. 6 Hatch covers are to be of steel, weathertight and generally hinged. The means of securing are to be such that weathertightness can be maintained in any sea condition. Where toggles are fitted, their diameter and spacing are to be in accordance with ISO Standard or equivalent.

6. 1. 7 Hinges are not to be used as securing devices unless specially considered.

6. 1. 8 The thickness of covers is to be not less than the Rule minimum thickness inside the line of openings for the deck at that point, or 8 mm, whichever is the lesser.

6. 1. 9 The covers are to be adequately stiffened.

6. 1. 10 To facilitate a swift and safe means of escape to the lifeboat and life raft embarkation deck, the following provisions apply to overhead hatches fitted along the escape routes addressed by SOLAS *Regulation 13 - Means of escape*:

a. escape hatches and their securing devices shall be of a type which can be opened from both sides;

b. the maximum force needed to open the hatch cover should not exceed 150 N; and

c. the use of a spring equalising, counterbalance or other suitable device on the hinge side to reduce the force needed for opening is acceptable.

6. 1. 11 Small hatches, including escape hatches, are to be situated clear of cargo containment areas, particularly in the case of offshore supply ships.

6. 1. 12 Where portable plates are required in decks for unshipping machinery, or for other similar reasons, they may be accepted provided they are of equivalent strength to the unpierced deck and are secured by gaskets and closely spaced bolts at a pitch not exceeding five diameters.

6. 1. 13 Satisfactory means are to be provided to prevent inadvertent flooding of chain lockers. *See* Pt 3, Ch 13, 8.12 Structural requirements associated with anchoring 8.12.5 and Pt 3, Ch 13, 8.12 Structural requirements associated with anchoring 8.12.7.

6. 1. 14 Where permitted by the National Authority, access hatch coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable with a minimum height of 230 mm.

6. 2 Manholes and flush scuttles

6. 2. 1 Manholes and flush scuttles fitted in Positions 1 and 2, or within superstructures other than enclosed superstructures, are to be closed by substantial covers capable of being made watertight. Unless secured by closely spaced bolts, the covers are to be permanently attached.

6. 3 Hatchways within enclosed superstructures or 'tween decks

6. 3. 1 The requirements of Pt 3, Ch 11, 6.1, Small hatchways on exposed decks are to be complied with where applicable.

6. 3. 2 Access hatches within a superstructure or deckhouse in Position 1 or 2 need not be provided with means for closing if all openings in the surrounding bulkheads have weathertight closing appliances.

6. 4 Companionways, doors and accesses on weather decks

6. 4. 1 Companionways on exposed decks are to be of equivalent construction, weathertightness and strength to a deckhouse in the same position and effectively secured to the deck.

6. 4. 2 Access openings in:

a. bulkheads at ends of enclosed superstructures;

b. deckhouses or companionways protecting openings leading into enclosed superstructures or to spaces below the freeboard deck; and

c. deckhouse on a deckhouse protecting an opening leading to a space below the freeboard deck

are to be fitted with doors of steel or other equivalent material, permanently and strongly attached to the bulkhead and framed, stiffened and fitted so that the whole structure is of equivalent strength to the unpierced bulkhead, and weathertight when closed. The doors are to be gasketed and secured weathertight by means of clamping devices or equivalent arrangements, permanently attached to the bulkhead or to the door. Doors are generally to open outwards and are to be capable of being operated and secured from both sides. The sill heights are to be as required by Pt 3, Ch 11, 6.4

Companionways, doors and accesses on weather decks 6.4.6. *See also* Pt 3, Ch 11, 7 Tanker access arrangements and closing appliances and Pt 4, Ch 9, 13 Access arrangements and closing appliances and Pt 4, Ch 11, 1 General and the Rules for Ships for Liquid Chemicals, concerning access openings in tankers, chemical tankers and ore or oil ships. Double doors are to be equivalent in strength to the unpierced bulkhead, and in Position 1, a centre pillar is to be provided which may be portable.

6. 4. 3 Elsewhere doors may be of hardwood not less than 50 mm in thickness or of equivalent material and strength.

6. 4. 4 Fixed lights in doors are to comply with the requirements for side scuttles as given in Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights 6.5.1 and Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights 6.5.2. Hinged steel deadlights may be external.

6. 4. 5 The height of doorway sills above deck sheathing of access openings in bulkheads at ends of enclosed superstructures is to be not less than 600mm in Position 1 and not less than 380mm otherwise.

6. 4. 6 The height of doorway sills above deck sheathing, if fitted, is to be not less than 600 mm in Position 1, and not less than 380 mm in Position 2.

6. 4. 7 Where access is provided from the deck above as an alternative to access from the freeboard deck, the height of sill into a bridge or a poop is to be not less than 380 mm. The same requirement applies to deckhouses on the freeboard deck. The sill height for doorways in a forecastle, if protecting a companionway, is to be 600 mm regardless of whether or not access is provided from above. If not protecting a companionway, the sill height may be 380 mm.

6. 4. 8 When the closing appliances of openings in superstructures and deckhouses do not comply with Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks 6.4.2, interior deck openings are to be treated as if exposed on the weather deck.

6. 4. 9 Where an access opening, in the top of a deckhouse situated on a raised quarterdeck, gives access below the freeboard deck or to an enclosed superstructure, the closing appliances in the surrounding bulkheads are not required to be gasketed, provided the raised quarterdeck is at least standard height, and the deckhouse is at least standard superstructure height.

6. 4. 10 The height of door sills may be required to be increased on ships of Type `A', Type `B-100' or Type `B-60' where this is shown to be necessary by the floatability calculations required by the *International Convention on Load Lines, 1966.*

6. 4. 11 Where doors in locations above Position 2 are included in the consideration of intact and damage stability or are in critical locations above Position 2, then the height of door sills is to be specially considered.

6. 4. 12 Direct access from the freeboard deck to the machinery space through exposed casings is not permitted on ships of Type `A', Type `B-100' or Type `B-60'. A door complying with Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks 6.4.2 may, however, be fitted in an exposed machinery casing on these ships, provided that it leads to a space or passageway which is of equivalent strength to the casing and is separated from the machinery space by a second weathertight door complying with Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks 6.4.2. The outer and inner weathertight doors are to have sill heights of not less than 600 mm and 230 mm, respectively and the space between is to be adequately drained by means of a screw plug or equivalent.

6. 4. 13 For a Type `A' ship with freeboards assigned greater than, or equal to, Type `B', inner doors are not required for direct access to the engine-room.

6. 4. 14 If internal access is provided from a wheelhouse in Position 2, or below, to spaces below the weather deck either directly or through other spaces, the opening should be protected by a hinged weathertight cover adequately secured, fitted on a coaming appropriate to its position, or by an equivalent arrangement, and the space adequately drained.

6. 4. 15 In way of a moonpool, where a working or platform deck is provided below the weather deck, openings in the surrounding bulkheads are to be kept to a minimum. Access or companionway openings are to be provided with weathertight closing appliances as for an exposed superstructure bulkhead, with 600 mm high coamings.

6. 4. 16 Where portable plates are required in casings for unshipping machinery, or for other similar reasons, they may be accepted provided they are of equivalent strength to the unpierced bulkhead and are secured by gaskets and close spaced bolts at a pitch not exceeding five diameters.

6. 4. 17 The sill heights of accesses closed by covers which are secured by closely spaced bolts or otherwise kept permanently closed at sea will be specially considered.

6. 4. 18 Where permitted by the National Authority, companionway coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable with a minimum height of 230 mm. Where the wheelhouse is on the freeboard deck, or located in the forward quarter of the ship's length, with internal access below, a weathertight cover, fitted to a coaming not less than 230 mm high, is to be provided for the access. Alternatively, storm covers are to be provided for windows in exposed positions. The wheelhouse is to be adequately drained.

6. 5 Side scuttles, windows and skylights

6. 5. 1 Side scuttles are defined as being round or oval openings with an area not exceeding 0.16 m^2.

6. 5. 2 Windows are defined as being rectangular openings generally, having a radius at each corner relative to the window size in accordance with a recognised National or International Standard, and round or oval openings with an area exceeding 0.16 m^2.

6. 5. 3 Deadlights are fitted to the inside of windows and side scuttles while storm covers, of comparable specifications to deadlights, are fitted to the outside of windows, where accessible. Deadlights can be hinged and storm covers can be hinged or portable.

6. 5. 4 A plan showing the location of side scuttles and windows is to be submitted. Attention is to be given to any relevant Statutory Requirements of the National Authority of the country in which the ship is to be registered.

6. 5. 5 Side scuttles and windows together with their glasses, deadlights and storm covers if fitted, are to be of an approved design or in accordance with a recognised National or International Standard. The minimum design pressures to which windows and side scuttles are to be designed are to be in accordance with Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks unless otherwise specified by the relevant requirements of Pt 4 Ship Structures (Ship Types)

6. 5. 6 Side scuttles and windows are to comply with the relevant requirements given in Pt 4 Ship Structures (Ship Types) for the applicable ship type in conjunction with the requirements of Pt 3, Ch 11, 6.5, Side scuttles, windows and skylights

6. 5. 7 Side scuttles to spaces below the freeboard deck, or to spaces within the first tier of enclosed superstructures, or to first tier deckhouses on the freeboard deck protecting openings leading below or considered buoyant in stability calculations, are to be fitted with efficient, hinged, inside deadlights.

6. 5. 8 Deadlights are to be capable of being closed and secured watertight if fitted below the freeboard deck or weathertight if fitted above.

6. 5. 9 No side scuttle is to be fitted in such a position that its sill is below a line drawn parallel to the freeboard deck at side and having its lowest point 2.5 per cent of the breadth *B* above the load waterline corresponding to the summer freeboard (or timber summer freeboard if assigned), or 500 mm, whichever is the greater distance, *See* Figure 11. 6. 1: Side Scuttle Positioning.

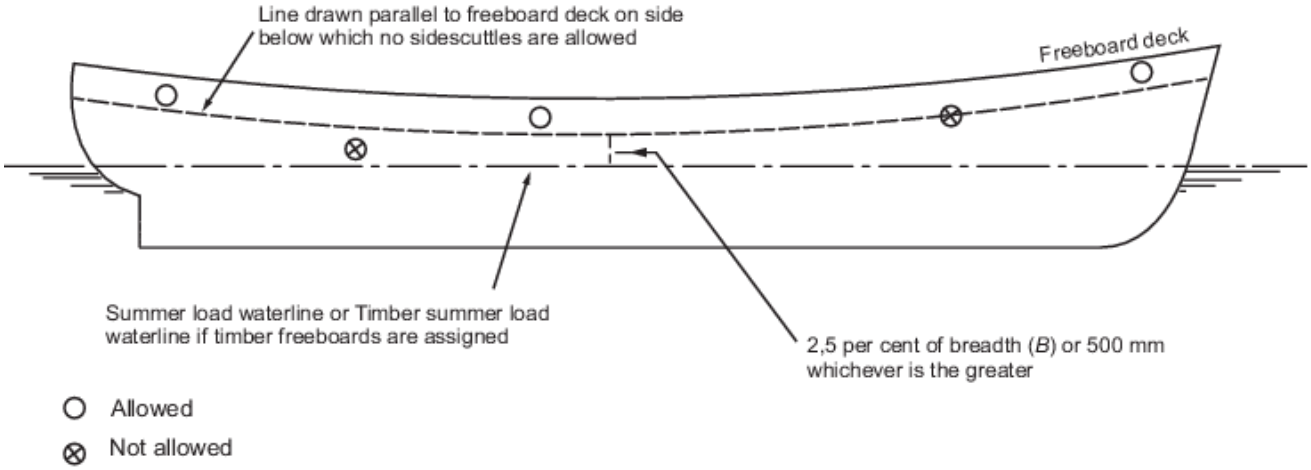
6. 5. 10 If the required damage stability or floatability calculations indicate that the side scuttles would become immersed at any intermediate stages of flooding or the final equilibrium waterline, these are to be of the non-opening type.

6. 5. 11 Windows are not to be fitted below the freeboard deck, in first tier end bulkheads or sides of enclosed superstructures, or in first tier deckhouses that are considered buoyant in stability calculations or protecting openings leading below.

6. 5. 12 Where windows are fitted in a deckhouse in the first tier, they are to be provided with strong, hinged, steel, weathertight storm covers. However, if there is an opening leading below deck in this deckhouse, this opening is to be treated as being on an exposed deck and is to be protected as required by Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks 6.4.2.

6. 5. 13 Where windows are permitted in an exposed bulkhead on the weather deck in the forward 0.25 of the load line length, strong external storm covers which can be portable and stored adjacent are to be provided.

Figure 11. 6. 1: Side Scuttle Positioning



6. 5. 14 Side scuttles and windows at the side shell in the second tier protecting direct access below or spaces considered buoyant in stability calculations are to be provided with efficient inside deadlights capable of being effectively closed and secured weathertight.

6. 5. 15 Side scuttles and windows set inboard from the side shell in the second tier protecting direct access below to spaces listed in Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights 6.5.7, are to be provided with either efficient hinged inside deadlights or, where they are accessible, permanently attached external storm covers of approved design and of substantial construction and capable of being effectively closed and secured weathertight.

6. 5. 16 Cabin bulkheads and doors in the second tier separating side scuttles and windows from a direct access leading below may be accepted in place of deadlights or storm covers fitted to the side scuttles or windows.

6. 5. 17 Side scuttles and windows set inboard from the side shell in the second tier, not protecting direct access below or spaces considered buoyant in the stability calculations, do not require deadlights or storm covers.

6. 5. 18 If fitted in a deckhouse in the second tier located within the forward 0.25 of the load line length windows are to be provided with strong, hinged, steel, weathertight storm covers. However, if there is an opening leading below deck in this deckhouse, this opening is to be treated as being on an exposed deck and is to be protected as required by Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks 6.4.2.

6. 5. 19 Where the wheelhouse is in the second tier located abaft the forward 0.25 of the load line length, in lieu of storm covers being provided for the wheelhouse windows, a weathertight cover, fitted to a coaming of not less than 230 mm in height around the internal stairway opening within the wheelhouse, can be accepted. If this arrangement is accepted, adequate means of draining the wheelhouse are to be provided.

6. 5. 20 Deckhouses or superstructure situated on a raised quarter deck or on the deck of a superstructure of less than standard height or on the deck of a deckhouse of less than standard height can be regarded as being in the second tier as far as the provision of deadlights is concerned, provided that the height of the raised quarter deck, superstructure or deckhouse is equal to, or greater than, the standard quarter deck height.

6. 5. 21 Where the wheelhouse is in the third tier located in the forward 0.25 of the load line length, in lieu of storm covers being provided for the wheelhouse windows, a weathertight cover, fitted to a coaming of not less than 230 mm in height around the internal stairway opening within the wheelhouse, can be accepted. If this arrangement is accepted, adequate means of draining the wheelhouse are to be provided.

6. 5. 22 Windows at the side shell in the third tier are to be provided with strong portable internal storm covers for 25 per cent of each size of window, with means of securing being provided at each window.

6. 5. 23 Windows at the side shell in the fourth tier located in the forward 0.25 of the load line length are to be provided with strong portable internal storm covers for 25 per cent of each size of window, with means of securing being provided at each window.

6. 5. 24 If necessary, for practical considerations, storm covers can be in two parts.

6. 5. 25 For windows in the second tier and higher above the freeboard deck, a glazing equivalent can be fitted in lieu of deadlights/storm covers. The thicknesses and arrangements are to be acceptable to the National Authority with whom the ship is registered. For arrangements of glazing acceptable to LR, *See* Table 11. 6. 1: Acceptable arrangements of glazing in lieu of portable storm covers/deadlights. Other glazing equivalents will be considered on a case-by-case basis.

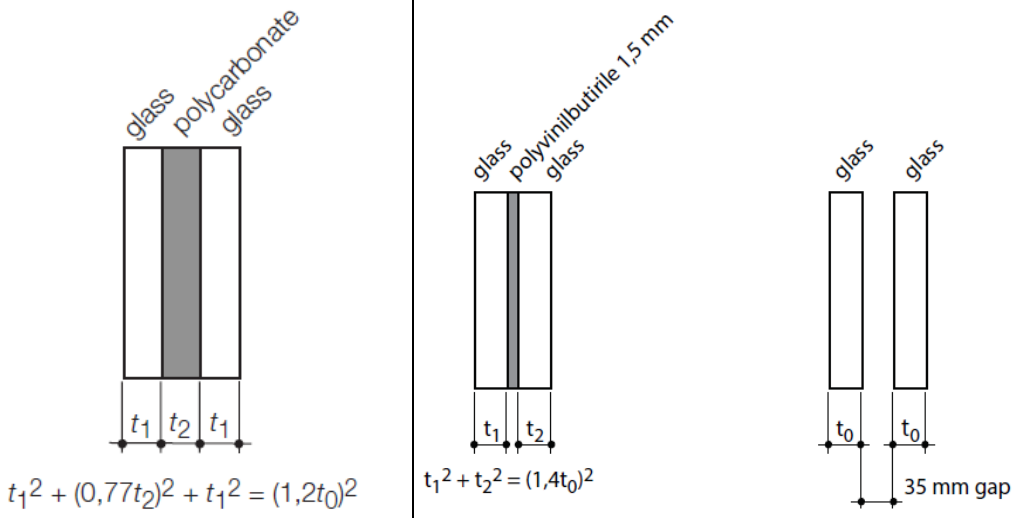
6. 5. 26 Windows are not to be fitted in machinery space boundaries. However, this does not preclude the use of glass in control rooms within the machinery space.

6. 5. 27 Skylights, where fitted, are to be of substantial construction and securely attached to their coamings. The height of the lower edge of the opening is to be as required by Pt 3, Ch 11, 5.1 General 5.1.1. The scantlings of the coaming are to be as required by this Section or Pt 3, Ch 11, 5 Hatch coamings, as appropriate. The thickness of glasses in fixed or opening skylights is to be appropriate to their size and position as required for side scuttles or windows. Glasses in any position are to be protected from mechanical damage and, where fitted in Positions 1 or 2, are to be provided with robust deadlights or storm covers permanently attached. Cargo pump room and machinery space skylights are not to contain glass.

6. 5. 28 Skylights to cargo pump rooms are to be capable of being closed from outside the pump room.

Table 11. 6. 1: Acceptable arrangements of glazing in lieu of portable storm covers/deadlights

In lieu of portable storm covers	In lieu of deadlights and storm covers



Symbols

t_0 = minimum thickness of toughened glass as required by Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights 6.5.5

6. 5. 29 Laminated toughened safety glass may also be used for windows but the total thickness will need to be greater than that required for the equivalent sized window using toughened safety glass. The equivalent thickness of laminated toughened safety glass is to be determined from the following formula:

$$T_{L1}^2 + T_{L2}^2 + \cdots T_{Ln}^2 = T_s^2$$

n = number of laminates

T_{Li} = thickness of glass laminate

T_s = thickness of toughened safety glass

Alternative arrangements that do not meet the above thickness requirement will be specially considered, provided that equivalent strength and bending stiffness to that of a single, thermally toughened pane of thickness, T_s, can be demonstrated in a four-point bending test as described in EN-ISO 1288-3 or an equivalent recognised National or International Standard, using not less than ten samples. The lower limit of the 90 per cent confidence level interval for the laminated pane shall not be less than the same for monolithic toughened safety glass. Small scale punch test or ring-in-ring test methods shall not be used.

6. 5. 30 Non-metallic frames are not acceptable for windows in the first and second tiers, and are not generally acceptable in any other position in external casings. Any proposals to fit non-metallic frames are to be submitted for consideration, and are to be acceptable to the Administration. The proposed locations, frame dimensions, glass thicknesses and the results of any tests carried out, are to be forwarded.

6. 6 Small hatchways on exposed fore decks

6. 6. 1 For the application of the following requirements, *See* Pt 3, Ch 11, 6.1, Small hatchways on exposed decks.

6. 6. 2 The number and size of hatchways and other access openings are to be kept to the minimum consistent with the satisfactory operation of the ship.

6. 6. 3 The height of coamings is to be in accordance with Pt 3, Ch 11, 5.1 General 5.1.1. Lower heights may be considered in relation to operational requirements and the nature of the spaces to which access is given.

6. 6. 4 ope hatches may be accepted with reduced coamings, but generally not less than 380 mm, provided they are well secured and closed before the ship leaves port. A suitable notice is to be displayed at the hatch stating that it is to be closed whilst the ship is at sea.

6. 6. 5 Where permitted by the National Authority, access hatch coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable with a minimum height of 230 mm.

6. 6. 6 The thickness of the coamings is to be not less than the Rule minimum thickness for the deck inside line of openings for that position, or 11 mm, whichever is the lesser.

6. 6. 7 The upper edge of the hatchway coamings is to be suitably reinforced by a horizontal section, normally not more than 170 to 190 mm from the upper edge of the coamings.

6. 6. 8 Hatches are to be fitted with primary securing devices such that their hatch covers can be secured in place and weather-tight by means of a mechanism employing any one of the following methods:

a. Butterfly nuts tightening onto forks (clamps),
b. Quick acting cleats, or
c. Central locking device.

Emergency escape hatches are excluded from options (a) and (b).

6. 6. 9 Dogs (twist tightening handles) with wedges are not acceptable as primary securing devices.

6. 6. 10 Escape hatches are to be capable of being opened from either side and are to have a quick-acting type securing device, e.g. one action wheel handle central locking device for latching/unlatching the hatch cover.

6. 6. 11 For a primary securing method using butterfly nuts, the forks (clamps) are to be of robust design. They are to be designed to minimise the risk of butterfly nuts being dislodged while in use; by means of curving the forks upward, a raised surface on the free end, or a similar method. The plate thickness of unstiffened steel forks is not to be less than 16 mm. An example arrangement is shown in Figure 11. 6. 3: Example of a primary securing method.

Figure 11. 6. 2: Arrangement of stiffeners

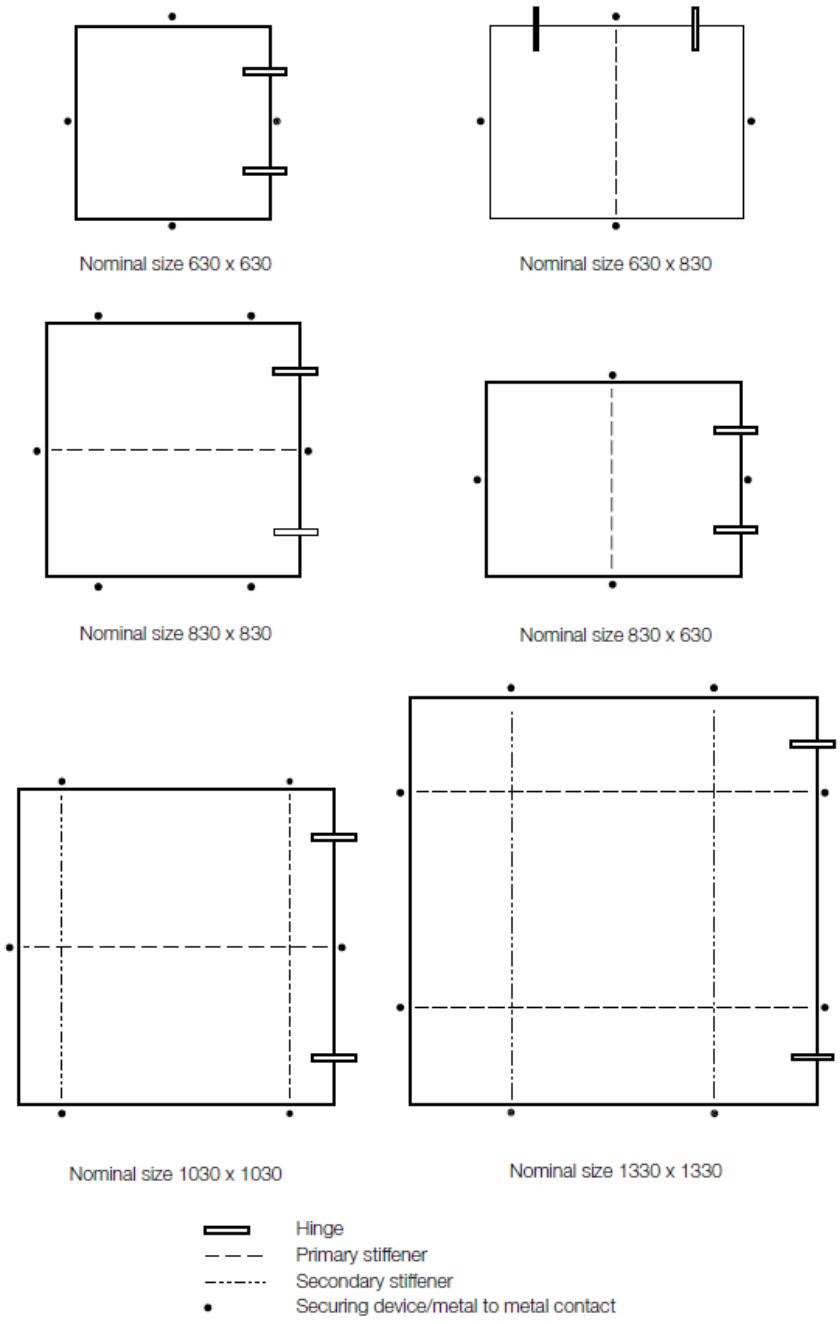


Figure 11. 6. 3: Example of a primary securing method

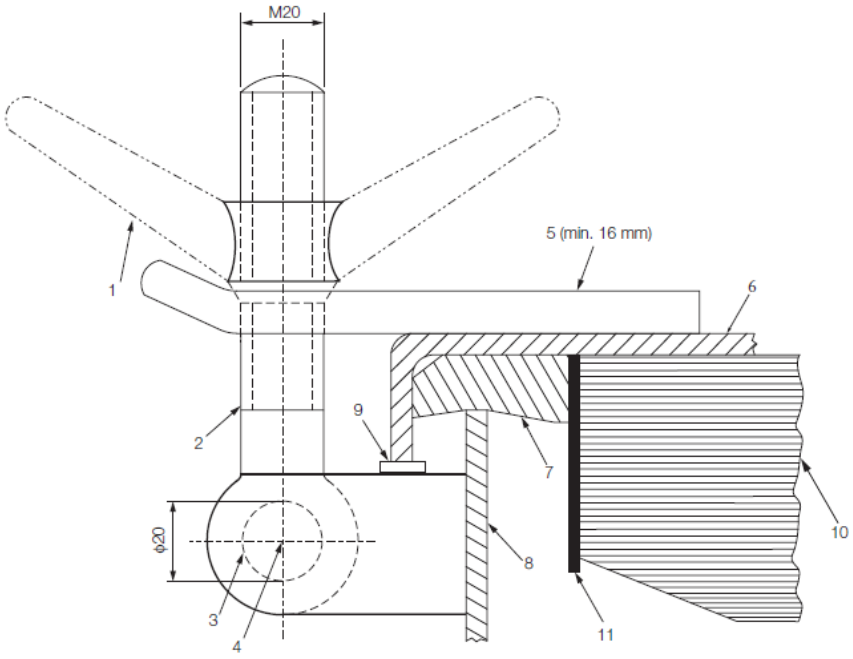

1. butterfly nut
2. bolt
3. pin
4. centre of pin
5. fork (clamp) plate
6. hatch cover
7. gasket
8. hatch coaming
9. bearing pad welded on the bracket of a toggle bolt for metal to metal contact
10. stiffener
11. inner edge stiffener

(Note: Dimensions in millimeters)

6. 6. 12 The hatch cover is to be fitted with a gasket of elastic material. This is to be designed to allow a metal to metal contact at a designed compression and to prevent over compression of the gasket by green sea forces that may cause the securing devices to be loosened or dislodged. The metal-to-metal contacts are to be arranged close to each securing device in accordance with Figure 11. 6. 2: Arrangement of stiffeners, and of sufficient capacity to withstand the bearing force.

6. 6. 13 The primary securing method is to be designed and manufactured such that the designed compression pressure can be achieved by one person without the need of any tools.

6. 6. 14 For small rectangular steel hatch covers, the plate thickness, stiffener arrangement and scantlings are to be in accordance with Table 11. 6. 2: Scantlings for small steel hatch covers on exposed deck and Figure 11. 6. 2: Arrangement of stiffeners. Stiffeners, where fitted, are to be aligned with the metal-to-metal contact points required in Pt 3, Ch 11, 6.6 Small hatchways on exposed fore decks 6.6.11, *See* Figure 11. 6. 2: Arrangement of stiffeners. Primary stiffeners are to be continuous. All stiffeners are to be welded to the inner edge stiffener, *See* Figure 11. 6. 3: Example of a primary securing method.

Table 11. 6. 2: Scantlings for small steel hatch covers on exposed deck

nominal size (mm x mm)	cover plate thickness (mm)	primary stiffeners Flat bar (mm x mm); number	secondary stiffeners

630 x 630	8	–	–
630 x 830	8	100 x 8.1	–
830 x 630	8	100 x 8.1	–
830 x 830	8	100 x 10.1	–
1030 x 1030	8	120 x 12.1	80 x 8.2
1330 x 1330	8	150 x 12.2	100 x 10.2

6. 6. 15 For hatch covers constructed of materials other than steel, the required scantlings are to provide equivalent strength.

6. 6. 16 For small hatch covers of circular or similar shape, the cover plate thickness and reinforcement are to be of equivalent strength to that of the small rectangular steel hatch covers described in Pt 3, Ch 11, 2.2 Stiffener arrangement 2.2.1.

6. 6. 17 For hatch covers located on the deck forward of the fore-most cargo hatch, the hinges are to be fitted such that the predominant direction of green sea will cause the cover to close. The hinges are normally to be located on the fore edge.

6. 6. 18 On small hatches located between the main hatches, for example between Numbers 1 and 2, the hinges are to be placed on the fore edge or outboard edge, whichever is practicable for protection from green water in beam sea and bow quartering conditions.

6. 6. 19 Hatches, excluding emergency escape hatches, are to be fitted with an independent secondary securing device, e.g. by means of a sliding bolt, a hasp or a backing bar of slack fit, which is capable of keeping the hatch cover in place, even in the event that the primary securing device became loosened or dislodged. It is to be fitted on the side opposite to the hatch cover hinges.

6. 6. 20 Small hatches, including escape hatches, are to be situated clear of cargo containment areas, particularly in the case of offshore supply ships.

6. 6. 21 Where portable plates are required in decks for unshipping machinery, or for other similar reasons, they may be accepted provided they are of equivalent strength to the unpierced deck and are secured by gaskets and closely spaced bolts at a pitch not exceeding five diameters.

6. 6. 22 Satisfactory means are to be provided to prevent inadvertent flooding of chain lockers, *See* Pt 3, Ch 13, 8.12 Structural requirements associated with anchoring 8.12.5 and Pt 3, Ch 13, 8.12 Structural requirements associated with anchoring 8.12.7.

PART

3

CHAPTER 11 **Closing Arrangements for Shell, Deck and Bulkheads**

SECTION 7 **Tanker access arrangements and closing appliances**

7. 1 Materials

7. 1. 1 Covers for access hatches, tank cleaning and other openings to cargo tanks and adjacent spaces are to be manufactured from steel complying with the Pt 2 Rules for the Manufacture, Testing and Certification of Materials.

7. 1. 2 Consideration will be given to the use of bronze, brass or other materials; however, aluminium alloy is not to be used for the covers of any openings to tanks.

7. 1. 3 Synthetic materials will be considered, taking into account their fire resistance and physical and chemical properties in relation to the intended operating conditions. Details of the properties of the material, the design of the cover and the method of manufacture are to be submitted for approval.

7. 1. 4 The hatch cover packing material is to be compatible with the cargoes to be carried and is to be efficiently held in place.

7. 2 Cargo tank access hatchways

7. 2. 1 Attention is drawn to IMO Resolutions concerning safe access to, and working in, large tanks.

7. 2. 2 Oiltight hatchways are to be kept to the minimum size required to provide reasonable access and ventilation. Where tanks are large or subdivided by wash bulkheads, additional hatchways may be required. In determining the size and location of hatchways, consideration should be given to the handling of materials and staging for maintenance in the tank.

7. 2. 3 The size and location of hatchways should also take into account access for personnel wearing breathing apparatus, and removal of injured personnel (possibly on a stretcher) from the bottom of the tank.

7. 2. 4 The height of hatch coaming is to be not less than 600 mm, measured above the upper surface of the freeboard deck, unless a lower height is permitted by the Administration of the country in which the ship is to be registered.

7. 2. 5 Taking account of sheer and camber, the height of any cargo tank hatch coaming is to be such as to ensure that the top of the hatch coaming is above the highest point of the tank over which it is fitted.

7. 2. 6 The height of the coaming may be required to be increased if this is shown to be necessary by the floatability calculations required by the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988*.

7. 2. 7 The thickness of the coaming plate is to be not less than 10 mm, but may be required to be increased, and edge stiffening fitted, where the coaming height exceeds 600 mm.

7. 2. 8 Unstiffened plate covers are to be not less than 12.5 mm in thickness, but if the area of the cover exceeds 1.2 m^2 this thickness may be required to be increased or stiffening fitted.

7. 2. 9 Unstiffened covers are to be secured by fastenings spaced not more than 600 mm apart on circular hatchways. On rectangular hatchways the spacing of fastenings is generally not to exceed 450 mm, and the distance between hatch corners and adjacent fastenings is to be not more than 230 mm.

7. 2. 10 The arrangement of fastenings on stiffened hatchway covers and covers of special design will be specially considered.

7. 2. 11 Where the cover is hinged, adequate stiffening of the coaming and cover in way of the hinge is to be provided. In general, hinges are not to be used as securing devices for the cover.

7. 3 Enlarged cargo tank access openings

7. 3. 1 Proposals to fit enlarged cargo tank accesses closed by bolted plate covers will be considered. Such openings may be of extended dimensions for ease of access and evacuation of personnel, *See* Pt 3, Ch 11, 7.2 Cargo tank access hatchways 7.2.3, and may incorporate a smaller access hatch for normal use constructed as required by Pt 3, Ch 11, 7.2, Cargo tank access hatchways.

7. 3. 2 The plate cover is to be not less than 15 mm in thickness and is to be secured by closely spaced studs to a ring of suitable dimensions, welded to the deck. The studs are not to penetrate the deck plating.

7. 4 Miscellaneous openings

7. 4. 1 Small openings for tank cleaning, ullage and similar purposes may be closed by flush covers which are to be not less than 12.5 mm in thickness and secured by studs not more than 100 mm apart. Studs are to be arranged in a ring of suitable width and thickness attached to the deck, and are not to penetrate the deck plating.

7. 4. 2 Small diameter holes provided for staging wires are to be closed by plugs of an approved pattern. The plugs are to be provided with a thick washer of suitable material which is also compatible with the intended cargoes. Spare plugs equal to at least 10 per cent of the number of holes are to be provided and maintained on board, *See also* Pt 4, Ch 9, 4 Hull envelope plating. If these openings are threaded they are to be protected while in use with a protective sleeve of suitable material.

7. 5 Access to spaces other than cargo tanks

7. 5. 1 Access to clean ballast or dry tanks and to cofferdams may be either by access hatch or by manhole generally complying with the preceding requirements.

7. 6 Equivalents

7. 6. 1 Alternative access cover designs and securing arrangements will be considered on the basis of equivalence to the above requirements and taking into account any relevant National Requirements.

7. 7 ther openings

7. 7. 1 For access to structure within cargo tanks, *See* Pt 4, Ch 9, 13 Access arrangements and closing appliances.

PART

3

CHAPTER **11** **Closing Arrangements for Shell, Deck and Bulkheads**

SECTION **8** **Side and stern doors and other shell openings**

8. 1 Symbols

8. 1. 1 The symbols used in this Section are defined as follows:

d = distance between closing devices, in metres

k = material factor, *See* Pt 3, Ch 2, 1.2, Steel, but is not to be taken less than 0.72 unless demonstrated otherwise by a direct strength analysis with regard to relevant modes of failure

l = moment of inertia, in cm^4, of the stiffener or girder, in association with an effective width of attached plating determined in accordance with Pt 3, Ch 3, 3 Structural idealisation

σ = bending stress, in N/mm^2

σ_e = equivalent stress, in N/mm^2

$= \sqrt{(\sigma^2 + 3\tau^2)}$

σ_o = minimum yield stress of the bearing material, in N/mm^2

τ = shear stress, in N/mm^2.

8. 2 General

8. 2. 1 These requirements cover cargo and service doors in the ship side (abaft the collision bulkhead) and stern area, below the freeboard deck and in enclosed superstructures.

8. 2. 2 For the requirements of bow doors, *See* Pt 4, Ch 2, 8 Bow doors and inner doors.

8. 2. 3 Side and stern doors are to be so fitted as to ensure tightness and structural integrity commensurate with their location and the surrounding structure, *See also* Pt 3, Ch 1, 6.4 Weathertight 6.4.2 and Pt 3, Ch 1, 6.5 Watertight 6.5.2.

8. 2. 4 In general, and for passenger ships in particular, the lower edge of door openings is not to be below a line drawn parallel to the freeboard deck at side, which has at its lowest point at least 230 mm above the upper edge of the uppermost Load Line.

8. 2. 5 When the lower edge is below the line specified in Pt 3, Ch 11, 8.2 General 8.2.4, the arrangement will be specially considered. Special consideration is to be given to preventing the spread of

leakage water over the deck. The reference to the uppermost Load Line is to be taken as the tropical fresh waterline or, if timber freeboards are assigned, the timber tropical fresh waterline.

8. 2. 6 Watertight doors below the freeboard deck, with the exception of pilot doors which are to open inwards, are to open outwards. Weathertight doors are generally to be arranged to open outwards, however inward opening doors will be considered provided these satisfy the requirements of Pt 3, Ch 11, 8.2 General 8.2.7.

8. 2. 7 Inward opening doors situated in the first two 'tween decks above the summer load waterline are to be fitted with a second independent securing device, such as a strongback or equivalent arrangement, capable of providing weathertight integrity. Where the consequences of water ingress due to failure of the door are minimal, such as a small pilot door giving access to a watertight trunk leading to the bulkhead deck, the required enhancements will be specially considered.

8. 2. 8 For passenger ships the following are also applicable:

a. Gangway, cargo and service ports fitted below the margin line, *See* Pt 3, Ch 3, 4.3 After peak bulkhead, are to satisfy the strength requirements given for side doors in this Section. They are to be effectively closed and secured watertight before the ship leaves port, and are to be kept closed during navigation. Such ports are not to have their lowest point below the deepest subdivision Load Line.

b. Where the inboard end of a rubbish chute is below the margin line in a passenger ship, the inboard end cover is to be watertight and, in addition to the discharge flap interlock, a screwdown automatic non-return valve is to be fitted in an easily accessible position above the deepest subdivision. The valve is to be controlled from a position above the bulkhead deck and provided with an open/shut indicator, and kept closed when not in use. A suitable notice is to be displayed at the valve position.

8. 2. 9 For ships complying with the requirements of this Section, the securing, supporting and locking devices are defined as follows:

a. A securing device is used to keep the door closed by preventing it from rotating about its hinges or other pivoted attachments to the ship.

b. A supporting device is used to transmit external and internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure.

c. A locking device locks a securing device in the closed position.

8. 2. 10 Ro-ro cargo spaces are spaces not normally subdivided in any way and extending to either a substantial length or the entire length of the ship, in which motor vehicles with fuel in their tanks for their own propulsion and/or goods (packaged or in bulk, in or on rail or road cars, vehicles (including road or rail tankers), trailers, containers, pallets, demountable tanks in or on similar stowage units or other receptacles) can be loaded and unloaded normally in a horizontal direction.

8. 2. 11 Special category spaces are those enclosed spaces above and below the bulkhead deck, into and from which vehicles can be driven and to which passengers have access, and which may be accommodated on more than one deck where total overall clear height for vehicles does not exceed 10 m.

8. 3 Scantlings

8. 3. 1 In general the strength of side and stern doors is to be equivalent to the strength of the surrounding structure.

8. 3. 2 Door openings in the side shell are to have well rounded corners and adequate compensation is to be arranged with web frames at sides and stringers or equivalent above and below, *See* Pt 4, Ch 1, 5 Shell envelope plating.

8. 3. 3 Doors are to be adequately stiffened, and means are to be provided to prevent movement of the doors when closed. Adequate strength is to be provided in the connections of the lifting/manoeuvring arms and hinges to the door structure and to the ship structure.

8. 3. 4 The thickness of the door plating is to be not less than the shell plating calculated with the door stiffener spacing, and in no case to be less than the minimum adjacent shell thickness.

8. 3. 5 Where stern doors are protected against direct wave impact by a permanent external ramp, the thickness of the stern door plating may be reduced by 20 per cent relative to the requirements of Pt 3, Ch 11, 8.3 Scantlings 8.3.4. Those parts of the stern door which are not protected by the ramp are to have the thickness of plating in full compliance with Pt 3, Ch 11, 8.3 Scantlings 8.3.4.

8. 3. 6 Where higher tensile steel is proposed, the plating thickness required in Pt 3, Ch 11, 8.3 Scantlings 8.3.4 and Pt 3, Ch 11, 8.3 Scantlings 8.3.5 may be reduced by $\sqrt{k}$.

8. 3. 7 The section modulus of horizontal or vertical stiffeners is to be not less than required for the adjacent shell framing using the actual stiffener spacing. Consideration is to be given, where necessary, to differences in fixity between ship's frames and door stiffeners.

8. 3. 8 Where necessary, door secondary stiffeners are to be supported by primary members constituting the main stiffening elements of the door.

8. 3. 9 The scantlings of such primary members are to be based on direct strength calculations. Normally, formulae for simple beam theory may be applied to determine the bending stress. Members are to be considered to have simply supported end connections. The design load is the uniformly distributed external sea pressure, p_e, as defined in Pt 3, Ch 11, 8.2 General 8.2.6. For minimum scantlings, p_e is to be taken as 25 kN/m^2 and the permissible stresses are as follows:

$$\tau = \frac{80}{\mathrm{k}}\ \mathrm{N/mm^2}$$

$$\sigma = \frac{120}{\mathrm{k}}\ \mathrm{N/mm^2}$$

$$\sigma_e = \frac{150}{\mathrm{k}}\ \mathrm{N/mm^2}$$

8. 3. 10 The webs of primary members are to be adequately stiffened, preferably in a direction perpendicular to the shell plating.

8. 3. 11 The stiffness of the edges of the doors and the hull structure in way are to be sufficient to ensure weathertight integrity. Edge stiffeners/girders are to be adequately stiffened against rotation and are to have a moment of inertia not less than:

$$I = 0.8 P_1 \mathrm{d}^4\ c\mathrm{m}^4$$

Where

P_1 = packing line pressure along edges, not to be taken less than 50 N/cm.

For edge girders supporting main door girders between securing devices, the moment of inertia is to be increased in relation to the additional force.

8. 3. 12 The buckling strength of primary members is to be specially considered.

8. 3. 13 All load transmitting elements in the design load path from door through securing and supporting devices into the ship structure, including welded connections, are to be to the same strength standard as required for the securing and supporting devices. These elements include pins, supporting brackets and back-up brackets. Where cut-outs are made in the supporting structure, the strength and stiffness will be specially considered.

8. 4 Doors serving as ramps

8. 4. 1 Where doors also serve as vehicle ramps, the plating and stiffeners are to be not less than required for vehicle decks, *See* Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles.

8. 4. 2 The support structure (including hinges) is to be assessed in accordance with Pt 3, Ch 9, 6.7 Ramp supporting structure.

8. 5 Arrangements for the closing, securing and supporting of doors

8. 5. 1 Doors are to be fitted with adequate means of closing, securing and support so as to be commensurate with the strength and stiffness of the surrounding structure. The hull supporting structure in way of the doors is to be suitable for the same design loads and design stresses as the securing and supporting devices. Where packing is required, the packing material is to be of comparatively soft type, and the supporting forces are to be carried by the steel structure only. Other types of packing may be considered. Maximum design clearance between securing and supporting devices is generally not to exceed 3 mm.

8. 5. 2 Devices are to be simple to operate and easily accessible. They are to be of a design approved by Lloyd's Register for the intended purpose.

8. 5. 3 Securing devices are to be equipped with positive locking arrangements. Arrangements are to be such that the securing devices are retained in the closed position within design limits of inclination, vibration and other motion-induced loads and in the event of loss of any actuating power supply.

8. 5. 4 Systems for door opening/closing and securing/ locking are to be interlocked in such a way that they can only operate in a proper sequence. Hydraulic systems are to comply with Pt 5, Ch 14, 9 Hydraulic systems.

8. 5. 5 Means are to be provided to enable the doors to be mechanically fixed in the open position taking into account the self weight of the door and a minimum wind pressure of 1.5 kN/m^2 acting on the maximum projected area in the open position.

8. 5. 6 The spacing for cleats or closing devices should not exceed 2.5 m and there should be cleats or closing devices positioned as close to the corners as practicable. Alternative arrangements for ensuring weathertight sealing will be specially considered.

8. 5. 7 Control and monitoring arrangements are to comply with the applicable requirements of Pt 6, Ch 2, 19 Ship safety systems.

8. 6 Design loads

8. 6. 1 The design force considered for the scantlings of primary members, securing and supporting devices of side shell doors and stern doors are to be taken not less than:

a. Design forces for securing or supporting devices of doors opening inwards:

External force:

$$P_e = Ap_e + P_e \text{kN}$$

Internal force:

$$P_i = P_0 + 10W\text{kN}$$

b. Design forces for securing or supporting devices of doors opening outwards:

External force:

$$P_e = Ap_e\text{kN}$$

Internal force:

$$P_i = P_0 + 10W + P_p\text{kN}$$

c. Design forces for primary members:
External force:

$$P_e = AP_e + 10\text{KN}$$

Internal force:

$$P_i = P_0 + 10W\text{kN}$$

whichever is the greater.
The symbols used are defined as follows:

p_e = external sea pressure, in kN/m^2, determined at the centre of gravity of the door opening and is not to be taken less than:

= for $Z_G < T$ $\quad 10(T - Z_G) + 25$ kN/m^2
for $Z_G \geq T$ $\quad 25$ kN/m^2

= For stern doors of ships fitted with bow doors, P_e is not to be taken less than:

p_{emin} = $0.6\lambda C_H(0.8 + 0.6L^{0.5})^2$kN/m^2

T = summer draught, in metres

Z_G = height of the centre of area of the door, in m, above the base line

L = length of ship, but need not be taken greater than 200 m

λ = coefficient depending on the area where the ship is intended to be operated:

= 1 for sea-going ships

= 0.8 for ships operated in coastal waters

= 0.5 for ships operated in sheltered waters

C_H = $0.0125L$ for $L < 80$ m

= 1 for $L \geq 80$ m

A = area, in m^2, of the door opening

W = weight of the door, in tonnes

P_p = total packing force, kN. When packing is fitted, the packing line force per unit length is to be specified, normally not to be taken less than: 5 kN/m

P_o = the greater of P_c and $5A$ kN

P_c = accidental force, in kN, due to loose cargo, etc. to be uniformly distributed over the area A and not to be taken less than 300 kN. For small doors such as bunker doors and pilot doors, the value of P_c may be taken as zero, provided an additional structure such as an inner ramp is fitted, which is capable of protecting the door from accidental force due to loose cargoes.

8. 7 Design of securing and supporting devices

8. 7. 1 Securing devices and supporting devices are to be designed to withstand the forces given above using the following permissible stresses:

$$\tau = \frac{80}{k} N/mm^2$$
$$\sigma = \frac{120}{k} N/mm^2$$
$$\sigma_e = \frac{150}{k} N/mm^2$$

The terms `securing device' and `supporting device' are defined in Pt 4, Ch 2, 8.2 General 8.2.8.

8. 7. 2 The arrangement of securing and supporting devices is to be such that threaded bolts are not to carry support forces. The maximum tensile stress in way of threads of bolts, not carrying support forces, is not to exceed:

$$\frac{125}{k} N/mm^2$$

8. 7. 3 For steel to steel bearings in securing and supporting devices, the normal bearing pressure is not to exceed $0.8\sigma_o$, *See* Pt 3, Ch 11, 8.1 Symbols 8.1.1. For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification. The normal bearing pressure is to be calculated by dividing the design force by the projected bearing area.

8. 7. 4 The distribution of the reaction forces acting on the securing and supporting devices may require to be supported by direct calculations taking into account the flexibility of the hull structure and the actual position and stiffness of the supports. Small and/or flexible devices, such as cleats, intended to provide load compression of the packing material are not generally to be included in these calculations.

8. 7. 5 Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be considered in the calculation of the reaction forces acting on the devices.

8. 7. 6 The number of securing and supporting devices is generally to be the minimum practicable whilst complying with Pt 3, Ch 11, 8.5 Arrangements for the closing, securing and supporting of doors 8.5.3 and taking account of the available space in the hull for adequate support.

8. 7. 7 The arrangement of securing devices and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable of withstanding the reaction forces, without exceeding, by more than 20 per cent, the permissible stresses as defined in Pt 3, Ch 11, 8.7 Design of securing and supporting devices 8.7.1.

8. 8 Operating and Maintenance Manual

8. 8. 1 An Operating and Maintenance Manual for the doors is to be provided on board and is to contain necessary information on:

a. main particulars and design drawings,
b. service conditions, e.g. service area restrictions, acceptable clearances for supports,
c. maintenance and function testing,
d. register of inspections, repairs and renewals.

8. 8. 2 For passenger/vehicle ferries and roll on-roll off cargo ships, *See* Pt 4, Ch 2, 1.1 Application 1.1.1, an Operating and Maintenance Manual for the doors, as defined in Pt 4, Ch 2, 8.7 Operating and Maintenance Manual 8.7.1, is to be provided on board instead of that required by Pt 3, Ch 11, 8.8 Operating and Maintenance Manual 8.8.1.

8. 8. 3 The Manual is to be submitted for approval, and is to contain a note recommending that recorded inspections of the door supporting and securing devices be carried out by the ship's staff at monthly intervals or following incidents that could result in damage, including heavy weather or contact in the region of the doors. Any damages recorded during such inspections are to be reported to LR.

8. 8. 4 Documented operating procedures for closing and securing the doors are to be kept on board and posted at an appropriate place.

PART

3

CHAPTER **11** **Closing Arrangements for Shell, Deck and Bulkheads**

SECTION **9** **Watertight doors in bulkheads below the freeboard deck**

9. 1 Openings in bulkheads

9. 1. 1 Certain openings below the freeboard deck are permitted, but these must be kept to a minimum and provided with means of closing to watertight standards. All such openings are to be to the satisfaction of the Surveyor.

9. 2 Watertight doors

9. 2. 1 Watertight doors are to be of equivalent strength to the unpierced bulkhead, efficiently constructed and fitted, and are to be capable of being closed watertight when the ship is listed up to 15° either way. They are to be operated under working conditions and hose tested in place, *See* Table 1. 9. 1: Testing requirements in Chapter 1.

9. 2. 2 The scantlings of the watertight doors are to comply with Pt 4, Ch 1, 9 Bulkheads using the actual stiffener spacing of the door.

9. 2. 3 The scantlings of the frames of the watertight doors are to satisfy the requirements of watertight bulkheads given in item 5 of Table 1. 9. 1: Watertight and deep tank bulkhead scantlings in Pt 4, Ch 1, 9 Bulkheads taking into account the arrangement of door stiffeners and securing arrangements.

9. 2. 4 Watertight doors of the sliding type are to be capable of being operated both at the door itself and from an accessible position above the bulkhead deck. Means are to be provided at all the remote operating positions to indicate whether the door is open or closed. Doors are to be capable of being remotely closed by power from the bridge. The relevant regulations regarding openings in watertight bulkheads, contained in the *SOLAS - International Convention for the Safety of Life at Sea* and applicable amendments, are also to be complied with.

9. 2. 5 Hinged watertight doors of approved pattern may be fitted in 'tween decks in approved positions. The hinges of these doors are to be fitted with gunmetal pins or gunmetal bushes.

9. 2. 6 The frames of vertical watertight doors shall have no groove at the bottom in which dirt might lodge and prevent the door closing properly.

9. 2. 7 Means are to be provided on the navigating bridge to indicate whether the watertight doors are open or closed. A notice is to be affixed to both sides of each such door or hatch cover to the effect that it is not to be left open.

9. 2. 8 In passenger ships the number and construction of the watertight doors in bulkheads will be specially considered. Each watertight door is to be tested, *See* Table 1. 9. 1: Testing requirements. The test may be carried out either before of after the door is fitted. The relevant regulations

regarding openings in watertight bulkheads in passenger ships, contained in the *SOLAS - International Convention for the Safety of Life at Sea* and applicable amendments, are also to be complied with.

PART

3

CHAPTER 11 **Closing Arrangements for Shell, Deck and Bulkheads**

SECTION 10 **External openings and openings in watertight bulkheads and internal decks in cargo ships**

10. 1 Shell and watertight subdivision openings

10. 1. 1 In addition to the requirements of Pt 3, Ch 11, 8 Side and stern doors and other shell openings and Pt 3, Ch 11, 9 Watertight doors in bulkheads below the freeboard deck, for cargo ships of 80 m in length and above, the relevant regulations concerning shell and watertight subdivision openings contained in the *SOLAS - International Convention for the Safety of Life at Sea* 1974, and amendments thereto are also to be complied with.

CHAPTER 12 Ventilators, Air Pipes and Discharges

SECTION 1 General

1. 1 Application

1. 1. 1 This Chapter applies to all ship types detailed in Pt 4 Ship Structures (Ship Types), and provides requirements for ventilators, air and sounding pipes and overboard discharges.

1. 1. 2 The requirements conform, where relevant, with those of the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988* Reference should also be made to any additional requirements of the National Authority of the country in which the ship is to be registered and to the relevant regulations of the *SOLAS - International Convention for the Safety of Life at Sea* and applicable amendments.

1. 2 Protection

1. 2. 1 In all cargo spaces and other areas where mechanical damage is likely, all air and sounding pipes, scuppers and discharges, including their valves, controls and indicators, are to be well protected. This protection is to be of steel or other equivalent material.

PART

3

CHAPTER **12 Ventilators, Air Pipes and Discharges**

SECTION **2 Ventilators**

2. 1 General

2. 1. 1 Ventilators located on the exposed deck over the forward 0.25L of the rule length, of ships of sea-going service of length 80 m or more, where the height of the exposed deck in way of the item is less than 0.1L or 22 m above the summer load waterline, whichever is the lesser, are to comply with the requirements of Pt 3, Ch 12, 5 Air pipes, ventilator pipes and their securing devices located on the exposed fore deck. All other ventilators are to comply with the following requirements.

2. 1. 2 Special care is to be taken in the design and positioning of ventilator openings and coamings, particularly in the region of the forward end of superstructures and other points of high stress. The deck plating in way of the coamings is to be efficiently stiffened.

2. 1. 3 Ventilators from deep tanks and tunnels passing through 'tween decks are to have scantlings suitable for withstanding the pressures to which they may be subjected, and are to be made watertight.

2. 1. 4 For height and location of cargo tank vent outlets, *See* the *Rules for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk* (hereinafter referred to as the Rules for Ships for liquefied Gases), or the *Rules for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk* (hereinafter reffered to as the Rules for Ships for Liquid Chemicals), where applicable.

2. 2 Coamings

2. 2. 1 The scantlings and height of ventilator coamings exposed to the weather are to be not less than required by Table 12. 2. 1: Ventilator coaming requirements but the thickness need not exceed that of the adjacent deck or bulkhead plating. In particularly exposed positions, the height of coamings and scantlings may be required to be increased.

Table 12. 2. 1: Ventilator coaming requirements

Feature	Requirements
Height (measured above sheathing if fitted)	(1) z_c=900 mm at Position 1(*See* Pt 3, Ch 1, 6.6 Position 1 and Position 2)
	z_c = 760 mm at Position 2(*See* Pt 3, Ch 1, 6.6 Position 1 and Position 2)
Thickness	(2) $t_c = 5.5 + 0.01\delta_v$mm where 7.5 mm $\leq t_c \leq$ 10.0 mm

Support	(3) If $z_c > 900$ mm the coaming is to be specially supported
Symbols	
t_c = thickness of coaming, in mm z_c = height of coaming, in mm δ_v = internal diameter of coaming, in mm	
Note Where the height of the ventilator exceeds that given in Item (1), the thickness given by (2) may be generally reduced, above that height, to a minimum of 6.5 mm. The ventilator is to be adequately stayed.	

2. 2. 2 Where ventilators in locations above Position 2 are included in the consideration of intact and damage stability or are in critical locations above Position 2, then the height of ventilator coamings is to be specially considered.

2. 2. 3 The height of ventilator coamings may be required to be increased on ships of Type `A', Type `B-100' and Type `B-60' where this is shown to be necessary by the floatability calculations required by the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988* .

2. 2. 4 For gooseneck ventilators, the coaming height is to be measured to the underside of the bend, this being the lowest point through which water on deck could pass freely to spaces below.

2. 2. 5 Where wall vents are fitted with an internal baffle which rises above the lower edge of the exterior opening, the coaming height is measured to the top of the baffle.

2. 2. 6 Where permitted by the National Authority, ventilator coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable, with a minimum height of 450 mm in Position 1 and 300 mm in Position 2.

2. 3 Closing appliances

2. 3. 1 All ventilator openings are to be provided with efficient weathertight closing appliances of steel or other equivalent material unless:

a. the height of the coaming is greater than 4.5 m where Table 12. 2. 1: Ventilator coaming requirements requires a minimum height of 900 mm; or
b. the height of the coaming is greater than 2.3 m where Table 12. 2. 1: Ventilator coaming requirements requires a minimum height of 760 mm.

2. 3. 2 In ships where the load line length, L_L (*See* Pt 3, Ch 1, 6.1, Principal particulars), is not more than 100 m, the closing appliances are to be permanently attached to the ventilator coaming. Where not so provided in other ships, they are to be conveniently stowed near the ventilator to which they are to be fitted.

2. 3. 3 Where, in ferries, ventilators are proposed to be led overboard in an enclosed 'tween deck, the closing arrangements are to be submitted for approval. If such ventilators are led overboard more than 4.5 m above the main vehicle deck, closing appliances may be omitted, provided that satisfactory baffles and drainage arrangements are provided, as in the case of air intakes or exhaust openings for machinery spaces, which may be arranged in the sides of the ship.

2. 3. 4 On offshore supply ships, to ensure satisfactory operation in all weather conditions, machinery space ventilation inlets and outlets are to be located in such positions that closing appliances will not be necessary.

2. 3. 5 Mushroom ventilators closed by a head revolving on a centre spindle (screw down head) are acceptable in Position 2, and also in sheltered positions in Position 1, excluding those described

in Pt 3, Ch 12, 2.1 General 2.1.1, but the diameter is not to exceed 300 mm if situated within the forward $0.25L_L$.

2. 3. 6 Mushroom ventilators with a fixed head and closed by a screw down plate (screw down cover) may be accepted in exposed positions within the forward $0.25L_L$, excluding those described in Pt 3, Ch 12, 2.1 General 2.1.1, up to a diameter of 750 mm.

2. 3. 7 Wall ventilators (jalousies) may be accepted provided they are capable of being closed weathertight by hinged steel gasketed covers secured by bolts or toggles.

2. 3. 8 A ventilator head not forming part of the closing arrangements is to be not less than 6.5 mm thick.

2. 3. 9 In order to limit the fire growth potential in every space of the ship, the main inlets and outlets of all ventilation systems shall be capable of being closed from outside the spaces being ventilated. The means of closing shall be easily accessible as well as prominently and permanently marked and shall indicate whether the inlet or outlet is open or closed. Battery room ventilators are only to be fitted with a means of closing, whenever:

a. the battery room does not open directly on to an exposed deck; or
b. the ventilation opening for the battery room is required to be fitted with a closing device according to the Load Line Convention; or
c. the battery room is fitted with a fixed gas fire extinguishing system.

Where a battery room ventilator is fitted with a closing device *See* Pt 6, Ch 2, 12.5 Thermal management and ventilation 12.5.2.

2. 4 Machinery spaces

2. 4. 1 In general, ventilators necessary to continuously supply the machinery space are to have coamings of sufficient height to comply with Pt 3, Ch 12, 2.3 Closing appliances 2.3.1 without having to fit weathertight closing appliances. Ventilators to emergency generator rooms are to be so positioned that closing appliances are not required.

2. 4. 2 Where due to ship size and arrangement this is not practicable, lesser heights for machinery space ventilator coamings fitted with weathertight closing appliances may be permitted by the administration in combination with other suitable arrangements to ensure uninterrupted, adequate supply of ventilation to these spaces.

2. 4. 3 Where closing appliances are fitted to ventilators serving emergency generator rooms or ventilation louvres are used for emergency generator rooms, the following requirements are to be applied in addition to the requirements of Pt 3, Ch 12, 2.4 Machinery spaces 2.4.2:

a. Ventilation louvres and closing appliances may either be hand-operated or power-operated (hydraulic/pneumatic/electric) and are to be operable under a fire condition.
b. Hand-operated ventilation louvres and closing appliances are to be kept open during the normal operation of the vessel. Corresponding instruction notices are to be provided at the location where hand operation is provided.
c. Power-operated ventilation louvres and closing appliances are to open automatically whenever the emergency generator is starting/in operation. Closed ventilation louvres and closing appliances are acceptable during normal operation of the vessel. In the event of power failure, the default position of the ventilation louvres or closing appliances is to be the open position.
d. Ventilation openings are to be capable of being operated manually from a clearly marked safe position outside the space where the closing operation can be easily confirmed. The louvre status (open/closed) is to be indicated at this position. Such closing is not to be possible from any other remote position.

PART

3

CHAPTER **12 Ventilators, Air Pipes and Discharges**

SECTION **3 Air and sounding pipes**

3. 1 General

3. 1. 1 Air pipes located on the exposed deck over the forward 0.25*L* of the rule length, of ships of sea-going service of length 80 m or more, where the height of the exposed deck in way of the item is less than 0.1*L* or 22 m above the summer load waterline, whichever is the lesser, are to comply with the requirements of Section 5. All other air and sounding pipes are to comply with the following requirements in addition to the applicable requirements of Pt 5, Ch 13, 12 Air, overflow and sounding pipes and Pt 5, Ch 15, 2 Piping systems for bilge, ballast, fuel oil, etc..

3. 1. 2 Striking plates of suitable thickness, or their equivalent, are to be fitted under all sounding pipes.

3. 1. 3 On offshore supply ships, air pipes are to be situated clear of the cargo containment areas.

3. 2 Height of air pipes

3. 2. 1 The height of air pipes from the upper surface of decks exposed to the weather, to the point where water may have access below, is normally to be not less than:

- 760 mm on the freeboard deck;
- 450 mm on the superstructure deck;
- these heights being measured above deck sheathing, where fitted.

3. 2. 2 Lower heights may be approved in cases where these are essential for the working of the ship, provided that the design and arrangements are otherwise satisfactory. In such cases, efficient, permanently attached closing appliances of an approved automatic type will generally be required.

3. 2. 3 The height of air pipes may be required to be increased on ships of Type `A', Type `B-100' and Type `B-60' where this is shown to be necessary by the floatability calculations required by the *International Convention on Load Lines, 1966.* An increase in height may also by required or recommended by individual Administrations when air pipes to fuel oil and settling tanks are situated in positions where sea water could be temporarily entrapped, e.g. in recesses in the sides and ends of superstructures or deckhouses, between hatch ends, behind high sections of bulwark, etc. This may entail an increase in tank scantlings, *See also* Pt 3, Ch 3 Structural Design.

3. 2. 4 Air pipes are generally to be led to an exposed deck. For alternative arrangements in an enclosed space on a main vehicle deck, *See* Pt 4, Ch 2, 9 Subdivision structure on vehicle deck.

3. 2. 5 Where air pipes are led through the side of superstructures, the opening is to be at least 2.3 m above the summer load waterline.

3. 2. 6 The minimum wall thickness of air pipes in positions indicated in Pt 3, Ch 12, 3.2 Height of air pipes 3.2.1 is to be:

- 6.0 mm for pipes of 80 mm external diameter or smaller;

- 8.5 mm for pipes of 165 mm external diameter or greater.

Intermediate minimum thicknesses are to be determined by linear interpolation.

3. 2. 7 Where permitted by the National Authority, air pipe coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable, with a minimum height of 450 mm on the freeboard deck and 300 mm on a superstructure deck.

3. 3 Closing appliances

3. 3. 1 All openings of air and sounding pipes are to be provided with permanently attached, satisfactory means of closing to prevent the free entry of water, *See also* Pt 3, Ch 12, 3.2 Height of air pipes 3.2.2.

3. 3. 2 Closing appliances are to be of an approved automatic type.

3. 3. 3 Pressure/vacuum valves as required by Pt 5, Ch 15, 4 Cargo tank venting, purging and gas-freeing may be accepted as closing appliances for cargo tanks.

PART

3

CHAPTER **12 Ventilators, Air Pipes and Discharges**

SECTION **4 Scuppers and sanitary discharges**

4. 1 General

4. 1. 1 Scuppers sufficient in number and size to provide effective drainage are to be fitted in all decks.

4. 1. 2 Scuppers draining weather decks and spaces within superstructures or deckhouses not fitted with efficient weathertight doors are to be led overboard.

4. 1. 3 Where the freeboard is such that the freeboard deck edge is immersed when the ship heels 5° or less, scuppers and discharges which drain spaces below the freeboard deck, or spaces within intact superstructures or deckhouses on the freeboard deck fitted with efficient weathertight doors, are to be led to the bilges in the case of scuppers or to suitable sanitary tanks in the case of sanitary discharges. Where the freeboard is such that the freeboard deck edge is immersed when the ship heels greater than 5° then they may be led overboard and fitted with means of preventing water from passing inboard in accordance with Pt 3, Ch 12, 4.2, Closing appliances.

4. 1. 4 In ships where an approved fixed pressure water spray fire–extinguishing system is fitted in vehicle or cargo spaces, deck scuppers of not less than 150 mm diameter are to be provided port and starboard, spaced about 9.0 m apart. The scupper area will require to be increased if the design capacity of the drencher system exceeds the Rule required capacity by 10 per cent or more. After installation, the two adjacent sections with the greatest aggregate drencher capacity are to be tested in operation to ensure that there is no build up of water on the deck, *See also* Pt 4, Ch 2, 11.2 Openings in main vehicle deck 11.2.2. The mouth of the scupper is to be protected by bars.

4. 1. 5 Where a sewage system is fitted, the shipside valves on the discharge pipe from the effluent tank(s) and the by-pass system are to comply with Pt 3, Ch 12, 4.2, Closing appliances.

4. 1. 6 The minimum wall thickness of pipes not indicated in Pt 3, Ch 12, 4.2 Closing appliances 4.2.6 is to be:

- 4.5 mm for pipes of 155 mm external diameter or smaller.
- 6.0 mm for pipes of 230 mm external diameter or greater.

Intermediate minimum thicknesses are to be determined by linear interpolation.

4. 1. 7 For the use of non-metallic pipe, *See* Pt 5, Ch 12, 5 Plastic pipes.

4. 1. 8 Scuppers and discharge pipes should not normally pass through fuel oil or cargo oil tanks. Where scuppers and discharge pipes pass, unavoidably, through fuel oil or cargo oil tanks, and are led through the shell within the tanks, the thickness of the piping should be at least the same thickness as Rule shell plating in way, derived from the appropriate Chapters, but need not exceed 19 mm.

4. 1. 9 Piping within tanks is to be tested in accordance with Pt 3, Ch 1, 8 Inspection and workmanship.

4. 1. 10 All piping is to be adequately supported.

4. 1. 11 *See also* the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk* or the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk*, where applicable.

4. 1. 12 For additional requirements for scuppers and sanitary discharges on dredging and reclamation craft, *See* Pt 4, Ch 12, 15 Spoil space weirs and overflows.

4. 2 Closing appliances

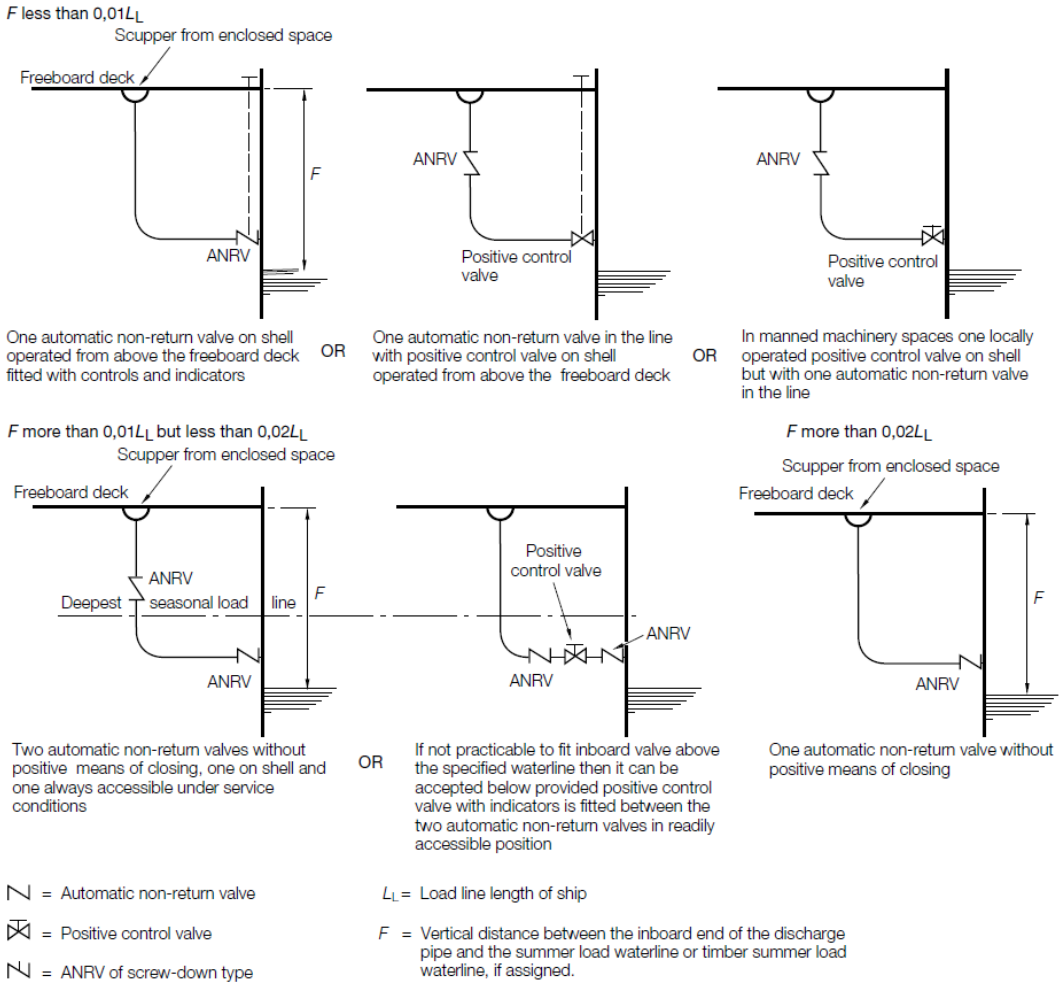
4. 2. 1 In general, each separate overboard discharge is to be fitted with a screw-down non-return valve capable of being operated from a position always accessible and above the freeboard deck. An indicator is to be fitted at the control position showing whether the valve is open or closed. A machinery space, whether manned or unattended (i.e. with **UMS** notation), is considered accessible. Cargo holds or spaces with access only by hatches or bolted manholes are not considered accessible.

4. 2. 2 Where a drencher fire-extinguishing system is provided in an enclosed vehicle space of a ferry, the scupper controls are to be operated from a position above the bulkhead deck, and outside the vehicle space protected by the drencher system, and are to be protected from mechanical damage.

4. 2. 3 Where the vertical distance from the summer load waterline to the inboard end of the discharge pipe exceeds $0.01L_L$ the discharge may be fitted with two automatic non-return valves without positive means of closing, instead of the screw-down non-return valve, provided that the inboard valve is always accessible for examination under service conditions.

4. 2. 4 Where the vertical distance from the summer load waterline to the inboard end of the discharge pipe exceeds $0.02L_L$, a single automatic non-return valve without positive means of closing may be fitted, *See* Figure 12. 4. 1: Diagrammatic arrangement of discharge valves.

Figure 12. 4. 1: Diagrammatic arrangement of discharge valves



4. 2. 5 The requirements for non-return valves are applicable only to those discharges which remain open during the normal operation of the ship. For discharges which are closed at sea, such as gravity drains from topside ballast tanks, a single screw down valve operated from the freeboard deck is considered to provide sufficient protection.

4. 2. 6 Scuppers and discharge pipes originating at any level which penetrate the shell either more than 450 mm below the freeboard deck or less than 600 mm above the summer load waterline, are to be fitted with an automatic non-return valve at the shell. This valve, unless required by Pt 3, Ch 12, 4.1 General 4.1.3, may be omitted provided the piping has a minimum wall thickness of:

- 7.0 mm for pipes of 80 mm external diameter or smaller;
- 10.0 mm for pipes of 180 mm external diameter;
- 12.5 mm for pipes of 220 mm external diameter or greater.

Intermediate minimum thicknesses are to be determined by linear interpolation. Unless required by Pt 3, Ch 12, 4.1 General 4.1.8, the maximum thickness need not exceed 12.5 mm.

4. 2. 7 The outboard valve is to be mounted directly on the shell and secured in accordance with Pt 5, Ch 13, 2.5 Ship-side valves and fittings (other than those on scuppers and sanitary discharges) 2.5.1. If this is impracticable, a short distance piece of rigid construction may be introduced between the valve and the shell. Valves should not be fitted in cargo tanks.

4. 2. 8 If a valve is required by Pt 3, Ch 12, 4.1 General 4.1.3, this valve should preferably be fitted as close as possible to the point of entry of the pipe into the tank. If fitted below the freeboard deck, the valve is to be capable of being controlled from an easily accessible position above the freeboard deck. Local control is also to be arranged, unless the valve is inaccessible. An indicator is to be fitted at the control position showing whether the valve is open or closed.

4. 2. 9 In a ship to which timber freeboards are assigned, the summer load waterline is to be regarded as that corresponding to the timber summer freeboard.

4. 2. 10 For ship side valves and fittings (other than those on scuppers and sanitary discharges), *See* Pt 5, Ch 13, 2 Construction and installation and Pt 6, Ch 1, 2 Essential features for control, alarm, monitoring and safety systems .

4. 3 Rubbish chutes, offal and similar discharges

4. 3. 1 Rubbish chutes, offal and similar discharges should be constructed of mild steel piping or plating of shell thickness. Other materials will be specially considered. Openings are to be kept clear of the sheerstrake and areas of high stress concentration.

4. 3. 2 Rubbish chute hoppers are to be provided with a hinged weathertight cover at the inboard end with an interlock so that the discharge flap and hopper cover cannot be open at the same time. The hopper cover is to be secured closed when not in use, and a suitable notice displayed at the control position.

4. 3. 3 Where the inboard end of the hopper is less than $0.01L_{\text{L}}$ above the summer load waterline, a suitable valve with positive means for closing is to be provided in addition to the cover and flap in an easily accessible position above the deepest seasonal waterline. The valve is to be controlled from a position adjacent to the hopper and provided with an open/shut indicator. The valve is to be kept closed when not in use, and a suitable notice displayed at the valve operating position.

4. 3. 4 Where damage stability requirements apply and the inboard end of the chute is below the equilibrium waterlines, or in passenger ships, where the inboard end of a rubbish chute is below the margin line; *See* Pt 3, Ch 11, 8.2 General 8.2.8.b.

4. 3. 5 In trawlers or fish factory ships, offal discharges in the fish working spaces are to be provided with either a non-return flap, preferably fitted at the shell which can be positively secured weathertight, or a separate positively controlled valve kept closed when not in use. A suitable notice is to be displayed at the flap or valve operating position.

4. 4 Materials for valves, fittings and pipes

4. 4. 1 All shell fittings and valves required by Pt 3, Ch 12, 4.2, Closing appliances are to be of steel, bronze or other approved ductile material; ordinary cast iron or similar material is not acceptable. Materials are to satisfy the requirements of the Pt 2 Rules for the Manufacture, Testing and Certification of Materials.

4. 4. 2 All these items, if made of steel or other approved material with low corrosion resistance, are to be suitably protected against wastage.

4. 4. 3 The lengths of pipe attached to the shell fittings, elbow pieces or valves are to be of galvanised steel or other equivalent approved material.

PART

3

CHAPTER **12 Ventilators, Air Pipes and Discharges**

SECTION **5 Air pipes, ventilator pipes and their securing devices located on the exposed fore deck**

5. 1 General

5. 1. 1 For the application of the following requirements relating to ventilators, *See* Pt 3, Ch 12, 2.1 General 2.1.1. For the application of the following requirements relating to air pipes, *See* Pt 3, Ch 12, 3.1 General 3.1.1. Air pipes complying with the following requirements are also to comply with the applicable requirements of Pt 5, Ch 13, 12 Air, overflow and sounding pipes and Pt 5, Ch 15, 2.5 Air and sounding pipes.

5. 1. 2 Special care is to be taken in the design and positioning of ventilator openings and coamings, particularly in the region of the forward end of superstructures and other points of high stress. The deck plating in way of the coamings is to be efficiently stiffened.

5. 1. 3 Ventilators from deep tanks and tunnels passing through 'tween decks are to have scantlings suitable for withstanding the pressures to which they may be subjected, and are to be made watertight.

5. 1. 4 For height and location of cargo tank vent outlets, *See* the Rules for Ships for Liquefied Gases, or Rules for Ships for Liquid Chemicals, where applicable.

5. 1. 5 On offshore supply ships, air pipes are to be situated clear of the cargo containment areas.

5. 2 Loading

5. 2. 1 The design pressure acting on air pipes, ventilator pipes and their closing devices is to be taken as not less than:

$$p = 0.5\rho V^2 C_d C_s C_p \text{kN/m2}$$

Where

P = density of sea water (1.025 t/m^3)

V = velocity of water over the fore deck

= 13.5 m/sec for $d \leq 0.5d_1$

$$= 13.5\sqrt{2(1-\frac{d}{d_1})} \text{for d} > 0.5\text{d}_1$$

d = distance from summer load waterline to exposed deck

d_1 = 0.1L but need not be taken as greater than 22 m

C_d = shape coefficient (0.5 for pipes,1.3 for air pipe or ventilator heads in general and 0.8 for an air pipe or ventilator head of cylindrical form with its axis in the vertical direction)

C_s = slamming coefficient (3.2)

C_p = protection coefficient (0.7 for pipes and ventilator heads located immediately behind a breakwater or forecastle and 1.0 elsewhere and immediately behind a bulwark).

5. 2. 2 Forces acting in the horizontal direction on the pipe and its closing device are to be not less than those calculated from Pt 3, Ch 12, 5.2 Loading 5.2.1 using the largest projected area of each component.

5. 3 Strength requirements

5. 3. 1 Bending moments and stresses in air and ventilator pipes are to be calculated at critical positions:

- at penetration pieces;
- at weld or flange connections; and
- at toes of supporting brackets.

5. 3. 2 Bending stresses in the net section are not to exceed $0.8\sigma_y$, where σ_y is the specified minimum yield stress or 0.2 per cent proof stress of the steel at room temperature. Irrespective of corrosion protection, a corrosion addition to the net section of 2.0 mm is then to be applied.

5. 3. 3 For standard air pipes of 760 mm coaming height closed by heads of not more than the tabulated projected area, pipe thicknesses and bracket heights are specified in Table 12. 5. 1: Air pipe thickness and bracket standards. Where brackets are required, three or more radial brackets are to be fitted. Brackets are to be of gross thickness 8 mm or more, of minimum length 100 mm, and height according to Table 12. 5. 1: Air pipe thickness and bracket standards but need not extend over the joint flange for the head. Bracket toes at the deck are to be suitably supported.

Table 12. 5. 1: Air pipe thickness and bracket standards

	Minimum	Maximum	
Nominal pipe	fitted gross	projected area	Height(1) of
diameter,	thickness,	of head,	brackets,
in mm	in mm	in cm^2	in mm
65A	6.0	-	480
80A	6.3	-	460
100A	7.0	-	380
125A	7.8	-	300
150A	8.5	-	300
175A	8.5	-	300

200A	8.5(2)	1900	300(2)
250A	8.5(2)	2500	300(2)
300A	8.5(2)	3200	300(2)
350A	8.5(2)	3800	300(2)
400A	8.5(2)	4500	300(2)
(1)	Brackets (*See* Pt 3, Ch 12, 5.3 Strength requirements 5.3.3) need not extend over the joint flange for the head.		
(2)	Brackets are required where the as fitted (gross) thickness is less than 10.5mm, or where the tabulated projected head area is exceeded.		
Note For other pipe heights, the relevant requirements of Pt 3, Ch 12, 5.3, Strength requirements are to be applied.			

5. 3. 4 For other configurations, loads according to Pt 3, Ch 12, 5.2, Loading are to be applied, and means of support determined in order to comply with the requirements of Pt 3, Ch 12, 5.3 Strength requirements 5.3.1 and Pt 3, Ch 12, 5.3 Strength requirements 5.3.2. Brackets, where fitted, are to be of suitable thickness and length according to their height. Pipe thickness is not to be taken less than as indicated in Pt 5, Ch 12 Piping Design Requirements.

Table 12. 5. 2: 900 mm Ventilator pipe thickness and bracket standards

	Minimum	Maximum	
Nominal pipe	fitted gross	projected area	Height of
diameter,	thickness,	of head,	brackets,
in mm	in mm	in cm^2	in mm
80A	6.3	-	460
100A	7.0	-	380
150A	8.5	-	300
200A	8.5	550	-
250A	8.5	880	-
300A	8.5	1200	-
350A	8.5	2000	-
400A	8.5	2700	-
450A	8.5	3300	-
500A	8.5	4000	-
Note For ventilator heights other than 900 mm, the relevant requirements of 5.3 are to be applied.			

5. 3. 5 For standard ventilators of 900 mm coaming height closed by heads of not more than the tabulated projected area, pipe thicknesses and bracket heights are specified in Table 12. 5. 2: 900 mm Ventilator pipe thickness and bracket standards. Brackets, where required, are to be as specified in Pt 3, Ch 12, 5.3 Strength requirements 5.3.3.

5. 3. 6 For ventilators of coaming height greater than 900 mm, the coaming support will be specially considered. Pipe thickness is not to be taken less than as indicated in Pt 5, Ch 12 Piping Design Requirements.

5. 3. 7 All component parts and connections of the air pipe or ventilator are to be capable of withstanding the loads defined in Pt 3, Ch 12, 5.2, Loading.

5. 4 Ventilator coamings

5. 4. 1 The height of ventilator coamings is to be not less than 900 mm, this height being measured above deck sheathing, where fitted. In particularly exposed positions, the heights of coamings and scantlings may be required to be increased.

5. 4. 2 The height of ventilator coamings may be required to be increased on ships of Type 'A', Type 'B-100' and Type 'B-60' where this is shown to be necessary by the floatability calculations required by the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988*.

5. 4. 3 For gooseneck ventilators, the coaming height is to be measured to the underside of the bend, this being the lowest point through which water on deck could pass freely to spaces below.

5. 4. 4 Where wall vents are fitted with an internal baffle which rises above the lower edge of the exterior opening, the coaming height is measured to the top of the baffle.

5. 4. 5 Where permitted by the National Authority, ventilator coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable, with a minimum height of 450 mm.

5. 5 Height of air pipes

5. 5. 1 The height of air pipes from the upper surface of decks exposed to the weather, to the point where water may have access below is normally to be not less than 760 mm, this height being measured above deck sheathing, where fitted.

5. 5. 2 Lower heights may be approved in cases where these are essential for the working of the ship, provided that the design and arrangements are otherwise satisfactory. In such cases, efficient, permanently attached closing appliances of an approved automatic type will generally be required.

5. 5. 3 The height of air pipes may be required to be increased on ships of Type 'A', Type 'B-100' and Type 'B-60' where this is shown to be necessary by the floatability calculations required by the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988*. An increase in height may also be required or recommended by individual Administrations when air pipes to fuel oil and settling tanks are situated in positions where sea-water could be temporarily entrapped, e.g. in recesses in the sides and ends of superstructures or deckhouses, between hatch ends, behind high sections of bulwark, etc. This may entail an increase in tank scantlings, *See also* Pt 3, Ch 3 Structural Design.

5. 5. 4 Air pipes are generally to be led to an exposed deck. For alternative arrangements in an enclosed space on a main vehicle deck, *See* Pt 4, Ch 2, 9 Subdivision structure on vehicle deck.

5. 5. 5 Where air pipes are led through the side of superstructures, the opening is to be at least 2.3 m above the summer load waterline.

5. 5. 6 Where permitted by the National Authority, air pipe coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable, with a minimum height of 450 mm.

5. 6 Closing appliances for ventilators

5. 6. 1 All ventilator openings are to be provided with efficient weathertight closing appliances unless the height of the coaming is greater than 4.5 m.

5. 6. 2 In ships where the load line length, L_L (*See* Pt 3, Ch 1, 6.1, Principal particulars), is not more than 100 m, the closing appliances are to be permanently attached to the ventilator coaming. Where not so provided in other ships, they are to be conveniently stowed near the ventilator to which they are to be fitted.

5. 6. 3 Where, in ferries, ventilators are proposed to be led overboard in an enclosed 'tween deck, the closing arrangements are to be submitted for approval. If such ventilators are led overboard more than 4.5 m above the main vehicle deck, closing appliances may be omitted, provided that satisfactory baffles and drainage arrangements are provided, as in the case of air intakes or exhaust openings for machinery spaces, which may be arranged in the sides of the ship.

5. 6. 4 On offshore supply ships, to ensure satisfactory operation in all weather conditions, machinery space ventilation inlets and outlets are to be located in such positions that closing appliances will not be necessary.

5. 6. 5 Rotating type mushroom ventilator heads are unsuitable for application on the exposed fore deck.

5. 6. 6 Wall ventilators (jalousies) may be accepted provided they are capable of being closed weathertight by hinged steel gasketed covers secured by bolts or toggles.

5. 6. 7 A ventilator head not forming part of the closing arrangements is to be not less than 6.5 mm thick.

5. 7 Closing appliances for air pipes

5. 7. 1 All openings of air pipes are to be provided with permanently attached, satisfactory means of closing to prevent the free entry of water, *See also* Pt 3, Ch 12, 5.5 Height of air pipes 5.5.2.

5. 7. 2 Closing appliances are to be of an approved automatic type where, with the ship at its summer load waterline, the openings are immersed at an angle of heel of 40° or, the angle of down flooding if this is less than 40°. *See also* Pt 3, Ch 3, 6 Minimum bow heights, reserve buoyancy and extent of forecastle.

5. 7. 3 Where the closing appliances are not of an automatic type, provision is to be made for relieving vacuum when the tanks are being pumped out.

5. 7. 4 In a ship to which timber freeboards are assigned, air pipes which will be inaccessible when the deck cargo is carried are to be provided with approved automatic closing appliances.

5. 7. 5 Pressure/vacuum valves as required by Pt 5, Ch 15, 4 Cargo tank venting, purging and gas-freeing may be accepted as closing appliances for cargo tanks.

CHAPTER **13 Ship Control Systems**

SECTION **1 General**

1. 1 Application

1. 1. 1 This Chapter applies to all the ship types detailed in Pt 4 Ship Structures (Ship Types), and requirements are given for rudders, nozzles, steering gear, bow and stern thrust unit structure, stabiliser structure, anchoring and mooring equipment, and emergency towing arrangements.

1. 1. 2 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation (*See* Pt 1, Ch 2, 2.3 Class notations (hull)) with the exception of the following:

- For Double Hull Tankers; Sections Pt 3, Ch 13, 2 Rudders to Pt 3, Ch 13, 6 Stabiliser structure are to be complied with as applicable.
- For Bulk Carriers; Sections Pt 3, Ch 13, 3 Fixed and steering nozzles to Pt 3, Ch 13, 6 Stabiliser structure and Section Pt 3, Ch 13, 12 Emergency towing arrangements are to be complied with as applicable.

1. 2 General symbols

1. 2. 1 The following symbols and definitions are applicable to this Chapter, unless otherwise stated:

L, B and C_b as defined in Pt 3, Ch 1, 6.1, Principal particulars

σ_o = minimum yield stress or 0. 5 per cent proof stress of the material, in N/mm^2

k = higher tensile steel factor, *See* Pt 3, Ch 2, 1.2, Steel.

1. 3 Navigation in ice

1. 3. 1 Where an ice class notation is included in the class of a ship, additional requirements are applicable as detailed in Pt 8 Rules for Ice and Cold Operations.

1. 4 Podded propulsion

1. 4. 1 Where podded propulsion is included in the class of a ship, additional requirements as detailed in Pt 5, Ch 9 Podded Propulsion Units are to be complied with, as applicable.

PART

3

CHAPTER **13 Ship Control Systems**

SECTION **2 Rudders**

2. 1 Application

2. 1. 1 This Section applies to ordinary profile rudders, and to some enhanced profile rudders with special arrangements for increasing the rudder force, as defined in Table 13. 2. 2: Rudder profiles.

2. 2 Design considerations

2. 2. 1 Effective means are to be provided for supporting the weight of the rudder without excessive bearing pressure, e.g. by a rudder carrier attached to the upper part of the rudder stock. The hull structure in way of the rudder carrier is to be suitably strengthened.

2. 2. 2 Suitable arrangements are to be provided to prevent the rudder from lifting.

2. 2. 3 In rudder trunks which are open to the sea, a seal or stuffing box is to be fitted above the deepest load waterline, to prevent water from entering the steering gear compartment and the lubricant from being washed away from the rudder carrier. If the top of the rudder trunk is below the deepest load waterline, two separate stuffing boxes are to be provided. Rudder trunk boundaries, where exposed to the sea, are to have a corrosion protection coating applied in accordance with the manufacturer's instructions.

2. 3 Materials

2. 3. 1 The requirements for materials are contained in the Part 2

2. 3. 2 Stern frames, rudder horns, shaft brackets, rudder stocks, pintles, coupling bolts, keys, and other rudder members are to be made of rolled, forged or cast carbon-manganese steel in accordance with Ch 3 Rolled Steel Plates, Strip, Sections and Bars, Ch 4 Steel Castings and Ch 5 Steel Forgings of the Part 2. The requirements for stern frames, rudder horns and shaft brackets are to be in accordance with Pt 3, Ch 6, 7 Sternframes and appendages.

2. 3. 3 For rudder stocks, pintles, coupling bolts and keys the minimum yield stress is not to be less than 200 N/mm^2.

2. 3. 4 For all parts of the rudder, including rudder stocks, pintles, coupling bolts and keys having a specified minimum yield stress differing from 235 N/mm^2, the material factor, k is to be determined in accordance with :

Table 13. 2. 1: Rudder material factor, *k*

Specified minimum yield stress, σ_o (N/mm^2)	k

$\sigma_o > 235$	$k = \left(\frac{235}{\sigma_0}\right)^{0.75}$
$\sigma_O \leq 235$	$k = \frac{235}{\sigma_0}$

Note 1. The specified minimum yield stress is not to be taken as greater than 70 per cent of the ultimate tensile strength.

Note 2.The specified minimum yield stress is not to be taken as greater than 450 N/mm^2.

2. 4 Welding and design details

2. 4. 1 Slot-welding is to be limited as far as possible. Slot welding is not to be used in areas subject to large in-plane stresses transverse to the slots or in way of cut-outs of semi-spade rudders. Continuous butt welding with backing may be accepted in lieu of slot welds. When continuous butt welding is applied, the root gap is to be between 6-10 mm. The bevel angle is to be at least 15°.

2. 4. 2 When slot welding is applied, the length of individual slots is to be not less than 75 mm with a minimum breadth of 2 times the plate thickness. The distance between ends of adjacent slots is to be not greater than 125 mm. The slots are to be fillet welded around the edges and filled with a suitable compound, e.g. epoxy putty. Slots are not to be filled with weld. The ends of slots are to be rounded.

2. 4. 3 The rudder, in way of rudder horn recesses of semi-spade rudders, are to have well radiused corners. The corner radii are not to be less than 5 times the local rudder plate thickness, but in no case less than 100 mm. Welding in the rudder side plating is to be positioned away from these corner radii. The weld connecting the side plate and the leading edge plate in way of these radiused corners is to be ground smooth.

2. 4. 4 Welds between plates and forged or cast parts or very thick plating are to be made as full penetration welds. In way of highly stressed areas e.g. cut-outs of semi-spade rudders and upper parts of spade rudders, cast or welded on ribs are to be arranged. Two sided full penetration welding is normally to be arranged. Where back welding is impossible welding is to be performed against ceramic backing bars or equivalent. Steel backing bars may be used and are to be continuously welded on one side to the heavy piece.

2. 5 Equivalence

2. 5. 1 Asia Classification Society *(hereinafter referred to as ACS)* may accept alternatives to the requirements given in this Section, provided they are deemed to be equivalent.

2. 5. 2 Direct analyses adopted to justify an alternative design are to take into consideration all relevant modes of failure, on a case by case basis. These failure modes may include, amongst others: yielding, fatigue, buckling and fracture. Possible damages caused by cavitation are also to be considered.

2. 5. 3 If deemed necessary by *ACS*, lab tests, or full scale tests may be requested to validate the alternative design approach.

2. 6 Rudder force

2. 6. 1 The lateral rudder force at the centre of pressure is to be determined for both ahead and astern conditions as follows:

$$C_R = 132K_1K_2K_3AV^2 \text{ N}$$

Where

A = rudder blade area, in m^2.

V = maximum service speed, in knots, for both the ahead and astern conditions.

= V_{ahead} is to be taken as the maximum service speed at the summer load waterline at maximum propeller RPM and corresponding engine MCR. Where this speed is less than 10 knots, V_{ahead} is to be replaced by the following expression:

V_{min} = $\frac{V_{ahead} + 20}{3}$

= V_{astern}, is to be taken as the maximum astern speed or $0.5V_{ahead}$, whichever is the greater.

K_1 = aspect ratio correction factor

= $\frac{\lambda + 2}{3}$

λ = $\frac{h_R^2}{A_t}$ but is not to be taken greater than 2.

h_R = mean height, in m, of the rudder blade, *See* Figure 13. 2. 1: Rudder co-ordinate system;

A_t = sum of rudder blade area A and area of rudder post or rudder horn, if any, within the mean height h_R, in m^2.

K_2 = rudder profile coefficient, *See*Table 13. 2. 2: Rudder profiles;

K_3 = 0.8 for rudders outside the propeller jet.

= 1.15 for rudders behind a fixed propeller nozzle.

= 1.0 otherwise.

Figure 13. 2. 1: Rudder co-ordinate system

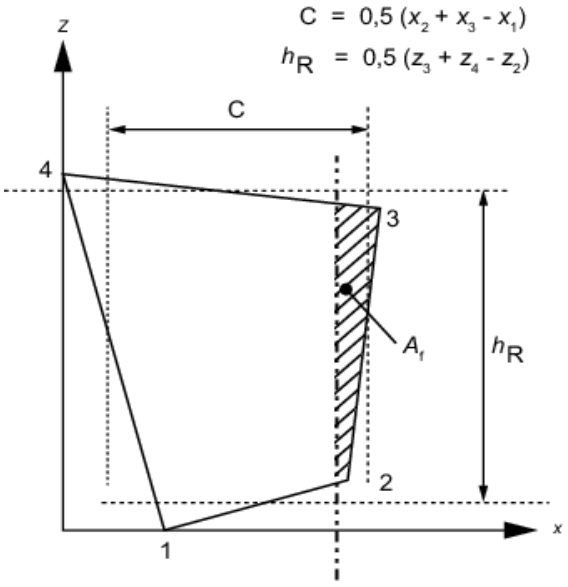

Table 13. 2. 2: *Rudder profiles*

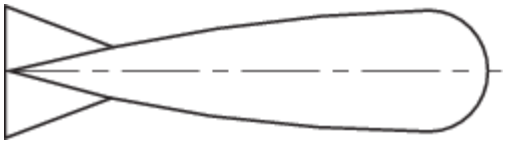
Profile Type	*K*2	
	Ahead condition	Astern condition
NACA-00 series 	1.10	0.80
Flat sided 	1.10	0.90
Hollow 	1.35	0.90
High lift rudders	1.70	To be specially considered
Fish tail	1.40	0.80

Single plate 	1.00	1.00
Mixed profiles	1.21	0.90
Note For rudder profiles not defined above, the value of K_2 may be determined on the basis of experimental results. These results are to be submitted for consideration.		

2. 7 Rudder torque for rudder blades without cut-outs

2. 7. 1 The maximum rudder torque, Q_R, is to be determined from both the ahead and astern conditions as follows:

$$Q_R = C_{R2}\text{Nm}$$

Where

C_R = lateral force acting on the rudder, as defined in Pt 3, Ch 13, 2.6 Rudder force 2.6.1.

r = distance from the centre of pressure to the centreline of the rudder stock.

$= c(\alpha - k_1)$, in m.

c = mean breadth of the rudder blade, (the mean chord length), in m, *See* Figure 13. 2. 1: Rudder co-ordinate system.

α = relative centre of pressure along the chord length, *See* Table 13. 2. 3: Relative centre of pressure along the chord length, α.

k_1 = ratio of the rudder blade area forward of the rudder stock centreline, to the rudder blade area:

$= \frac{A_f}{A}$

A_f = portion of the rudder blade area situated ahead of the centreline of the rudder stock.

For the ahead condition the rudder torque, Q_R is not to be taken less than:

$$Q_R = 0.1cC_R\text{Nm}$$

Table 13. 2. 3: Relative centre of pressure along the chord length, α

Condition	Behind fixed structure	Not behind a fixed structure
Ahead	0.25	0.33
Astern	0.55	0.66

Note Fixed structure is defined as any relatively stationary structure immediately ahead of the rudder, for example rudder horns of semi-spade rudders.

2. 8 Rudder torque for rudder blades with cut-outs (semi-spade rudders)

2. 8. 1 The maximum rudder torque, Q_R, is to be determined from both the ahead and astern conditions, for rudder blades with cut-outs, as follows. The pressure distribution for rudder blades with cut-outs is assumed to be proportional to the areas above and below the base of the cut-out. The rudder blade area, A, is to be divided into parts as per Figure 13. 2. 2: Rudder Areas.

$$Q_R \qquad Q_{R1} + Q_{R2} \text{Nm}$$

Where

Q_{R1} = $C_{R1} r_1$.

Q_{R2} = $C_{R2} r_2$

C_R = lateral force acting on the rudder, as defined in Pt 3, Ch 13, 2.6 Rudder force 2.6.1

C_{R1} = $C_R \frac{A_1}{A}$

C_{R2} = $C_R \frac{A_2}{A}$

r_1 = $c_1(\alpha - k_1)$, in m.

r_2 = $c_2(\alpha - k_2)$, in m.

c_1 = mean breadth, in m, of partial area A_1.

c_2 = mean breadth, in m, of partial area A_2.

α = relative centre of pressure along the chord length, *See* Table 13. 2. 3: Relative centre of pressure along the chord length, α.

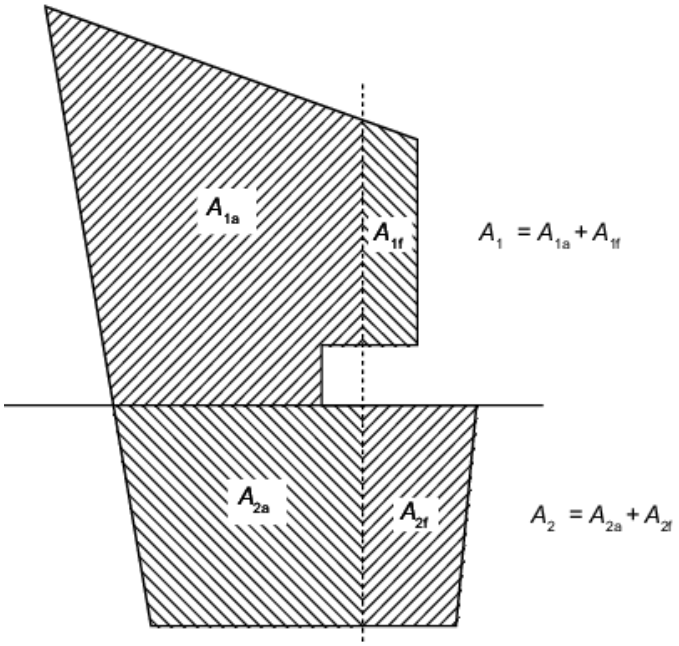
K_1 = $\frac{A_{1f}}{A_1}$

K_2 = $\frac{A_{2f}}{A_2}$

For the ahead condition the rudder torque, Q_R is not to be taken less than:

$$Q_R = 0.1 \frac{A_1 c_1 + A_2 c_2}{A} C_R \ Nm$$

Figure 13. 2. 2: Rudder Areas



2. 9 Rudder strength calculation

2. 9. 1 The rudder force and resulting rudder torques as given in Pt 3, Ch 13, 2.6, Rudder force, Pt 3, Ch 13, 2.7 Rudder torque for rudder blades without cut-outs or Pt 3, Ch 13, 2.8 Rudder torque for rudder blades with cut-outs (semi-spade rudders), cause bending moments and shear forces in the rudder body, bending moments and torques in the rudder stock, supporting forces in pintle bearings and rudder stock bearings and bending moments, shear forces and torques in rudder horns and heel pieces. The rudder body is to be stiffened by horizontal and vertical webs enabling it to act as a bending girder.

2. 9. 2 The bending moments, shear forces and torques as well as the reaction forces described in Pt 3, Ch 13, 2.9 Rudder strength calculation 2.9.1 are to be determined by direct calculations or where otherwise stated by an approximate simplified formulae. For rudders supported by sole pieces or rudder horns these structures are to be included in the calculation model in order to account for the elastic support of the rudder body.

2. 10 Rudder stock scantlings

2. 10. 1 The scantlings of the rudder stock are to be not less than required by Table 13. 2. 4: Rudder stock diameter.

The rudder stock diameter is to be dimensioned such that the stresses do not exceed the permissible stresses given in Table 13. 2. 5: Rudder stock permissible stresses.

2. 10. 2 Before significant reductions in rudder stock diameter due to the application of steels with yield stresses exceeding 235 N/mm^2 are granted, *ACS* may require the evaluation of the rudder stock deformations. Large deformations of the rudder stock are to be avoided in order to avoid excessive edge pressures in way of bearings.

2. 10. 3 For spade rudders the stock diameter corrected for higher tensile steel is to be greater than 90 per cent of the uncorrected stock diameter unless direct calculations are submitted showing that the slope of the stock at the lowest main bearing does not exceed 0.0035 when the rudder blade is

loaded by a lateral force of C_R, as defined in Pt 3, Ch 13, 2.6 Rudder force 2.6.1, acting at the center of pressure.

2. 10. 4 For rudders having an increased diameter of the rudder stock in way of the rudder, the increased diameter is to be maintained to a point as far as practicable above the top of the lowest bearing. The diameter may then be tapered to the diameter required in way of the tiller. The length of the taper is to be at least three times the reduction in diameter. Particular care is to be taken to avoid the formation of a notch at the upper end of the taper, *See* Figure 13. 2. 3: Rudder stock taper.

2. 10. 5 Sudden changes of section or sharp corners in way of the rudder coupling, jumping collars and shoulders for rudder carriers, are to be avoided. Jumping collars are not to be welded to the rudder stock. Keyways in the rudder stock are to have rounded ends and the corners at the base of the keyway are to be radiused.

Table 13. 2. 4: Rudder stock diameter

Item	Requirement
(1) Rudder stock diameter due to combined loads	$d_c = d_t \sqrt[6]{1 + \frac{4}{3}\left(\frac{M}{Q_R}\right)^2}$
(2) Rudder stock diameter required for transmission of the rudder torque (e.g. in way of tiller)	$d_t = 4.2\sqrt[3]{Q_R k}$
Symbols	
Q_R = maximum rudder torque, in Nm, as calculated in Pt 3, Ch 13, 2.8 Rudder torque for rudder blades with cut-outs (semi-spade rudders) M = bending moment, in Nm, at the section of the rudder stock under consideration, *See* Pt 3, Ch 13, 2.9 Rudder strength calculation 2.9.2.	
Note 1. If direct calculations are not carried out, then the following approximate formulae may be applied: For rudders with a heel support; $M = \frac{h_R}{10\left(\frac{c^2}{A}\right)} C_R$ For spade rudders; $M = C_R h_c$ For semi-spade rudders; $M = \frac{h_R}{10\left(1 + \frac{c^2}{A}\right)} C_R$ where h_R = mean height, in m, of the rudder blade, *See* Figure 13. 2. 1: Rudder co-ordinate system.	

h_c = the distance, in m, from the centroid of the rudder blade area to the centre of the lowest main bearing;

c = mean breadth of the rudder blade, (the mean chord length), in m, *See* Figure 13. 2. 1: Rudder co-ordinate system.

A = rudder blade area, in m^2.

Figure 13. 2. 3: Rudder stock taper

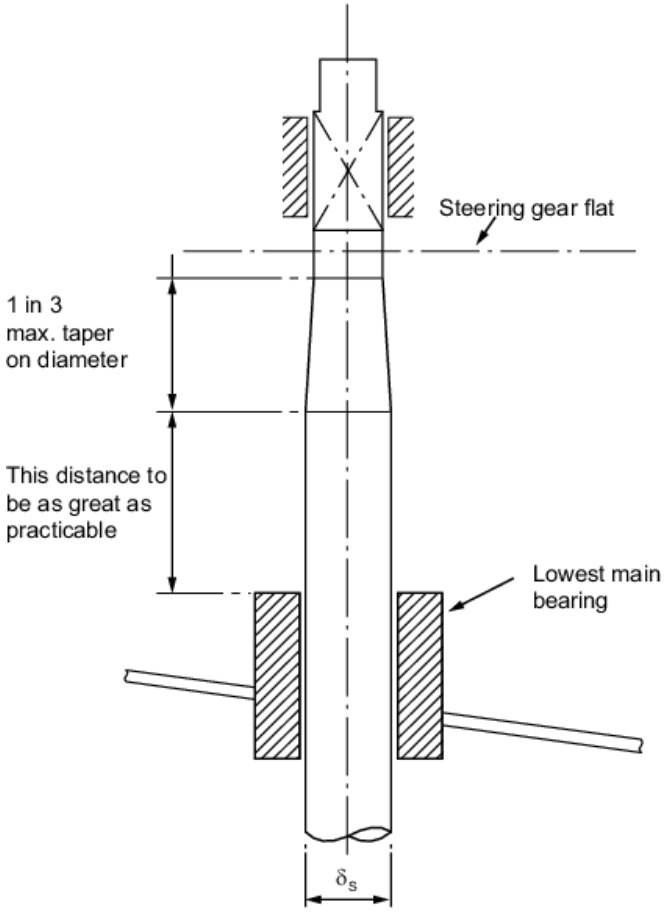


Table 13. 2. 5: Rudder stock permissible stresses

Mode	Permissible stress, N/mm^2
(1) Torsional shear stress, τ_t	$\frac{68}{k}$
(2) Equivalent stress, σ_c	$\frac{118}{k}$
Symbols	

Equivalent stress:

$$\sigma_c = \sqrt{\sigma_b^2 + 3\tau_t^2} \quad N/mm^2$$

Bending stress:

$$\sigma_b = 10.2 \times 10^3 \frac{M}{d_c^3} \quad \mathrm{N/mm^2}$$

Torsional stress:

$$\tau_t = 5.1 \times 10^3 \frac{Q_R}{d_c^3} \quad \mathrm{N/mm^2}$$

M = bending moment, in Nm, at the section of the rudder stock under consideration, *See* Pt 3, Ch 13, 2.9 Rudder strength calculation 2.9.2.

d_c= actual stock diameter, in mm.

2. 11 Rudder blade

2. 11. 1 The scantlings of a double plated rudder are to be not less than required by Table 13. 2. 6: Double plated rudder construction.

2. 11. 2 The scantlings of single plate rudders are to be not less than required by Table 13. 2. 7: Single plate rudder construction.

2. 11. 3 All rudders are to be dimensioned such that the stresses do not exceed the permissible stresses given in Table 13. 2. 8: Rudder blade permissible stresses.

2. 11. 4 In way of rudder couplings, pintles, and cut-outs of semi-spade rudders the plating thickness is to be suitably increased. Adequate hand or access holes are to be arranged in the rudder plating in way of pintles as required, and the rudder plating is to be reinforced locally in way of these openings, *See* Table 13. 2. 9: Thickness of side plating and vertical web plates in way of solid parts.

2. 11. 5 For spade rudders fitted with a fabricated rectangular mainpiece, the mainpiece is to be designed with its forward and aft transverse sections at similar distances forward and aft of the rudder stock transverse axis.

2. 11. 6 Internal surfaces of double plate rudders are to be efficiently coated. Alternatively, where it is intended to fill the rudder with plastic foam or use a corrosion inhibitor, details are to be submitted. Means for draining the rudder are to be provided.

Table 13. 2. 6: Double plated rudder construction

Item	Requirement
(1) Rudder side, top and bottom plating	$t = 5.5s\beta\sqrt{k(T + \frac{C_R 10^{-4}}{A})} + 2.5\ mm$
(2) Webs, vertical and horizontal	tw ≥ 0.7t but is not to be less than 8 mm
(3) Nose plate	tn ≥ 1.25t but need not exceed 22 mm

(4) Mainpiece, (*See* Notes 1 and 2)	Rectangular (fabricated)	Breadth and width ≥ d_c The side plating of the mainpiece is to extend 0.2c and is to be in accordance with (1) and the vertical webs as per (2), but in no case are either to be less than tM.	$t_M \geq 8.5 + 0.56\sqrt{d_c}\sqrt[3]{k}$ mm (*See* Note 3 and 4)
	Tubular	Inside diameter ≥ d_c	
Symbols			
T = draught, in m, as given in Pt 3, Ch 1, 6.1, Principal particulars; C_R = rudder force, in N, as defined in Pt 3, Ch 13, 2.6 Rudder force 2.6.1; A = rudder area, in m^2; $\beta = \sqrt{1.1 - 0.5\left(\frac{s}{b}\right)^2}$; max. 1.00 if b/s ≥ 2.5 k = material factor, as defined in Pt 3, Ch 13, 2.3 Materials 2.3.4 s = smallest unsupported width of plating in m b = greatest unsupported width of plating in m c = chord length in m, as defined in Figure 13. 2. 1: Rudder co-ordinate system.			
Note 1. The mainpiece bending stresses are to be not greater than those in Table 13. 2. 8: Rudder blade permissible stresses. **Note** 2. The mainpiece plating attached to solid forged or cast parts, is not to be less than that required by Pt 3, Ch 13, 2.12 Connections of rudder blade structure with solid parts. **Note** 3. The stock diameter to be used for calculating the mainpiece plate thickness is to be based on the mild steel stock scantlings, as given in Table 13. 2. 4: Rudder stock diameter. **Note** 4. The requirement of *t*M need only be applied to the upper part of the rudder plate: for semi spade rudders; above a point midway between the lowest pintle and the bottom of the rudder. for spade rudders; above a point one third of the height of the rudder above the base.			

Table 13. 2. 7: Single plate rudder construction

Item	Requirement
(1) Blade thickness	The greater of; $t_b = 1.5sV\sqrt{k + 2.5}$; or 10 mm.
(2) Arms	$t_a = t_b$ The section modulus is not to be less than: $Z_a = 0.5\ sC_1^2\ V^2kcm^3$
(3) Mainpiece, *See* Note 1	As per Table 13. 2. 4: Rudder stock diameter
Symbols	
s = spacing of stiffening arms, in m, but is not to exceed 1 m. V = speed in knots, as defined in Pt 3, Ch 13, 2.6 Rudder force 2.6.1. C_1 = horizontal distance from the aft edge of the rudder to the centreline of the rudder stock, in m.	

Note 1. For spade rudders the lower third may be taper down to 0.75 d_c.

Table 13. 2. 8: Rudder blade permissible stresses

Item	Permissible stress, N/mm^2		
	Bending stress, σ_b	Shear stress, τ	Equivalent stress, σ_c
Rudder blade, clear of cut-outs	$\frac{110}{k}$	$\frac{50}{k}$	$\frac{120}{k}$
Rudder blade in way of cut-outs, of semi-spade rudders	75	50	100

2. 12 Connections of rudder blade structure with solid parts

2. 12. 1 Solid parts in forged or cast steel, which house the rudder stock or the pintle, are to be provided with protrusions, except as follows, *See* Figure 13. 2. 4: Cross-section of the connection between rudder blade structure and rudder stock housing. These protrusions are not required when the web plate thickness is less than:

a. 10 mm for web plates welded to the solid part on which the lower pintle of a semi-spade rudder is housed and for vertical web plates welded to the solid part of the rudder stock coupling of spade rudders.

b. 20 mm for other web plates.

2. 12. 2 The solid parts are in general to be connected to the rudder structure by means of two horizontal web plates and two vertical web plates, *See* Figure 13. 2. 4: Cross-section of the connection between rudder blade structure and rudder stock housing.

2. 12. 3 The minimum section modulus of the cross-section of the structure of the rudder blade formed by vertical web plates and rudder plating, which is connected with the solid part where the rudder stock is housed is to be not less than:

$$w_s = c_s d_c^3 \left(\frac{H_{E-H_x}}{H_E}\right)\frac{k}{k_s}10^{-4} \quad \text{cm}^3$$

Where

c_s = coefficient, to be taken equal to:

= 1.0 if there is no opening in the rudder plating or if such openings are closed by a full penetration welded plate.

= 1.5 if there is an opening in the considered cross-section of the rudder.

d_c = rudder stock diameter, in mm.

H_E = vertical distance between the lower edge of the rudder blade and the upper edge of the solid part, in m.

H_X = vertical distance between the considered cross-section and the upper edge of the solid part, in m.

k = material factor for the rudder blade plating, *See* Pt 3, Ch 13, 2.3 Materials 2.3.4.

k_s = material factor for the rudder stock, *See* Pt 3, Ch 13, 2.3 Materials 2.3.4.

2. 12. 4 The actual section modulus of the cross-section of the structure of the rudder blade is to be calculated with respect to the symmetrical axis of the rudder, *See* the x-x axis in Figure 13. 2. 4: Cross-section of the connection between rudder blade structure and rudder stock housing. The breadth of the rudder plating to be considered for the calculation of section modulus is to be not greater than:

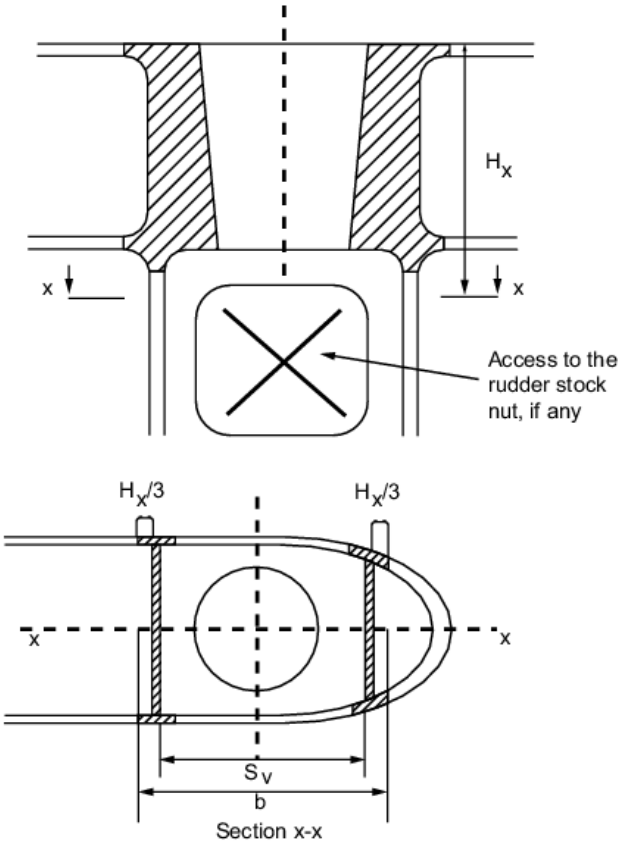
$$b = s_v + \frac{2H_x}{3} \quad m$$

Where

s_v = spacing between the two vertical webs, in m.

Where openings for access to the rudder stock nut are not closed by a full penetration welded plate, they are not to be included in the section modulus calculations.

Figure 13. 2. 4: Cross-section of the connection between rudder blade structure and rudder stock housing



2. 12. 5 The thickness of the horizontal web plates connected to the solid parts as well as that of the rudder blade plating between these webs, is to be not less than the greater of the following values:

t_H = $1.2\,t$ mm

t_H = $0.045\frac{d_s^2}{S_H}$ mm

Where

t = as calculated in Table 13. 2. 6: Double plated rudder construction

d_S = stock diameter, in mm, to be taken equal to:

= d_c for the solid part housing the rudder stock, as calculated in Table 13. 2. 4: Rudder stock diameter.

= $d_p$for the solid part housing the pintle, as calculated in Table 13. 2. 12: Pintle requirements.

S_H = spacing between the two horizontal web plates, in mm.

The increased thickness of the horizontal webs is to extend fore and aft of the solid part at least to the next vertical web.

2. 12. 6 The thickness of the vertical web plates welded to the solid part where the rudder stock is housed as well as the thickness of the rudder side plating above and below this solid part is to be not less than the values obtained from Table 13. 2. 9: Thickness of side plating and vertical web plates in way of solid parts. The increased thickness is to extend above and below the solid piece at least to the next horizontal web.

Table 13. 2. 9: Thickness of side plating and vertical web plates in way of solid parts

Type of rudder	Thickness of vertical web plates, in mm		Thickness of rudder plating, in mm, *See* Note 1	Area with opening
	Rudder blade without opening	Rudder blade with opening	Rudder blade without opening	
Rudder supported by sole piece	1.2 t	1.6 t	1.2 t	1.4 t
Semi-spade and spade rudders	1.4 t	2.0 t	1.3 t	1.6 t
Symbols				
t = thickness of the rudder plating, in mm, as calculated in Table 13. 2. 6: Double plated rudder construction c = chord length in m, as defined in Figure 13. 2. 1: Rudder co-ordinate system.				
Note 1. The side plating of the mainpiece is to extend at least 0.2c.				

2. 13 Rudder stock flange couplings

2. 13. 1 Rudder stock horizontal and vertical flange couplings are to be in accordance with Table 13. 2. 10: Horizontal and Vertical flange couplings.

2. 13. 2 For rudders with horizontal coupling arrangements the rudder stock should be forged when the stock diameter exceeds 350 mm. Where the stock diameter does not exceed 350 mm the rudder stock may be either forged or fabricated. Where the upper flange is welded to the rudder stock, a full penetration weld is required and its integrity is to be confirmed by non-destructive examination. The flange material is to be from the same welding materials group as the stock. Such rudder stocks are to be subjected to a furnace post-weld heat treatment (PWHT) after completion of all welding operations. For carbon or carbon manganese steels, the PWHT temperature is not to be less than 600°C.

2. 13. 3 For a horizontal flange coupling of a spade rudder, the palm radius, between the rudder stock and the flange, is not to be less than that calculated from Figure 13. 2. 5: Rudder stock horizontal

flange palm radius for spade rudders, *See also* Figure 13. 2. 7: Rudder stock horizontal flange coupling.

Where

d_c, R, t_f are defined in Table 13. 2. 10: Horizontal and Vertical flange couplings

b_f = breadth of flange, in mm.

2. 13. 4 For all rudder types, with a horizontal welded flange connection to the rudder stock, the connection details are in general to be in accordance with Figure 13. 2. 6: Welded joint between rudder stock and coupling flange.

2. 13. 5 The connecting bolts for coupling the rudder to the rudder stock are to be positioned with sufficient clearance to allow the fitting and removal of the bolts and nuts without contacting the palm radius. The surface forming the palm radius is to be free of hard and sharp corners and is to be machined smooth to the Surveyor's satisfaction. The surface in way of bolts and nuts is to be machined smooth to the Surveyor's satisfaction.

2. 13. 6 Coupling bolts are to be fitted bolts and their nuts are to be locked effectively.

Table 13. 2. 10: Horizontal and Vertical flange couplings

Item	Requirement	
	Horizontal coupling	Vertical coupling
Number of coupling bolts	n ≥ 6	n ≥ 8
Diameter of coupling bolts, in mm	$d_b = 0.62\sqrt{\frac{d_c^3 k_b}{n e_m k_s}}$	$d_b = 0.81 d_c \sqrt{\frac{k_b}{n k_s}}$
Thickness of coupling flange, in mm	The greater of the following, (*See* Note 1): $t_f = d_b\sqrt{\frac{k_f}{k_b}}$ (b) $t_f = 0.9 d_b$ (c) $t_f = 0.33 d_c \sqrt[3]{k_s}$ (*See* Notes 2 and 3)	$t_f = d_b$
Width of flange material outside the bolt holes, in mm	$W_f = 0.67 d_b$	$W_f = 0.67 d_b$
First moment of area of bolts about centre of coupling, in cm^3	$m = 0.00071 n d_c d_b^2 \sqrt{\frac{k_b}{k_s}}$	$m = 0.00043 d_c^3 \sqrt{\frac{k_b}{k_s}}$
Stress concentration factor for as built scantlings	$\alpha_{asbuitt} \le \alpha_{max}$(See Note 2)	-
Symbols		
d_c = stock diameter, in mm, as calculated in Table 13. 2. 4: Rudder stock diameter. n = total number of bolts. e_m = mean distance, in mm, of the bolt axes from the centre of the bolt system. k_s = material factor for the stock. k_b = material factor for the bolts.		

k_f = material factor for flange.

d_b = bolt diameter, in mm.

w_f = width of flange material outside the bolt holes, in mm.

m = first moment of area of bolts about the centre of the coupling, in cm^3.

$$\alpha_{asbuilt} = \frac{0.73}{\sqrt{\frac{R}{d}}}$$

$\alpha_{asbuilt}$ = stress concentration factor for as built scantlings.

α_{max} = maximum allowable stress concentration factor.

$$\alpha_{max} = \left((53.82 - 35.29k_{max})\frac{d^3}{hC_R 10^3}\right) - \left(\left(1.8 - 6.3\frac{R}{d}\right)\left(\frac{t_f - t_{fa}}{t_{fa}}\right)\right)$$

h = vertical distance, in m, between the centre of pressure and the centre point of the palm radius, *See* Figure 13. 2. 7: Rudder stock horizontal flange coupling.

k_{max} = the greater of k_s or k_f

R = palm radius, in mm, between the rudder stock and connection flange.

t_f = minimum thickness of coupling flange, in mm.

t_{fa} = as built flange thickness, in mm.

Note 1. Where the value of d_b is to be calculated for a number of bolts not exceeding 8.

Note 2. This requirement is only applicable for spade rudders with horizontal couplings, *See* Figure 13. 2. 7: Rudder stock horizontal flange coupling.

Note 3. For a twin spade rudder arrangement with a single screw, and where the rudders are positioned within the slipstream of the propeller:

the thickness of the palm plate/coupling flange is not to be less than $0.35d\sqrt[3]{k_s}$

where the stock is welded to the palm plate, the stock diameter is to be increased by 14 per cent

Figure 13. 2. 5: Rudder stock horizontal flange palm radius for spade rudders

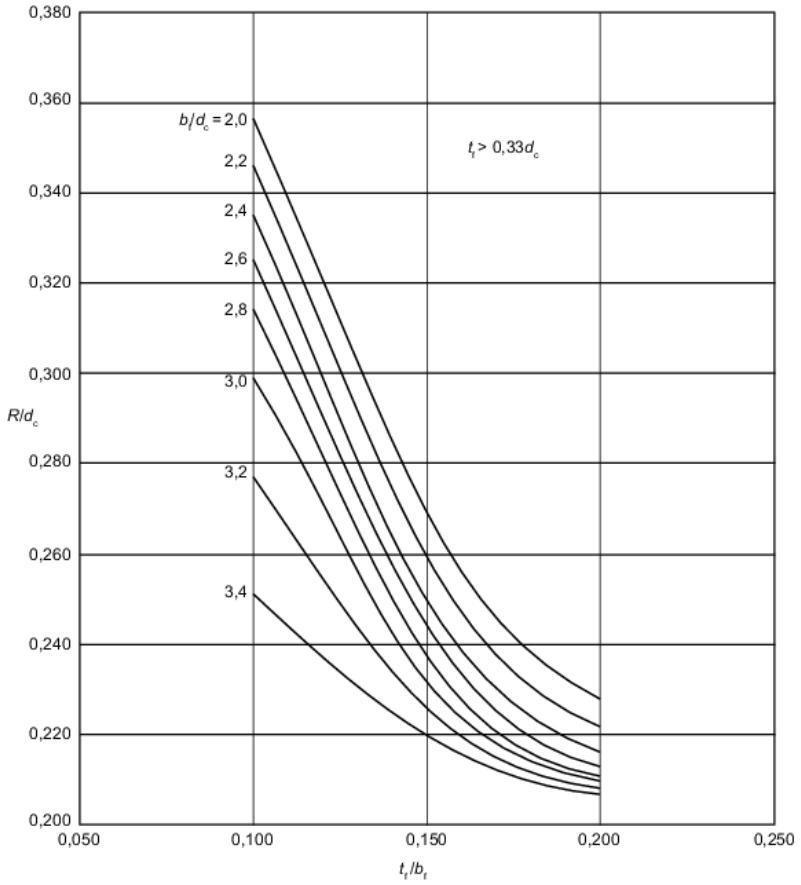


Figure 13. 2. 6: Welded joint between rudder stock and coupling flange

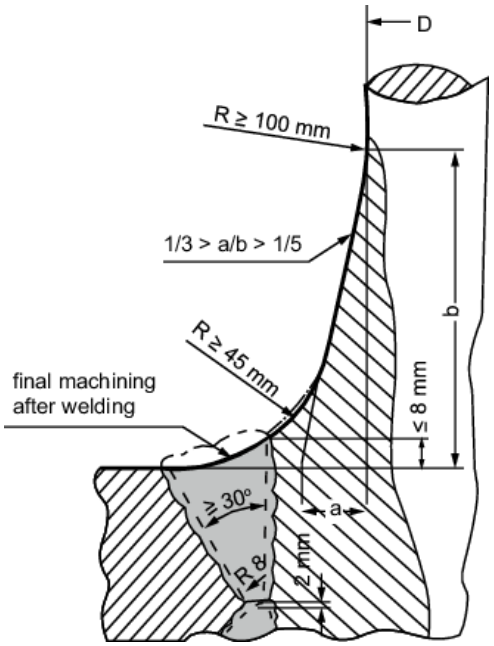

Figure 13. 2. 7: Rudder stock horizontal flange coupling

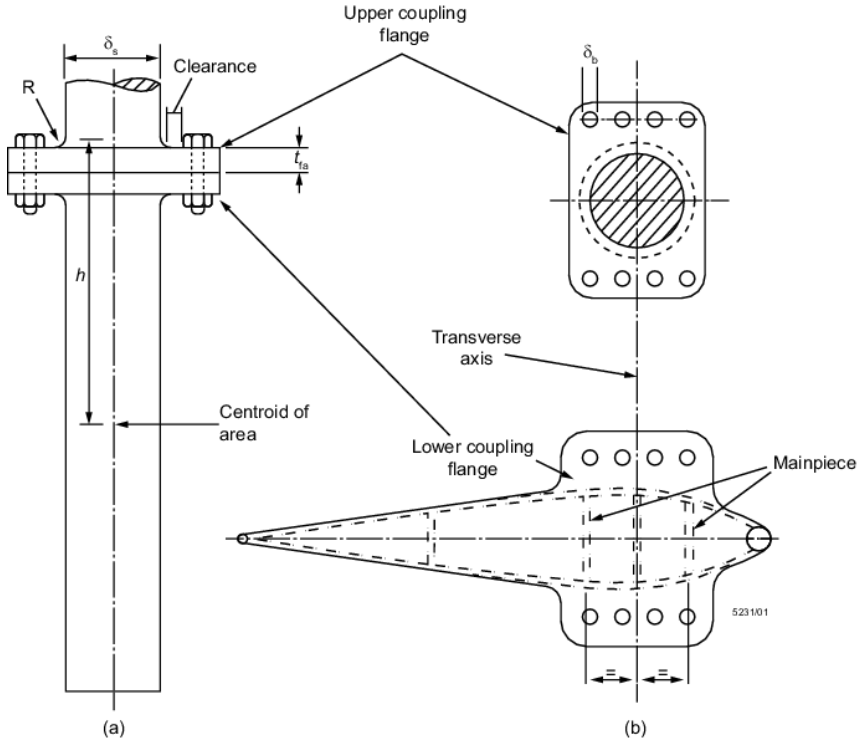


2. 14 Cone couplings with key

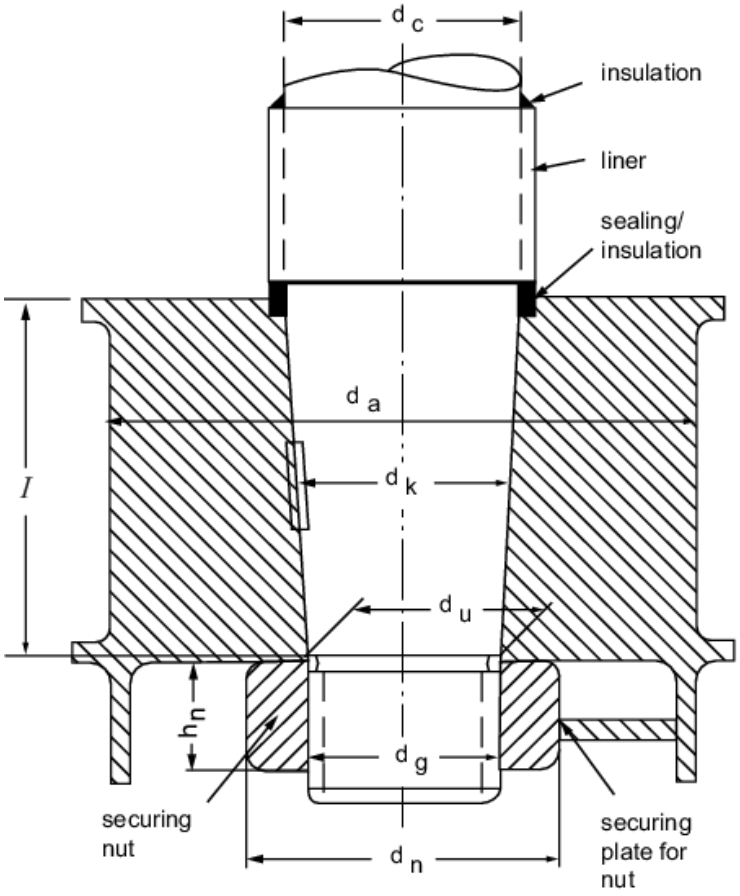
2. 14. 1 Cone couplings without hydraulic arrangements for mounting and dismounting the coupling are to have a taper ratio, θ_t on diameter of 1:8 to 1:12;

Where

$$\theta_t = \frac{d_c - d_u}{l}$$

The cone shapes are to fit exactly. The cone coupling is to be secured by a nut and the nut itself is to be secured, e.g. by a securing plate, *See* Figure 13. 2. 8: Cone coupling with key.

Figure 13. 2. 8: Cone coupling with key



2. 14. 2 The coupling length ℓ is to be, not less than $1.5d_c$.

2. 14. 3 For couplings between stock and rudder where a key is provided, the shear area of the key is not to be less than:

$$a_s = \frac{17.55 Q_F}{d_k \sigma_{F1}} \text{ cm}^2$$

where

Q_F = design yield moment of rudder stock, in Nm.

$$Q_F = 0.02664 \frac{d_t^3}{k}$$

d_t = stock diameter, in mm, as calculated in Table 13. 2. 4: Rudder stock diameter.

d_k = mean diameter of the conical part of the rudder stock, in mm, at the key.

σ_{F1} = minimum specified yield stress of the key material, in N/mm^2.

Where the actual diameter d_{ta} is greater than the calculated diameter d_t, the diameter d_{ta} is to be used. However, d_{ta} need not be taken greater than 1.145 d_t.

2. 14. 4 The effective surface area of the key (without rounded edges) between key and rudder stock or cone coupling is not to be less than:

$$a_k = \frac{5Q_F}{d_k \sigma_{F2}} \text{ cm}^2$$

where

σ_{F2} = minimum specified yield stress of the key, stock or coupling material, in N/mm^2, whichever is less.

2. 14. 5 2.14.5 The dimensions of the securing nut are to be in accordance with Table 13. 2. 11: Securing nut dimensions, *See also* Figure 13. 2. 8: Cone coupling with key:

Table 13. 2. 11: Securing nut dimensions

Item	Requirement
External thread diameter	$d_g \geq 0.65 d_c$
Height	$h_n \geq 0.6 d_g$
Outer diameter	The greater of the following: $d_n \geq 1.2 d_i$, $d_n \geq 1.5 d_u$
Symbols, *See* Figure 13. 2. 8: Cone coupling with key.	
d_c = stock diameter, in mm d_g = external thread diameter, in mm h_n = height of securing nut, in mm d_n = minimum distance across flats of securing nut, in mm d_u = inner diameter of securing nut, in mm	

2. 14. 6 It is to be proved that 50 per cent of the design yield moment is solely transmitted by friction in the cone couplings. This can be done by calculating the required push-up pressure and push-up length in accordance with Pt 3, Ch 13, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.4 and Pt 3, Ch 13, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.5 for a torsional moment $Q'\text{F} = 0.5 Q_F$.

2. 15 Cone couplings with special arrangements for mounting and dismounting the couplings

2. 15. 1 Where the stock diameter exceeds 200 mm, the press fit is recommended to be effected by a hydraulic pressure connection. In such cases the cone is to be more slender, and is to have a taper ratio, θ_t, on diameter of 1:12 to 1:20.

2. 15. 2 In the case of hydraulic pressure connections the nut is to be effectively secured against the rudder stock or the pintle.

2. 15. 3 For the safe transmission of the torsional moment by the coupling between rudder stock and rudder body the push-up pressure and the push-up length are to be determined in accordance with Pt 3, Ch 13, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.4 and Pt 3, Ch 13, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.5.

2. 15. 4 The push-up pressure, P_{req} is not to be less than the greater of the two following values:

$$p_{req1} = \frac{2Q_F}{d_m^2 l \pi \mu_0} 10^3 \quad N/mm^2$$

$$p_{req2} = \frac{6M_b}{l^2 d_m} 10^3 \quad N/mm^2$$

Where

Q_F = design yield moment of rudder stock, in Nm, as defined in Pt 3, Ch 13, 2.14 Cone couplings with key 2.14.3.

d_m = mean cone diameter in, mm = $\frac{(d_u + d_c)}{2}$

l = cone length in, mm, *See* Figure 13. 2. 8: Cone coupling with key.

M_b = bending moment in the cone coupling (e.g. in case of spade rudders), in Nm.

μ_0 = frictional coefficient, to be taken as 0.15.

d_u = upper cone diameter, *See* Figure 13. 2. 8: Cone coupling with key

d_c = lower cone diameter, *See* Figure 13. 2. 8: Cone coupling with key

It has to be proved by the designer that the push-up pressure does not exceed the permissible surface pressure in the cone. The permissible surface pressure is to be determined by the following formula:

$$p_{perm} = \frac{0.95\sigma_g(1-\alpha^2)}{\sqrt{3+\alpha^4}} P_b \quad N/mm^2$$

Where

$$P_b = \frac{3.5M_b}{d_m l^2} 10^3$$

σ_g = minimum specified yield stress of the material of the gudgeon in N/mm^2.

$$\alpha = \frac{d_m}{d_a}$$

d_m = mean cone diameter in, mm.

d_a = outer diameter of the gudgeon to be not less than 1.25 d_c, in mm, *See* Figure 13. 2. 8: Cone coupling with key.

l = cone length in, mm, *See* Figure 13. 2. 8: Cone coupling with key.

m_b = bending moment in the cone coupling (e.g. in case of spade rudders), in Nm.

2. 15. 5 The push-up length $\Delta\ell$, is to comply with the following formula:

$$\Delta\ell_1 \leq \Delta\ell \leq \Delta\ell_2$$

Where

$$\Delta\ell_1 = \frac{p_{req}\, d_m}{E\left(\frac{1-\alpha^2}{2}\right)\theta_t} + \frac{0.8R_{tm}}{\theta_t} \quad mm$$

$$\Delta\ell_2 = \frac{p_{perm}\, d_m}{E\left(\frac{1-\alpha^2}{2}\right)\theta_t} + \frac{0.8R_{tm}}{\theta_t} \quad mm$$

Where

p_{req} p_{perm}, α, d_m are defined in Pt 3, Ch 13, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.4

R_{tm} = mean roughness, in mm, taken equal to 0.01

E = Young's modulus of the material, in N/mm^2

θ_t = taper on diameter, *See* Pt 3, Ch 13, 2.14, Cone couplings with key

2. 15. 6 In case of hydraulic pressure connections the required push-up force P_e, for the cone may be determined by the following formula:

$$P_e = P_{req}\, d_m \Pi l \left(\frac{\theta_t}{2} + 0.02\right) N$$

The value 0.02 is a reference for the friction coefficient using oil pressure. It varies and depends on the mechanical treatment and roughness of the details to be fixed. Where due to the fitting procedure a partial push-up effect caused by the rudder weight is given, this may be taken into account when fixing the required push-up length, subject to approval by *ACS*.

2. 16 Pintles

2. 16. 1 Rudder pintles and their bearings are to be in accordance with the requirements of this sub-section and Pt 3, Ch 13, 2.17, Bearings.

2. 16. 2 The bottom pintle on semi-spade rudders and all pintles over 500 mm in diameter are if inserted into their sockets from below, to be keyed to the rudder or sternframe as appropriate or to be hydraulically assembled, with the nut adequately locked, *See* Pt 3, Ch 13, 2.14, Cone couplings with key and Pt 3, Ch 13, 2.15, Cone couplings with special arrangements for mounting and dismounting the couplings.

2. 16. 3 Where liners are fitted to pintles, they are to be shrunk on or otherwise efficiently secured. If liners are to be shrunk on, the shrinkage allowance is to be indicated on the plans. Where liners are formed by stainless steel weld deposit, the pintles are to be of weldable quality steel and details of the procedure are to be submitted, *See also* Pt 3, Ch 13, 2.17 Bearings 2.17.2.

2. 16. 4 Where an ***IWS** (In-water Survey) notation is to be assigned, means are to be provided for ascertaining the rudder pintle and bush clearances and for verifying the security of the pintles in their sockets with the vessel afloat.

Table 13. 2. 12: Pintle requirements

Item	Requirement	
(1) Pintle diameter, in mm	$d_P = 0.35\sqrt{Bk_p}$	
(2) Pintle taper	Method of assembly	Taper (on diameter)
	Keyed and other manually assembled pintles applying locking by securing nut	1:8 – 1:12

	Pintles mounted with oil injection and hydraulic nut	1:12 – 1:20
(3) Pintle bearing length	$d_{p1} \leq l_p \leq 1.2\ d_{pl}$	
(4) Pintle housing/gudgeon	$b_g \geq 0.25 d_{pl}$	
(5) Liner or bush in way of pintle bearings, in mm	$t = 0.01\sqrt{B}$	
Symbols		
k_p = material factor for pintle B = bearing force, in N d_p = actual pintle diameter measured to the inside of the liner, in mm d_{pl} = diameter measured to the outside of the pintle liner, in mm b_g = thickness of pintle housing/gudgeon in way of pintles (measured from the outside of bush if fitted).		
Note 1. The minimum dimensions of threads and nuts are to be determined according to Table 13. 2. 11: Securing nut dimensions.		

2. 16. 5 The required push-up pressure for pintle is to be determined by the following formula:

$$p_{req} = 0.4\frac{B_1 d_p}{d_m^2 l} \quad N/mm^2$$

Where

d and l are defined in Pt 3, Ch 13, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.4.

B_1 = supporting force in the pintle, in N

d_p = actual pintle diameter, in mm.

The push-up length is to be calculated in accordance with Pt 3, Ch 13, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.5, using the required push-up pressure and properties for the pintle.

2. 17 Bearings

2. 17. 1 Bearings are to comply with the requirements of Table 13. 2. 13: Bearings. The fitting of bearings is to be carried out in accordance with the manufacturer's recommendations to ensure that they remain secure under all fore*See*able operating conditions.

2. 17. 2 Where it is proposed to use stainless steel for liners or bearings for rudder stocks and/or pintles, the chemical composition is to be submitted for approval. Synthetic rudder bearing materials are to be of a type approved by *ACS*. When this type of lining material is used, arrangements to ensure an adequate supply of sea-water to the bearing are to be provided.

Table 13. 2. 13: Bearings

tem	Requirement

(1) Bearing surface area	$A_B = \frac{B}{q_a}$ mm^2	
(2) Bearing length	The length/diameter ratio of the bearing surface is not to be greater than 1.2.	
(3) Clearance	Bearing material	Minimum clearance (on diameter)
	Metal	$0.001d + 1.0$
	Synthetic	*See* Notes 1, 2, 3 and 4
(4) Liners and bushes	Material	Minimum thickness
	Metal and synthetic material	8 mm
	Lignum vitae	22 mm
(5) Main bearing housing wall thickness, *See* Note 5	Greater than $0.2d_c$	

Symbols

A_B = bearing surface, in mm^2, defined as the projected area (length x outer diameter) of liner

d = stock diameter, as calculated in Table 13. 2. 4: Rudder stock diameter, or pintle diameter as calculated in Table 13. 2. 12: Pintle requirements

B = bearing force, in N

q_a = allowable surface pressure, *See* Table 13. 2. 14: Maximum surface pressure.

Note 1. If non-metallic bearing material is applied, the bearing clearance is to be specially determined considering the material's swelling and thermal expansion properties. This clearance is not to be less than 1.5 mm on bearing diameter unless a smaller clearance is supported by the manufacturer's recommendation and there is documented evidence of satisfactory service history with a reduced clearance.

Note 2. For bearings which are pressure lubricated the clearance must be restricted to enable the pressure to be maintained.

Note 3. The value of the proposed minimum clearance is to be indicated on plans submitted for approval.

Note 4. Proposals for higher pressures or other materials will be specially considered on the basis of satisfactory test results.

Note 5. Where web stiffening is fitted on the bearing, a reduction in wall thickness will be considered.

Table 13. 2. 14: Maximum surface pressure

Bearing material	q_a (N/mm^2) (*See* Note 1)
Lignum vitae	2.5
White metal, oil lubricated	4.5
Synthetic material with hardness between 60 and 70 Shore D (*See* Note 2)	5.5 (*See* Note 3)

Steel (*See* Note 4) and bronze and hot-pressed bronze-graphite materials	7.0

Note 1. Proposals for higher pressures will be specially considered on the basis of satisfactory test results.

Note 2. Indentation hardness test at 23°C and with 50 per cent moisture according to a recognised standard. Synthetic bearing materials are to be of an approved type.

Note 3. Surface pressures exceeding 5.5 N/mm^2 may be accepted in accordance with bearing manufacturer's specification and tests, but in no case more than 10 N/mm^2.

Note 4. Stainless and wear-resistant steel in an approved combination with stock liner.

CHAPTER **13 Ship Control Systems**

SECTION **3 Fixed and steering nozzles**

3. 1 General

3. 1. 1 The requirements given in this Section are applicable to fixed and steering nozzles with an inner diameter of not greater than 5 metres.

3. 1. 2 For nozzles with an inner diameter greater than 5 metres, the maximum pressure acting on the nozzle is to be submitted by the designer. This pressure is to be used to determine the nozzle scantlings in accordance with the requirements of Pt 3, Ch 13, 3.3 Nozzle scantlings to Pt 3, Ch 13, 3.5 Nozzle headbox.

3. 1. 3 Suitable arrangements are to be provided to prevent the steering nozzle from lifting.

3. 1. 4 Effective means are to be provided for supporting the weight of the nozzle. The hull structure, in way of the nozzle supports, is to be suitably strengthened.

3. 1. 5 Care is to be taken in the manufacture of the nozzle to ensure its internal preservation and watertightness. The preservation and testing are to be as required for rudders, *See* Pt 3, Ch 13, 2.11 Rudder blade, Table 1. 9. 1: Testing requirements and Table 1. 8. 1: Trial trip and operational tests.

3. 2 Design pressure

3. 2. 1 The design pressure for propeller nozzles, in kN/m^2, is to be determined as follows: این جدول پایین فرق دارهRullبا

$$P_d = c_z P_{d0}$$

$$P_{d0} = 9 + 0.0025\, N\delta_p \text{ for } N_N \leq 63$$

$$P_{d0} = 13 + 0.002 N\delta_p \text{ for } 63 < N_N \leq 200$$

$$P_{d0} = \varepsilon C_f \frac{N}{A_p} \text{ for } N_N > 200$$

Where

N_N = is the nozzle numeral

$= 0.01\, N\delta_p$

N = is the maximum shaft power in kW

A_p = is the propeller disc area, in m^2, taken equal to:

$= \frac{\pi \delta_p^2}{4}$

δ_p = is the propeller diameter in m

ε = is a factor obtained from the following formula:

$\varepsilon = 0.21 - 2 \times 10^{-4} \frac{N}{A_p}$ but not to be taken less than 0.1

c_z = is a coefficient taken equal to:

c_z = 1.0 in Zone 2 (propeller zone)

c_z = 0.5 in Zone 1

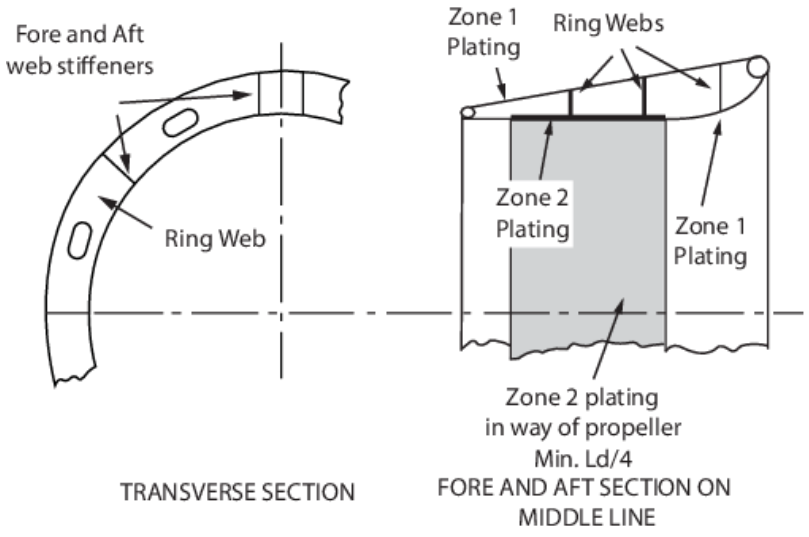
See also Figure 13. 3. 1: Nozzle construction

c_f = is a coefficient taken equal to:

c_f = 1.0 for fixed nozzles

c_f = 1.25 for steering nozzles

Figure 13. 3. 1: Nozzle construction



3. 3 Nozzle scantlings

3. 3. 1 The scantlings of propeller nozzles are to be not less than required by Table 13. 3. 1: Nozzle construction.

Table 13. 3. 1: Nozzle construction

Item	Requirement
(1) Nozzle plating	$t = 5s\sqrt{P_d k} + t_k$ but not less than 7.5 mm

(2) Ring webs and web stiffeners	Not less than the attached nozzle plating in way of Zone 1
(3) Webs in way of headbox and pintle support structure	$t_w = t + 4$ mm
(4) Section modulus of nozzle profile about its neutral axis	$Z = n\delta_p^2 L_d V^2$ cm^3
Symbols	
P_d = nozzle design pressure, in kN/m^2, *See* Pt 3, Ch 13, 3.2 Design pressure t = thickness of nozzle plating, in mm t_w = thickness of web plating, in mm s = spacing of web rings, in m k = material factor, as defined in Pt 3, Ch 13, 1.2 General symbols t_k = corrosion thickness, to be taken as: t_k = 2.5 in general t_k = 1.5 for fresh water environments t_k = 0 for stainless steel δ_p = propeller diameter, in m L_d = nozzle length, in m n = coefficient taken equal to: n = 1.0 for steering nozzles n = 0.7 for fixed nozzles V is as defined in Pt 3, Ch 1, 6.1, Principal particulars	

3. 3. 2 The Zone 2 nozzle plating is to be carried well forward and aft of the propeller tips with due allowance being made on steering nozzles for the rotation of the nozzle in relation to the propeller, and is to extend at least $0.25L_d$ in length.

3. 3. 3 Fore and aft web stiffeners are to be fitted between the inner and outer skins of the nozzle. Both sides of the headbox and pintle support structure, are to be connected to fore and aft webs of increased thickness.

3. 3. 4 The adjacent ring webs fore and aft of those connected to the headbox and pintle support structure are to be of a similar thickness to the ring webs connected to the headbox and pintle support structure.

3. 3. 5 Local stiffening is to be fitted in way of the top and bottom supports which are to be integrated with the web stiffeners and ring webs. Continuity of bending strength is to be maintained in these regions.

3. 3. 6 The plating thickness of attached fins is to be not less than the Zone 1 nozzle plating thickness. Solid fins should be not less than 25 mm thick.

3. 4 Nozzle stock

3. 4. 1 The requirements for the nozzle stock are to be derived, in accordance with Pt 3, Ch 13, 2.10 Rudder stock scantlings, using the lateral nozzle force and maximum nozzle torque obtained in this sub-Section.

3. 4. 2 The lateral nozzle force, C_R, at the centre of pressure is to be determined as follows:

$$C_R = P_d A_t 10^3 \text{ N}$$

Where

P_d = nozzle design pressure in Zone 2, in kN/m^2

A_t = total projected area of nozzle and supporting structure, in m^2

$A_t = A_n + A_f + A_s$

Where

A_n = projected area of nozzle, in m^2, to be taken as $1.57\delta_p L_d$

A_f = projected area of nozzle flap, in m^2

A_s = projected area of support structure in the longitudinal plane, in m^2

where δ_p and L_d are defined in Table 13. 3. 1: Nozzle construction.

3. 4. 3 The maximum nozzle torque,Q_R, is to be determined as follows:

$$Q_R = C_R \times r \text{Nm}$$

Where

r = distance from the centre of pressure to the stock, in m, to be taken as: $c(a - k_1)$

c = nozzle length plus the length of the nozzle flap if present

a = relative centre of pressure along the nozzle length, to be taken as:

a = 0.25 for fixed nozzles

a = 0. 33 for steering nozzles

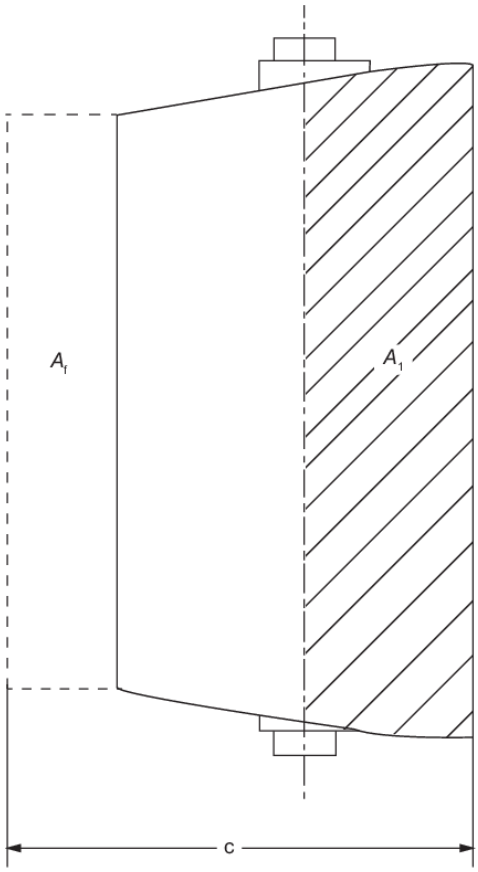
k_1 = ratio of the nozzle area forward of the stock centreline to the combined area of the nozzle and flap

$$k_1 = \frac{A_1}{A_n + A_f}$$

A_1 is the portion of the projected nozzle area located forward of the stock centreline, *See also* Figure 13. 3. 2: Nozzle geometry

C_R, A_n and A_f are given in Pt 3, Ch 13, 3.4 Nozzle stock 3.4.2.

Figure 13. 3. 2: Nozzle geometry



3. 5 Nozzle headbox

3. 5. 1 The section modulus of the headbox, Z, about the longitudinal axis is to be not less than:

$$Z = 0.143 P_d A_t D_h \times 10^2 \text{ cm}^3$$

Where

P_d = nozzle design pressure in Zone 2, in kN/m^2

D_H = $\delta_h + \frac{\delta_p}{2}$

Where

δ_h = depth of headbox, in m

δ_p = propeller diameter, in m

A_t = is given in Pt 3, Ch 13, 3.4 Nozzle stock 3.4.2.

3. 5. 2 Plans detailing the integration of the headbox into the sternframe are to be submitted.

3. 6 Ancillary items

3. 6. 1 Requirements for ancillary items such as bearings, couplings, pintles, etc. are given in Pt 3, Ch 13, 2 Rudders.

3. 7 Welding

3. 7. 1 Double continuous welds are to be used as far as practicable for the connection between the inner and outer nozzle plating and the internal stiffening rings and webs. Slot welding is not permitted for the inner nozzle plating.

3. 7. 2 Additional welding requirements are given in Pt 3, Ch 13, 2.4 Welding and design details.

3. 8 Azimuth thrusters

3. 8. 1 In general, the scantlings of similar structures, such as azimuth thrusters, are to be calculated in accordance with the requirements of Pt 3, Ch 13, 3.3 Nozzle scantlings where the design pressure,P_d, is to be derived from loads specified by the designer. The stock may be assessed using these loads and the permissible design stresses given in Table 13. 2. 5: Rudder stock permissible stresses.

PART

3

CHAPTER **13 Ship Control Systems**

SECTION **4 Steering gear and allied systems**

4. 1 General

4. 1. 1 For the requirements of steering gear, *See* Pt 5, Ch 19 Steering Systems.

PART

3

CHAPTER **13 Ship Control Systems**

SECTION **5 Bow and stern thrust unit structure**

5. 1 Unit wall thickness

5. 1. 1 The wall thickness of the unit is, in general, to be in accordance with the manufacturer's practice, but is to be not less than either the thickness of the surrounding shell plating plus 10 per cent or 15 mm, whichever is greater.

5. 2 Framing

5. 2. 1 The unit is to be framed to the same standard as the surrounding shell plating.

5. 2. 2 The unit is to be adequately supported and stiffened.

PART

3

CHAPTER **13 Ship Control Systems**

SECTION **6 Stabiliser structure**

6. 1 Fin stabilisers

6. 1. 1 The box into which the stabilisers retract is to have perimeter plating of the same thickness as the surrounding Rule shell plating plus 2 mm, but is to be not less than 12.5 mm, and is to be stiffened to the same standard as the shell.

6. 1. 2 The stabiliser machinery and surrounding structure is to be adequately supported and stiffened. Where bending stresses are induced in the structure under fatigue conditions the maximum stress is not to exceed 39.0 N/mm^2.

6. 2 Stabiliser tanks

6. 2. 1 The general structure of the tank is to comply with the Rule requirements for deep tanks. Sloshing forces in the tank structure are to be taken into account. Where such forces are likely to be significant, the scantlings will be required to be verified by additional calculation.

PART

3

CHAPTER **13 Ship Control Systems**

SECTION **7 Equipment**

7. 1 General

7. 1. 1 To entitle a ship to the figure **1** in its character of classification, equipment in accordance with the requirements of Table 13. 7. 1: Equipment requirements is to be provided. The regulations governing the assignment of the character figure **1** for equipment are given in Pt 1, Ch 2, 2 Character of classification and class notations.

7. 1. 2 For ships intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.6 to Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.10, equipment differing from these requirements may be approved if considered suitable for the particular service on which the ship is to be engaged, *See also* Table 13. 7. 1: Equipment requirements.

7. 1. 3 Where the Committee has agreed that anchoring and mooring equipment need not be fitted in view of the particular service of the ship, the character letter **N** will be assigned, *See also* Pt 1, Ch 2, 2.2 Character symbols 2.2.2.

Table 13. 7. 1: Equipment requirements

Ship type	Service	Required equipment
Cargo ships, bulk carriers, tankers, ferries, dredgers, etc. (*See* Pt 3, Ch 13, 1.1 Application 1.1.2)	Unrestricted service	(1) The equipment is to be selected from the following sub-Sections as appropriate, using N_C Anchor and chain cables — *See* Table 13. 7. 2: Equipment - Bower anchors and chain cables Mooring lines — *See* Pt 3, Ch 13, 7.5 Mooring lines (Equipment Number ≤ 2000) or Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number > 2000) as appropriate. Towing line — *See* Pt 3, Ch 13, 7.8 Towline and towing arrangement
Ferries	Certain restricted services, *See* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.9	(2) As per item (1), using N_C and N_A as appropriate Mass of bower anchor — N_A = one grade below N_C Chain cable length and diameter — N_A = one grade below N_C Stream anchor may be omitted
		(3) As per item (2), and

	Specified coastal service, *See* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.8	Chain cables	Where L < 40 m, wire ropes may be used in place of chain cables when the requirements specified under Pt 3, Ch 13, 7.4 Chain cables and chain locker 7.4.7 and Pt 3, Ch 13, 7.4 Chain cables and chain locker 7.4.9 are complied with. Where 40 m ≤ L ≤ 90 m, chain cables may be replaced with wire rope of equal minimum breaking strength when: (a) the requirements specified for L < 40 m are complied with and (b) have a minimum mass per unit length of 30% that of Grade U2 chain cable required by Table 13. 7. 2: Equipment - Bower anchors and chain cables.
Dredging and reclamation craft	Extended protected waters service, *See* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.7	(4) As per item (1), using N_C and N_A as appropriate $N_A = N_C$ reduced by two grades, except for stream anchors or mooring lines Stream anchor	– not required if ship fitted with positioning spuds
	Protected waters service, *See* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.6	(5) As per item (1), using N_C and N_A as appropriate Mass of bower anchor	$N_A = 0.5N_C$
		Chain cable diameter	$N_A = 0.5N_C$
		Bower anchors	powered ships – two anchors
		Bower anchors	unpowered (manned) ships – one anchor
		Chain cable length	– greater of $2L$ m or $10.0T_D$ m, but need not exceed requirements for an ordinary cargo ship with anchors of the same mass
		Mooring lines	– as required for N_C
		Wire ropes	– may be substituted for chain cable on bower anchors if breaking strength ≥1.5 times that of the chain cable
Trawlers, stern trawlers, fishing vessels	Unrestricted service	(6) The equipment for fishing vessels is to be selected from Pt 3, Ch 13, Table 13. 7. 4: Equipment – Stream anchors, stream wires, towlines and mooring lines Chain cables	Where L < 40 m, wire ropes (including those fitted to trawl winches) may be used in place of chain cables when the requirements specified under Pt 3, Ch 13, 7.4 Chain cables and chain locker 7.4.7 and Pt 3, Ch 13, 7.4 Chain cables and chain locker 7.4.9 are complied with.
		Hawsers and warps	– Sufficient in number and strength for proper working of the ship

Tugs	Unrestricted and restricted service	(7) As per item (1) using N_C except as stated below Stream anchor – not required Towlines – adequate for tug's maximum bollard pull with factor of safety ≥ 2.0
	Service restricted, *See* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.7 to Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.10	(8) As per item (1) using N_C Mass of bower anchor – reduced to correspond to two Equipment Letters below that required for N_C Chain cable diameter – reduced to correspond to two Equipment Letters below that required for N_C Anchor chains – As item (3) in this Table
	Protected waters service, *See* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.6	(9) As per item (1) using N_A Mass of bower anchor – $N_A = 0.5N_C$ Chain cable diameter – $N_A = 0.5N_C$ Chain cable length – = 0.5 times length required by N_A Where $N_C < 90$, the requirements for anchors and chain cable will be specially considered Anchor chains – As item (3) in this Table
Offshore supply ships	Unrestricted service	(10) As per item (1) using N_C Chain cable length and diameter – increased to correspond to two Equipment Letters above that required for N_C. Need not be applied for ships with **DP(AAA)**, **DP(AA)** or **DP(AM)** notations
Manned barges and pontoons	Service restricted, *See* Pt 1, Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.7 to Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.10	(11) As per item (4) in this Table
Unmanned barges and pontoons	Unrestricted service, or service restricted,*See* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.7 to Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.10	(12) As per item (1) using N_C and N_A as appropriate Anchors – $L < 30$ m, no anchor need be carried Anchors – $L \geq 30$ m, one anchor to be fitted Anchor cable length – greater of 40 m or $2L$ m
		(a) Unrestricted service: mass of anchors and chain cable diameters as for N_C (b) Protected water service, *See* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.6: mass of anchors and chain cable diameters, $N_A = 0.5N_C$

		(c) Service restriction, *See* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.7 to Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.10: mass of anchor and chain cable diameter, N_A reduced to correspond to two Equipment Letters below N_C	
		Mooring lines	L < 65 m, two mooring lines to be fitted
			$L \geq 65$ m, three mooring lines to be fitted length of mooring lines to be the greater of 2L or 80 m, but need not exceed that for manned ships Strength of each line to be that required by NC Consideration will be given to proposals to omit anchoring equipment in association with the assignment of the character figure 1, *See* Pt 1, Ch 2, 2.2, Character symbols. Where L < 65 m consideration will be given to the omission of anchoring and mooring equipment, in which case the character letter N will be assigned in the character of classification, *See* Pt 1, Ch 2, 2.2, Character symbols

Symbols

L = length of ship as defined in Pt 3, Ch 1, 6.1, Principal particulars

N_A = actual equipment number to be used, if different from N_C

N_C = calculated equipment number for ship as required by Pt 3, Ch 1, 7.1 Calculation of Equipment Number

T_D = maximum depth at which ship is designed to dredge, in metres

7. 1. 4 Where the ship is intended to perform its primary designed service function only while it is anchored, moored, towed or linked, the character letter **T** will be assigned, *See also* Pt 1, Ch 2, 2.2 Character symbols 2.2.2.

7. 1. 5 For classification purposes, the character figure **1**, or either of the character letters **N** or **T**, is to be assigned.

7. 1. 6 The anchoring equipment required herewith is intended for temporary mooring of a ship within a harbour or sheltered areas when the ship is awaiting berth, tide, etc. It is designed to hold a ship only in good holding ground conditions to avoid dragging of the anchor. In poor holding ground, the holding power of the anchors would be significantly reduced.

7. 1. 7 It is assumed that under normal circumstances a ship uses only one bower anchor and chain cable at a time.

7. 1. 8 All anchors and chain cables are to be tested at establishments and on machines recognised by the Committee and under the supervision of *ACS*'s Surveyors or other Officers recognised by the Committee, and in accordance with Ch 10 Equipment for Mooring and Anchoring of the Rules for Materials.

7. 1. 9 Test certificates showing particulars of weights of anchors, or size and weight of cable and of the test loads are applied to be furnished. These certificates are to be examined by the Surveyors when the anchors and cables are placed on board the ship.

7. 1. 10 Steel wire and fibre ropes are to be tested as required by Ch 10 Equipment for Mooring and Anchoring of the Rules for Materials.

7. 2 Anchors

7. 2. 1 Anchors are to be of an approved design. The design of all anchor heads is to be such as to minimise stress concentrations, and in particular, the radii on all parts of cast anchor heads are to be as large as possible, especially where there is considerable change of section.

7. 2. 2 Anchors which must be specially laid the right way up, or which require the fluke angle or profile to be adjusted for varying types of sea bed, will not generally be approved for normal ship use, but may be accepted for offshore units, floating cranes, etc. In such cases suitable tests may be required.

7. 2. 3 The mass of each bower anchor given in Table 13. 7. 2: Equipment - Bower anchors and chain cables is for anchors of equal mass. The masses of individual anchors may vary by ± 7 per cent of the masses given in the Table, provided that the total mass of the anchors is not less than would have been required for anchors of equal mass.

7. 2. 4 The mass of the head, including pins and fittings, of an ordinary stockless anchor is to be not less than 60 per cent of the total mass of the anchor.

7. 2. 5 When stocked bower or stream anchors are to be used, the mass excluding the stock is to be not less than 80 per cent of the mass given in Table 13. 7. 2: Equipment - Bower anchors and chain cables for ordinary stockless bower anchors. The mass of the stock is to be 25 per cent of the total mass of the anchor, including the shackle, etc. but excluding the stock.

7. 2. 6 It is recommended that anchor lashings, e.g. a 'devil's claw', be fitted to hold the anchor tight against the hull or the anchor pocket. Anchor lashings are to be designed to resist at least a load corresponding to twice the anchor mass plus 10 m of cable without exceeding 40 per cent of the yield strength of the material.

Table 13. 7. 2: Equipment - Bower anchors and chain cables

Equipment number		Equipment Letter	Stockless bower anchors		Stud link chain cables for bower anchors			
						Diameter, in mm		
Exceeding	Not Exceeding		Number	Mass of anchor, in kg	Total length, in metres	Mild steel (Grade 1 or U1)	Special quality steel (Grade U2)	Extra special quality steel (Grade U3)

7. 3 High holding power anchors

7. 3. 1 When high holding power anchors are used as bower anchors, the mass of each such anchor may be 75 per cent of the mass given in the Table for ordinary stockless bower anchors.

7. 3. 2 Anchor designs for which approval is sought as high holding power anchors are to be tested at sea to show that they have holding powers of at least twice those of approved standard stockless anchors of the same mass. For holding power test requirements relating to high holding power anchors, *See* Ch 10, 1.3 Anchor holding power tests for HHP and SHHP anchors of the Part 2.

7. 3. 3 The anchor is to be suitable for the ship's use and is not to require prior adjustment or special placement on the sea bottom.

7. 3. 4 High holding power anchors are to be of a design that will ensure that the anchors will take effective hold of the sea bed without undue delay and will remain stable, for holding forces up to those required by Pt 3, Ch 13, 7.3 High holding power anchors 7.3.2, irrespective of the angle or position at which they first settle on the sea bed when dropped from a normal type of hawse pipe. In case of doubt, a demonstration of these abilities may be required.

7. 4 Chain cables and chain locker

7. 4. 1 An easy lead of the cables from the windlass to the anchors and chain lockers is to be arranged.

7. 4. 2 Chain cables may be of mild steel, special quality steel or extra quality steel in accordance with the requirements of Ch 10 Equipment for Mooring and Anchoring of the Part 2 and are to be graded in accordance with Table 13. 7. 3: Chain cable steel grades. The total length of chain cable given in Table 13. 7. 2: Equipment - Bower anchors and chain cables is to be divided in approximately equal parts between the two bower anchors.

7. 4. 3 Grade U1 material having a tensile stress of less than 400 N/mm^2 is not to be used in association with high holding power anchors. Grade U3 material is to be used only for chain 20.5 mm or more in diameter.

7. 4. 4 Where stream anchors are used in association with chain cable, this cable may be either stud link or short link. Also for Equipment Number ≤ 90, short link chain cables may be used for bower anchors as an alternative to stud link chain cables.

7. 4. 5 The form and proportion of links and shackles are to be in accordance with Ch 10 Equipment for Mooring and Anchoring of the Part 2.

7. 4. 6 Where Owners require equipment for anchoring at depths greater than 82.5 m and up to 120 m, the recommendations specified in Pt 3, Ch 13, 10 Anchoring equipment in deep and unsheltered water shall be complied with.

7. 4. 7 Wire rope may be used in place of chain cable for bower anchors on ships with Rule length L less than 40 m when subjected to the following conditions:

a. The length of the wire rope is to be equal to 1.5 times the corresponding tabular length of chain cable specified by Table 13. 7. 2: Equipment - Bower anchors and chain cables or Table 13. 7. 5: Equipment for fishing vessels as appropriate.
b. The breaking strength is to be equal to that of tabular chain cable of Grade U1.

7. 4. 8 Wire ropes or chain cable are to be used for stream anchors as specified by Table 13. 7. 4: Equipment – Stream anchors, stream wires, towlines and mooring lines.

7. 4. 9 When wire ropes are used instead of chain cable in accordance with Pt 3, Ch 13, 7.4 Chain cables and chain locker 7.4.7 or Pt 3, Ch 13, 7.4 Chain cables and chain locker 7.4.8:

a. A short length of chain cable is to be fitted between the wire rope and bower or stream anchor having a length of 12.5 m or the distance between the anchor in the stowed position and the winch, whichever is less.
b. All surfaces being in contact with the wire need to be rounded with a radius of not less than 10 times the wire rope diameter (including stem).

7. 4. 10 Where wire rope is used in lieu of chain cable for anchoring, galvanised wire rope with an independent wire core in accordance with Ch 10, 6 Steel wire ropes of the Part 2 is to be used. Wire rope terminal fittings are to comply with an acceptable code or standard. The strength of terminations, connecting fittings, shackles or links is not to be less than that of the anchor line.

7. 4. 11 The chain locker is to be of adequate capacity and depth to provide an easy direct lead of the cables through the chain pipes and facilitate self-stowing of the cables. The chain locker is to be provided with an internal division so that the port and starboard chain cables can be separately stowed.

7. 4. 12 The chain locker boundaries are to be watertight up to the weather deck. Where the means of access to the chain locker is located below the weather deck, the access cover and its securing arrangement in general are to be in accordance with recognised standards for watertight manhole with bolted covers (e.g. ISO 5894 Ships and marine technology – Manholes with bolted covers). Butterfly nuts and/or hinged bolts are prohibited as the securing mechanism for the access cover.

7. 4. 13 The chain locker is to be provided with adequate drainage facilities.

Table 13. 7. 3: Chain cable steel grades

		Tensile strength

Grade	Material	N/mm^2
U1	Mild steel	300 - 490
U2 (a)	Special quality steel (wrought)	490 - 690
U2 (b)	Special quality steel (cast)	490 - 690
U3	Extra special quality steel	690 min.

7. 5 Mooring lines (Equipment Number ≤ 2000)

7. 5. 1 It is recommended that the breaking strength, length and number of mooring lines provided on board ships with equipment number of less than or equal to 2000 be not less than those specified in Table 13. 7. 4: Equipment – Stream anchors, stream wires, towlines and mooring lines. The Equipment Number is to be calculated in accordance with Pt 3, Ch 1, 7.1 Calculation of Equipment Number. Deck cargo as given by the loading manual is to be included in the determination of side-projected area A to be used in this sub-Section including the equipment number calculations.

7. 5. 2 It is the Owners responsibility to ensure the adequacy of the mooring equipment. The equipment should be verified through carrying out ship specific mooring calculations. The mooring calculations are to be representative of the anticipated mooring configurations, as well as accounting for operational and environmental considerations. This section details minimum recommendations only, and where the calculations provide a lesser specification it is recommended that they be increased in accordance with this section.

7. 5. 3 For ships having the ratio of side projected area A and equipment number as defined in Pt 3, Ch 1, 7.1 Calculation of Equipment Number greater than 0.9, the following number of lines is to be added to the number of mooring lines as given by the Table 13. 7. 4: Equipment – Stream anchors, stream wires, towlines and mooring lines:

a. One line where $0.9 < \frac{A}{\text{Equipment Number}} \leq 1.1$

b. Two lines where $1.1 < \frac{A}{\text{Equipment Number}} \leq 1.2$

c. Three lines where $1.2 < \frac{A}{\text{Equipment Number}}$.

7. 5. 4 It is permitted to reduce the individual mooring line lengths specified by Table 13. 7. 4: Equipment – Stream anchors, stream wires, towlines and mooring lines by up to 7 per cent provided the total length of mooring lines is not less than the total length, if all the lines were of equal given lengths.

7. 6 Mooring lines (Equipment Number > 2000)

7. 6. 1 The recommended minimum breaking strength, length and number of mooring lines for ships with equipment number greater than 2000, calculated in accordance withPt 3, Ch 1, 7.1 Calculation of Equipment Number are provided in this sub-Section. Deck cargo as given by the Loading Manual is to be included in the determination of side-projected area A to be used in the equipment number calculations.

7. 6. 2 It is the Owners responsibility to ensure the adequacy of the mooring equipment. The equipment should be verified through carrying out ship specific mooring calculations. The mooring calculations are to be representative of the anticipated mooring configurations, as well as accounting for operational and environmental considerations. This section details minimum recommendations only, and where the calculations provide a lesser specification it is recommended that they be increased in accordance with this section. A typical mooring arrangement is indicated in Figure 13. 7. 1: Typical mooring arrangement and the following is defined with respect to mooring lines.

a. Breast line: A mooring line that is deployed perpendicular to the ship, restraining the ship in the off-berth direction.
b. Spring line: A mooring line that is deployed almost parallel to the ship, restraining the ship in the fore or aft direction.
c. Head/stern line: A mooring line that is oriented between longitudinal and transverse direction, restraining the ship in the off-berth and in the fore or aft direction. The amount of restraint in fore or aft and off-berth direction depends on the line angle relative to these directions.

7. 6. 3 The strength of mooring lines and the number of head, stern, and breast lines for ships with an Equipment Number > 2000 are based on the side-projected area A_1. Side projected area A_1 is to be calculated similar to the side-projected area A according to Pt 3, Ch 1, 7.1 Calculation of Equipment Number but considering the following conditions:

a. For oil tankers, chemical tankers, bulk carriers, and ore carriers, the lightest ballast draft is to be considered for the calculation of the side-projected area A_1. For other ships the lightest draft of usual loading conditions is to be considered if the ratio of the freeboard in the lightest draft and the full load condition is equal to or above two. Usual loading conditions mean loading conditions as given by the trim and stability booklet that are to be expected to regularly occur during operation and, in particular, excluding light weight conditions, propeller inspection conditions, etc.
b. Wind shielding of the pier can be considered for the calculation of the side-projected area A_1 unless the ship is intended to be regularly moored to jetty type piers. The lower part of the side projected area above the waterline for the considered loading condition can be disregarded up to the pier height in the calculation of the side-projected area A_1. Actual height of the pier above the waterline is to be used in the calculation but in general not to exceed 3 m.
c. Deck cargo as given by the Loading Manual is to be included for the determination of side-projected area A_1. Deck cargo need not be considered if the usual light draft condition without cargo on deck generates a larger side-projected area A_1 than the full load condition with cargo on deck. The larger of both side-projected areas should be chosen as side-projected area A_1.

7. 6. 4 The mooring lines specified are based on a maximum current speed of 1.0 m/s and the following maximum wind speed V_w:

V_w = $25.0 - 0.002\ (A_1 - 2000)$ m/s for passenger ships, ferries and car carriers with $2000\ m^2 < A1 \leq 4000\ m^2$

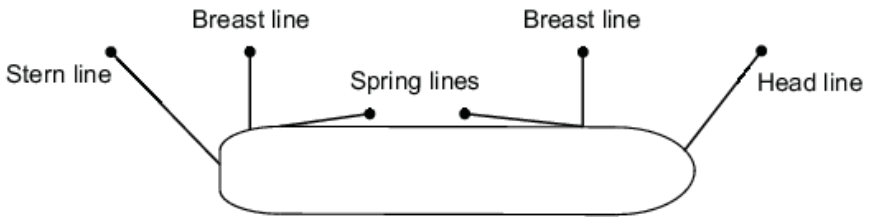
= 21.0 m/s for passenger ships, ferries and car carriers with $A_1 > 4000\ m^2$

= 25.0 m/s for other ships

7. 6. 5 The maximum wind speed V_w is representative of the mean wind speed over a 30 second period from any direction and at a height of 10 m above the ground. The current speed considered is a representative of the maximum current speed acting on bow or stern (±10°) at a depth of one-half of the mean draft. Furthermore, it is considered that the ships are moored to solid piers that provide shielding against cross currents.

7. 6. 6 Additional loads caused by higher wind or current speeds, cross currents, additional wave loads, or reduced shielding from non-solid piers, for example are to be specially considered. Consideration is also to be given to the fact that unfavourable mooring layouts can significantly increase the loads on individual mooring lines.

Figure 13. 7. 1: Typical mooring arrangement



7. 6. 7 The minimum breaking strength, in kN, of the mooring lines (MBL) is to be taken as:

$$\text{MBL} = 0.1 \times A_1 + 350$$

Where

A_1 = Side projected area as defined by Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number > 2000) 7.6.3

7. 6. 8 The minimum breaking strength may be limited to 1275 kN (130 tonnes). However in these cases, the moorings are to be considered as not sufficient for the environmental conditions given by Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number > 2000) 7.6.4. For these ships, the acceptable wind speed V_W^*, in m/s, to be calculated as follows:

$$V_W^* = V_w \times \sqrt{\frac{\text{MBL}^*}{\text{MBL}}}$$

Where

V_w = wind speed as per Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number > 2000) 7.6.4

MBL* = the breaking strength of the mooring lines intended to be supplied

MBL = required breaking strength provided by Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number > 2000) 7.6.7

However, the intended minimum breaking strength MBL* is not to be taken less than that corresponding to an acceptable wind speed of 21 m/s:

$$\text{MBL}^* \geq \left(\frac{21}{V_W}\right)^2 \times \text{MBL}$$

7. 6. 9 If the mooring lines are intended to be supplied for an acceptable wind speed V_W^*, higher than V_w as per Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number > 2000) 7.6.4, the minimum breaking strength to be taken as:

$$\text{MBL}^* = \left(\frac{V_W^*}{V_W}\right)^2 \times \text{MBL}$$

Where

MBL = required breaking strength provided by Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number > 2000) 7.6.7

7. 6. 10 The total number of head, stern and breast lines is specified as:

$$n = 8.3 \times 10^{-4} \times A_1 + 6$$

Where

A_1 = side projected area as defined by Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number $>$ 2000) 7.6.3

However, for oil tankers, chemical tankers, bulk carriers and ore carriers the total number of head, stern and breast lines is to be taken as:

$$n = 8.3 \times 10^{-4} \times A_1 + 4$$

The total number of head, stern and breast lines is to be rounded to the nearest whole number. The number may be increased or decreased in conjunction with an adjustment to the strength of the lines. The adjusted strength, MBL*, is to be taken as:

$$\text{MBL}^* = 1.2 \times \text{MBL} \times \frac{n}{n^*} \leq \text{MBL}, \text{ for increased number of lines}$$

$$\text{MBL}^* = \text{MBL} \times \frac{n}{n^*}, \text{ for reduced number of lines}$$

Where

n = number of lines for the considered ship type as calculated by the above formula without rounding

n^* = increased or decreased total number of head, stern and breast lines

Vice versa, the strength of head, stern and breast lines may be increased or decreased in conjunction with an adjustment to the number of lines.

7. 6. 11 The total number of spring lines is to be taken not less than:

- Two lines where EN < 5000,
- Four lines where EN ≥ 5000.

The strength of spring lines is to be the same as that of the head, stern and breast lines. If the number of head, stern and breast lines is increased in conjunction with an adjustment to the strength of the lines, the number of spring lines is also to be increased likewise, but rounded up to the nearest even number.

7. 6. 12 The length of mooring lines is to be taken as 200 m. It is permitted to reduce the length of individual mooring line by up to 7 per cent provided that the total length of mooring lines is not less than the total length, if all the lines were of equal given lengths.

7. 7 Mooring Arrangement and winches

7. 7. 1 The recommendations with respect to the mooring arrangement and mooring winches are provided by this sub-Section.

7. 7. 2 Mooring lines in the same service (e.g. breast lines) are to be of the same characteristics in terms of strength and elasticity.

7. 7. 3 As far as possible, a sufficient number of mooring winches is to be fitted so as to allow all mooring lines to be belayed on winches. This allows for an efficient distribution of the load to all mooring lines in the same service and for the mooring lines to shed the load before they break. If the mooring arrangement is designed such that mooring lines are partly to be belayed on bitts or bollards, it is to be understood that these lines may not be as effective as the mooring lines belayed on winches.

7. 7. 4 In the case of ships with Rule length L greater than 90 m, all ropes having breaking strengths in excess of 736.0 kN and used in normal mooring operations are to be handled by, and stored on,

suitably designed winches. Alternative methods of storing shall give due consideration to the difficulties experienced in manually handling ropes having breaking strengths in excess of 490.0 kN.

7. 7. 5 The mooring winch is to be fitted with brakes, the holding capacity of which is sufficient to prevent unreeling of the mooring line when the rope tension is equal to 80 per cent of the minimum breaking strength of the rope as fitted on the first layer. The winch is to be fitted with brakes that will allow for the reliable setting of the brake rendering load.

7. 7. 6 For powered winches the maximum hauling tension which can be applied to the mooring line (the reeled first layer) is to be not less than 2/9, nor to be more than, 1/3, of the rope's minimum breaking strength. For automatic winches these figures apply when the winch is set to the maximum power with automatic control.

7. 7. 7 For powered winches on automatic control, the rendering tension which the winch can exert on the mooring line (the reeled first layer) is not to exceed 1.5 times, nor be less than 1.05 times, the hauling tension for that particular power setting of the winch. The winch is to be marked with the range of rope strengths for which it is designed.

7. 7. 8 Mooring lines are to have a straight lead from the mooring drum to the fairlead as far as practicable.

7. 7. 9 When a mooring line changes direction, the contact surface on the fitting shall have a large radius so as to minimise the wear experienced by the mooring lines. Recommendations from the rope manufacturer for the intended rope type are also to be complied with.

7. 8 Towline and towing arrangement

7. 8. 1 The recommended towlines are given in Table 13. 7. 4: Equipment – Stream anchors, stream wires, towlines and mooring lines and are intended as ship's own towline, for being towed by a tug or another ship. This sub-Section also provides recommendations with respect to the towing arrangement.

7. 8. 2 The equipment number used for the selection of the towline is to be calculated in accordance with Pt 3, Ch 1, 7.1 Calculation of Equipment Number. Deck cargo as given by the Loading Manual is to be included in the determination of side-projected area A to be used in the equipment number calculations.

7. 8. 3 Towing lines are to be led through a closed chock. The use of open fairleads with rollers or closed roller fairleads is to be avoided.

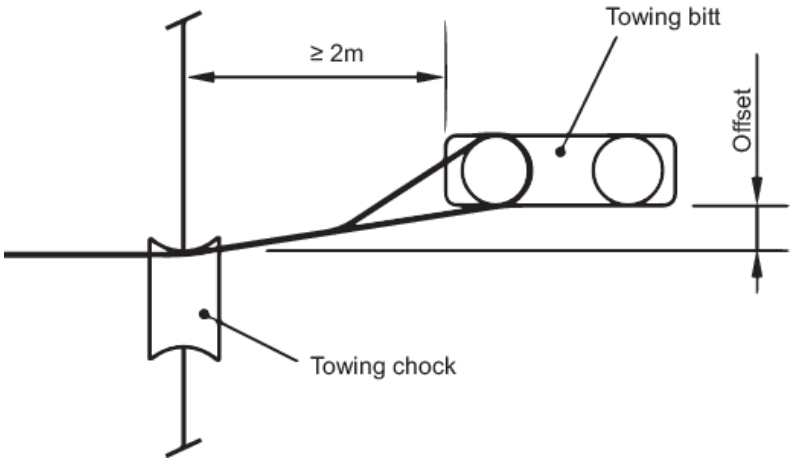
7. 8. 4 For the purpose of towing, it is recommended to provide at least one chock close to centreline of the ship forward and aft. It is also beneficial to provide additional chocks on port and starboard side at the transom and at the bow.

7. 8. 5 Towing lines are to have a straight lead from the towing bitt or bollard to the chock.

7. 8. 6 For the purpose of towing, bitts or bollards serving a chock are to be located slightly offset and at a distance of at least 2 m away from the chock, *See* Figure 13. 7. 2: Typical towing arrangement.

7. 8. 7 Attention is to be given to the arrangement of the equipment for towing and mooring operations in order to prevent interference of mooring and towing lines as far as practicable. It is beneficial to provide dedicated towing arrangements separate from the mooring equipment.

Figure 13. 7. 2: Typical towing arrangement



7. 8. 8 For emergency towing arrangements for tankers, reference is made to Pt 3, Ch 13, 12 Emergency towing arrangements. For all ships other than tankers, towing arrangements of sufficient strength are to be provided fore and aft, as defined by 'other towing service' in Pt 3, Ch 13, 9.2, Towing.

7. 9 Mooring and towline construction

7. 9. 1 Towlines and mooring lines are to be of wire, natural fibre or synthetic fibre construction or of a mixture of wire and fibre. For synthetic fibre ropes it is recommended that lines with reduced risk of recoil (snap-back) be used to mitigate the risk of injuries or fatalities in the case mooring line failure.

7. 9. 2 Notwithstanding the strength recommendations, no fibre rope shall be less than 20 mm in diameter. For polyamide ropes the minimum breaking strength is to be increased by 20 per cent and for other synthetic ropes by 10 per cent to account for strength loss due to, among other causes, aging and wear.

7. 9. 3 Wire ropes used for towlines and mooring lines are generally to be of a flexible construction with not less than 144 wires in six strands with seven fibre cores for strengths up to 490 kN, and 222 wires in six strands with one fibre core for strengths exceeding 490 kN. The wires laid round the fibre centre of each strand are to be made up in not less than two layers.

7. 9. 4 Wire ropes for towlines and mooring lines used in association with mooring winches (on which the rope is stored on the winch drum) are to be of suitable construction.

7. 9. 5 The towing and mooring lines are to be tested in accordance with Ch 10, 6 Steel wire ropes and Ch 10, 7 Fibre ropes of the Part 2 for wire ropes and fibre ropes, respectively.

Table 13. 7. 4: Equipment – Stream anchors, stream wires, towlines and mooring lines

Equipment Number		Stockless stream anchor	Stream wire or chain (*See* Note 1)		Mooring lines (*See* Note 2)			Towline

Note 1. For equipment number ≤ 110, short link chain cables may be considered as an alternative to stud link chain cables.

PART

3

CHAPTER **13 Ship Control Systems**

SECTION **8 Anchor windlass design and testing**

8. 1 General

8. 1. 1 A windlass used for handling anchors,

suitable for the size of chain cable required by Pt 3, Ch 13, 7 Equipment and complying with the following criteria is to be fitted. Where Owners require equipment significantly in excess of Rule requirements, it is their responsibility to specify increased windlass power.

8. 1. 2 The design, construction and testing of windlasses are to conform with a relevant National or International Standard or code of practice acceptable to *ACS*. To be considered acceptable, the standard, or code of practice, is to specify criteria for evaluation of stresses, performance and testing.

8. 1. 3 Operation and maintenance procedures for the anchor windlass are to be incorporated in the vessel operations manual.

8. 2 Plans and particulars to be submitted

8. 2. 1 The following plans showing the design specifications, the standard of compliance, engineering analyses and details of construction, as applicable, are to be submitted for evaluation:

- Windlass design specifications, anchor and chain cable particulars, performance criteria, and standard of compliance.
- Windlass foundation drawings including the supporting structure below deck. The details shall include bolts, chocks, shear stoppers etc., along with the foot print loads for the specified windlass ratings.
- Chain stopper foundation drawings including the supporting structure below deck. The details shall include bolts, chocks, shear stoppers etc., along with the foot print loads for the specified rating.
- Windlass arrangement plans showing all the components of the anchoring/mooring system such as the prime mover, shafting, cable lifter, anchors and chain cables; mooring winches, wires and fairleads, if they form part of the windlass machinery, brakes, controls, etc.
- Dimensions, materials, welding details, as applicable, of all torque-transmitting components (shafts, gears, clutches, couplings, coupling bolts, etc.) and all load-bearing components (shaft bearings, cable lifter, sheaves, drums, bed-frames, etc.) of the windlass and of the winch, where applicable, including brakes, chain stopper (if fitted), and foundation.
- Hydraulic system, to include:

  i. piping diagram along with system design pressure;

ii. safety valves arrangement and settings;
iii. material specifications for pipes and equipment;
iv. typical pipe joints, as applicable;
v. technical data and details for hydraulic motors;
vi. cooling systems arrangements for hydraulic system oil.

- Electrical one-line diagram along with cable specification and size, motor controller, protective device rating or setting, as applicable.
- Control, monitoring and instrumentation arrangements.
- Engineering analyses for torque-transmitting and load-bearing components demonstrating their compliance with recognised standards or codes of practice. Analyses for gears are to be in accordance with a recognised standard.
- Calculations proving satisfactory inertia loads for the intended windlass, *See* Pt 3, Ch 13, 8.4 Windlass design 8.4.1.b.
- Plans and data for windlass electric motors including associated gears rated 100 kW and over.
- Calculations demonstrating that the windlass prime mover is capable of attaining the hoisting speed, the required continuous duty pull, and the overload capacity are to be submitted if the 'load testing' including 'overload' capacity of the entire windlass unit is not carried out at the shop (*See* Pt 3, Ch 13, 8.9 Shop inspection and testing 8.9.1.b).

8. 3 Materials and fabrication

8. 3. 1 Materials used in the construction of torque-transmitting and load-bearing parts of windlasses are to comply with *ACS*'s Part 2 or an appropriate National or International Standard acceptable to *ACS*, provided that the Standard gives reasonable equivalence to the requirements of *ACS*. The proposed materials are to be indicated in the construction plans and are to be approved in connection with the design. All such materials are to be certified by the material manufacturers and are to be traceable to the manufacturers' certificates.

8. 3. 2 Weld joint designs are to be shown in the submitted construction plans and are to be appraised in association with the approval of the windlass design in accordance with an appropriate National or International Standard acceptable to *ACS*.

8. 3. 3 Welding procedures, welding consumables and welders are to comply with the *ACS* Part 2 or an appropriate National or International Standard acceptable to *ACS*.

8. 3. 4 The degree of non-destructive examination of welds and post-weld heat treatment, if any, are to be specified and submitted for consideration.

8. 4 Windlass design

8. 4. 1 In addition to the requirements of the National or International Standard or code of practice acceptable to *ACS* (*See* Pt 3, Ch 13, 8.1 General 8.1.2) the following performance requirements are to be complied with:

a. Holding Loads: Calculations are to be made to show that, in the holding condition (single anchor, brake fully applied and chain cable lifter declutched) and under a load equal to 80 per cent of the specified minimum breaking strength of the chain cable, the maximum stress in each load bearing component will not exceed the maximum permissible yield. For installations fitted with a chain cable stopper, 45 per cent of the specified minimum breaking strength of the chain cable may instead be used for the calculation.

b. Inertia Loads: The design of the drive train, including prime mover, reduction gears, bearings, clutches, shafts, cable lifter and bolting is to consider the dynamic effects of sudden stopping and starting of the prime mover or chain cable, so as to limit inertial load.

c. Continuous Duty Pull: The windlass is to have sufficient power to exert a continuous duty pull , Z_{cont1}, over a period of 30 minutes corresponding to the grade and diameter, d_c, of the chain cables as follows:

i. for specified design anchorage depths up to 82.5 m when using ordinary stockless anchors:

Chain cable grade	Z_{cont1} (N)
U1	$37.5d_c^2$
U2	$42.5d_c^2$
U3	$47.5d_c^2$

ii. for specified design anchorage depths greater than 82.5 m a continuous duty pull Z_{cont2} is:

$$Z_{cont\ 2} = Z_{cont\ 1} + (D_a - 82.5)0.27d_c^2 \text{N}$$

Where

d_c = is the chain diameter, in mm

D_a = is the specified design anchorage depth, in metres

The anchor masses are assumed to be the masses as given in Table 13. 7. 2: Equipment - Bower anchors and chain cables. The value of Z_{cont} is based on the hoisting of one anchor at a time, and assumes that the effects of buoyancy and hawse pipe efficiency (assumed to be 70 per cent) have been accounted for. In general, stresses in each torque-transmitting component are not to exceed 40 per cent of yield strength (or 0.2 per cent proof stress) of the material under these loading conditions.

d. Overload Capability: The windlass prime mover is to be able to provide, for a period of at least two minutes, the necessary temporary overload capacity for breaking out the anchor. This temporary overload capacity is to be a pull equal to the greater of:

i. short term pull:
1.5 times the continuous duty pull as defined in Pt 3, Ch 13, 8.4 Windlass design 8.4.1.c, or

ii. anchor breakout pull:

$$12.18W_a + \frac{7.0L_c d_c^2}{100} \text{N}$$

Where

L_c = is the total length of chain cable on board, in metres, as given by Table 13. 7. 2: Equipment - Bower anchors and chain cables

W_a = is the mass of bower anchor (kg) as given in Table 13. 7. 2: Equipment - Bower anchors and chain cables.

Note The speed in this period may be lower than normal.

e. Hoisting Speed: The mean speed of the chain cable during hoisting of the anchor and cable is to be 0.15 m/s.

f. Brake Capacity: The capacity of the windlass brake is to be sufficient to stop the anchor and chain cable when paying out the chain cable in a controlled manner. Where a chain cable

stopper is not fitted, the brake is to produce a torque capable of withstanding a pull equal to 80 per cent of the specified minimum breaking strength of the chain cable without any permanent deformation of strength members and without brake slip. Where a chain cable stopper is fitted, 45 per cent of the breaking strength may instead be applied. The following simplified formula is to be used to calculate the required brake capacity:

$K_b d_c^2(44 - 0.08d_c)$N

where K_b is given in Table 13. 8. 1: Values of Kb.

Table 13. 8. 1: Values of K_b

	K_b	
Cable grade	Windlass used in conjunction with chain stopper	Chain stopper not fitted
U1	4.41	7.85
U2	6.18	11.0
U3	8.83	15.7

8. 4. 2 As an alternative to conducting the engineering analyses required by Pt 3, Ch 13, 8.4,, Windlass design 8.4.1, approval of the windlass mechanical design can be based on a type test, in which case the testing procedure is to be submitted for consideration.

8. 4. 3 Calculations for torque transmitting components are to be based on 1500 hours of operation with a nominal load spectrum factor of K_m = 1.0. Alternatively unlimited hours with K_m = 0.8 can be applied.

8. 4. 4 The following criteria are to be used for gearing design:

a. Torque is to be based on the performance criteria specified in Pt 3, Ch 13, 8.4,, Windlass design 8.4.1.
b. The use of an equivalent torque, T_{eq}, for dynamic strength calculations is acceptable but the derivation is to be submitted to ACS for consideration.
c. The application factor for dynamic strength calculation, K_A, is to be 1.15.
d. Calculations are to be based on 1500 hours of operation.
e. The static torque is to be 1.5 x T_n where T_n is the nominal torque.
f. The minimum factors of safety for load capacity of spur and helical gears, as derived using ISO 6336 or a relevant National or International standard acceptable to *ACS*, are to be 1.5 for bending stress and 0.6 for contact stress.

Gears intended to transmit power greater than 100 kW are to be certified by, and the gears are to meet the requirements of Pt 5, Ch 5 Gearing.

8. 5 Hydraulic systems

8. 5. 1 Hydraulic systems, where employed for driving windlasses, are to comply with the requirements of Pt 5, Ch 14, 9 Hydraulic systems.

8. 6 Electrical systems

8. 6. 1 Electric motors are to meet the requirements of Pt 6, Ch 2, 9 Rotating machines. Motors exposed to weather are to have enclosures suitable for their location, *See also* Pt 6, Ch 2, 1.11 Location and construction 1.11.1.

8. 6. 2 Motor branch circuits are to be protected in accordance with the applicable Rules, and cable sizing is to be in accordance with the requirements of the Pt 6, Ch 2, 11 Electric cables, optical fibre cables and busbar trunking systems (busways).

8. 7 Control arrangements

8. 7. 1 All control devices are to be capable of being controlled from readily accessible positions and protected against unintentional operation.

8. 7. 2 The maximum travel of the levers is not to exceed 600 mm if movable in one direction only, or 300 mm to either side from a central position if movable in both directions. They are to move toward the right when hauling and toward the left when paying out. Alternatively, they are to move backward when hauling and forward when paying out.

8. 7. 3 Wherever practical, the lever is to move in the direction of the intended movement.

8. 7. 4 For lever-operated brakes, the brake is to engage when the lever is pulled and disengage when the lever is pushed. The physical effort on the brake for the operator is not to exceed 160 N.

8. 7. 5 For pedal-operated brakes the maximum travel is not to exceed 250 mm and the physical effort for the operator is not to exceed 320 N.

8. 7. 6 The handwheel or crankhandle is to actuate the brake when turned clockwise and release it when turned counterclockwise. The physical effort for the operator is not to exceed 250 N for speed regulation and 500 N at any moment.

8. 7. 7 When not provided with automatic sequential control, separate push-buttons are to be provided for each direction of operation.

8. 7. 8 The push-buttons are to actuate the machinery when depressed and stop and effectively brake the machinery when released.

8. 7. 9 The above mentioned individual push-buttons may be replaced by two ‘start’ and ‘stop’ push-buttons.

8. 7. 10 Control systems, whether electric, pneumatic or hydraulic, are to comply with the general requirements of Pt 6, Ch 1, 2 Essential features for control, alarm, monitoring and safety systems .

8. 8 Protection arrangements

8. 8. 1 Where applicable, moving parts of windlass machinery are to be provided with suitable railings and/or guards to prevent injury to personnel.

8. 8. 2 Protection is to be provided for preventing persons from coming into contact with surfaces having temperatures over 50°C.

8. 8. 3 Steel surfaces not protected by lubricant are to be protected by a coating in accordance with the requirements of a relevant National or International Standard acceptable to *ACS*.

8. 8. 4 For arrangements of power transmission systems and relief requirements *See* Pt 5, Ch 14, 9.1 General.

8. 8. 5 Electrical cables installed in exposed locations on open deck are to be provided with effective mechanical protection.

8. 8. 6 Means are to be provided to contain potential debris resulting from severe damage of the prime mover due to over-speed in the event of uncontrolled rendering of the cable, particularly when an axial piston type hydraulic motor forms the prime mover.

8. 8. 7 An arrangement to release the anchor and chain in the event of windlass power failure is to be provided. Windlasses are to be fitted with couplings which are capable of disengaging between

the cable lifter and the drive shaft. Hydraulically or electrically operated couplings are to be capable of being disengaged manually.

8. 8. 8 The design of the windlass is to be such that the following requirements or equivalent arrangements will minimise the probability of the chain locker or forecastle being flooded in bad weather:

a. a weathertight connection can be made between the windlass bedplate, or its equivalent, and the upper end of the chain pipe by means of a cover or seal, and
b. access to the chain pipe is adequate to permit the fitting of a cover or seal, of sufficient strength and proper design, over the chain pipe while the ship is at sea.

8. 9 Shop inspection and testing

8. 9. 1 Windlasses are to be inspected during fabrication at the manufacturers' facilities by a Surveyor for conformance with the approved plans. Acceptance tests, as specified in the specified Standard (*See* Pt 3, Ch 13, 8.1 General 8.1.2), are to be witnessed by the Surveyor and include the following tests, as a minimum:

a. No-load test. The windlass is to be run without load at nominal speed in each direction for a total of 30 minutes. If the windlass is provided with a gear change, an additional run in each direction for 5 minutes at each gear change is required.
b. Load test. The windlass is to be tested to verify that the continuous duty pull, overload capacity and hoisting speed as specified in Pt 3, Ch 13, 8.4,, Windlass design 8.4.1 can be achieved. Where the manufacturer's works does not have adequate facilities, these tests, including the adjustment of the overload protection, can be carried out on board ship. In these cases, functional testing in the manufacturer's works is to be performed under no-load conditions.
c. Brake capacity test. The holding power of the brake is to be verified through testing if not verified by calculation.

8. 9. 2 Windlass performance characteristics specified in Pt 3, Ch 13, 8.9, Shop inspection and testing 8.9.1 are based on the following assumptions:

a. one cable lifter only is connected to the drive shaft;
b. continuous duty and short term pulls are measured at the cable lifter;
c. hawse pipe efficiency assumed to be 70 per cent.

8. 10 On-board testing

8. 10. 1 Each windlass is to be tested under working conditions after installation on board to demonstrate satisfactory operation. Each unit is to be independently tested for braking, clutch functioning, lowering and hoisting of the chain cable and anchor, proper riding of the chain over the cable lifter, proper transit of the chain through the hawse pipe and the chain pipe, and effecting proper stowage of the chain and the anchor. It is to be confirmed that anchors properly seat in the stored position and that chain stoppers function as designed, if fitted. The braking capacity is to be tested by intermittently paying out and holding the chain cable by means of the application of the brake.

8. 10. 2 The mean hoisting speed, as specified in Pt 3, Ch 13, 8.4 Windlass design 8.4.1.e is to be measured and verified. For testing purposes, the speed is to be measured over two shots of chain cable and initially with at least three shots of chain (82.5 m or 45 fathoms in length) and the anchor submerged and hanging free. Following trials, the ship will be eligible to be asigned a descriptive note **specified design anchorage depth . . . metres**, which will be entered in column 6 of the *Register Book*.

8. 10. 3 Load testing is to be carried out if this was not previously completed as required by Pt 3, Ch 13, 8.9 Shop inspection and testing 8.9.1.b.

8. 10. 4 Where the depth of water in the trial area is inadequate, suitable equivalent simulating conditions will be considered as an alternative.

8. 11 Marking and identification

8. 11. 1 The windlass is to be permanently marked with the following information:

a. Nominal size of the cable chain including mean diameter, grade and percentage of the breaking load the windlass is designed to hold (e.g. 100/3/45).

b. Maximum anchorage depth, in metres.

8. 12 Structural requirements associated with anchoring

8. 12. 1 The windlass or winch is to be efficiently bedded and secured to the deck. The thickness of the deck in way of the windlass or winch is to be increased and the supporting structure for the anchor windlass is to be examined for the brake holding loads specified by Pt 3, Ch 13, 8.4, Windlass design. The allowable stresses specified in Table 13. 8. 2: Allowable stresses in windlass and chain stopper supporting structure are to be used to derive the net scantlings of the supporting structure. A corrosion addition of 2 mm is to be added to the net thickness derived. The structural design integrity of the bedplate is the responsibility of the Shipbuilder and windlass or winch manufacturer.

8. 12. 2 Where cables pass through stoppers, these stoppers are to be manufactured from ductile material and be designed to minimise the possibility of damage to, or snagging of, the cable. They are to be capable of withstanding without permanent deformation a load equal to 80 per cent of the Rule breaking load of the cable passing over them. The allowable stresses specified in Table 13. 8. 2: Allowable stresses in windlass and chain stopper supporting structure are to be used to derive the net scantlings of the supporting structure. A corrosion addition of 2 mm is to be added to the net thickness derived.

Table 13. 8. 2: Allowable stresses in windlass and chain stopper supporting structure

	Permissible stress N/mm^2
Normal stress (*See* Note 1) Shear stress	$1.00\ \sigma_0$ $0.58\ \sigma_0$
Symbols	
σ_0 = specified minimum yield stress, N/mm^2	
Note *1* Normal stress is defined as the sum of bending and axial stresses.	

8. 12. 3 Hawse pipes and anchor pockets are to be of ample thickness and of a suitable size and form to house the anchors efficiently, preventing, as much as practicable, slackening of the cable or movements of the anchor being caused by wave action. The shell plating and framing in way of the hawse pipes are to be reinforced as necessary. Reinforcing is also to be arranged in way of those parts of bulbous bows liable to be damaged by anchors or cables. Substantial chafing lips are to be provided at shell and deck. These are to have sufficiently large, radiused faces to minimise the probability of cable links being subjected to high bending stresses. Alternatively, roller fairleads of suitable design may be fitted. Where unpocketed rollers are used, it is recommended that the roller diameter be not less than eleven times the chain diameter. Where hawse pipes are not fitted, alternative arrangements will be specially considered.

8. 12. 4 The chain locker is to be of a capacity and depth adequate to provide an easy direct lead for the cable into the chain pipes, when the cable is fully stowed. Chain or spurling pipes are to be of suitable size and provided with chafing lips. The port and starboard cables are to be separated by a division in the locker.

8. 12. 5 Where means of access is provided to the chain locker it is to be closed by a substantial cover and secured by closely spaced bolts. Where a means of access to spurling pipes or cable lockers is located below the weather deck, the access cover and its securing arrangements are to be in accordance with ISO 5894-1999, or an equivalent National Standard acceptable to *ACS*, recognised standards or equivalent for watertight manhole covers. Butterfly nuts and/or hinged bolts are prohibited as the securing mechanism for the access cover.

8. 12. 6 Chain lockers and spurling pipes are to be watertight up to the exposed weather deck and the space is to be efficiently drained. However, bulkheads between separate chain lockers, or which form a common boundary of chain lockers, need not be watertight.

8. 12. 7 Spurling pipes are to be provided with permanently attached closing appliances to minimise water ingress. Examples of acceptable arrangements are:

a. steel plates with cutouts to accommodate chain links, or
b. canvas hoods with a lashing arrangement that maintains the cover in the secured position.

8. 12. 8 Provision is to be made for securing the bitter end of the chain cable to the ship structure. The fastening for securing the bitter end is to be capable of withstanding a force of not less than 15 per cent and not greater than 30 per cent of the minimum breaking strength of the as fitted chain cable. It is to be provided with suitable means such that, in case of emergency, the chain cable may be easily slipped to sea from an accessible position outside the chain cable locker. Where the mechanism for slipping the chain cable to sea penetrates the chain locker bulkhead, this penetration is to be made watertight.

8. 12. 9 Alternatively the cable end connection may be accepted where it has been designed and constructed to a recognised National or International Standard.

8. 12. 10 The cable clench supporting structure is to be adequately stiffened in accordance with the breaking strength of the fastening provided.

8. 12. 11 Satisfactory arrangements are to be made for the stowage and working of the stream anchor, if provided.

8. 12. 12 On dredging and reclamation craft the following are to be complied with:

a. On unpowered ships, the windlass may be hand operated.
b. On split type vessels, the arrangements are to be such that jamming of the anchor cable during opening and closing operations of the hull will not occur.

8. 12. 13 When wire rope instead of chain is used for the anchor cable, it is to be stored on a suitably designed drum or reel. Fairleads intended for use with wire rope cable are to be designed to minimise wear and to avoid kinking or other damage occurring to the rope. Fairleads should, in general, be fitted with rollers having a diameter not less than eleven times the diameter of the anchor cable or as specified/ recommended by the rope manufacturer.

8. 13 Structural requirements for windlasses on exposed fore decks

8. 13. 1 Windlasses located on the exposed deck over the forward 0.25L of the rule length, of ships of sea-going service of length 80 m or more, where the height of the exposed deck in way of the item is less than 0.1L or 22 m above the summer load waterline, whichever is the lesser, are to comply with the following requirements. Where mooring winches are integral with the anchor windlass, they are to be considered as part of the windlass.

8. 13. 2 The following pressures and associated areas are to be applied, *See* Figure 13. 8. 1: Windlass loading:

- 200 kN/m^2 normal to the shaft axis and away from the forward perpendicular, over the projected area in this direction;
- 150 kN/m^2 parallel to the shaft axis and acting both inboard and outboard separately, over the multiple of f times the projected area in this direction;

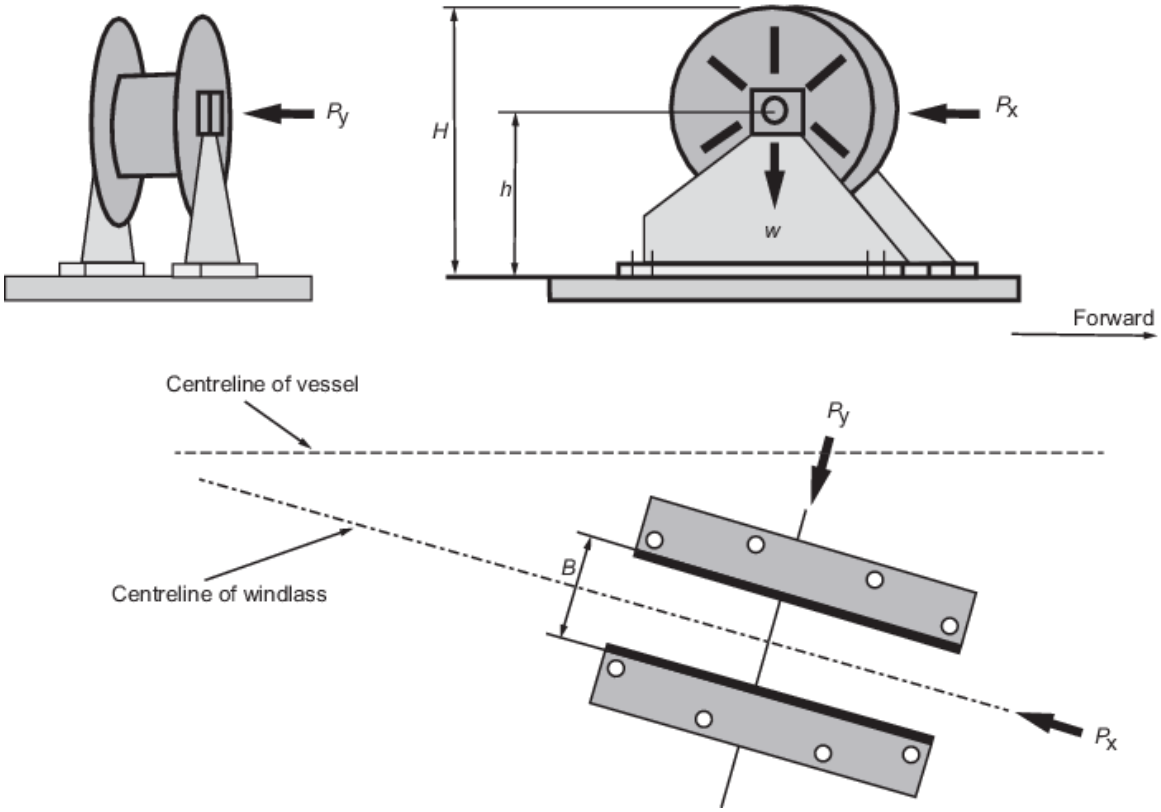
Where

f = $1 + B/H$, but not greater than 2.5

B = width of windlass measured parallel to the shaft axis, in metres

H = overall height of windlass, in metres.

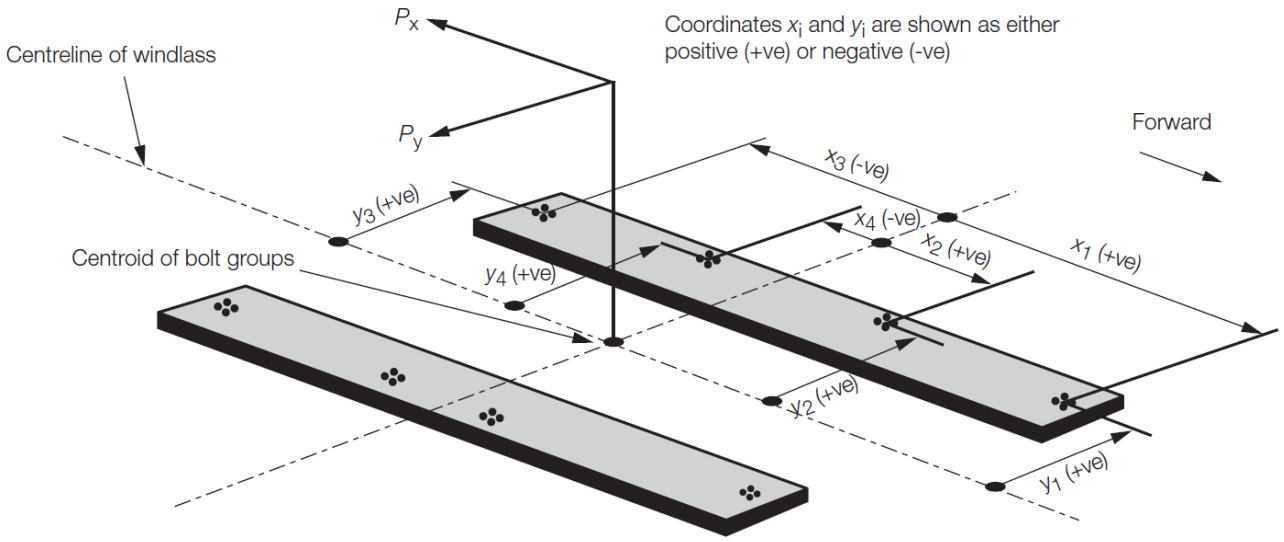
Figure 13. 8. 1: Windlass loading



Note P_y is to be examined from both inboard and outboard directions separately, *See* Pt 3, Ch 13, 8.13 Structural requirements for windlasses on exposed fore decks 8.13.2. The sign convention for y_i is reversed when P_Y is from the opposite direction as shown.

8. 13. 3 Forces in the bolts, chocks and stoppers securing the windlass to the deck are to be calculated. The windlass is supported by N bolt groups, each containing one or more bolts, *See* Figure 13. 8. 2: Direction of forces and weight.

Figure 13. 8. 2: Direction of forces and weight



8. 13. 4 The axial force R_i in bolt group (or bolt) i, positive in tension, may be calculated from:

$$R_{xi} = P_x h x_i A_i / I_x \text{ in kN}$$

$$R_{yi} = P_y h y_i A_i / I_y \text{ in kN, and}$$

$$R_i = R_{xi} + R_{yi} - R_{si} \text{ in kN}$$

where

P_x = force acting normal to the shaft axis, in kN

P_y = force acting parallel to the shaft axis, either inboard or outboard whichever gives the greater force in bolt group i, in kN

h = shaft height above the windlass mounting, in cm

x_i, y_i = x and y coordinates of bolt group i from the centroid of all N bolt groups, positive in the direction opposite to that of the applied force, in cm

A_i = cross sectional area of all bolts in group i, in cm^2

I_x = $\Sigma A_i x_i^2$ for N bolt groups, in cm^4

I_y = $\Sigma A_i y_i^2$ for N bolt groups, in cm^4

R_{si} = static reaction at bolt group i, due to weight of windlass, in kN.

8. 13. 5 Shear forces F_{xi}, F_{yi} applied to the bolt group i, and the resultant combined force F_i may be calculated from:

$$F_{xi} = (P_x - \mu g M)/N \text{ in kN}$$

$$F_{yi} = (P_y - \mu g M)/N \text{ in kN}$$

$$F_i = \sqrt{(F_{xi}^2 + F_{yi}^2)}\ kN$$

Where

α = coefficient of friction (0.5)

M = mass of windlass, in tonnes

g = gravity acceleration (9.81 m/sec^2)

N = number of bolt groups.

8. 13. 6 Tensile axial stresses in the individual bolts in each bolt group i are to be calculated. The horizontal forces F_{xi} and F_{yi} are normally to be reacted by shear chocks. Where 'fitted' bolts are designed to support these shear forces in one or both directions, the von Mises equivalent stresses in the individual bolts are to be calculated, and compared to the stress under proof load. Where pourable resins are incorporated in the holding down arrangements, due account is to be taken in the calculations.

8. 13. 7 The safety factor against bolt proof strength is to be not less than 2.0.

8. 13. 8 Bolts are to be of lSO 898/1 material Grade 8.8, 10.9 or 12.9 or equivalent and are to be pretensioned by controlled means to 70 to 90 per cent of their yield stress. Pretensioning is to be in accordance with the manufacturer's instructions and, in general, pretensioning by bolt torqueing up to bolt size M30 may be used. Beyond this, pretensioning is to be carried out by an hydraulic tensioning device and the elongation of the bolts measured to determine pre-load. Where resin chocks are proposed plans and calculations are to be submitted for consideration.

8. 13. 9 The windlass is to be efficiently bedded and secured to the deck. The thickness of the deck in way of the windlass is to be increased. Adequate stiffening of the deck in way of the windlass is to be provided. The scantlings of the supporting structure and deck are to be determined by additional calculations applying the weight of the windlass combined with the resultant force on the seat due to the application of the following design loads:

- P_x (as defined in Pt 3, Ch 13, 8.13 Structural requirements for windlasses on exposed fore decks 8.13.4);
- P_y;
- P_x and P_y combined;

The allowable stresses given in Table 13. 8. 3: Allowable stress in windlass supporting structure for green sea loading are not to be exceeded.

Table 13. 8. 3: Allowable stress in windlass supporting structure for green sea loading

	Bending stress, in N/mm^2	Shear stress, in N/mm^2	Combined stress, in N/mm^2
Allowable stress	$\frac{150}{k}$	$\frac{87}{k}$	$\frac{213}{k}$
k = material factor, *See* Pt 3, Ch 2, 1.2, Steel			

8. 13. 10 The axial tensile and compressive forces in Pt 3, Ch 13, 8.13 Structural requirements for windlasses on exposed fore decks 8.13.4 and the lateral forces in Pt 3, Ch 13, 8.13 Structural requirements for windlasses on exposed fore decks 8.13.5 are also to be considered in the design of the supporting structure.

PART

3

CHAPTER **13 Ship Control Systems**

SECTION **9 Structural requirements associated with towing and mooring**

9. 1 eneral

9. 1. 1 This Section applies to the design and construction of shipboard fittings and supporting structures used for the normal towing and mooring operations. Normal towing means towing operations necessary for manoeuvring in ports and sheltered waters associated with the normal operations of the ship.

9. 1. 2 The arrangements, equipment and fittings of sufficient safe working load are to be provided to enable the safe conduct of all towing and mooring operations associated with the normal operations of the ship.

9. 1. 3 For ships, not subject to SOLAS Regulation II-1/3-4 Paragraph 1, but intended to be fitted with equipment for towing by another ship or a tug, e.g. such as to assist the ship in case of emergency as given in SOLAS Regulation II-1/3-4 Paragraph 2, the requirements designated as 'other towing' in this Section are to be applied to the design and construction of those shipboard fittings and supporting hull structures.

9. 1. 4 This Section is not applicable to the design and construction of shipboard fittings and supporting hull structures used for special towing services such as escort towing, canal transit towing, emergency towing for tankers etc. These requirements are also not applicable to special purpose ships.

9. 1. 5 Shipboard fittings means bollards and bitts, fairleads, stand rollers, chocks used for the normal mooring of the ship, and the similar components used for normal or other towing of the ship. Any weld or bolt or equivalent device connecting the shipboard fitting to the supporting structure is part of the shipboard fitting. Other components such as capstans, winches, etc. are not covered by this Section.

9. 1. 6 Supporting hull structures means that part of the ship structure on/in which the shipboard fitting is placed and which is directly submitted to the forces exerted on the shipboard fitting. The supporting hull structure of capstans, winches, etc. used for normal or other towing and mooring operations mentioned above is also to comply with the requirements specified in this Section.

9. 2 Towing

9. 2. 1 The strength of shipboard fittings used for normal towing operations at bow, sides and stern and their supporting hull structures are to comply with the requirements specified in this sub-Section.

9. 2. 2 Where a ship is equipped with shipboard fittings intended to be used for other towing services, the strength of these fittings and their supporting hull structures are also to comply with the requirements specified.

9. 2. 3 Shipboard fittings for towing are to be located on stiffeners and/or girders which are part of the deck construction so as to facilitate efficient distribution of the towing load. Other arrangements are acceptable (for chocks in bulwarks, etc.), provided that the strength is confirmed adequate for the intended service.

9. 2. 4 The design load applied to shipboard fittings and supporting hull structure is not to be less than that given in Table 13. 9. 1: Minimum design load for deck fittings and supporting structure – Towing.

Table 13. 9. 1: Minimum design load for deck fittings and supporting structure – Towing

Use/Item	Minimum design load (*See* Notes 1 to 3)
Normal towing (harbour/manoeuvring)	1.25 times the intended maximum towing load (e.g. static bollard pull) as indicated on the towing and mooring arrangements plan
Other towing service (SOLAS Regulation II-1/3-4 Paragraph 2)	Minimum breaking strength of the towline
For fittings intended to be used for both normal towing and other towing service	The greater of the specified loads in each case

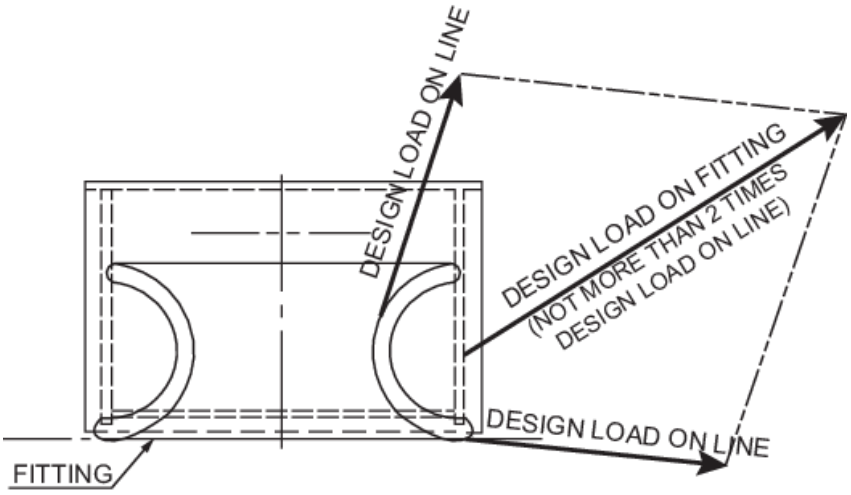
Note 1. When a safe towing load TOW greater than that determined according to Pt 3, Ch 13, 9.2 Towing 9.2.12 is requested, then the design load is to be increased in accordance with the appropriate TOW/design load relationship given in this sub-Section.

Note 2. Side projected area including that of deck cargoes as given by the loading manual is to be taken into account for selection of towing lines and the loads applied to shipboard fittings and supporting hull structure.

Note 3. The increase of the minimum breaking strength for synthetic ropes need not to be taken into account for the loads applied to shipboard fittings and supporting hull structure.

9. 2. 5 The design load is to be applied to fittings in all directions that could occur by taking into account the arrangement shown on the towing and mooring arrangements plan. Where the towing line takes a turn at a fitting, the total design load applied to the fitting is equal to the resultant of the design loads acting on the line, *See* Figure 13. 9. 1: Design load applied to fittings. However, in no case does the design load applied to the fitting need to be greater than twice the design load on the line.

Figure 13. 9. 1: Design load applied to fittings



9. 2. 6 Shipboard fittings are to be selected from an acceptable National or International standard and to be based on the following minimum loads.

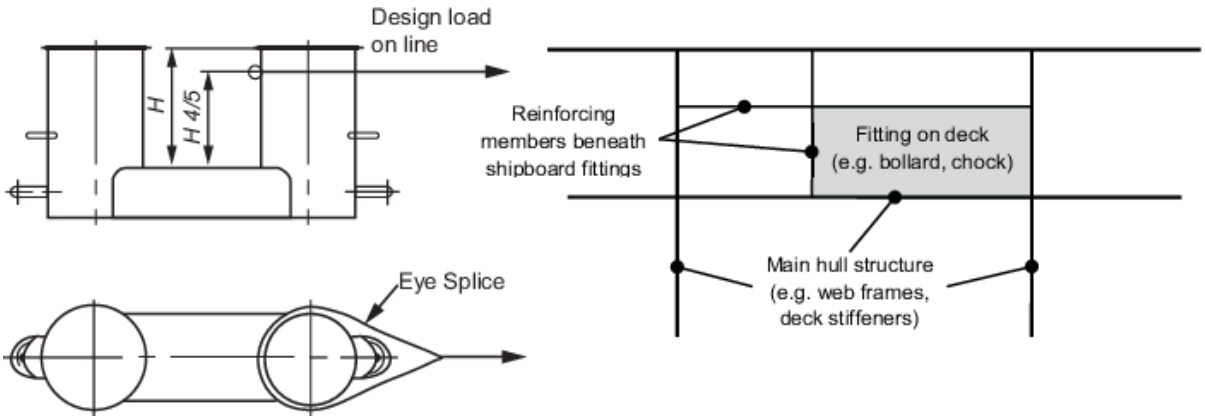
- For normal towing operations, the intended maximum towing load (e.g. static bollard pull) as indicated on the towing and mooring arrangements plan;
- For other towing service, the minimum breaking strength of the towline in accordance with Pt 3, Ch 13, 7.8 Towline and towing arrangement (*See* Notes 2 and 3 of Table 13. 9. 1: Minimum design load for deck fittings and supporting structure – Towing);
- For fittings intended to be used for both, i.e. normal and other towing operations, the greater of the loads specified in each case is to be used.

9. 2. 7 Towing bitts (double bollards) are to be chosen for the towing line attached with an eye splice if the industry standard distinguishes between different methods to attach the line, i.e. figure-of eight or eye splice attachment.

9. 2. 8 When the shipboard fitting is not selected from an accepted industry standard, the strength of the fitting based on net scantlings and its attachment to the ship is to be adequate for the loads specified by the Table 13. 9. 1: Minimum design load for deck fittings and supporting structure – Towing based on the acceptance criteria given in Pt 3, Ch 13, 9.2 Towing 9.2.10 or Pt 3, Ch 13, 9.2 Towing 9.2.11 as appropriate. Towing bitts (double bollards) are required to resist the loads caused by the towing line attached with an eye splice. For strength assessment, beam theory or finite element analysis using net scantlings is to be applied, as appropriate. Corrosion additions and wear down allowance is to be added to the net scantlings as defined in this Section.

9. 2. 9 The net scantlings of the supporting hull structure for the fittings are to be adequate for the loads specified by the Table 13. 9. 1: Minimum design load for deck fittings and supporting structure – Towing based on the acceptance criteria given in by Pt 3, Ch 13, 9.2 Towing 9.2.10 or Pt 3, Ch 13, 9.2 Towing 9.2.11 as appropriate. The reinforced members beneath shipboard fittings are to be effectively arranged for any variation of direction (horizontally and vertically) of the towing forces acting upon the shipboard fittings, *See* Figure 13. 9. 2: Supporting hull structure for a sample arrangement. Proper alignment of the fitting and its supporting hull structure is to be ensured. The acting point of the towing force on a shipboard fitting is to be taken at the attachment point of a towing line or at a change in its direction. For bollards and bitts the attachment point of the towing line is to be taken not less than 4/5 of the tube height above the base as indicated in Figure 13. 9. 2: Supporting hull structure. Corrosion additions are to be added to the net scantlings as defined in this Section.

Figure 13. 9. 2: Supporting hull structure



9. 2. 10 In the case of strength assessment using beam theory or grillage analysis, the stress within the supporting structure of fittings is not to exceed that given in Table 13. 9. 2: Allowable stress within the supporting structure of shipboard fittings.

9. 2. 11 For strength calculations by means of finite element analysis, the geometry is to be idealised as realistically as possible. The ratio of element length to width is not to exceed 3. Girders are to be modelled using shell or plane stress elements. Symmetric girder flanges are generally to be modelled by beam or truss elements. At least three elements are to be used across the depth of the girder. In way of small openings in girder webs the web thickness is to be reduced to a mean thickness over the web height. Large openings are to be modelled. Stiffeners are generally to be modelled by using shell, plane stress, or beam elements. Stresses are to be read from the centre of the individual element. For shell elements the stresses are to be evaluated at the mid plane of the element. The equivalent stress within the supporting structure of fittings is not to exceed the specified minimum yield strength of the material.

Table 13. 9. 2: Allowable stress within the supporting structure of shipboard fittings

	Normal stress, in N/mm^2	Shear stress, in N/mm^2
Allowable stress	$\frac{235}{k}$	$\frac{141}{k}$

where

$k = \frac{235}{\sigma_0}$

σ_0 = specified minimum yield strength of the material in N/mm^2

Note Normal stress is defined as the sum of bending and axial stresses. No stress concentration factors accounted for and as such may need to be considered separately.

9. 2. 12 The safe towing load (TOW) is the load limit for towing purposes. TOW used is not to exceed 80 per cent of the design loads specified by Table 13. 9. 1: Minimum design load for deck fittings and supporting structure – Towing.

9. 2. 13 TOW, in tonnes, of each shipboard fitting is to be marked (by weld bead or equivalent) on the deck fittings used for towing. For fittings intended to be used for both, towing and mooring, SWL, in tonnes, according to Pt 3, Ch 13, 9.3, Mooring is to be marked in addition to TOW.

9. 2. 14 The above requirements on TOW apply for the use with no more than one towline line. If not otherwise chosen, for towing bitts (double bollards) TOW is the load limit for a towing line attached with an eye-splice.

9. 2. 15 The towing and mooring arrangements plan mentioned in Pt 3, Ch 13, 9.4, Towing and mooring arrangements plan is to define the method of use of towing lines.

9. 3 Mooring

9. 3. 1 The strength of shipboard fittings used for mooring operations and their supporting hull structures as well as the strength of supporting hull structures of winches and capstans are to comply with the requirements specified in this sub-Section.

9. 3. 2 Shipboard fittings, winches and capstans for mooring are to be located on stiffeners and/or girders which are part of the deck construction so as to facilitate efficient distribution of the mooring load. Other arrangements are acceptable (for chocks in bulwarks, etc.) provided that the strength is confirmed adequate for the service.

9. 3. 3 The design load applied to shipboard fittings and supporting hull structure is not to be less than that given in Table 13. 9. 3: Minimum design load for deck fittings and supporting structure - Mooring.

9. 3. 4 The design load is to be applied to fittings in all directions that could occur by taking into account the arrangement shown on the towing and mooring arrangements plan. Where the mooring line takes a turn at a fitting, the total design load applied to the fitting is equal to the resultant of the design loads acting on the line, *See* Figure 13. 9. 1: Design load applied to fittings. However, in no case does the design load applied to the fitting need to be greater than twice the design load on the line.

Table 13. 9. 3: Minimum design load for deck fittings and supporting structure - Mooring

Use/Item	Minimum design load (*See* Notes 1 to 3)
Moorings (Fittings and their supporting hull structure)	1.15 times the breaking strength of the mooring lines given in Pt 3, Ch 13, 7.5 Mooring lines (Equipment Number ≤ 2000) or Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number > 2000) as appropriate.
Winches (Supporting hull structure only)	1.25 times the intended maximum brake holding load, where the maximum brake holding load is to be assumed not less than 80% of the minimum breaking strength of the mooring line given in Pt 3, Ch 13, 7.5 Mooring lines (Equipment Number ≤ 2000) or Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number > 2000) as appropriate.
Capstans (Supporting hull structure only)	1.25 times the maximum hauling in force, where hauling in force is defined as the maximum pull of the capstan or 1.25 times the intended maximum brake holding load if that be greater.

Note 1. When a safe working load SWL greater than that determined according to the Rules is requested, the design load is to be increased in accordance with the appropriate SWL/design load relationship given in Pt 3, Ch 13, 9.3 Mooring 9.3.12.

Note 2. Side projected area including that of deck cargoes as given by the loading manual is to be taken into account for the selection of mooring lines and the loads applied to shipboard fittings and supporting hull structure.

Note 3. The increase of the minimum breaking strength for synthetic ropes need not to be taken into account for the loads applied to shipboard fittings and supporting hull structure.

9. 3. 5 Shipboard fittings are to be selected from an acceptable National or International standard and to be based on the minimum breaking strength of the mooring line as given in Pt 3, Ch 13, 7.5 Mooring lines (Equipment Number ≤ 2000) or Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number > 2000), corresponding to the ship's equipment number (*See* Notes 2 and 3, Table 13. 9. 3: Minimum design load for deck fittings and supporting structure - Mooring).

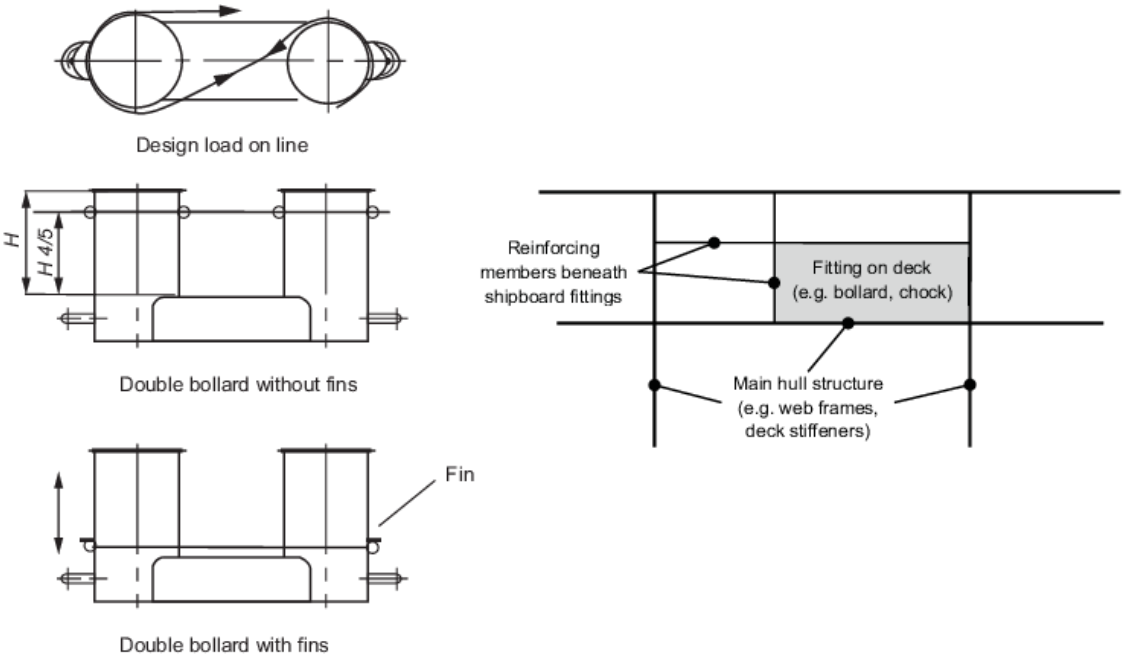
9. 3. 6 Mooring bitts (double bollards) are to be chosen for the mooring line attached in figure-of-eight fashion if the industry standard distinguishes between different methods to attach the line, i.e. figure-of-eight or eye-splice attachment.

9. 3. 7 When the shipboard fitting is not selected from an accepted industry standard, the strength of the fitting based on net scantlings and its attachment to the ship is to be adequate for the loads specified in Table 13. 9. 3: Minimum design load for deck fittings and supporting structure - Mooring based on the acceptance criteria given in Pt 3, Ch 13, 9.3 Mooring 9.3.10 or Pt 3, Ch 13, 9.3 Mooring 9.3.11 as appropriate. Mooring bitts (double bollards) are required to resist the loads caused by the mooring line attached in figure-of-eight fashion. For strength assessment, beam theory or finite element analysis using net scantlings is to be applied, as appropriate. Corrosion additions and wear down allowance is to be added as defined in this Section.

9. 3. 8 The net scantlings of the supporting hull structure for the fittings are to be adequate for the loads given in Table 13. 9. 3: Minimum design load for deck fittings and supporting structure - Mooring based on the acceptance criteria given in Pt 3, Ch 13, 9.3 Mooring 9.3.10 or Pt 3, Ch 13, 9.3 Mooring 9.3.11 as appropriate. The arrangement of reinforced members beneath shipboard fittings, winches and capstans is to consider any variation of direction (horizontally and vertically) of the mooring forces acting upon the shipboard fittings, *See* Figure 13. 9. 3: Supporting hull structure for a sample arrangement. Proper alignment of fitting and supporting hull structure is to be ensured. The acting point of the mooring force on shipboard fittings is to be taken at the attachment point of a mooring line or at a change in its direction. Corrosion additions are to be added to the net scantlings as defined in this Section.

9. 3. 9 For bollards and bitts the attachment point of the mooring line is to be taken not less than 4/5 of the tube height above the base, *See* Figure 13. 9. 3: Supporting hull structure. However, if fins are fitted to the bollard tubes to keep the mooring line as low as possible, then the attachment point of the mooring line is to be taken at the location of the fins, *See* Figure 13. 9. 3: Supporting hull structure.

Figure 13. 9. 3: Supporting hull structure



9. 3. 10 In the case of strength assessment using beam theory or grillage analysis, the stress within the supporting structure of fittings is not to exceed that given in Table 13. 9. 2: Allowable stress within the supporting structure of shipboard fittings.

9. 3. 11 For strength calculations by means of finite element analysis, the geometry is to be idealised as realistically as possible. The ratio of element length to width is not to exceed 3. Girders are to be modelled using shell or plane stress elements. Symmetric girder flanges are generally to be modelled by beam or truss elements. At least three elements are to be used across the depth of the girder. In way of small openings in girder webs the web thickness is to be reduced to a mean thickness over the web height. Large openings are to be modelled. Stiffeners are generally to be modelled by using shell, plane stress, or beam elements. Stresses are to be read from the centre of the individual element. For shell elements the stresses are to be evaluated at the mid plane of the element. The equivalent stress within the supporting structure of fittings is not to exceed the specified minimum yield strength of the material.

9. 3. 12 The Safe Working Load (SWL) is the load limit for mooring purposes. Unless a greater SWL is requested, the SWL assigned shall be the minimum breaking strength of the mooring line given in Pt 3, Ch 13, 7.5 Mooring lines (Equipment Number ≤ 2000) and Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number > 2000), corresponding to the ship's equipment number (*See* Notes 2 and 3 of). Design load on line Double bollard without fins Fitting on deck (e.g. bollard, chock) Main hull structure (e.g. web frames, deck stiffeners) Reinforcing members beneath shipboard fittings Double bollard with fins Fin

9. 3. 13 The SWL, in tonnes, of each shipboard fitting is to be marked (by weld bead or equivalent) on the deck fittings used for mooring. For fittings intended to be used for both, mooring and towing, the TOW, in tonnes, according to Pt 3, Ch 13, 9.2, Towing is to be marked in addition to the SWL.

9. 3. 14 The above requirements on SWL apply for the use with no more than one mooring line.

9. 3. 15 The towing and mooring arrangements plan mentioned in Pt 3, Ch 13, 9.4, Towing and mooring arrangements plan is to define the method of use of mooring lines.

9. 4 Towing and mooring arrangements plan

9. 4. 1 The SWL and TOW for the intended use for each shipboard fitting is to be noted in the towing and mooring arrangements plan available on board for the guidance of the Master. It is to be noted that TOW is the load limit for towing purpose and SWL that for mooring purpose. If not otherwise chosen, for towing bitts it is to be noted that TOW is the load limit for a towing line attached with an eye splice.

9. 4. 2 Information provided on the plan is to include in respect for each shipboard fitting:

a. location on the ship;
b. fitting type;
c. SWL/TOW;
d. purpose (mooring/harbour towing/other towing);
e. manner of applying towing or mooring line load, including limiting fleet angles.
f. the arrangement of mooring lines showing number of lines (*N*);
g. the minimum breaking strength of each mooring line (MBL);
h. the acceptable environmental conditions as given in Pt 3, Ch 13, 7.6 Mooring lines (Equipment Number > 2000) for the recommended minimum breaking strength of mooring lines for ships with EN > 2000:
   - 30 second mean wind speed from any direction (V_W or V_W^*)
   - Maximum current speed acting on bow or stern ($\pm 10^\circ$).

Note Item (c) with respect to items (d) and (e), is subject to approval. Fleet angle is defined as the maximum angle the line deviates from a direction perpendicular to the drum axis of a mooring/towing winch.

9. 4. 3 The above information as given Pt 3, Ch 13, 9.4 Towing and mooring arrangements plan 9.4.2 is to be incorporated into the pilot card in order to provide the pilot with proper information on harbour and other towing operations.

9. 5 Corrosion addition

9. 5. 1 An allowance for corrosion is to be added to the net thickness derived as indicated below:

- For the supporting hull structure, a corrosion addition of 2 mm is to be added to the net thickness derived.
- For pedestals and foundations on deck which are not part of a fitting according to an accepted industry standard, 2.0 mm.
- For shipboard fittings not selected from an accepted industry standard, 2.0 mm.

9. 6 Wear allowance

9. 6. 1 In addition to the corrosion addition given in Pt 3, Ch 13, 9.5 Corrosion addition, the wear allowance, t_w, for shipboard fittings that are not selected from an acceptable National or International standard, is not to be less than 1.0 mm, added to surfaces which are intended to regularly contact the line.

PART

3

CHAPTER **13 Ship Control Systems**

SECTION **10 Anchoring equipment in deep and unsheltered water**

10. 1 General

10. 1. 1 It is recommended that the equipment requirements specified in this Section are complied with if the vessel intends to anchor in deep and unsheltered water. Where a ship's anchoring equipment complies with the requirements of this Section, the ship will be eligible to be assigned the special features notation **DWA**.

10. 1. 2 The equipment specified is for ships intended to anchor in water with depth up to 120 m, current with speed up to 1.54 m/s, wind with speed up to 14 m/s and waves with significant height of up to 3 m. The scope of chain cable, being the ratio between the length of chain paid out and water depth, is assumed to be not less than 3 to 4. These requirements are applicable only to ships with a Rule length L of not less than 135 m.

10. 1. 3 The requirements specified in other Sections of this Chapter need to be complied with unless alternative requirements are provided.

10. 2 Anchor and chain cable

10. 2. 1 Anchors and chain cables to be in accordance with Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m and based on the Equipment Number EN_1 obtained from the following equation.

$$EN_1 = 0.628\left[a\left(\frac{EN}{0.628}\right)^{1/2.3} + b(1-a)\right]^{2.3}$$

Where

a = $1.83 \times 10^{-9} \times L + 2.09 \times 10^{-6} \times L^2 - 6.21 \times 10^{-4} L + 0.0866$

b = $0.156 \times L + 8.372$

L = Rule length, in metres, *See* Pt 3, Ch 1, 6.1 Principal particulars 6.1.1

EN = Equipment Number calculated in accordance with Pt 3, Ch 1, 7.1 Calculation of Equipment Number

10. 2. 2 The bower anchors are to be connected to their chain cables and positioned on board ready for use.

10. 2. 3 Anchors are to be of the stockless High Holding Power (HHP) type. The mass of the head of a stockless anchor, including pins and fittings, is to be not less than 60 per cent of the total mass of the anchor.

10. 2. 4 The mass, per anchor, of bower anchors given in Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m is for anchors of equal mass. The mass of individual anchors may vary to 7 per cent of the tabular mass, but the total mass of anchors is not to be less than that specified for anchors of equal mass.

10. 2. 5 Bower anchors are to be associated with stud link chain cables of special (U2) or extra special (U3) quality. The total length of chain cable, as given in Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m is to be approximately divided between the two bower anchors.

10. 3 Anchor windlass and chain stopper

10. 3. 1 The windlass unit prime mover is to be able to supply for at least 30 minutes a continuous duty pull Z_{cont}, in N, given by:

$$Z_{cont} = 35d^2 + 13.4\, m_A$$

Where

d = chain diameter, in mm, as per Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m

m_A = HHP anchor mass, in kg, as per Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m

10. 3. 2 The windlass is to have sufficient power to exert, over a period of at least two minutes, a pull equal to the greater of:

a. short term pull:
1.5 times the continuous duty pull as defined in Pt 3, Ch 13, 10.3 Anchor windlass and chain stopper 10.3.1

b. anchor breakout pull:

$$12.18 m_A + \frac{7.0 L_c d^2}{100} N$$

Where

L_c = is the total length of chain cable on board, in metres, as given by Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m

m_A = is the mass of HHP bower anchor (kg) as given in Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m

d = chain diameter, in mm, as per Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m

10. 3. 3 The capacity of the windlass brake is to be sufficient to stop the anchor and chain cable when paying out the chain cable. Where a chain cable stopper is not fitted, the brake is to produce a torque capable of withstanding a pull equal to 80 per cent of the specified minimum breaking strength of the chain cable without any permanent deformation of strength members and without brake slip. Where a chain cable stopper is fitted, 45 per cent of the breaking strength is to be applied instead.

10. 3. 4 As far as practicable, for testing purposes the speed of the chain cable during hoisting of the anchor and cable is to be measured over 37.5 m of chain cable and initially with at least 120 m of chain

and the anchor submerged and hanging free. The mean speed of the chain cable during hoisting of the anchor from the depth of 120 m to the depth of 82.5 m is to be at least 4.5 m/min.

10. 3. 5 The chain cable stopper, if fitted, along with its attachments is to be designed to withstand, without any permanent deformation, 80 per cent of the specified minimum breaking strength of the chain cable.

Table 13. 10. 1: Anchoring equipment for ships in unsheltered water with depth up to 120m

Equipment Number EN_1		High holding power stockless bower anchors		Stud link chain cable for bower anchors		
					Min. diameter

CHAPTER **13 Ship Control Systems**

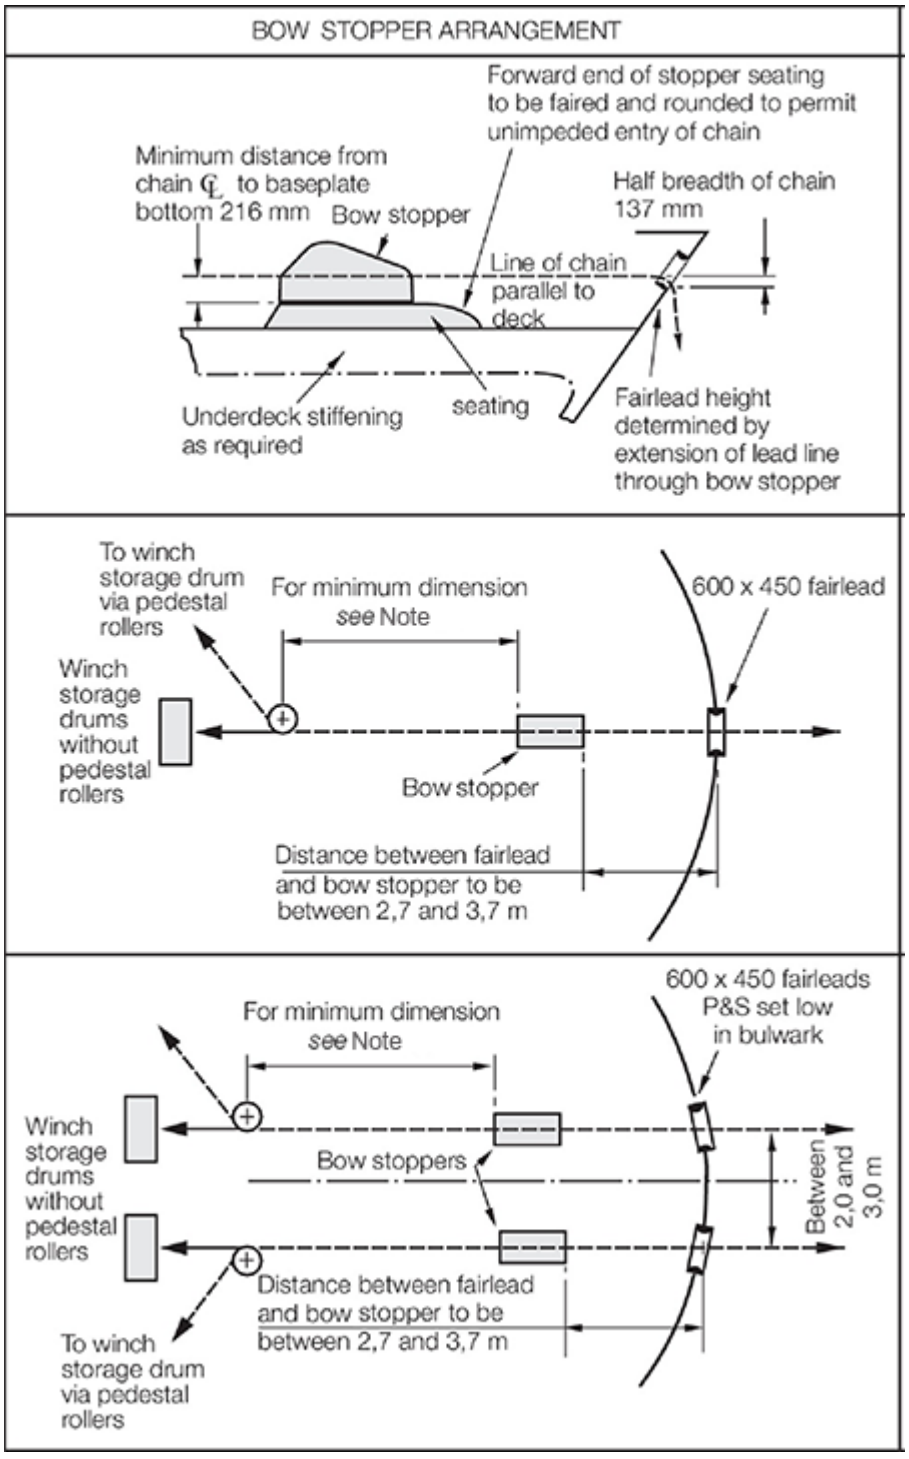
SECTION **11 Mooring of ships at single point moorings**

11. 1 General

11. 1. 1 These requirements are applicable to conventional oil tankers which intend to utilise the fittings standardised for single point moorings. For other ship types, the applicability would be specially considered. The requirements specified include the type, strength and location of the required fittings.

11. 1. 2 A ship provided with mooring arrangements in accordance with the requirements of this Section will be eligible to be assigned the Class notation **SPM4** where a single mooring line arrangement is provided for and **DSPM4** where a dual mooring line arrangement is provided for, *See* Figure 13. 11. 1: Positioning of forward fairleads, bow chain stoppers and pedestal roller leads.

Figure 13. 11. 1: Positioning of forward fairleads, bow chain stoppers and pedestal roller leads



Note Pt 3, Ch 13, 11.2 Arrangements 11.2.7.c

11. 2 Arrangements

11. 2. 1 The ship is to be fitted with bow chain stoppers and bow fairleads. In addition, pedestal roller fairleads may be required for alignment purposes but a direct straight lead from the chain stopper to the winch storage drum is the preferred arrangement. However, consideration of safety and protection from risk of injury to mooring personnel should take priority in determining whether pedestal rollers should be fitted as well as their number and positioning.

11. 2. 2 In order to ensure matching with terminal mooring equipment, the requirements for shipboard fittings are specified in association with ranges of ship deadweight as shown in Table 13. 11. 1: Deadweight group for shipboard fittings requirements.

Table 13. 11. 1: Deadweight group for shipboard fittings requirements

Group	Deadweight in tonnes
I	≤100 000
II	>100 000 ≤150 000
III	>150 000

11. 2. 3 Bow chain stoppers:

a. The number, chain cable size and minimum safe working load of bow chain stoppers should be as given in Table 13. 11. 2: Fittings requirements for deadweight group.

b. Bow chain stoppers should be located between 2.7 m and 3.7 m aft of the bow fairlead and should be positioned so as to give correct alignment with the bow fairlead and the pedestal fairlead or the storage drum of the winch, *See* Figure 13. 11. 1: Positioning of forward fairleads, bow chain stoppers and pedestal roller leads.

c. The leading edge of the stopper base plate is to be suitably faired to allow unimpeded entry of the combination chafe chain into the stopper. The chain referred to, forms part of the standardised SPM equipment.

d. The safety factor on yield of bow chain stoppers should be a minimum of 2 when the safe working load is applied.

e. The bow chain stopper(s) are to be type approved confirming that they are constructed in strict compliance with a standard recognised by *ACS* which specifies SWL, yield strength and safety factors.

Table 13. 11. 2: Fittings requirements for deadweight group

Group	Chain size, in mm	No. of chain stoppers	SWL, in kN (tonnes)
I	76	1, *See* Note	1960 (200)
II	76	1, *See* Note	2450 (250)
III	76	2	3430 (350)
Note Ships in this size range may elect to fit two stoppers to ensure full range terminal acceptance, *See* Pt 3, Ch 13, 11.1 General 11.1.2.			

11. 2. 4 The deck in way of bow chain stoppers is to have a minimum thickness of 15 mm. Their foundations, welds attaching them to the ship and associated ship supporting structure are to be demonstrated adequate to resist horizontal loads equal to 2 x SWL as given in Table 13. 11. 2: Fittings requirements for deadweight group. This is to be accomplished by suitable engineering analysis or calculations together with an inspection of the installation.

11. 2. 5 Bow chain stoppers are to be permanently marked with the SWL and appropriate serial numbers so that the certificates can be easily cross-referenced to the fitted equipment.

11. 2. 6 Bow fairleads:

a. One centrally located bow fairlead should be provided for ships fitted with one bow chain stopper. Two bow fairleads should be provided for ships fitted with two bow chain stoppers, *See* Figure 13. 11. 1: Positioning of forward fairleads, bow chain stoppers and pedestal roller leads.

b. Bow fairlead openings should be at least 600 x 450 mm for 76 mm chafe chain size. Where more than one bow fairlead is installed, the spacing of centres should be between 2 m and 3 m.

c. The height of the centre of the bow fairlead opening above the deck should be determined by the extension, parallel to the deck, of the lead line of the chain cable to the bow chain stopper, *See* Figure 13. 11. 1: Positioning of forward fairleads, bow chain stoppers and pedestal roller leads. The fairlead should have a minimum radius equal to seven times the chain radius.

d. The scantlings of the fairlead are to be determined in association with a load of 2 x SWL with hawser angles up to 90 degrees from the ship's centre line, both port and starboard in the horizontal plane and to 30 degrees above and below horizontal in the vertical plane.

e. The bow fairleads are to be type approved confirming that they are constructed in strict compliance with a standard recognised by *ACS* which specifies SWL and safety factors.

f. Their foundations and associated ship supporting structure are to be demonstrated adequate by detailed engineering analysis or calculations together with an inspection of the installation.

11. 2. 7 Pedestal roller fairleads:

a. Pedestal roller fairleads should have a minimum radius equal to 10 times the radius of wire mooring ropes with a fibre core, seven times the radius of wire mooring ropes with a steel core or three times the radius of synthetic mooring ropes.

b. The number of pedestal roller fairleads used for each bow chain stopper should not exceed two and the angle subtended by the change of direction of the pick-up rope should be minimal.

c. The minimum distance of pedestal roller fairleads from the bow chain stopper should be 3.0 m. Any variation in the minimum distance will be specially considered.

d. Details of local strengthening of the deck in way of pedestal roller fairleads should be submitted for approval.

11. 2. 8 The winch drum used for handling the mooring gear should be capable of exerting a continuous duty pull of not less than 147 kN and be of sufficient size to accommodate 150 m of 80 mm diameter rope. Winch drum ends (warping ends) to handle pick-up ropes should be avoided. Remotely-operated winch storage drums are recommended.

PART

3

CHAPTER **13 Ship Control Systems**

SECTION **12 Emergency towing arrangements**

12. 1 Structural requirements

12. 1. 1 This Section applies to ships equipped with emergency towing arrangements in accordance with IMO *Resolution MSC.35(63) - Adoption of Guidelines for Emergency Towing Arrangements on Tankers - (adopted on 20 May 1994)Amended by Resolution MSC.132(75)*.

12. 1. 2 Where a ship is provided with an emergency towing arrangement and the supporting structure complies with the requirements of this Section, the ship will be eligible to be assigned the descriptive note **ETA** which will be entered in column 6 of the *Register Book*.

12. 1. 3 The design load for strong points and associated fairleads shall be at least the specified breaking strength of the weakest component of the emergency towing arrangement, for angles of tow as specified in IMO *Resolution MSC.35(63) - Adoption of Guidelines for Emergency Towing Arrangements on Tankers - (adopted on 20 May 1994)Amended by Resolution MSC.132(75)*.

12. 1. 4 The deck and its supporting structure in way of strongpoints and fairleads are to be suitably reinforced to resist design loads of at least 1.3 times the specified breaking strength of the weakest component of the emergency towing arrangement, for angles of tow as specified in IMO *Resolution MSC.35(63) - Adoption of Guidelines for Emergency Towing Arrangements on Tankers - (adopted on 20 May 1994)Amended by Resolution MSC.132(75)*. The deck in way of strongpoints and fairleads is to have a minimum thickness of 15 mm.

12. 1. 5 Stresses induced in the strongpoints, fairleads and associated ship supporting structure, determined using the design loads from Pt 3, Ch 13, 12.1 Structural requirements 12.1.3 and Pt 3, Ch 13, 12.1 Structural requirements 12.1.4 as appropriate, are not to exceed the permissible values given in Table 13. 12. 1: Permissible stress values. The capability of the structure to withstand buckling is also to be assessed.

Table 13. 12. 1: Permissible stress values

	Permissible stress N/mm^2
Direct stress	σ_o
Shear stress	$\frac{\sigma_0}{\sqrt{3}}$
Combined stress	σ_o
Symbols	
σ_o = specified minimum yield stress, in N/mm^2	

12. 1. 6 The weld between the fittings and the deck shall be capable of resisting the design load specified in Pt 3, Ch 13, 12.1 Structural requirements 12.1.3.

12. 1. 7 The structural arrangement is to be such that continuity will be ensured. Abrupt changes of shape or section, sharp corners and other points of stress concentration are to be avoided.

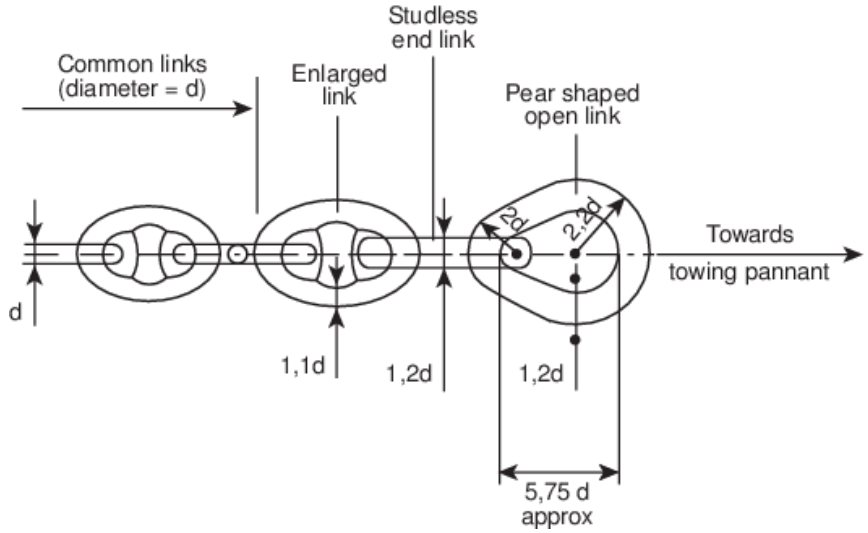
12. 1. 8 Designs of emergency towing arrangements shall be prototype-tested as required by the IMO *Resolution MSC.35(63) - Adoption of Guidelines for Emergency Towing Arrangements on Tankers - (adopted on 20 May 1994)Amended by Resolution MSC.132(75)*

12. 2 Chafing chain and wire or fibre rope for Emergency Towing Arrangements

12. 2. 1 Chafing chains are to be manufactured, tested and certified in accordance with Ch 10, 2 Stud link chain cables for ships of the Rules for Materials Grades U2 and U3.

12. 2. 2 The outboard end of the chafing chain is to include a pear-shaped link allowing connection to a shackle corresponding to the type of ETA and chain grade. A typical arrangement is shown in Figure 13. 12. 1: Typical outboard chafing chain end.

Figure 13. 12. 1: Typical outboard chafing chain end



12. 2. 3 The chafing chain is to be able to withstand a breaking load not less than twice the safe working load (SWL). The nominal diameter of common link for chafing chains is to comply with the value indicated in Table 13. 12. 2: Nominal diameter of common link for chafing chains for ETA.

Table 13. 12. 2: Nominal diameter of common link for chafing chains for ETA

Type of ETA	Nominal diameter of common link, *d* min	
	Grade U2	Grade U3
ETA 1000	62 mm	52 mm
ETA 2000	90 mm	76 mm

12. 2. 4 Steel wire ropes are to be manufactured, tested and certified in accordance with Ch 10, 6 Steel wire ropes of the Rules for Materials.

12. 2. 5 Fibre ropes are to be manufactured, tested and certified in accordance with Ch 10, 7 Fibre ropes of the Rules for Materials.

3

CHAPTER **14 Cargo Securing Arrangements**

SECTION **1 General**

1. 1 Application

1. 1. 1 All cargo ships, regardless of tonnage, except those engaged solely in the carriage of either liquid or solid bulk cargoes, are to be provided with a Cargo Securing Manual approved by the Flag Administration, as required by SOLAS 1974 (as amended). Pt 3, Ch 14, 2 Fixed cargo securing fittings, materials and testing, Pt 3, Ch 14, 4 Ship structure, Pt 3, Ch 14, 7 Container securing arrangements for stowage using cell guides (if applicable) and Pt 3, Ch 14, 10 Surveys apply to all ships for which a Cargo Securing Manual is required. It is recommended that the container securing arrangements in the Cargo Securing Manual be designed in accordance with Pt 3, Ch 14, 3 Loose container securing fittings, materials and testing , Pt 3, Ch 14, 5 Container securing arrangements for stowage on exposed decks without cell guides, Pt 3, Ch 14, 6 Container securing arrangements for underdeck stowage without cell guides, Pt 3, Ch 14, 8 Determination of forces for container securing arrangements and Pt 3, Ch 14, 9 Strength of container securing arrangements. Furthermore, it is recommended that the container securing arrangements be submitted to ACS, for formal approval. In cases where ACS is authorised to carry out the approval of the Cargo Securing Manual on behalf of a National Administration and the container securing arrangements have not been designed on the basis of the ACS Rules nor received formal ACS approval, the Cargo Securing Manual will be annotated accordingly, highlighting this fact. In general, Cargo Securing Manuals can be approved by ACS if authorised by the National Authority.

1. 1. 2 Fixed fittings which are part of the container lashing equipment or which may affect the strength of the ship's hull are subject to approval on the basis of the requirements of this Chapter. Details of the connection and the supporting ship structure require approval to satisfy the design loads determined in accordance with Pt 3, Ch 14, 8 Determination of forces for container securing arrangements or the safe working load of the fixed fitting, as applicable. Drawings are to be submitted showing details of the fittings, the attachment, the local foundations and information about the intended materials and welding.

1. 1. 3 The requirements for container securing arrangements have been framed in relation to ISO Standard Series 1 ISO 1496-1:1990, including Amendment Nos. 1, 2 and 3, Freight Containers. For previous ISO 1496-1:1984 containers, reference should be made to ACS Rules. Proposals to consider higher allowable forces in accordance with ISO 1496-1, including Amendment No. 4, 2006, will be specially considered. Proposals for the securing of other types of containers will be specially considered.

1. 1. 4 Containers are to be loaded so as not to exceed the weights and distribution within the stack according to the Cargo Securing Manual (CSM). The permissible loading patterns are to be clearly indicated on the Container Securing Arrangement Plan carried on board the ship.

1. 1. 5 Containers may be approved and certified using ACS *Container Certification Scheme*.

1. 1. 6 Where it is intended and specified that loose or fixed parts of the container securing system are used for lifting appliance purposes, e.g. pedestal sockets and fittings used for lifting of hatch covers, or twistlocks used for vertical tandem lifting, the requirements of ACS Guideline for

Lifting Appliances in a Marine Environment-are applicable. If no approval from lifting aspects is sought, the devices will be considered as part of a container securing arrangement only.

1. 1. 7 For ships having the class notation **Container Ship**, an effective breakwater is to be fitted to protect the containers against green sea impact loads. For other ships which are equipped for the carriage of containers on deck, protection of the cargo is recommended by the provision of a breakwater. *See also*Pt 3, Ch 14, 8.2, Ship motion, wind and green sea forces acting on containers.

1. 1. 8 Forward of 0.75*L*, it is recommended that all door ends face aft in order to improve the performance of the container walls to withstand green sea loads.

1. 1. 9 Improper ship handling related to course and speed or threshold phenomena like parametric rolling can create adverse forces acting on the ship and the cargo which are in excess of the forces determined on the basis of Section Pt 3, Ch 14, 8 Determination of forces for container securing arrangements. It is the responsibility of the Master to apply good seamanship in order to mitigate excessive ship motions to reduce forces acting on the cargo stowage arrangements.

1. 2 Classification notations and descriptive notes

1. 2. 1 Ships with container securing arrangements which are designed and constructed in accordance with this Chapter will be eligible to be assigned the special features notation **CCSA** (certified container securing arrangements). In addition to the fixed fittings, the Initial and Periodical Survey requirements of Section Pt 3, Ch 14, 10 Surveys for all loose fittings are applicable. Where loose container securing fittings are supplied for part container stowage only, the special features notation will be suitably modified.

1. 2. 2 Ships with container securing arrangements which are designed and constructed in accordance with this Chapter, but where the Initial and Periodical Survey requirements for loose fittings in Section Pt 3, Ch 14, 10 Surveys are not requested, will be eligible to be assigned the descriptive note **CSA** (container securing arrangement).

1. 2. 3 The advantage of having an onboard lashing program to calculate forces acting on the stowage arrangement is highlighted. It is recommended that all ships carrying containers on a regular basis be equipped with such a tool. This may be an extension to the loading instrument covered under Pt 3, Ch 4, 8.3 Loading instrument. It is recommended that the program be approved by ACS. If the program to carry out lashing calculations is approved by ACS and installed and maintained in accordance with the requirements of Pt 3, Ch 4, 8.4 Onboard lashing program, the ship will be eligible to be assigned the special features notation **BoxMax**.

1. 2. 4 It is a prerequisite for assignment of the special features notation **BoxMax** that the container securing arrangements in the Cargo Securing Manual are designed in accordance with this Chapter and submitted to ACS for formal approval.

1. 2. 5 The container securing arrangements of a container ship may take into account specific voyage routes and seasons, provided the ship has been assigned the special features notation **BoxMax** with one of the following supplementary letter sequences: **V** or **V,W** or **V,W,L** or **M**. The features offered by these supplementary letter sequences are defined in Table 14. 1. 1: BoxMax notation features.

1. 2. 6 The onboard lashing program is to be capable of performing calculations specific to defined sea areas and seasons, and the weather dependent factors for these areas and seasons have been supplied by ACS.

- If the weather dependent factors have been supplied by ACS for specific sea areas, the ship will be eligible to be assigned the special features notation **BoxMax(V)**.
- If the factors have been supplied by ACS for specific sea areas in combination with seasons, the ship will be eligible to be assigned the special features notation **BoxMax(V,W)**.

- If the factors have been supplied by ACS for limited voyages, the ship will be eligible to be assigned the special features notation **BoxMax(V,W,L)**.
- If the factors have been supplied by ACS for ship motions and environmental conditions, the ship will be eligible to be assigned the special features notation **BoxMax(M)**.

See also Pt 3, Ch 4, 8.4 Onboard lashing program.

1. 2. 7 For details of the individual features for the **BoxMax** notation, *See* Table 14. 1. 1: BoxMax notation features.

1. 2. 8 A ship designed to carry containers that is provided with safe access and securing arrangements in accordance with the *Rules for Ergonomic Container Lashing* will be eligible to be assigned the special features notation **ECL** (Ergonomic Container Lashing), with supplementary descriptor.

Table 14. 1. 1: BoxMax notation features

Notation	Additional feature description
BoxMax(V)	**V**: Voyage dependencies The assessment of the loads acting on the containers and the container securing arrangements may take account of the areas on the trading route of the ship. The North Atlantic represents one of the most severe weather areas in the world. For other areas the weather conditions may be less severe, and hence the assignment of the **BoxMax(V)** notation allows weather dependent factors to be applied to the environmental (dynamic) loads acting on the container stacks in-hold or on-deck. For the **V** feature, the weather dependent factors are determined on the basis of the annual environmental wave data, *See* Note 1. The weather dependent factors applicable to annual environmental wave data for the requested sea areas will be supplied by ACS, *See* Note 2.
BoxMax(V,W)	**W**: Weather dependency (Season dependency) The **BoxMax(V,W)** notation allows the change in weather conditions for various seasons to be taken into account for the assessment of the environmental loads acting on container stacks in-hold or on-deck. For example, this allows enhanced flexibility for the carriage of containers in the summer season, when the weather conditions are usually less severe than in the winter months. For the **W** feature, the weather dependent factors are determined on the basis of the seasonal environmental wave data. The weather dependent factors applicable to seasonal environmental wave data for the requested sea areas will be supplied by ACS, *See* Note 2.

BoxMax(V,W,L)	**L**: Limited duration voyages The **BoxMax(V,W,L)** notation potentially allows increased flexibility for the carriage of containers on board the ship for limited duration voyages. When applying the **L** feature, limited duration voyage factors are applicable for voyages of less than 48 hours. They are suitable for short coastal voyages, for example between ports such as Hamburg and Rotterdam or between Hong Kong and Xiamen (China). Typically it will allow enhanced flexibility for the carriage of containers and may allow reduced lashing requirements between local ports. The process of application of the **BoxMax(V,W,L)** limited duration voyage feature is given in Pt 3, Ch 14, 1.3 Application of the BoxMax(V,W,L) notation. The weather dependent factors applicable to limited duration voyages based on wave heights predicted by weather forecasts will be supplied by ACS.
BoxMax(M)	**M**: Ship motion monitoring The **BoxMax(M)** notation allows maximum flexibility in the way containers are carried for any voyage. The degree of lashing can be fully appropriate to operation, *See* Note 3. The Master will be required to manage the motion of the ship during the voyage by good seamanship and by weather routing, and not exceed the declared ship motions. The maximum motion of the ship during the voyage is to be recorded and compared to the declared ship motion. The process of application of the **BoxMax(M)** ship motion monitoring feature is given in *Pt 3, Ch 14, 1.4 Application of the BoxMax(M) notation*.
Note 1: The weather dependent factors are described in Pt 3, Ch 14, 1.7 Symbols and definitions 1.7.1. **Note** 2: ACS will supply weather dependent factors applicable to the list of sea areas requested by the owner. The requested sea areas must cover the whole of the voyage route to be used. If the vessel sails outside of the requested sea areas then all the weather dependent factors should be set to 1.0. **Note** 3: ACS will supply weather dependent factors in the form of a look up table specific to the ship; the voyage factors shall be selected based on the maximum ship motion being declared.	

1. 3 Application of the BoxMax(V,W,L) notation

1. 3. 1 The **BoxMax(V,W,L)** notation requires the following process to be applied by the Ship's Master.

1. 3. 2 For the limited duration voyage feature to be applicable the following process must be in place:

a. The ship must subscribe to an ocean weather forecast service provided by a recognised and reputable met ocean weather forecasting organisation. The forecast is to include wind speed and wave heights for a minimum period of 5 days and preferably 10 days. The responsibility for selection of the weather forecasting organisation lies with the Master.

b. The limited voyage feature shall not hazard safe navigation and adverse weather conditions should be avoided as far as possible.

1. 3. 3 The limited duration voyage feature can only be applied in the following scenarios:

a. The maximum length of a limited duration voyage is 48 hours in Open Water. A limited duration voyage may be slightly extended at the Master's discretion provided the forecast is favourable. Voyages longer than this will need to be considered using the **BoxMax(V,W)** approaches.

b. There should be no warnings for major storms with maximum sustained winds of more than 119 km per hour for an area within 500 miles from the long-range weather forecast.

where

Open Water — May be taken as starting at the outer harbour limits or harbour breakwater, as applicable. The concept of Open Water here is used to define the point at which the ship will leave the confines of the port and any estuaries or inshore navigation confines.

T_{depart} — Is to be taken as the estimated time in hours after the initial forecast that the ship enters Open Water after leaving the port of departure.

T_{arrive} — Is to be taken as the estimated time in hours after the initial forecast that the ship leaves Open Water prior to entering the port of arrival.

1. 3. 4 The supplied weather dependent factors applicable to limited duration voyages are based on the significant wave height.

1. 3. 5 The Master needs to select the appropriate significant wave height for the limited duration voyage, H_{SL}. The significant wave height for the limited duration voyage is to be rounded up to the next integer and is to be selected as follows:

H_{SL} = $H_{foercast}$ if the T_{arrive} is less than 72 hours after the time of the initial forecast.

= $H_{forecast} + 1$ m if the is more than 72 hours after the time of the initial forecast.

Where $H_{forecast} + 2$ m if the T_{arrive} is more than hours after the time of the initial forecast.

$H_{forecast}$ is the maximum significant wave height predicted for the limited duration voyage. It is to be extracted from the forecast at the time of planning the cargo stowage up to the time when the vessel leaves Open Water prior to entering the port of arrival. The forecast period is not to be less than 5 days.

The time of the initial forecast is to be taken as the most recent forecast prior to commencement of cargo planning operations.

1. 3. 6 When the ship departs, if the latest forecast is more severe than the earlier forecasts, then is to be taken as the maximum significant wave height from the latest forecast for the period up to the time the ship leaves Open Water prior to entering the port of arrival +24 hours for the planned voyage, if this exceeds from Pt 3, Ch 14, 1.3 Application of the BoxMax(V,W,L) notation 1.3.5.

1. 3. 7 The significant wave height used for the limited duration voyage should be recorded in the cargo plan information and the onboard lashing computer for the voyage. The ship specific weather dependent coefficients for a range of significant wave heights will be provided by ACS as part of the **BoxMax(V,W,L)** notation.

1. 3. 8 Example of application of **BoxMax(V,W,L)**:

Scenario 1

Date	14 July	15 July	16 July	17 July	18 July	19 July
Voyage schedule	Planning commences at 14:00			Stowage and lashing Leaves quayside At 13:00 Enters Open Water at 16:00	Voyage 18 hours Leaves Open Water at 10:00 Arrive at quayside	

Forecast day 14 July @ 12:00 – initial forecast						
Forecast time	12:00					
Time from initial forecast				T_{depart} = 76 hrs	T_{arrive} = 94 hrs	
Forecast wave height	3.3 m	3.3 m	3.7 m	3.7 m	3.5 m	3.5 m
$H_{forecast}$	3.7 m					
$\Delta H_{forecast}$ **(T_{arrive}>72h) (T_{arrive}<96h)**	1.0 m					
Limited duration H_{SL}	3.7 m+1.0 m=4.7 m rounded up to the next integer = 5 m					
Action	Plan lashing requirement with H_{SL} = 5 m					
Forecast day 15 July @ 12:00						
Forecast time	-	12:00				
Forecast wave height	-	3.5 m	3.7 m	3.5 m	3.3 m	3.2 m
Action	-	Monitor weather forecast – no change in wave height expected				
Forecast day 16 July @ 12:00						
Forecast time	-	-	12:00			
Forecast wave height	-	-	3.7 m	3.7 m	3.5 m	3.3 m
Action	-	-	Monitor weather forecast – no change in wave height expected			
Forecast day 17 July @ 12:00						
Forecast time	-	-	-	12:00		
Forecast wave height	-	-	-	3.8 m	4.1 m	4.0 m
Action	-	-	-	Max forecast wave height increased to 4.1 m. 4.1 m is less than planning wave height of 5.0 m Voyage can be undertaken. Monitor latest forecast and actual sea state		
Forecast day 18 July @ 12:00						
Forecast time	-	-	-	-	12:00	
Forecast wave height	-	-	-	-	4.2 m	4.0 m
Action	-	-	-	Monitor latest forecast and actual sea state		

Scenario 2

Date	14 July	15 July	16 July	17 July	18 July	19 July

Voyage schedule	Planning commences at 14:00			Stowage and lashing Leaves quayside At 13:00 Enters Open Water at 16:00	Voyage 18 hours Leaves Open Water at 10:00 Arrive at quayside	
Forecast day 14 July @ 12:00 – initial forecast						
Forecast time	12:00					
Time from initial forecast				Tdepart = 76 hrs	Tarrive = 94 hrs	
Forecast wave height	3.3 m	3.3 m	3.7 m	3.7 m	3.5 m	3.3 m
Hforecast	3.7 m					
ΔHforecast (Tarrive>72h) (Tarrive<96h)	1.0 m					
Limited duration HSL	3.7 m + 1.0 m = 4.7 m rounded up to the next integer = 5 m					
Action	Plan lashing requirement with HSL = 5 m					
Forecast day 15 July @ 12:00						
Forecast time	-	12:00				
Forecast wave height	-	3.5 m	3.7 m	3.7 m	3.5 m	3.8 m
Action	-	Monitor weather forecast				
Forecast day 16 July @ 12:00						
Forecast time	-	-	12:00			
Forecast wave height	-	-	3.7 m	3.7 m	4.4 m	4.5 m
Action	-	-	Forecast indicates increasing waveheight (Maximum wave height still below HSL of 5 m) Consider reassessing lashing requirement with increased waveheight. Monitor weather forecast			
Forecast day 17 July @ 12:00						
Forecast time	-	-	-	12:00		
Forecast wave height	-	-	-	4.8 m	5.5 m	5.4 m
Action	-	-	-	Final forecast from Tdepart to Tarrive + 24 hours is higher than HSL, hence cargo plan needs to be reassessed. Master needs to select an appropriate HSL value, e.g. 6 m. Might result in delay to planned departure.		
Forecast day 18 July @ 12:00						
Forecast time	-	-	-	-	12:00	
Forecast wave height	-	-	-	-	5.5 m	5.4 m
Action	-	-	-	-	Monitor latest forecast and actual sea state	

1. 4 Application of the BoxMax(M) notation

1. 4. 1 The **BoxMax(M)** notation requires the following process to be applied by the Ship's Master.

1. 4. 2 For the ship motion monitoring notation to be applicable the following process must be in place:

a. At the start of a voyage, the Master shall declare the maximum expected ship motions and environmental conditions and assign weather dependent factors accordingly. The responsibility for selection of appropriate ship motions and environmental conditions lies with the Master.

b. The ship motion monitoring feature shall not hazard safe navigation and adverse weather conditions should be avoided as far as possible.

1. 4. 3 The supplied weather dependent factors applicable to ship motion notation are based on the declared ship motion and environmental conditions.

1. 4. 4 The maximum ship motion, environmental conditions and weather dependent factors planned for the voyage should be recorded in the cargo plan information and the onboard lashing computer for the voyage. The ship specific weather dependent coefficients for a range of ship motion and environmental conditions will be provided by ACS as part of the **BoxMax(M)** notation.

1. 4. 5 ACS can provide ship specific guidance with regard to voyage ship motion predictions and environmental loading.

1. 5 Plans and information required

1. 5. 1 For all fixed cargo securing arrangements, except container securing arrangements, the following information and plans are to be submitted:

a. Details of certification including safe working load (SWL) of fixed cargo securing fittings.

b. Plans of structure in way of fixed cargo securing fittings.

c. Direction of loads imposed on the ship's fixed cargo securing fittings.

d. A general arrangement of fixed cargo securing fittings.

1. 5. 2 For container securing arrangements, the following plans and information are to be submitted:

a. General arrangement plan showing the disposition and design weights of the containers.

b. Details of materials, design, scantlings of cell guides structure, lashing bridges, pedestals, and other container securing arrangements, where fitted.

c. Details of certification, including safe working load (SWL), of fixed and loose container securing fittings.

d. Plans of structure in way of fixed container securing fittings and arrangements.

e. Design values of the following ship parameters for the container load departure and arrival conditions:

i. Moulded draught (T_c)

ii. Transverse metacentric height (GM).

f. Cargo Securing Manual, *See* Pt 3, Ch 14, 1.5 Plans and information required 1.5.3.

1. 5. 3 The Cargo Securing Manual is to include the following information:

a. For vessels with an approved onboard lashing program, representative lashing calculations based on one design GM value within the following range:

i. A lower design GM value of 2.5 per cent of the breadth B.

ii. An upper design GM value of 7.5 per cent of B for ships with a breadth less than 52 m and 10 per cent of B for ships where $B \geq 52$ m.

b. For vessels without an approved onboard lashing program, representative lashing calculations based on design GM values as follows:

i. A lower design GM value of 2.5 per cent of the breadth B.

ii. An upper design *GM* value of 7.5 per cent of *B* for ships with a breadth less than 52 m and 10 per cent of *B* for ships where *B*>= 52 m.

iii. Actual GM values of the ship in the container loaded condition from the approved Trim and Stability Booklet or Loading Manual when the actual design GM values are outside the range specified in i) and ii).

c. For vessels with notation **BoxMax(V)**, **BoxMax(V,W)**, **BoxMax(V,W,L)** or **BoxMax(M)** representative calculations based on applicable weather reduction factors are to be included in the Cargo Securing Manual.

1. 5. 4 Where containers of types other than ISO containers are to be incorporated in the stowage arrangement, the Cargo Securing Manual is to indicate clearly the locations where these containers are stowed. The manual is also to indicate the container weights and required securing arrangements for stacks composed entirely of ISO Standard containers.

1. 6 Securing systems

1. 6. 1 Containers are to be secured by one, or a combination, of the following systems:

- Corner locking devices.
- Rod, wire or chain lashings.
- Buttresses, shores or equivalent structural restraint.
- Cell guides.

Alternative systems will be considered on the basis of their suitability for the intended purpose.

1. 6. 2 Dunnage is not to be used in association with approved container securing systems except where forming part of an approved line load stowage, *See* Pt 3, Ch 14, 5.5 Line Load stowage.

1. 7 Symbols and definitions

1. 7. 1 The following definitions are applicable to this Chapter, except where otherwise stated:

a = breadth of the container, in metres (for longitudinally stowed containers)

b = length of the container, in metres (for longitudinally stowed containers)

c_i = height of container i, in metres

d_i = flange thickness of container securing device (e.g. twistlock) below container i, in metres

a_0 = acceleration parameter

$$= f_{HS}(1.58 - 0.47C_b)(\frac{2.4}{\sqrt{L}} + \frac{34}{L} - \frac{600}{L^2})$$

a_{surge} = longitudinal acceleration due to surge, in m/s^2

$= 0.275a_0$ g

a_{sway} = transverse acceleration due to sway, in m/s^2

$= 0.55a_0$ g

a_{heave} = vertical acceleration due to heave, in m/s^2

= a_0 g

a_{roll} = roll acceleration at the centre of motion of the vessel, in rad/s^2

= $0.69.\frac{\varphi}{T_{r^2}}$

a_{pitch} = acceleration due to pitch, in rad/s^2

$0.69(1+\frac{0.98}{\sqrt{L}})\frac{\Psi}{T_{p^2}}$

T_p = period of pitch of the ship, in seconds

= $0.80\sqrt{C_1 L}$

where

C_1 = 0.95 for Motion Case 1

= 0.52 for all other Motion Cases

T_r = period of roll of the ship, in seconds

= $\frac{0.82B}{\sqrt{GM}}$

φ = design roll angle for container securing arrangements, in degrees

= $f_{HsR}\varphi_f$ but not less than 12 degrees

Where

φ_f = $55f_{BK}e^{(-0.025B)}$ but need not be taken greater than 30 degrees

If φ_f is less than φ_m:

φ_f = $55f_{gm}f_V f_{BK}e^{(-0.025\ B)}$ but is not to be taken greater than φ_m

Where

φ_m the minimum unrestricted roll angle, in degrees, is to be taken as:
For ships with a breadth greater than 58 m:

= 22 degrees for *GM* values below 7.5 per cent of the breadth, *B*

= 18 degrees for *GM* values above 10 per cent of the breadth, *B*

for *GM* values between 7.5 and 10 per cent of the breadth, *B*, the minimum unrestricted roll angle is to be determined by linear interpolation.

For ships with a breadth less than 54 m

= 22 degrees

For ships with breadth, *B*, between 54 m and 58 m, the minimum unrestricted roll angle is to be determined by linear interpolation.

f_v = is to be taken as 1.0

f_{gm} = $\frac{7.5GM}{B} + 0.6$but is not to be taken less than 1.0

Note The calculations assume that the Master takes action to avoid synchronous rolling and parametric rolling. ACS can provide ship specific guidance with regard to synchronous rolling and parametric rolling.

Ψ = design pitch angle, in degrees,

= $1350L^{-0.94}(1.0 + \left(\frac{0.82}{\sqrt{L}}\right)^{1.2})f_{H_3p}$

but need not exceed 8°

e = base of natural logarithms

= 2.7183

f_{ap} = hull form coefficient

= for Motion Case MC1:

= $1.2R_A^{0.3}$ for $R_A > 1.0$

= 1.2 for $R_A \leq 1.0$

= for all other Motion Cases:

= 1.0

R_A = area ratio factor for combined stern and bow shape, defined in Pt 4, Ch 2, 2.4 Design vertical wave bending moments. For the purpose of container stowage calculation, R_A is to be taken as 1.5 if this value is not available

f_{BK} = bilge keel coefficient

= 1.2 for ships without bilge keels

= 1.0 for ships with bilge keels

f_{Hs} = weather-dependent factor for acceleration

= 1.0 for unrestricted worldwide service

f_{HsP} = weather-dependent factor for pitch

= 1.0 for unrestricted worldwide service

f_{HsVw} = weather-dependent factor for wind

= 1.0 for unrestricted worldwide service

C_{p1} = hull whipping factor

= $1 + f_{MC}f_{wh}$

f_{MC} = Motion Case coefficient

= $1.0f_{w1}$ for MC1

= 0 for MC2

= $0.5f_{w1}$ for MC3

= $0.25f_{wl}$ for MC4

$0.5f_{wl}$ for MC5

0 for MC6

f_{wh} = whipping coefficient

= 0.55 for $x_c/L \leq 0.25$

= 0.20 at $x_c/L = 0.5$

= 0.45 for $x_c/L \geq 0.75$

intermediate values are to be obtained by linear interpolation

f_{wl} = length-dependent factor for whipping

= 0 for L $\leq$ 250 m

= 1.0 for L $\geq$ 350 m

intermediate values are to be obtained by linear interpolation

g = acceleration due to gravity and is to be taken as 9.81 m/s^2

x_c = longitudinal centre of gravity of a container forward of the aft end of L, in metres

z_c = vertical centre of gravity of a container above the keel, in metres

c_{vcg} = vertical location of the centre of gravity of the container measured positive upward from the bottom of the corner castings. To be taken at 33 percent of the height of the container. Other values of c_{vcg}will be specially considered.

x_i = longitudinal coordinate of the centre of gravity of container i, in metres, from O_m measured positive forwards in ship coordinate system, *See*Figure 14.1.1 Diagrammatic representation of symbols

= $x_c - x_{om}$

y_i = transverse coordinate of the centre of gravity of container i, in metres, from O_m measured positive to port in ship coordinate system, *See*Figure 14.1.1 Diagrammatic representation of symbols

z_i = vertical coordinate of the centre of gravity of container i, in metres, from O_m measured positive upwards in ship coordinate system, *See*Figure 14.1.1 Diagrammatic representation of symbols

= $z_c - z_{om}$

x_{om} = longitudinal centre of motion forward of the aft end of L. To be taken at the LCF of the ship

z_{om} = vertical centre of motion above the keel. To be taken as the greater of $2T_c/3 + KG/3, T_c$ or $D/2$

A = side area of the container, in m^2

GM = transverse metacentric height of the ship, in metres

KG = vertical distance of the centre of gravity of the ship above the keel, in metres

L = Rule length, in metres, *See* Pt 3, Ch 1, 6.1 Principal particulars 6.1.1

C_b = block coefficient, *See* Pt 3, Ch 1, 6.1 Principal particulars 6.1.6

MCn = Motion Case n

LCF = longitudinal centre of flotation. To be taken at 0.48L from the aft end of L

O_m = centre of motion, to be taken on the centreline at x_{om} and z_{om}, *See* Figure 14.1.1 Diagrammatic representation of symbols and Figure 14. 1. 2: Ship coordinate system and sign convention of motio

R = the rating, or maximum operating gross weight for which the container is certified, and is equal to the tare weight plus payload of the container, in tonnes

T_c = moulded draught in the container load condition, in metres

V_w = wind speed, in m/s.

= 40fHsVw

W = weight of the container and contents, in tonnes. The following minimum weights W are to be used:

= 2.5 tonnes for 20 ft containers

= 3.5 tonnes for 40 ft containers

= 4.0 tonnes for 45 ft containers

= 4.5 tonnes for 48 ft and 53 ft containers.

Figure 14. 1. 1: Diagrammatic representation of symbols

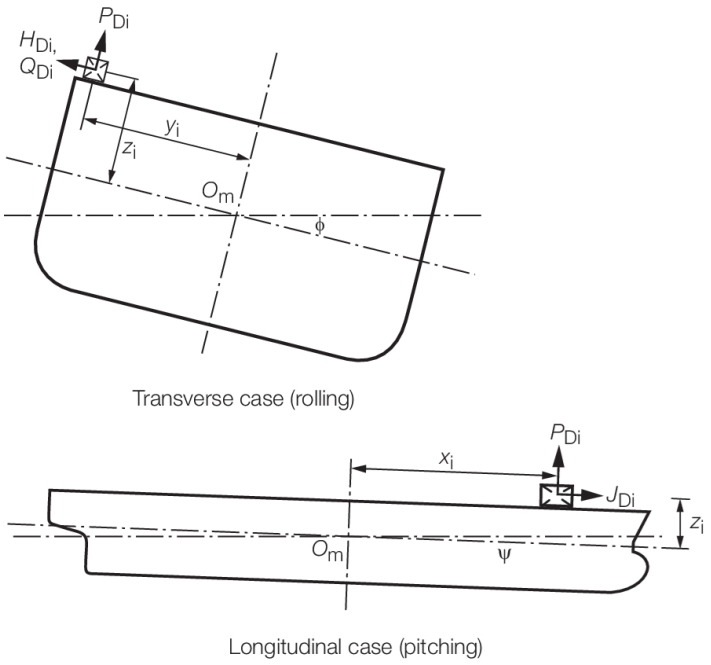

Figure 14. 1. 2: Ship coordinate system and sign convention of motio

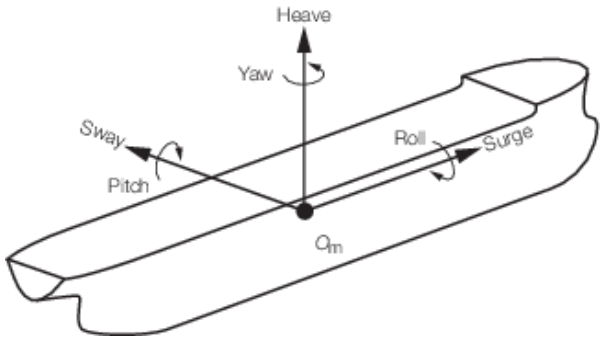


1. 7. 2 The sign convention for ship motions and accelerations is shown in Figure 14. 1. 2: Ship coordinate system and sign convention of motio. This is based on a right-handed coordinate system. The roll, pitch and yaw motions are defined positive clockwise as shown. For instance, positive sway is defined as the translation toward port and positive pitch as the rotation of the bow down and stern up.

PART

3

CHAPTER **14 Cargo Securing Arrangements**

SECTION **2 Fixed cargo securing fittings, materials and testing**

2. 1 General

2. 1. 1 Randomly selected samples of fixed cargo securing fittings are to be subjected to prototype testing and, upon satisfactory completion, will be granted General Approval.

2. 1. 2 Randomly selected samples drawn from production runs are to be subjected to production testing prior to delivery to the ship.

2. 1. 3 Cargo securing fittings, certified by an organisation other than ACS, will be accepted where the certification scheme is to the satisfaction of ACS.

2. 2 Materials and design

2. 2. 1 Steel used for the construction of the fixed cargo securing fittings is to comply with the requirements of the Pt 2 Rules for the Manufacture, Testing and Certification of Materials or with an equivalent specification acceptable to ACS. Due account is to be taken of the grade and tensile strength of the hull material in way of the attachment. The chemical composition of the steel is to be such as to ensure acceptable qualities of weldability. Where necessary, tests are to be carried out to establish specific welding procedures.

2. 2. 2 Where securing arrangements are intended to operate at low ambient temperatures, special consideration is to be given to the specification of the steel.

2. 2. 3 Proposals for the use of materials other than steel will be specially considered.

2. 2. 4 Attention is drawn to the need for measures to be taken to prevent water accumulation in pockets or recesses that could lead to excessive corrosion.

2. 3 Prototype testing

2. 3. 1 Prototype tests to determine the breaking or failure loads are to be carried out on at least two randomly selected samples of each item used in the securing system. The relationship between design breaking load and safe working load (SWL) is to be as indicated in Table 14. 2. 1: Design breaking loads and proof loads for fixed cargo securing fittings.

Table 14. 2. 1: Design breaking loads and proof loads for fixed cargo securing fittings

Minimum design breaking load		Minimum proof load	
for SWL $\leq$ 400 kN	for SWL $>$ 400 kN	for SWL $\leq$ 400 kN	for SWL $>$ 400 kN

2 x SWL	SWL + 400 kN	1.5 x SWL	SWL + 200 kN
Note Breaking and proof loads for fixed cargo securing fittings of a material other than steel will be specially considered.			

2. 3. 2 The Surveyor is to be satisfied that the design and materials of the fittings are in accordance with the approved plans.

2. 3. 3 For acceptance, no permanent deformation (other than due to initial embedding of component parts) is to be induced by test loads up to the proof load given in Table 14. 2. 1: Design breaking loads and proof loads for fixed cargo securing fittings.

2. 3. 4 When considering the test modes, all expected directions of operation are to be taken into account. Jigs are to be employed, where necessary, in order that satisfactory simulation is obtained.

2. 3. 5 In the interest of standardisation of the strength of container securing fittings, safe working loads in accordance with Table 14. 2. 2: Test loads and test modes for fixed container securing fittings are recommended.

Table 14. 2. 2: Test loads and test modes for fixed container securing fittings

Item No.	Description	Required test modes		Recommended minimum, in kN		
				SWL	Proof load	Breaking load
1	Flush socket		Pull-out load	250	375	500
			Pull-out load	250	375	500
2	Pedestal socket		Tangential load	200	300	400
3	'D' ring		Tensile load	250	375	500
4	Lashing plate		Tensile load	250	375	500

Note*1*. For items 3 and 4, where specifically designed for use with chain or steel wire rope (SWR) lashings, a lesser SWL may be considered.

Note*2*. For items 1 and 2, where multiple flush sockets or pedestal sockets are involved, test loads are to be applied simultaneously to each socket opening which can be loaded simultaneously in service.

Note*3*. For item 4, where multiple lashing points are fitted in one deck plate fitting, testing is to be similarly arranged as for Note 2.

Note*4*. Where containers with strength higher than required for ISO containers are used, consideration will be given to the required minimum loads.

Note*5*. The test modes illustrated above are diagrammatic only.

2. 3. 6 Where one of the required two randomly selected test samples fails before the design breaking load is reached, this can be accepted, provided that:

a. the failure is not less than 95 per cent of the design breaking load;
b. an additional randomly selected sample is tested satisfactorily; and
c. the average failure load of the three randomly selected samples is equal to or greater than the design breaking load.

2. 4 Production testing

2. 4. 1 The nature and extent of proposed production testing will be considered by ACS, but the arrangements are to be at least equivalent to one of the following testing procedures:

a. One randomly selected sample from every 50 pieces, or from each batch if fewer than 50 pieces, is to be proof loaded in accordance with Table 14. 2. 1: Design breaking loads and proof loads for fixed cargo securing fittings.
b. All fittings are to be loaded to the SWL of the item.

2. 4. 2 Consideration will be given to a reduced frequency of the mechanical production testing proposed in Pt 3, Ch 14, 2.4 Production testing 2.4.1, provided that:

a. the prototype test results indicate a breaking load at least 50 per cent greater than that required by Table 14. 2. 1: Design breaking loads and proof loads for fixed cargo securing fittings; and
b. a suitable non-destructive inspection procedure is agreed.

2. 4. 3 Permanent deformation (other than that due to initial embedding of component parts) will not be accepted unless tests are conducted in accordance with Pt 3, Ch 14, 2.4 Production testing 2.4.1 and the SWL of the sample is 250 kN or greater. In this case, consideration may be given to acceptance of permanent deformation in the load range between SWL + 125 kN and the proof load, provided that satisfactory manual operation can be achieved after completion of tests.

2. 4. 4 In the event of premature failure or serious plastic deformation occurring in a test sample, a further randomly selected sample is to be selected for testing. In the event that this sample is found to be unsatisfactory, the associated batch will be rejected.

PART

3

CHAPTER **14** **Cargo Securing Arrangements**

SECTION **3** **Loose container securing fittings, materials and testing**

3. 1 General

3. 1. 1 Randomly selected samples of loose container securing fittings are to be subjected to prototype testing and, upon satisfactory completion, will be granted General Approval.

3. 1. 2 Randomly selected samples drawn from production runs are to be subjected to production testing prior to delivery to the ship in accordance with Pt 3, Ch 14, 3.4, Production testing.

3. 1. 3 Loose container securing fittings, certified by an organisation other than LR, will be accepted where the certification scheme is to the satisfaction of ACS.

3. 1. 4 In the following, the term 'fully automatic fitting' is used to describe fittings which do not require manual operation during unloading of the containers. It should be noted that usually these fittings do not mechanically secure the container in the vertical direction (perpendicular to the hatch cover) in the upright condition when subjected to pure vertical motions. Other modes of operation and novel design will be specially considered.

3. 2 Materials and design

3. 2. 1 Steel used for loose container securing fittings is to comply with the requirements of the Rules for Materials or with an equivalent specification acceptable to ACS.

3. 2. 2 Where loose container securing fittings are intended to operate at low ambient temperatures, special consideration is to be given to the specification of the steel.

3. 2. 3 Proposals for the use of materials other than steel will be specially considered.

3. 2. 4 Locking devices and other fittings which are inserted into the container castings on the quayside before lifting on board are to be such as to minimise the risk of them working loose under the effects of vibration and the risk of them falling out.

3. 2. 5 For twistlocks, bottom twistlocks, midlocks, stackers with intermediate plates and fully automatic fittings, the contact areas, for both tension and compression between the fitting and the corner castings of the containers, are to be such as not to exceed a bearing stress of 300 N/mm2 under the safe working load of the fitting. No increase in the permissible stress level will be given due to higher strength material of the fittings. In the case where the design is such that the contact area is sloped or inclined and not parallel to the container corner casting, the effective contact area will be specially considered.

3. 3 Prototype testing

3. 3. 1 Prototype tests are to be in accordance with Pt 3, Ch 14, 2.3 Prototype testing 2.3.1, except that Table 14. 3. 1: Design breaking loads and proof loads for loose container securing fittings and Table 14. 3. 2: Test loads and test modes for loose container securing fittings are to be applied in lieu of Table 14. 2. 1: Design breaking loads and proof loads for fixed cargo securing fittings and Table 14. 2. 2: Test loads and test modes for fixed container securing fittings respectively. For vertical lashing, *See*Pt 3, Ch 14, 5.4 Containers in more than two tiers 5.4.9.b.

Table 14. 3. 1: Design breaking loads and proof loads for loose container securing fittings

Item			Min. proof load		Min. design breaking load	
			SWL ≤ 400 kN	SWL > 400 kN		SWL > 400 kN
Lashings						
Wire rope					3 x SWL	
	Rod:	higher tensile steel	1.5 x SWL	SWL + 200 kN	2 x SWL	
	Chain:	mild steel			3 x SWL	SWL + 400 kN
	higher tensile steel				2.5 x SWL	
Other loose container securing fittings			1.5 x SWL		2 x SWL	
Note*1*. Higher tensile steel is defined for this purpose as steel having a yield stress not less than 315 N/mm^2. **Note***2*. Breaking and proof loads for lashings of material other than steel will be considered.						

Table 14. 3. 2: Test loads and test modes for loose container securing fittings

Item No.	Description	Required test modes		Recommended minimum, in kN		
				SWL	Proof load	Breaking load
1	Lashing rod			180	270	360
2	Lashing rod (HTS)			250	375	500
3	Lashing chain (MS)			80	—	200
4	Lashing chain (HTS)			100	—	300
5	Lashing steel wire rope			120	—	360
6	Turnbuckle		Tensile load	250	375	500
7	Twistlock (manual,		Shear load	200	300	400

	semi-automatic and fully automatic fittings)		Tensile load	250	375	500
8	Midlock		Shear load	200	300	400
			Tensile load	250	375	500
9	Stacker		Shear load	200	300	400
Note*1*. Where containers with strength higher than required for ISO containers are used, special consideration will be given to the required minimum loads.						
Note*2*. The test modes illustrated above are diagrammatic only.						
Note*3*. Other fittings not covered in this Table may be specially considered, *See also* Pt 3, Ch 14, 3.5 Function and environmental testing 3.5.1.						

3. 4 Production testing

3. 4. 1 The nature and extent of proposed production testing will be considered by ACS, but the arrangements are to be at least equivalent to one of the following testing procedures:

a. For:

i. **Loose container securing fittings except chain or wire rope lashings**. One randomly selected sample from every 50 pieces, or from each batch if fewer than 50 pieces, is to be proof loaded in accordance with Table 14. 3. 1: Design breaking loads and proof loads for loose container securing fittings.

ii. **Chain or wire rope lashings**. One randomly selected sample from every 50 pieces, or from each batch if fewer than 50 pieces, is to be tested to breaking.

b. All fittings, securing devices and lashings are to be proof loaded to the SWL of the item and in addition, one randomly selected sample from every batch of chain or wire rope lashings is to be tested to breaking.

3. 4. 2 Permanent deformation (other than that due to initial embedding of component parts) will not be accepted unless tests are conducted in accordance with Pt 3, Ch 14, 3.4 Production testing 3.4.1.a.ii and the SWL of the sample is 250 kN or greater. In this case, consideration may be given to acceptance of permanent deformation in the load range between SWL + 125 kN and the proof load, provided that satisfactory manual operation can be achieved after completion of tests.

3. 4. 3 In the event of premature failure or serious plastic deformation occurring in a test sample, a further randomly selected sample is to be selected for testing. In the event that this sample is found to be unsatisfactory, the associated batch will be rejected.

3. 5 Function and environmental testing

3. 5. 1 For fittings of novel design or with special features, in addition to the prototype and production testing, a function test may be required to demonstrate that the fitting is fit for purpose. Details of the function test will be considered on an individual basis, taking into consideration the mode of operation of the fitting. In addition, ACS reserves the right to require environmental tests. The

actual test depends on the individual design of the fitting. The tests are to verify that environmental and ageing effects, such as corrosion, icing, debris contamination, etc. do not impinge on the safe operation of the fitting. In this case, ACS reserves the right to require the submission of maintenance instructions as part of the approval procedure.

PART

3

CHAPTER **14 Cargo Securing Arrangements**

SECTION **4 Ship structure**

4. 1 General

4. 1. 1 The ship structure and hatch covers in way of fixed cargo securing fittings are to be strengthened as necessary, *See* Pt 3, Ch 14, 1.1 Application 1.1.2.

4. 1. 2 A breakwater may be required, *See* Pt 3, Ch 14, 1.1 Application 1.1.7.

4. 2 Strength

4. 2. 1 The SWL of the fixed cargo securing fitting is to be used as the design load when approving the weld attachments and the support structure of the fixed cargo securing fitting.

4. 2. 2 For container securing arrangements, the design load when approving the weld attachment and supporting structure is to be calculated in accordance with Pt 3, Ch 14, 9 Strength of container securing arrangements.

4. 2. 3 When considering the loads, all expected directions of operation are to be taken into account.

4. 2. 4 Stresses induced in the weld attachments, supporting structure, cell guides and other structures serving as fixed cargo securing points, determined using the design loads as defined in Pt 3, Ch 14, 4.2 Strength 4.2.1 to Pt 3, Ch 14, 4.2 Strength 4.2.3, are not to exceed the permissible values given in Table 14. 4. 1: Permissible stress values.

Table 14. 4. 1: Permissible stress values

	Permissible stress, N/mm^2
Normal stress (bending, tension, compression)	$0.67\sigma_o$
Shear stress	$0.4\sigma_o$
Combined stress	$0.86\sigma_o$
Symbols	
σ_o = specified minimum yield stress, in N/mm^2	

4. 2. 5 Structural strength of container lashing bridges is to be assessed in accordance with the ACSPlus SDA Guideline for the Assessment of Container Ship Lashing Bridge Structures.

PART

3

CHAPTER **14** **Cargo Securing Arrangements**

SECTION **5** **Container securing arrangements for stowage on exposed decks without cell guides**

5. 1 General

5. 1. 1 Containers stowed on deck or on hatch covers are generally to be aligned in the fore and aft direction (longitudinally stowed), but alternative arrangements will be considered.

5. 1. 2 Containers are to be stowed so that they do not extend beyond the ship's side. Adequate support is to be provided where they overhang hatch coamings or other deck structures. The stowage arrangements are to be such as to permit safe access for personnel in the necessary working of the ship, and to provide sufficient access for operation and inspection of the securing devices.

5. 1. 3 Where containers are stowed on hatch covers, the covers are to be effectively restrained against sliding by approved type stoppers or equivalent. Details of the locations of stoppers relative to the supporting structure are to be submitted at an early stage.

5. 1. 4 Stanchions and similar structure supporting containers and securing devices, such as D-rings for lashings, are to be of adequate strength for the imposed loads and of sufficient stiffness to minimise any deflection which could lead to a reduction in the effectiveness of the securing device.

5. 1. 5 In the region forward of 0.75*L*, additional securing devices may be required due to green sea forces, *See* Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.4.

5. 1. 6 In general, stowage of heavy containers on top of lighter containers is to be avoided, unless validated as being satisfactory by an approved onboard lashing program or covered by the approved container securing arrangement.

5. 1. 7 Approved semi-automatic and fully-automatic fittings and twistlocks are to be used.

For fittings where the locking method requires defined clearances between the corner castings and the fixed foundations, such fittings are not to be used at the lowest tier of a stack which is resting with one side on a hatch cover panel and bridging to a container stanchion. The same applies if the stack is resting on different hatch cover panels or foundations where relative deflection during ship operation can occur.

5. 2 Containers in one tier

5. 2. 1 Containers are to be secured at their lower corners by approved locking devices.

5. 2. 2 Alternatively, containers may be secured by lashings fitted diagonally or vertically at both ends of each container, in association with cone fittings at each container corner.

5. 3 Containers in two tiers

5. 3. 1 Containers are to be secured at their lower corners at each tier by approved locking devices.

5. 3. 2 Where the calculations indicate that separation forces will not occur at any point in the stack, double stacking cones may be fitted at all internal corners of the stack and bridge fittings used to connect the tops of the rows in the transverse direction. Locking devices are to be fitted at all external corners.

5. 3. 3 Alternatively, containers may be secured by lashings in association with stacking cones or, where the calculations indicate that separation forces may occur, with locking devices.

5. 4 Containers in more than two tiers

5. 4. 1 Containers are to be secured at their lower corners at each tier by approved locking devices.

5. 4. 2 Alternatively, containers may be secured by lashings. One or two tiers of lashings may be fitted in association with stacking cones or, where the calculations indicate that separation forces may occur, with locking devices.

5. 4. 3 When lashings are employed, they are usually fitted to the bottom corner casting of a container. Proposals to attach lashings to the top casting of a container will be considered. The reduced strength of the upper corner casting compared to the lower corner castings is to be taken into account.

5. 4. 4 Internal lashings arranged in pairs (internal para-lash arrangements) are acceptable. Lashings in pairs are generally to be attached one to the bottom corner casting of the upper tier and the other to the top corner casting of the lower tier container. Suitable connections are to be provided at the lower ends. *See also* Table 14. 3. 2: Test loads and test modes for loose container securing fittings.

5. 4. 5 Approved semi-automatic or fully-automatic fittings may be used with internal lashing or external lashing arrangements.

5. 4. 6 or external lashing arrangements, if the stack forces are such that lifting occurs at the uppermost lashing connection point, then the force in the lashing device is to include allowance for the lifting force. The effect of lifting at lashing point connections below the uppermost connection may be ignored.

5. 4. 7 The ACS approval process for fully-automatic fittings includes a requirement that the fitting passes a tensile load test. This test specifies a maximum allowable vertical separation under the tensile load and therefore the effect of the magnitude of the opening clearance under tensile loads may be ignored in the calculation of the additional vertical force in the lashing rod. For semi-automatic twistlocks used with external lashings, the nominal clearance of the fitting is not to exceed the maximum values specified in the ACS test procedure. Non--ACS approved fittings will be specially considered, *See*Pt 3, Ch 14, 3.1 General 3.1.3.

5. 4. 8 Proposals to use horizontal lashings connected to lashing bridges will be specially considered. The forces in such securing systems are to be determined by direct calculations, taking into account the following effects:

- stiffness of the container walls, the lashings and the lashing bridge; and
- the possible horizontal displacements of the containers relative to the lashing bridge due to the clearances of the hatch cover stoppers and the container securing fittings.

5. 4. 9 When vertical lashings are used in combination with container securing fittings, consideration is to be given to the vertical clearances between the fittings and the container corner castings:

a. The lashing assembly is to remain elastic when subject to an elongation equating to the number of interface fittings fitted below the point where the vertical lashing is applied to the stack. In

order to avoid overstressing of the rod and the turnbuckle, provision of spring or elastic elements incorporated into the turnbuckle may be advantageous. When lashing from lashing bridge level, the number of interfaces is to be counted down to the level where the lowest container is resting. The lashing rod is to be fitted to the bottom casting of the container. For container securing fittings having design clearances in accordance with ISO 3874, a nominal clearance per fitting of 10 mm is to be taken to determine the total elongation of the lashing system. For fittings having clearances in excess of 10 mm, the total elongation is to be calculated, taking into consideration the higher clearances.

b. A prototype test is to be carried out to demonstrate that the vertical lashing has a safe working load of 150 kN when elongated up to the calculated total design clearance plus 10 per cent without plastic deformation.

c. It is recommended that the load-bearing effect of vertical lashing arrangements be explicitly taken into account when performing lashing calculations. Where this is not done, it is acceptable to either:

i. allow the permissible calculated lifting force to be increased to SWL+150 kN where SWL is the safe working load of the container securing fittings below the fitting position of the vertical lashing. The nominal lifting force for these fittings is not to exceed 400 kN at the securing fittings below the fitting position of the vertical lashing; or

ii. calculate the force in the lashing rod taking into account the lifting force at the rod connection point.

5. 4. 10 For stowage arrangements incorporating fully-automatic fittings which do not mechanically secure the container in pure vertical direction when subject to vertical motions, it is to be ensured that no separation occurs under the load cases specified in Pt 3, Ch 14, 8 Determination of forces for container securing arrangements. In addition, where stacks in the outermost position, anywhere in the length of the vessel, are secured with fully-automatic fittings without lashings, provisions such as breakwaters, effective side screens, plated bulwarks or similar, are to be provided to prevent the possibility of green sea buoyancy forces causing the containers to disengage, *See*Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.10. Alternatively, the lowest tier of containers is to be secured by manual or semi-automatic twistlocks.

5. 4. 11 If the carriage of one or more tiers of 20 ft containers being overstowed with at least one tier of 40 ft containers, the so-called ‘Russian Stow Arrangement’, is desired, the following requirements apply.

a. At the 20 ft gap the containers are to be secured by means of midlocks, whereas the fore and aft ends are to be secured by twistlocks and if necessary supplemented by lashing rods.

b. The 40 ft overstow container is to be secured by twistlocks or if necessary with a combination of twistlocks and lashing rods. The stack is to be assessed in a twostep procedure, as follows:

i. For location at the 40 ft ends, the entire mixed stack is to be considered as a 40 ft stack. The weights of the 40 ft containers are to be considered in the calculations. For the tiers of 20 ft containers, the weight of one 20 ft container is to be taken as the basis for the calculation at each tier.

ii. For the location of the 20 ft tiers at the mid-bay position, the assessment is to be carried out as for an unlashed stack. The 40 ft overstow container does not need to be taken into consideration.

5. 4. 12 No lashings are to be applied to the ends of a 45 ft, 48 ft or 53 ft container if stowed on top of a shorter unit.

5. 5 Line Load stowage

5. 5. 1 Where the containers are supported on bearers placed to distribute the stackweight as Line Loads, the following requirements are to be complied with:

a. The stack is, in general, to comprise a maximum of two tiers of loaded containers.
b. The load from the upper tier is to be transferred through the container corners. Line loading is not to be used between tiers.
c. The load on each vertical corner post of the bottom tier, calculated in accordance with Pt 3, Ch 14, 9 Strength of container securing arrangements, is not to exceed one half of the Rated Load of the container.
d. Where the calculations indicate that lifting forces may occur, locking devices are to be fitted at the container corners.
e. The clearance below the bottom container corner casting is to be such that the stacking cone or equivalent cannot be dislodged under shear loading.

5. 5. 2 Where an approved Line Load stowage system is installed, the special features notation will be suitably modified.

5. 6 Systems incorporating structural restraint

5. 6. 1 Containers may be secured by the use of a fixed structure providing permanent buttresses in association with portable frameworks. Proposals to adopt such systems will be considered on the basis of the loads developed in the structure and the corresponding stresses.

5. 6. 2 The framework or other devices securing the containers are to be aligned with the container corner castings and any clearance gap is to be kept to the minimum to reduce shifting.

PART

3

CHAPTER **14 Cargo Securing Arrangements**

SECTION **6 Container securing arrangements for underdeck stowage without cell guides**

6. 1 General

6. 1. 1 Containers are generally to be stowed in holds in the fore and aft direction, but alternative arrangements will be considered. The securing arrangements are to be designed on the basis of the most severe distribution of loads which may arise in the container stack.

6. 1. 2 Containers may be secured by locking devices only or by a combination of locking devices, buttresses, shores or lashings. Containers are, in general, to be restrained at every corner at the base of the stack and at all intermediate levels.

6. 1. 3 Where stacks consist of one or two tiers only, consideration will be given to the omission of corner locking devices. Containers must, however, be secured by a minimum of two corner locking devices.

6. 1. 4 Where the calculations indicate that separation forces could occur at any particular level, twistlocks or equivalent means of securing are to be fitted at that level. Elsewhere, consideration will be given to the use of double stacking cones.

6. 1. 5 Where the calculations indicate that separation forces will not occur between containers at any level, consideration will be given to the use of stacking cones in lieu of locking devices throughout.

6. 1. 6 Buttresses are generally to be of the tension and compression type and are to be provided with means of adjustment to ensure tightness when fitted in place. Where applicable, the attachment to the ship's structure is also to include means for vertical adjustment of the buttress to match container stacks of different heights.

6. 1. 7 Shores of the compression-only type may be permanently attached to the ship structure or they may be hinged or portable. When in place they are to abut the container corner castings with minimal clearance. Means are to be provided to prevent slackening of the device.

6. 1. 8 Adjacent stacks of containers are to be linked in line with buttresses or shores in order to transmit lateral loads. The fittings used for these linkages are to be of adequate strength to transmit the loads imposed.

6. 1. 9 The ship's structure supporting shores and buttresses is to be reinforced as necessary.

6. 1. 10 Proposals for alternative securing systems, including systems relying on minimal clearance between containers and hull structure, will be specially considered.

6. 1. 11 6.1.11 Attention is drawn to the safety at work aspects for fittings which require operation on top of containers, e.g. double stacking cones, bridge fittings, buttresses and shores. Where these fittings are used, fall protection is to be provided.

PART

3

CHAPTER **14** **Cargo Securing Arrangements**

SECTION **7** **Container securing arrangements for stowage using cell guides**

7. 1 General

7. 1. 1 Cell guide systems may be fitted to support containers stowed in holds or on exposed decks.

7. 1. 2 The cell guides are not to form an integral part of the ship's structure. The guide system is generally to be so designed as to keep it free of the main hull stresses.

7. 1. 3 Cell guides are to be designed to resist loads caused by loading and unloading of the containers, to prevent shifting of the containers and to transmit the loads caused by motions of the ship into the main hull structure.

7. 2 Arrangement and construction

7. 2. 1 Cell guides are to be of robust construction and generally fabricated from steel plate and rolled sections. They are to have sufficient vertical extent and continuity to provide efficient support to containers. Guide bars are to be effectively attached to the supporting structure to prevent tripping or distortion resulting from container loading.

7. 2. 2 The intersection between cell guide and cross ties is to provide adequate torsional stability.

7. 2. 3 Intermediate brackets are to be fitted to vertical cell guides at suitable intervals.

7. 2. 4 The cell guides are to give a total clearance between the container and guide bars not exceeding 25 mm in the transverse direction and 40 mm in the longitudinal direction. The deviation of the cell guide bar from its intended line is not generally to exceed 4 mm in the transverse direction and 5 mm in the longitudinal direction.

7. 2. 5 Athwartship cross ties are to be fitted between cell guides at a spacing determined from the loading on the guides but, generally, not more than 3.0 m apart. Wherever possible, cross ties are to be arranged in line with the corners of the containers as stowed and are to be supported against fore and aft movement at a minimum of two points across the breadth of the hold. Where, however, the maximum fore and aft deflection in the cross tie can be shown not to exceed 20 mm, one support point may be accepted.

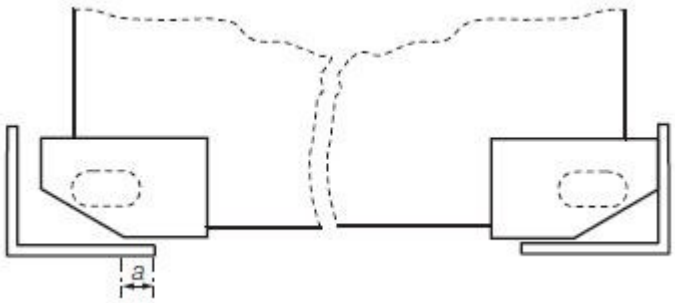
7. 2. 6 Longitudinal tie bars may be required to be fitted where shown necessary by the force calculations for the structure. Where fitted, they are to comply with the requirements of Pt 3, Ch 14, 7.2 Arrangement and construction 7.2.5.

7. 2. 7 Where, at the sides or ends of holds, the guide rails are fitted to transverse or longitudinal bulkheads, the bulkhead is to be locally reinforced to resist the additional loads.

7. 2. 8 If the carriage of 45 ft Euro containers complying with EU Directive 96/53 is specified to be carried in 45 ft cell guides, attention is to be paid to the arrangement of the corner castings,

*See*Figure 14.7.1 45 ft euro container in cell guides. The guide bars need to be increased in order to ensure that a minimum design overlap, *a*, of 20 mm is achieved, taking into account the design clearances and tolerances defined in Pt 3, Ch 14, 7.2 Arrangement and construction 7.2.4. Consideration is to be given to the torsional loads being applied to the guide bars.

Figure 14. 7. 1: ft euro container in cell guides



7. 3 Carriage of 20 ft containers in 40 ft cell guides in holds

7. 3. 1 Where the cell guides are arranged for the carriage of 40 ft containers, provision may be made for the installation of temporary intermediate cell guides for 20 ft containers. The permanent structure is to be designed such that it is suitable for either loading pattern.

7. 3. 2 Alternatively, permanent means for the support of 20 ft containers at the mid-length of a cell arranged for 40 ft containers will be considered. Such means may include the following:

a. A pillar (inboard) and vertical rest bar (on the longitudinal bulkhead) against which the container stack may rest. The pillar is to be supported laterally by the deck structure over and is to be sufficiently stiff to control lateral deflection of the container stacks.

b. Guide bars supported transversely by slim structure within the gap between containers and with longitudinal ties as necessary.

Details of proposals will be individually considered, taking into account the loads on the support structure and the resulting deflections.

7. 3. 3 Where it is desired to stow 20 ft containers without external support at the mid-bay location with or without 40 ft overstow, so-called ‘mixed stowage’ arrangements meeting the following requirements are applicable:

a. Maximum homogeneous container weights for 20 ft containers stowed in cell guides with no 40 ft container overstowed can be derived from Table 14. 7. 1: Maximum container weights of Wh 20 ft containers stowed in 40 ft cell guides with no overstow, depending on the transverse acceleration and the number of tiers in the stack.

b. Maximum homogeneous container weights for 20 ft containers stowed in cell guides with one or more 40 ft containers overstowed can be derived from:

i. Table 14. 7. 2: Maximum containers weights, Wh of 20 ft containers stowed in 40 ft cell guides with overstow, diagonal stacking cone arrangement

ii. Table 14. 7. 3: Maximum container weights Wh of 20 ft containers stowed in 40 ft cell guides with overstow, other stacking cone arrangement

c. All inhold mixed stowage tables have been derived on the basis of all 20 ft containers having the same weight. However it is acceptable to carry non-homogeneous stacks provided the following two conditions are met:

i. 20 ft containers heavier than specified in the weight W_h can be loaded provided that the average container weight excluding the lowest container in the stack does not exceed W_h, i.e.

$$\Sigma_2^N W_i \leq (N-1)W_{\mathrm{h}}$$

ii. The total moment of 20 ft containers in a stacks about the base is not to be greater than the moment exerted by an equivalent homogeneous stack of weight W_{h}, i.e.

$$\sum_{i=2}^{N}(W_i \,.\, e_a(i-1)) \leq (N-1).W_h.\frac{C_a.N}{2}$$

where

W_{i} weight of container *i*.

c_{i} height of container *i*.

W_{h} is the homogeneous container weight as determined from Table 14. 7. 1: Maximum container weights of Wh 20 ft containers stowed in 40 ft cell guides with no overstow, Table 14. 7. 2: Maximum containers weights, Wh of 20 ft containers stowed in 40 ft cell guides with overstow, diagonal stacking cone arrangement or Table 14. 7. 3: Maximum container weights Wh of 20 ft containers stowed in 40 ft cell guides with overstow, other stacking cone arrangement as applicable. Where W_{h} is corrected by Note 5 of the tables, W_{h} is to be taken as W_{hc}.

c_{a} average height of the 20 ft containers in the stack.

N Number of 20 ft containers.

d. The weight of the lowest container in the stack may be increased to its rated value.

e. The force in the corner post in the lowest container is not to exceed the permissible compression value given in Table 14. 9. 6: Allowable forces in containers in stacks with the same base size. The force is to be determined by:

$$V = -\frac{a_z(w_{40s} + W_{20s-1})}{4}$$

where

V is the compressive force in the corner post

W_{40s} is the total weight of the 40 ft containers, in tonnes

$W_{20S\text{-}1}$ is the total weight of the 20 ft containers excluding the weight of the lowest container, in tonnes

a_Z is the maximum vertical acceleration of all containers in the stack, *See*Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.5

f. Means are to be provided to prevent transverse sliding of the bottom of the stacks of 20 ft containers at the mid-bay position. This is to be in the form of permanently attached chocks at the inner bottom or equivalent. The design clearance is to be the same as for the cell guides and in accordance with Pt 3, Ch 14, 7.2 Arrangement and construction 7.2.4.

g. 20 ft containers stowed with no stacking cones are to be restrained to avoid transverse movement, e.g. all containers at the same tier height in a bay are to be of the same height and structural constraints between the containers and the hull are to be provided.

h. The 20 ft containers are to have closed steel walls and top (no open frame containers, e.g. tank or bulk containers).

Table 14. 7. 1: Maximum container weights of Wh 20 ft containers stowed in 40 ft cell guides with no overstow

	Maximum homogeneous container weights, in tonnes (number of 20 ft containers)

0.550	24.0	21.8	17.9	14.8	12.8	11.2

Note 1. Linear interpolation is to be used to determine intermediate values.

Note 2.40 ft overstow containers not included in the number of tiers.

Note 3. Maximum container weights for transverse acceleration and number of tiers outside of those presented will be specially considered.

Note 4. The maximum container weight should not exceed the rated weight of the container.

Note 5. Where the homogeneous container weight (W_h) derived from the table is lower than the rated weight of the container, the maximum homogeneous weight is to be corrected to account for the height of the containers used, as follows: $W_{hc} = W_h w_{ac}$ Where:$W_{ac} = \frac{2.591}{c_a}$which is not to be taken greater than 1c_a is the average height of the 20 ft containers

7. 3. 4 Alternative proposals for stowage arrangements will be individually considered and are to be accompanied by supporting calculations.

7. 4 Cell guide systems on exposed decks

7. 4. 1 Analysis methods for the strength of the cell guide structure are to take due account of the interactive effects between guide structure and supporting deck structure and also of the deformation of the hull girder.

7. 4. 2 At its lower end the guide structure is to be efficiently connected to the deck structure. Cross ties are to be arranged between guides in a transverse direction at a spacing determined by the loading on the guides but in general not more than 3 m apart. Cross-bracing members of adequate strength and sufficient number are to be fitted in the transverse and longitudinal directions to prevent excessive deflection of the guide structure.

7. 4. 3 The height of guide bars above the deck is to be sufficient to ensure adequate restraint to the uppermost container tiers.

7. 4. 4 Where the cell guide structure is attached to highly stressed hull or deck elements, such as sheerstrakes, special attention is to be given to the design of the connection and the grade and quality of steel utilised.

7. 5 Entry guide devices

7. 5. 1 A device to pre-centre the container and direct it into the cell guides is normally to be fitted at the top of the guide bars. Such devices include:

- fixed even peaks,
- fixed high and low peaks,
- 'flip-flop' systems,

but other devices will be considered. The device is to be of robust construction.

PART

3

CHAPTER **14 Cargo Securing Arrangements**

SECTION **8 Determination of forces for container securing arrangements**

8. 1 General

8. 1. 1 The forces acting in the securing system are to be determined for each loading condition and associated set of motions of the ship. Although the operation of anti-roll devices or other systems may improve the behaviour of the ship in a seaway, the effect of such devices is not to be taken into account to reduce the determination of the forces for container securing arrangements.

8. 1. 2 The following forces are to be taken into account:

- Static gravity forces.
- Inertial forces generated by the ship motions in a seaway.
- Wind forces.
- Forces imposed by the securing arrangements.
- Wave impact forces and effects of consequential hull girder whipping.

8. 1. 3 Forces due to pre-tensioning the securing devices need not, in general, be included in the calculation, provided that they do not exceed 5 kN in any one item. Special consideration will be given to cases where forces obtained from pre-stressing are an integral part of the design of the system.

8. 2 Ship motion, wind and green sea forces acting on containers

8. 2. 1 The forces acting on each container due to gravity, ship motion accelerations, ship rolling and pitching angles and wind forces and green sea forces are to be calculated as follows.

8. 2. 2 The equations for ship motion accelerations and other motion parameters are given in Pt 3, Ch 14, 1.7, Symbols and definitions. These are to be used for the calculation of accelerations to derive the forces for the container securing arrangements. Alternatively, the ship motion values may be derived by direct calculation methods using the same principles as those used to derive the Rule equations. The formulae in Pt 3, Ch 14, 1.7, Symbols and definitions are applicable to container ships. Values for other ship types will be specially considered.

8. 2. 3 The following six Motion Cases (MCs) are to be considered:

MC1: Head sea case that maximises vertical acceleration

MC2: Beam sea case that maximises roll motion

MC3: Oblique sea case that maximises pitch acceleration

MC4: Oblique sea case with forward speed that maximises roll motion

MC5: Oblique sea case that maximises combined transverse and vertical accelerations

MC6: Beam sea case that maximises heave acceleration

Each Motion Case comprises 2 Motion Combination Factor (MCF) sets. Each MCF set represents an Equivalent Design Wave (EDW) that generates response values equivalent to the long-term response values of the critical load components for ship motion forces acting on containers. The Motion Combination Factors are given in Table 14. 8. 3: Motion Combination Factors (MCFs).

8. 2. 4 The individual force components for each Motion Case due to gravity, ship motions, wind and green seas acting on a container *i* are to be determined as follows, *See* Figure 14. 1. 1: Diagrammatic representation of symbols and Table 14. 9. 1: Acceleration force application:

H_{Di} = force acting on container *i* in kN in transverse direction parallel to deck, positive to port

= Wa_y

J_{Di} = force acting on container *i* in kN in longitudinal direction parallel to deck, positive forward

= Wa_x

P_{Di} = force acting on container *i* in kN in vertical direction normal to deck, positive upward

= Wa_z

Q_{Di} = wind force acting on exposed container *i* in kN in transverse direction parallel to deck, positive to port

= $Q_{DSi}Q_{DMi}$

Where

Q_{DMi} = wind force magnitude acting on exposed container *i* in kN in transverse direction parallel to deck

= $0.5bc\rho_a C_{rmll} C_z C_{wh} V_{wh}^2 10^{-3}$

where

C_{roll} wind force coefficient to include effect of roll angle

= $\left(\frac{1}{1 + 0.026 \mid C_y d\varphi}\right) + 0.65$

ρ_a density of air in kg/m^3 is to be taken as

= 1.204

C_Z wind force height distribution coefficient

= $\left(1 - \frac{z_{ci} - z_{bc}}{z_{tc} - z_{bc}}\right)^{0.25}$

V_{wh} mean wind speed over the stack in m/s

$$= 0.63V_m \frac{z_{tc}^{1.11} - z_{bc}^{1.11}}{z_{tc} - z_{bc}}$$

z_{tc} height above moulded draught, T_c, of the top of the highest container in the stack under consideration, in m

z_{bc} height above moulded draught, T_c, of the underside of the lowest container in the outermost stack, in m

Where

z_{ci} height above moulded draught, T_c, of the centre of the side wall of container i, in m

C_{wh} wind heading coefficient, given in Table 14. 8. 1: Wind heading coefficient Cwh

C_{yG} transverse acceleration motion combination factor C_{yG}, given in Table 14. 8. 3: Motion Combination Factors (MCFs)

Other symbols are defined in Pt 3, Ch 14, 1.7, Symbols and definitions.

می باشدRullدر سطرهای بعدی 3 تا فرمول در

Q_{DSi} = Wind force direction coefficient

= 1 if $H_{Di} > 0$kN

= -1 if $H_{Di} \leq 0$kN

H_{Gi} = green sea force acting on container i, in kN in transverse direction parallel to deck, positive to port

= $-bc_i P_{gs}$ for port side exposed containers

= $bc_i P_{gs}$ for starboard side exposed containers

Note 1. H_{Gi} is only to be applied when H_{Gi} will increase the transverse force H_{Di}.

Note 2. *See also*Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.8 and Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.11.

J_{Gi} = green sea force acting on container i, in kN in longitudinal direction parallel to deck, positive forward

= $-ac_i P_{gs}$

Note 1. J_{Gi} is only to be applied when J_{Gi} will increase the longitudinal force J_{Di}.

Note 2. *See also*Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.10 and Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.11.

P_{Gi} = green sea force acting on container i, in kN in the upwards direction normal to deck

= $1.5ab$

Note 1. P_{Gi} is only to be applied when the vertical acceleration a_z> -9.81 m/s^2 (downward acceleration less than gravitational acceleration).

Note 2. *See also*Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.10 and Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.11.

Where

P_{gs} = green sea pressure in kN/m^2, *See*Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.11 and Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.12.

Table 14. 8. 1: Wind heading coefficient C_{wh}

	Wind heading coefficient C_{wh}
Motion case *See* Note 1	Only applied to the exposed side walls of containers as defined in Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.7 and Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.8
MC1, *See* Note 2	0
MC2	1.00
MC3	0.866
MC4	0.866
MC5	0.866
MC6	1.00
Note*1*. For definition of Motion Cases, *See*Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.7. **Note***2*. No wind loads are to be applied to Motion Case MC1.	

8. 2. 5 The total instantaneous acceleration values acting on container *i*, including the static gravitational term, are to be taken as:

- Longitudinal acceleration (parallel to deck, positive forward)

$$a_x = C_{xS}a_{surge} + C_{xP}a_{pitch}\,z_i - g\sin(C_{xG}\psi)\text{m/s}^2$$

- Transverse acceleration (parallel to deck, positive to port)

i. For containers on the port side and on the centreline:

$$a_y = C_{yS}a_{sway} - C_{yR}a_{roll}z_i + g\sin(C_{yG}\varphi)\text{m/s}^2$$

ii. For containers on the starboard side:

$$a_y = -C_{yS}a_{sway} + C_{yR}a_{roll}z_i - g\sin(C_{yG}\varphi)\text{m/s}^2$$

- Vertical acceleration (normal to deck, positive upwards)

i. For containers on the port side and on the centreline:

$$a_z = C_{p1}\left(C_{zH}a_{heave} + C_{zR}a_{roll}\,y_i - f_{ap}C_{zP}a_{pitch}x_i\right) - g\cos(C_{xG}\psi)\cos(C_{yG}\varphi)\text{m/s}^2$$

ii. For containers on the starboard side

$$a_z = C_{p1}\left(C_{zH}a_{heave} - C_{zR}a_{roll}\,y_i - f_{ap}C_{zP}a_{pitch}x_i\right) - g\cos(C_{xG}\psi)\cos(C_{yG}\varphi)\text{m/s}^2$$

where the Motion Combination Factors $C_{xS}, C_{xP}, C_{xG}, C_{yS}, C_{yR}, C_{yG}, C_{zH}, C_{zR}$ and C_{ZP} for each Motion Case are given in Table 14. 8. 3: Motion Combination Factors (MCFs).

8. 2. 6 Wind forces are to be applied to the outer faces of the outermost container stack in accordance with Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.4. Wind forces may also need to be applied to inboard stacks in accordance with Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.7. The wind forces are to be taken as acting in the athwartships direction. Only positive forces of wind pressure are to be applied; suction forces need not be included. *See*Figure 14.8.1 Application of wind forces

8. 2. 7 Wind forces are to be applied to containers in inboard stacks if the centre of the windward side wall of the container is above the wind shear line, *See* Figure 14. 8. 1: Application of wind forces. The wind shear line is to be taken at an angle of 35 degrees to the horizontal and passing through the upper corner of the uppermost container of any windward stack, *See* Figure 14. 8. 1: Application of wind forces. The roll angle is to be ignored in the assessment of the wind shear line. The wind force is to be derived in accordance with Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.4 but *See also*Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.8.

Hence wind forces are to be applied to containers in inboard stacks if:

$$z_{ci} > z_{ws} + (|y_{ws} - y_{ci}|)\tan(35)$$

Where

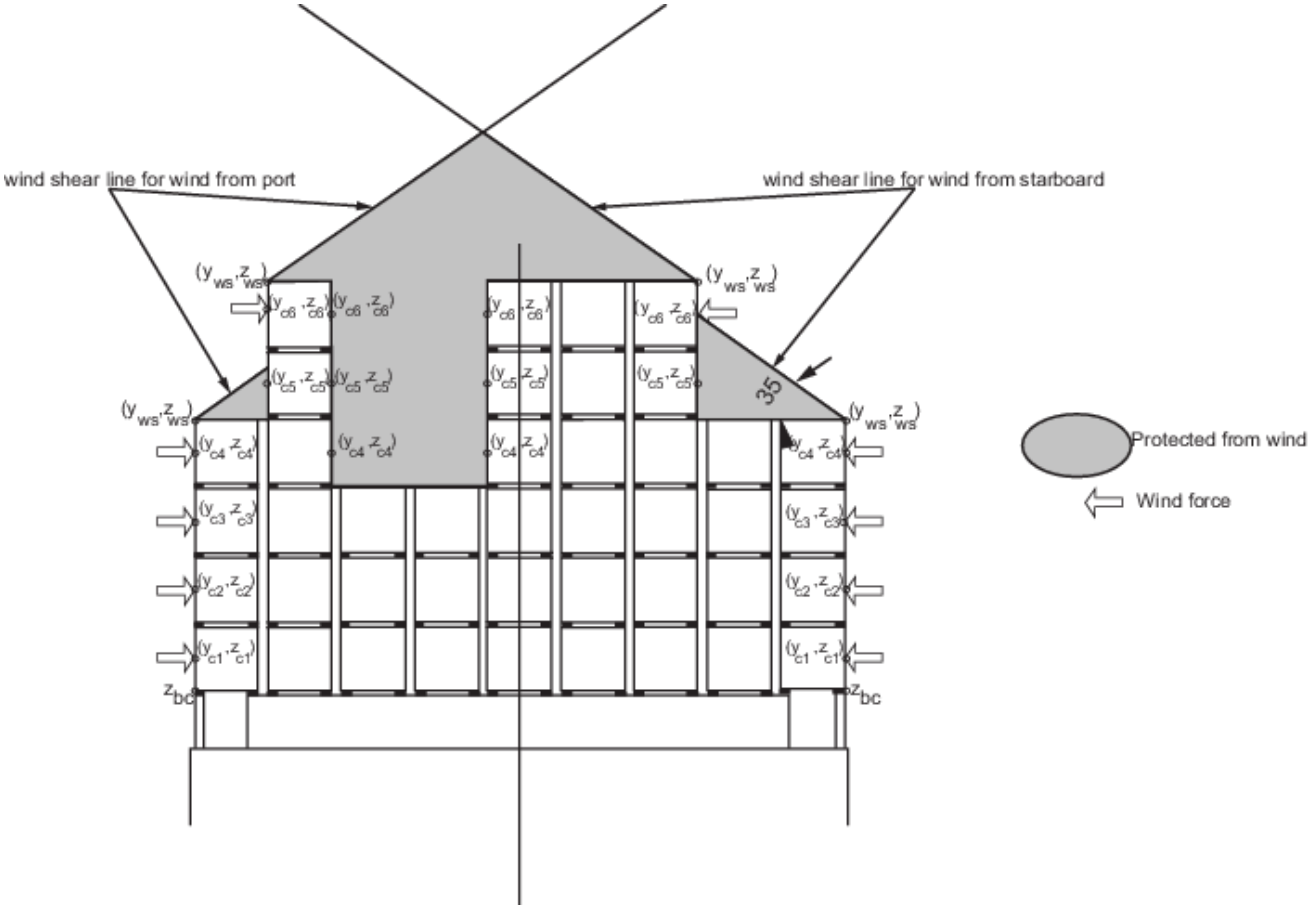
z_{ci} is the vertical position of the centre of the windward side wall of container *i* of the stack under consideration

y_{ws} is the transverse position of the windward top corner of the uppermost container of the stacks windward of the stack under consideration

z_{ws} is the vertical position of the windward top corner of the uppermost container of the stacks windward of the stack under consideration

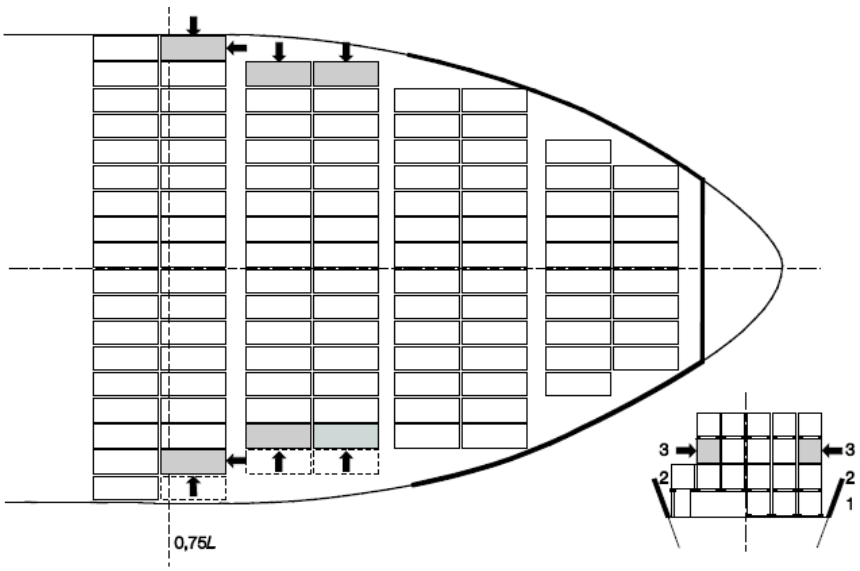
y_{ci} is the transverse position of the centre of the windward side wall of container i of the stack under consideration

Figure 14. 8. 1: Application of wind forces

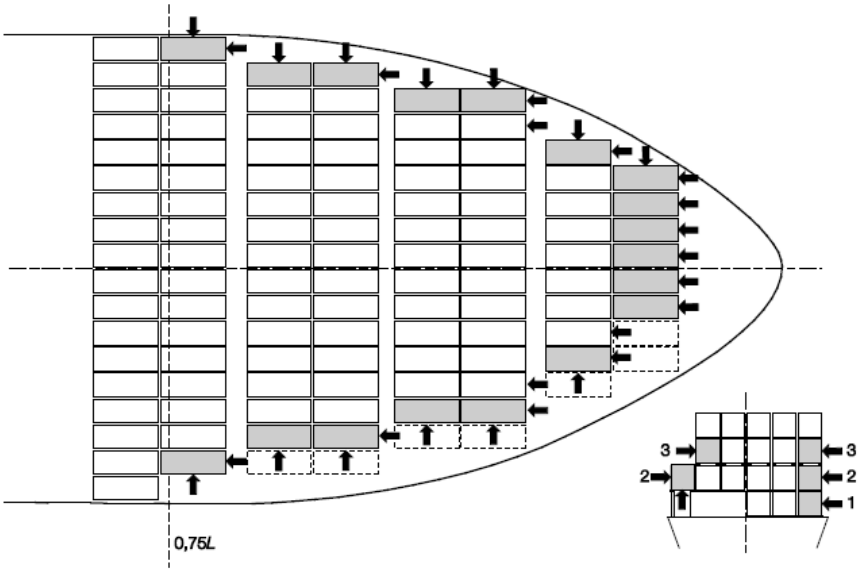


Note. The formula in Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.7 compares points at the container base and centre. The drawing compares points at the side. Both comparisons yield the same result.

Figure 14. 8. 2: Example of application of green sea forces



(a) Green sea loading on lowest three tiers only – Effective breakwaters (Forward and wrap around)



(b) Green sea loading on lowest three tiers only – No effective breakwater

8. 2. 8 A container is considered protected from wind in the transverse direction or from green sea loads in the longitudinal or transverse direction if an effective breakwater or similar extends above mid height of the container.

8. 2. 9 A container is considered partially protected from wind if an outboard container partially shields an inboard container as follows:

- An outboard 40ft container is considered to fully protect a longer inboard container.
- An outboard 20ft container is considered to partially protect a longer inboard container from wind. In this case the full wind force is to be applied over the exposed portion of the longer inboard container when the exposed length is more than 3m. The resulting wind force is to be applied solely to the end wall of the exposed portion.

8. 2. 10 A container is considered protected from green sea loads in the vertical direction if:

- the underside is less than 0.5 m above the hatch cover or deck; or
- an effective breakwater or similar extends above the bottom of the container.

8. 2. 11 Green sea loads need only be applied to a container when (*See*Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.7):

- the container $x_c > 0.75L$;
- the container is in the lowest three tiers of a stack;
- the container is in one of the two most outboard positions on the deck; and
- the container is not protected, *See*Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.8*and*Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.10.

Note In general, Tier 1 position corresponds to lowest tier of containers sitting just above the deck and Tier 2 position corresponds to the lowest tier of containers sitting just above the hatch covers, *See*Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers 8.2.7.

8. 2. 12 The green sea pressure is given by:

for $L>100$

$$P_{gs} = C_{G1}L^2 + C_{G2}L + C_{G3}\text{kN/m}^2 \text{ but not less than 0}$$

for $L \leq 100$, P_{gs} is to be taken as:

= 1.5 for Tier 1

= 1.0 for Tier 2

= 0.5 for Tier 3

where

C_{G1}, C_{G2}, C_{G3} are defined in Table 14. 8. 2: Green sea pressure coefficients

Proposals to use other values for green sea forces will be specially considered

Table 14. 8. 2: Green sea pressure coefficients

	C_{G1}	C_{G2}	C_{G3}

PART

3

CHAPTER **14 Cargo Securing Arrangements**

SECTION **9 Strength of container securing arrangements**

9. 1 General

9. 1. 1 The securing system is to be designed on the basis of the most severe combination of the forces specified in Pt 3, Ch 14, 8 Determination of forces for container securing arrangements in such a manner that the resultant forces on the containers and securing devices are within allowable limits., the forces are to be calculated for the most severe condition applicable to each arrangement.

9. 1. 2 The resultant forces in the containers are not to exceed the allowable values given in Pt 3, Ch 14, 9.4, Allowable forces on containers, fittings and lashing devices.

9. 1. 3 The resultant forces in the securing devices and supports are not to exceed the allowable working loads for which the device has been approved, *See*Pt 3, Ch 14, 2 Fixed cargo securing fittings, materials and testing and Pt 3, Ch 14, 3 Loose container securing fittings, materials and testing.

9. 1. 4 The container orientation is to follow the cargo securing manual, however, if unknown the container door end is assumed to face aft.

9. 1. 5 The forces in lashing devices, where fitted, are not to exceed the allowable safe working loads (SWLs) of the lashings as determined from Pt 3, Ch 14, 3 Loose container securing fittings, materials and testing.

9. 1. 6 For containers that are stowed in the fore and aft direction, it is sufficient to calculate the forces in the lashing rods based on assessment of the transverse and vertical loads acting on the containers. The vertical forces in the corner posts are to include the effects of transverse and longitudinal loads acting on the containers.

9. 1. 7 For containers that are stowed athwartships, the transverse, longitudinal and vertical loads acting on the containers will need to be taken into account in calculating the forces in the lashing rods. The vertical forces in the corner posts are to include the effects of transverse and longitudinal loads acting on the containers. The approach to be adopted should be agreed with ACS.

9. 2 Forces applied to each container

9. 2. 1 Forces due to acceleration, green water and wind in accordance with Pt 3, Ch 14, 8 Determination of forces for container securing arrangements, are to be applied as follows:

- Acceleration forces are to be calculated about the centre of gravity of the container.
- Vertical acceleration forces and self-weight are to be distributed to the four bottom corner castings.
- Vertical, transverse and longitudinal green sea loads act uniformly over the exposed panel of the container.
- Wind loads act uniformly over the exposed panel of the container.

9. 2. 2 Table 14. 9. 1: Acceleration force application shows a method to apply the forces to a container, assuming centre of gravity of the container is to be taken as half way along its length, midway between the port and starboard wall, and c_{VGGi} off the container floor.

Table 14. 9. 1: Acceleration force application

Acceleration Force	Figure
(a) Longitudinal acceleration force	 **where** $F_{Top} = \frac{J_{Di}}{4} \cdot \left(1 - \frac{c_{VCGi}}{c_i}\right)$ $F_{Bottom} = \frac{J_{Di}}{4} \cdot \left(1 - \frac{c_{VCGi}}{c_i}\right)$
(b) Transverse acceleration force	 **where** $F_{Top} = \frac{J_{Di}}{4} \cdot \left(1 - \frac{c_{VCGi}}{c_i}\right)$ $F_{Bottom} = \frac{J_{Di}}{4} \cdot \left(1 - \frac{c_{VCGi}}{c_i}\right)$
(c) Vertical acceleration force	 **Where** $F = \frac{p_{Di}}{4}$

Note The force application assumes the centre of gravity of the container is to be taken as half way along its length, midway between the port and starboard wall and c_{VCGi} off the container floor.

9. 3 Analysis of the container stack

9. 3. 1 ACS Guidance Notes for *Calculation Procedure of Container Stack Analysis* describes a methodology that complies with these requirements.

9. 3. 2 The application of ship motion and environmental loads will induce forces in the container boxes and lashing devices which result in distortion of the container stack. The key structural items resisting this distortion are as follows:

- The shear stiffness of the container end and side panels;
- The axial stiffness of the container corner posts;
- The stiffness of the lashing devices, including lashing bridge structure, when present;
- Under certain conditions and lashing arrangements, the twistlock can experience lifting forces which result in increased stack distortion.

All these aspects need to be considered in the stack analysis.

9. 3. 3 The forces in the containers, twistlocks and lashing devices are calculated from the stack distortion. Using the forces applied to the stack in *9.2 Forces applied to each container* and the stiffness of the stack, the overall stack deformation is calculated using the standard force-displacement equations. Non-linearity of the system as a consequence of twistlock separation and lashing rods is to be considered in evaluating the deformation. The inclusion of twistlock separation and corner post stiffness results in an increase in the loads in the lashing devices. The inclusion of a lashing bridge structure significantly affects the support a lashing device can provide for the stack and hence must be considered.

9. 3. 4 The overall distortion behaviour of a container is a combination of its shear stiffness and corner post stiffness. A container is to be modelled as a combination of shear only panels representing the walls, and rod elements representing the corner posts and horizontal frame structures. The shear stiffness of the container walls is to be taken as specified in Table 14. 9. 2: Shear spring stiffness of container walls. The area and Young's Modulus of the corner posts and horizontal frame members is to be taken as specified in Table 14. 9. 3: Container post properties.

Table 14. 9. 2: Shear spring stiffness of container walls

Container height	Door end kN/mm	Closed end kN/mm	Side wall kN/mm
2.438 m (8 ft)	3.7	16.7	6.1
2.591 m (8 ft 6 in)	3.5	15.4	5.7
2.743 m (9 ft)	3.3	14.3	5.4
2.896 m (9 ft 6 in)	3.2	13.3	5.1

Table 14. 9. 3: Container post properties

Property	Corner post properties	Horizontal post properties
Effective Area	3800 mm^2	2000 mm^2
Young's Modulus	206 kN/mm^2	206 kN/mm^2

9. 3. 5 Lashing devices are to be taken into account and their properties modelled to capture their behaviour. These include but are not limited to lashing rods and shore devices.

9. 3. 6 Lashing rods are to be modelled using tension only rod elements. Elongation may be determined by reference to an effective cross-sectional area and an effective modulus of elasticity of the lashing (allowance for straightening and stretching), which in the absence of actual test values,is to be taken as specified in Table 14. 9. 4: Effective modulus of elasticity of lashing devices.

9. 3. 7 Lashing rod stiffness, k_{Lr}, in kN/mm may be derived as follows:

$$k_{l,r} = \frac{E_r A_r}{l_r}$$

Where

E_r = effective modulus of elasticity, in kN/mm^2, *See* Table 14. 9. 4: Effective modulus of elasticity of lashing devices

A_r = cross sectional area of lashing device, in mm^2

l_r = length of lashing rod device, in mm

9. 3. 8 For external and internal para-lash arrangements, each lashing rod is to be individually modelled and connected to the relevant container casting.

9. 3. 9 Other lashing rod arrangements, e.g. an internal para-lash with load equaliser arrangements, will need to be specially considered.

Table 14. 9. 4: Effective modulus of elasticity of lashing devices

Lashing equipment	Effective modulus of elasticity
Steel rod lashings of hook type, including turnbuckle	98 kN/mm^2
Short (one tier) steel rod lashings (knob type), including turnbuckle and lashing eyes	140 kN/mm^2
Long (two tier) steel rod lashings (knob type), including turnbuckle and lashing eyes	175 kN/mm^2
Steel wire rope lashings	90 kN/mm^2
Steel chain lashings (based on the nominal diameter of the chain)	80 kN/mm^2
Adjustable tension/compression buttress	120 kN/mm^2
Aluminium or other materials	To be specially considered

9. 3. 10 Any other element introducing flexibility into the structure between the lashing point and the base of the container stack is to be evaluated and taken into account. Examples of this could be flexibility of the lashing bridge, sliding of a hatch cover or torsional deformations of the hull.

9. 3. 11 Where lashing devices are attached to a lashing bridge, the lashing bridge transverse stiffness is to be taken into account and may be modelled as an additional rod element. For lashing bridge designs with multiple lashing platforms, a lashing bridge rod element is required for each platform.

All the lashing bridge rod elements are to be connected in series. The bottom of the lashing bridge can be assumed to be rigidly fixed.

A default Rule stiffness for each platform of the lashing bridge is to be modelled with a rod with a transverse spring stiffness (K_{lbyi}) calculated from the following:

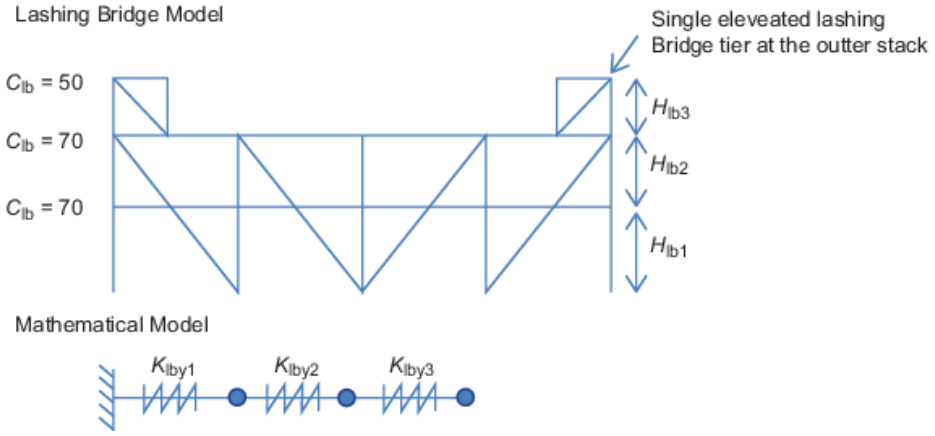
$$K_{lbyi} = \frac{C_{lb}}{H_{lbi}} \text{kN/mm}$$

Where

H_{lbi} is the height of lashing bridge tier *i*, taken in m, *See*Figure 14.9.1 Lashing bridge transverse spring stiffness

C_{lb} is the lashing bridge stiffness coefficient, taken as 50 for single elevated lashing bridge tiers at the outer stack, *See*Figure 14.9.1 Lashing bridge transverse spring stiffness, and 70 otherwise.

Figure 14. 9. 1: Lashing bridge transverse spring stiffness



9. 3. 12 For lashing bridge designs having a higher transverse stiffness than the default stiffness value of $70/H_{lbi}$, in kN/mm, the stack analysis can be based on the actual stiffness value determined in accordance with the *ACSPlus ADP Guideline for the Assessment of Container Ship Lashing Bridge Structures*.

9. 3. 13 Alternative proposals for the transverse stiffness of the lashing bridge will be individually considered.

9. 3. 14 Inherent in the twistlock design is a need for play in order to be able to fit the device. This play allows easy installation of the twistlocks, but this also means that vertical lifting of the top container occurs before the twistlock comes in to tension. Twistlocks therefore have three states, *See* Table 14. 9. 5: Twistlock separation and states. This vertical lifting distance is referred to as twistlock separation. If this separation occurs then it can significantly increase the transverse stack deformation and the forces in the lashing devices. The assessment of the effects of twistlock separation is particularly critical for external lashing arrangements.

Table 14. 9. 5: Twistlock separation and states

State	Figure	Description

Twistlock closed		Twistlock closed and in compression. The distance between the container castings is equal to the twistlock height.
Twistlock open		Twistlock open and in tension. The distance between the container castings is equal to the twistlock height plus twistlock separation.
Twistlock float		Float condition with zero axial force. The distance between the container castings is in between closed and open state.

9. 3. 15 Twistlock separation and height is to be provided by the lashing manufacturer. If this information is not available, the twistlock flange height is to be taken as 28 mm and the twistlock separation as 18 mm for FATs, SATs and manual twistlocks.

9. 3. 16 In the analysis of container stacks, it may be assumed that shear deformation of twistlocks can be ignored.

9. 3. 17 Initial displacement of containers due to tolerances in container fittings will be considered in conjunction with the stowage arrangement proposed. Generally, initial displacement may be neglected in calculation procedures for conventional stowages.

9. 4 Allowable forces on containers, fittings and lashing devices

9. 4. 1 The racking force of the container panels is calculated from the transverse shear deformation and the shear stiffness. The absolute racking force on the container end and side panels must not exceed the allowable racking force specified in Table 14. 9. 6: Allowable forces in containers in stacks with the same base size

9. 4. 2 The vertical force in the corner post is to be calculated from the compression of the post plus the vertical force due to shear in the end wall acting on the post. The maximum compressive force in each corner post of the container must not exceed the vertical forces at each top corner casting and in each corner post specified in Table 14. 9. 6: Allowable forces in containers in stacks with the same base size.

9. 4. 3 The maximum vertical compressive force in the twistlock is not to be greater than the allowable vertical forces at each bottom corner casting, compression and the maximum vertical tensile force in the twistlock is not to be greater than the allowable vertical corner pull-out force at each bottom corner casting.

9. 4. 4 The twistlock tensile load is to be less than the safe working load.

9. 4. 5 The forces and force components in the lashing devices must not be greater than the allowable lashing forces on the corner castings and the safe working load of the lashing device.

9. 4. 6 Table 14. 9. 6: Allowable forces in containers in stacks with the same base size and Pt 3, Ch 14, 9.4 Allowable forces on containers, fittings and lashing devices 9.4.12 show the values for allowable forces for ISO containers according to ISO 1496-1:1990 including Amendment Nos. 1, 2, 3 and 4. Other configurations will be specially considered.

9. 4. 7 The allowable forces for containers of other dimensions, e.g. 24 ft, 48 ft and 53 ft, will be determined on the basis of the values in Table 14. 9. 6: Allowable forces in containers in stacks with the same base size and of the forces for which the container has been certified.

9. 4. 8 The resultant forces in the securing devices and supports are not to exceed the allowable safe working loads for which the device has been approved, *See* Pt 3, Ch 14, 2 Fixed cargo securing fittings, materials and testing and Pt 3, Ch 14, 3 Loose container securing fittings, materials and testing.

9. 4. 9 The forces in lashing devices, where fitted, are not to exceed the allowable safe working loads (SWLs) of the lashings as determined from Pt 3, Ch 14, 3 Loose container securing fittings, materials and testing.

9. 4. 10 Table 14. 2. 2: Test loads and test modes for fixed container securing fittings and Table 14. 3. 2: Test loads and test modes for loose container securing fittings show the allowable safe working loads for loose fittings, including twistlocks, and securing devices. The forces in lashing devices are not to exceed the safe working loads (SWLs).

9. 4. 11 Table 14. 3. 2: Test loads and test modes for loose container securing fittings show the allowable shear force of the twistlocks. The calculated twistlock shear force is to be increased by 10 per cent due to misalignment, corrosion and design tolerances before comparing to the safe working load.

9. 4. 12 When Fully Automatic Twistlocks (FATs) are used, it is to be ensured that at least one of the port and starboard FATs at each end is in compression. This is to ensure that the FATs would not become disengaged.

Table 14. 9. 6: Allowable forces in containers in stacks with the same base size

	20 ft	40 ft	45 ft
	in kN		
Horizontal force from a container casting acting parallel to the side face	150	150	150
Horizontal force from lashing on container casting acting parallel to the end face, *See* Note 1	225	225	225
Vertical force from lashing on lower container casting acting parallel to the end or side face, *See* Note 1	250	250	250
Resultant force from lashing on upper container casting acting parallel to the end or side face	188	188	188
Racking force on container end	150	150	150
Racking force on container side	150	150	150
Vertical forces at each top corner casting, tension	250	250	250
Vertical forces at each bottom corner casting, tension	250	250	250
Vertical forces at each top corner casting and in each corner post, compression	848 *See* Note 4	848 *See* Note 4	942
Vertical forces at each bottom corner casting, compression	$848 + \left(\frac{1.8Rg}{4}\right)$ *See* Note 3	$848 + (1.8Rg/4)$ *See* Note 3	$942 + \frac{1.8Rg}{4}$ *See* Note 3
Transverse forces acting at the level of and parallel to the top face, tension or compression, *See* Note 2	340	340	340
Transverse forces acting at the level of and parallel to the bottom face, tension or compression, *See* Note 2	500	500	500

Note*1*. In no case is the resultant of the horizontal and the vertical forces to exceed the limiting values derived from Figure 14. 9. 2: Allowable forces for 20 ft or 40 ft containers constructed to ISO 1496-1:1990 including Amendment Nos. 1, 2 and 3. The horizontal and vertical forces are the maximum components of a diagonal force and are not to be used as the maximum load if horizontal or vertical lashings are employed.

Note*2*. Where a buttress supports the stack at an intermediate level, the total transverse force in the containers at the level is not to exceed the sum of the appropriate top and bottom forces.

Note *3*. The vertical compression force on the lower corner casting on the closed end of the lowest container may exceed $848 + (1.8Rg/4)$ kN or $942 + (1.8Rg/4)$ as applicable, provided the following conditions are complied with:

The vertical compression force acting on the lowest container from the container above does not exceed 848 kN.

The horizontal racking force acting on the lowest container from the container above does not exceed 150 kN.

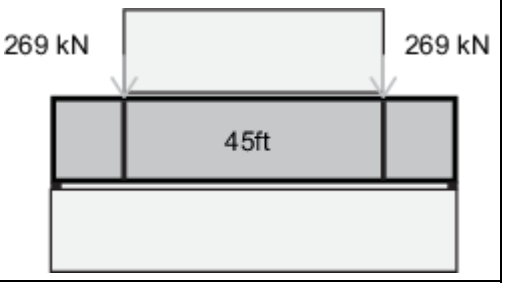
The local ship side or hatch cover container foundation is designed and approved for the increased design compression force.

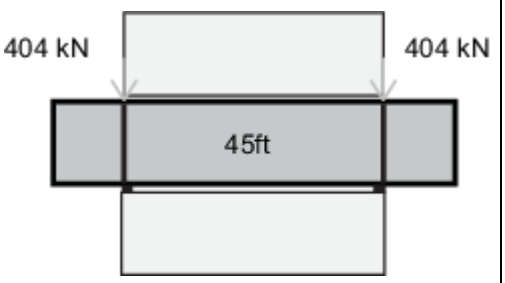
The loose bottom container securing fittings should have a contact area fulfilling the requirements of Pt 3, Ch 14, 3.2 Materials and design 3.2.5.

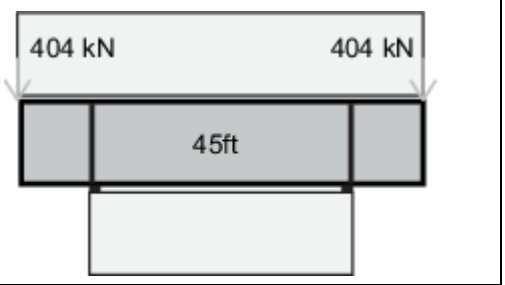
Note 4. Containers that are certified to comply with ISO 1496-1:1990 including Amendment 4 may have the top corner casting and post compression increased to 942 kN.

Table 14. 9. 7: Allowable compression forces for posts and corner castings of 40 ft and 45 ft containers in mixed stacks

Allowable force in kN



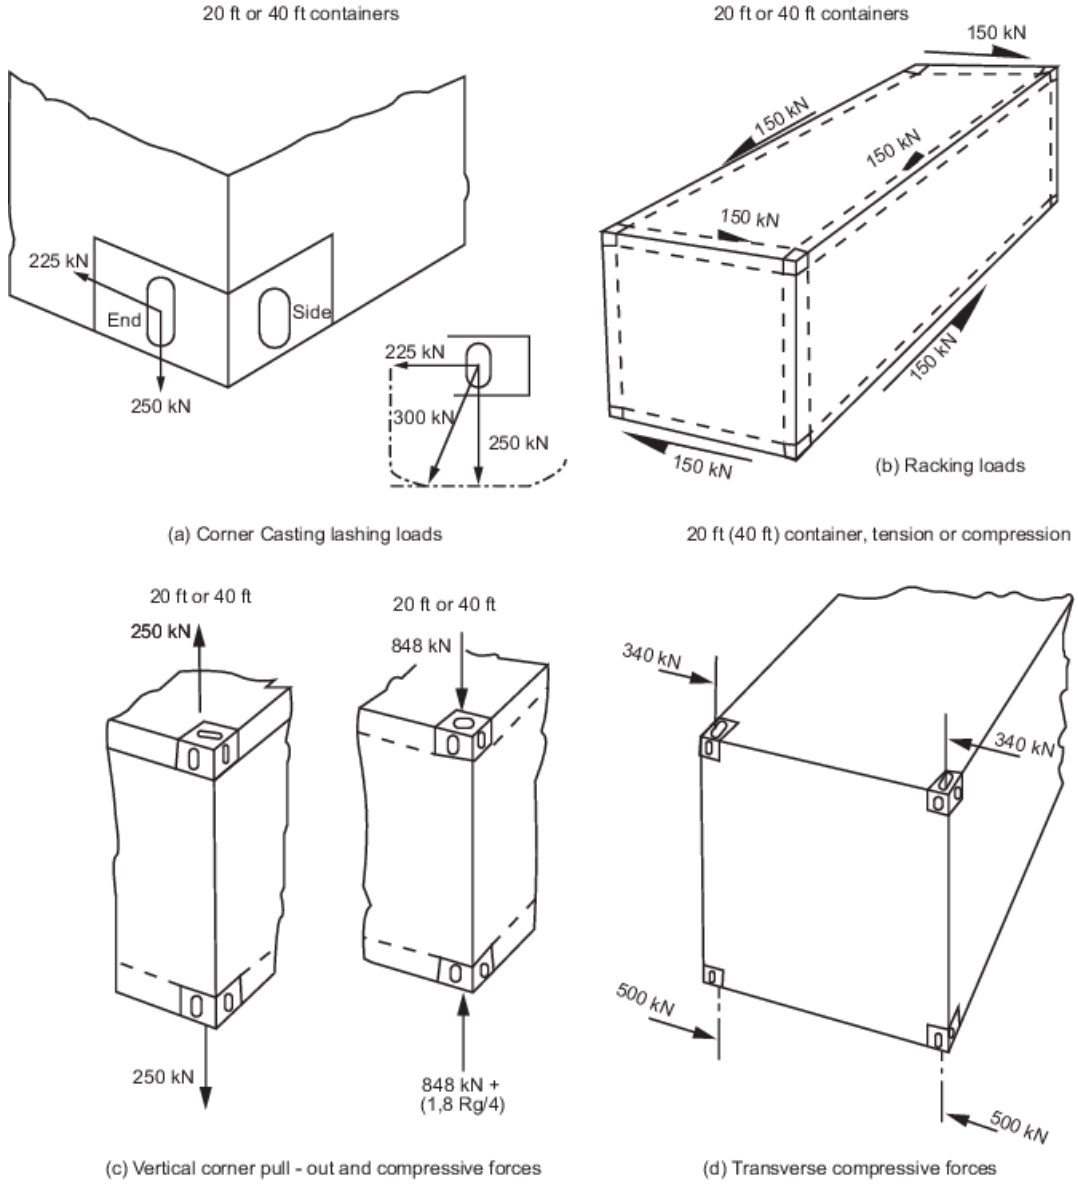




Note 1. *See* Notes 1 and 2 of Table 14. 9. 6: Allowable forces in containers in stacks with the same base size

Note 2. The allowable compression force for the bottom container casting may be increased by (1.8 Rg)/4

Figure 14. 9. 2: Allowable forces for 20 ft or 40 ft containers constructed to ISO 1496-1:1990 including Amendment Nos. 1, 2 and 3



PART

3

CHAPTER **14 Cargo Securing Arrangements**

SECTION **10 Surveys**

10. 1 Initial Survey

10. 1. 1 The following requirements are mandatory for fixed fittings, including cell guides, if fitted, on all ships. For ships having a **CCSA** class notation the requirements are also applicable for loose fittings.

10. 1. 2 The Surveyor is to be satisfied that the materials, workmanship and arrangements are satisfactory and in accordance with the requirements and the approved plans. Any items found not to be in accordance with the requirements or the approved plans, or any material, workmanship or arrangements found to be unsatisfactory are to be rectified.

10. 1. 3 A Register or plan is to be kept on board and up to date, and is to be made available to the Surveyor upon request. The Register or plan is to contain sufficient details to enable all fittings to be identified, including:

- a simple sketch;
- the name of the item;
- the number supplied;
- the manufacturer's mark or code; and
- the safe working load with the corresponding breaking load.

10. 1. 4 For container securing arrangements, a suitable Container Stowage Arrangement Plan is to accompany the Register. Where containers of types other than ISO containers are proposed to be carried, their stowage locations are to be clearly indicated on the plan.

10. 1. 5 The Register and stowage plans, if applicable, may be included in the Cargo Securing Manual.

10. 2 Periodical Surveys

10. 2. 1 For the requirements for Periodical Surveys, *See* Pt 1, Ch 3, 2.2 Annual Surveys and Pt 1, Ch 3, 5.3 Examination and testing.

CHAPTER 15 **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION 1 **General**

1. 1 Definitions

1. 1. 1 **Quality Assurance Scheme.** Asia Classification Society (hereinafter referred to as 'ACS') Quality Assurance requirements for the hull construction of ships are defined as follows:

- **Quality Assurance.** All activities and functions concerned with the attainment of quality including documentary evidence to confirm that such attainment is met.
- **Quality system.** The organisation structure, responsibilities, activities, resources and events laid down by Management that together provide organised procedures (from which data and other records are generated) and methods of implementation to ensure the capability of the shipyard to meet quality requirements.
- **Quality programme.** A documented set of activities, resources and events serving to implement the quality system of an organisation.
- **Quality plan**. A document derived from the quality programme setting out the specific quality practices, special processes, resources and activities relevant to a particular ship or series of sister ships. This document will also indicate the stages at which, as a minimum, direct survey and/or system monitoring will be carried out by the Classification Surveyor.
- **Quality control.** The operational techniques and activities used to measure and regulate the quality of hull construction to the required level.
- **Inspection.** The process of measuring, examining, testing, gauging or otherwise comparing the item with the approved drawings and the shipyard's written standards including those which have been agreed by ACS for the purposes of classification of the specific ship type concerned.
- **Assessment.** The initial comprehensive review of the shipyard's quality systems, prior to the granting of approval, to establish that all the requirements of these Rules have been met.
- **Audit**. A documented activity aimed at verifying by examination and evaluation that the applicable elements of the quality programme continue to be effectively implemented.
- **Hold point**. A defined stage of manufacture beyond which the work must not proceed until the inspection has been carried out by all the relevant personnel.
- **System monitoring.** The act of checking, on a regular basis, the applicable processes, activities and associated documentation that the Shipbuilder's quality system continues to operate as defined in the quality programme.

- **Special process.** A process where some aspects of the required quality cannot be assured by subsequent inspection of the processed material alone. Manufacturing special processes include welding, forming and the application of protective treatments. Inspection and testing processes classified as special processes include non-destructive examination and pressure and leak testing.

1. 2 Scope of the Quality Assurance Scheme

1. 2. 1 This Chapter specifies the minimum Quality System requirements for a shipyard to construct ships under ACS Quality Assurance Scheme.

1. 2. 2 For the purposes of this Chapter of the Rules, hull construction comprises the hull structure; containment systems, including those which are independent of the main hull structure; appendages; superstructures; deckhouses; and closing appliances all as required by the Rules.

1. 2. 3 Although the requirements of this Scheme are, in general, for steel ships of all welded construction, other materials for use in hull construction will be considered.

PART

3

CHAPTER 15 **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION 2 **Application**

2. 1 Certification of the shipyard

2. 1. 1 ACS will give consideration to a shipyard's Quality Assurance System provided, at all times, there is full commitment by all the shipyard personnel to the implementation and maintenance of this system. On satisfactory completion of assessments and audits ACS will issue certificates of approval to the shipyard as indicated in Pt 3, Ch 15, 2.1 Certification of the shipyard 2.1.2.

2. 1. 2 ACS Quality Assurance Scheme comprises:

Part 1 The requirements of the Quality System for hull construction which are applicable to shipyards operating a quality programme but not necessarily constructing to ACS Class. Certificates of approval valid for three years will be issued, with intermediate audits at intervals of 6 months.

Part 2 The Quality System requirements for hull construction for application to ships under construction to ACS Class as part of the Special Survey. ACS particular requirements for construction of ships to its Class, and the continuous involvement in the hull construction process by a combination of direct survey and systems monitoring by ACS Surveyors, are provided for by Part 2. Where ACS considers that there is a stage in construction at which a high degree of direct inspection by the Surveyors is desirable, this stage will be described on the Part 2 Approval Certificate.

Certificates of approval for Part 2 will be valid for one year, and will be issued after satisfactory assessment/audit carried out at a suitable stage during construction to ACS Class. Part 1 certification will automatically be issued, or re-issued as applicable, on attainment of Part 2 approval.

2. 1. 3 Chemical carriers with cargo tank structure of material other than carbon manganese steel and the cargo containment system on ships for liquefied gases will be specially considered. The procedure relating to the construction of such structure on chemical carriers and liquefied gas containment systems is to be separately prescribed in the Quality Plan which will be subject to approval by ACS.

2. 1. 4 The Quality System at a shipyard will be examined for compliance with these Rules by the assessments and audits as laid down in Pt 3, Ch 15, 4 Requirements of Parts 1 and 2 of the Scheme, Pt 3, Ch 15, 5 Additional requirements for Part 2 of the Scheme and Pt 3, Ch 15, 6 Initial assessment of the shipyard. Initial and periodical approval of the system will be considered by the Committee on receipt of satisfactory assessment and audit reports.

2. 1. 5 All information and data submitted by a Shipbuilder for approval under this Scheme and for maintenance of approval will be treated by ACS in strict confidence and will not be disclosed to any third party without the prior written consent of the Shipbuilder.

2. 1. 6 A list of shipyards approved under the Scheme will be held in the *List of Shipyards Approved to the Requirements of the Quality Assurance Scheme.*

PART

3

CHAPTER 15 **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION 3 **Particulars to be submitted**

3. 1 Documentation and procedures

3. 1. 1 Under either Part of the Scheme, the documentation to meet the requirements of Pt 3, Ch 15, 4 Requirements of Parts 1 and 2 of the Scheme is to be submitted. This documentation includes the Quality Manual, Quality Plans, documented procedures and work instructions.

3. 1. 2 Additionally, under Part 2 of the Scheme the documentation to meet the requirements of Pt 3, Ch 15, 5 Additional requirements for Part 2 of the Scheme is to be submitted for approval. Construction plans and all necessary particulars are also to be submitted for approval in accordance with the relevant requirements of the Rules. *See*Pt 1, Ch 2, 3.2 New construction surveys 3.2.1.

3. 2 Amendments

3. 2. 1 Any major changes to the documentation or procedures required by Pt 3, Ch 15, 4 Requirements of Parts 1 and 2 of the Scheme or Pt 3, Ch 15, 5 Additional requirements for Part 2 of the Scheme are to be re-submitted.

PART

3

CHAPTER 15 **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION 4 **Requirements of Parts 1 and 2 of the Scheme**

4. 1 General

4. 1. 1 The requirements of this Section are applicable to shipyards *See*king approval under Parts 1 and 2 of the Scheme.

4. 2 Policy statement

4. 2. 1 A policy statement, signed by the chief executive of the shipyard concerned, confirming the full commitment of all levels of personnel in the shipyard to the implementation and sustained operation of quality assurance methods is to be included in the Quality Manual.

4. 3 Responsibility

4. 3. 1 Personnel responsible for functions affecting quality are to have defined responsibility and authority to identify, control and evaluate quality.

4. 4 Management Representative

4. 4. 1 The Shipbuilder is to appoint a Management Representative, who is to be independent of other functions unless specifically agreed otherwise by ACS, and who is to have the necessary authority and responsibility for ensuring that the requirements of the Scheme are complied with.

4. 4. 2 The Management Representative is to have the authority to stop production if serious quality problems arise.

4. 5 Quality control and testing personnel

4. 5. 1 The Shipbuilder is to utilise quality control and testing personnel whose performance and continued freedom of influence from production pressures is to be systematically confirmed by the Management Representative.

4. 6 Resources

4. 6. 1 Sufficient resources shall be provided by the shipyard to enable the requirements identified by the Quality Management System to be effectively implemented.

4. 7 The Quality Management System

4. 7. 1 The Shipbuilder is to establish, document and maintain an effective Quality Management System that will ensure and demonstrate that materials and consumables used, and working processes employed, conform to the requirements for hull construction.

4. 7. 2 **Quality Manual**. The basic documentation is to be in the form of a Quality Manual which sets out the general quality policies and which references the detailed procedures, standards, etc. and includes the requirements of Pt 3, Ch 15, 4.2 Policy statement to Pt 3, Ch 15, 4.24, Sub-contracted personnel, services and components and, where appropriate, Pt 3, Ch 15, 5.1 Quality System procedures to Pt 3, Ch 15, 5.10 Sub-contracted personnel, services and components.

4. 7. 3 **Procedures**. The Shipbuilder is to establish, document and maintain an adequate and defined control of the hull construction process comprising:

a. defined and documented controls, processes, procedures, tolerances, acceptance/rejection criteria and workmanship standards; and
b. the provision of Quality Plans for each ship or series of sister ships for the processes and procedures for manufacture, inspection and testing involved from receipt of material through to completion of the hull construction process.

4. 7. 4 **Work instructions**. The Shipbuilder is to develop and maintain clear and complete documented work instructions for the processes and standards involved in the construction of the hull. Such instructions are to provide directions to various levels of personnel.

4. 8 Regulatory requirements

4. 8. 1 The Shipbuilder is to establish that the requirements of all applicable Regulations are clearly specified and agreed with the Owner/Classification Society/Regulatory Authority. These Regulations are to be made available for all functions that require them and their suitability is to be reviewed.

4. 8. 2 The Shipbuilder is to establish a design verification procedure to ensure that the regulatory requirements have been incorporated into the design output.

4. 9 Control of hull drawings

4. 9. 1 The Shipbuilder is to establish, document and maintain a procedure for the submission to the Classification Society and other regulatory bodies of all the necessary drawings required for approval sufficiently early and in such a manner that the requirements of the Classification Society and other regulatory bodies can be included in the design before construction commences. This procedure is to include a provision which ensures that all amendments to approved drawings are incorporated in the working drawings and that design revisions are re-submitted for approval.

4. 10 Documentation and change control

4. 10. 1 The Shipbuilder is to establish a procedure to ensure that:

a. valid drawings, specifications, procedures, work instructions and other documentation necessary for each phase of the fabrication process are prepared;
b. all necessary documents and data are made readily available at all appropriate work, testing and inspection locations;
c. all amended drawings and changes to documentation are processed in a timely manner to ensure inclusion in the production process;
d. records are maintained of amendments and changes to documentation; and
e. provision is made for the prompt removal or immediate identification of all superseded drawings and documentation throughout the shipyard.

4. 11 Purchasing data and receipt

4. 11. 1 The Shipbuilder is to maintain purchasing documents containing a clear description of the materials ordered for use in hull construction and the standards to which material must conform, and the identification and certification requirements.

4. 11. 2 For the requirements for receiving inspection of purchased items *See*Pt 3, Ch 15, 4.15 Control of inspection and testing.

4. 12 Owner supplied material

4. 12. 1 The Shipbuilder is to have procedures for the inspection, storage and maintenance of Owner supplied materials and equipment.

4. 13 Identification and traceability

4. 13. 1 The Shipbuilder is to establish and maintain a procedure to ensure that materials and consumables used in the hull construction process are identified (by colour-coding and/or marking as appropriate) from arrival at the shipyard through to erection in such a way as to enable the type and grade to be readily recognised. The procedure is to ensure that the Shipbuilder has the ability to identify material in the completed vessel and ensure traceability to the mill sheets.

4. 14 Fabrication control

4. 14. 1 The Shipbuilder is to establish, document and maintain suitable procedures to ensure that fabrication and construction operations are carried out under controlled conditions. Controlled conditions are to include:

a. clearly documented work instructions defining material treatment, marking, cutting, forming, sub-assembly, assembly, erection, fitting of closing appliances, use of fabrication aids and associated fit-up, weld preparation, welding and dimensional control procedures;
b. criteria for workmanship and manufacturing tolerances. These are to be documented in a clear manner and made available to the appropriate workforce, and are to include acceptance/rejection criteria; and
c. documented instructions for the control of equipment and machines used in fabrication. These are to be made available to the appropriate workforce and supplied to individuals where necessary.

4. 14. 2 The Shipbuilder is to establish and control welding, non-destructive examination and painting which are part of the fabrication system, the equipment used in such processes and the environment in which they are employed. Operators of these special processes are to be properly qualified. Details of these processes are to be included in the relevant Quality Plans.

4. 14. 3 A list of approved welding procedures is to be maintained and made available to relevant personnel. Records of the results of testing for approval are also to be maintained. Lists of appropriately qualified welders are to be maintained. Procedures for distribution and recycling of welding consumables are to be implemented.

4. 14. 4 The Shipbuilder is to establish, document and maintain adequate maintenance schedules and standards for all equipment associated with the hull construction process.

4. 15 Control of inspection and testing

4. 15. 1 The Shipbuilder is to be responsible for ensuring that all incoming plates, sections, castings, components, fabrications and consumables and other materials used in the hull construction process are inspected or otherwise verified as conforming to purchase order requirements.

4. 15. 2 The Shipbuilder is to provide an inspection system at suitable stages of the fabrication process from the material delivery to the completion of hull construction. The inspection system is to confirm and record the inspections carried out.

4. 16 Indication of inspection status

4. 16. 1 The Shipbuilder is to establish and maintain a system for identifying the inspection status of structural components at appropriate stages of the fabrication process. This may include the direct marking of components. Records of inspection and measurements are to be identifiable to components to which they refer and be readily accessible to production and inspection personnel and to Classification Surveyors.

4. 17 Inspection, measuring and test equipment

4. 17. 1 The Shipbuilder is to be responsible for the control, calibration, and maintenance of the inspection, measuring and test equipment used in the fabrication and non-destructive examination of the hull structure.

4. 17. 2 The calibration system is to allow traceability back to appropriate National Standards. Where these do not exist the basis of calibration is to be defined.

4. 18 Non-conforming materials and corrective action

4. 18. 1 The Shipbuilder is to establish and define procedures to provide for:

a. the clear identification and segregation from production areas of all plates, sections, castings, components, fabrications, consumables and other materials which do not conform to the agreed specification; and
b. the initiation of authorised corrective or alternative action.

4. 19 Protection and preservation of quality

4. 19. 1 The Shipbuilder is to establish and maintain a procedure to control handling and preservation processes for both the material used in fabrication and the structural components at all stages of the fabrication process. This procedure is to ensure conformance to specified requirements and established standards.

4. 19. 2 Welding consumables are to be stored, handled and recycled according to maker's recommendations.

4. 20 Records

4. 20. 1 The Shipbuilder is to develop and maintain records that demonstrate achievement of the required quality and the effective operation of the Quality System. Records demonstrating sub-contractor achievement of these requirements are to be maintained. These records are to be retained and available for a defined period. These records are to include identification of materials and consumables used in fabrication, the number and class of defects found during fabrication and information regarding corrective action taken. Records of particular processes, e.g. plate surface preparation and priming, marking, cutting, forming, accuracy control, non-destructive examination, audits and all other records pertaining to the operation of the Quality System are also to be maintained.

4. 21 Internal audit and management review

4. 21. 1 Internal audits of the performance of all aspects of the systems relating to design, production and testing are to be carried out systematically by appointed staff and recorded under the authority of the Management Representative. These staff members will not normally audit functions for which they are directly responsible.

4. 21. 2 Using data obtained from the audits and any other available relevant information, management reviews are to take place at specified intervals or more frequently as deemed necessary in order to review the performance of the Quality System.

4. 21. 3 The Shipbuilder is to establish, document and maintain a procedure for corrective application of data feedback from previous construction, including previous ships during the guarantee period.

4. 21. 4 The Shipbuilder is to establish, document and maintain a procedure to provide for the analysis of departures from manufacturing standards, steel material scrapped, reworked or repaired during the fabrication and construction process in order to detect trends, investigate the cause to determine the action needed to correct the processes and work procedures, or to identify the further training of operators as appropriate.

4. 21. 5 Agreed improvements to the Quality System are to be implemented within a time scale appropriate to the nature of the improvement.

4. 22 Training

4. 22. 1 The Shipbuilder is to establish and maintain a system to identify training needs and ensure that all personnel involved in the fabrication, erection and quality-involved functions have adequate experience, training and qualifications. This requirement extends to sub-contractor personnel working within the shipyard. Records are to be available to the Classification Surveyor.

4. 23 Sampling

4. 23. 1 Any sampling processes used by the Shipbuilder are to be in accordance with specified or Statutory Requirements or to the satisfaction of the Classification Surveyor as applicable.

4. 24 Sub-contracted personnel, services and components

4. 24. 1 The requirements of the Scheme are applicable, as appropriate, to all sub-contractor personnel and sub-contracted services operating within the shipyard.

4. 24. 2 The requirements of the Scheme are not applicable to sub-contractor personnel or sub-contracted services operating at locations outside the shipyard. In these circumstances it will be necessary for inspections to be carried out by the ACS Surveyor using conventional survey methods.

PART

3

CHAPTER 15 **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION 5 **Additional requirements for Part 2 of the Scheme**

5. 1 Quality System procedures

5. 1. 1 The procedures detailed in Pt 3, Ch 15, 4.7, The Quality Management System are to be submitted for approval.

5. 2 Quality Plans

5. 2. 1 Quality Plans for ships which are to be classed by ACS are to be submitted for approval well in advance of commencement of work, irrespective of any submissions that may have been made for sister ships under Part 1 of the Scheme. Such Quality Plans are to outline all of the manufacturing, testing and inspection operations to be performed by the Shipbuilder and by which personnel they will be carried out. The Quality Plans are then to be submitted to the ACS Surveyors who will indicate all the stages at which they will perform system monitoring, carry out direct inspection and participate in hold point inspections. These hold points will include, but not be limited to, the following:

a. Radiographs and other test records of non-destructive examinations as required for Classification purposes, *See*Ch 13, 2.12 Non-destructive examination of welds of the Rules for Materials.

b. The items described in Pt 3, Ch 1, 8 Inspection and workmanship relevant to the scope of this Chapter.

5. 2. 2 Notwithstanding what may have been agreed in the Quality Plans, the ACS Surveyors have the discretion to increase their involvement, *See also*Pt 3, Ch 15, 8.1 General 8.1.5.

5. 3 Material supplier approval

5. 3. 1 The Shipbuilder is to ensure that hull construction materials and consumables used are selected from manufacturers who are approved by ACS.

5. 4 Identification and traceability

5. 4. 1 The procedure required by Pt 3, Ch 15, 4.13 Identification and traceability 4.13.1 is to be submitted for approval.

5. 5 Fabrication control

5. 5. 1 The information required by Pt 3, Ch 15, 4.14 Fabrication control 4.14.1.b will be examined for acceptability.

5. 5. 2 Procedures for material treatment, forming, weld preparation and welding are to be submitted for approval.

5. 5. 3 Procedures required by Pt 3, Ch 15, 4.14 Fabrication control 4.14.3 are to be submitted to the ACS Surveyors for approval.

5. 6 Control of inspection and testing

5. 6. 1 The inspection stages incorporated into the Scheme are to include specific checks for fit-up and welding which are to be carried out at each sub-assembly, assembly, pre-erection and erection stage as well as self-checking by the operator. The number of recorded checks to each stage will be agreed with the ACS Surveyor, after consideration of documentary evidence of quality being achieved. Repairs, where required, are to be effected after each check. Collated Quality Control data to demonstrate the efficiency of the above self-check system are to be made available to the ACS Surveyor by the Shipbuilder. The Quality Plans referred to in Pt 3, Ch 15, 4.7 The Quality Management System 4.7.3.b provide the opportunity for the Shipbuilder and the ACS Surveyor to consider the structural design and ship type fully in order to determine the most efficient and effective inspection stages.

5. 7 Control of non-conforming materials and corrective action

5. 7. 1 All predetermined repair procedures are to be consistent with the requirements of Pt 3, Ch 15, 4.7,, The Quality Management System 4.7.3 and are to be to the satisfaction of the ACS Surveyor. Where a defect is found, whether by the ACS Surveyor or through shipyard inspection, for which no agreed repair procedure exists, approval is to be obtained from the ACS Surveyor before any corrective action is effected.

5. 8 Records

5. 8. 1 The shipyard is to make data available to the ACS Surveyor, to demonstrate the efficiency of the inspection system, *See*Pt 3, Ch 15, 5.6 Control of inspection and testing 5.6.1.

5. 9 Training

5. 9. 1 The competence of the welding operators, non-destructive examination and other personnel involved in special processes and inspection are to be to the satisfaction of the ACS Surveyor.

5. 10 Sub-contracted personnel, services and components

5. 10. 1 The requirements of the Scheme are not applicable to those services operating at locations outside the shipyard. It will be necessary for inspections to be carried out by the ACS Surveyor using conventional survey methods.

5. 10. 2 The methods of control for the requirements of Pt 3, Ch 15, 4.24 Sub-contracted personnel, services and components 4.24.1 are to be submitted to the ACS Surveyor.

PART

3

CHAPTER 15 **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION 6 **Initial assessment of the shipyard**

6. 1 General

6. 1. 1 In the first instance applications for approval under this Scheme will be considered on the recommendation of the local Surveyors.

6. 1. 2 After receipt and appraisal of the main quality documentation, an assessment of the shipyard is to be carried out by the Surveyors to examine all aspects of the Quality System applicable to hull construction.

6. 1. 3 The Surveyors will review the quality arrangements proposed by the Shipbuilder at the shipyard. They may advise as to how the proposed Quality System might be improved and where it is considered inadequate, advise how it might be revised to be acceptable to ACS.

6. 1. 4 For assessment to Part 1 of the Scheme, the Surveyors will review the Quality System in association with the quality documentation and will check that all aspects of the System are established and in accordance with the requirements of Pt 3, Ch 15, 3 Particulars to be submitted.

6. 1. 5 For assessment of Part 2 of the Scheme, the Surveyors will confirm that the requirements given in Pt 3, Ch 15, 3 Particulars to be submitted have been fully implemented and are complied with by a detailed examination of work in progress and by confirming that workmanship and the quality level being consistently achieved are to their satisfaction.

PART

3

CHAPTER 15 **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION 7 **Approval of the shipyard**

7. 1 General

7. 1. 1 If the initial assessment confirms that the shipyard's quality arrangements are satisfactory, the Committee will issue Part 1 or Part 2 and Part 1 of ACS Quality Assurance Approval Certificates as appropriate. Maintenance of approval will be subject to the provisions of Pt 3, Ch 15, 8 Maintenance of approval.

7. 1. 2 Approval by another organisation will not be accepted as sufficient evidence that the arrangements for hull construction comply with these requirements.

PART

3

CHAPTER **15** **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION **8** **Maintenance of approval**

8. 1 General

8. 1. 1 For Part 2 of the Scheme, the arrangements approved at the shipyard are to be kept under review by the Surveyors to ensure that the approved Quality System is being maintained in a satisfactory manner. This is to be carried out by:

a. Regular and systematic audits by the ACS Surveyor.
b. Comprehensive Annual Audits. The audit team leader will be formally nominated by ACS.

8. 1. 2 Where a comprehensive audit cannot be carried out due to lack of a current building programme to Class, demonstration that the requirements of Part 1 of the Scheme are being maintained may be confirmed by audit review at intervals of six months, normally by the local Surveyors. Where necessary a comprehensive triennial audit would be carried out by a Surveyor formally nominated by ACS. The degree of re-assessment for re-approval at the recommencement of building to ACS Class would be at the discretion of the Committee.

8. 1. 3 All documentation, including reports, is to be available to the Surveyors.

8. 1. 4 Minor alterations in the approved procedures may be permitted provided that the Surveyors are advised and their prior concurrence obtained. Major alterations would need to be submitted for approval and may require an additional audit.

8. 1. 5 In a shipyard constructing ships to ACS Class, the following are applicable:

a. The ACS Surveyor is to be allowed access at all reasonable times to all records pertaining to quality and to all parts of the shipyard involved in the implementation and maintenance of the Quality Assurance Programme.
b. The ACS Surveyor is immediately to advise the Management Representative of any matter pertaining to the Quality System with which he is not satisfied.
c. When minor deficiencies in the approved procedures are discovered during audits, or if workmanship is considered unsatisfactory, the ACS Surveyor will apply more intensive auditing and inspection.
d. Notwithstanding any of the provisions of the Quality System, all work related to Classification of ships with ACS is to be to the satisfaction of the ACS Surveyor.

PART

3

CHAPTER **15** **Quality Assurance Scheme for the Hull Construction of Ships**

SECTION **9** **Suspension or withdrawal of approval**

9. 1 General

9. 1. 1 When the Surveyors have drawn attention to significant faults or deficiencies in the Quality System or its operation and these have not been rectified within a period of time acceptable to ACS, the approval of the system, together with the associated certification, will be withdrawn and the shipyard's name deleted from the *List of Shipyards Approved to the Requirements of the Quality Assurance Scheme*.

9. 1. 2 If a significant period of time elapses between such withdrawal and any application for reinstatement, the reapproval procedures, if agreed to by the Committee, may require a restructuring of the Quality Management System and will always require a complete re-examination as for an initial assessment.

12. 1 Safe Return to Port and Orderly Evacuation – Descriptive Note SRtP 1441

PART

3

CHAPTER 16 **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**

SECTION 1 **General**

1. 1 Application

1. 1. 1 Where one or more of ACSPlus Guidelines have been satisfactorily applied whether on a mandatory or voluntary basis, the associated ACSPlus notation or descriptive note as detailed in Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.17 or Pt 1, Ch 2, 2.8 Descriptive notes 2.8.2 will be assigned.

1. 1. 2 In addition to the ACSPlus Guidelines indicated in this Chapter, details of all ACSPlus Guidelines are given in the *ACSPlus Guidelines Overview* document. Details of machinery ACSPlus Guidelines can also be found in Pt 5, Ch 21 Requirements for Condition Monitoring and Condition-Based Maintenance Systems.

PART

3

CHAPTER 16 **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**

SECTION 2 **Construction monitoring**

2. 1 Construction Monitoring notation – CM

2. 1. 1 Extended controls on structural alignment, fit up and workmanship standards are to be applied in accordance with the *ACSPlus Construction Monitoring Guideline*, to areas of the ship structure that have been requested or have been shown by other ACSPlus Guidelines to be in need of particular attention. The ACSPlus Construction Monitoring Guideline is mandatory when one or more of the Guidelines indicated in Pt 3, Ch 16, 3 Structural design assessment, Pt 3, Ch 16, 4 Fatigue design assessment, or Pt 3, Ch 16, 5 Whipping design assessment have been applied, whether voluntarily or on a mandatory basis. Where the relevant Guidelines have been applied, the ACSPlus notation **CM** is to be assigned, *See also*Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.17.

PART

3

CHAPTER 16 **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**

SECTION 3 **Structural design assessment**

3. 1 Structural Design Assessment notation - SDA

3. 1. 1 Where specified in the Rules the ship structure is to be assessed using finite element modelling in accordance with the applicable ACSPlus SDA Guidelines. Where the relevant Guidelines have been applied whether on a voluntary or mandatory basis the ACSPlus notation **SDA** will be assigned, *See also*Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.17. In general the mandatory application criteria for implementation of one of the associated ACSPlus SDA Guidelines is as follows:

a. bulk carriers and oil tankers without a **CSR** notation greater than 190 m in length;
b. ore carriers equal to and greater than 150 m in length;
c. container ships with a beam greater than 32 m;
d. the primary structure of LNG ships fitted by membrane cargo tanks;
e. the primary structure of LNG ships fitted with independent Type B spherical cargo tanks;
f. the primary structure of LPG ships fitted with Independent Type A cargo tanks;
g. passenger ships where it is required to utilise the load carrying capability of the superstructure for longitudinal strength; or where it is considered that the superstructure will be subjected to a significant load from flexure of the hull girder; or, where a limited number of transverse bulkheads above the bulkhead deck are present to carry the racking response;
h. other ships of abnormal hull form or where the type, size and structural configuration demand; and
i. upon application of any of the following ACSPlus notations: **FDA, FDA plus(), FDA ICE, FDA SPR** and, **WDA1** and **WDA2**, *See also*Pt 3, Ch 16, 4 Fatigue design assessment and Pt 3, Ch 16, 5 Whipping design assessment.

In addition to the above, and where applicable, the structural capability to withstand dynamic loadings from partially filled tanks or the influence of thermal loadings may also be required to be assessed.

PART

3

CHAPTER 16 **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**

SECTION 4 **Fatigue design assessment**

4. 1 Fatigue Design Assessment notations – FDA, FDA plus, and FDA ICE and FDA SPR

4. 1. 1 Where specified in the Rules the fatigue performance of the hull structure is to be assessed in accordance with the applicable ACSPlus FDA Guidelines. Where an appraisal has been made whether on a voluntary or mandatory basis of the fatigue performance of the hull structure in accordance with the relevant Guidelines and found to comply with the requirement of 20 years fatigue life based on the 100A1 Fatigue Wave Environment (World-wide) trading pattern the ACSPlus notation **FDA** will be assigned, *See also*Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.17. In general the ACSPlus FDA Guideline is mandatory for all bulk carriers and oil tankers without a **CSR** notation and of length greater than 190 m or where the type, size and structural configuration demand. The ACSPlus notation **FDA** is not applicable to ships approved using the IACS Common Structural Rules.

4. 1. 2 Where an appraisal is requested for a higher level of fatigue performance of the hull structure than that made for the assignment of the ACSPlus notation **FDA**, the relevant Guidelines for the application of the ACSPlus notation **FDA plus()** are to be applied. The appraisal may be made based upon a specific trading pattern, which is to be expressed in terms of either a Worldwide trading route, as defined in the relevant ACSPlus Guidelines, or a North Atlantic trading route (that utilises the wave data from IACS Recommendation 34). The ACSPlus notation **FDA plus()** is to be followed by the number of years that the vessel has been assessed for the specific trading pattern shown in brackets, for either the Worldwide or North Atlantic trading routes, denoted by **WW**and **NA** respectively, e.g. **FDA plus(25, NA)**. This Guideline is applicable to all ships including those built in accordance with the IACS Common Structural rules.

4. 1. 3 Where an appraisal is requested for the fatigue performance of the hull structure when navigating through ice, the relevant ACSPlus FDA ICE Guidelines are to be applied. Where the relevant Guidelines have been applied the ACSPlus notation **FDA ICE** will be assigned, *See also* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.17.

4. 1. 4 Where specified in the Rules an appraisal is to be made of the fatigue performance of the hull structure taking into account of the effects due to the continuous vibrational response of the hull girder in waves (springing) in accordance with the relevant ACSPlus Guidelines. Where the relevant Guidelines have been applied the ACSPlus notation **FDA SPR** will be assigned, *See also* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.17.

PART

3

CHAPTER 16 **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**

SECTION 5 **Whipping design assessment**

5. 1 Whipping Design Assessment notations – WDA1 and WDA2

5. 1. 1 Where specified in the Rules an appraisal is to be made of the dynamic response of the hull structure due to wave impact loads (Whipping) in accordance with the relevant ACSPlus Guidelines. Where the relevant Guidelines have been applied the ACSPlus notation Whipping Design Assessment Level 1 **WDA1** will be assigned, *See also* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.17.

5. 1. 2 Where specified in the Rules an appraisal is to be made of the dynamic response of the hull structure due to wave impact loads (Whipping) in accordance with the relevant ACSPlus Guidelines. Where the relevant Guidelines have been applied the ACSPlus notation Whipping Design Assessment Level 2**WDA2** will be assigned, *See also* Pt 1, Ch 2, 2.3 Class notations (hull).

PART

3

CHAPTER **16** **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**

SECTION **6** **Ship Event Analysis**

6. 1 Ship Event Analysis

6. 1. 1 At the Owner's request and in order to enhance safety and awareness on board during ship operation, the *ACSPlus Ship Event Analysis Guideline* applies to all ships where it is intended to provide a hull surveillance system for:

a. Monitoring of the ship's hull girder stresses and motions, and warning the ship's personnel that these stress levels or the frequency and magnitude of slamming motions are approaching a level where corrective action is advisable.

b. Monitoring of the ship's hull girder stresses and local ice loads when the ship is navigating in ice, and warning the ship's personnel that the load levels or the frequency and magnitude of ice impacts are approaching a level where corrective action is advisable.
The descriptive note is to be appended by HSS followed by the number of strain gauges fitted shown in brackets. In addition the extension of one or more of the following associated supplementary characters may be shown, e.g. **ACSPlus(SEA(HSS-2,VDR))**:

- **L** The display of the relevant information in the cargo control area;
- **M** The display and recording of the ship's motion;
- **N** The facility to display and record navigational information;
- **VDR** An interface with the ship's voyage data recorder system to enable the recording of hull stress, ship motion and hull pressure information.

PART

3

CHAPTER **16** **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**

SECTION **7** **Enhanced scantlings**

7. 1 Enhanced Scantlings - Descriptive note ES

7. 1. 1 Where scantlings in excess of the approved Rule minimum are fitted at defined locations, a descriptive note **ES**, Enhanced Scantlings. For example, the note **ES+1** will indicate that an extra 1 mm has been fitted to the hull envelope plating (i.e. deck, side and bottom).

PART

3

CHAPTER **16** **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**

SECTION **8** **Corrosion protection of internal tanks and spaces**

8. 1 Protective coating systems in dedicated sea-water ballast tanks and double-side skin spaces – ACSPlus Notations AS(B) or AS(B,D)

8. 1. 1 For ships that are required to comply with IMO *Resolution MSC.215(82) - Performance Standard for Protective Coatings for Dedicated Seawater Ballast Tanks in all Types of Ships and Double-Side Skin Spaces of Bulk Carriers - (Adopted on 8 December 2006)*, all dedicated sea-water ballast tanks for all ship types and double-side skin spaces of bulk carriers are to have type approved coating systems applied in accordance with ACSPlus Guideline *Anti-Corrosion Systems Notation*, *See* Ch 15 Corrosion Prevention of the Rules for Materials and Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.17 for the list of ACSPlus AS notations.

8. 1. 2 **AS(B)** or **AS(B,D)** notations indicate that the ship's sea water ballast tanks and double-side skin spaces of bulk carriers are coated with approved coating systems according to IMO *Resolution MSC.215(82) - Performance Standard for Protective Coatings for Dedicated Seawater Ballast Tanks in all Types of Ships and Double-Side Skin Spaces of Bulk Carriers - (Adopted on 8 December 2006)*.

8. 2 Protective coating systems in the cargo oil tanks of crude oil tankers – ACSPlus Notation AS(C)

8. 2. 1 For ships that are required to comply with IMO *Resolution MSC.291(87) – Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as Amended – (Adopted on 21 May 2010)* , Owners may request to receive the optional notation **AS(C)**, which indicates that the cargo oil tanks are protected in compliance with IMO *Resolution MSC.288(87) – Performance Standard for Protective Coatings for Cargo Oil Tanks of Crude Oil Tankers – (Adopted on 14 May 2010)* , and are to have type approved coating systems applied in accordance with ACSPlus Guideline *Anti-Corrosion System Notation* and Ch 15 Corrosion Prevention of the Rules for Materials.

8. 2. 2 **AS(C)** notation indicates that the ship's cargo oil tanks are protected using approved materials in accordance with IMO *Resolution MSC.291(87) – Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as Amended – (Adopted on 21 May 2010)* .

8. 2. 3 When in compliance with IMO *Resolution MSC.291(87) – Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as Amended – (Adopted on 21 May 2010)* , but the **AS(C)** notation is not requested, this compliance may be indicated on the applicable certification, Ch 15 Corrosion Prevention of the Rules for Materials.

8. 3 Alternative means of corrosion protection for cargo oil tanks of crude oil tankers – ACSPlus notation AS(C*)

8. 3. 1 For ships that are required to comply with the IMO *Resolution MSC.291(87) – Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as Amended – (Adopted on 21 May 2010)* , as amended, Owners may request to receive the optional notation **AS(C*)**, which indicates that all cargo tanks are protected in accordance with IMO *Resolution MSC.289(87) – Performance Standard for Alternative Means of Corrosion Protection for Cargo Oil Tanks of Crude Oil Tankers – (Adopted on 14 May 2010)* , by application of corrosion resistant steel, *See*Ch 3, 1.3 Corrosion resistant steels for cargo oil tanks of crude oil tankers of the Rules for Materials and ACSPlus Guideline *Anti-Corrosion System Notation*.

8. 3. 2 **AS(C*)** notation indicates that the ship's cargo oil tanks are protected using approved materials in accordance with IMO *Resolution MSC.291(87) – Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as Amended – (Adopted on 21 May 2010)* , as amended.

8. 3. 3 When in compliance with IMO *Resolution MSC.291(87) – Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as Amended – (Adopted on 21 May 2010)* , but the **AS(C*)** notation is not requested, this compliance may be indicated on the applicable certificate.

8. 4 Protective coatings for void spaces on bulk carriers and oil tankers – ACSPlus Notation AS(V)

8. 4. 1 For ships within the scope of IMO *Resolution MSC.244(83) - Adoption of Performance Standard for Protective Coatings for Void Spaces on Bulk Carriers and Oil Tankers - (Adopted on 5 October 2007)*, Owners may request to receive the optional notation **AS(V)**, which indicates that the void spaces are protected according to the *ACSPlus Guideline Anti- Corrosion System Notation*.

8. 4. 2 **AS(V)** notation indicates that the ship's void spaces are protected in accordance with IMO *Resolution MSC.244(83) - Adoption of Performance Standard for Protective Coatings for Void Spaces on Bulk Carriers and Oil Tankers - (Adopted on 5 October 2007)*.

8. 4. 3 When in compliance with IMO *Resolution MSC.244(83) - Adoption of Performance Standard for Protective Coatings for Void Spaces on Bulk Carriers and Oil Tankers - (Adopted on 5 October 2007)*, but the **AS(V)** notation is not requested, this compliance may be indicated on the applicable certificate.

8. 5 Protective coating systems in dedicated seawater ballast tanks – Descriptive note PCWBT ()

8. 5. 1 For ships that are not required to comply with IMO *Resolution MSC.215(82) - Performance Standard for Protective Coatings for Dedicated Seawater Ballast Tanks in all Types of Ships and Double-Side Skin Spaces of Bulk Carriers - (Adopted on 8 December 2006)* , all sea-water ballast spaces having boundaries formed by the hull envelope are to have a corrosion protection coating applied, *See* ACSPlus Guideline *Protective Coatings in Water Ballast Tanks (PCWBT)*. The month and year that the coating is approved is to be appended to the descriptive note within brackets.

8. 5. 2 Where requested, a descriptive note **PCWBT ()** (Protective Coating in Water Ballast Tanks) indicates that all sea-water ballast spaces having boundaries formed by the hull envelope have a corrosion protection coating applied, and that the coating remains efficient and is maintained in good condition. The month and year that the coating is approved is to be appended to the descriptive note within brackets.

CHAPTER **16** **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**

SECTION **9** **Ship Emergency Response Service**

9. 1 Ship Emergency Response Service - Descriptive note SERS

9. 1. 1 This service, offered by ACS, provides a rapid computer assisted analysis of a damaged ship's stability and damaged longitudinal strength in the event of a casualty to the ship.

9. 1. 2 Where an Owner adopts this service, the descriptive note **SERS**, `Ship is registered with ACS Ship Emergency Response Service', will be assigned.

CHAPTER **16** **ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships**

SECTION **10** **Assessment of Ballast Water Management Plans**

10. 1 Ballast Water Management Plan – Descriptive note BWMP

10. 1. 1 Compliance with this Guideline is optional. A ship meeting the requirements of this Guideline will be eligible for an appropriate **BWMP ()** descriptive note. The extension of one or more of the following associated supplementary characters may be shown in brackets, detailing the method(s) used:

- **S** Sequential method
- **F** Flow through method
- **D** Dilution method
- **T** Treatment method.

CHAPTER 1 General Cargo Ships

SECTION 1 General

1. 1 Application

1. 1. 1 This Chapter applies to sea-going ships designed primarily for the carriage of general cargo. The requirements are intended to cover the midship region, but may also apply with suitable modification to the taper regions forward and aft in way of cargo spaces.

1. 2 Structural configuration

1. 2. 1 The Rules provide for a basic structural configuration of a multi-deck or a single deck hull which includes a double bottom, or a single bottom arrangement. The structural configuration may also include a single or multiple arrangement of cargo hatch openings, and side tanks.

1. 2. 2 Individual consideration may be required where the ship incorporates double hull construction, large deck openings or other special design features.

1. 2. 3 Longitudinal framing is, in general, to be adopted at the strength deck outside line of openings and at the bottom, but special consideration will be given to proposals for transverse framing in these regions.

1. 3 Class notations

1. 3. 1 In general, ships complying with the requirements of this Chapter will be eligible to be classed **100A1**.

1. 3. 2 Where a ship has been specially strengthened for heavy cargoes in accordance with the requirements listed in Pt 4, Ch 7, 8.2 Carriage of heavy cargoes, it will be eligible to be classed **100A1 strengthened for heavy cargoes**.

1. 3. 3 The following additional notations and annotations can be appended to the main class notation giving further detailed description of the loading criteria incorporated into the design:

a. **RD** (Relative density):
Where a ship has tanks appraised for a maximum permissible relative density greater than 1.025, the notation **RD(specified tank names, density)** may be added.

b. **WDL(+)** (Weather deck load):
The notation **WDL(+)** may be added. If requested, the maximum permissible weather deck load and extent can be identified in the notation, e.g. **WDL(5.0 t/m^2 from Aft to Fr. 26)** .

1. 3. 4 Ships intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.6 to 2.3.10, will receive individual consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval.

1. 3. 5 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 Classification Regulations, to which reference should be made.

1. 4 Information required

1. 4. 1 For the information required, *See* Pt 3, Ch 1, 5 Information required. In addition the following are to be supplied:

a. Cargo loadings on decks, hatchways and inner bottom if these are to be in excess of Rule. Where concentrated or point loads occur, their magnitude and points of application are to be defined.

b. The maximum pressure head in service on tanks, also details of any double bottom tanks interconnected with side tanks.

c. Details of the proposed depths of any partial fillings where water ballast or liquid cargo is intended to be carried in the holds, or large deep tanks.

1. 5 Symbols and definitions

1. 5. 1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

L, B, D, T and V	=	as defined in Pt 3, Ch 1, 6 Definitions
k_L, k	=	higher tensile steel factor, *See* Pt 3, Ch 2, 1 Materials of construction
e	=	base of natural logarithms 2.7183
l	=	overall length of stiffening member, or pillar, in metres, *See* Pt 3, Ch 3, 3 Structural idealisation
l_e	=	effective length of stiffening member, or pillar, in metres, *See* Pt 3, Ch 3, 3 Structural idealisation
t	=	thickness of plating, in mm
s	=	spacing of secondary stiffeners, in mm
A	=	cross-sectional area of stiffening member, in cm^2
C	=	stowage rate, in m^3/tonne, *See* Pt 3, Ch 3, 5 Design loading
C_w	=	a wave head in metres
	=	$7.71 \times 10^{-2} L e^{-0.0044}$ L where L is not to be taken greater than 227
I	=	inertia of stiffening member, in cm^4, *See* Pt 3, Ch 3, 3 Structural idealisation
S	=	spacing or mean spacing of primary members, in metres
Z	=	section modulus of stiffening member, in cm^3, *See* Pt 3, Ch 3, 3 Structural idealisation
ρ	=	relative density (specific gravity) of liquid carried in a tank but is not to be taken less than 1.025.

PART

4

CHAPTER **1** **General Cargo Ships**

SECTION **2** **Materials and protection**

2. 1 Materials and grades of steel

2. 1. 1 Materials and grades of steel are to comply with the requirements of Pt 3, Ch 2 Materials.

2. 2 Protection of steelwork

2. 2. 1 For the protection of steelwork, in addition to the requirements specified in Pt 3, Ch 2, 3 Corrosion protection the requirements of Pt 4, Ch 1, 2.2 Protection of steelwork 2.2.2 are to be complied with.

2. 2. 2 Ceiling is to be laid on the inner bottom under cargo hatchways, but may be omitted provided that the inner bottom plating is increased by 2 mm. In any ship which is regularly to be discharged by grabs, ceiling is to be laid on the inner bottom, and the inner bottom plating increased by 3 mm. Alternatively, the ceiling may be omitted provided that the inner bottom plating is increased in thickness by a minimum of 5 mm. The ceiling is to be 76 mm thick in softwood or 65 mm thick in hardwood, and is to be laid at right angles to the inner bottom stiffening. Where it is intended to use plywood or other forms of ceiling of an approved type instead of planking, the thickness will be considered for each case. Ceiling is also to be laid over bilges, and fitted with portable sections which are to be readily removable. The spaces between the frames at the top of the bilge ceiling are to be closed by steel plates, wood chocks, cement or other suitable means. Inner bottom manhole covers or fittings, where projecting above the inner bottom plating, are to be provided with a steel protection coaming around each manhole, and a wood or steel cover is to be fitted.

2. 2. 3 Where plated decks are sheathed with wood or approved compositions, the minimum thicknesses given in Pt 4, Ch 1, 4.2 Deck plating, Pt 3, Ch 5, 2 Deck structure and Pt 3, Ch 6, 2 Deck structure may be reduced by 10 per cent for a 50 mm sheathing thickness or five per cent for 25 mm, with intermediate values in proportion. The steel deck is to be coated with a suitable material in order to prevent corrosive action, and the sheathing or composition is to be effectively secured to the deck. *See also* the fire protection requirements relating to deck coverings in the relevant *SOLAS - International Convention for the Safety of Life at Sea* Regulations or Pt 6, Ch 3, 4 Refrigeration plant, pipes, valves and fittings as applicable.

2. 2. 4 Where cargo battens or equivalent are fitted in the holds of dry cargo ships, the descriptive note `SF' *(Sparring Fitted)* will be entered in the *Register Book.* The battens, when fitted, are to extend from above the upper part of the bilge to the underside of beam knees in the holds, and in all cargo spaces in the 'tween decks and superstructures, up to the underside of beam knees. Wood cargo battens are to be not less than 50 mm in thickness, and the clear space between adjacent rows is, in general, not to exceed 230 mm. The dimensions and spacing of battens made of other materials will be considered. Nets may be adopted in lieu of battens, and other alternative proposals will be specially considered. For arrangements in way of a refrigerated hold, *See* Pt 6, Ch 3, 4 Refrigeration plant, pipes, valves and fittings.

PART

4

CHAPTER 1 General Cargo Ships

SECTION 3 Longitudinal strength

3. 1 General

3. 1. 1 Longitudinal strength calculations are to be made in accordance with the requirements given in Pt 3, Ch 4 Longitudinal Strength.

3. 1. 2 The requirements of Pt 3, Ch 4, 8.3 Loading instrument regarding loading instruments are not applicable to general cargo ships under 120 m.

3. 2 Fast cargo ships

3. 2. 1 The hull section modulus for ships of length, L, between 120 m, and 170 m, and maximum service speed greater than 17.5 knots in association with a bow shape factor, ψ, of more than 0.15, is to comply with the requirements of this sub-Section.

3. 2. 2 The bow shape factor is defined as:

$$\psi = \frac{100\sum A_b}{L^{1.5}B}$$

Where

a_0 = projection of upper deck at waterline (F.P.), in metres

a_1 = projection of upper deck at waterline ($0.1L$ from F.P.), in metres

a_2 = projection of upper deck at waterline ($0.2L$ from F.P.), in metres

b = projection of upper deck at waterline (F.P. to bow line), in metres

$$\sum A_b = \frac{ba_0}{2} + 0.1L(a_1 + a_2)$$

See also Figure 1. 3. 1: Derivation of bow shape factor.

3. 2. 3 For longitudinal strength requirements, the Rule minimum hull midship section modulus and the distribution of longitudinal material in the forward half-length will be considered. In general, the following requirements are to be complied with:

a. The vertical hull midship section modulus, about the horizontal neutral axis, at deck is to be not less than $331Lk\Sigma A_b$ cm^3, or that required by Pt 3, Ch 4, 5 Hull bending strength, whichever is the greater. $\sum A_b$ is defined in Pt 4, Ch 1, 3.2 Fast cargo ships 3.2.2.

b. The horizontal hull midship section modulus, about a vertical axis through the ship centreline, is to be not less than $32.5L^2D$ cm^3.

c. In the forward half-length, the hull section modulus is not to be a lesser percentage of the midship value than that shown in Table 1. 3. 1: Fast cargo ships.

d. Any load or ballast condition resulting in a sagging still water bending moment, or a hogging moment less than 80 per cent of the Rule value of still water bending moment, will be specially considered with a view to minimising the compressive stresses in the deck in waves.

Figure 1. 3. 1: Derivation of bow shape factor

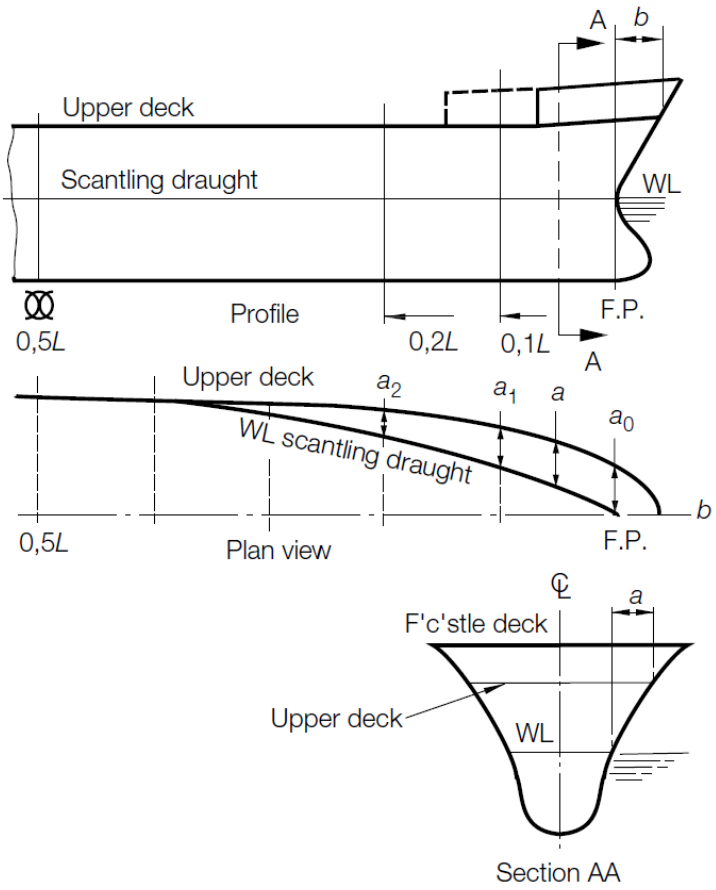

Table 1. 3. 1: Fast cargo ships

Position	Percentage of midship vertical modulus(modulus about horizontal axis)	Percentage of midship horizontal modulus(modulus about vertical axis)
Station 10 (mid-L_{pp})	100	100
12	98	87
14	95	62
16	81	38
18	44	17
20 (F.P.)	0	0

Note *1.* Intermediate values to be obtained by interpolation.

Note *2.* L_{pp} as defined in Pt 3, Ch 1, 6 Definitions.

3. 2. 4 For local strength, in general the following requirements are to be complied with:

a. Longitudinal deck stiffening is to be carried forward to the fore peak bulkhead or as far forward as practical. Where a long forecastle is fitted, the buckling strength of the proposed structure will be specially considered.

b. Substantial web frames in way of deck transverses are to be fitted in the forward half-length. Scantlings of webs and frames are to be based on actual lengths, not 'tween deck heights, and collars are to be fitted at ends of members in way of high shear.

c. Scantlings of bottom structure in forward part are to be specially considered.

d. Deck and side shell panels forward of 0.5*L* from F.P. are to be examined to establish the critical buckling stress from the following formula:

$$\sigma_\varepsilon = \frac{\pi^2 E}{12(1-v^2)}\left(\frac{t}{s}\right)^2 K_c N/mm^2$$

Where

s = length of shorter edge, in mm

t = thickness of plating, in mm

E = Young's modulus, in N/mm^2

K_c = a factor depending on aspect ratio and boundary restraint

= 4 for longitudinally stiffened plating or as shown in Figure 1. 3. 2: Plate factor, KC for transversely stiffened plating

ν = Poisson's ratio (0.3 for steel and aluminium alloy).

Where the buckling stresses, as evaluated, exceed 50 per cent of yield stress, the actual critical buckling stress is given by:

$$\sigma_{ac} = \sigma_0\left(1 - \frac{\sigma_0}{4\sigma_c}\right) \text{N/mm}^2$$

Where

σ_{ac} = corrected critical buckling stress, in N/mm^2

σ_o = yield stress, in N/mm^2

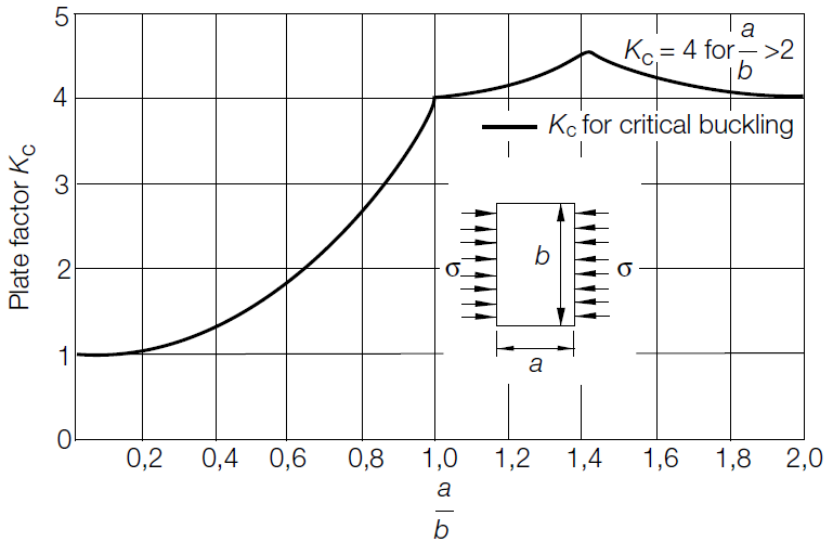
The critical buckling stress from the above formulae must be not less than 176.6 N/mm^2 within 0.4*L* amidships, nor less than 147.2 N/mm^2 for the deck forward of this, nor less than 117.7 N/mm^2 for the side shell between the first and second deck forward of 0.5*L* from F.P. For higher tensile steel plating, the above permissible stresses are to be divided by *k*.

e. In order to obtain the necessary critical buckling strength, either of the following is to be applied:

i. plate thickness to be increased, or

ii. panel aspect ratio to be altered by the fitting of additional panel stiffening.

Figure 1. 3. 2: Plate factor, K_C



PART

4

CHAPTER **1** **General Cargo Ships**

SECTION **4** **Deck structure**

4. 1 General

4. 1. 1 Longitudinal framing is, in general, to be adopted at the strength deck outside line of openings, but special consideration will be given to proposals for transverse framing. Requirements are given in this Section for longitudinal and transverse framing systems of all deck structure, except decks in way of erections. For erection decks, *See* Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks.

4. 2 Deck plating

4. 2. 1 The thickness of strength/weather deck plating in the midship region is to comply with the requirements of Table 1. 4. 1: Strength/weather deck plating. Outside the line of openings the thickness is also to be that necessary to give the hull section modulus required by Pt 3, Ch 4, 5 Hull bending strength.

4. 2. 2 The thickness of lower deck plating in the midship region is to comply with the requirements of Table 1. 4. 2: Lower deck plating.

4. 2. 3 The thickness of the strength deck stringer plate is to be increased by 20 per cent at the ends of bridges, poop and forecastle.

4. 2. 4 The deck plating thickness and supporting structure are to be suitably reinforced in way of cranes, masts, derrick posts and deck machinery.

4. 2. 5 Where long, wide hatchways are arranged on lower decks, it may be necessary to increase the deck plating thickness to ensure effective support for side framing.

4. 3 Deck stiffening

4. 3. 1 The scantlings of strength/weather deck longitudinals in the midship region are to comply with the requirements of Table 1. 4. 3: Strength/weather deck longitudinals.

4. 3. 2 The lateral and torsional stability of longitudinals together with web and flange buckling criteria are to be verified in accordance with Pt 3, Ch 4, 7 Hull buckling strength.

4. 3. 3 The scantlings of cargo and accommodation deck longitudinals are to comply with the requirements of Table 1. 4. 4: Cargo and accommodation deck longitudinals.

4. 3. 4 End connection of longitudinals to bulkheads are to provide adequate fixity and, so far as is practicable, direct continuity of longitudinal strength. Where L exceeds 215 m, the deck longitudinals are to be continuous through transverse structure, including bulkheads, but alternative arrangements will be considered. Higher tensile steel deck longitudinals are to be continuous irrespective of the ship length.

4. 3. 5 The scantlings of strength/weather, cargo and accommodation deck transverse beams are to comply with the requirements of Table 1. 4. 5: Strength/weather, cargo and accommodation deck beams.

4. 3. 6 The end connections of beams are to be in accordance with the requirements of Pt 3, Ch 10, 3 Secondary member end connections.

Table 1. 4. 1: Strength/weather deck plating

Location	Minimum thickness, in mm	
	Longitudinal framing	Transverse framing
(1) Outside line of openings (*See* Notes 1 and 2)	The greater of the following: (a) $t = 0.001_{s1}(0.059L_1 + 7)\sqrt{\frac{F_D}{k_L}}$ (b) $t = 0.00083_{s1}\sqrt{LK} + 2.5$	The greater of the following: (a) $t = 0.001_{s1}f_1(0.083L_1 + 10)\sqrt{\frac{F_D}{k_L}}$ (b) $t = 0.001_{s1}\sqrt{LK} + 2.5$
(2) Inside line of openings (*See* Note 2)	(b) $t = 0.00083_{s1}\sqrt{LK} + 2.5$ but not less than 6.5	$t = 0.00083_{s1}\sqrt{LK} + 1.5$ but not less than 6.5
(3) In way of the crown of a tank	$t = 0.004sf\sqrt{\frac{pkh_4}{1.025}} + 3.5$ or as (1) or (2), whichever is the greater, but not less than 7.5 mm where $L \geq 90$m, or 6.5 mm where $L < 90$ m	

Symbols

L, k_L, k, ρ, s, S as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

f = $1.1 - \frac{s}{2500}$ but not to be taken greater than 1.0

f_1 = $\frac{1}{1 + \left(\frac{s}{1000S}\right)^2}$

h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

s_1 = s but is not to be taken less than the smaller of $470 + \frac{L}{0.6}$ mm or 700 mm

F_D = as defined in Pt 3, Ch 4, 5.7 Local reduction factors

L_1 = L but need not be taken greater than 190 m.

Note *1.* The thickness derived in accordance with (1) is also to satisfy the buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength.

Note *2.* The deck thickness is to be not less than the basic deck end thickness for taper as given in Pt 3, Ch 3 Structural Design, Table 3. 2. 1: Taper requirements for hull envelope

Table 1. 4. 2: Lower deck plating

Location	Minimum thickness, in mm	
	Second deck	Third or platform decks
(1) Outside line of openings	$t = 0.012_{s1}\sqrt{k}$ but not less than 6.5	$t = 0.01_{s1}\sqrt{k}$ but not less than 6.5

(2) Inside line of openings	t=0.01$s_1\sqrt{k}$ but not less than 6.5
(3) In way of the crown or bottom of a tank	$t = 0.004sf\sqrt{\frac{\rho kh_4}{1.025}} + K_1$ but not less than 7.5 where L≥90 m, or 6.5 where L<90 m
(4) Plating forming the upper flange of underdeck girders	Clear of deck openings, $t=\sqrt{\frac{A_f}{1.8k}}$ In way of deck openings, t=1.1$\sqrt{\frac{A_f}{1.8k}}$ Minimum breadth, b = 760 mm
Symbols	
s, S, k, ρ, as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1 b = breadth of increased plating, in mm f = 1.1 – $\frac{s}{25005}$ but not to be taken greater than 1.0 h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading s_1 = s but is not to be taken less than the smaller of 470 + $\frac{L}{0.6}$ mm or 700 mm A_f = girder face area, in cm^2 K_1 = 2.5 mm at bottom of tank. = 2.5 mm at bottom of tank = 3.5 mm at crown of tank **Note** Where a deck loading exceeds 43.2kN/m^2(4.4 tonne-f /m^2), the thickness of plating will be specially considered.	

Table 1. 4. 3: Strength/weather deck longitudinals

Location	Modulus, in cm^3	Inertia, in cm^4
(1) In way of dry cargo spaces, *See* Note 1		
(a) Outside line of openings	$Z = 0.043skh_{T1}le^2F_1$	—
(b) Inside line of openings	$Z = sk(400h_1 + 0.005(l_eL_2)^2 \times 10^{-4}$	—
(2) In way of the crown or bottom of a tank	$Z = \frac{0.0113\rho skh_4l_e^2}{b}$ or as (1)(a) or (1)(b) above, whichever is the greater	$I = \frac{2.3}{k}l_eZ$
(3) In way of superstructure	To be specially considered	—
Symbols		

L, s, k_L, k, ρ as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

b = 1.4 for rolled or built sections

= 1.6 for flat bars

c_1 = $\frac{60}{225 - 165F_D}$

d_w = depth of longitudinal, in mm

F_1 = $0.25c_1$

h_1 = weather head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

l_e = as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1, but not to be taken less than 1.5 m

F_D = as defined in Pt 3, Ch 4, 5.7 Local reduction factors

h_{T1} = $\frac{L_1}{56}$ for Type `B-60' ships

= the greater of $\frac{L_1}{70}$ or 1.20 m for Type `B' ships

L_1 = L but need not be taken greater than 190 m

L_2 = L but need not be taken greater than 215 m

Note *1.* Where weather decks are intended to carry deck cargo and the load is in excess of 8.5 kN/m^2 (0.865 tonne-f/m^2), the scantlings of longitudinals may be required to be increased to comply with the requirements for location (1) Table 1. 4. 4: Cargo and accommodation deck longitudinals using the equivalent design head, for specified cargo loading, for weather decks given in Table 3. 5. 1: Design heads and permissible cargo loadings in Pt 3, Ch 3 Structural Design .

Note *2.* The buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength are to be complied with. The ratio of the web depth d_w to web thickness t is to comply with the following requirements: (a)Built up profiles and rolled angles:

$\frac{d_w}{t} \leq 60\sqrt{k_L}$ Flat bars:

$\frac{d_w}{t} \leq 18\sqrt{k_L}$ when continuous at bulkheads

$\frac{d_w}{t} \leq 15\sqrt{k_L}$ when non-continuous at bulkheads

Note *3.* The web depth of longitudinals, d_w is to be not less than 60 mm.

Table 1. 4. 4: Cargo and accommodation deck longitudinals

Location	Modulus, in cm^3	Inertia, in cm^4
(1) Cargo decks		
(a) L ≥ 90 m	$Z = sk\ (5.9\ L_1 + 25\ h_2 le^2) \times 10^{-4}$	—
(b) L < 90 m	$Z = 0.005skh_2le^2$	—
(2) Accommodation decks		
(a) L ≥ 90 m	$Z = sk(5.1L_1 + 25h_3l_e^2) \times 10^{-4}$	—
(b) L < 90 m	$Z = 0.00425skh_3l_e^2$ *See* Note 1	—

(3) In way of the crown or bottom of a tank	As in (1) or (2) as applicable, or $Z = \frac{0.0113\rho skh_4 l_e^2}{\gamma}$ whichever is the greater	$I = \frac{2.3}{k} l_e Z$

Symbols

L, s, k, ρ as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

d_w = web depth of longitudinal, in mm, *See* Note 2

h_2 = cargo head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

h_3 = accommodation head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

l_e = as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1, but not to be taken less than 1.5 m

L_1 = *L* but need not be taken greater than 190 m

γ = 1.4 for rolled or built sections

= 1.6 for flat bars

Note *1.* The section modulus of accommodation deck longitudinals need not be taken greater than the value required by location (1)(a), in Table 1. 4. 3: Strength/weather deck longitudinals.

Note *2.* The web depth of longitudinals, d_w, to be not less than 60 mm.

Table 1. 4. 5: Strength/weather, cargo and accommodation deck beams

Location	Modulus, in cm^3	Inertia, in cm^4
(1) Strength/weather decks	The lesser of the following: a) $Z = (K_1K_2TD + K_3B_1sh_1le^2)k \times 10^4$ (b) $Z = 2K_3B_1skh_1le^2 \times 10^{-4}$	—
(2) Cargo decks	$Z = (400K_1TD + 38.8sh_2l_e^2)k \times 10^{-4}$	—
(3) Accommodation decks	$Z = (530K_1TD + 38.8\text{sh } 3l_e^2)k \times 10^{-4}$	—
(4) In way of the crown or bottom of a tank	As (1), (2) or (3) as applicable, or $Z = \frac{0.0113\text{ps}kh_4 l_{2_e}}{\gamma}$ whichever is the greater	$I = \frac{2.3}{k} l_e Z$
Symbols		

B, D, T, s, k, ρ as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

d_w = depth of beam, in mm

h_1 = weather deck head in metres, *See* Pt 3, Ch 3, 5 Design loading

h_2 = cargo head in metres, *See* Pt 3, Ch 3, 5 Design loading

h_3 = accommodation head in metres, *See* Pt 3, Ch 3, 5 Design loading

h_4 = tank head in metres, *See* Pt 3, Ch 3, 5 Design loading

l_e as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1, but to be taken as not less than 1.83 m

B_1 = B, but need not be taken greater than 21.5 m

K_1 = a factor dependent on the number of decks (including poop and bridge superstructures) at the position of the beam under consideration:

= 1 deck 20.0

= 2 decks 13.3

= 3 decks 10.5

= 4 or more 9.3

K_2 a factor dependent on the location of the beam:

= at short bridge and poops 133

= elsewhere 530

K_3 a factor dependent on the location of the beam:

= elsewhere 3.3

= span adjacent to the ship side 3.6

γ 1.4 for rolled or built sections

= 1.6 for flat bars

Note *1.* Where weather decks are intended to carry deck cargo and the load is in excess of 8.5 kN/m^2, the scantlings of beams may be required to be increased to comply with the requirements for location (2) using the equivalent design head, for specified cargo loading, for weather decks given in Table 3. 5. 1: Design heads and permissible cargo loadings.

Note *2.* The web depth of beams, d_w, is to be not less than 60 mm.

4. 4 Deck supporting structure

4. 4. 1 **Girders and transverses** supporting deck longitudinals and beams, also hatch side girders and hatch end beams, are to comply with the requirements of Table 1. 4. 6: Deck girders, transverses and hatch beams. In general, transverses, webs or frames of increased scantlings, *See* Table 1. 6. 3: Shell framing (transverse), are to be arranged in way of hatch end beams and deck transverses, and these are to be in line with the double bottom floors where practicable. Equivalent transverse ring scantling arrangements will be considered.

4. 4. 2 **Transverses** supporting deck longitudinals are, in general, to be spaced not more than 3.8 m apart where the length, L, is 100 m or less, and $(0.006L + 3.2)$m apart where L is greater than 100 m.

4. 4. 3 The web thickness, stiffening arrangements and end connection of primary supporting members are to be in accordance with Pt 3, Ch 10, 4 Construction details for primary members.

4. 4. 4 Where a girder is subject to concentrated loads, such as pillars out of line, the scantlings are to be suitably increased. Also, where concentrations of loading on one side of the girder may occur, the girder is to be adequately stiffened against torsion. Reinforcements may be required in way of localised areas of high stress.

4. 4. 5 **Pillars** are to comply with the requirements of Table 1. 4. 7: Pillars.

4. 4. 6 Pillars are to be fitted in the same vertical line wherever possible, and effective arrangements are to be made to distribute the load at the heads and heels of all pillars. Where pillars support eccentric loads, they are to be strengthened for the additional bending moment imposed upon them.

4. 4. 7 Tubular and hollow square pillars are to be attached at their heads to plates supported by efficient brackets, in order to transmit the load effectively. Doubling or insert plates are to be fitted to the inner bottom under the heels of tubular or hollow square pillars, and to decks under large pillars. The pillars are to have a bearing fit and are to be attached to the head and heel plates by continuous welding. At the heads and heels of pillars built of rolled sections, the load is to be well distributed by means of longitudinal and transverse brackets.

4. 4. 8 In double bottoms under widely spaced pillars, the connections of the floors to the girders, and of the floors and girders to the inner bottom, are to be suitably increased. Where pillars are not directly above the intersection of plate floors and girders, partial floors and intercostals are to be fitted as necessary to support the pillars. Manholes are not to be cut in the floors and girders below the heels of pillars. Where longitudinal framing is adopted in the double bottom, equivalent stiffening under the heels of pillars is to be provided, and where the heels of pillars are carried on a tunnel, suitable arrangements are to be made to support the load.

4. 4. 9 Where pillars are fitted inside tanks or under watertight flats, the tensile stress in the pillar and its end connections is not to exceed 108 N/mm^2 at the test heads. In general, such pillars should be of built sections, and end brackets may be required.

4. 4. 10 Pillars are to be fitted below deckhouses, windlasses, winches, capstans and elsewhere where considered necessary.

4. 4. 11 **Non-watertight pillar bulkheads** are to comply with the requirements of Table 1. 4. 8: Non-watertight pillar bulkheads.

4. 4. 12 **Cantilevers** and their supporting frames are to comply with the requirements of Table 1. 4. 9: Cantilever beams.

4. 5 Deck openings

4. 5. 1 The corners of main cargo hatchways in the strength deck within 0.5L amidships are to be elliptical, parabolic or rounded, with a radius generally not less than $\frac{1}{24}$of the breadth of the opening. Rounded corners are to have a minimum radius of 300 mm if the deck plating extends inside the coaming, or 150 mm if the coamings are welded to the inner edge of the plating in the form of a spigot. Where elliptical corners are arranged, the major axis is to be fore and aft, the ratio of the major to minor axis is to be not less than 2 to 1 nor greater than 2.5 to 1, and the minimum half-length of the major axis is to be defined by l_1 in Figure 1. 4. 5: Elliptical and parabolic corners. Where parabolic corners are arranged, the dimensions are also to be as shown in Figure 1. 4. 5: Elliptical and parabolic corners.

4. 5. 2 Where the corners of large openings in the strength deck are parabolic or elliptical, insert plates are not required. For other shapes of corner, insert plates of the size and extent shown in Figure 1. 4. 6: Insert plates for large openings will, in general, be required. The required thickness of the insert plate is to be not less than 25 per cent greater than the adjacent deck thickness, outside line of openings with a minimum increase of 4 mm. The increase need not exceed 7 mm.

4. 5. 3 Welded attachments close to or on the free edge of the hatch corner plating are to be avoided (e.g. welded protection strips or shedder plates) and the butt welds of corner insert plates to the adjacent deck plating are to be located well clear of butts in the hatch coaming.

4. 5. 4 Openings in the strength deck outside the line of hatch openings are to be kept to the minimum number consistent with operational requirements. Openings are to be arranged clear of hatch corners and, so far as possible, clear of one another. Where, within 0.4L amidships, deck openings have a total breadth or shadow area breadth, in one transverse section that exceeds the limitation given in Pt 3, Ch 3, 3.4 Calculation of hull section modulus 3.4.6 and Pt 3, Ch 3, 3.4 Calculation

of hull section modulus 3.4.7, compensation will be required to restore the excess. This is generally to be arranged by increasing the deck plate thickness, but other proposals will be considered. Plate panels in which openings are cut are to be adequately stiffened, where necessary, against compression and shear buckling. The corners of all openings are to be well rounded and the edges smooth.

Table 1. 4. 6: Deck girders, transverses and hatch beams

Location and arrangements	Modulus, in cm^3	Inertia, in cm^4
(1) Girders and transverses in way of dry cargo spaces and clear of hatch openings:	*See also* Note	
(a) supporting up to three point loads	Z to be determined from calculations using Note and stress $\frac{123.5}{k}$N/mm^2 $\left(\frac{12.6}{\mathrm{k}}\mathrm{kgf/mm2}\right)$and assuming fixed ends.	$I = \frac{1.85}{k} l_e Z$
(b) supporting four or more point loads or a uniformly distributed load	$Z = 5.85\mathrm{kS_1Hg}l_e^2$	
(2) Hatch side girders in way of dry cargo spaces at weather decks (with deep coamings):		
(a) supporting up to three point loads	Z to be determined from calculations using Note and stress $\frac{100.4}{k}$N/mm^2 $\left(\frac{10.25}{\mathrm{k}}\mathrm{kgf}/mm^2\right)$ and assuming fixed ends	$I = \frac{2.3}{k} l_e Z$
(b) supporting four or more point loads or a uniformly distributed load	$Z = 5.85kS_1H_gl_e^2$	
(3) Hatch side girders in way of dry cargo spaces at lower decks (without deep coamings):		
(a) supporting up to three point loads	Z to be determined from calculations using stress$\left(\frac{112.5}{\mathrm{k}}\right)$ N/mm$^2\left(\frac{11.5}{\mathrm{k}}\mathrm{kgf}/mm^2\right)$	$I = \frac{2.8}{k} l_e Z$
(b) supporting four or more point loads or a uniformly distributed load	$Z = 5.20\mathrm{kS_1}H_gl_e^2$	
(4) Hatch end beams in way of dry cargo spaces and supported at centreline, *See* Figure 1. 4. 1: Hatch end beam arrangements:		
(a) In association with longitudinal framing when there is no transverse between the hatch end beam and adjacent transverse bulkhead or equivalent supporting structure	$Z = 19kK_1H_\mathrm{g}l_\mathrm{e}S_1l_1 + 2.37\mathrm{kS}_eH_\mathrm{g}l_\mathrm{e}^2$	

(b) In association with longitudinal framing where there is one or more transverse between the hatch end beam and adjacent transverse bulkhead or equivalent supporting structure	$Z = 19kK_1H_gl_e(S_1l_1 + S_2l_2)$	$I = \frac{2.8}{k} l_e Z$
(c) In association with transverse framing when the hatch end beam supports the hatch side girder and in line girder only	$Z = 19kK_1H_gl_e(S_1l_1 + S_3l_3)$	
(d) In association with transverse framing when the hatch end beam supports the hatch side girder, an in line girder and an additional girder between the hatch side and the centreline	$Z = 19kH_gl_e(K_1(S_1l_1 + S_4l_4) + K_2S_5l_5)$	
(5) Girders and transverses in way of the crown or bottom of a tank	$Z = 11.7\rho kh_4Sl_e^2$	$I = \frac{2.8}{k} l_e Z$

Symbols

S, l_e, k, ρ as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

l_1, l_2, l_3, l_4, l_5, in metres, as indicated in Figure 1. 4. 1: Hatch end beam arrangements

B_h = breadth of hatchway, in metres, as used to determine K_1

H_g = weather head h_1, or cargo head h_2, or accommodation head h_3, in metres, as defined in Pt 3, Ch 3, 5 Design loading, whichever is applicable

K_1, K_2 = factors, dependent on the girder arrangments, as follows:

$\frac{B_h}{2l_e}$ or $\frac{X}{l_e}$	K_1 or K_2
0.2	0.143
0.3	0.177
0.4	0.191
0.5	0.187
0.6	0.179
0.7	0.169
0.8	0.141
0.9	0.085
1.0	0.000

S_e, S_1, S_2, S_3, S_4, S_5, in metres as indicated in Figure 1. 4. 1: Hatch end beam arrangements

X = distance, in metres, from centreline of ship to an additional girder, if fitted, as shown inFigure 1. 4. 1: Hatch end beam arrangements, as used to determine K_2

Note In single deck ships the section modulus of deck transverses is to be increased by 15 per cent.

Table 1. 4. 7: Pillars

Symbols	Parameter	Requirement

b = breadth of side of a hollow rectangular pillar or breadth of flange or web of a built or rolled section, in mm d_p = mean diameter of tubular pillars, in mm	(1) Cross-sectional area of all types of pillar	$A_p = \frac{kP}{12.36 - 51.5\frac{l_e}{r\sqrt{k}}} cm^2$ *See* Note
k = local scantling higher tensile steel factor, *See* Pt 3, Ch 2, 1.2 Steel 1.2.3, but not less than 0.72 l= overall length of pillar, in metres l_e= effective length of pillar, in metres, and is taken as: for hold pillars 0.65l for 'tween deck pillars 0.80l l_p = distance, in metres, between centres of two adjacent spans of girders or transverses supported by the pillar.	(2) Minimum wall thickness of tubular pillars	The greater of the following: (a) $t = \frac{P}{d_p\left(0.392 - 1.53\frac{l_e}{r}\right)}$ mm (b) $t = \frac{d_p}{40}$ mm but not to be less than (c)t = 5.5 mm where L < 90 m, or = 7.5 mm where L ≥ 90 m
r = least radius of gyration of pillar cross-section, in mm, and may be taken as: $r = 10\sqrt{\frac{I}{A_p}}$ mm A_p = cross-sectional area of pillar, in cm^2 C, S as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1 H_g as defined in Table 1. 4. 6: Deck girders, transverses and hatch beams I = least moment of inertia of cross-section, in cm^4	(3) Minimum wall thickness of hollow rectangular pillars or web plate thickness of l or channel sections	The lesser of (b) and (c) and not to be less than (a): (a) $t = \frac{P}{b\left(0.5 - 1.95\frac{l_e}{r}\right)}$ mm (b) $t = \frac{br}{600l_e}$ mm (c) $t = \frac{b}{55}$ mm but to be not less than t = 5.5 mm where L < 90 m, or = 7.5 mm where L ≥ 90 m
P = load, in kN, supported by the pillar and is to be taken as $\frac{9.81SH_g l_p}{C} + P_a$ but not less than 19.62 kN	(4) Minimum thickness of flanges of angle or channel sections	The lesser of the following: (a) $t_f = \frac{br}{200l_e}$ mm (b) $t_f = \frac{b}{18}$ mm
P_a = load, in kN, from pillar or pillars above (zero if no pillars over)	(5) Minimum thickness of flanges of built or rolled I sections	The lesser of the following: (a) $t_f = \frac{br}{400l_e}$ mm (b) $t_f = \frac{b}{36}$ mm
Note As a first approximation A_p may be taken as $\frac{\sqrt{kP}}{9.32}$ and the radius of gyration estimated for a suitable section having this area. **Note** If the area calculated using this radius of gyration differs by more than 10 per cent from the first approximation, a further calculation using the radius of gyration corresponding to the mean area of the first and second approximation is to be made.		

4. 5. 5 Openings in the strength deck outside the line of hatch openings having a stress concentration factor in excess of 2.4 will require edge reinforcements in the form of a spigot of adequate

dimensions, but alternative arrangements will be considered. The area of any edge reinforcement which may be required is not to be taken into account in determining the required sectional area of compensation for the opening. Alternatively, the shape of the opening is to be such that a stress concentration factor of 2.4 is not exceeded. In this respect, reinforcement will not in general, be required in way of:

a. elliptical openings having their major axis fore and aft and a ratio of length to breadth not less than 2 to 1, or
b. openings of other shapes provided that it has been shown by suitable tests that the stress concentration factor does not exceed 2.4.

Table 1. 4. 8: Non-watertight pillar bulkheads

Parameter	Requirement	
	Ships with $L < 90$ m	Ships with $L \geq 90$ m
(1) Minimum thickness of bulkhead plating	5.5 mm in holds and 'tween decks	7.5 mm in holds
		6.5 mm in 'tween decks
(2) Maximum stiffener spacing	1500 mm	1500 mm
(3) Minimum depth of stiffeners or corrugations	100 mm in holds	150 mm in holds
	75 mm in 'tween decks	100 mm in 'tween decks
(4) Cross-sectional area (including plating) for rolled, built or swedged stiffeners supporting beams, longitudinals, girders or transverses	(a) Where $\frac{S}{t} \leq 80$ (b) Where $\frac{s}{t} \geq 120$ (c) Where $80 < \frac{S}{t} < 120$	$A=A_1$ $A=A_2$ A is obtained by interpolation between A_1 and A_2
(5) Cross-sectional area (including plating) for symmetrical corrugation	(a)Where $\frac{b}{t_p} \leq \frac{750\lambda l_e}{(\lambda+0.25)r}$ (b)Where $\frac{b}{t_p} > \frac{750\lambda l_e}{(\lambda+0.25)r}$	$A=A_1$ $A=A_2$

Symbols

d_w, t_p, b, c as defined in Pt 3, Ch 3, 3 Structural idealisation

r = radius of gyration, in mm, of stiffener and attached plating

= $10\sqrt{\frac{I}{A}}$ mm for rolled, built or swedged stiffeners

= $d_w\sqrt{\frac{3b+c}{12(b+c)}}$ mm for symmetrical corrugation

I = moment of inertia, in cm^4, of stiffener and attached plating

s = spacing of stiffeners, in mm

A = cross-sectional area, in cm^2, of stiffener and attached plating

$A_1 = \frac{P}{12.36 - 51.5\frac{l_e}{r}}$ cm^2

As a first approximation A_1 may be taken as

$\frac{P}{9.32}$

$A_2 = \frac{P}{4.9-14.7\frac{l_e}{r}} cm^2$

As a first approximation A_2 may be taken as

$\frac{P}{3.92}$

P, l_e as defined in Table 1. 4. 7: Pillars

$\lambda = \frac{b}{c}$

4. 5. 6 Lower deck openings should be kept clear of main hatch corners and the areas of high stress, so far as possible. Compensation will not, in general, be required unless the total width of openings in any frame space, or between any two transverses, exceeds $15k$ per cent of the original effective plating width. The requirements of Pt 4, Ch 1, 4.5 Deck openings 4.5.4 also apply to lower deck openings except that:

a. the thickness of inserts, if required, for the second deck hatch corners is to be 2.5 mm greater than the deck thickness,
b. inserts will not generally be required for hatch corners on third decks, platform decks and below, and
c. reinforcement will not generally be required for circular openings, provided that the plate panels in which they are situated are otherwise adequately stiffened against compression and shear buckling.

4. 5. 7 All openings are to be adequately framed; attention is to be paid to structural continuity, and abrupt changes of shape, section or plate thickness are to be avoided. Arrangements in way of corners and openings are to be such as to minimise the creation of stress concentrations. Where a deck longitudinal is cut, compensation is to be arranged to ensure full continuity of strength.

Table 1. 4. 9: Cantilever beams

Location and supporting arrangements	Required modulus, in cm^3, *See* Notes	
	Cantilever beam	Supporting frame
(1) Any position - no support from end girders	Z_o=$8.67kM_o$(Z_o=$85kM_o$)	Z_v=$\frac{v}{H_1}\left(\frac{fZ_o}{u} - kZ_t\right)$
(2) At hatch side - uniform loading, partial support received from hatch side girder, *See* Figure 1. 4. 3: Section moduli of hatch end beams:		
(a) Hatch side girder supported by Rule hatch end beams or pillars at hatch corners	Z_u=$0.9Z_0 - kG$	Z_v=$\frac{v}{H_1}\left(\frac{fZ_u}{u} - kZ_t\right)$
(b) Hatch side girder supported by end bulkheads of hold - no Rule hatch end beams or pillars	Z_u as in (a) or the following formula, whichever is the greater: $\left(\frac{n+1}{n}\right)\left(0.45\left(1+\frac{1}{\beta}\right)Z_o - k\beta G - (1-\beta)kE\right)$	

(c) No transverse bulkheads between hatchways, no Rule hatch end beams or pillars, *See* Notes	Z_u as in (a) or the following formula, whichever is the greater: $\left(\frac{n+1}{n}\right)\left(\frac{Z_o}{\beta} - 0.5kE\right)$	
(d) At hatch side - concentrated loading	Z_u as in (a), (b) or (c), whichever is applicable, or as the following formula, whichever is the greater: $I_o - kG_1$	
Case (1) or (2)	Required inertia, in cm^4	
	$I_u = \frac{9u}{k} Z_u$	—

Note *1.* Where a transverse bulkhead is fitted at only one end of a hatchway the section modulus of cantilever beams is to be a mean of the values obtained from (2)(b) and (2)(c).

Note *2.* Where only cantilevers in the length of a hatchway consist of two or three close together at the mid-length of hatchway, their modulus is to be determined by calculating the modulus of a single cantilever at mid-length and dividing this by the actual number of cantilevers.

Note *3.* If a negative value is obtained for the required section modulus, cantilevers are not necessary for the arrangement considered.

Note *4.* In calculating the actual section modulus of a cantilever or supporting frame, the effective area of attached plating is to be as given in Pt 3, Ch 3, 3 Structural idealisation. Intermediate beams or frames within the effective breadth may be included in the calculation.

Note *5.* Rule hatch end beams are those with scantlings determined from Table 1. 4. 6: Deck girders, transverses and hatch beams, assuming that the hatch side girder has a span between hatch end beams.

Note *6.* The section modulus of cantilever beams is to be not less than that determined from Table 1. 4. 5: Strength/weather, cargo and accommodation deck beams for beams in the same position.

Note *7.* The section modulus of side frames, pillars or pillar bulkhead stiffeners supporting cantilevers is to be not less than that required for ordinary side frames, pillars or pillar bulkhead stiffeners, as determined from the appropriate Sections of the Rules.

Note *8.* The scantlings of the cantilever bracket within the shaded area shown in Figure 1. 4. 2: Deck cantilevers are to be as follows:

(a) Where tripping brackets are not fitted:

$t = (0.0075d_c + 5)\sqrt{k}\text{mm}$

$A_f = \left(\frac{27Z_d}{e}\left(1 - \frac{e}{1420f}\right) - \frac{et}{300}\right)kcm^2$

(b) Where tripping brackets are fitted at the positions indicated in Figure 1. 4. 2: Deck cantilevers:

$t = (0.0075d_c + 5)\sqrt{k}\text{mm}$

$A_f = \left(\frac{20Z_d}{e}\left(1 - \frac{e}{1420f}\right) - \frac{et}{200}\right)kcm^2$

In general the radius at the throat of the cantilever bracket is to be not less than d_c.

Note *9.* The cantilever beam and supporting frame face plates may be gradually tapered from the limits of the shaded area shown in Figure 1. 4. 2: Deck cantilevers. The web depth of the supporting frame may be tapered to a minimum of $0.5d_f$ at the base.

Note *10.* Where the web thickness of cantilevers or supporting frames is less than $\frac{d_w}{60\sqrt{k}}$ transverse web stiffeners are to be fitted spaced approximately $1.5d_w$ apart. In no case is the web thickness outside the limits of the cantilever brackets to be less than $\frac{d_w}{85\sqrt{k}}$

Where stiffeners are fitted parallel to the face plates, the stiffening arrangements will be specially considered.

Symbols

f = overall length of cantilever, in metres

k = higher tensile steel factor as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

l_b = distance, in metres, between transverse bulkheads, *See* Figure 1.4.4 Deck supporting structure. Where there is no bulkhead midway between hatchways, l_b is to be measured to a point midway between hatchways

l_h = length of hatchway, in metres, *See* Figure 1. 4. 2: Deck cantilevers

C = cargo stowage rate in m^3/tonne as defined in Pt 3, Ch 3, 5 Design loading, and is to be taken as 1.39 m^3/tonne unless specified otherwise

Where there is no centreline support:

d_c = web depth of cantilever, at root of bracket, in mm, *See* Figure 1. 4. 2: Deck cantilevers

d_f = web depth of frame at root of bracket, in mm, *See* Figure 1. 4. 2: Deck cantilevers

d_w = web depth of cantilever or frame, in mm

e = web depth, in mm, as shown in Figure 1. 4. 2: Deck cantilevers

Z_a = section modulus, in cm^3, of hatch side girder which is to be not less than that calculated from Table 1. 4. 6: Deck girders, transverses and hatch beams, taking the span between cantilevers

Z_b = mean of section moduli, in cm^3, of longitudinal girders in line with hatch side girder (Z_b is to be taken not greater than Z_a)

$Z_d = \frac{fZ_u}{u}$

Z_o = section modulus, in cm^3, of cantilever beam, not supported by end girder, at distance u from outer end

Z_t = section modulus, in cm^3, of frame or stiffener above cantilever, *See* Figure 1. 4. 2: Deck cantilevers. (Where there is no frame or stiffener above cantilever Z_t = 0)

Z_u = section modulus, in cm^3, of cantilever beam, partially supported by hatch side girder at end, at distance u from outer end

Z_v = section modulus, in cm^3, of supporting frame, at distance v from lower end

Z_1, Z_2, Z_3 = mean of section moduli, in cm^3, of hatch end beams calculated for the positions shown in Figure 1. 4. 3: Section moduli of hatch end beams. Z_2 is to be taken as the smaller modulus of the two sections adjacent to the hatch side

$\beta = \frac{l_h}{l_b}$

E is determined as follows:

When centreline bulkheads or pillars are fitted:

$E = \frac{4}{n+1}\left((Z_1 + Z_2) + \frac{2u}{B_h}(Z_2 + Z_3)\right)$

n = number of cantilevers between the hatch end beams

t = thickness of cantilever bracket, in mm

u, v = lever arms, in metres, as shown in Figure 1. 4. 2: Deck cantilevers

A_f = sectional area, in cm^2, of cantilever bracket face plate

B_h = breadth of hatch, in metres, *See* Figure 1. 4. 2: Deck cantilevers

$E = \frac{4}{n+1}(Z_1 + Z_2)$

$G = \frac{7u}{(n+1)l_h}(Z_a + Z_b)$

$G_1 = \frac{3.5uZ_a}{S_c}$

H_1, H_2, H_3 = mean height of hold or 'tween decks, in metres, as shown in Figure 1. 4. 2: Deck cantilevers. At weather decks, H_2 and H_3 are to be taken equivalent to the weather head h_1 as defined in Pt 3, Ch 3, 5 Design loading

M_o = bending moment, in kN m, on the cantilever beam due to the load supported by a single cantilever. This bending moment is to be calculated about an axis at a distance u from the end. For hatch side cantilevers with uniformly distributed loading this will equal

$\frac{4.9S_c u}{C}(H_2 B_h + H_3 u)$

S_c = spacing of cantilevers, in metres, *See* Figure 1. 4. 4: Deck supporting structure

Figure 1. 4. 1: Hatch end beam arrangements

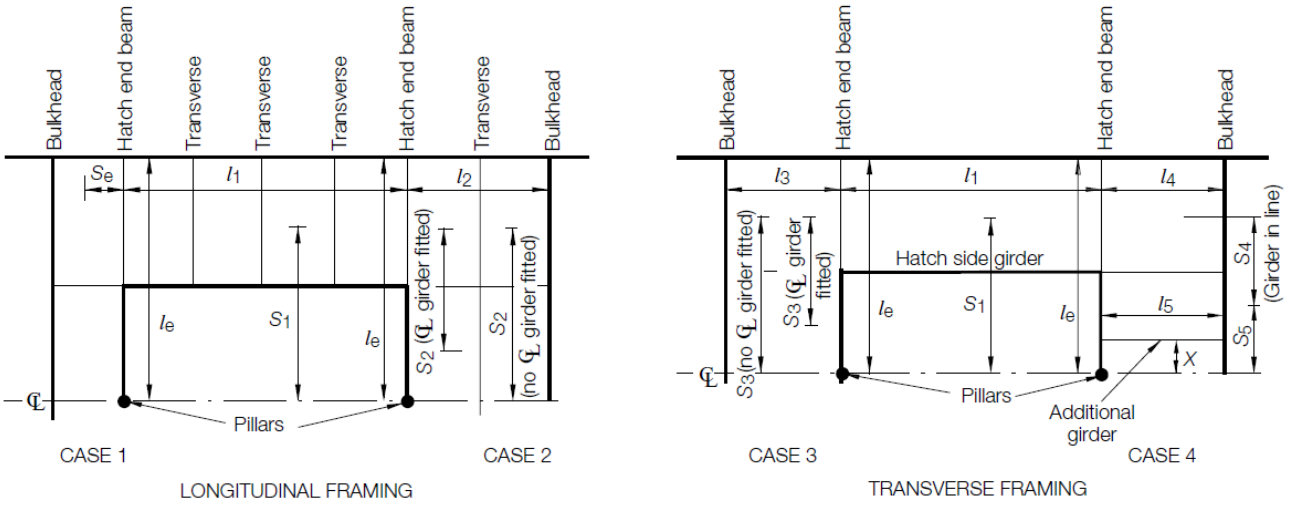


Figure 1. 4. 2: Deck cantilevers

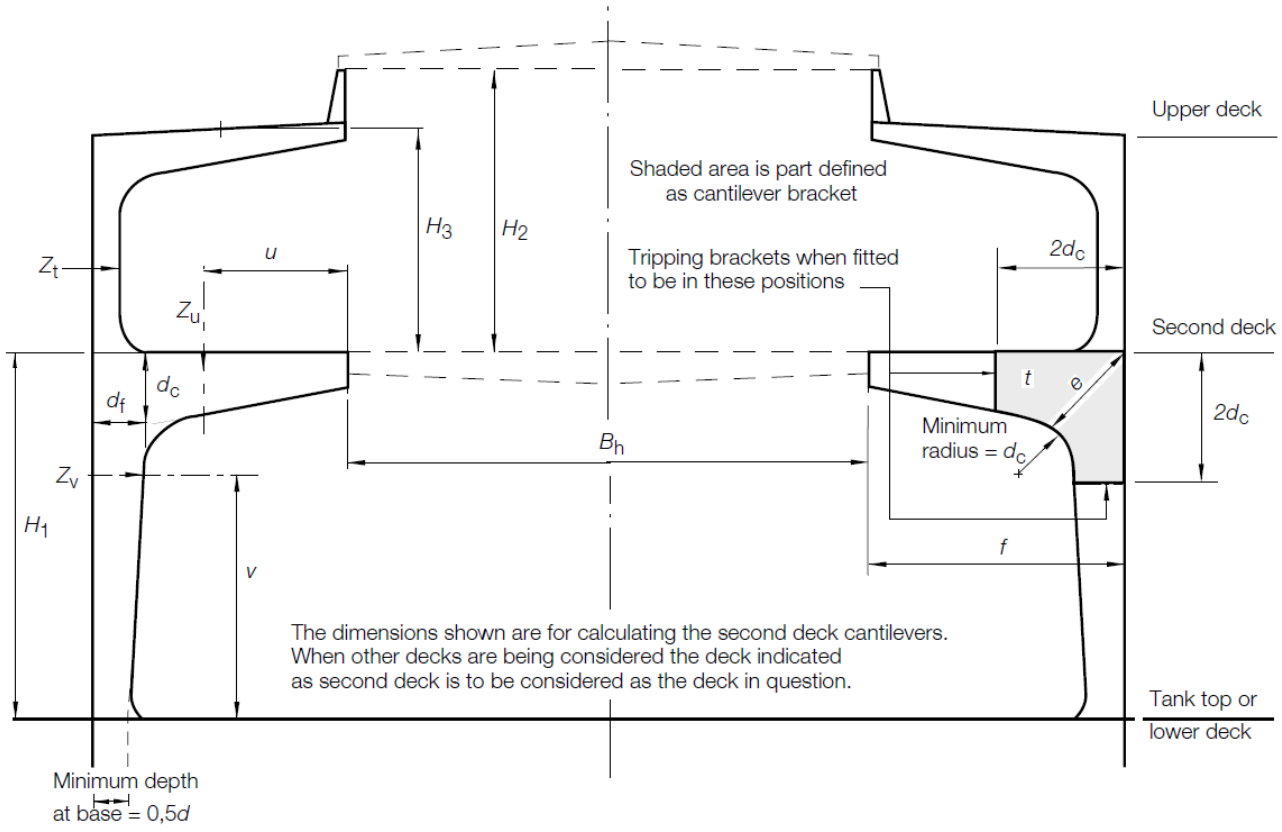

Figure 1. 4. 3: Section moduli of hatch end beams

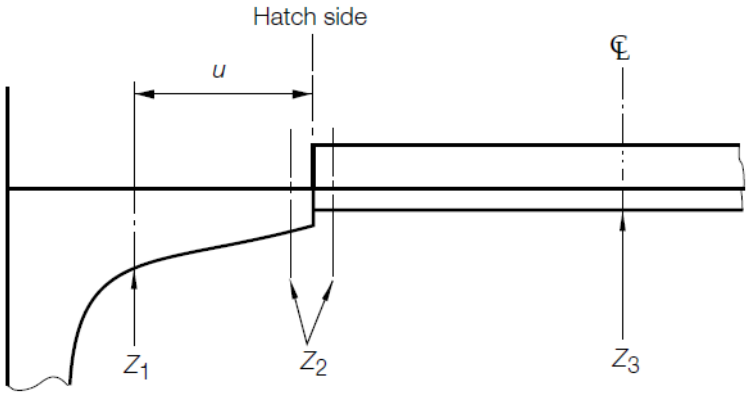

Figure 1. 4. 4: Deck supporting structure

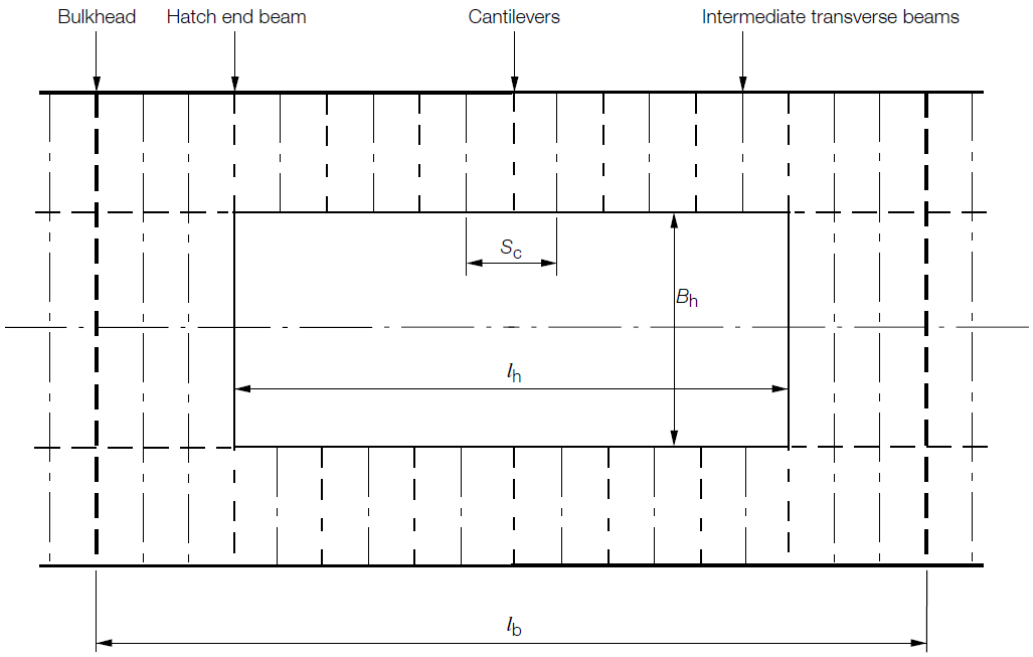

Figure 1. 4. 5: Elliptical and parabolic corners

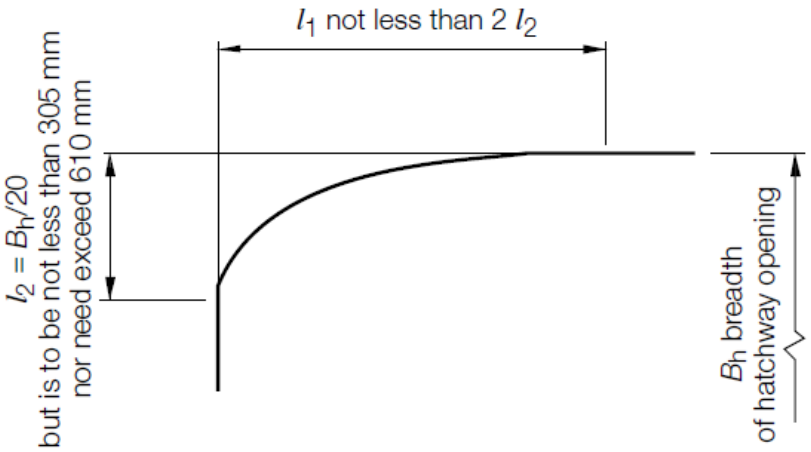

Figure 1. 4. 6: Insert plates for large openings

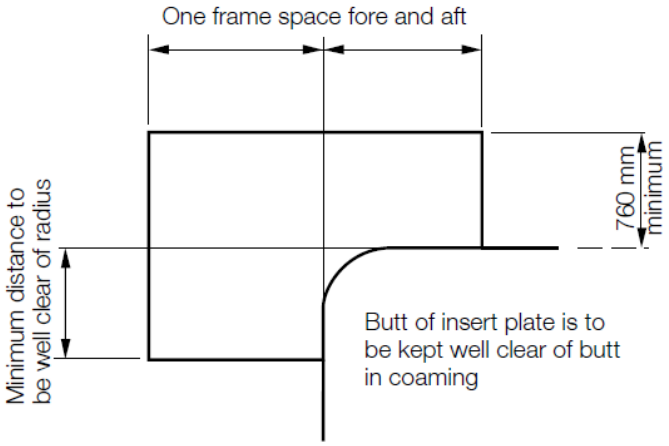

PART

4

CHAPTER **1** **General Cargo Ships**

SECTION **5** **Shell envelope plating**

5. 1 General

5. 1. 1 Requirements are given in this Section for longitudinal or transversely framed shell plating, and attention is drawn to the requirements of Pt 4, Ch 1, 6.1 General 6.1.1. In ships with a transversely framed bottom construction, the bottom shell plating is, in general, to be reinforced with additional continuous, or intercostal, longitudinal stiffeners, *See also* Pt 4, Ch 1, 7.1 General 7.1.2. Alternative arrangements will be considered.

5. 1. 2 For ships intended to load or unload while aground, *See* Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

5. 2 Keel

5. 2. 1 5.2.1 The cross-sectional area and thickness of bar keels, and the width and thickness of plate keels, are to comply with the requirements of Table 1. 5. 1: Bar and plate keels. Forged or rolled bar keels are also to comply with the material requirements of Ch 3 Rolled Steel Plates, Strip, Sections and Bars of the Pt 2 Rules for the Manufacture, Testing and Certification of Materials).

Table 1. 5. 1: Bar and plate keels

Item and parameter	Requirement
(1) Bar keels:	
Cross-sectional area	$A = (1.8L - 16)\ cm^2$
Thickness	$t = (0.6L + 8)\ mm$
(2) Plate keels:	
Breadth	$b = 70B\ mm$ but need not exceed 1800 mm and is not to be less than 750 mm
Thickness	$t = (t_1 + 2)\ mm$ where t_1 is as in location (1) in Table 1. 5. 2: Bottom shell and bilge plating, using the spacing in way of the keel plate t is to be taken not less than the adjacent bottom shell thickness
Symbols	

L, *B* as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

b = breadth of keel, in mm

t = thickness of keel, in mm

A = cross-sectional area, in cm^2

5. 3 Bottom shell and bilge

5. 3. 1 In the midship region the thickness of bottom shell plating to the upper turn of bilge is to be that necessary to give the hull section modulus required by Pt 3, Ch 4, 5 Hull bending strength, and is to be not less than the minimum values given by Table 1. 5. 2: Bottom shell and bilge plating.

5. 4 Side shell

5. 4. 1 In the midship region, the thickness of side shell and sheerstrake plating including the sides of bridge superstructures is to be not less than the values given by Table 1. 5. 3: Side shell plating, but may be required to be increased locally on account of high shear forces in accordance with Pt 3, Ch 4, 6 Hull shear strength.

5. 4. 2 Sea inlets, or other openings, are to have well rounded corners and so far as possible, are to be kept clear of the bilge radius. Openings on, or near to, the bilge radius are to be elliptical. The thickness of sea inlet box plating is to be the same as the adjacent shell, but not less than 12.5 mm and need not exceed 25 mm.

5. 4. 3 Where a rounded sheerstrake is adopted the radius should, in general, be not less than 15 times the thickness.

5. 4. 4 The sheerstrake thickness is to be increased by 20 per cent at the ends of a bridge superstructure extending out to the ship's side. In the case of a bridge superstructure exceeding $0.15L$, the side plating at the ends of the superstructure is also to be increased by 25 per cent and tapered gradually into the upper deck sheerstrake.

5. 4. 5 In general, compensation will not be required for holes in the steerstrake which are clear of the gunwale or any deck openings situated outside the line of the main hatchways and whose depth does not exceed 20 per cent of the depth of the sheerstrake or 380 mm, whichever is the lesser. Openings are not to be cut in a rounded gunwale. Cargo door openings are to have well rounded corners, and the proposed compensation for the door openings will be individually considered.

Table 1. 5. 2: Bottom shell and bilge plating

Location	Minimum thickness, in mm	
	Longitudinal framing	Transverse framing
(1) Bottom plating, *See* Notes 1 and 2	The greater of the following: (a) $t = 0.001s_1(0.043L_1 + 10)\sqrt{\frac{F_B}{k_L}}$ (*See* Note 4) (b) $t = 0.0063s_1\sqrt{\frac{h_{T2}k}{1.8-F_B}}$	The greater of the following: (a) $t = 0.00\text{ls}_1f_1(0.056L_1 + 16.7)\sqrt{\frac{F_B}{k_L}}$ (*See* Note 4) (b) $t = 0.0063s_1\sqrt{\frac{h_{T2}k}{1.8-F_B}}$

(2) Bilge plating - where framed, *See* Notes 1 and 2	t as for (1)	t as for (1)
(3) Bilge plating -where unframed, *See* Note 3	Provided that transverses or adequate bilge brackets are spaced not more than $\frac{8t^2}{DR_B}\sqrt{\frac{t}{R_B}} \times 10^6$mm apart $t = \frac{R_B F_B}{165k_L}$ but is to be not less than the adjacent bottom plating	

Symbols

L, D, T, s, S, k_L, *k* as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

C_w is as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1.

Where

$L > 227$ m, C_w is not to be taken less than 6.446 m

$f_1 = \frac{1}{1+\left(\frac{s}{1000S}\right)^2}$

h_{T2} = $(T+0.5C_w)$, in metres but need not be taken greater than $1.2T$ m

s_1 = s, but is not to be taken less than the smaller of $470 + \frac{L}{0.6}$mm or 700mm

F_B = as defined in Pt 3, Ch 4, 5.7 Local reduction factors

L_1 = L but need not be taken greater than 190 m

R_B = bilge radius, in mm, *See* Note 3

Note *1.* The thickness derived in accordance with (1) is also to satisfy the buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength.

Note *2.* The thickness of bottom shell or bilge plating is to be not less than the basic shell end thickness for taper as given in Pt 3, Ch 3 Structural Design, Table 3. 2. 1: Taper requirements for hull envelope.

Note *3.* Where longitudinally framed and the lowest side longitudinal lies a distance *a* mm above the uppermost turn of bilge and/or the outermost bottom longitudinal lies a distance *b* inboard of the lower turn of bilge, the bilge radius is to be taken as $R_B + \frac{(a+b)}{2}$mm. In no case is *a* or *b* to be greater than *s*.

Note *4.* Where separate maximum sagging and hogging still water bending moments are assigned, F_B may be based on the hogging moment.

Table 1. 5. 3: Side shell plating

Location	Minimum thickness, in mm	
	Longitudinal framing	Transverse framing
(1) Side shell clear of sheerstrake, *See* Notes 1, 2 and 4	(a) Above $\frac{D}{2}$from base: The greater of the following: (i) $t = 0.001s_1(0.059L_1 + 7)\sqrt{\frac{F_D}{k_L}}$ (ii) $t = 0.0042s_1\sqrt{h_{T1}k}$	(a) Within $\frac{D}{4}$from the gunwale: The greater of the following: (i) $t = 0.00085s_1 f_1(0.083L_1 + 10)\sqrt{\frac{F_D}{k_L}}$ (ii) $t = 0.0042s_1\sqrt{h_{T1}k}$

	(b) At upper turn of bilge, *See* Note 3: The greater of the following: (i) $t = 0.001s_1(0.059L_1 + 7)\sqrt{\frac{F_M}{k_L}}$ (ii) $t = 0.0054s_1\sqrt{\frac{h_{T2}k}{2-F_B}}$	(b) Within $\frac{D}{4}$ from mid-depth: The greater of the following: (i) $t = 0.001s_1(0.059L_1 + 7)\sqrt{\frac{F_M}{k_L}}$ (ii) $t = 0.005ls_1\sqrt{h_{T1}k}$
	(c) Between upper turn of bilge and $\frac{D}{2}$ from base: The greater of the following: (i) *t* from (b)(i) (ii) *t* from interpolation between (a)(ii) and (b)(ii)	(c) Within $\frac{D}{4}$ from base (excluding bilge plating) *See* Note 3: The greater of the following: (i) $t = 0.00085s_1f_1(0.083L_1 + 10)\sqrt{\frac{F_B}{k_L}}$ (ii) $t = 0.0056s_1\sqrt{\frac{h_{T2}k}{1.8-F_B}}$
(2) Sheerstrake, *See* Notes 1, 2 and 4	The greater of the following: (i) $t = 0.00ls_1(0.059L_1 + 7)\sqrt{\frac{F_D}{k_L}}$ (ii) $t = 0.00083s_1\sqrt{Lk} + 2.5$ but *t* is to be not less than the thickness of the adjacent side plating	The greater of the following: (i) $t = 0.00ls_Lf_1(0.083L_1 + 10)\sqrt{\frac{F_D}{k_L}}$ (ii) $t = 0.001s_1\sqrt{Lk} + 2.5$ but *t* is to be not less than the thickness of the adjacent side plating

Symbols

L, D, T, S, s, k_L, *k*, as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

C_w is as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1.

Where $L > 227$ m, C_w is not to be taken less than 6.446 m

f_1 = $\frac{1}{1 + \left(\frac{s}{1000S}\right)^2}$

h_{T1} = $T+C_w$ m but need not be taken greater than $1.36T$

h_{T2} = $T + 0.5C_w$ m but need not be taken greater than $1.2T$

s_1 = *s*, but is not to be taken less than the smaller of

$470 + \frac{L}{0.6}$ mm or 700mm

F_D, F_B = as defined in Pt 3, Ch 4, 5.7 Local reduction factors

F_M = the greater of F_D or F_B

L_1 = *L*, but need not be taken greater than 190 m

Note *1.* The thickness is also to satisfy the buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength.

Note *2.* The thickness of side shell or sheerstrake plating is to be not less than the basic shell end thickness for taper, as given in Pt 3, Ch 3 Structural Design, Table 3. 2. 1: Taper requirements for hull envelope. The width of the sheerstrake (where of different thickness from the side shell) is to be not less than that required by Table 2. 2. 1: Material classes and grades in Pt 3, Ch 2 Materials.

Note *3.* The thickness of side shell need not exceed that determined from Table 1. 5. 2: Bottom shell and bilge plating for bottom shell, but using the spacing of side frames or longitudinals.

Note *4.* For the expressions contained in (i), where separate maximum sagging and hogging still water bending moments are assigned, F_D may be based on the sagging moment and F_B on the hogging moment.

PART

4

CHAPTER **1** **General Cargo Ships**

SECTION **6** **Shell envelope framing**

6. 1 General

6. 1. 1 Longitudinal framing is, in general, to be adopted at the bottom, but special consideration will be given to proposals for transverse framing in this region. Transverse or longitudinal framing can be adopted for the side shell. Requirements are given in this Section for longitudinal and transverse framing systems.

6. 1. 2 End connections of longitudinals to bulkheads are to provide adequate fixity and, so far as practicable, direct continuity of longitudinal strength. Where L exceeds 215 m, the bottom longitudinals are to be continuous in way of both watertight and non-watertight floors, but alternative arrangements will be considered. Higher tensile steel longitudinals within 10 per cent of the ship's depth at the bottom and deck are to be continuous irrespective of the ship length, *See also* Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members.

6. 1. 3 Stiffeners and brackets on side transverses, where fitted on one side and connected to higher tensile steel longitudinals between the base line and $0.8D_2$ above the base line, are to have their heels well radiused to reduce stress concentrations. Where a symmetrical arrangement is fitted, i.e. bracket or stiffening on both sides, and it is connected to higher tensile steel longitudinals, the toes of the stiffeners or brackets are to be well radiused. Alternative arrangements will be considered if supported by appropriate direct calculations, *See also* Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members.

6. 1. 4 Where higher tensile steel side longitudinals pass through transverse bulkheads in the cargo area, well radiused brackets of the same material are to be fitted on both the fore and aft side of the connection between the upper turn of bilge and $0.8D_2$ above the base line. Particular attention should be given to ensuring the alignment of these brackets. Alternative arrangements will be considered if supported by appropriate direct calculations, *See also* Pt 4, Ch 1, 6.2 Longitudinal stiffening 6.2.3.

6. 1. 5 For ships intended to load or unload while aground, *See* Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

6. 2 Longitudinal stiffening

6. 2. 1 For non-**CSR** tankers, bulk carriers and ore carriers (*See* Pt 1, Ch 2, 2.3 Class notations (hull)) the scantlings of bottom and side longitudinals in the midship region are to comply with the requirements given in Table 1. 6. 2: Shell framing (longitudinal). In general other ships are to comply with Table 1. 6. 1: Shell framing (longitudinal).

6. 2. 2 The lateral and torsional stability of longitudinals together with web and flange buckling criteria are to be verified in accordance with Pt 3, Ch 4, 7 Hull buckling strength.

6. 2. 3 Where higher tensile steel asymmetrical sections are adopted in double bottom tanks which are interconnected with double skin side tanks or combined hopper and topside tanks the requirements of Pt 4, Ch 1, 6.1 General 6.1.3 and Pt 4, Ch 1, 6.1 General 6.1.4 are to be complied with regarding arrangements to reduce stress concentrations. Alternatively, it is recommended that bulb plate or symmetrical sections are adopted.

6. 3 Transverse stiffening

6. 3. 1 The scantlings of main and 'tween deck frames, and bottom frames in way of bracket floors, in the midship region are to comply with the requirements given in Table 1. 6. 3: Shell framing (transverse).

6. 3. 2 The scantlings of main frames are normally to be based on Rule standard brackets at top and bottom, whilst the scantlings of 'tween deck frames are normally to be based on a Rule standard bracket at the top only.

6. 3. 3 End connections of transverse main and 'tween deck frames are to be in accordance with Pt 3, Ch 10, 3 Secondary member end connections.

6. 4 Primary supporting structure

6. 4. 1 Side transverses supporting longitudinal stiffening, and webs and stringers supporting transverse side stiffening, are to comply with the requirements of Table 1. 6. 4: Primary structure.

6. 4. 2 Side transverses are to be spaced not more than 3.8 m apart when the length, L, is less than 100 m and $(0.006\mathrm{L} + 3.2)$ m apart where L is greater than 100 m.

Table 1. 6. 1: Shell framing (longitudinal)

Location	Modulus, in cm^3
(1) Side longitudinals in way of dry spaces, including double skin construction, *See* Note 2	The lesser of the following: (a) $Z = 0.056skh_{T1}l_e^2F_1F_S$ (b) Z from (3)(a) evaluated using s, k and l_e for the longitudinal under consideration and the remaining parameters evaluated at the base line
(2) Side longitudinals in way of double skin tanks or deep tanks, *See* Note 2	The greater of the following: (a) Z as from (1) (b) As required by Ch1, 9 for deep tanks
(3) Bottom and bilge longitudinals, *See* Notes 1, 2, 3 and 4	The greater of the following: (a) $Z = \gamma skh_{T2}l_e^2F_1$ (b) $Z = \gamma skh_{T3}l_e^2F_{sb}$
Symbols	

L, D, T, s, k,k_L, ρ, as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

l_e = as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1, but is not to be taken less than 1.5 m except in way of the centre girder brackets required by Pt 4, Ch 1, 8.5 Floors 8.5.3 where a minimum span of 1.25 m may be used

l_{e1} = l_e in metres, but is not to be taken less than 2.5 m and need not be taken greater than 5.0 m

C_l = $\frac{60}{225-165F_D}$ at deck

C_1 = 1.0 at $\frac{D_2}{2}$

C_1 = $\frac{75}{225-150F_B}$at baseline

Intermediate values of c_1 are to be obtained by interpolation.

D_1 = D_2, in metres, but is not to be taken less than 10 and need not be taken greater than 16

D_2 = D, in metres, but need not be taken greater than $1.6T$

F_B,F_D as defined in Pt 3, Ch 4, 5.7 Local reduction factors

F_l = $\frac{D_2c_1}{4D_2+20h_5}$for side longitudinals above $\frac{D_2}{2}$

F_l = = $\frac{D_2c_1}{25D_2+20h_5}$for side longitudinals below$\frac{D_2}{2}$ and for bottom longitudinals

F_1 is not to be taken less than = 0.14

L_1 = L but need not be taken greater than 190 m

F_s is a fatigue factor for side longitudinals to be taken as follows:

(a) For built sections and rolled angle bars

F_s = $\frac{1.1}{k}\left[1-\frac{2b_{f1}}{b_f}(1-k)\right]$at $0.6D_2$ above the base line

F_S = 1.0 at D_2 and above

F_S = F_{SB} at the base line.

Intermediate values of F_s are to be obtained by interpolation.

b) For flat bars and bulb plates $\frac{b_{f1}}{b_f}$may be taken as 0.5

F_{sb} is a fatigue factor for bottom longitudinals = longitudinals $= 0.5(1 + F_s$ at $0.6D_2)$

Where

b_{f1} = the minimum distance, in mm, from the edge of the face plate of the side longitudinal under consideration to the centre of the web plate, *See* Pt 4, Ch 9, 5.2 Symbols 5.2.1

h_{Tl} = $C_w\left(1-\frac{h_6}{D_2-T}\right)$in metres, for longitudinals above the waterline, at draught T

Where $C_w\left(1-\frac{h_6}{D_2-T}\right)$ is not to be taken less than $\frac{L_1}{56}$m for Type 'B-60' ships or less than the greater of $\frac{L_1}{70}$or 1.20 for Type 'B' ships

h_{T1} = $\left[h_6+C_W\left(1-\frac{h_6}{2T}\right)\right]F_\lambda$,in metres, for longitudinals below the waterline at draught T.

h_{T1} need not exceed $0.86\left(h_5+\frac{D_1}{8}\right)$ for $F_1 \le 0.14$ and $\left(h_5+\frac{D_1}{8}\right)$ for $F_1 > 0.14$

h_{T2} = (T+0.5C_W), in metres for bottom longitudinals but need not be taken greater than $1.2T$

h_{T3} = h_4-0.25T, in metres

h_4 = load head required by Pt 4, Ch 1, 9.1 General for deep tanks

h_5 = vertical distance, in metres, from longitudinal to deck at depth, D_2

h_6 = vertical distance, in metres, from the waterline at draught T to the longitudinal under consideration

b_f = the width of the face plate, in mm, of the side longitudinal under consideration, *See* Pt 4, Ch 9, 5.2 Symbols 5.2.1

C_W = a wave head, in metres = $7.71 \times 10^{-2} Le^{-0.0044\,L}$ where e = base of natural logarithms 2.7183

F_λ = 1.0 for L $\leq$ 200 m

= [1.0 + 0.0023(L – 200)] for L > 200 m

γ = $0.002l_{e1} + 0.046$

Note *1*. The buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength are to be complied with. The ratio of the web depth, d_w, to web thickness, t, is to comply with the following requirements:

(a) Built up profiles and rolled angles:

$$\frac{d_w}{t} \leq 60\sqrt{k_L}$$

(b) Flat bars:

$\frac{d_w}{t} \leq 18\sqrt{k_L}$ when continuous at bulkheads

$\frac{d_w}{t} \leq 15\sqrt{k_L}$ when non-continuous at bulkheads

Note *2*. Where struts are fitted midway between transverses in way of double bottom tanks, or double skin construction, the modulus of the bottom or side longitudinals may be reduced by 50k per cent from that obtained from the locations (1), (2), or (3) as applicable.

Note *3*. Where the bilge radius exceeds the Rule height of a double bottom the modulus of the longitudinal above this nominal height is to be derived from the location (1) or (2) as applicable.

Note *4*. Where no bilge longitudinals are fitted and bilge brackets are required by location (3) in Table 1. 5. 2: Bottom shell and bilge plating, at least two brackets are to be fitted.

Table 1. 6. 2: Shell framing (longitudinal)

Location	Modulus, in cm^3
(1) Side longitudinals in way of dry spaces, including double skin construction, *See* Note 2	The lesser of the following: (a) $Z = 0.056\text{skh}_{T1}l_e^2F_1F_S$ (b) Z from (3)(a) evaluated using s and l_e for the longitudinal under consideration and the remaining parameters evaluated at the base line
(2) Side longitudinals in way of double skin tanks or deep tanks, *See* Note 2	The greater of the following: (a) Z as from (1) As required by Pt 4, Ch 1, 9.1 General for deep tanks using h_{T3} instead of h_4, but need not exceed Z from (3)(b) evaluated using γ, s and fige for the longitudinal under consideration and the remaining parameters evaluated at the base line
(3) Bottom and bilge longitudinals, *See* Notes 1, 2, 3 and 4	The greater of the following: (a) $Z = \gamma skh_{T2}l_e^2F_{sb}$ (b) $Z = \gamma skh_{T3}l_e^2F_{sb}$

Symbols

L, D, T, s, k, ρ, as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

l_e = as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1, but is not to be taken less than 1.5 m except in way of the centre girder brackets required by Pt 4, Ch 1, 8.5 Floors 8.5.3 where a minimum span of 1.25 m may be used

$l_{e1} = l_e$ in metres, but is not to be taken less than 2.5 m and need not be taken greater than 5.0 m

$c_1 = \frac{60}{225-165F_D}$ at deck

c_1 = 1.0 at $\frac{D_2}{2}$

$c_1 = \frac{75}{225-150F_B}$ at baseline

intermediate values c_1 are to be obtained by interpolation

$D_1 = D_2$, in metres, but is not to be taken less than 10 and need not be taken greater than 16

$D_2 = D$, in metres, but need not be taken greater than $1.6T$

F_B,F_D as defined in Pt 3, Ch 4, 5.7 Local reduction factors

$F_1 = \frac{D_2 c_1}{4D_2+20h_5}$ for side longitudinals above $\frac{D_2}{2}$

$F_1 = \frac{D_2 c_1}{25D_2+20h_5}$ for side longitudinals below $\frac{D_2}{2}$ and bottom longitudinals

F_1 is not to to be taken less than 0.14

$L_1 = L$ but need not be taken greater than 190 m

F_s is a fatigue factor for side longitudinals to be taken as follows:

(a) For built sections and rolled angle bars

$F_s = \frac{1.1}{k}\left[1 - \frac{2b_{f1}}{b_f}(1-k)\right]$ at $0.6D_2$ above the base line

F_S = 1.0 at D_2 and above,

$F_S = F_{SB}$ at the base line

Intermediate values of F_s are to be obtained by linear interpolation.

(b) For flat bars and bulb plates $\frac{b_{fl}}{b_f}$ may be taken as 0.5

F_{sb} is a fatigue factor for bottom longitudinals $= 0.5(1 + F_s$ at $0.6D_2)$

Where

b_{fl} = the minimum distance, in mm, from the edge of the face plate of the side longitudinal under consideration to the centre of the web plate, *See* Pt 4, Ch 9, 5.2 Symbols 5.2.1

$h_{T1} = C_W\left(1 - \frac{h_6}{D_2-T}\right)F_\lambda$, in metres, for longitudinals above the waterline, at draught T

Where $\left(1 - \frac{h_6}{D_2-T}\right)$ is not to be taken less than 0.7

$h_{T1} = \left[h_6 + C_W\left(1 - \frac{h_6}{2T}\right)\right]F_\lambda$, in metres, for longitudinals below the waterline at draught T.

h_{T1} and h_{T2} need not exceed $0.86\left(h_5 + \frac{D_1}{8}\right)$ for $F_1 \leq 0.14$ and $\left(h_5 + \frac{D_1}{8}\right)$ for $F_1 > 0.14$

$h_{T2} = (T + 0.5C_W)\, F_\lambda$, in metres for bottom longitudinals

$h_{T3} = h_4 - 0.25T$, in metres at the base line

$h_{T3} = h_4$ in metres, at and above $T/4$ from the base line

Intermediate values of $h_{T\,3}$ are to be obtained by linear interpolation

h_4 = load head required by Pt 4, Ch 1, 9.1 General for deep tanks

h_5 = vertical distance, in metres, from longitudinal to deck at depth, D_2

h_6 = vertical distance, in metres, from the waterline at draught T to the longitudinal under consideration

b_f = the width of the face plate, in mm, of the side longitudinal under consideration, *See* Pt 4, Ch 9, 5.2 Symbols 5.2.1

C_W = a wave head, in metres $= 7.71 \times 10^{-2} L e^{-0.0044L}$ where e = base of natural logarithms 2.7183

$F_\lambda = 1.0$ for $L \leq 200$ m

$= [1.0 + 0.0023(L - 200)]$ for $L > 200$ m

$\gamma = 0.002 l_{e1} + 0.046$

Note *1*. The buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength are to be complied with. The ratio of the web depth, d_w, to web thickness, t, is to comply with the following requirements:

(a) Built up profiles and rolled angles:

$$\frac{d_w}{t} \leq 60\sqrt{k_L}$$

(b) Flat bars:

$\frac{d_w}{t} \leq 18\sqrt{k_L}$ when continuous at bulkheads

$\frac{d_w}{t} \leq 15\sqrt{k_L}$ when non-continuous at bulkheads

Note *2*. Where struts are fitted midway between transverses in way of double bottom tanks, or double skin construction, the modulus of the bottom or side longitudinals may be reduced by $50k$ per cent from that obtained from the locations (1), (2), or (3) as applicable.

Note *3*. Where the bilge radius exceeds the Rule height of a double bottom the modulus of the longitudinal above this nominal height is to be derived from the location (1) or (2) as applicable.

Note *4*. Where no bilge longitudinals are fitted and bilge brackets are required by location (3) in Table 1. 5. 2: Bottom shell and bilge plating, at least two brackets are to be fitted.

Table 1. 6. 3: Shell framing (transverse)

Location	Modulus, in cm^3	Inertia, in cm^4
*(1)*Main, 'tween deck and superstructure frames in dry spaces, *See* Note 3	The greater of the following: (a) $Z = C$ s $kh_{T1}H^2 \times 10^{-3}$ (b) $Z = 6.7skhH_2^2 \times 10^{-3}$	$I = \frac{3.2}{k} HZ$
*(2)*Main and 'tween deck frames in way of fuel or water ballast tanks or cargo holds used for water ballast	The greater of the following: (a)1.15 x Z from (1) (b) $Z = 6.7skhH_2^2 \times 10^{-3}$	$I = \frac{3.2}{k} HZ$

*(3)*Frames supporting hatch end beams or deck transverses, *See* Note 2	The greater of the following: *(a)*Z from (1) (b) $Z = 2.5(0.2l_s^2 + H_1^2)kS_1H_g$	$I = \frac{3.2}{k}HZ$
*(4)*Bottom frames of double bottom bracket floors	$Z = 2.15skTl_e \times 10^{-2}$	—
Symbols		
D, T, s, k as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1		

C = end connection factor

= 3.4 where two Rule standard brackets are fitted

= 3.4 (1.8 − 0.8 (la/l)where one Rule standard bracket and one reduced bracket fitted

= 3.4 (2.15 − 1.15 ($lamean/$l) where two reduced brackets are fitted

= 6.1 where one Rule standard bracket is fitted

= 6.1 (1.2 − 0.2 (la/l) where one reduced bracket is fitted

= 7.3 where no bracket is fitted

The requirements for frames where brackets larger than Rule standard are fitted will be specially considered

l_a = equivalent arm length, in mm, as derived from Pt 3, Ch 10, 3.4 Scantlings of end brackets 3.4.1

l_{amean} = mean equivalent arm length, in mm, for both brackets

h_{T1} = head, in metres, at middle of H

= $C_w\left(1-\frac{h_6}{D_1-T}\right)F_\lambda$, in metres for frames where the mid-length of frame is above the waterline, at draught T

where$\left(1-\frac{h_6}{D_1-T}\right)$ is not to be taken less than 0.7

= $[h_6+C_w\left(1-\frac{h_6}{2T}\right)]F_\lambda$, in metres for frames where the mid-length of frame is below the waterline at draught T

h = h_4 or h_5, whichever is the greater

h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

h_5 = head, in metres, measured from the mid-length of H, to the deck at side

h_6 = vertical distance in metres, from waterline at draught T to the mid-length of H

l_s = distance, in metres, from side shell to inboard support of beam or transverse

l_e = effective length, in metres, of bottom frames for double bottom bracket floors

l_h = length, in metres, of hatch side girder

C_w = a wave head, in metres,

= $7.71\times10^{-2}Le^{-0.0044\,L}$

= where e = base of natural logarithm 2.7183

$F\lambda$ = 1.0 for L ≤ 200 m

= (1.0 + 0.0023 (L − 200)) for L > 200 m

D_1 = D, but need not be taken greater than $1.6T$

H = H_{MF} or H_{TF} as applicable, *See* Note 1

MF = vertical framing depth, in metres, of main frames, as shown inFigure 1. 6. 1: Framing depths for various structural configurations, but is to be taken not less than 3.5 m

H_{TF} = vertical framing depth, in metres, of 'tween deck frames, as shown in Figure 1. 6. 1: Framing depths for various structural configurations, but is to be taken not less than 2.5 m

H_1 = H, but need not be taken greater than 3.5 m

H_2 = H, where H_{MF} is to be taken not less than 2.5 m

H_9 = weather head, h_1, or cargo head, h_2, in metres, as defined in Pt 3, Ch 3, 5 Design loading, whichever is applicable

S = spacing, in metres, of deck transverses

S_1 $= \frac{l_h}{4}$ for hatch end beams

$= S$ for transverses

Note *1.* Where frames are inclined at more than 15° to the vertical, H_{MF} or H_{TF} is to be measured along a chord between span points of the frame.

Note *2.* If the modulus obtained from (3) for frames under deck transverses exceeds that obtained from (1) and (2), the intermediate frames may be reduced provided that the combined modulus is maintained and the reduction in any intermediate frame is not greater than 35 per cent. The reduced modulus is to be not less than that given by (1)(b).

Note *3.* The scantlings of main frames are not to be less than those of the 'tween deck frames above.

Figure 1. 6. 1: Framing depths for various structural configurations

CHAPTER 1 General Cargo Ships

SECTION 7 Single bottom structure

7. 1 General

7. 1. 1 Requirements are given in this Section for single bottom construction in association with transverse framing, and are generally applicable to the following ships:

a. Cargo ships of less than 500 tons gross tonnage,
b. Ships not propelled by mechanical means, and
c. Trawlers and fishing vessels.

Cases where a single bottom structure is adopted in association with longitudinal framing will be considered.

7. 1. 2 Ships with single bottoms are to have a centre girder fitted. In addition, one side girder is to be fitted on each side of the centreline where B does not exceed 10 m, and two side girders on each side where B is greater than 10 m and does not exceed 17 m. In addition, continuous or intercostal longitudinal stiffeners are to be fitted where the panel size exceeds the ratio 4 to 1. Centre and side girders are to extend as far forward and aft as practicable, and where they cut at bulkheads the longitudinal strength is to be maintained.

7. 1. 3 Plate floors are to be fitted at every frame, and the tops of floors, in general, may be level from side to side, but in ships having considerable rise of floor, and towards the ends, the depth of the floor plates is to be increased. Floor plates forming part of a watertight or deep tank bulkhead are to be not less than 900 mm in depth measured at the centreline, and the thickness is to be not less than that required for the bottom strake of a bulkhead.

7. 1. 4 For ships intended to load or unload while aground, *See* Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

Table 1. 7. 1: Single bottom girders and floors

Item	Depth, in mm	Thickness, in mm	Face plate area, in cm^2	
(1) Centre girder	As for floors	$t = \sqrt{Lk} + 2$ but not less than 6.0	$A_f = 0.67Lk$ but not less than 12.5*See* Notes 2 and 3	
(2) Side girders	As for floors	$t = \sqrt{Lk}$ but not less than 6.0	$A_f = (0.25L + 5)k$ but not less than 10.0 *See* Note 3	
(3) Floors	Where $B \leq 10$ m $d_f = 40(B + T)$ Where $B > 10$m (*See*Note 1) $d_f = 40(1.5B + T) - 200$		$t = \frac{s\sqrt{k}}{s_1}\left(\frac{d_f}{100} + 3\right)$ but not less than 6.0	$A_f = \frac{5Tsk}{s_1}\left(1 - \frac{2.5}{B}\right)$ *See* Notes 2 and 3

Symbols

L, B, T, s, k = as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

b_f = breadth of face plate, in mm

d_f = overall depth of floor at the centreline, in mm

s_1 = a standard frame spacing, in mm, and is to be taken as $2(L + 240)$

A_f = cross-sectional area of face plate, in cm^2

Note *1.* If the side frames are attached to the floors by brackets, the Rule depth of floor may be reduced by 15 per cent and the floor thickness determined using the reduced depth. The brackets are to be flanged and have the same thickness as the floors, and their arm lengths clear of the frame and are to be the same as the reduced floor depth given above.

Note *2.* The face plate thickness of floors and centre girder is to be not less than the floor plate thickness.

Note *3.* The thickness of face plates is to be: not less than $\frac{b_f}{16\sqrt{k}}$ nor more than $\frac{b_f}{8}$

7. 1. 5 Provision is made for the free passage of water from all parts of the bottom to the suctions, taking into account the pumping rates required.

7. 2 Girders and floors

7. 2. 1 The scantlings of girders and floors are to comply with the requirements of Table 1. 7. 1: Single bottom girders and floors.

PART

4

CHAPTER **1** **General Cargo Ships**

SECTION **8** **Double bottom structure**

8. 1 Symbols and definitions

8. 1. 1 The symbols used in this Section are defined as follows:

L, B, T = as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

d_{DB} = Rule depth of centre girder, in mm

d_{DBA} = actual depth of centre girder, in mm

h_{DB} = head from top of inner bottom to top of over-flow pipe, in metres

s = spacing of stiffeners, in mm

H_{DB} = height from tank top, at position under consideration, to deck at side amidships, in metres

Z_{BF} = section modulus of bottom frame at bracket floor, in cm^3.

8. 2 General

8. 2. 1 Except as specified in Pt 4, Ch 1, 8.2 General 8.2.5, cargo ships other than tankers are to be fitted with a double bottom extending from the collision bulkhead to the after peak bulkhead, as far as this is practicable and compatible with the design and proper working of the ship.

8. 2. 2 Where a double bottom is required to be fitted, its depth at the centreline, d_{DB}, is to be in accordance with Pt 4, Ch 1, 8.3, Girders 8.3.1 and the inner bottom is to be continued out to the ship's side in such a manner as to protect the bottom to the turn of the bilge.

8. 2. 3 Small wells constructed in the double bottom, in connection with drainage arrangements, are not to extend in depth more than necessary. In no case shall the vertical distance from the bottom of such a well to a plane coinciding with the keel line be less than 500 mm or $B/40$ whichever is greater for passenger ships and cargo ships other than tankers unless compliance for that part of the ship with paragraph 8 of SOLAS Chapter II-1 *Regulation 9 - Double bottoms in passenger ships and cargo ships other than tankers* is demonstrated. Keel line is defined in SOLAS Chapter II-1, Part A, *Regulation 2 - Definitions* and B is defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1.

8. 2. 4 Other well arrangements (e.g. for lubricating oil under main engines) can be considered provided they give protection equivalent to that afforded by the double bottom. For a cargo ship of 80 m in length and upwards or for a passenger ship, proof of equivalent protection is to be shown by demonstrating that the ship is capable of withstanding bottom damages as specified in paragraph 8 of SOLAS Chapter II-1 *Regulation 9 - Double bottoms in passenger ships and cargo ships other than tankers*. Alternatively, wells for lubricating oil below main engines can protrude into the

double bottom below the boundary line defined by the distance $B/20$ provided that the vertical distance between the well bottom and a plane coinciding with the keel line is not less than $B/40$ or 500 mm, whichever is greater. For cargo ships of less than 80 m in length, the arrangements shall provide a level of safety satisfactory to the Flag Administration.

8. 2. 5 A double bottom need not be fitted in way of watertight compartments used exclusively for the carriage of liquids, provided the safety of the ship in the event of bottom damage is not thereby impaired. In addition, a double bottom need not be fitted on the following ships:

a. Cargo ships of less than 500 tons gross tonnage.
b. Ships not propelled by mechanical means.
c. Trawlers and fishing vessels.

8. 2. 6 This Section provides for longitudinal or transverse framing in the double bottom, but for ships exceeding 120 m in length and for ships strengthened for heavy cargoes, longitudinal framing is, in general, to be adopted. For the additional requirements for ships specially strengthened for heavy cargoes, *See* Pt 4, Ch 7, 1.3 General class notations.

8. 2. 7 For ships intended to load or unload while aground, *See* Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

8. 2. 8 Girders and the side walls of duct keels are to be continuous, and the structure in way is to be sufficient to withstand the forces imposed by dry-docking the ship.

8. 2. 9 Adequate access is to be provided to all parts of the double bottom. The edges of all holes are to be smooth. The size of opening should not, in general, exceed 50 per cent of the double bottom depth, unless edge reinforcement is provided. In way of ends of floors and fore and aft girders at transverse bulkheads, the number and size of holes are to be kept to a minimum, and the openings are to be circular or elliptical. Edge stiffening may be required in these positions.

8. 2. 10 Provision is to be made for the free passage of air and water from all parts of the tank to the air pipes and suctions, account being taken of the pumping rates required. To ensure this, sufficient air holes and drain holes are to be provided in all longitudinal and transverse non-watertight primary and secondary members. The drain holes are to be located as close to the bottom as is practicable, and air holes are to be located as close to the inner bottom as is practicable, *See also* Pt 3, Ch 10, 5.3 Openings and Pt 4, Ch 9, 5.8 Openings in longitudinals.

8. 3 Girders

8. 3. 1 The minimum depth of the centre girder is to be taken as the greater of the following:

a. $d_{\mathrm{DB}} = 28B + 205\sqrt{T}\mathrm{mm}$
b. d_{DB}=50B mm, but need not be taken as greater than 2000 mm
c. d_{DB}=760 mm.

8. 3. 2 The centre girder thickness is to be not less than:

$t = (0.008d_{\mathrm{DB}} + 4)\sqrt{k}\mathrm{mm}$

nor less than 6.0 mm. The thickness may be determined using the value for d_{DB} without applying the minimum depths specified in Pt 4, Ch 1, 8.3 Girders 8.3.1.b and Pt 4, Ch 1, 8.3 Girders 8.3.1.c.

8. 3. 3 **In transversely framed ships** where the breadth, B, does not exceed 10 m, no side girders are required, and one vertical stiffener is to be fitted to the floors on each side, about midway between the centreline and the margin plate. One side girder is to be fitted where the breadth, B, exceeds 10 m but does not exceed 20 m, and for greater breadths two girders are to be fitted on each side of the centreline. The non-watertight side girders are to extend as far forward and aft as practicable and are to have a thickness not less than:

$t = (0.008d_{DB} + 1)\sqrt{k}\mathrm{mm}$

nor less than 6.0 mm.

8. 3. 4 Vertical stiffeners are to be fitted at every bracket floor (*See* Pt 4, Ch 1, 8.5 Floors 8.5.7), and are to have a depth not less than the depth of the tank top frame or 150 mm, whichever is the greater. For ships with a length, L, less than 90 m, stiffeners are to have a depth of not less than $1.65L$ mm with a minimum of 50 mm. The thickness is to be as required for the girder. Watertight side girders are to have a thickness 1 mm greater than required by Pt 4, Ch 1, 8.3 Girders 8.3.3 for non-watertight side girders. Where the double bottom tanks are interconnected with side tanks or cofferdams, the thickness is to be as for deep tanks (*See* Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1) with h, in metres, measured to the highest point at the side tank or cofferdam.

8. 3. 5 **In longitudinally framed ships** one side girder is to be fitted where the breadth, B, exceeds 14 m, and two girders are to be fitted on each side of the centreline where B exceeds 21 m. The girders are to extend as far forward and aft as practicable and are to have a thickness not less than:

$t = (0.0075d_{DB} + 1)\sqrt{k}$mm
nor less than 6.0 mm.
In general, a vertical stiffener, having a depth not less than 100 mm and a thickness equal to the girder thickness, is to be arranged midway between floors.

8. 3. 6 **Watertight side girders** are to have a plating thickness corresponding to the greater of the following:

a. $t = (0.0075d_{DB} + 2)\sqrt{k}$mm, or
b. thickness t as for deep tanks (*See* Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1) with h, in metres, measured to the highest point of the side tank, or cofferdam if the double bottom is interconnected with these tanks.

8. 3. 7 Watertight side girder stiffeners are to be in accordance with the requirements for watertight floors, *See* Pt 4, Ch 1, 8.5 Floors 8.5.4 and Pt 4, Ch 1, 8.5 Floors 8.5.5.

8. 3. 8 **Duct keels,** where arranged, are to have a thickness of side plates corresponding to the greater of the following:

a. $t = (0.008d_{DB} + 2)\sqrt{k}$mm, or
b. thickness t, as for deep tanks, (*See* Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1) with h, in metres, measured to the highest point of the side tank, or cofferdam if the double bottom tank is interconnected with these tanks.

8. 3. 9 The sides of duct keels are, in general, to be spaced not more than 2.0 m apart. Where the sides of the duct keels are arranged on either side of a centreline or side girder, each side is, in general, to be spaced not more than 2.0 m from the centreline or side girder. The inner bottom and bottom shell within the duct keel are to be suitably stiffened. The primary stiffening in the transverse direction is to be suitably aligned with the floors in the adjacent double bottom tanks. Where the duct keels are adjacent to double bottom tanks which are interconnected with side tanks or cofferdams, the stiffening is to be in accordance with the requirements for deep tanks, *See* Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1. Access to the duct keel is to be by watertight manholes or trunks.

8. 3. 10 The buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength are also to be satisfied.

8. 4 Inner bottom plating and stiffening

8. 4. 1 The thickness of the inner bottom plating in the holds is to be not less than:

$t = 0.00136(s + 660)\sqrt[4]{k^2LT}nm$
nor less than 6.5 mm in holds and 7.5 mm under hatchways if no ceiling is fitted.

8. 4. 2 The thickness of the inner bottom plating as determined in Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening 8.4.1 is to be increased by 2 mm under the hatchways if no ceiling is fitted. If cargo is to be regularly discharged by grabs, *See* Pt 4, Ch 1, 2.2 Protection of steelwork 2.2.2.

8. 4. 3 A margin plate, if fitted, is to have a thickness throughout 20 per cent greater than that required for inner bottom plating.

8. 4. 4 Where the double bottom tanks are common with side tanks or cofferdams, the thickness of the inner bottom plating is to be not less than that required for deep tanks (*See* Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1), with h, in metres, taken to the highest point of the side tank or cofferdam, and K_1 is to be taken as 'elsewhere'.

8. 4. 5 Inner bottom longitudinals, or tank top frames at bracket floors within the range of cargo holds, are to have a section modulus not less than 85 per cent of the Rule value for bottom longitudinals (*See* Pt 4, Ch 1, 6.2 Longitudinal stiffening 6.2.1) or bottom frames in way of bracket floors (*See* Pt 4, Ch 1, 6.3 Transverse stiffening 6.3.1), whichever is applicable. The unsupported span of tank top frames is generally not to exceed 2.5 m. Where the double bottom tanks are interconnected with side tanks, hopper and topside tanks or cofferdams, the scantlings are to be not less than those required for deep tanks, *See* Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1. For higher tensile steel inner bottom longitudinals the requirements of Pt 4, Ch 1, 6.2 Longitudinal stiffening 6.2.2 are to be complied with where applicable.

8. 4. 6 The buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength are also to be satisfied.

8. 5 Floors

8. 5. 1 **In longitudinally framed ships**, plate floors are to be fitted under bulkheads and elsewhere at a spacing not exceeding 3.8 m. The thickness of non-watertight plate floors is to be not less than:

$t = (0.009d_{DB} + 1)\sqrt{k}$mm

nor less than 6.0 mm. The thickness need not be greater than 15 mm, but the ratio between the depth of the double bottom and the thickness of the floor is not to exceed $130\sqrt{k}$. This ratio may, however, be exceeded if suitable additional stiffening is fitted. Vertical stiffeners are to be fitted at each longitudinal, having a depth not less than 150 mm and a thickness equal to the thickness of the floors. For ships of length, L, less than 90 m, the depth is to be not less than $1.65L$ mm, with a minimum of 50 mm.

8. 5. 2 The thickness of watertight floors for longitudinally framed ships is to be not less than:

a. $t = (0.008d_{DB} + 3)\sqrt{k}$mm, or

b. $t = (0.009d_{DB} + 1)\sqrt{k}$mm

c. whichever is the greater,

but need not exceed 15 mm on floors of normal depth. The thickness is also to satisfy the requirements for deep tanks (*See* Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1) with h, in metres, taken to the highest point of the side tank, or cofferdam if the double bottom tank is interconnected with these tanks. The scantlings of stiffeners are to be in accordance with the requirements of Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1 for deep tanks, or as required by Pt 4, Ch 1, 8.5 Floors 8.5.4 whichever is the greater. The stiffeners are to be connected to the inner bottom and shell longitudinals.

8. 5. 3 Between plate floors, transverse brackets having a thickness not less than $0.009d_{DB}$ mm are to be fitted, extending from the centre girder and margin plate to the adjacent longitudinal. The brackets, which are to be suitably stiffened at the edge, are to be fitted at every frame at the margin plate, and those at the centre girder are to be spaced not more than 1.25 m.

8. 5. 4 **In transversely framed ships**, plate floors are to be fitted under bulkheads, in way of change in depth of double bottom and elsewhere at a spacing not exceeding 3.0 m. The shell inner bottom plating between these floors is to be supported by bracket floors. The thickness of non-watertight plate floors is to be not less than:

$t = (0.008d_{DB} + 1)\sqrt{k}$mm

but need not exceed 15 mm and is to be not less than 6 mm. Watertight or strengthened floors are to be fitted below, or in the vicinity of, watertight bulkheads, and their thickness is to be 2 mm greater than that derived above for non-watertight floors, but need not exceed 15 mm on floors of normal depth. If the depth of such floors exceeds 915 mm but does not exceed 2000 mm, the floors are to be fitted with vertical stiffeners spaced not more than 915 mm apart and having a section modulus not less than:

$$Z = 5.41 d_{\mathrm{DBA}}^2 h_{\mathrm{DB}} sk \times 10^{-9} \text{ cm}^3$$

The ends of the stiffeners are to be sniped.

8. 5. 5 Where the double bottom tanks are interconnected with side tanks or cofferdams, or where the depth of floor exceeds 2000 mm, the scantlings of watertight floors are to be not less than those required for deep tanks (*See* Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1), and the ends of the stiffeners are to be bracketed top and bottom.

8. 5. 6 Where floors form the boundary of a sea inlet box, the thickness of the plating is to be the same as the adjacent shell, but not less than 12.5 mm and need not exceed 25 mm. The scantlings of stiffeners, where required are, in general, to comply with Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1 for deep tanks. Sniped ends for stiffeners on the boundaries of these spaces are to be avoided wherever practicable. The stiffeners should be bracketed or the free end suitably supported to provide alignment with backing structure.

8. 5. 7 **Where bracket floors** are fitted, the bottom frames are to be derived from Pt 4, Ch 1, 6.3 Transverse stiffening 6.3.1. The unsupported span of the frames is not to exceed 2.5 m. The breadth of the brackets attaching the frames and the reverse frames to the centre girder and margin plate is to be three-quarters of the depth of the centre girder. The brackets are to be flanged on the unsupported edge and are to have the same thickness as the plate floors.

8. 5. 8 **Where struts** are fitted to reduce the unsupported span of the frames, reverse frames and longitudinals, they are to have a cross-sectional area of not less than:

a. $A = 0.32 Z_{BF} \text{cm}^2$ for ZBF ≤ 83.5, or

b. $A = 23.2 + \frac{Z_{BF}}{25} \text{cm}^2$ for ZBF > 83.5

where Z_{BF} is the modulus, in cm^3, of the frame or longitudinal based on the effective length between floors as defined in Pt 3, Ch 3, 3 Structural idealisation.

PART

4

CHAPTER **1** **General Cargo Ships**

SECTION **9** **Bulkheads**

9. 1 General

9. 1. 1 The requirements of this Section cover watertight and deep tank transverse and longitudinal bulkheads. Requirements are also given for shaft tunnel boundaries and non-watertight bulkheads. For transverse bulkheads in way of ballast holds, stools may be required, *See* Pt 4, Ch 7, 10.2 Bulkheads supported by stools.

9. 1. 2 The requirements of this Section apply to a vertical system of stiffening on bulkheads. They may also be applied to a horizontal system of stiffening provided that equivalent end support and alignment are provided.

9. 1. 3 For number and disposition of transverse watertight bulkheads, *See* Pt 3, Ch 3, 4 Bulkhead requirements.

9. 1. 4 The buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength are also to be satisfied.

9. 2 Watertight and deep tank bulkheads

9. 2. 1 The scantlings of watertight and deep tank bulkheads are to comply with the requirements of Table 1. 9. 1: Watertight and deep tank bulkhead scantlings to Table 1. 9. 3: Bulkhead end constraint factors. Where bulkhead stiffeners support deck girders, transverses or pillars over, the requirements of Pt 4, Ch 1, 4.4 Deck supporting structure 4.4.11 are also to be satified.

9. 2. 2 In way of partially filled holds or tanks, the scantlings and structural arrangements of the boundary bulkheads are to be capable of withstanding the loads imposed by the movement of the liquid in those spaces. The magnitude of the predicted loadings, together with the scantling calculations may require to be submitted, *See* Pt 3, Ch 3, 5.4 Design pressure for partially filled tanks.

9. 2. 3 In deep tanks, fuel oil or oil carried as cargo is to have a flash point of 60°C or above (closed-cup test). Where tanks are intended for other liquid cargoes of a special nature the scantlings and arrangements will be considered in relation to the nature of the cargo.

9. 2. 4 Where watertight bulkhead stiffeners are cut in way of watertight doors in the lower part of a bulkhead, the opening is to be suitably framed and reinforced. Where stiffeners are not cut but the spacing between the stiffeners is increased on account of watertight doors, the stiffeners at the sides of the doorways are to be increased in depth and strength so that the efficiency is at least equal to that of the unpierced bulkhead, without taking the stiffness of the door frame into consideration. Watertight recesses in bulkheads are generally to be so framed and stiffened as to provide strength and stiffness equivalent to the requirements for watertight bulkheads.

9. 2. 5 A centreline bulkhead is, generally, to be fitted in deep tanks which extend from side to side of the ship and are intended for the carriage of fuel oil for the ship's use. The bulkhead may be intact or perforated as desired. If intact, the scantlings are to be as required for boundary bulkheads. If perforated, the modulus of the stiffeners may be 50 per cent of that required for boundary

bulkheads, using h_4 measured to the crown of the tank. The stiffeners are to be bracketed at top and bottom. The area of perforation is to be not less than five per cent nor more than 10 per cent of the total area of the bulkhead. Where brackets from horizontal girders on the boundary bulkheads terminate at the centreline bulkhead, adequate support and continuity are to be maintained.

9. 3 Shaft tunnels

9. 3. 1 Where shaft tunnels are required as specified in Pt 3, Ch 3, 4 Bulkhead requirements the thickness of the tunnel plating is to comply with Table 1. 9. 1: Watertight and deep tank bulkhead scantlings for holds or deep tanks as appropriate. If the top plating is well curved, the thickness may be reduced by 10 per cent in dry cargo holds. If the top plating is flat, it is to be not less than 1.1 times the thickness required for watertight bulkheads in dry cargo holds. Under hatchways the top plating is to be increased by 2 mm, unless covered with wood not less than the thickness specified in Pt 4, Ch 1, 2.2 Protection of steelwork 2.2.2, which is to be secured by fastenings which do not penetrate the plating. Where it is intended to use plywood or other forms of ceiling of an approved type instead of planking, the thickness will be considered in each case. The tunnel stiffeners are to comply with Table 1. 9. 1: Watertight and deep tank bulkhead scantlings for holds or deep tanks, as appropriate. When the section modulus of curved stiffeners is determined, the values of ω_1 and ω_2 are to be taken as 1.0. The span of the stiffener, l_e, is to be taken as the overall height of the tunnel, measured vertically at the centreline of the tunnel. If the tunnel top is flat, scantlings of the stiffeners are also to comply with Pt 4, Ch 1, 4.3 Deck stiffening. The lower end connection to the tank top is to be welded. Additional strengthening is to be fitted under the heels of pillars or masts stepped on the tunnel.

Table 1. 9. 1: Watertight and deep tank bulkhead scantlings

Item and requirement	Watertight bulkheads	Deep tank bulkheads
(1) Plating thickness for plane, symmetrically corrugated and double plate bulkheads	$t = 0.004sf\sqrt{h_4 k}$mm but not less than 5.5 mm	$t = 0.004sf\sqrt{\frac{\rho h_4 k}{1.025}} + 2.5$mm but not less than 6.5 mm, where L<90 m; not less than 7.5 mm, where L≥90m
	In the case of symmetrical corrugations, s is to be taken as b or c in Figure 3. 3. 1: Corrugation dimensions in Pt 3, Ch 3, whichever is the greater	
(2) Modulus of rolled and built stiffeners, swedges, double plate bulkheads and symmetrical corrugations	$Z = \frac{skh_4 l_e^2}{71\gamma(\omega_1+\omega_2+2)} cm^3$	$Z = \frac{skh_4 l_e^2}{22\gamma(\omega_1+\omega_2+2)} cm^3$
	In the case of symmetrical corrugations, s is to be taken as p, *See also* Note 2	
(3) Inertia of rolled and built stiffeners and swedges	—	$I = \frac{2.3}{k} l_e Z cm^4$

(4) Symmetrical corrugations and double plate bulkheads	Additional requirements to be complied with as detailed in Table 1. 9. 2: Symmetrical corrugations and double plate bulkheads (additional requirements)	
(5) Stringers or webs supporting vertical or horizontal stiffening		
(a) Modulus	$Z = 5.5\mathrm{kh}_4\mathrm{Sle}^2$ cm^3	$Z = 11.7\rho k h_4 S l_e^2$ cm^3
(b) Inertia	—	$I = \frac{2.5}{k} l_e Z cm^4$

Symbols

s, S, I, k, ρ as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

d_w = web depth of stiffening member, in mm

f = $1.1 - \frac{s}{2500S}$ but not to be taken greater than 1.0

h_4 = load head, in metres measured as follows:

For watertight bulkhead plating, the distance vertically from a point one-third of the height of the plate above its lower edge to a point 0.91 m above the bulkhead deck at side or perpendicular to the deepest equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater, *See also* Figure 3. 5. 2: Heads for watertight and deep tank bulkheads in Pt 3, Ch 3

For deep tank bulkhead plating, the distance from a point one-third of the height of the plate above its lower edge to the top of the tank, or half the distance to the top of the overflow, whichever is the greater, *See also* Figure 3. 5. 2: Heads for watertight and deep tank bulkheads in Pt 3, Ch 3

For watertight bulkhead stiffeners or girders, the distance vertically from the middle of the effective length to a point 0.91 m above the bulkhead deck at sideside, or perpendicular to the deepest equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater, *See also* Figure 3. 5. 2: Heads for watertight and deep tank bulkheads in Pt 3, Ch 3

For deep tank bulkhead stiffeners or girders, the distance from the middle of the effective length to the top of the tank, or half the distance to the top of the overflow, whichever is the greater, *See also* Figure 3. 5. 2: Heads for watertight and deep tank bulkheads

l_e = effective length of stiffening member, in metres, and for bulkhead stiffeners, to be taken as $l - e_1 - e_2$, *See also* Figure 1. 9. 1: End connections

p = spacing of corrugations as shown in Figure 3.3.1 Corrugation dimensions

γ = 1.4 for rolled or built sections and double plate bulkheads

= 1.6 for flat bars

= 1.1 for symmetrical corrugations of deep tank bulkheads

= 1.0 for symmetrical corrugations of watertight bulkheads

ω, e = as defined in Table 1. 9. 3: Bulkhead end constraint factors, *See also* Figure 1. 9. 1: End connections

Note *1.* In no case are the scantlings of deep tank bulkheads to be less than the requirements for watertight bulkheads where watertight bulkheads are required by Pt 3, Ch 3, 5 Design loading.

Note *2.* In calculating the actual modulus of symmetrical corrugations the panel width b is not to be taken greater than that given by Pt 3, Ch 3, 3.2, Geometric properties of section

Note *3.* For rolled or built stiffeners with flanges or face plates, the web thickness is to be not less than $\frac{d_w}{60\sqrt{k}}$ whilst for flat bar stiffeners the web thickness is to be not less than $\frac{d_w}{60\sqrt{k}}$

Figure 1. 9. 1: End connections

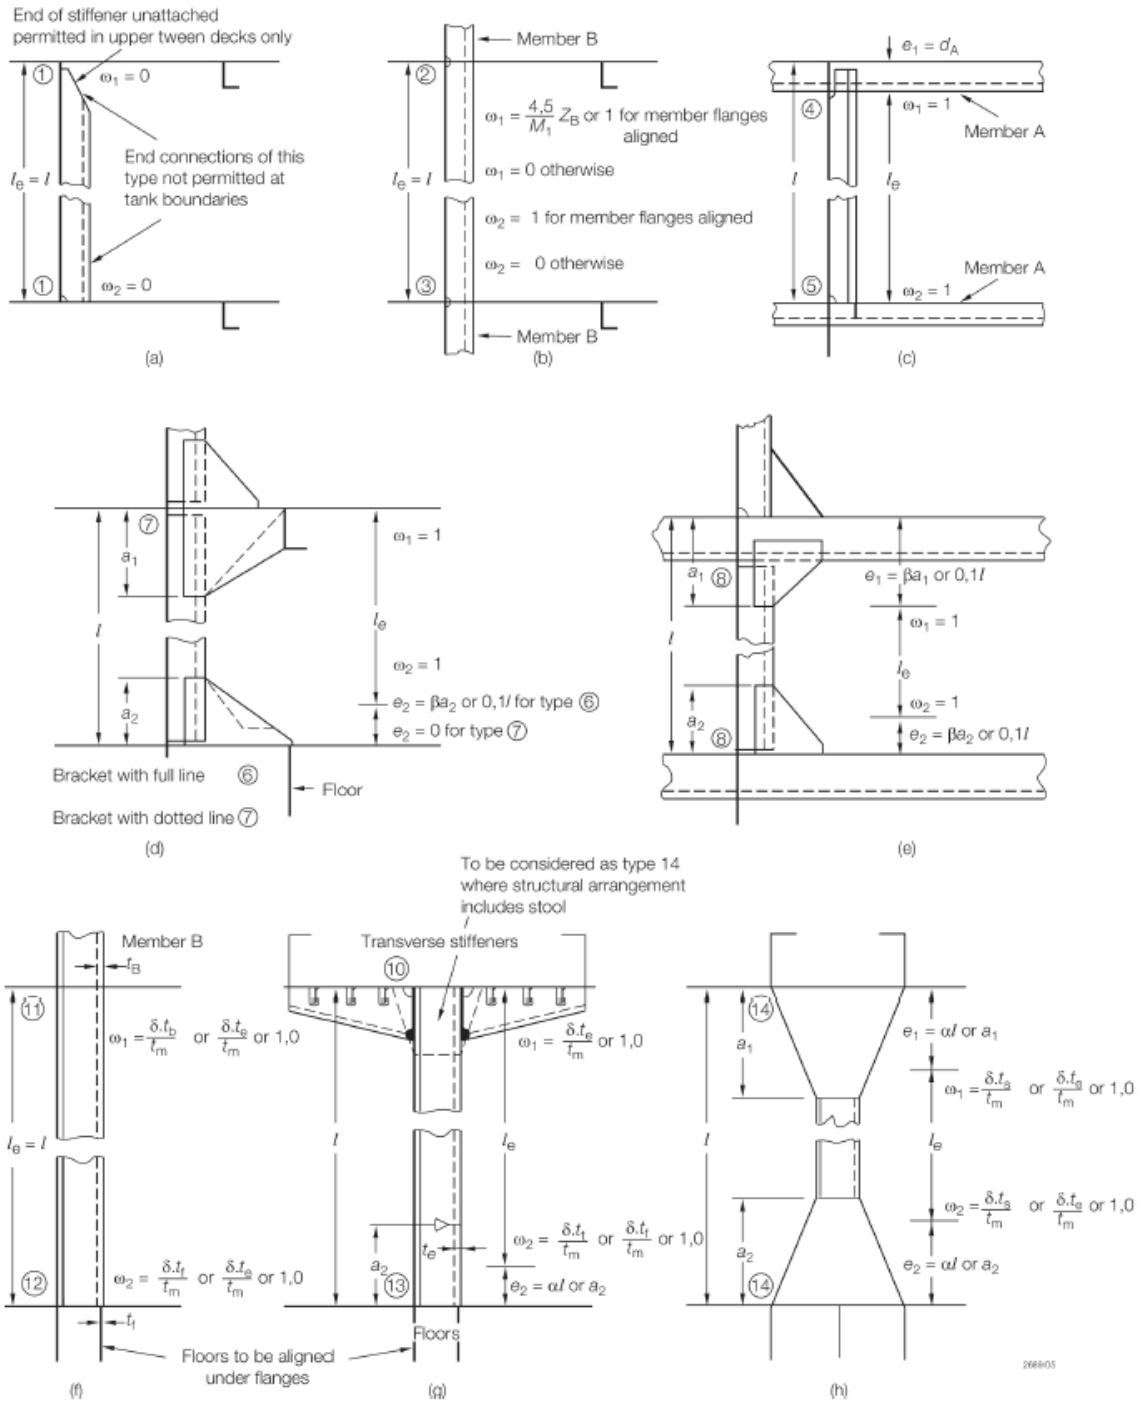

Table 1. 9. 2: Symmetrical corrugations and double plate bulkheads (additional requirements)

Symbols	Type of bulkhead	Parameter	Watertight bulkheads	Deep tank bulkheads

s, *k* as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1 *b* = panel width as shown in Figure 3. 3. 1: Corrugation dimensions in Pt 3, Ch 3 Structural Design *d* = depth, in mm, of symmetrical corrugation or double plate bulkhead l_e as defined in Table 1. 9. 1: Watertight and deep tank bulkhead scantlings A_w = shear area, in cm^2, of webs of double plate bulkhead θ = angle of web corrugation to plane of bulkhead	Symmetrically corrugated, *See also* Notes 1 and 2	$\frac{b}{t}$	Not to exceed: $85\sqrt{k}$ at top, and $70\sqrt{k}$ at bottom	Not to exceed: $70\sqrt{k}$ at top, and at bottom
		d	—	To be not less than: $39l_e$ mm
		θ	To be not less than 40°	
Note *1.* The plating thickness at the middle of span l_e of corrugated or double plate bulkheads is to extend not less than $0.2l_e$ m above mid span. **Note** *2.* Where the span of corrugations exceeds 15 m, a diaphragm plate is to be arranged at about mid-span. **Note** *3. See also* Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members 5.2.1.	Double plate, *See also* Notes 1 and 3	$\frac{s}{t}$	Not to exceed:	$75\sqrt{k}$ at top, and $65\sqrt{k}$ at bottom
		$\frac{d}{t_w}$	Not to exceed:	$85\sqrt{k}$ at top, and $75\sqrt{k}$ at bottom
		d	—	To be not less than: $39l_e$ mm
		A_w	To be not less than: $\frac{0.12Z}{l_e} cm^2$ at top and $\frac{0.18Z}{l_e} cm^2$ at bottom	To be not less than: $\frac{0.07Z}{l_e} cm^2$ at top and $\frac{0.10Z}{l_e} cm^2$ at bottom

Table 1. 9. 3: Bulkhead end constraint factors

Type	End connection (*See* Figure 1. 9. 1: End connections)		ω	*e*	μ
Rolled or built stiffeners and swedges					
1	End of stiffeners unattached or attached to plating only		0	0	—
2	Members with webs and flanges (or bulbs) in line and attached at deck or horizontal girder, *See also* Note 1	Adjacent member of B of smaller modulus	The lesser of $\frac{4.5Z_B}{M_1}$ or 1.0	0	—
3		Adjacent member of B of same or larger modulus	1.0	0	—
4	Bracketless connection to longitudinal member	Member A within length *l*	1.0	$\frac{d_A}{1000}$	—
5		Member A outside length *l*	1.0	0	—

6	Bracketed connection	To transverse member	Bracket extends to floor	1.0	The lesser of βa or $0.1l$	—
7			Otherwise	1.0	0	—
8		To longitudinal member		1.0	The lesser of βa or $0.1l$	—
Symmetrical corrugations or double plate bulkheads						
9	Welded directly to deck– no bulkhead in line	No longitudinal brackets		0	0	—
10		With longitudinal brackets and transverse stiffeners supporting corrugated bulkhead		The lesser of $\frac{\delta t_e}{t_m}$ or 1.0	0	—
11	Welded directly to deck or girder	Bulkhead B, having same section, in line		The least of $\frac{\delta t_f}{t_m}$ or $\frac{\delta t_e}{t_m}$ or 1.0	0	—
12	Welded directly to tank top and effectively supported by floors in line with each bulkhead flange, *See also* Note 2	Thickness at bottom same as that at mid-span		The least of $\frac{\delta t_f}{t_m}$ or $\frac{\delta t_e}{t_m}$ or 1.0	0	—
13		Thickness at bottom greater than that at mid-span		The least of $\frac{\delta t_f}{t_m}$ or $\frac{\delta t_e}{t_m}$ or 1.0	The lesser of αl or a	The lesser of $\frac{t_f}{t_m}$ or $\frac{t_e}{t_m}$
14	Welded to stool efficiently supported by ship's structure			For deep tank bulkheads 1.0 For watertight bulkheads the least of $\frac{\delta t_s}{t_m}$ or $\frac{\delta t_e}{t_m}$ or 1.0	The lesser of αl or a	$\frac{10Z_s}{M_2}$
Symbols						

s, l, ρ, *k,* as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

a = height, in metres, of bracket or end stool or lowest strake of plating of symmetrically corrugated or double plate bulkheads, *See* Figure 1. 9. 1: End connections

d_A = web depth, in mm, of adjacent member A

e = effective length, in metres, of bracket or end stool, *See* Figure 1. 9. 1: End connections

h_o = h_4 but measured from the middle of the overall length l

l_e, p, h as defined in Table 1. 9. 1: Watertight and deep tank bulkhead scantlings

t_B = thickness, in mm, of flange plating of member B

t_f = thickness, in mm, of supporting floor

t_m, t_e, = thickness, in mm, of flange plating of corrugation or double plate bulkhead at mid-span or end, respectively Subscripts 1 and 2 when applied to ω, *e*, and *a* refer to the top and bottom ends of stiffener

$M_1 = \frac{ph_4sl_{2e}}{71}$ for watertight bulkheads

$= \frac{ph_4sl_{2e}}{22}$ for deep tank bulkheads

$M_2 = \frac{ph_0sl_2}{71}$ for watertight bulkheads

$= \frac{ph_0sl_2}{22}$ for deep tank bulkheads

In the case of symmetrical corrugations $s=p$

Z_B = section modulus, in cm^3, of adjacent member B

Z_s = section modulus, in cm^3, of horizontal section of stool adjacent to deck or tank top over breadth *s* or *p* (as applicable)

All material which is continuous from top to bottom of stool may be included in the calculation

α = a factor depending on μ and determined as follows:

where $\mu \leq 1.0$ $\alpha = 0$

where $\mu > 1.0$ $\alpha = 0.5 - \frac{1}{\sqrt{2\mu+2}}$

β = a factor depending on the end bracket stiffening and to be taken as:

1.0 for brackets with face bars directly connected to stiffener face bars
0.7 for flanged brackets
0.5 for unflanged brackets

μ = a factor representing end constraint for symmetrical corrugation and double plate bulkheads

ω = an end constraint factor relating to the different types of end connection, *See* Figure 1. 9. 1: End connections

t_s = thickness, in mm, of stool adjacent to bulkhead

δ = 1.0 generally

$\delta = \frac{0.932\sqrt{k}}{\xi}$ for corrugated watertight bulkheads

ξ = 1.0 where full continuity of corrugation webs is provided at the ends

ξ = greater of 1.0 and (η + 0.333) where full continuity is not provided

η = lesser of 1.0 and $\frac{50t_m\sqrt{k}}{b}$ for welded sections

η = lesser of 1.0 and $\frac{60t_m\sqrt{k}}{b}$ for cold formed sections

Note *1*. Where the end connection is similar to type 2 or 3, but member flanges (or bulbs) are not aligned and brakets are not fitted, ω=0.

Note *2*. Where the end connection is similar to type 12 or 13, but a transverse girder is arranged in place of one of the supporting floors, special consideration will be required.

CHAPTER 2 **Ferries, Roll On-Roll Off Ships and Passenger Ships**

SECTION 1 **General**

1. 1 Application

1. 1. 1 This Chapter applies to seagoing passenger ships and ferries, including those with roll on-roll off capability, as well as passenger yachts, sailing passenger ships, roll on-roll off cargo ships and vehicle carriers defined as follows:

a. A **passenger ship** is defined as a ship specially designed and constructed for the carriage of more than 12 passengers.

b. A **passenger ferry** is defined as a ship specially designed and constructed for the carriage of more than 12 passengers on a regular scheduled service between specified ports operating in reasonable weather conditions. Reasonable weather is defined in Pt 1, Ch 2, 2.1 Definitions 2.1.5

c. A **roll on-roll off passenger ship** is defined as a ship specially designed and constructed for the carriage of more than 12 passengers, as well as the carriage of vehicles accessed by means of ramps and doors located at the bow, stern or through the side shell, or any combination thereof.

d. A **roll on-roll off passenger ferry** is defined as a ship specially designed and constructed for the carriage of more than 12 passengers, as well as the carriage of vehicles accessed by means of ramps and doors located at the bow, stern or through the side shell, or any combination thereof where the ferry is on regular scheduled service between specified ports operating in reasonable weather. Reasonable weather is defined in Pt 1, Ch 2, 2.1 Definitions 2.1.5

e. A **passenger/vehicle ferry** has the same definition as a roll on-roll off passenger ferry.

f. A **passenger yacht** is defined as a yacht that is specially designed and constructed in accordance with National Administration requirements for passenger yachts.

g. A **sailing passenger ship** is defined as a ship specially designed and constructed for the carriage of more than 12 passengers and incorporating sail devices which are intended to be the primary means of propulsion.

h. A **roll on-roll off cargo ship** is defined as a ship specially designed and constructed for the carriage of vehicles and cargo in pallet form or in containers, loaded/unloaded by wheeled vehicles and accessed by means of ramps and doors located at the bow, stern or through the side shell, or any combination thereof.

i. A **vehicle carrier**, sometimes referred to as a pure car carrier or a pure car/truck carrier, is defined as a ship specially designed and constructed for the carriage of large numbers of vehicles, accessed by means of ramps and doors located at the stern and/or through the side shell.

1. 1. 2 Ships intended to operate only in certain areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2 Classification Regulations, will receive individual

consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval.

1. 1. 3 The scantlings and arrangements are to be as required by Pt 4, Ch 1 General Cargo Ships except as otherwise specified in this Chapter.

1. 1. 4 The scantlings of the primary supporting structure for multi-decked passenger ships are to be assessed by direct calculation, in accordance with the *ACSPlus Structural Design Assessment Guideline* for passenger ships, wherever:

a. the superstructure will be subjected to significant load from flexure of the hull girder; or
b. it is required to utilise the load-carrying capability of the superstructure for longitudinal strength; or
c. a limited number of transverse bulkheads above the bulkhead deck are present to carry the racking response ; or
d. as required by ACS.

See also Pt 4, Ch 2, 1.3 Class notations 1.3.7 and Pt 4, Ch 2, 13 Direct calculation.

1. 1. 5 A multi-decked ship is generally defined as a ship having one or more continuous decks above the bulkhead deck which contribute to the global strength of the ship. The efficiency of decks can vary in conjunction with their length, scantlings arrangement and materials.

1. 1. 6 The scantlings of the primary supporting structure of a vehicle ferry, passenger/vehicle ferry, roll on–roll off cargo ship, roll on–roll off passenger ship or vehicle carrier are to be assessed by direct calculation in accordance with the *ACSPlus Structural Design Assessment Guideline* for Ro–Ro ships and the *ACSPlus Construction Monitoring Guideline. See also* Pt 4, Ch 2, 1.3 Class notations 1.3.7 and Pt 4, Ch 2, 13 Direct calculation.

1. 1. 7 For the purpose of providing operational information to the Master for safe return to port after a flooding casualty, passenger ships having a Load Line length of 120 m or more or having three or more main vertical zones are to have:

a. an onboard stability computer; or
b. shore-based support.

Where an onboard computer system having a stability computation capability is provided, the system is to be certified in accordance with ACS's document entitled *Approval of Longitudinal Strength and Stability Calculations Programs*, *See also* Pt 1, Ch 2, 1.1 General 1.1.11.

1. 2 Structural configuration

1. 2. 1 The requirements provide for a basic structural configuration of a multi-deck hull which includes a double bottom, and in some cases wing tanks up to the lowest deck.

1. 2. 2 For passenger ships, the structural arrangements detailed in Chapter II-1, Part B, of the *International Convention for the Safety of Life at Sea, 1974*, and applicable amendments as they apply to passenger ships are to be complied with in their entirety.

1. 2. 3 Where bulkheads are omitted in accordance with Pt 3, Ch 3, 4 Bulkhead requirements, a system of partial bulkheads, web frames and deck transverses should be fitted to provide equivalent transverse strength.

1. 2. 4 Longitudinal framing is, in general, to be adopted at the strength deck and at the bottom, but special consideration will be given to proposals for transverse framing in these regions.

1. 2. 5 Reference should be made to the Regulations of the *International Convention for the Safety of Life at Sea, 1974* and applicable amendments and to the relevant Statutory Requirements of the National Authority of the country in which the ship is to be registered.

1. 2. 6 Attention is also drawn to the requirements for passenger ships given in:

- Bulkhead requirements, *See* Pt 3, Ch 3, 4 Bulkhead requirements

- Closing arrangements for shell, deck and bulkheads, *See* Pt 3, Ch 11, 6 Miscellaneous openings, Pt 3, Ch 11, 8 Side and stern doors and other shell openings and Pt 3, Ch 11, 9 Watertight doors in bulkheads below the freeboard deck
- Electrical installations, *See* Pt 6, Ch 2 Electrical Engineering
- Fire protection, detection and extinction, *See* SOLAS Reg. II-2 *Part B - Prevention of fire and explosion1* and *Part C - Suppression of fire*.

1. 2. 7 Attention is drawn to National Authority requirements relating to the stowage and securing of vehicles and cargo units on board roll on-roll off ships. Steel used for the construction of fixed securing fittings attached to the ship's structure is to comply with the requirements of Pt 2 Rules for the Manufacture, Testing and Certification of Materials , or with an equivalent acceptable specification. Due account is to be taken of the grade and tensile strength of the hull material in way of the attachment and the chemical composition of the steel is to be such as to ensure acceptable qualities of weldability.

1. 2. 8 Sailing passenger ships are to be fitted with auxiliary propulsive power to ensure adequate speed and manoeuvrability of the vessel in conditions when the sail systems are not available for use. The auxiliary propulsion and other essential machinery are to comply with the requirements of Pt 5 Main and Auxiliary Machinery of the Rules, as applicable.

1. 2. 9 Sail systems may be made up in the form of soft sails, semi-rigid and rigid sail configurations including wind turbines or systems incorporating rotating cylinders.

1. 2. 10 For sailing vessels, a continuous visual read out of the apparent wind speed and direction is to be available to the ship's master when the vessel is under way. Sail control and service systems are to provide adequate speed of response to neutralise the sail system in the event of high wind conditions. Sufficient information and evidence is to be submitted to substantiate that the foregoing arrangements are in place.

1. 2. 11 For sailing passenger ships, the Rules for classification will, in principle, apply to the mast arrangements and standing gear, but will exclude running gear, yards, booms and sail arrangements.

1. 2. 12 For sailing passenger ships, the equipment requirements will be in accordance with the letter and numeral two grades higher than that corresponding to the calculated Equipment Numeral.

1. 3 Class notations

1. 3. 1 In general, ships complying with the requirements of this Chapter will be eligible to be classed:

- **'100A1 passenger ship'**, or
- **'100A1 passenger ferry'**, or
- **'100A1 roll on-roll off passenger ship'**,or
- **'100A1 roll on-roll off passenger ferry'**,or
- **'100A1 passenger/vehicle ferry'**, or

- **'100A1 sailing passenger ship'**, or
- **'100A1 roll on-roll off cargo ship'**, or
- **'100A1 vehicle carrier'**.

1. 3. 2 متنی وجود ندارد

1. 3. 3 A ship assigned a class notation incorporating the word `passenger', which is also designed to fulfil other functions not associated with passenger carrying is to comply with the requirements of this Chapter for passenger ships together with the requirements of the relevant Chapter of this Part for the particular ship type.

1. 3. 4 Where ferries are specially reinforced for the carriage of trains on fixed rails, the class notation will also include the word `train'.

1. 3. 5 The Regulations for the classification and assignment of class notations are given in Pt 1, Ch 2 Classification Regulations, to which reference should be made.

1. 3. 6 The 'ACSPlus Guidelines' for hull construction of ships are detailed in Pt 3, Ch 16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships and the classification notations and descriptive notes associated with these procedures are given in Pt 1, Ch 2, 2 Character of classification and class notations.

1. 3. 7 The 'Structural Design Assessment' (**SDA**) and 'Construction Monitoring' (**CM**) Guidelines detailed in the *ACSPlus Guidelines Manual*, published by ACS, are mandatory for multi-decked passenger ships where it is considered that the superstructure will be subjected to a significant load from flexure of the hull girder; or, where it is required to utilise the load carrying capability of the superstructure for longitudinal strength, and for other passenger ships of abnormal hull form, or of unusual structural configuration or complexity.

1. 4 Information required

1. 4. 1 In addition to the information and plans required by Pt 3, Ch 1, 5 Information required, the following details are to be submitted:

- The intended service areas required for ships designed to operate within specified geographical limits.
- Stern or bow ramps.
- Bow, stern and side doors.
- Movable decks, if fitted, including stowing arrangements for portable components.
- Sail plans and associated operational and design conditions, including apparent wind speeds (sailing ships).
- Masts and all structural components of the standing rigging (sailing ships).
- The standing rigging and all standing rigging attachments (sailing ships).
- The design deck loadings including details of wheeled vehicles, *See* Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles, and trains, where applicable.
- Locations of fixed securing points for wheeled vehicles, with indication of the magnitude and direction of the imposed lashing force.

1. 5 Symbols

1. 5. 1 For the definition of symbols not defined in this Chapter, *See* Pt 4, Ch 1, 1.5, Symbols and definitions.

1. 5. 2 The following definitions apply to ships employing sails:

Standing rigging – Rigging of fixed length used to support masts/bowsprit.

Running rigging – Rigging used to control yards, booms and sails and which may pass over revolving sheaves.

Apparent wind speed – The vector resultant of the combination of real wind speed and ship velocity.

PART

4

CHAPTER **2** **Ferries, Roll On-Roll Off Ships and Passenger Ships**

SECTION **2** **Longitudinal strength**

2. 1 General

2. 1. 1 Longitudinal strength calculations are to be made in accordance with the requirements given in Pt 3, Ch 4 Longitudinal Strength and the additional notes contained in this Section.

2. 1. 2 The design vertical wave bending moments and design wave shear forces to be used in Pt 3, Ch 4 Longitudinal Strength are to be determined in accordance with Pt 4, Ch 2, 2.5, Design wave shear force and Pt 4, Ch 2, 2.4, Design vertical wave bending moments below. For ships of unusual hullform or where their design parameters are outwith the applicability of the Rules, *See* Pt 3, Ch 4 Longitudinal Strength, special consideration will be given to the values and distributions of the wave induced global loads.

2. 1. 3 The still water bending moment and shear force envelopes are to take into account the requirements of Pt 4, Ch 2, 2.3, Still water bending moments and shear forces.

2. 1. 4 For ships where the side shell or side casings contain large openings or where the effectiveness of the superstructures in resisting hull girder bending loads is expected to be reduced by the presence of large numbers of windows or openings, the combined hull and superstructure response may require to be verified using direct calculation techniques.

2. 2 Calculation of hull section modulus

2. 2. 1 The calculation of section modulus is to be in accordance with Pt 3, Ch 3, 3.4, Calculation of hull section modulus and the additional notes in this Section. In general, the effective sectional area of continuous longitudinal strength members, after deduction of openings, is to be used for the calculation of midship section modulus. For ships where the effectiveness of the superstructure is only partial due to the presence of large or numerous shell openings or discontinuities in the shell envelope, an equivalent section modulus for the purposes of this Section may be derived using direct calculations in accordance with the SDA Guideline relevant to the ship type.

2. 2. 2 Structural members which contribute to the overall hull girder strength are to be carefully aligned so as to avoid discontinuities resulting in abrupt variations of stresses and are to be kept clear of any form of openings which may affect their structural performances.

2. 2. 3 In general, short superstructures, *See also* Pt 3, Ch 3, 3.4 Calculation of hull section modulus 3.4.2, or deckhouses will not be accepted as contributing to the global longitudinal or transverse strength of the ship. However, where it is proposed to include substantial continuous stiffening members, special consideration will be given to their inclusion on submission of the designer's/ Builder's calculations, *See also* Pt 4, Ch 2, 2.6 Buckling strength.

2. 2. 4 Adequate transition arrangements are to be fitted at the ends of effective continuous longitudinal strength members in the deck and bottom structures.

2. 2. 5 Scantlings of all continuous longitudinal members of the hull girder based on the minimum section stiffness requirements determined from Pt 4, Ch 4, 5 Lifting appliances, equipment integration and foundations are to be maintained within 0.4L amidships. However, in special cases, based on consideration of type of ship, hull form and loading conditions, the scantlings may be gradually reduced towards the ends of the 0.4L part, bearing in mind the desire not to inhibit the ship's loading and operational flexibility.

2. 2. 6 Structural material which is longitudinally continuous but which is not considered to be fully effective for longitudinal strength purposes may be specially considered. The global longitudinal strength assessment must take into account the presence of such material when it can be considered effective. The consequences of failure of such structural material and subsequent redistribution of stresses into or additional loads imposed on the remaining structure is to be considered.

2. 2. 7 In particular, all longitudinally continuous material will be fully effective in tension whereas this may not be so in compression due to a low buckling capability. In this case, it may be necessary to derive and apply different hull girder section moduli to the hogging and sagging bending moment cases.

2. 3 Still water bending moments and shear forces

2. 3. 1 The design still water hogging and sagging bending moment distribution envelope, M_S, is to be taken as the maximum sagging (negative) and maximum hogging (positive) still water bending moments, calculated at each position along the ship. The maximum moments from all loading conditions are to be used to define the still water bending moment distribution envelope.

2. 3. 2 It is normal for ships which have a low deadweight requirement or a uniform loading rate in association with a low block coefficient to have a hogging still water bending moment in all conditions of loading. For these ships, the maximum design sagging still water bending moment may be taken as the minimum actual hogging bending moment.

2. 3. 3 The design still water shear force distribution envelope, Q_S, is to be taken as the maximum positive and negative shear force values, calculated at each position along the ship. The maximum shear forces from all loading conditions are to be used to define the still water shear force distribution envelope.

2. 4 Design vertical wave bending moments

2. 4. 1 The minimum value of vertical wave bending moment, M_w at any position along the ship may be taken as follows:

$$M_w = f_1 f_2 C_2 M_{wo} \text{kNm}$$

where

M_{wo} = $0.1 C_1 L^2 B_{WL}(C_b + 0.7)$kNm

B_{WL} = maximum waterline breadth, in metres

= C_1, C_2, L and C_b are given in Pt 3, Ch 4, 5 Hull bending strength

= and

f_1 = is given in Pt 3, Ch 4, 5 Hull bending strength

f_2 = is the hogging, f_{fH}, or sagging, f_{fS}, correction factor based on the amount of bow flare, stern flare, length and effective buoyancy of the aft end of the ship above the waterline

f_{fS} = is the sagging (negative) moment correction factor and is to be taken as

f_{fS} = $-1.10R_A^{0.3}$ for values of $R_A > 1.0$

f_{fS} = -1.10 for values of $R_A \leq 1.0$

f_{fH} = is the hogging (positive) moment correction factor and is to be taken as

f_{fH} = $$\frac{1.9C_b}{(C_b + 0.7)^d}$$

= R_A is an area ratio factor, *See* Pt 4, Ch 2, 2.4 Design vertical wave bending moments 2.4.2.

2. 4. 2 The area ratio factor, R_A, for the combined stern and bow shape is to be derived as follows:

$$R_A = \frac{30(A_{BF} + 0.5A_{SF})}{LB_{WL}}$$

Where

A_{BF} = is the bow flare area, in m^2

A_{SF} = is the stern flare area, in m^2

2. 4. 3 The bow flare area, A_{BF}, is illustrated in Figure 2. 2. 1: Derivation of bow and stern flare areas and may be derived as follows:

$$A_{BF}\text{-}A_{UB}\text{-}A_{LB}\ m^2$$

Where

A_{UB} = is half the water plane area at a waterline of $T_{C,U}$ of the bow region of the hull forward of $0.8L$ from the AP

A_{LB} = is half the water plane area at the design draught of the bow region of the hull forward of $0.8L$ from the AP

= Note the AP is to be taken at the aft end of L

= The design draught is to be taken as T, *See* Pt 3, Ch 1, 6.1, Principal particulars.

Alternatively the following formula may be used

$$A_{BF} = 0.005L(b_0 + 2b_1 + b_2) + b_0 a/2 m^2$$

Where

b_0 = projection of $T_{C,U}$ waterline outboard of the design draught waterline at the FP, in metres, *See* Figure 2. 2. 1: Derivation of bow and stern flare areas

b_1 = projection of $T_{C,U}$ waterline outboard of the design draught waterline at $0.9L$ from the AP, in metres

b_2 = projection of $T_{C,U}$ waterline outboard of the design draught waterline at $0.8L$ from the AP, in metres

a = projection of $T_{C,U}$ waterline forward of the FP, in metres

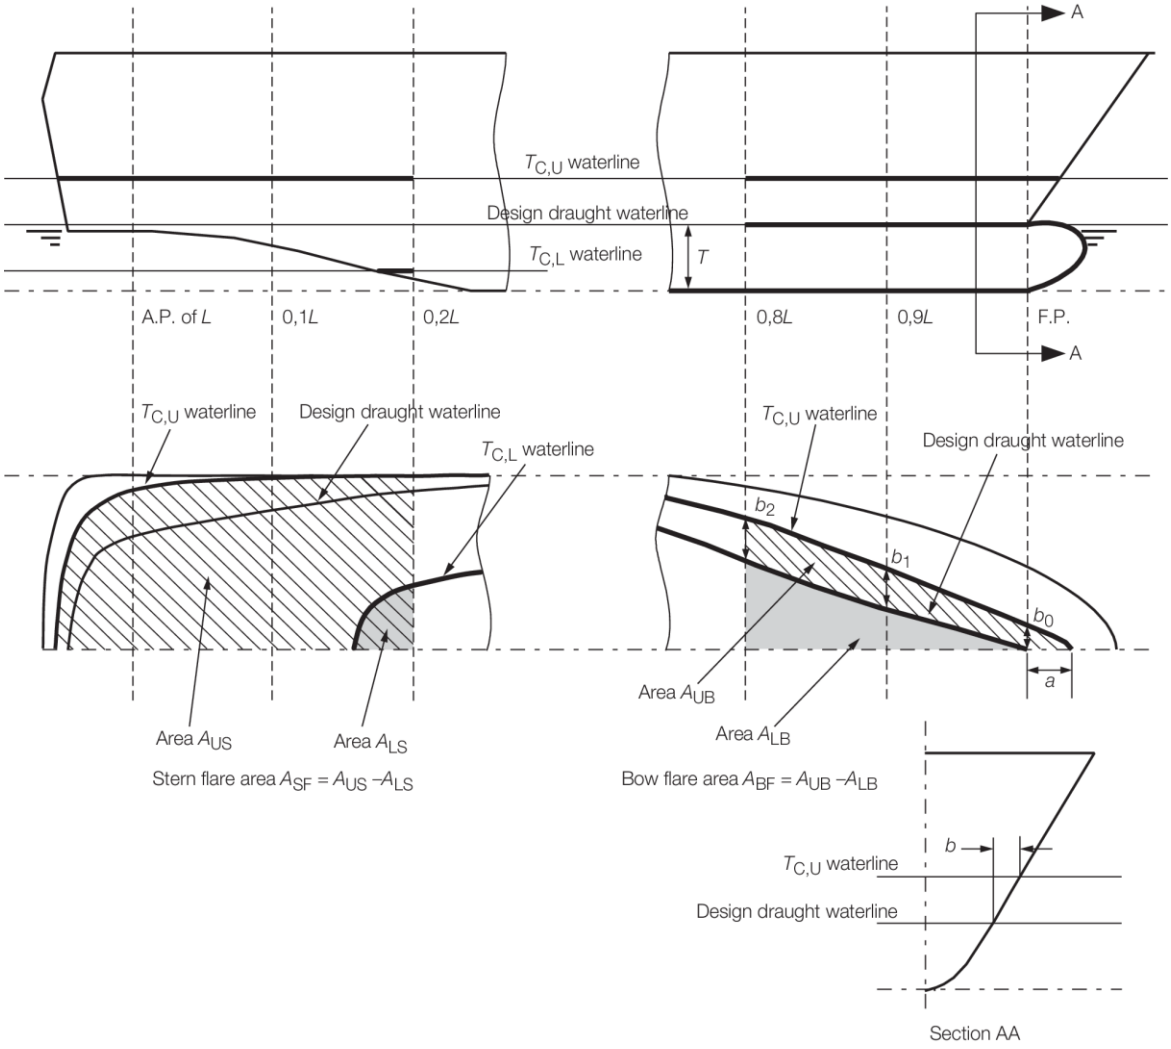
$T_{C,U}$ = is a waterline taken $C_1/2$ m above the design draught

$T_{C,U}$ = $T + \frac{C_1}{2}$ m

C_1 = is given in Pt 3, Ch 4 Longitudinal Strength Table 4. 5. 1: Wave bending moment factor

= For ships with large bow flare angles above the $T_{C,U}$ waterline the bow flare area may need to be specially considered.

Figure 2. 2. 1: Derivation of bow and stern flare areas



2. 4. 4 The stern flare area, A_{SF}, is illustrated in Figure 2. 2. 1: Derivation of bow and stern flare areas and is to be derived as follows:

$$A_{SF} = A_{US} - A_{LS} m^2$$

A_{US} = is half the water plane area at a waterline of $T_{C,U}$ the stern region of the hull aft of 0.2L from the AP

A_{LS} = is half the water plane area at a waterline of $T_{C,L}$ the stern region of the hull aft of 0.2L from the AP

$T_{C,L}$ = is a waterline taken $C_1/2$ m below the design draught

$T_{C,L}$ = $T - \frac{C_1}{2}$ m

= For ships with tumblehome in the stern region, the maximum breadth at any waterline less than $T_{C,U}$ is be used in the calculation of A_{US}. The effects appendages including bossings are to be ignored in the calculation of A_{LS}.

2. 4. 5 Direct calculation methods may be used to derive the vertical wave bending moments, *See* Pt 3, Ch 4, 2.5 Direct calculation procedures.

2. 4. 6 The sagging correction factor, f_{fS}, in the vertical wave bending moment formulation in Pt 4, Ch 2, 2.3 Still water bending moments and shear forces 2.3.1 may be derived by direct calculation methods. Appropriate direct calculation methods include a combination of long-term ship motion analysis, non linear ship motion analysis and static balance on a wave crest or trough.

2. 5 Design wave shear force

2. 5. 1 The design vertical wave shear force, Q_w, at any position along the ship is given by:

$$Q_w = K_f K_2 Q_{wo}\ kN$$

where
Q_{wo} and K_2 are given in Pt 3, Ch 4, 6.3 Design wave shear force
K_f is to be taken as follows, *See also* Figure 2. 2. 2: Shear force factor Kf:

a. Positive shear force:

K_f = 0 at aft end of L

= +0.836f_{fH} between 0.2L and 0.3L from aft

= +0.70 at 0.4L

= –0.65f_{fS} at 0.6L

= –0.91f_{fS} between 0.7L and 0.85L from aft

= 0 at forward end of L

b. Negative shear force:

K_f = 0 at aft end of L

= +0.836f_{fS} between 0.15L and 0.3L from aft

= +0.65f_{fS} at 0.4L

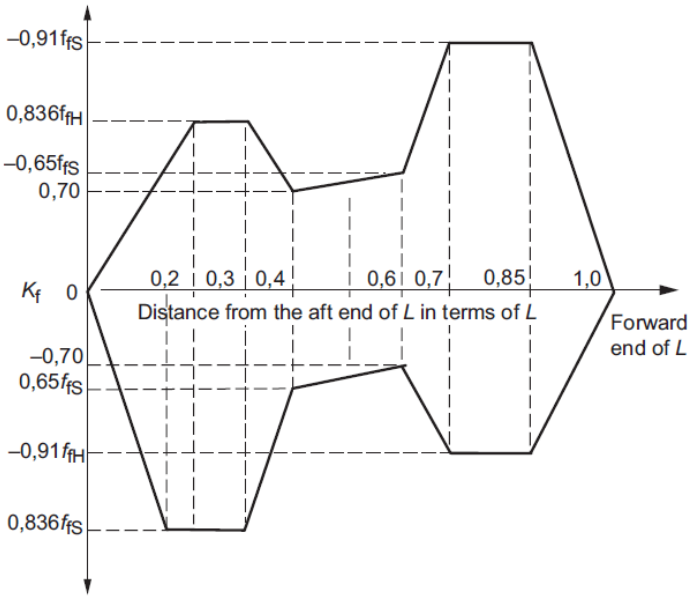
= -0.70 at 0.6$_L$

= –0.91f_{fH} between 0.7L and 0.85L from aft

= 0 at forward end of L

Intermediate values of K_f to be obtained by linear interpolation.
f_{fS} and f_{fH} are defined in Pt 4, Ch 2, 2.4 Design vertical wave bending moments 2.4.1.

Figure 2. 2. 2: Shear force factor K_f



2. 6 Buckling strength

2. 6. 1 The buckling requirements in Pt 3, Ch 4, 7 Hull buckling strength are to be applied to plate panels and longitudinals subject to hull girder compression and shear stresses. The design stresses are to be based on the design values of still water and wave bending moments and shear forces and are given in Pt 4, Ch 2, 2.4 Design vertical wave bending moments 2.4.1 and Pt 4, Ch 2, 2.5 Design wave shear force 2.5.1.

2. 6. 2 The standard deduction for corrosion, d_t, to be applied to plating and longitudinals is to be taken in accordance with Table 4. 7. 1: Standard deduction for corrosion, dt in Pt 3, Ch 4 Longitudinal Strength.

2. 6. 3 The buckling factors of safety, λ, to be applied to the corrected critical buckling stress, σ_{CRB}, of plate panels and longitudinals subjected to hull girder compression are given in Table 2. 2. 1: Buckling factors of safety, λ, where the corrected critical buckling stress is to be determined in accordance with Pt 3, Ch 4, 7.3 Elastic critical buckling stress.

2. 6. 4 The shear buckling requirements of Pt 3, Ch 4, 7.3 Elastic critical buckling stress are to be applied.

Table 2. 2. 1: Buckling factors of safety, λ

Structural item	Buckling factor of safety, λ
Longitudinally effective plating	1.0
Longitudinal stiffeners when the buckling failure mode of the attached plating is elasto-plastic, *See* Note	1.1
Longitudinal stiffeners when the buckling failure mode of the attached plating is elastic, *See* Note	1.25
Note The buckling mode of failure of the attached plating is defined as follows: elastic	$\sigma_E \leq 0.5\ \sigma_o$

elasto-plastic $\sigma_E > 0.5\ \sigma_o$

where

Note

σ_E = the elastic critical buckling stress, *See* Pt 3, Ch 4, 7.3 Elastic critical buckling stress

σ_o = specified minimum yield stress, in N/mm^2.

PART

4

CHAPTER **2** **Ferries, Roll On-Roll Off Ships and Passenger Ships**

SECTION **3** **Deck structure**

3. 1 Loading

3. 1. 1 In general, loadings for decks should comply with the requirements of Pt 4, Ch 1 General Cargo Ships except where specified in this Section.

3. 1. 2 Vehicle decks for the carriage of cars, trucks, etc. are to have a loading for wheeled vehicles as specified in Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles. Where vehicle decks are also used for the carriage of cargo, the loadings derived from Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles are to be not less than would be required by Pt 4, Ch 1 General Cargo Ships.

3. 1. 3 For ferries and passenger ships classed **100A1**, the minimum design loadings for decks are not to be taken as less than those in Table 2. 3. 1: Design deck loadings (ferries and passenger ships only).

3. 1. 4 For ferries and passenger ships classed **100A1** with a specified operating area service notation, the loadings for decks in way of baggage and accommodation spaces are to be in accordance with Table 2. 3. 1: Design deck loadings (ferries and passenger ships only).

3. 1. 5 Mooring decks, afterward and forward, other than when part of the strength deck, are to comply with the requirements for forecastles, *See* Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks. Canopy decks or aprons protecting mooring decks are to be designed using the weather head for forecastle decks reduced by 0.3 m.

3. 1. 6 For movable decks, *See* Pt 3, Ch 9, 4 Movable decks.

3. 1. 7 For train decks, the minimum design loading will be specially considered.

Table 2. 3. 1: Design deck loadings (ferries and passenger ships only)

Deck		Design pressures P_s, in kN/m^2	
		Secondary structures	Primary structures
Internal Decks	Decks in way of accommodation and public spaces (including internal muster stations), *See* Note	6.38	3.19
	Stairwell landing areas where people may congregate	6.38	6.38

	Deck supporting baggage spaces	$3.53H_t$	$3.53H_t$
	Decks in way of stores and refrigerated spaces	14.13	14.13
	Decks in way of workshop and machinery spaces (excludes A/C machinery spaces)	18.34	18.34
External Decks	Magradomes	2.45	2.45
	Balconies	3.92	1.96
	Weather exposed superstructure decks	2.26	2.26
	Weather exposed lifeboat deck, external muster stations	8.44	8.44
	Exposed decks subjected to sea loads	*See* Pt 3 Ship Structures (General), Table 3. 5. 1: Design heads and permissible cargo loadings	
Symbols			
H_t = 'tween deck height, in metres			
Note The design pressure, P_s, may be reduced by 12 per cent for ferries and passenger ships with a specified operating area service notation.			

Table 2. 3. 2: Thickness of deck plating for ferries and passenger ships where a relevant SDA is applied

Deck location	Plating thickness (mm)
Accommodation and public spaces	$t = 0.008s\sqrt{k}$
Baggage handling and storage	$t = 0.009s\sqrt{k}$
Storerooms	$t = 0.01s\sqrt{k}$
Workshops and machinery spaces	$t = 0.01s\sqrt{k}$
Weather exposed lifeboat deck	$t = 0.00083s1\sqrt{Lk} + 2.5$
Symbols	
L, k, s as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1 $s_1 = s$ but is not to be taken less than the smaller of $470 + \frac{L}{0.6}$mm or 700 mm	
Note The thickness of deck plating is in no case to be less than 5.0 mm	

3. 1. 8 For ferries, roll on-roll off cargo ships and passenger ships (other than for vehicle decks), the minimum thicknesses of decks are to be in accordance with Pt 4, Ch 1 General Cargo Ships or Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks as appropriate.

3. 1. 9 For ferries and passenger ships where direct calculations have been carried out in accordance with the SDA Guideline relevant to the ship type (including multi-decked ships), the minimum thicknesses of decks are to be in accordance with Table 2. 3. 2: Thickness of deck plating for ferries and passenger ships where a relevant SDA is applied.

3. 1. 10 For roll on-roll off cargo ships, the thickness of deck plating (other than for vehicle decks) will generally be in accordance with Pt 4, Ch 1 General Cargo Ships.

3. 1. 11 Where decks are required to resist hull girder bending, the thickness is to satisfy the requirements of Pt 3, Ch 4, 7 Hull buckling strength.

3. 1. 12 Where deck plating is required to form the effective flange of deck primary members, the thickness may need to be increased locally taking account of the compressive forces acting, *See also* Pt 3, Ch 10 Welding and Structural Details, Table 10. 4. 1: Minimum thickness of primary members.

3. 1. 13 Vehicle deck plating is to satisfy the requirements for plating loaded by wheeled vehicles as specified in Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles. Where vehicle decks are also to be used for the carriage of cargo, the thickness of plating derived from Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles is to be not less than would be required by Pt 4, Ch 1, 4.2 Deck plating.

3. 1. 14 The thickness of all other decks will generally be in accordance with Pt 4, Ch 1 General Cargo Ships.

3. 2 Deck stiffening

3. 2. 1 For ferries, roll on-roll off cargo ships and passenger ships, the deck stiffening (other than for vehicle decks) is generally to be in accordance with Pt 4, Ch 1 General Cargo Ships or Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks as appropriate.

3. 2. 2 For ferries and passenger ships where direct calculations have been carried out in accordance with the SDA Guideline relevant to the ship type (including multi-decked ships), the deck stiffening is to be in accordance with.

3. 2. 3 Vehicle deck beams and longitudinals are to have scantlings in accordance with the requirements for wheeled vehicles as specified in Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles. Where vehicle decks are also to be used for the carriage of cargo, the scantlings derived from Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles are to be not less than would be required by Pt 4, Ch 1, 4.3 Deck stiffening.

Table 2. 3. 3: Modulus of deck beams and longitudinals for ferries and passenger ships where a relevant SDA is applied

Position of beam/longitudinal	Modulus, in cm^3
Decks, excluding those for the stowage of cargo or vehicles	$Z = 0.00083 f_R P_s l_e^2 sk$ but not less than: Z = 0.025s
Symbols	
l_e, s, Z, and k as defined in Pt 4, Ch 1, 1.5, Symbols and definitions P_s = deck loading, in kN/m^2, *See* Table 2. 3. 1: Design deck loadings (ferries and passenger ships only). f_R = 1, for ships with unrestricted service f_R = 0.81 for ships with a specified operating area service notation	

3. 3 Deck supporting primary structure

3. 3. 1 For ferries, roll on-roll off cargo ships, and passenger ships the primary structure supporting four or more point loads or a uniformly distributed load is to be in accordance with Table 1. 4. 6: Deck girders, transverses and hatch beams.

3. 3. 2 For ferries and passenger ships where direct calculations have been carried out in accordance with the SDA Guideline relevant to the ship type (including multi-decked ships), the section modulus of primary members supporting four or more point loads or a uniformly distributed load is not to be taken as less than:

$$Z = 0.673SP_s\mathrm{k}l_e^2(\mathrm{cm}^3)$$

Where

l_e, S, Z and k are as defined in Pt 4, Ch 1, 1.5, Symbols and definitions

P_s = deck design loading, in kN/m^2, *See* Table 2. 3. 1: Design deck loadings (ferries and passenger ships only).

3. 3. 3 For ferries and passenger ships where direct calculations have been carried out in accordance with the SDA Guideline relevant to the ship type (including multi-decked ships), the moment of inertia of primary members supporting more than four point loads is not to be taken as less than:

$$I = \frac{1.85}{k}l_\mathrm{e}Z(\mathrm{cm}^4)$$

Where

Z, l_e and k are defined in Pt 4, Ch 1, 1.5, Symbols and definitions.

3. 3. 4 Scantlings of primary structure are to be verified for the following cases using direct calculation methods.

a. The structural support arrangement is complex either due to arrangement or loading pattern.
b. Large openings are incorporated in the webs of primary members.
c. The structure is of novel or unusual design.
d. Primary members supporting up to three point loads.

The stress criteria in Table 1. 4. 6: Deck girders, transverses and hatch beams in Chapter 1 are to be complied with.

3. 3. 5 Direct calculations should be carried out in accordance with the SDA Guideline relevant to the ship type.

3. 3. 6 Vehicle deck structure is to be of adequate strength for the upward forces imposed at fixed securing points. Local reinforcement is to be fitted as necessary.

PART

4

CHAPTER **2** **Ferries, Roll On-Roll Off Ships and Passenger Ships**

SECTION **4** **Shell envelope plating**

4. 1 Bottom and side shell

4. 1. 1 For ferries and passenger ships classed **100A1** with a specified operating area service notation the keel thickness for $0.4L$ amidships is to be as required by Pt 4, Ch 1, 5 Shell envelope plating. At ends, the keel thickness may be reduced by 25 per cent from the above value, but is to be not less than that of the adjacent shell plating.

4. 1. 2 The thickness of side shell plating above $1.6T$ including superstructures may require special consideration depending on the particular structural arrangement, hull vertical bending and shear stresses and position of the shell above the waterline. In no case are the shell scantlings above $1.6T$ to be less than the following:

a. $t_{zm} = t_{stell} - (Z_m - 1.6T)(0.24 + 0.0012L)\sqrt{\frac{ks_1}{s_b}}$

b. $t_{zm} = (4 + 0.02L)\sqrt{\frac{ks_1}{s_b}}$

c. as required by Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks

Where

t_{shell} = minimum required shell thickness above D/2 for the specific location, as calculated in Pt 4, Ch 1, 5 Shell envelope plating

t_{zm} = minimum shell thickness at Z_m

Z_m = vertical height in metres above base

= L and T as defined in Pt 3, Ch 1, 1.5 Intact stability.

= s_1, s_b as defined in Table 5. 3. 1: Shell plating forward in Pt 3, Ch 5 Fore End Structure for fore end or Table 6. 3. 1: Shell plating aft in Pt 3, Ch 6 Aft End Structure for aft end.

4. 1. 3 Openings in the side shell and superstructure plating for windows and doors are to be suitably stiffened and the thickness and grade of plating in way will be specially considered.

4. 1. 4 For ships with broad flat counter stern sections which are liable to be subjected to large wave impact loading, the effect of wave impact loading on the plating and framing of the local shell structure is to be additionally considered, *See* Pt 4, Ch 2, 4.3, Strengthening for wave impact loads and Pt 4, Ch 2, 5.2, Strengthening for wave impact loads.

4. 1. 5 The plating and framing of the forward shell structure for ships with significant bow flare is to be additionally considered with regard to wave impact loading, *See* Pt 4, Ch 2, 4.3, Strengthening for wave impact loads and Pt 4, Ch 2, 5.2, Strengthening for wave impact loads.

4. 1. 6 The minimum thickness of the shell plating at ends and for taper is to be not less than the values given in Table 2. 4. 1: End shell thickness, and is in no case to be less than 6 mm.

4. 1. 7 For ferries and passenger ships classed **100A1** with a specified operating area service notation, the bottom and side shell minimum thickness at ends may be taken 20 per cent less than that required by Table 2. 4. 1: End shell thickness and Pt 3, Ch 5 Fore End Structure and Pt 3, Ch 6 Aft End Structure, but is in no case to be less than 6 mm.

Table 2. 4. 1: End shell thickness

Scantling length	Thickness, in mm
70 m and below	$(6.5 + 0.033L)\sqrt{\frac{ks_1}{s_b}} - 1.0$
Between 70 m and 110 m	$(6.5 + 0.033L)\sqrt{\frac{ks_1}{s_b}} - 0.5$
Over 110 m	Pt 3, Ch 5 Fore End Structure and Pt 3, Ch 6 Aft End Structure
Symbols	
L as defined in Pt 3, Ch 1, 1.5 Intact stability s_1, s_b as defined in Table 5. 3. 1: Shell and deck plating in Pt 3, Ch 5 Fore End Structure for fore end or Table 6. 3. 1: Shell plating aft in Pt 3, Ch 6 Aft End Structure for aft end	

4. 2 Bow flare and wave impact pressures

4. 2. 1 This Section is applicable to:

a. bow flare region;
b. sides and undersides of sponsons; and
c. other parts of the side shell plating close to and above the design waterline that are expected to be subjected to wave impact pressures.

The wave impact pressure, P_{bf}, in kN/m^2 due to relative motion is to be taken as:

$$P_{bf} = 0.5\left(K_{bf}V_{bf}^2 + K_{rv}H_{rv}V_{rv}^2\right)\text{kN/m}^2$$

Where

K_{bf} = hull form shape coefficient for wave impacts

$= \frac{\pi}{\tan\psi}$ for $\psi \geq 10$

$= 28\,(1 - \tan(2\psi))$ for $\psi < 10$

V_{bf} = wave impact velocity, in m/s, and is given by

$= \sqrt{V_{thbf^2} + 2m_1 \ln(N_{bf})}$ for $N_{bf} \geq 1$

$= 0$ for $N_{bf} < 1$

V_{thbf} = threshold velocity for wave impact, in m/s, to be taken as:

$= \dfrac{\sqrt{10}}{\cos\ \alpha_p}$

In ( ) is the natural logarithm

N_{bf} = No. of wave impacts in a three hour period and is given by

$= 1720 PR_{bf} \sqrt{\frac{m_1}{m_0}}$

PR_{bf} = probability of a wave impact and is given by

$= e^{-u}$

$u = \left(\frac{Z_{wl^2}}{2m_0} + \frac{V_{thbf^2}}{2m_1}\right)$

Z_{wl} = distance of the centroid of the area of plating or stiffener above the local design waterline

m_1 = variance of the relative vertical velocity

$= 0.25(\omega_e f_{s1} H_{rm})^2$

m_0 = variance of the relative vertical motion

$= 0.25(f_{s1} H_{rm})^2$

ω_e = effective encounter wave frequency

$= \omega\left(1 + \dfrac{0.4 q \omega V_{sl}}{g}\right)$

where

q = 1.0 for $\frac{x}{L} \geq 0.5$

= – 0.6 for $\frac{x}{L} < 0.5$

ω = effective wave frequency based on 80 per cent ship length

$= \sqrt{\dfrac{2\pi g}{0.8 L_{wL}}}$

f_{sl} = probability level correction factor for relative vertical motion

= 1.0 for $C_b \leq 0.6$

= 1.2 for $C_b > 0.6$

V_{sl} = $0.515V$, in m/s

K_{rv} = hull form shape coefficient for impact due to forward speed

$= \frac{\pi}{\tan(90 - \alpha_p)}$ for $\alpha_p \leq 80$

$= 28\left(1 - \tan\left(2(90 - \alpha_p)\right)\right)$ for $\alpha_p > 80$

H_{rv} = relative wave heading coefficient

for $\frac{x}{L} \geq 0.5$

= 1 for $\gamma_p > 45$

= $\cos(45 - \gamma_p)$ for $\gamma_p \leq 45$

for $\frac{x}{L} < 0.5$

= 0

The point at which the following angles are to be measured for assessment of plating and stiffeners is detailed in Table 2. 4. 2: Positions at which αp, βp and γp are to be measured:

V_{rv} = relative forward speed, in m/s

= $0.515V\sin\gamma_p$

α_p = buttock angle measured in the longitudinal plane, in degrees, *See* Figure 2. 4. 1: Bow flare and bottom slamming angles and Table 2. 4. 2: Positions at which αp, βp and γp are to be measured

ψ = effective deadrise angle, in degrees

For $C_b > 0.6, \psi$ is to be taken as the maximum of α_p and β_p, *See* Figure 2. 4. 1: Bow flare and bottom slamming angles and Table 2. 4. 2: Positions at which αp, βp and γp are to be measured

For $C_b \leq 0.6, \psi$ is to be taken as the maximum of α_p and β

where

β = $\beta_p - 10°$, but is to be taken as not less than 0°

NOTE

The 10° deduction is to allow for the effects of roll motion on the impact pressures.

γ_p = waterline angle measured in the horizontal plane, in degrees, *See* Figure 2. 4. 1: Bow flare and bottom slamming angles and Table 2. 4. 2: Positions at which αp, βp and γp are to be measured.

NOTE

Where only two angles are known and are measured in orthogonal planes, the third angle may be obtained by the following expression:

α_p = $\tan^{-1}(\tan\beta_p \tan\gamma_p)$

The relative vertical motion, H_{rm}, is to be taken as

$$H_{rm} = C_{w,min}\left(1 + \frac{4.5}{(C_b + 0.2)}\left(\frac{X_{wL}}{L_{wL}} - x_m\right)^2\right)$$

Where

$C_{w,min}$ = $\dfrac{C_w}{k_m\sqrt{2}}$

C_w = a wave head in metres

Where

= $0.0771L_{WL}(C_b + 0.2)^{0.3}e^{(-0.0044\ L_{wL})}$

k_m = $1 + \dfrac{4.5(0.5 - x_m)2}{(C_b + 0.2)}$

x_m = $0.45 - 0.6F_n$ but is not to be less than 0.2

F_n = $\dfrac{0.515V}{\sqrt{gL_{WL}}}$

L_{WL} = waterline length at summer load draught

X_{WL} = longitudinal distance, in metres, measured forwards from the aft end of the L_{WL} to the location being considered

V = speed, in knots

for $\frac{x}{L} \geq 0.5$

= is to be taken as the maximum service speed, in knots, as defined in Pt 3, Ch 1, 6 Definitions For passenger yachts not required to maintain high speeds in severe weather, the value of V may be specially considered, but is not to be taken as less than the greater of $\frac{V}{3}$ or 5 knots. Where V has been specially considered it is to be noted in the classification records as a memorandum that should state: "A design speed of … knots has been used for the assessment of bow structure with regards to bow flare impacts. It should be noted that this speed may not be appropriate for all conditions and it is the responsibility of the Master to apply good Seamanship to minimise bow flare slamming."

for $\frac{x}{L} < 0.5$

= 0 knots, for passenger ships

= 5 knots, for all other ship types

C_b = Rule block coefficient.

Table 2. 4. 2: Positions at which α_p, β_p and γ_p are to be measured

Framing system	Plating	Secondary stiffeners
Longitudinally framed	Mid-distance between longitudinals	Mid-distance between frames
Transversely framed	0.5s from the bottom edge of the plate strake or primary member	Mid-distance between primary members

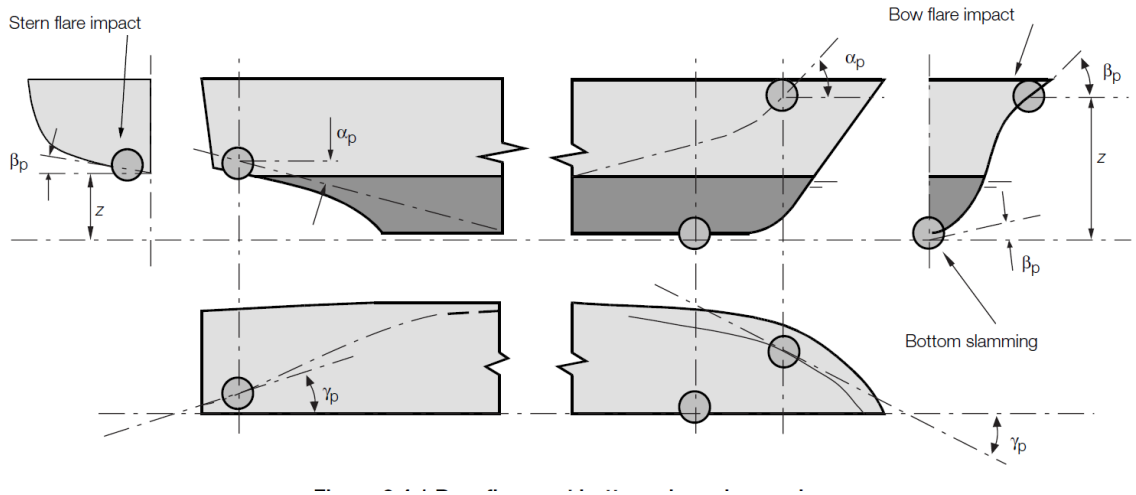
4. 2. 2 Alternatively, P_{bf} may be derived by the direct calculations carried out in accordance with a procedure agreed by ACS.

4. 3 Strengthening for wave impact loads

4. 3. 1 The shell envelope in the forward and after portions of the hull are to be strengthened against bow flare or wave impact pressure. Typically, strengthening is to be considered over the following areas:

- over the after body in way of a flat counter stern which is close to the waterline;
- over the fore end side and bow structure above the waterline and up to the deck at side;
- other areas where the hull exhibits significant flare.

Figure 2. 4. 1: Bow flare and bottom slamming angles



4. 3. 2 The thickness of the side shell plating is to be not less than:

$$t = 3.2 s_c \sqrt{k h_5} C_R \times 10^{-2} \text{ mm}$$

Where

s_c = is the length of the shorter edge of a plating panel framed by primary and secondary members, *See* Figure 2. 4. 2: Chord spacing and mean chord spacing for secondary members

h_s = equivalent wave impact head, in metres

h_s = $0.1 P_{bf}$ m

P_{bf} = is defined in Pt 4, Ch 2, 4.2 Bow flare and wave impact pressures 4.2.1

C_R = panel ratio factor

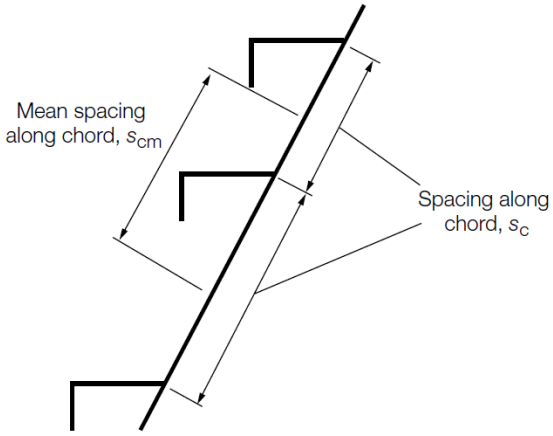
C_R = $\left(\frac{l}{s_c}\right)_{0.41}$ but is not to be taken less than 0.06 or greater than 0.1

l = overall panel length, in metres, measured along a chord between the primary members.

4. 3. 3 The structural scantlings required in areas strengthened against bow flare slamming are to be tapered to meet the normal shell envelope requirements.

4. 3. 4 The side structure scantlings required by this Section must in no case be taken less than those required by the remaining Sections of Pt 4, Ch 2 Ferries, Roll On-Roll Off Ships and Passenger Ships.

Figure 2. 4. 2: Chord spacing and mean chord spacing for secondary members



PART

4

CHAPTER **2** **Ferries, Roll On-Roll Off Ships and Passenger Ships**

SECTION **5** **Shell envelope framing**

5. 1 Side structure

5. 1. 1 The scantlings of frames, or side longitudinals, web frames or transverses, and stringers below 1.6T above base are to satisfy the requirement of Pt 4, Ch 1 General Cargo Ships and this Section, but may be required to be confirmed by direct calculation. The scantlings of these members above 1.6T from base may require special consideration on the basis of the particular structural arrangements, design deck loading, hull vertical bending stresses, and position of the member above the waterline.

5. 1. 2 The scantlings of side transverses supporting shell longitudinals above 1.6T are to satisfy the requirements of:

a. Pt 4, Ch 1, 6 Shell envelope framing, Pt 3, Ch 5, 4 Shell envelope framing and Pt 3, Ch 6, 4 Shell envelope framing.

b. The minimum geometric properties required in order to provide rotational constraint to the end of the deck transverse in way:

$$Z_s = \frac{0.677SkP_sL_d^3}{\left(\left(\frac{I_d}{I_s}\right)L_s + L_d\right)}\text{cm}^3$$

but is not to be less than $0.339SkP_sL_d^2$ cm^3

I_s is not to be less than $I_d\left(\frac{L_s}{L_d}\right)\left(\frac{Z_{dR}}{Z_d}\right)$cm^4

Where

P_s = deck design loading, in kN/m^2, *See* Table 2. 3. 1: Design deck loadings (ferries and passenger ships only)

L_d = span of adjacent deck transverse, in metres

Z_d = actual modulus of adjacent deck transverse, in cm^3

Z_{dR} = Rule modulus of adjacent deck transverse, in cm^3

I_d = moment of inertia of adjacent deck transverse, in cm^4

L_s = span of side shell transverse, in metres

I_s = moment of inertia of side shell transverse, in cm^4

S,k = as defined in Pt 4, Ch 2, 1.5 Symbols 1.5.1

= Due account should be taken of the shell window dimensions when determining the effective width of attached plating.

5. 1. 3 The required modulus of transverse main and 'tween deck frames, which may have reasonably constant convex curvature over their entire length, may be corrected for curvature as follows:

$$Z_{min} = Z_{rule}\left(\frac{1}{\text{Cosh}\left(\frac{2\pi Y_c}{l_e}\right)}\right)^3 \text{ cm}^3$$

Where

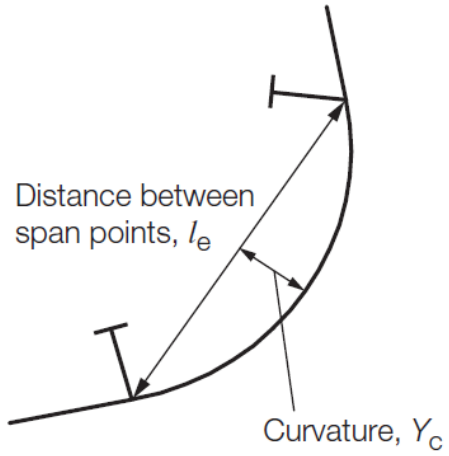
Z_{rule} = modulus requirement, in cm^3, from Pt 4, Ch 1 General Cargo Ships using l_e

l_e = distance between span support points, in metres, as shown in Figure 2. 5. 1: Distance between span support points and curvature

Y_c = curvature measured from a line intersecting the end support points to the frame at mid-span, in metres, as shown in Figure 2. 5. 1: Distance between span support points and curvature

Z_{min} = is not to be less than $0.5Z_{rule}$

Figure 2. 5. 1: Distance between span support points and curvature



5. 1. 4 Where ramp openings are fitted adjacent to the ship's side, adequate support for the side framing is to be provided.

5. 2 Strengthening for wave impact loads

5. 2. 1 The side structure in the forward and after portions of the hull is to be strengthened against bow flare or wave impact pressure. Typically, strengthening is to be considered over the following areas:

- over the after body in way of a flat counter stern which is close to the waterline.
- over the fore end side and bow structure above the waterline and up to the deck at side.
- other areas where the hull exhibits significant flare.

5. 2. 2 The scantlings of secondary stiffeners are not to be less than:

a. Effective plastic section modulus of stiffeners:

$$Z_p = 3.75 h_s S_{cm} k l_e^2 \times 10^{-3} \text{ cm}^3$$

Where

h_s = wave impact head, in metres, as defined in Pt 4, Ch 2, 4.3 Strengthening for wave impact loads 4.3.2

s_{cm} = mean spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in Figure 2. 4. 2: Chord spacing and mean chord spacing for secondary members

Other symbols are as defined in Pt 4, Ch 2, 1.5 Symbols 1.5.2

b. Web area of secondary stiffeners

$$A = 3.7 s_{cm} k h_s \left(l_e - \frac{s_{cm}}{2000}\right) \times 10\text{–}4 \text{ cm2}$$

Where

s_{cm} = mean spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in Figure 2. 4. 2: Chord spacing and mean chord spacing for secondary members

h_s = wave impact head, in metres, as defined in Pt 4, Ch 2, 4.3 Strengthening for wave impact loads 4.3.2

Other symbols are as defined in Pt 4, Ch 2, 1.5 Symbols 1.5.2.

5. 2. 3 The effective section properties of secondary stiffeners are to be taken as:

a. Plastic section modulus of secondary stiffeners, Z_p, is to be taken as:

$$Z_p = (2.8 \times 10^{-4} \, s_{cm} t_p^2) - (10^{-3} b_f b_{fc} t_f \sin \theta_e) + (5 \times 10^{-4} (h_w^2 t_w + 2 b_f t_f h_w) \cos \theta_e) \text{cm}^3$$

Where

θ_e = $C_0(90 - \varphi)$

C_o = 1.1

φ = the angle between the stiffener and the side shell, in degrees

$b\text{-}_{fc}$ = $0.5(b_f - t_w)$ for L profiles

= 0 for flat bar and T profiles

= $\frac{c}{2}$ for bulb profiles, *See* Figure 4. 7. 1: Dimensions of longitudinals in Pt 3, Ch 4 Longitudinal Strength, for c

h_w = height of stiffener web, in mm

t_w = web thickness, in mm

b_f = breadth of flange, in mm

t_f = flange thickness, in mm

t_p = thickness of attached plating, in mm

a. Web area of secondary stiffeners, A_s, is to be taken as:

$A_s = 0.01(h_w + t_p)t_w \sin\varphi \text{cm}^2$

5. 2. 4 Where the stiffener web is not perpendicular to the plating, tripping brackets have to be fitted in order to obtain adequate lateral stability.

5. 2. 5 The scantlings of primary members are not to be less than:

a. Section modulus of primary members

$Z = 2\gamma_z k h_5 q v l_e^2 cm^3$

b. Web area of primary members

$A = 0.2\gamma_A k h_s q v_e \text{cm}^2$

Where

h_s = wave impact head, in metres, as defined in Pt 4, Ch 2, 4.3 Strengthening for wave impact loads 4.3.2

= and

γ_A and γ_Z are strength factors dependent on the load position
for $q < 1$ $\gamma_A = q^3 - 2q^2 + 2$ and $\gamma_Z = 3q^3 - 8q^2 + 6q$
for $q = 1$ $\gamma_A = 1$ and $\gamma_Z = 1$

$q = \frac{u}{l_e}$ but ≤ 1

for web frames:

u = is the minimum of g_{bfv} or l_e

v = is the minimum of g_{bfh} or S_{cm}

for primary stringers:

u = is the minimum of g_{bfh} or l_e

v = is the minimum of g_{bfv} or S_{cm}

Where

l_e = is the effective length of the primary member, in metres

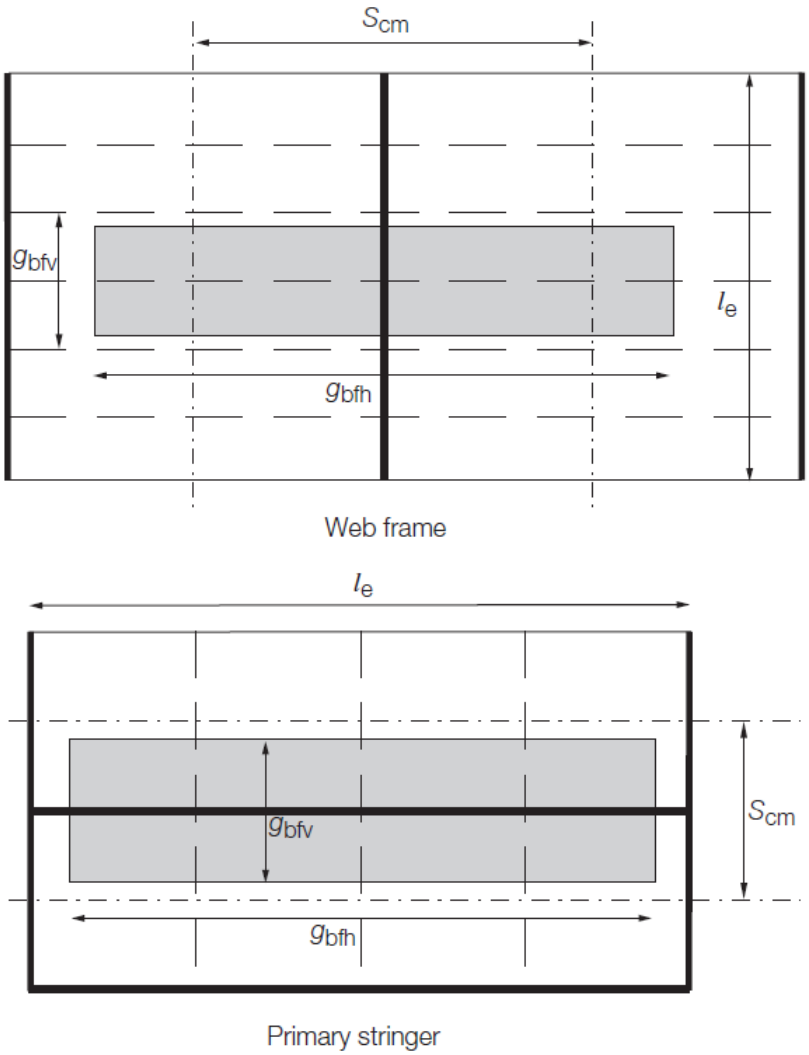
S_{cm} = is the mean spacing between primary members along the plating, in metres, *See* Figure 2. 5. 2: Mean spacing between primary members, Scm, and the extents of wave impact pressure gbfh and gbfv

= g_{bfv} and g_{bfh} are defined in Pt 4, Ch 2, 5.2 Strengthening for wave impact loads 5.2.6

= Other symbols are as defined in Pt 4, Ch 2, 1.5 Symbols 1.5.2.

c. The web of the primary member is to be adequately stiffened.

Figure 2. 5. 2: Mean spacing between primary members, S_{cm}, and the extents of wave impact pressure g_{bfh} and g_{bfv}



5. 2. 6 The extents of the wave impact pressure are to be derived as follows:

a. the vertical extent, g_{bfv}, is to be taken as:

$$g_{bfv} = \frac{4}{\sin \psi \sqrt{8\ K_{bf}}} \text{m}$$

b. the horizontal extent, g_{bfh}, is to be taken as:

$$g_{bfh} = 4 \text{ m}$$

Where

= K_{bf} and ψ are given in Pt 4, Ch 2, 4.2 Bow flare and wave impact pressures 4.2.1.

5. 2. 7 For primary members with cut-outs for the passage of secondary stiffeners, and which may have web stiffeners connected to the secondary stiffener, buckling checks are to be carried out to ensure that the primary member web plating and web stiffener will not buckle under the design load. The buckling procedure to be followed is given in Table 5. 1. 3: Buckling procedure for primary member web plating and web stiffener in Pt 3, Ch 5 Fore End Structure. Where the web stiffener

is fitted with a bracket, the buckling capability of the web stiffener in way of the cut-out is to take account of the bracket. Where no web stiffener is fitted, the buckling capability of the primary member web plating is to be checked for the total load transmitted to the connection.

5. 2. 8 Where the angle between primary structure web and the plating is less than 70°, the effective section modulus and shear area are to take account of the non-perpendicularity.

5. 2. 9 The structural scantlings required in areas strengthened against bow flare slamming are to be tapered to meet the normal shell envelope requirements.

5. 2. 10 The side structure scantlings required by this Section must in no case be taken less than those required by the remaining Sections of Pt 4, Ch 2 Ferries, Roll On-Roll Off Ships and Passenger Ships.

PART

4

CHAPTER **2** **Ferries, Roll On-Roll Off Ships and Passenger Ships**

SECTION **6** **Double bottom**

6. 1 General

6. 1. 1 A double bottom is to be fitted in accordance with Pt 4, Ch 1, 8 Double bottom structure.

6. 1. 2 Where podded drive systems are to be employed, adequate floors and girders are to be arranged in order to efficiently integrate the unit into the aft structure. The adequacy of the hull structure supporting the unit is to be verified using the maximum external forces and moments stated by the manufacturer. Due account is to be taken of additional forces induced by ship motion accelerations.

6. 2 Transmission of pillar loads

6. 2. 1 In ships where the deck centreline supports are widely spaced, transmission of the pillar loads to the double bottom structure will be specially considered, and additional reinforcement may be required if high shear and bending stresses are induced by the concentrated loads. The reinforcement should take the form of additional floors, and fore and aft girders. The final reinforcement is to be confirmed by direct calculation.

6. 2. 2 Where, in multi-decked passenger ships, the Rule deck loadings from Table 2. 3. 1: Design deck loadings (ferries and passenger ships only) have been used to determine the primary deck supporting structure, the cumulative pillar load P_p may be taken as:

$$P_p = \sum(b_p S_p) P_s \text{kN}$$

where

b_p = breadth of deck supported by pillar

S_p = mean spacing between pillars

P_s = *See* Table 2. 3. 1: Design deck loadings (ferries and passenger ships only).

6. 2. 3 Pillars are to be provided with suitable pads at their heels. Long pillars, and those terminating at the inner bottom are to be bracketed. At pillar heads, the free edges of deck primary structure face plates are to be at least 20 mm clear of the pillar head attachment weld. Where necessary, gusset plates are to be fitted at primary member intersections in way of pillars. These gussets may be applied as doublers onto the primary member face plates and should be at least equal in thickness to the pillar or the face plate, whichever is greater. Where pillars act in tension, the gussets are to be integral with the primary member face plates. The axial stress in tensile pillars is not to exceed 110/k N/mm^2 and full penetration welds are to be arranged in way of the end connections.

6. 3 Ferries and passenger ships with a specified operating area service

6. 3. 1 The thickness of double bottom centre girders may be reduced by 10 per cent, and the thickness of double bottom side girders and floors may be reduced by five per cent, from the values required by Pt 4, Ch 1, 8 Double bottom structure, but is in no case to be less than 6 mm.

PART

4

CHAPTER **2** **Ferries, Roll On-Roll Off Ships and Passenger Ships**

SECTION **7** **Peak, watertight and deep tank bulkheads**

7. 1 General

7. 1. 1 The scantlings of watertight and deep tank bulkheads are to comply with the requirements of Pt 4, Ch 1 General Cargo Ships.

7. 1. 2 The load head, h_4 to be used in watertight bulkhead scantlings for passenger ships is, in addition, to comply with the following:

- For watertight bulkhead plating, the distance from a point one-third of the height of the plate above its lower edge to a point 0.91 m above the bulkhead deck at side, or to the deepest intermediate/equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater.
- For watertight bulkhead stiffeners or girders, the distance from the middle of the effective length to a point 0.91 m above the bulkhead deck at side, or to the deepest intermediate/equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater.

7. 1. 3 Partial watertight bulkheads and webs fitted above the bulkhead deck which are to be included in damage stability calculations, are to be assessed as watertight, *See* Pt 4, Ch 2, 7.1 General 7.1.2.

7. 2 Ferries and passenger ships with a specified operating area service

7. 2. 1 The thickness of bulkhead plating for peak tanks and deep tanks, other than the collision bulkhead, may be reduced by 0.5 mm, and the modulus of bulkhead stiffeners, swedges, corrugations and girders may, in general, be reduced by 20 per cent from the values required by Pt 4, Ch 1, 9 Bulkheads.

PART

4

CHAPTER **2** **Ferries, Roll On-Roll Off Ships and Passenger Ships**

SECTION **8** **Bow doors and inner doors**

8. 1 Symbols

8. 1. 1 The symbols used in this Section are defined as follows:

a = vertical distance, in metres, from the bow door pivot to the centroid of the vertical projected area of bow door, *See* Figure 2. 8. 1: Bow door (upward hinging)

b = horizontal distance, in metres, from the bow door pivot to the centroid of the horizontal projected area of bow door, *See* Figure 2. 8. 1: Bow door (upward hinging)

c = horizontal distance, in metres, from bow door pivot to centre of gravity of bow door, *See* Figure 2. 8. 1: Bow door (upward hinging)

d = vertical distance, in metres, from bow door pivot to the centre of gravity of the bow door, *See* Figure 2. 8. 1: Bow door (upward hinging)

h = height of the door, in metres, between the levels of the bottom of the door and the upper deck or between the bottom of the door and the top of the door, whichever is the lesser, *See* Figure 2. 8. 2: Definition of α and β

k = material factor (*See* Pt 3, Ch 2, 1.2 Steel), but is not to be taken less than 0.72 unless demonstrated otherwise by a direct strength analysis with regard to relevant modes of failure

l = projected length, in metres, of the door at a height of $\frac{h}{2}$ above the bottom of the door, *See* Figure 2. 8. 2: Definition of α and β

w = width of bow door at half height, in metres

A_z = area, in m^2, of the horizontal projection of the bow door, between the bottom of the door and the top of the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door,whichever is the lesser, *See* Figure 2. 8. 1: Bow door (upward hinging). Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is the lesser

A_s = area of stiffener web, in cm^2

A_x = area, in m^2, of the transverse vertical projection of the bow door, between the bottom of the door and the top of the door or between the bottom of the door and the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, *See* Figure 2. 8. 1: Bow door (upward hinging) Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is lesser. In determining the height from the bottom of the door to the upper deck or to the top of the door, the bulwark is to be excluded

A_y = area, in m^2, of the longitudinal vertical projection of the bow door, between the bottom of the door and the top of the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, *See* Figure 2. 8. 1: Bow door (upward hinging) Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is the lesser

W = weight of bow visor, in tonnes

q = distance, in metres, from the centroid of the hydrostatic head profile, to the top of the cargo space

C_H = $0.0125L$ where $L < 80$ m

= 1.0 where $L \geq 80$ m

L = length of ship, but need not be taken greater than 200 m

V = as defined in Pt 4, Ch 2, 1.5 Symbols 1.5.1

λ = coefficient depending on the area where the ship is intended to be operated

= 1.0 for sea-going ships

= 0.8 for ships operated in coastal waters

= 0.5 for ships operated in sheltered waters

σ = bending stress, in N/mm^2

σ_e = equivalent stress, in N/mm^2

= $\sqrt{\sigma^2 + 3\tau^2}$

σ_y = yield stress of the bearing material, in N/mm^2

τ = shear stress, in N/mm^2.

Figure 2. 8. 1: Bow door (upward hinging)

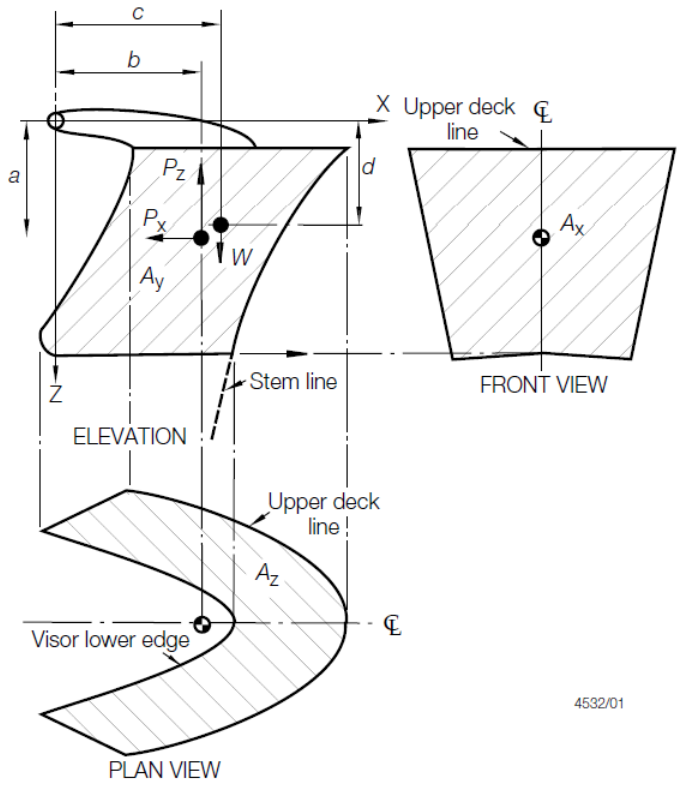


Figure 2. 8. 2: Definition of α and β

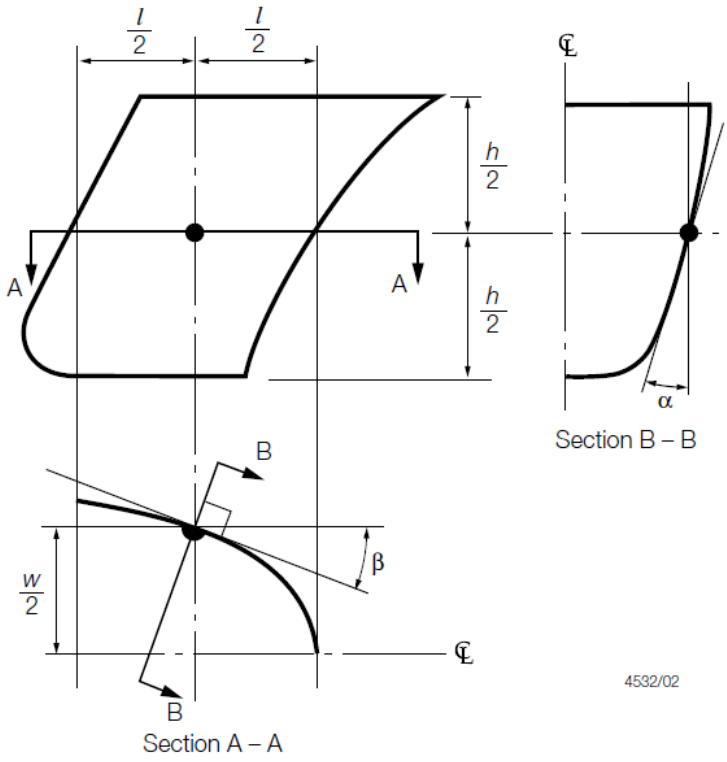


8. 2 General

8. 2. 1 Bow doors are defined by the following types:

a. Visor doors opened by rotating upwards and outwards about a horizontal axis through two or more hinges located near the top of the door and connected to the primary structure of the door by longitudinally arranged lifting arms.

b. Side-opening doors opened either by rotating outwards about a vertical axis through two or more hinges located near the outbound edges or by horizontal translation by means of linking arms arranged with pivoted attachments to the door and the ship. It is expected that side-opening bow doors will be arranged in pairs.

Other bow door types will be specially considered.

8. 2. 2 Bow doors are to be situated above the freeboard deck. A watertight recess in the freeboard deck located forward of the collision bulkhead and above the deepest waterline, fitted for arrangement of ramps or other related mechanical devices, may be regarded as a part of the freeboard deck for the purpose of this requirement.

8. 2. 3 Where bow doors lead to a complete or long forward enclosed superstructure, or to a long non-enclosed superstructure which is fitted to attain minimum bow height equivalence, an inner door is to be fitted. The inner door is to be part of the collision bulkhead. Where a sloping vehicle ramp forming the collision bulkhead above the freeboard deck is arranged, the inner door may be omitted if the ramp is weathertight over its complete length and fulfils the requirements of Pt 3, Ch 3 Structural Design concerning the position of the collision bulkhead.

8. 2. 4 Bow doors are to be fitted with arrangement for ensuring weathertight sealing, such as gaskets, and to give effective protection to inner doors.

8. 2. 5 Inner doors forming part of the collision bulkhead are to be watertight over the full height of the cargo space and arranged with fixed sealing supports on the aft side of the doors.

8. 2. 6 Bow doors and inner doors are to be arranged so as to preclude the possibility of the bow door causing structural damage to the inner door or to the collision bulkhead in the case of damage to or detachment of the bow door. If this is not possible, a second separate inner weathertight door, complying with Pt 4, Ch 2, 8.2 General 8.2.5, is to be installed.

8. 2. 7 The requirements for inner doors are based on the assumption that vehicles and cargo are effectively lashed and secured against movement from the stowed position.

8. 2. 8 For ships complying with the requirements of this Section, the securing, supporting and locking devices are defined as follows:

a. A securing device is used to keep the door closed by preventing it from rotating about its hinges.

b. A supporting device is used to transmit external and internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure.

c. A locking device locks a securing device in the closed position.

8. 2. 9 The scantlings and arrangements of side shell and stern doors are to be in accordance with the requirements of Pt 3, Ch 11, 8 Side and stern doors and other shell openings.

8. 3 Scantlings

8. 3. 1 The strength of the bow door is to be equivalent to the surrounding structure, as given in Pt 3, Ch 5, 6 Fore peak structure.

8. 3. 2 For bow doors, including bulwark, of unusual form or proportions, the areas and angles used for the determination of design values of external forces are to be specially considered.

8. 3. 3 Bow doors of the visor or hinged opening type are to be adequately stiffened, and means are to be provided to prevent lateral or vertical movement of the doors when closed. Care is to be taken to ensure that adequate strength is provided in the connections of the hinge or linking arms to the door structure and to the ship structure.

8. 3. 4 The thickness of the bow door plating is not to be less than the side shell plating calculated with the door stiffener spacing, and in no case to be less than the minimum shell plate end thickness or forecastle side thickness as appropriate.

8. 3. 5 The section modulus of horizontal or vertical stiffeners is not to be less than required for end framing. Consideration is to be given, where necessary, to differences in fixity between ship frames and bow door stiffeners.

8. 3. 6 The stiffener webs are to have a net sectional area not less than:

$$A_s = \frac{10Q}{\tau} cm^2$$

τ is to be taken as $\frac{100}{k}$ $\mathrm{N/mm^2}$

Where

Q = shear force, in kN calculated using the uniformly distributed external sea pressure, p_e, defined in Pt 4, Ch 2, 8.6, Design of securing and supporting devices 8.6.1

8. 3. 7 Bow door secondary stiffeners are to be supported by primary members constituting the main stiffening elements of the door.

8. 3. 8 The scantlings of such primary members are to be based on direct strength calculations. Normally, formulae for simple beam theory may be applied to determine the bending stress. Members are to be considered to have simply supported end connections. The design load, P_e, is the uniformly distributed external sea pressure. The formulae for P_e given in Pt 4, Ch 2, 8.6, Design of securing and supporting devices 8.6.1, may be used with α and β defined as:

α = flare angle, in degrees, generally to be measured normal to the shell between the vertical axis and the vertical tangent to the outer shell of the door measured at the point on the bow door, one half of the projected length (l/2) aft of the stern line on the plane at the half height of the door (h/2) (*See* Figure 2. 8. 2: Definition of α and β)

β = entry angle, in degrees, generally to be measured on the outer shell of the door between the longitudinal axis and the waterplane tangent measured at the point on the bow door, one half of the projected length (l/2) aft of the stem line on the plane at the half height of the door (h/2) (*See* Figure 2. 8. 2: Definition of α and β)

The permissible stresses are as follows:

$$\tau = \frac{80}{k} \quad \mathrm{N/mm^2}$$

$$\sigma = \frac{120}{k} \quad \mathrm{N/mm^2}$$

$$\sigma_e = \frac{150}{k} \quad \mathrm{N/mm^2}$$

8. 3. 9 The webs of primary members are to be adequately stiffened, preferably in a direction perpendicular to the shell plating.

8. 3. 10 The primary members of the bow doors and hull structure in way are to have sufficient stiffness to ensure the integrity of the boundary support of the doors.

8. 3. 11 All load transmitting elements in the design load path, from door through securing arrangements and supporting devices into the ship structure, including welded connections, are to be to the same strength standard. These elements include pins, supporting brackets and back-up brackets. Where cut-outs are made in the supporting structure, the strength and stiffness will be specially considered.

8. 3. 12 For bow doors and inner doors, the distribution of forces acting on the securing devices and the supporting devices is to be supported by direct calculations taking into account the flexibility of the structure and the actual position and stiffness of the supports.

8. 3. 13 The buckling strength of primary members is to be specially considered.

8. 4 Vehicle ramps

8. 4. 1 Where doors also serve as vehicle ramps, the scantlings are to be not less than would be required by Pt 4, Ch 2, 3.2 Deck plating 3.2.3 and Pt 4, Ch 2, 3.3 Deck stiffening 3.3.3 and where they form part of the collision bulkhead the arrangement is to be in accordance with Pt 3, Ch 3, 4.5 Watertight recesses, flats and loading ramps.

8. 5 Arrangements for the closing, securing and supporting of doors

8. 5. 1 Bow doors are to be fitted with adequate means of closing, securing and supporting so as to be commensurate with the strength and stiffness of the surrounding structure. The hull supporting structure in way of the bow doors is to be suitable for the same design loads and design stresses as the securing and supporting devices. Where packing is required, the packing material is to be of a comparatively soft type, and the supporting forces are to be carried by the steel structure only. Maximum design clearance between securing and supporting devices is not to exceed 3 mm.

8. 5. 2 Securing devices are to be simple to operate and easily accessible. They are to be of a design approved by ACS for the intended purpose.

8. 5. 3 Securing devices are to be equipped with positive locking arrangements. Arrangements are to be such that the devices are retained in the closed position within design limits of inclination, vibration and other motion-induced loads and in the event of loss of any actuating power supply.

8. 5. 4 Systems for door opening/closing and securing/locking are to be interlocked in such a way that they can only operate in a proper sequence. Hydraulic systems are to comply with Pt 5, Ch 14, 9 Hydraulic systems.

8. 5. 5 Means are to be provided to enable the bow doors to be mechanically fixed in the open position taking into account the self-weight of the door and a minimum wind pressure of 1.5 kN/m^2 (0.153 tonne-f/m^2) acting on the maximum projected area in the open position.

8. 5. 6 The spacing for side and top cleats should not exceed 2.5 m and there should be cleats positioned as close to the corners as practicable. Alternative arrangements for ensuring weathertight sealing will be specially considered.

8. 5. 7 Control and monitoring arrangements are to comply with Pt 6, Ch 2, 19 Ship safety systems.

8. 6 Design of securing and supporting devices

8. 6. 1 The external design forces for securing devices, supporting devices and surrounding structure are to be taken not less than P, taking the direction of the pressure into account:

$$P_x = A_x p_e$$

$$P_y = A_y p_e$$

$$P_{yz} = A_z p_e$$

Where

p_e = external sea pressure, not to be taken less than:

a. For bow doors:

$$p_e = 0.8(0.15V + 0.6\sqrt{L})^2 \text{kN/m}^2$$

or

$$p_e = 2.75\lambda C_H(0.22 + 0.15\tan\alpha)(0.4V\sin\beta + 0.6\sqrt{L})^2 \text{kN/m}^2$$

whichever is the greater.

b. For inner doors:

$$p_e = 0.45L \text{kN/m}^2$$

or

$$p_e = 10q \text{kN/m}^2$$

whichever is the greater

The symbols are as defined in Pt 4, Ch 2, 8.1 Symbols 8.1.1.

8. 6. 2 The inner door internal design pressure, considered for the scantlings of securing devices, is not to be less than 25 kN/m^2.

8. 6. 3 For visor doors, the pivot arrangement is to be such that the visor is self-closing under external loads. The closing moment, M_c, is to be taken as:

$$M_c = P_x a + l0Wc - P_z b \text{kNm}$$

but is not to be less than:

$$M_c = 10Wc + 0.1\sqrt{(a^2 + b^2)(p_x^2 + p_z^2)} kN\ m$$

8. 6. 4 For visor doors, two securing devices are to be provided at the lower part of the door, each capable of providing the full reaction force required to prevent opening of the door within the permissible stresses given in Pt 4, Ch 2, 8.6 Design of securing and supporting devices 8.6.7. The opening moment M_o, to be balanced by this reaction force, is to be taken as not less than:

$$M_o = 10Wd + 5A_X a \text{kNm}$$

8. 6. 5 For visor type doors, the securing and supporting devices, excluding hinges, are to be capable of resisting the vertical design force (P_z – 10W) kN, within the permissible stresses given in Pt 4, Ch 2, 8.6 Design of securing and supporting devices 8.6.7.

8. 6. 6 For side-opening doors, securing devices are to be provided such that in the event of a failure of any single securing device the remainder are capable of providing the full reaction force required to prevent the opening of the door. The permissible stresses given in Pt 4, Ch 2, 8.6 Design of securing and supporting devices 8.6.7 are not to be exceeded. The opening moment about the hinges to be balanced by this reaction force is not to be less than that calculated when the following loads are applied:

a. An internal pressure of 5 kN/m^2.
b. A force of $10W$ kN acting forward at the centroid of mass.

8. 6. 7 Securing devices and supporting devices are to be designed to withstand the forces given above using the following permissible stresses:

$$\tau = \frac{80}{k} \quad \text{N/mm}^2$$

$$\sigma = \frac{120}{k} \text{ N/mm}^2$$

$$\sigma_e = \frac{150}{k} \text{ N/mm}^2$$

8. 6. 8 The arrangement of securing and supporting devices is to be such that threaded bolts are not to carry support forces. The maximum tensile stress in way of threads of bolts, not carrying support forces, is not to exceed:

$$\frac{125}{k} \text{ N/mm}^2$$

8. 6. 9 For steel to steel bearings in securing and supporting devices, the nominal bearing pressure is not to exceed $0.8\sigma_y$. For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification. The nominal bearing pressure is to be calculated by dividing the design force by the projected bearing area.

8. 6. 10 The reaction forces to be applied to the effective securing and supporting devices are to be determined from the combination of external loads defined in Table 2. 8. 1: Combination of external loads.

Table 2. 8. 1: Combination of external loads

Bow door type	Combination of external loads	
	Case 1 (Head seas)	Case 2 (Quartering seas)
Visor doors, *See* Notes 1 and 2	P_x and P_z *See* Note 3	$0.7P_y$ acting on each side separately, together with $0.7P_x$ and $0.7P_z$
Side opening, *See* Notes 1 and 2	P_x, P_y and P_z acting on both doors, *See* Note 3	$0.7P_x$ and $0.7P_z$ acting on both doors and $0.7P_y$ acting on each door separately
Note *1.* P_x, P_y and P_z are defined in Pt 4, Ch 2, 8.6, Design of securing and supporting devices 8.6.1. These forces are to be applied at the centroid of the projected areas. **Note** *2.* The self-weight of the door is to be included in the combination of external loads. **Note** *3.* The Case 1 forces are generally to give rise to a zero moment about the transverse axis through the centroid of area A_x, *See*Figure 2. 8. 1: Bow door (upward hinging).		

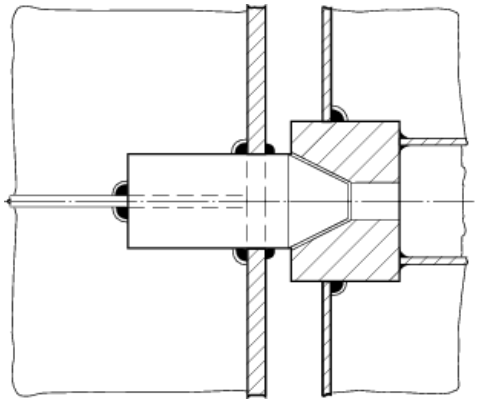
8. 6. 11 The distribution of the reaction forces acting on the securing and supporting devices is to be supported by direct calculations taking into account the flexibility of the hull structure and the actual position and stiffness of the supports. Small and/or flexible devices, such as cleats, intended to provide load compression of the packing material are not to be included in these calculations.

8. 6. 12 The hinge or linking arms of a bow door and its supports are to be designed for the static and dynamic opening forces. A minimum wind pressure of 1.5 kN/m^2, acting on the transverse projected area of the door is to be taken into account.

8. 6. 13 For side-opening doors, supporting devices are to be provided in way of girder ends at the closing of the two doors to prevent one side shifting towards the other under the effect of asymmetrical pressure. A typical arrangement is shown inFigure 2. 8. 3: Typical supporting device between doors.

8. 6. 14 Inner doors are to be gasketed and weathertight.

Figure 2. 8. 3: Typical supporting device between doors



8. 6. 15 Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included and considered to calculate the reaction forces acting on the devices.

8. 6. 16 The number of securing and supporting devices is to be the minimum practicable whilst complying with Pt 4, Ch 2, 8.6 Design of securing and supporting devices 8.6.4 and Pt 4, Ch 2, 8.6 Design of securing and supporting devices 8.6.17 and taking account of the available space for adequate support in the hull structure.

8. 6. 17 The arrangement of securing devices and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable of withstanding the reaction forces, resulting from the external loads defined in Table 2. 8. 1: Combination of external loads, without exceeding, by more than 20 per cent, the permissible stresses as defined in Pt 4, Ch 2, 8.6 Design of securing and supporting devices 8.6.7.

8. 7 Operating and Maintenance Manual

8. 7. 1 An Operating and Maintenance Manual for the bow doors and inner doors is to be provided on board and is to contain the following information:

a. main particulars and design drawings,
- special safety precautions;
- details of vessel;
- equipment and design loading for ramps;
- key plan of equipment for doors and ramps;
- manufacturers' recommended testing for equipment; and
- a description of the equipment for:
  - bow doors;
  - inner bow doors;
  - bow ramp/doors;
  - side doors;
  - stern doors;
  - central power pack;
  - bridge panel;
  - ramps leading down from the main deck;
  - engine control room panel.

b. service conditions:
- limiting heel and trim of the ship for loading/unloading;
- limiting heel and trim for door operations;
- operating instructions for doors and ramps; and

- emergency operating instructions for doors and ramps.

c. maintenance:
- schedule and extent of maintenance;
- troubleshooting and acceptable clearances; and
- manufacturers' maintenance procedures.

d. register of inspections, including inspection of locking, securing and supporting devices, repairs and renewals.

This Manual is to be submitted for approval, and is to contain a note recommending that recorded inspections of the door supporting and securing devices be carried out by the ship's staff at monthly intervals or following incidents that could result in damage, including heavy weather or contact in the region of the doors. Any damages recorded during such inspections are to be reported to ACS.

8. 7. 2 Documented operating procedures for closing and securing the bow doors and inner doors are to be kept on board and posted at an appropriate place.

PART

4

CHAPTER **2** **Ferries, Roll On-Roll Off Ships and Passenger Ships**

SECTION **9** **Subdivision structure on vehicle deck**

9. 1 General

9. 1. 1 The requirements of this Section cover subdivision structure fitted on the vehicle deck(s) of roll on-roll off passenger ships. Subdivision structure includes partition doors, bulkheads and longitudinal casings.

9. 1. 2 Where a ship is provided with subdivision structure that complies with the requirements of this Section, the ship will be eligible to be assigned the descriptive note **SSDS** (Subdivision Structure and Damage Stability).

9. 1. 3 The fitting of subdivision structure on the vehicle deck(s) forms one option to mitigate the stability-reducing effects of water on the vehicle deck(s) after damage. Such measures may be required by the National Administration with whom the ship is registered and/or by the National Administration within whose territorial jurisdiction the ship is intended to operate, for example *See* The Stockholm Agreement.

9. 2 Design loads

9. 2. 1 For calculation of the design loads, an equivalent depth of water on the first vehicle deck above the design waterline, d, in metres, is to be derived in accordance with the requirements of the National Administration, *See* Pt 4, Ch 2, 9.1 General 9.1.3

9. 2. 2 It is assumed that vehicles and cargo are effectively lashed and secured to prevent movement from the stowed position.

9. 2. 3 The design heads (*See* Figure 2. 9. 1: Design heads for different locations in compartment) are not to be taken less than the greater of 0.5 m and:

a. For transverse structure more than 1.5 m away from the longitudinal boundaries of the compartment:

$$h_{\mathrm{T}} = 1.4\sqrt{L_c dK} \text{ in metres, for z} < 1$$

$$= 1.4\sqrt{L_c dK}\left(1 - \frac{(z-1)}{1.4\sqrt{{}_c dK - 1}}\right) \text{ in metres, for } z \geq 1$$

Symbols are as defined in Pt 4, Ch 2, 9.2 Design loads 9.2.4.

b. For longitudinal structure more than $L_c/6$ away from the transverse boundaries of the compartment:

$$h_{\mathrm{L}} = \sqrt{\mathrm{B}_c \, \mathrm{d}} \text{ in metres, for z} < 1$$

$$= \sqrt{B_c\, d}\left(1 - \frac{z-1}{(1.4\sqrt{B_d}d-1)}\right) \text{ in metres, for z} \geq 1$$

Symbols are as defined in Pt 4, Ch 2, 9.2 Design loads 9.2.4.

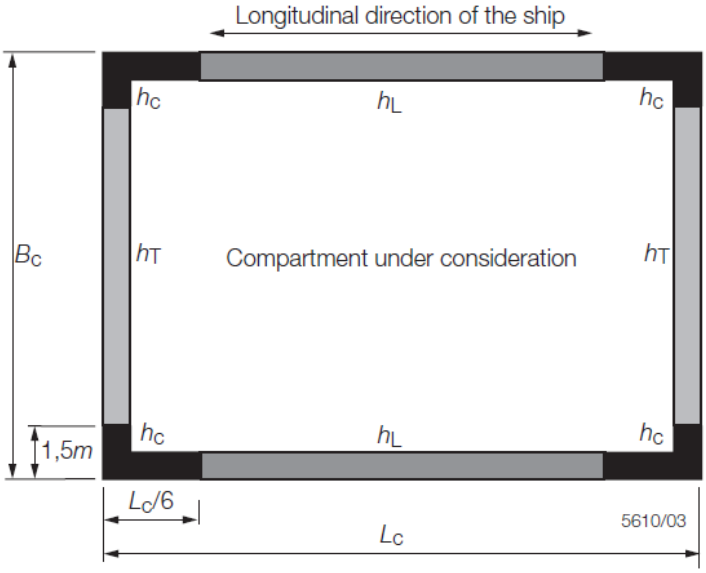
c. For structure elsewhere:

$$h_c = \frac{L_c K}{2} + \sqrt{R} \text{ in metres, for z} < 1$$

$$= \left(\frac{L_c K}{2} + \sqrt{R}\right)\left(1 - \frac{(z-1)}{1.4\left(\frac{L_c K}{2}+R\right)-1}\right) \text{ in metres, for z} \geq 1$$

Symbols are as defined in Pt 4, Ch 2, 9.2 Design loads 9.2.4.

Figure 2. 9. 1: Design heads for different locations in compartment



9. 2. 4 Symbols, as used in Pt 4, Ch 2, 9.2 Design loads 9.2.3, are defined as follows:

d = equivalent depth of water on the vehicle deck, in metres, in the upright condition taking into account the volume of flooded and accumulated water on the vehicle deck calculated in accordance with the requirements of the National Administration, *See* Pt 4, Ch 2, 9.1 General 9.1.3 and Pt 4, Ch 2, 9.2 Design loads 9.2.1

z = vertical distance, between the point under consideration and the flooded vehicle deck, in metres. For plate panels the point under consideration is to be taken as one third of the panel height above its lower edge. For stiffeners the point under consideration is to be taken as the midspan of the effective length

B_c = breadth of compartment, in metres, *See* Figure 2. 9. 1: Design heads for different locations in compartment

K = $0.21e(-^{-0.0033\,L}pp)$ and need not exceed 0.14

L_c = length of compartment, in metres, *See* Figure 2. 9. 1: Design heads for different locations in compartment

R = $B_c d - \frac{L_{2c} K_2}{12}$ and is not to be taken less than 0

e = base of natural logarithms, 2.7183

L_{pp} = as defined in Pt 3, Ch 1, 6 Definitions

9. 2. 5 The design heads calculated in Pt 4, Ch 2, 9.2 Design loads 9.2.3 are based on the ship being in the upright condition. Where the actual damaged floating position is specified, the design heads will be specially considered taking this into account.

9. 2. 6 The subdivision structure, and access doors within the subdivision structure, are to be capable of withstanding the design loading applied from the side of the compartment under consideration.

9. 2. 7 Consideration will be given to the use of design heads agreed by the National Administration.

9. 3 Height of subdivision structure

9. 3. 1 The height of the subdivision structure, H_D, is not to be less than:

- 4m, or
- $8d$, but not less than 2.2 m, or
- the height between the vehicle deck under consideration and the underside of the next watertight deck above,

whichever is the lesser.

d = is defined in Pt 4, Ch 2, 9.2 Design loads 9.2.4.

9. 3. 2 For special arrangements, such as hanging car decks or wide side casings, other subdivision structure heights may be accepted on the basis of detailed model tests in the flooded conditions under investigation by the National Administration.

9. 4 Material

9. 4. 1 Where materials other than steel are used, the scantlings are to be specially considered.

9. 5 Scantlings of subdivision structure other than doors

9. 5. 1 The minimum scantlings of subdivision bulkheads and casings are to be derived in accordance with Table 1. 9. 1: Watertight and deep tank bulkhead scantlings for watertight bulkheads, where h_4 is to be substituted by either of h_T, h_L or h_c, depending on the location under consideration.

9. 5. 2 Where a cut-out is made in the subdivision structure for the fitting of an access door, the strength and integrity of the subdivision structure are to be maintained.

9. 6 Scantlings of subdivision doors

9. 6. 1 The plate thickness of subdivision doors of single plate construction is not to be less than the greater of:

t = $0.004sf(hk)^{0.5}$ mm, or

t = 5.0 mm

Where

s,k = as defined in Pt 4, Ch 2, 1.5 Symbols 1.5.1

f = as defined in Table 1. 9. 1: Watertight and deep tank bulkhead scantlings in Pt 4, Ch 1 General Cargo Ships

h = h_T, h_L or h_c as defined in Pt 4, Ch 2, 9.2 Design loads 9.2.3, as appropriate.

9. 6. 2 For subdivision doors of a double plate construction the plate thickness is to be specially considered.

9. 6. 3 The scantlings of primary and secondary stiffeners of subdivision doors are to be based on direct strength calculations.

9. 6. 4 The direct strength calculations are also to provide an assessment of the door, under the design load, to enable the leakage and hence the drainage requirements of Pt 4, Ch 2, 9.9 Watertightness and drainage to be assessed.

9. 6. 5 For the purpose of the direct strength calculations. the stresses induced in the subdivision door, determined using the design loads from Pt 4, Ch 2, 9.2, Design loads, are not to exceed the permissible values given in Table 2. 9. 1: Permissible stress values. Checks are also to be carried out to ensure that the door will not buckle under the design loads.

Table 2. 9. 1: Permissible stress values

Stress type	Permissible stress
Direct stress	σ_o
Shear stress	$\frac{\sigma_o}{3}$
Combined stress	σ_o
Symbols	
σ_o = specified minimum yield stress, in N/mm^2	

9. 6. 6 Where a cut-out is made within the subdivision door for the fitting of an access door, the strength of the subdivision door is to be maintained.

9. 7 Closing, securing and supporting of subdivision doors

9. 7. 1 The closing and securing devices of doors are to comply with the following requirements:

a. Securing devices are to be simple to operate and easily accessible. They are to be of a design approved by ACS for the intended purpose.

b. Securing devices and supporting devices are to be designed to withstand the design loads calculated in Pt 4, Ch 2, 9.2 Design loads 9.2.1 in association with the permissible stresses shown in Table 2. 9. 2: Permissible stress values.

c. The arrangement of securing and supporting devices is to be such that threaded bolts do not carry support forces. The maximum tensile stress in way of threads of bolts not carrying support forces is not to exceed $0.5\sigma_o$.

d. For steel to steel bearings in securing and supporting devices, the bearing pressure is not to exceed $0.8\sigma_o$. For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification. The bearing pressure is to be calculated by dividing the design force by the projected bearing area.

e. Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included when calculating the reaction forces acting on the devices.

f. Securing devices are to be equipped with positive locking arrangements. Arrangements are to be such that the securing devices are retained in the closed position within design limits of inclination, vibration and other motion-induced loads and in the event of loss of any actuating power supply.
g. Hydraulic systems are to comply with Pt 5, Ch 14, 9 Hydraulic systems.
h. Control and monitoring arrangements are to comply with Pt 6, Ch 2, 19 Ship safety systems.

Table 2. 9. 2: Permissible stress values

Stress type	Permissible stress
Direct stress	$0.8\sigma_o$
Shear stress	$0.5\sigma_o$
Combined stress	$0.8\sigma_o$
Symbols	
σ_o = specified minimum yield stress, in N/mm^2	

9. 7. 2 The reaction forces to be applied to the effective securing and supporting devices are to be determined using the applicable design loads calculated using the heads in Pt 4, Ch 2, 9.2, Design loads together with the weight of the door.

9. 8 Access doors

9. 8. 1 Access doors are permitted to be fitted in subdivision doors or bulkheads in order to provide acess between compartments.

9. 8. 2 Access doors may be manually operated.

9. 8. 3 The strength of access doors is to be not less than that of the surrounding structure.

9. 8. 4 Means are to be provided to ensure that access doors are closed and secured when not in use after the ship has left the berth.

9. 8. 5 A notice is to be displayed on the access doors stating that the door is to be closed and secured at all times when not in use, when the ship is under way.

9. 8. 6 Means are to be provided on the navigation bridge to indicate whether the access doors are opened or closed.

9. 9 Watertightness and drainage

9. 9. 1 Subdivision doors and access doors are to be fitted with gaskets in order to minimise leakage. For access doors where down flooding could result, particular attention is to be paid to drainage requirements.

9. 9. 2 The gasket arrangement shall provide sufficient flexibility to absorb possible racking deformation.

9. 9. 3 Attention is drawn to the drainage requirements of Pt 5, Ch 13, 3.1 General with respect to the compartments created by subdivision structures.

9. 9. 4 The drainage arrangement for each compartment is to have sufficient capacity to handle leakage from any adjacent flooded compartment.

9. 10 Ventilation of vehicle deck spaces

9. 10. 1 Attention is drawn to the ventilation requirement of Pt 6, Ch 2, 14.13 Special requirements for ships with spaces for carrying vehicles with fuel in their tanks, for their own propulsion 14.13.3, since subdivision structure could disrupt air flow.

9. 11 Operating and Maintenance Manual

9. 11. 1 An Operating and Maintenance Manual for the subdivision doors is to be provided on board and is to contain the following:

- main particulars and design drawings,
- service conditions (e.g. service area restrictions),
- maintenance and function testing,
- register of inspections, repairs and renewals.

9. 11. 2 The Manual is to be submitted for approval. It is to contain a note recommending that recorded inspections of supporting and securing devices are to be carried out by the ship's staff at monthly intervals, or following incidents that could result in damage, including heavy weather or contact in the region of the subdivision doors. Any damages recorded during such inspections are to be reported to ACS.

9. 11. 3 Documented operating procedures for closing and securing the subdivision doors are to be kept on board and posted in an appropriate place.

PART

4

CHAPTER **2** **Ferries, Roll On-Roll Off Ships and Passenger Ships**

SECTION **10** **Masts and standing rigging**

10. 1 General

10. 1. 1 Masts are generally to be of tubular construction and may be either stayed or unstayed. Special consideration will be given to other forms of construction.

10. 1. 2 Masts are to be of sufficient strength to withstand the worst combination of loads from both the operational case with full sail, reduced sail configurations where applicable and survival conditions.

10. 1. 3 Masts are to be adequately supported using stays if necessary.

10. 1. 4 Drainage is to be provided to prevent the build-up of sea-water or condensation within the mast structure. Steel masts should, where possible, be coated internally with a suitable anti-corrosive preparation.

10. 1. 5 Openings in the masts for entry and exit of running rigging or cables should be adequately compensated with suitable insert plates or doublers.

10. 1. 6 Masts are to be efficiently integrated into the hull and in principle, carried through to the keel. Alternative arrangements of supporting masts will require to be specially considered.

10. 1. 7 Where ship response data are not available the values for roll, pitch and heave given in Table 2. 10. 1: Ship motions should be used.

10. 2 Design loadings and allowable stresses

10. 2. 1 The mast and standing rigging design is to be considered with respect to the loads from the following conditions:

R1 - Operational case with full press of sails for the maximum operational apparent wind speed as specified by the designer.

R2 - Storm conditions with reduced sail.

R3 - Survival case with sails reefed/stowed/weathervaning with the environmental loads resulting from the combination of a maximum wind speed of 63 m/sec and the accelerations produced by ship motions.

Table 2. 10. 1: Ship motions

Motion	Maximum single amplitude	Period, in seconds

Roll	$\Phi = \sin^{-1}\theta$ degrees but need not exceed 30° and is not to be taken less than 22°	$T_r = \frac{0.7B}{\sqrt{GM}}$
Pitch	$\Psi = 12e^{-0.0033L_{pp}}$ degrees, but need not exceed 8°	$T_p = 0.5\sqrt{L_{pp}}$
Heave	$\frac{L_P}{80}$ m	$T_h = 0.5\sqrt{L_{pp}}$

where

L_{pp}, B as defined in Pt 3, Ch 1, 6 Definitions

GM = transverse metacentric height of loaded ship, in metres

$\theta = \left(0.45 + 0.1\frac{L}{B}\right)\left(0.54 - \frac{L}{1270}\right)$

10. 2. 2 The mast section is to be designed to have a margin against failure due to column buckling using the greatest combined design axial and bending stress in both the transverse and fore and aft directions.

10. 2. 3 For loadcases R1 and R2 described in Pt 4, Ch 2, 10.2 Design loadings and allowable stresses 10.2.1, the following condition is to be satisfied:

$$\frac{\sigma_b}{\sigma_y} + \frac{\sigma_a}{\sigma_c} \leq 0.67$$

For loadcase R3 the following condition is to be satisfied:

$$\frac{\sigma_b}{\sigma_y} + \frac{\sigma_a}{\sigma_c} \leq 0.85$$

Where

σ_b = is the bending stress in the mast section under consideration

σ_y = is the tensile yield stress for the material

σ_a = is the axial stress in the mast section under consideration

σ_c = is the critical buckling stress for the mast section.

10. 2. 4 For thin walled masts, constructed from either flat or curved shells, calculations are to be submitted demonstrating adequate margin against local elastic instability.

10. 3 Materials of mast construction

10. 3. 1 In general masts are to be constructed from either steel or aluminium alloy tubular members, extrusions and/or welded constructions, and are, generally, to comply with Pt 2 Rules for the Manufacture, Testing and Certification of Materials, where appropriate.

10. 3. 2 Other materials will be specially considered.

10. 4 Standing rigging

10. 4. 1 Standing rigging is to be so arranged such that it does not foul running rigging or interfere with the operation of the sails. Protection is to be provided against routine quay contacts.

10. 4. 2 Standing rigging is to be effectively attached to the masts, deck and hull structure and is to be so designed that it cannot become disconnected during operation.

10. 4. 3 Standing rigging is to be properly erected using tensioning devices to ensure that the correct pre-tension is applied as specified by the designer.

10. 4. 4 The initial pre-tension applied to standing rigging is to be measured and recorded.

10. 5 Design loadings

10. 5. 1 The forces in the standing rigging are to be obtained by direct calculation methods for the load conditions given in Pt 4, Ch 2, 10.2 Design loadings and allowable stresses 10.2.1.

10. 5. 2 The minimum factors of safety on the breaking strength of shrouds and stays are as follows:

Sail cases R1 and R2	3.5
Survival case R3	2.0

10. 6 Shroud and stay attachment points

10. 6. 1 Standing rigging is to be effectively attached to the masts, ship's deck or bulwark structure. Chain plates, mast eyeplates and the structure in way are to be reinforced to withstand a load of 1.2 x breaking strength of the appropriate shroud or stay.

Generally the hull structure in way of shroud/stay attachment should be capable of withstanding the wire breaking load without permanent deformation of the structure.

10. 6. 2 Increased mast wall thickness, or internal or external mast stiffening rings or diaphragms are to be arranged in way of the toes of shroud and stay eyeplates to resist mast wall punching shear loads. Where additional mast stiffening rings or diaphragms are not fitted, the mast wall is not to be less than:

$$t_{\text{wall}} = \frac{2\left(h_{\text{eyc}}\, B_s k_{\text{mast}}\right)}{\left(t_{\text{cye}} l_{\text{eye}}\right)} (\text{mm})$$

Where

h_{eye} = eyeplate pin axis from mast wall, mm, *See* Figure 2. 10. 1: Definition of heye and leye

B_s = breaking strength, in kN, of attached rigging component

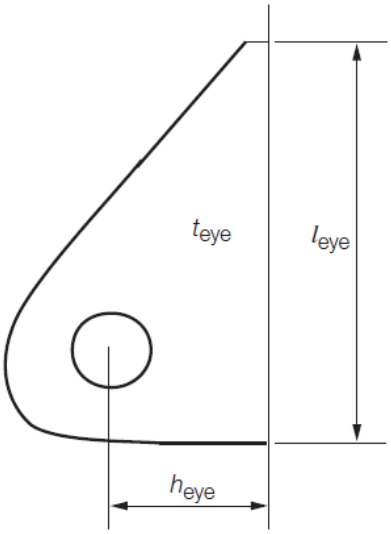
k_{mast} = mast material factor, k

t_{eye} = eyeplate thickness, mm, *See* Figure 2. 10. 1: Definition of heye and leye

l_{eye} = eyeplate length, mm, *See* Figure 2. 10. 1: Definition of heye and leye

10. 6. 3 The attachments of the stays and shrouds are to be efficiently integrated into the hull structure and due regard given to any attachments to the sheerstrake.

Figure 2. 10. 1: Definition of h_{eye} and l_{eye}



10. 6. 4 Where it is intended to use mechanical attachments (bolting) of running rigging or other gear to the mast walls, the number of holes are to be kept to a minimum and are to be staggered in order to maintain the structural integrity of the mast. All details are to be submitted.

10. 7 Materials for rigging

10. 7. 1 In general, standing rigging is to be made from galvanised steel wire rope (GSWR) with galvanised steel rigging screws, shackles and terminations, and is to comply with the requirements of ACS. Special consideration will, however, be given to other rigging materials.

10. 7. 2 Alternatively, stainless steel wire rope or solid rod rigging may be used in place of GSWR.

10. 7. 3 The steel wire rope, solid rods and loose fittings used for standing rigging are to be manufactured to a recognised National or International Standard and at an ACS approved works.

10. 7. 4 Rigging components from other sources will be specially considered.

10. 7. 5 Where stainless steel rigging is employed, particular attention is to be given to the selection of the grade of material used as some stainless steels are prone to stress corrosion cracking and consequent fatigue failure, the onset of which is not readily observed.

10. 7. 6 Attention is drawn to the requirements of the Flag Administration for the vessel who may have requirements regarding the application of certain materials, systems or criteria.

10. 8 Testing and certification

10. 8. 1 All equipment items used for standing rigging, including loose items of gear such as shackles, bottle screws, sheaves, etc. are to be tested and surveyed in accordance with ACS requirements. For systems employing specialised devices or materials, individual consideration will be given to the testing and survey requirements.

10. 8. 2 For sailing passenger ships, the equipment requirement will be in accordance with the letter and numeral two grades higher than that corresponding to the calculated Equipment Numeral.

PART

4

CHAPTER **2** **Ferries, Roll On-Roll Off Ships and Passenger Ships**

SECTION **11** **Miscellaneous openings**

11. 1 General

11. 1. 1 The requirements of Pt 3, Ch 11, 6 Miscellaneous openings are to be complied with.

11. 2 Openings in main vehicle deck

11. 2. 1 Where the main vehicle deck is enclosed, all companionways and openings in the deck which lead to spaces below are generally to be protected by steel doors or hatch covers. Approved fire doors may be accepted in lieu of steel doors. The sills or coamings are to be not less than 230 mm above the main vehicle deck, with the exception of those leading to machinery spaces which are to have sills or coamings not less than 380 mm. Exceptionally, when such openings are to be kept closed at sea, sills or coamings may be reduced in height, provided that the sealing arrangements are adequate. In such cases, the doors or hatch covers are to be secured weathertight by gaskets and a sufficient number of clamping devices. Such items as portable plates in the main vehicle deck arranged for the removal of machinery parts, etc. may be arranged flush with the deck, provided they are secured by gaskets and closely spaced bolts at a pitch not exceeding five diameters.

11. 2. 2 Scuppers from vehicle or cargo spaces above the bulkhead deck fitted with an approved fixed pressure water spray fire-extinguishing system are to be led directly overboard and are to be fitted with means of preventing water from passing inboard in accordance with Pt 3, Ch 12, 4.2 Closing appliances.

11. 2. 3 Inboard draining scuppers do not require valves but are to be led to suitable drain tanks (not engine room or hold bilges) and the capacity of the tanks is to be sufficient to hold approximately 20 minutes of drenching water. The arrangements for emptying these tanks are to be approved and suitable high level alarms provided.

11. 2. 4 A drainage system is to be arranged in the area between bow door and ramp, or where no ramp is fitted, between the bow door and inner door. The system is to be equipped with an audible and visual alarm function to the navigation bridge being set off when the water levels in these areas exceed 0.5 m or the high water level alarm, whichever is the lesser.

11. 2. 5 The drainage arrangement for each area is to have sufficient capacity to prevent accumulation of water in case of leakage. Scuppers are to be provided on both sides of the ship with a diameter not less than 50 mm and in accordance with Pt 3, Ch 12, 4 Scuppers and sanitary discharges. Alternatively, a bilge suction should be provided.

11. 2. 6 If the main vehicle deck is not totally enclosed, scuppers or freeing ports are to be provided consistent with the requirements of Pt 3, Ch 8, 5.3 Freeing arrangements.

11. 2. 7 Air pipes from cofferdams or void spaces may terminate in the enclosed 'tween deck space on the main vehicle deck provided the space is adequately ventilated and the air pipes are provided with weathertight closing appliances.

11. 2. 8 Between the bow door and the inner door a television surveillance system is to be fitted with a monitor on the navigation bridge and in the engine control room. The system must monitor the position of doors and a sufficient number of their securing devices. Special consideration is to be given for lighting and contrasting colour of objects under surveillance, *See also* Pt 4, Ch 2, 8.5 Arrangements for the closing, securing and supporting of doors 8.5.7.

11. 3 Strength assessment of windows in large passenger ships

11. 3. 1 On windows in the second tier and higher above the freeboard deck, a glazing equivalent may be fitted in lieu of deadlights/storm covers. The thicknesses and arrangements are to be acceptable to the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the ship is intended to operate. For arrangements of glazing acceptable to ACS, *See* Table 2. 11. 1: Acceptable arrangements of glazing in lieu of portable storm covers/deadlights. Alternative arrangement of glazing in lieu of deadlights/storm covers may be accepted provided details are submitted for consideration.

11. 3. 2 For passenger ships the design pressure, H_d, on windows is to be taken as given in Table 2. 11. 2: Design pressure, Hd, on windows, or an equivalent National or Internationally Recognised Standard.

11. 3. 3 The thickness, t_o, of toughened safety glass is to be taken as given in Table 2. 11. 3: Thickness of toughened glass.

11. 3. 4 Toughened safety glass of laminated construction will also be accepted, provided the requirements of Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights 6.5.29 are complied with.

Table 2. 11. 1: Acceptable arrangements of glazing in lieu of portable storm covers/deadlights

In lieu of portable storm covers	In lieu of deadlights and storm covers
 $t_1^2 + (0{,}77t_2)^2 + t_1^2 = (1{,}2t_0)^2$	 $t_0^2 + t_0^2 = (1{,}4t_0)^2$ Symbols	
t_0 = minimum thickness of toughened glass as calculated in Table 2. 11. 3: Thickness of toughened glass	

Table 2. 11. 2: Design pressure, H_d, on windows

Window location	Design pressure head H_d in metres
Between the design waterline and a point $Z_{1.5}$ m above the waterline	Per BS MA 25: 1973
Between a point $Z_{1.5}$ m above the waterline and the deck immediately above (at $Z_{d1.5}$)	1.5
Over the next 2 'tween deck heights	$1.5 - f_w\left(\frac{Z_w - Z_{dL,s}}{H_{t1} + H_{t2}}\right)$
For subsequent decks to the top of the navigation bridge	0.25 sides and aft ends 0.75 house fronts
From the top of the navigation bridge to the uppermost deck, for house fronts	0.75 at top of navigation bridge 0 at uppermost continuous deck, with linear variation between, but not less than 0.25
From the top of the navigation bridge to the uppermost deck, at sides and aft ends	0.25

Symbols

f_w = 1.25 in way of sides and ends of superstructures

= 0.75 in way of house fronts

$Z_{1.5}$ = the vertical location in metres above the waterline at which the BS MA:25 pressure as given in Annex E of BS MA:25 (is 1973) 1.5t/m^2

$Z_{d1.5}$ = the vertical location in metres of the deck at which the pressure is 1.5 t/m^2 from Table 2. 11. 1: Acceptable arrangements of glazing in lieu of portable storm covers/deadlights

Z_w = the vertical location in metres above the waterline to the point under consideration

$H_{t1}+H_{t2}$ = sum of the appropriate 'tween deck heights in metres

Table 2. 11. 3: Thickness of toughened glass

Window type	Thickness, t_o, in mm
Rectangular	$b\sqrt{\frac{H_d\beta}{4000}}$
Circular	$0.0175r\sqrt{H_d}$
Semi-circular	$0.011r\sqrt{H_d}$

Symbols

b	= length of shorter side of window, in mm
H_d	= design pressure head, in metres, as calculated in Table 2. 11. 2: Design pressure, Hd, on windows
β	= $0.54_{\ R} - 0.078A_R^2 - 0.17$ for $A_R \leq 3$
	= 0.75 for $A_R > 3$
A_R	= aspect ratio of window, in mm
	= a/b
a	= length of longer side of window, in mm
r	= the radius of the window, in mm

11. 4 Frame design and testing

11. 4. 1 **Application**. The testing requirements contained in this Section are for all exterior window and glass balustrade designs on all tiers for passenger ships regardless of length. The testing is to be carried out for characteristic window and balustrade sizes (largest, smallest) and forms (circular, semicircular and rectangular) for each passenger ship. Window and balustrade designs, which are not covered by Type Approval Certification, will require prototype testing in order to confirm structural integrity and weather or water tightness as required. Tests are to be carried out to the satisfaction of the Surveyor.

11. 4. 2 **Water tightness**. hydrostatic test is to be carried out in order to examine the water tightness of windows. This is carried out by applying the design pressure head H_d, as calculated in Pt 4, Ch 2, 11.3, Strength assessment of windows in large passenger ships, to the external face of the window and maintained at this level for at least 15 minutes.

11. 4. 3 **Structural testing**. A hydrostatic test is to be carried out in order to examine the capability of the frame, mullions and the retaining arrangement for the glazing. This is carried out by applying a test pressure of $4H_d$ (H_d as calculated in Pt 4, Ch 2, 11.3, Strength assessment of windows in large passenger ships for windows and Pt 4, Ch 2, 12.3 Weather design loads for balustrades) to the external face of the window, utilising an aluminium alloy plate of appropriate temper and thickness to simulate the flexural response in lieu of the glazing. A full-scale test with actual glazing in place may be acceptable provided that the stresses induced are within allowable limits. Details of the calculations made and testing procedures are to be submitted for review prior to the test. Alternative means of demonstrating adequacy of frame, mullions and the retaining arrangement for the glazing may be specially considered.

11. 4. 4 Equivalent proposals for testing will be considered. Where alternative testing procedures are proposed, these are to be agreed with ACS before commencement.

11. 4. 5 **Chemically toughened glass.**

a. Chemically toughened glass may be used in lieu of thermally toughened glass provided it can be demonstrated the strength of the arrangement is at least equivalent in strength to that of thermally toughened glass.
b. The glazing system is to be of laminated construction.
c. Method of testing will be specially considered.

11. 4. 6 The overlap between glazing and the retaining frame is not to be less than 12 mm.

11. 5 Strength of mullions

11. 5. 1 The section modulus of mullions is not to be less than:

$$Z = 10.78 H_d l A_m k 10^{-9} cm^3$$

where

a = *See* Table 2. 11. 4: Mullion arrangements

b = *See* Table 2. 11. 4: Mullion arrangements

r = *See* Table 2. 11. 4: Mullion arrangements

l = a for rectangular windows

= $2r$ for semi-circular windows

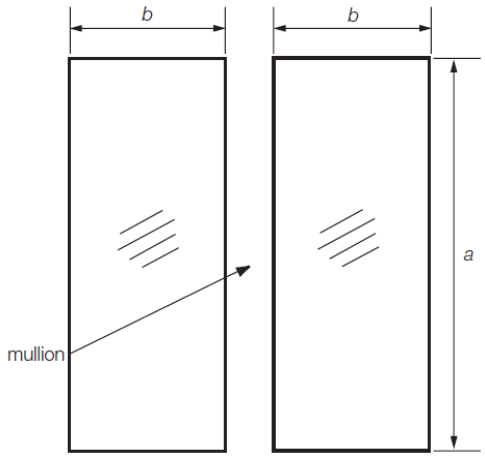
H_d = design pressure head, in metres, as calculated in Pt 4, Ch 2, 11.3 Strength assessment of windows in large passenger ships 11.3.2

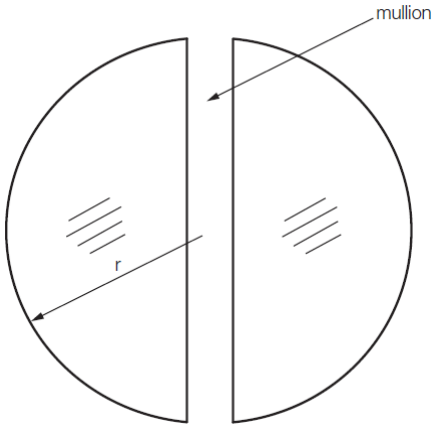
A_m = ab for rectangular windows

= $1.22r^2$ for semi-circular windows

k = as defined in Pt 4, Ch 2, 1.5 Symbols 1.5.1.

Table 2. 11. 4: Mullion arrangements

Rectangular windows	Semi-circular windows
	




Symbols

a = dimension parallel to mullion, in mm

b = length of shorter side of window, in mm

r = radius of the window, in mm

11. 6 Bonded windows and side scuttles

11. 6. 1 A ‘bonded window’ or ‘bonded side scuttle’ is one in which the glazing material is secured in its frame from outside of the ship by glue or other adhesive material. No mechanical fixing is provided for the glazing. Bonded windows and side scuttles are to comply with the requirements of Pt 4, Ch 2, 11 Miscellaneous openings. Proposals to secure glazing from the inside of the ship are to be specially considered using the requirements in this Section as a basis. It should be noted that bonding from the inside is not recommended and where it is proposed, further testing will be

required. Non-load bearing secondary bonded glazing, e.g. glazing to improve thermal insulation, is not required to comply with the requirements of this sub- Section.

11. 6. 2 The adhesive is to be flexible enough to support the glazing without holding it firm. The glue strip is to be elastic, with width and thickness designed to allow the glazing to move in both directions in the plane of the glazing without undue forces on the bonding or the substrate. The glass is to be free to settle under-load and not to be forced to follow deflections in the supporting structure. If substantial racking of the glazing opening under-load is expected, the bonding is to be designed to accommodate such deflections.

11. 6. 3 Bonded windows and side scuttles may be considered as acceptable, in general, depending on their position, size of vessel and applicable statutory requirements, noting the distinction between glazing and the frame, which may have different requirements.

11. 6. 4 Bonded windows are not permitted in galley areas, including glazing in galley doors (internal or external). They are not permitted on escape routes and evacuation routes where a fire rating is required. The fire integrity of bulkheads is not to be impaired.

11. 6. 5 Bonded windows and side scuttles are not acceptable on fire-fighting vessels, i.e. those with a fire-fighting notation.

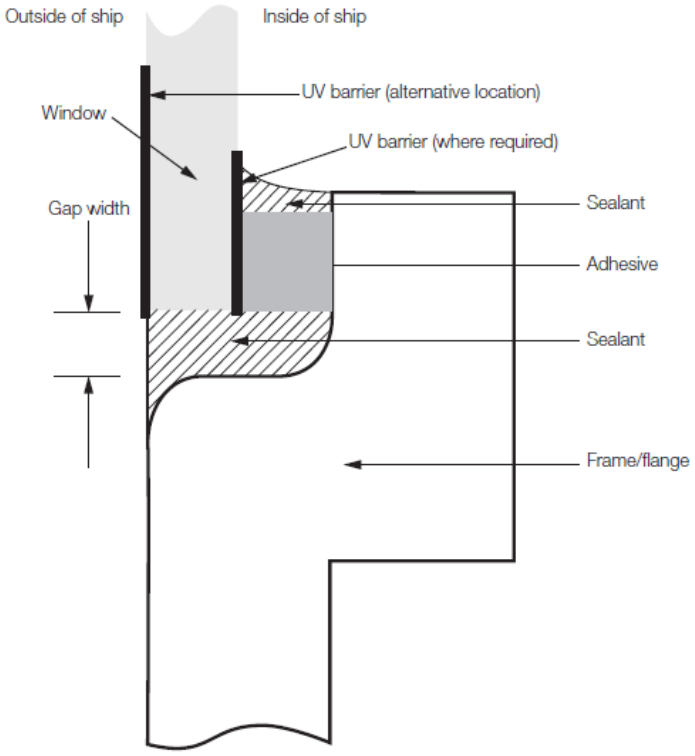
11. 6. 6 The failure of laminated glass is considered to pose a lower risk to safety than that of single pane glass. In the event of breaking, laminated glass more readily holds together and tends not to break up into large sharp pieces. Therefore, in general, laminated glazing is preferred. When laminated glass is used, the sealant is to be compatible with the interlayer. Lamination thickness is to be in accordance with Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights 6.5.29. Special consideration will be given to single pane toughened safety glass.

11. 6. 7 The durability of the adhesive and the sealant in the long term marine environment is to be considered in the approval process. Adhesive is to be approved in accordance with Ch 14, 2.15 Adhesive and sealant materials of the Pt 2 Rules for the Manufacture, Testing and Certification of Materials . The adhesive bead is to be resistant to or protected from UV radiation, either by an optically dense area at the edges of the glazing or by overlapping trim or UV shielding tape. The adhesive bead is to be resistant to or protected from fungal attack. Arrangements are to be in accordance with the adhesive manufacturer's published guidelines and relevant ACS Rules.

11. 6. 8 The edges of the bonding recess are to be rounded to facilitate the application of the sealant without air entrapment. The width of the gap between the flange and the glazing is to be large enough to accommodate the movement of the glazing as a result of hull deflection and thermal expansion, *See* Figure 2. 11. 1: Gap width between flange and window, bonded from outside of the ship. Recommended gap widths for bonded windows are to be taken as:

Gap width	Length of longest side of window
10–15 mm	<1.5 m
15–20 mm	1.5–3.0 m.

Figure 2. 11. 1: Gap width between flange and window, bonded from outside of the ship



11. 6. 9 The minimum adhesive width and thickness are to be in accordance with the adhesive manufacturer's published guidelines.

PART

4

CHAPTER **2** **Ferries, Roll On-Roll Off Ships and Passenger Ships**

SECTION **12** **External glass balustrades**

12. 1 General

12. 1. 1 Attention is drawn to relevant requirements of National and International Standards concerning the construction of barriers using glass, as well as applicable statutory regulations for the Protection of Crew, *See* the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988* and its Protocol of 1988.

12. 1. 2 The requirements of this Section apply solely to external glass balustrades. External glass balustrades are barriers constructed with glass that are used on exposed decks.

12. 2 Design considerations

12. 2. 1 External glass balustrades should not be situated in areas deemed essential for the operation of the ship. Such areas include mooring decks, lifeboat decks, external muster stations and in the vicinity of davits. Where external glass balustrades are not to be used, more traditional bulwarks or guard rails are to be fitted in accordance with Pt 3, Ch 8, 5 Bulwarks, guard rails and other means for the protection of crew.

12. 2. 2 External glass balustrades are to be designed to resist the most unfavourable anticipated loads within service, including weather loads or personnel loads without unacceptable deflection. Detailed plans and calculations are to be submitted clearly indicating the position, arrangement and the anticipated loads for all external glass balustrades.

12. 2. 3 External glass balustrades are to be not less than 1.0 m in height.

12. 2. 4 External glass balustrades are to provide water freeing areas in accordance with Pt 3, Ch 8, 5.3 Freeing arrangements.

12. 2. 5 Laminated toughened safety glass is to be used for the glazing of all external glass balustrades.

12. 2. 6 In general openings should not be greater than 76 mm unless required for water freeing. Openings for water freeing are not to be greater than 230 mm.

12. 2. 7 Consideration should be given to minimising the possibility of surface deterioration of the balustrade glass infill panels in service by means of suitable edge protection or finishes.

12. 2. 8 The total horizontal deflection of external glass balustrades is not to exceed 25 mm when subject to the anticipated loads specified in Pt 4, Ch 2, 12.3 Weather design loads or Pt 4, Ch 2, 12.4 Personnel design loads .

12. 2. 9 Special consideration may be given to external glass balustrades that are not constructed in accordance with this Section.

12. 3 Weather design loads

12. 3. 1 External glass balustrades are to be designed to resist the anticipated weather loadings dependent on their location specified in Table 2. 11. 2: Design pressure, Hd, on windows. It is recommended that the equivalent monolithic thickness of the glass infill panels be derived through direct calculations using the design pressures given in Table 2. 11. 2: Design pressure, Hd, on windows and a safety factor of 2 on the characteristic failure strength of toughened safety glass. The equivalent laminated toughened safety glass thickness can then be obtained in accordance with Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights 6.5.29.

12. 4 Personnel design loads

12. 4. 1 External glass balustrades are to be designed to resist the most unfavourable anticipated personnel loads, which are to be specified by the designer. The specified personnel loads are to be not less than 1.5 times the commensurate loads specified in *EN 1991-1-1:2002 Eurocode 1: Actions on structures – Part 1-1: General actions – Densities, self-weight, imposed loads for buildings*.

12. 5 Balustrade stanchions

12. 5. 1 External glass balustrades are to be fitted with fixed stanchions of adequate strength to resist the anticipated loads imposed between stanchions specified in Pt 4, Ch 2, 12.3 Weather design loads and Pt 4, Ch 2, 12.4 Personnel design loads using a bending stress coefficient not greater than 0.6.

12. 6 Balustrade top rail

12. 6. 1 External glass balustrades are to be fitted with a continuous top rail.

12. 6. 2 The top rail is to be sufficiently stiff so as not to permanently deflect when subject to the personnel loads specified in Pt 4, Ch 2, 12.4 Personnel design loads .

12. 6. 3 The top rail is to be sufficiently stiff so as not to deflect more than $L_b/96$ when subject to the personnel loads specified in Pt 4, Ch 2, 12.4 Personnel design loads .

Where

L_b = span of top rail between stanchions, in m.

12. 6. 4 The top rail minimum section modulus is to be greater than:

$$Z = \frac{141 \times q_k \times L_b^2}{f_\sigma \sigma_o} \text{cm}^3$$

Where

L_b = span of top rail between stanchions, in m.

q_k = line load on top rail, in kN/m, in accordance with Pt 4, Ch 2, 12.4 Personnel design loads and to be taken not less than 1 kN/m

σ_o = specified minimum yield stress in N/mm^2.

f_σ = bending stress coefficient not to be taken greater than 0.6.

12. 7 Impact Resistance and Containment

12. 7. 1 External glass balustrades are to be subject to a prototype pendulum impact test in accordance with *EN 13049:2003 Windows — Soft and heavy body impact — Test method, safety requirements and classification*or an equivalent National or International Standard utilising a drop height of not less than 1.5m. The test specimens including the retaining arrangements should be the same as the finished installation.

PART

4

CHAPTER **2** **Ferries, Roll On-Roll Off Ships and Passenger Ships**

SECTION **13** **Direct calculation**

13. 1 Application

13. 1. 1 Direct calculations are to be employed in derivation of scantlings where required by preceding Sections of this Chapter or by related provisions included in Pt 3 Ship Structures (General).

13. 1. 2 Direct calculation methods are also generally to be used where additional calculations are required by the Rules in respect of unusual structural arrangements.

13. 2 Procedures

13. 2. 1 For details of ACS's direct calculation procedures, *See* Pt 3, Ch 1, 2 Direct calculations. For requirements concerning use of other calculation procedures, *See* Pt 3, Ch 1, 3 Equivalents.

CHAPTER **3** **Tugs**

SECTION **1** **General**

1. 1 Application

1. 1. 1 Sections 1 to 8 of this Chapter apply to tugs.

1. 1. 2 Pt 4, Ch 3, 9 Escort operation, performance numeral and trials of this Chapter applies to tugs and offshore supply ships intended to provide escort operation.

1. 1. 3 The scantlings and arrangements are to be as required by Pt 4, Ch 1 General Cargo Ships except as otherwise specified. The draught, T, used for the determination of scantlings is to be not less than $0.85D$.

1. 2 Class notations

1. 2. 1 Ships complying with relevant requirements will be assigned one or more of the class notations given in Table 3. 1. 1: Class notations.

1. 2. 2 Tugs intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.6 to Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.10, will receive individual consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval. In particular, tugs complying with the requirements of this Chapter and Pt 3, Ch 13, 7 Equipment for the relevant reduced equipment requirements, will be eligible to be classed:

- **A1 tug protected waters service**; or
- **A1 escort tug protected waters service**; or
- **A1 escort tug EPN (F,B,V,C) protected waters service**; or
- **A1 escort tug EPN (CFD: F,B, V) protected waters service**; or
- **100A1 tug with service restriction notation**; or
- **100A1 escort tug with service restriction notation**; or
- **100A1 escort tug EPN (F,B,V,C) with service restriction notation**; or
- **100A1 escort tug EPN (CFD: F,B, V) with service restriction notation**;

whichever is applicable.

1. 2. 3 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 Classification Regulations to which reference should be made.

Table 3. 1. 1: Class notations

Class Notation	Applicable Sections
100A1 tug	Pt 4, Ch 3, 1 General to Pt 4, Ch 3, 8 Fenders
100A1 escort tug	Pt 4, Ch 3, 1 General to Pt 4, Ch 3, 9 Escort operation, performance numeral and trials, except Pt 4, Ch 3, 9.3, Performance numeral and trials and Pt 4, Ch 3, 9.4 Computational Fluid Dynamics Predicted Performance
100A1 escort tug EPN (F, B, V, C)	Pt 4, Ch 3, 1 General to Pt 4, Ch 3, 9 Escort operation, performance numeral and trials except Pt 4, Ch 3, 9.4 Computational Fluid Dynamics Predicted Performance
100A1 escort tug EPN (CFD: F, B, V)	Pt 4, Ch 3, 1 General to Pt 4, Ch 3, 9 Escort operation, performance numeral and trials, except Pt 4, Ch 3, 9.3, Performance numeral and trials
Note Tugs which comply with the anchor handler requirements in Pt 4, Ch 4, 1 General to Pt 4, Ch 3, 8 Fenders will be eligible for the additional notation **anchor handler**.	

1. 3 Information required

1. 3. 1 In addition to the information and plans required by Pt 3, Ch 1, 5 Information required, plans covering the following items are to be submitted for approval where applicable:

- Support structure and foundations of towing equipment.
- Skegs, propeller guards and other structures which support the weight of the vessel during dry-docking.

1. 3. 2 The following supporting documents are to be submitted for information:

- Towing arrangements, including lines of action, magnitudes and corresponding points of application of towline pulls on towing equipment.
- Details of the breaking strength of the components of the towline system, together with maximum pull and brake holding load, or equivalent, of towing winches where applicable.

PART

4

CHAPTER **3** **Tugs**

SECTION **2** **Longitudinal strength**

2. 1 General

2. 1. 1 The longitudinal strength standard is to comply with the relevant requirements of Pt 3, Ch 4 Longitudinal Strength.

2. 1. 2 The requirements of Pt 3, Ch 4, 8.3 Loading instrument regarding loading instruments are not applicable to tugs.

PART

4

CHAPTER **3** **Tugs**

SECTION **3** **Floors in single bottoms**

3. 1 Floors

3. 1. 1 Single bottom floors are to be in accordance with the requirements of Pt 4, Ch 1, 7 Single bottom structure, except that floors clear of the machinery space may be flanged in lieu of a face plate being fitted.

PART

4

CHAPTER 3 **Tugs**

SECTION 4 **Panting and strengthening of bottom forward**

4. 1 Panting region reinforcement

4. 1. 1 The arrangements to resist panting required by Pt 3, Ch 5 Fore End Structure do not apply to tugs less than 46 m in length. In tugs 46 m or more in length, additional stiffening is also to be fitted in the 'tween decks throughout the panting region.

4. 2 Strengthening of bottom forward

4. 2. 1 The requirements for strengthening of bottom forward detailed in Pt 3, Ch 5 Fore End Structure do not apply to tugs.

PART

4

CHAPTER **3 Tugs**

SECTION **5 Machinery casings**

5. 1 Escape hatches

5. 1. 1 Any emergency exit from the machinery room to the deck is to be capable of being used at extreme angles of heel, and should be positioned as high as possible above the waterline and on or near the ship's centreline. Covers to escape hatches are to have hinges arranged athwartships. Coaming heights are to be at least 600 mm above the upper surface of the deck.

PART

4

CHAPTER **3 Tugs**

SECTION **6 Freeing arrangements**

6. 1 General

6. 1. 1 If the only means of access to the wheelhouse is external, then stormboards, or an equivalent, are to be fitted between the deckhouse and the ship's sides forward of any deckhouse doors up to the height of the bulwark rail. A gap is to be left between the deck and the bottom board for freeing purposes.

PART

4

CHAPTER **3** **Tugs**

SECTION **7** **Towing arrangements**

7. 1 Towing equipment

7. 1. 1 For tugs which normally tow over the stern with the main towline connection to the hull ahead of the propellers, the position of towline connection is normally to be five to 10 per cent of the ship's length abaft amidships, but in no circumstances is it to be sited forward of a position, five per cent of the ship's Rule length abaft the longitudinal centre of gravity of the tug in any anticipated condition of loading.

7. 1. 2 The attachment of the towline to the tug is to be located as low as practicable in order to minimise heeling moments arising from working conditions. Reliable slip arrangements which facilitate towline release regardless of the angle of the towline are to be provided.

7. 1. 3 It is recommended that the slip arrangements should also be operable from the bridge. The arrangements should be tested to the Surveyor's satisfaction. The breaking strength of the hook, or its equivalent, should generally be 50 per cent in excess of that of the towline, *See* Pt 3, Ch 13, 7 Equipment.

7. 1. 4 The emergency release systems provided on towing winches that are used for towing ships within close quarters, ports or terminals, are also to comply with the requirements specified in Pt 7, Ch 16 Towing Winch Emergency Release Systems.

7. 2 Towing equipment foundations

7. 2. 1 Direct support for towing equipment by means of pillars and/or pillar bulkheads is to be arranged as far as this is practicable.

7. 2. 2 The design load to be considered for the strength assessment of the towing equipment and the associated supporting structures is to be as given in Table 3. 7. 1: Tug towing equipment design loads, unless a higher design load is specified by the designer/owner.

Table 3. 7. 1: Tug towing equipment design loads

Class Notation	Design Force or Bollard Pull as appropriate (kN)	Design Load (kN)
tug protected waters service	$T_{\mathrm{BP}} \leq 200$	$2.T_{BP}$
	$200 < T_{\mathrm{BP}} < 800$	$\left(\frac{2600 - T_{\mathrm{BP}}}{1200}\right) \cdot T_{\mathrm{BP}}$
	$T_{\mathrm{BP}} \geq 800$	$1.5.T_{BP}$
tug	$T_{\mathrm{BP}} \leq 400$	$2.5 \cdot T_{BP}$

	$400 < T_{BP} < 1000$	$\left(\frac{3400 - T_{BP}}{1200}\right) \cdot T_{BP}$
	$T_{BP} \geq 1000$	$2.T_{BP}$
escort tug protected waters service	$T_{DF} \leq 500$	$2.4 \cdot T_{DF}$
	$500 < TDF < 1000$	$\left(\frac{2000 - T_{DF}}{625}\right) \cdot T_{DF}$
	$T_{DF} \geq 1000$	$1.6 \cdot T_{DF}$
escort tug	$T_{DF} \leq 500$	$3.T_{DF}$
	$500 < T_{DF} < 1000$	$\left(\frac{2000 - T_{DF}}{500}\right) \cdot T_{DF}$
	$T_{DF} \geq 1000$	$2.T_{DF}$
Where T_{BP} = Bollard pull of the tug as submitted by the designer and represents the towline maximum continuous force (also called quasi-static towline force). T_{DF} = Design force as submitted by the designer and represents the towline maximum continuous force for escort operations (also called quasi-static towline force).		
Note 1 The Design loads shown in this table include dynamic effects.		

7. 2. 3 Scantlings of pillars and pillar bulkheads are to be in accordance with Pt 4, Ch 1, 4.4, Deck supporting structure.

7. 2. 4 The scantling requirements for towing arrangements are detailed in the following subsections:

- Towing winches Pt 4, Ch 3, 7.3 Towing winches
- Towline guiding fittings Pt 4, Ch 3, 7.4 Towline guiding fittings
- Towing hooks: Pt 4, Ch 3, 7.5 Towing hooks
- Towing equipment supporting structure: Pt 4, Ch 3, 7.6, Supporting Structure

7. 2. 5 Generally, the foundations of towing fairleads are to be carried through the deck and integrated into suitable underdeck structure.

7. 2. 6 On tugs which utilise an indirect method of towing, attention is drawn to the increased out-of-plane forces that occur in towing fairleads.

7. 3 Towing winches

7. 3. 1 The scantlings of towing winches (including winch drums, drum shafts, brakes, support frames and connections to the hull strucuture) are to be determined by direct calculations using the Design Loads given in Pt 4, Ch 3, 7.2 Towing equipment foundations 7.2.2 and are to be able to sustain the following:

- The Design Loads (in the most unfavourable anticipated position of the towline) without permanent deformation i.e. $\sigma_e \leq 1, \sigma_y$.
- The winch BHL (in the most unfavourable anticipated position of the towline), without exceeding $\sigma_e \leq 0.80\sigma_y$.
- The anticipated maximum RP (in the most unfavourable anticipated position of the towline), without exceeding $\sigma_e \leq 0.40\sigma_y$.

Where

BHL is the brake holding load, i.e. the maximum towline force the towing winch can withstand without slipping of the (activated) brake, considering the towline at the first inner layer.

RP is the rated pull, i.e. the winch maximum hauling-in load considering the towline at the first inner layer.

σ_e = equivalent stress, in N/mm^2

σ_y = specified minimum tensile yield stress of the material, in N/mm^2

7. 4 Towline guiding fittings

7. 4. 1 Towline guiding fittings, such as fairleads, staples, towing pins, stern rollers and equivalent components which guide the towline, shall be able to sustain the force exerted by the towline loaded under a tension equal to the design load as specified in Table 3. 7. 1: Tug towing equipment design loads, in the most unfavourable anticipated position of the towline. The fittings shall not exceed the following permissible stress levels:

- $\sigma \leq 0.75_{ref}$;
- $\tau \leq 0.47_{ref}$;
- $\sigma_e \leq 0.85_{ref}$

Where

σ = normal stress, in N/mm^2

τ = shear stress, in N/mm^2

σ_e = equivalent stress, in N/mm^2

σ_{ref} = $\frac{235}{k_L}$= Reference stress of the material in N/mm^2, but may be taken as σ_y for fittings not made of welded construction

k_L = as defined in Pt 3 Ship Structures (General), Table 2. 1. 1: Values of kL

7. 4. 2 Towline guiding fittings used for guiding the towline when towing on a towing winch shall be able to sustain the force exerted by the towline loaded under a tension equal to the winch BHL (with the most unfavourable anticipated position of the towline) without exceeding the specified permissible stress criteria.

7. 4. 3 Where a towline guiding fitting has been designed for a specific Safe Working Load (SWL), defined as the maximum static working load, the fitting shall be able to sustain a force equal to 2 times the SWL without exceeding the above-specified permissible stress criteria.

7. 5 Towing hooks

7. 5. 1 The scantlings of towing hooks, their load carrying attachments (transferring load from the hook to the hull structure) are to be determined by direct calculations using the Design Loads given in Pt 4, Ch 3, 7.2 Towing equipment foundations 7.2.2 and are to be able to sustain the Design Load (in the most unfavourable anticipated position), without exceeding $\sigma_e \leq 0.80\sigma_y$.

7. 6 Supporting Structure

7. 6. 1 The scantlings of the supporting structures of towing equipment shall be such that they able to sustain the force exerted upon them with the towing equipment under the action of the towline (with the most unfavourable anticipated position) loaded under a tension equal to the DL as specified in Table 3. 7. 1: Tug towing equipment design loads, without exceeding the following permissible stress levels:

- $\sigma \leq 0.75_{ref}$,
- $\tau \leq 0.47_{ref}$,
- $\sigma_e \leq 0.85_{ref}$

Where

σ = normal stress, in N/mm^2

τ = shear stress, in N/mm^2

σ_e = equivalent stress, in N/mm^2

σ_{ref} = $=\frac{235}{k_L}=$ Reference stress of the material in N/mm^2,

k_L = as defined in Pt 3 Ship Structures (General), Table 2. 1. 1: Values of kL

7. 6. 2 In addition, supporting structures of towing equipment used for escort or towing on a winch services shall be such that they able to sustain the force exerted upon them with the towing equipment under the action of the towline (with the most unfavourable anticipated position) loaded under a tension equal to the BHL of the associated winch without exceeding the permissible stress criteria in Pt 4, Ch 3, 7.6 Supporting Structure 7.6.1.

7. 6. 3 Where a towline guiding fitting has been designed for a specific Safe Working Load (SWL), defined as the maximum static working load, the supporting structure shall be able to sustain a force equal to 2 times the SWL without exceeding the permissible stress criteria in Pt 4, Ch 3, 7.6 Supporting Structure 7.6.1.

PART

4

CHAPTER **3** **Tugs**

SECTION **8** **Fenders**

8. 1 Ship's side fenders

8. 1. 1 An efficient fender is to be fitted to the ship's side at deck level extending all fore and aft.

PART

4

CHAPTER **3** **Tugs**

SECTION **9** **Escort operation, performance numeral and trials**

9. 1 General

9. 1. 1 An escort tug is a tug intended for escort operation. Escort operation is an operation in which the tug closely follows the assisted ship providing control by steering and braking, as necessary.

9. 1. 2 Escort tugs are to be capable of utilising methods of towing through which steering and braking forces are generated by a combination of propulsive and hydrodynamic forces developed by the tug, acting on the towline to the attended ship, *See* example in Figure 3. 9. 1: Forces generated during a typical escort mode.

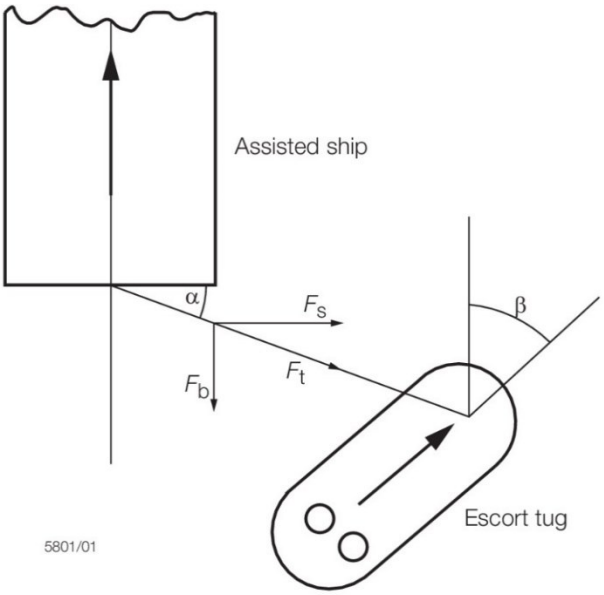
9. 1. 3 The intact stability of the tug during escort operation is to comply with a Standard recognised by the National Administration with whom the ship is registered and/or by the National Administration within whose territorial jurisdiction the tug is intended to operate, as applicable. Attention is drawn to the inherent problems relating to the quick release of the towline and the sudden loss of propulsion power during the escort operation in addition to the maximum steering and braking forces.

9. 2 Towing arrangements

9. 2. 1 The specified breaking strength of the towline is to be at least 2.5 x maximum design towline force.

9. 2. 2 The towing winch is to include a system of continuous load monitoring, with a bridge readout display and an overload prevention system, which is to be operational during escort duties. The overload prevention system is to be designed with the capability to pay out the towline in a controlled manner when the load reaches the maximum design towline force, and is to be capable of alerting the Master and crew.

Figure 3. 9. 1: Forces generated during a typical escort mode



F_t = force exerted by the tug on the assisted ship via the towline
F_s = steering (athwartships) component of F_t
F_b = breaking (longitudinal) component of F_t
α = angle between assisted ship's transverse axis and towline
β = angle between centreline of assisted ship and centreline of tug

9. 3 Performance numeral and trials

9. 3. 1 Escort tugs which carry out full scale performance trials in accordance with the requirements of this Section will be eligible to have the escort performance numeral **EPN (F,B,V,C)** appended to the **escort tug** notations, *See* Pt 4, Ch 3, 1.2 Class notations 1.2.1 and Pt 4, Ch 3, 1.2 Class notations 1.2.2 and Pt 4, Ch 4, 1.2 Class notations 1.2.2,

Where

F is the maximum steering force (F_s), in tonnes, *See* Figure 3. 9. 1: Forces generated during a typical escort modeand Pt 4, Ch 3, 9.3 Performance numeral and trials 9.3.6.

B is the maximum braking force (F_b), in tonnes, *See* Figure 3. 9. 1: Forces generated during a typical escort mode and Pt 4, Ch 3, 9.3 Performance numeral and trials 9.3.6.

V is the speed, in knots, at which **F** and **B** are determined.

C is the time, in seconds (s), required for the escort tug in manoeuvring from maintained oblique position of tug giving maximum steering force F_s on one side of assisted vessel to mirror position on the other side, *See* Pt 4, Ch 3, 9.3 Performance numeral and trials 9.3.6. The towline angle, **α**, need not be taken less than 30°, *See*Figure 3. 9. 1: Forces generated during a typical escort mode.

9. 3. 2 The performance numeral may be determined with speed **V** equal to either 8 knots or 10 knots. If both sets of numerals are determined at the trials then the class notation will include them all.

9. 3. 3 A trials plan, which includes the estimated forces, is to be submitted and approved prior to trials being undertaken.

9. 3. 4 The trials of the escort tug are to be performed using a ship capable of maintaining almost constant heading and speed when subjected to the steering and braking forces from the escort tug.

9. 3. 5 The following trials are to be carried out in calm weather conditions and in the presence of a Lloyd's Register Surveyor:

- Steering and braking force capability test, *See* Pt 4, Ch 3, 9.3 Performance numeral and trials 9.3.6.
- Bollard pull test, *See* Pt 4, Ch 3, 9.3 Performance numeral and trials 9.3.8.

A record of the results is to be kept on board the escort tug.

9. 3. 6 Prior to commencing a trial, the following data are to be recorded:

- Wind speed and direction.
- Sea state.
- Current speed and direction.
- Water depth.
- The main particulars and the loading condition of the assisted ship.
- Loading condition of the escort tug.

9. 3. 7 **Steering and braking force capability test** is a test by which the steering force, F_s, and braking force, F_b, are determined when utilising the method, shown inFigure 3. 9. 1: Forces generated during a typical escort mode, of towing at a range of towline angles, α, from 0 to 90 degrees and for a range of operating speeds up to and including the maximum escort speed. The following parameters are to be continuously recorded during the test:

- Position, speed and heading of the assisted ship and the escort tug.
- Towline force, F_t.
- Angle of towline, α.
- Heel angle of the escort tug.
- Direction of thrust and power absorbed by all propellers and thrusters of the tug.
- Rudder angles of the tug.

9. 3. 8 The length of the towline is to represent a typical operating condition and is to be recorded prior to and at the completion of the test. The steering and braking forces for a given speed and angle can be calculated by using the average values of the recorded towline force.

9. 3. 9 9.3.9 **Bollard pull test** is to be carried out in accordance with ACS *Guide for Certification of Bollard Pull*.

9. 4 Computational Fluid Dynamics Predicted Performance

9. 4. 1 Where the performance of the escort tug during escort operation in indirect towing mode has been predicted and reported using computational fluid dynamics in accordance with the requirements of this Section and in lieu of full-scale performance trials, the vessel will be eligible to have **EPN (CFD: F,B,V)** appended to the **escort tug** notation, *See* Pt 4, Ch 3, 1.2 Class notations 1.2.1, Pt 4, Ch 3, 1.2 Class notations 1.2.2 and Pt 4, Ch 4, 1.2 Class notations 1.2.2.

9. 4. 2 The computational fluid dynamics investigation is to include escort performance prediction with an escort speed equal to 8 knots and/or 10 knots.

9. 4. 3 A computational fluid dynamics report is to be submitted to ACS for consideration. The performance prediction simulating the trials detailed in Pt 4, Ch 3, 9.3, Performance numeral and trials is to be carried out in accordance with ACSPlus Guidelines titled *Guidelines for CFD Escort Tug Performance*.

9. 4. 4 The length of the towline in the computational fluid dynamics simulation is to represent a typical operating condition.

9. 4. 5 The report or a summary of the results obtained therein is to be kept on board the vessel and made available prior to the commencement of any full-scale performance trials.

CHAPTER **4** **Offshore Support Vessels**

SECTION **1** **General**

1. 1 Application

1. 1. 1 This Chapter applies to sea-going ships specially designed and constructed to support the operations of offshore installations, including the carriage of specialised stores and cargoes to such facilities. These may be defined as:

a. **AHTS**: Assigned to vessels designed for anchor handling, towing and supply of specialised stores and cargo.

b. **Anchor handler**: Assigned to vessels specially designed, constructed and equipped for handling anchors used to secure floating offshore installations.

c. **Cable laying vessel**: Assigned where special consideration has been given to operations for laying/maintaining underwater cables.

d. **Diving support vessel**: Assigned where a diving system has been installed and where special consideration has been given to the launch and recovery systems for diving operations, including the strength and continuity in way of moon pools, large hatches, heavy loads, etc.

e. **Offshore supply vessel**: Assigned to vessels designed for the carriage of specialised stores and cargoes to fixed or floating offshore installations.

f. **Offshore support vessel**: Assigned to vessels designed for the provision of support services to fixed or floating offshore installations.

g. **Offshore well stimulation ship**: Assigned where a plant has been installed and where special consideration has been given to operations associated with the stimulation of wells for offshore oil/gas production.

h. **Pipe laying vessel**: Assigned where special consideration has been given to operations for laying/maintaining pipes associated with offshore oil/gas production.

i. **Seismographic support vessel**: Assigned where special consideration has been given to operations associated with seismographic research and survey.

j. **Standby vessel**: Assigned to vessels designed to provide rescue assistance and afford safe refuge in the event of an emergency on or near an offshore installation.

k. **Subsea support vessel**: Assigned where special consideration has been given to operations associated with subsea construction and installation support, inspection, repair and maintenance.

1. 1. 2 Where appropriate, ACS may request direct calculations or additional requirements to be complied with, for novel or additional features pertinent to a given Ship Type listed within this Chapter, *See also* Pt 3, Ch 1, 2.1 General 2.1.1.

1. 1. 3 The scantlings and arrangements are to be as required by Pt 4, Ch 1 General Cargo Ships, except as otherwise specified in this Chapter.

1. 1. 4 Attention is drawn to the need for Masters to be able to assess the stability of their ships quickly and accurately in all service conditions, *See* Pt 1, Ch 2, 3 Surveys - General.

1. 1. 5 Where towing equipment is fitted, the requirements of Pt 4, Ch 3, 7 Towing arrangements are to be applied.

1. 1. 6 Attention is drawn to the National and International standards applicable to vessels in this chapter as required by the Flag Administation

1. 2 Class notations

1. 2. 1 In general, ships complying with the requirements of this Chapter and relevant additional requirements will be eligible for one or a combination of the notations indicated in Table 4. 1. 1: Type notations applicable to offshore support vessels.

Table 4. 1. 1: Type notations applicable to offshore support vessels

Class Notation	Requirements
Offshore support vessel	Pt 4, Ch 4, 1 General to Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk
Offshore supply vessel	Pt 4, Ch 4, 1 General to Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk
Cable laying vessel **Pipe laying vessel** **Diving support vessel** **Subsea support vessel** **Seismographic support vessel**	Pt 4, Ch 4, 1 General, Pt 4, Ch 4, 2 Longitudinal strength, Pt 4, Ch 4, 7 Engine exhaust outlets and Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk, *See* Note 2
Standby vessel	Pt 4, Ch 4, 1 General to Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk
Anchor handler	Pt 4, Ch 4, 1 General to Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk
Offshore Tug	Pt 4, Ch 3, 1 General to Pt 4, Ch 3, 8 Fenders and Pt 4, Ch 4, 1 General to Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk
AHTS (Anchor Handler Tug Supply)	Pt 4, Ch 3, 1 General to Pt 4, Ch 3, 8 Fenders; and Pt 4, Ch 4, 1 General to Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk

Note *1.* A ship designed to fulfil more than one function can be assigned a combination of the notations listed above, e.g.:

- **100A1 Offshore supply vessel/Standby vessel**
- **100A1 Offshore supply vessel /Anchor handler**
- **100A1 Offshore supply vessel /Standby vessel/Oil Recovery**
- Any combination of the requirements listed in this Table.

Note 2. ACS may request direct calculations or additional requirements to be complied with, *See* Pt 4, Ch 4, 1.1 Application 1.1.2

1. 2. 2 The following additional special features may be requested:

- **EWP** (Enhanced Weather Protection):

The notation **EWP** may be added if the vessel complies with requirements in Pt 4, Ch 4, 9 Enhanced weather protection, e.g. **Offshore supply vessel EWP**. The notation is mandatory for vessels that are intended for unrestricted worldwide service and that are required to stay on station in adverse weather conditions. The enhanced features provide additional protection in harsh weather.

- **Oil Recovery:**

A vessel complying with the requirements of Pt 7, Ch 5 Ships Equipped for Oil Recovery Operations will be eligible for the notation **Oil Recovery**.

- **WDL(+)** (Weather deck load):

If the weather deck scantlings have been approved for a loading greater than a design head of 3.5 m, the notation **WDL(+)** may be added. If requested, the maximum permissible weather deck load and extent can be identified in the notation, e.g. **WDL(5.0 t/m2 from Aft to Fr. 26)**.

- **RD** (Relative density):

Where a ship has tanks appraised for a maximum permissible relative density greater than 1.025, the notation **RD(specified tank names, density)** may be added, *See* Pt 4, Ch 1 General Cargo Ships.

- **LFPL** (Low flashpoint liquids):

Ships intended for the carriage of liquids with flash point below 60°C (closed-cup test) in bulk are to be built and equipped in accordance with the relevant requirements of Pt 4, Ch 4, 8 Transport and handling of hazardous and noxious liquid substances in bulk and will be given the class notation **LFPL**. If requested, the concerned cargo, flash point (closed-cup test) and tank can be identified in the notation, e.g. **LFPL(methanol, 12°C, No. 7 centre tank)**.

1. 2. 3 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 Classification Regulations, to which reference should be made.

1. 3 Information required

1. 3. 1 In addition to the information and plans required by Pt 3, Ch 1, 5 Information required, plans covering the following items are to be submitted where applicable:

- Independent cargo tanks.
- Cargo tank foundations and securing arrangements.
- Towing arrangements, including supports and foundations of towing winches.
- Arrangements for the stowage of deck cargoes (cargo containment) and details of any associated racks or other similar structures and their supports/foundations together with information to indicate design loads.
- Movable decks, including the stowing arrangements for portable components.
- Freeing arrangements.

1. 3. 2 In addition to the information and plans required by Pt 4, Ch 4, 1.3 Information required 1.3.1, details of local strengthening for the following items are to be submitted where applicable:

- The arrangement and integration into the hull of equipment, tanks, supports, foundations, etc. in conjunction with their mass, working load and holding capability information.
- For unusual structural arrangement and equipment, calculations are to be submitted showing acceptable structural strength.

- Supports and foundations for anchor handling and laying arrangements for anchors carried as cargo.
- Supports for towing arrangements.
- The arrangement for fast rescue craft.

1. 4 Symbols

1. 4. 1 The symbols are as defined in Pt 4, Ch 1, 1.5, Symbols and definitions.

PART

4

CHAPTER **4** **Offshore Support Vessels**

SECTION **2** **Longitudinal strength**

2. 1 General

2. 1. 1 The longitudinal strength standard is to comply with the relevant requirements of Pt 3, Ch 4 Longitudinal Strength.

2. 1. 2 The requirements of Pt 3, Ch 4, 8.3 Loading instrument regarding loading instruments are generally not applicable to offshore supply ships.

PART

4

CHAPTER 4 **Offshore Support Vessels**

SECTION 3 **Hull envelope plating**

3. 1 Hull envelope plating

3. 1. 1 Anchor handing activities often give rise to areas of high local loads and/or frequent impacts, such as in way of stern rollers and immediately adjacent to high duty bollards. The shell in way of high loads and/or frequent impacts is to be suitably reinforced by increasing shell plate thickness, additional stiffening support or other appropriate means.

3. 2 Side shell

3. 2. 1 The thickness of side shell is to be that required by Pt 4, Ch 1, 5.4 Side shell but is not to be less than given by Table 4. 3. 1: Minimum side shell thickness

3. 2. 2 As an alternative, where over the length of a vessel, portions of the sheerstrake that are not protected by an efficient fender, the sheerstrake is to be increased by a minimum of 5 mm thickness. The increased thickness shall extend from the deck level to not less than 600 mm below the deck level.

Table 4. 3. 1: Minimum side shell thickness

Ship type	Minimum thickness, mm
Offshore supply ships	9
Standby vessels	8
Anchor handler	9

3. 3 Weather decks

3. 3. 1 Where cargo is to be carried on weather decks, the scantlings are to be suitable for the specified loadings. The thickness, t, of deck plating is to be not less than the greater of:

a.

$$t = 0.025L + 4.5 + t_a \text{ mm}$$

b.

$$t = 0.1 f_m^s \sqrt{\frac{PF_D}{f_y \sigma}} t_a \text{mm}$$

Where

P = specified design load for weather deck, in tonnef/m^2

= $\frac{h}{1.39}$

h = equivalent design head, in metres, not to be taken less than 3.5 m

s = spacing of secondary stiffeners, in mm

σ = yield stress of plating, in N/mm^2

F_D = as defined in Pt 3, Ch 4, 5.7 Local reduction factors

f_m = 0.75

f_y = 0.67

t_a = 2.5 mm, in general

= 1.0 mm, for ships with dedicated class notation **standby vessel**.

3. 3. 2 Scantlings are to be increased locally where specialised cargoes are likely to induce concentrated loads that exceed the specified design load. Acceptable stress levels are given in Pt 4, Ch 3, 7.2 Towing equipment foundations 7.2.4.

3. 3. 3 Deck areas, where there are arrangements for the collection and handling of anchors and associated equipment, are to be protected by wooden sheathing. Alternatively, this can be omitted if the plate thickness is increased by 2.5 mm.

3. 4 Cargo containment

3. 4. 1 Means are to be provided to enable deck cargoes to be adequately secured and protected. In general, suitable inner bulwarks, rails, bins or storage racks of substantial construction are to be provided and properly secured to adequately strengthened parts of the hull structure. Properly designed locking equipment or efficient means of lashing containers are to be fitted where appropriate. Small hatches (including escape hatches), valve controls, ventilators, air pipes, etc. are to be situated clear of the cargo containment areas.

PART

4

CHAPTER **4** **Offshore Support Vessels**

SECTION **4** **Hull envelope framing**

4. 1 General

4. 1. 1 The section moduli of side longitudinals, the main and 'tween deck frames are to be not less than kZ, cm^3

Where

k = 1.25 in general

= 1.10 for ships with dedicated class notation **standby vessel**

Z = as required by Pt 4, Ch 1, 6 Shell envelope framing, Pt 3, Ch 5, 4 Shell envelope framing and Pt 3, Ch 6, 4 Shell envelope framing for the appropriate location.

4. 1. 2 Frames are not to be scalloped.

4. 1. 3 The scantlings of deck secondary stiffeners are to be in accordance with the requirements of Table 1. 4. 4: Cargo and accommodation deck longitudinals (1) or Table 1. 4. 5: Strength/weather, cargo and accommodation deck beams (2) in Pt 4, Ch 1 General Cargo Ships, where h_2 is to be taken as the specified design loading and not less than a design head of 3.5 m.

PART

4

CHAPTER 4 **Offshore Support Vessels**

SECTION 5 **Lifting appliances, equipment integration and foundations**

5. 1 Lifting appliances

5. 1. 1 Where the vessel has fitted onboard lifting appliances, which are considered by ACS to be essential for the vessel to fulfil its primary operational role, and if there are no alternative means of operation, it is a requirement that the lifting appliance(s) is classed in accordance with the requirements of the **LA** or **L̇A** notation, *See* Pt 3, Ch 9, 6 Lifting appliances and support arrangements.

- Where the **LA** notation is assigned,the lifting appliance(s) are to be designed, built and surveyed in accordance with ACS Guideline for Lifting Appliances in a Marine Environment.
- Where the **L̇A** notation is assigned, the lifting appliance(s) have been classed by a recognised classification society other than ACS and later transferred into class with ACS. From the time the **LA** notation is assigned, the subject appliance(s) is to be tested and surveyed in accordance with ACS Guideline for Lifting Appliances in a Marine Environment.

A lifting appliance forms an essential feature of a vessel if the purpose of the vessel is predominantly to support the appliance, and the purpose of the floating structure is impaired if the appliance is not functioning.

5. 1. 2 For non-classed lifting appliances, generally it is a requirement of National Authorities that lifting appliances are approved, examined, tested and certified by a competent person or organisation. It is ACS's interpretation of the intention of current National Regulations that every lifting appliance is to be certified. *See also* Pt 3, Ch 9, 6 Lifting appliances and support arrangements.

5. 2 Equipment foundation loads and permissible stresses

5. 2. 1 When considering the loads, all expected directions of operation are to be taken into account. The supporting arrangements for equipment which are not considered to be lifting appliances are to be loaded in accordance with Pt 4, Ch 4, 5.2 Equipment foundation loads and permissible stresses 5.2.1.

Table 4. 5. 1: Loading conditions

Loading/conditions	Loads

Transit/Stowed	Gravity loads; Environmental loads such as wind and waves as applicable; and inertia forces generated by ship motions, *See also ACS Guideline for Lifting Appliances in a Marine Environment, Ch 4, 2.11 Forces due to ship motion*.
Operation	Equipment operational load

5. 2. 2 Permissible stress values used for equipment integration and foundations are to be in accordance with the *ACS Guideline for Lifting Appliances in a Marine Environment, Ch 4, 5 Pedestals and foundation*

5. 3 Equipment supporting arrangements loads and permissible stresses

5. 3. 1 Support arrangements for lifting appliances which are part of the hull or main support structure are classification items and are to be in accordance with Pt 3, Ch 9, 6 Lifting appliances and support arrangements. For supporting structure that is not part of the hull or main support, reference is made to ACS Guideline for Lifting Appliances in a Marine Environment, Ch 4, 5 Pedestals and foundation.

5. 4 Support arrangements for towing equipment

5. 4. 1 Direct support for towing and deck equipment, if applicable, is to be in accordance with Pt 4, Ch 3, 7.2, Towing equipment foundations.

PART

4

CHAPTER 4 **Offshore Support Vessels**

SECTION 6 **Miscellaneous openings**

6. 1 General

6. 1. 1 For offshore supply ships the requirements of Pt 3, Ch 11, 6 Miscellaneous openings are to be complied with.

6. 2 Access from freeboard deck

6. 2. 1 There is to be no direct access from the freeboard deck to machinery or other spaces below the freeboard deck. Indirect access may be arranged via a space or passageway fitted with an outer door having a sill not less than 600 mm high and an inner door having a sill not less than 380 mm high. The inner door is to be self-closing and gastight. The space or passageway between the two doors is to be adequately drained. It is desirable, however, that access to spaces below the freeboard deck is arranged from a position above the superstructure deck. Where it is necessary to provide an emergency escape trunk which cannot terminate within a superstructure space, the arrangements for maintaining the integrity of the hatch or outlet are to be approved by ACS.

6. 3 Windows and side scuttles

6. 3. 1 Requirements for windows and side scuttles are to be determined in accordance with Pt 3, Ch 11, 6.5, Side scuttles, windows and skylights.

PART

4

CHAPTER **4** **Offshore Support Vessels**

SECTION **7** **Engine exhaust outlets**

7. 1 Location

7. 1. 1 Engine exhaust outlets are to be located as high as is practicable above the deck and are to be fitted with spark arresters.

PART

4

CHAPTER 4 **Offshore Support Vessels**

SECTION 8 **Transport and handling of hazardous and noxious liquid substances in bulk**

8. 1 Scope

8. 1. 1 This Section applies to the arrangement and scantling of sea-going ships as defined in Pt 4, Ch 4, 1.1,, Application and intended for the carriage of hazardous and noxious substances, i.e.;

a. Products which are listed in chapter 17 or chapter 18 of the IBC Code and the latest edition of the MEPC.2/Circular (Provisional categorization of liquid substances in accordance with MARPOL Annex II and the IBC Code) and their related references to chapter 15 and chapter 19; or
b. Oil-based/water-based mud containing mixtures of products listed in 1(a); or
c. Liquid carbon dioxide (high purity and reclaimed quality) and liquid nitrogen; or
d. Contaminated backloads.

8. 1. 2 The requirements of this Section are non-mandatory and need not be complied with for classification with ACS, although compliance may be insisted upon, in part or in full, by the Flag Administration.

8. 1. 3 Ships complying with the requirements of this Section will be eligible for the optional special feature notation **HNLS**.

8. 1. 4 Carriage of products not listed in Pt 4, Ch 4, 8.1 Scope 8.1.1 may be permitted in accordance with the *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels* (OSV Chemical Code) 1.1 Application 1.1.10.

8. 1. 5 Compliance with the *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels* (OSV Chemical Code) will warrant the issuance of a certificate of fitness in line with the Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels 1.4 Surveys and certification 1.4.1.

8. 1. 6 This Section is to be considered as additional to the requirements listed in Pt 4, Ch 4, Sections 1 to 7 in these Rules.

8. 2 Definitions and equivalents

8. 2. 1 The definitions applicable to this Section are as per the *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels* (OSV Chemical Code) 1.2 Definitions.

8. 2. 2 Equivalents to the requirements of this Section will be considered in accordance with the *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels* (OSV Chemical Code) 1.3 Equivalents.

8. 3 Design

8. 3. 1 The goals of this sub-Section are:

a. To ensure that the cargo tanks are located in protected location(s) in the event of minor hull damage.

b. To ensure that the cargo containment and handling systems are located so that the consequences of any release of cargo will be minimised, and to provide safe access for operation and inspection.

8. 3. 2 The vessel is to be designed in accordance with the following:

a. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 2.3 Non-cargo discharges below the freeboard deck.*

b. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 2.9 Location of cargo tanks.*

c. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 3 Vessel design.*

d. Segregation of cargo tanks from spaces which are intended to be non-hazardous, where diagonal or corner to corner situations occur, will be specially considered. *See also* Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.9 of these Rules.

e. With respect to access to spaces in the cargo area, spaces which are of confined or cellular construction adjacent to cargo or slop tanks, such as double bottom tanks and cofferdams, are to have dual access from the upper deck, spaced as widely apart as possible. Pipe tunnels and duct keels to which access is normally required for operational purposes are to be provided with means of access not more than 60 m apart. In all cases, however, access is to be provided at each end of the tunnel or duct keel.

8. 4 Special requirements for products with a flashpoint not exceeding 60°C, toxic products and acid

8. 4. 1 The goal of this sub-Section is to ensure that the consequences of any release of liquid cargo with severe safety hazards, from compliant vessels, will be minimised; and to provide protection to the vessel and crew from fire, toxic vapour and corrosive substances.

8. 4. 2 Where the vessel is designed to carry cargoes with a flashpoint not exceeding 60°C, toxic products or acid, it shall comply with the following:

a. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 4 Special requirements for products with a flashpoint not exceeding 60°C, toxic products and acid.*

b. With respect to toxic products, vapour return lines are to be fitted with shut-off valves and blank flanges.

c. With respect to internal cargo tanks for the carriage of acids, the surface is to be smooth and free of obstruction, and the arrangements at corners are to be appropriate to the intended lining arrangements.

d. With respect to tank or piping surfaces to be exposed to acid cargos, the corrosion protection lining is to be applied in a solid state.

e. Linings approved for use with acids are considered to be an acid-resistant material that is applied to the tank or piping system in a solid state with a defined elasticity property, which is to be greater than the elasticity of the structural steel.

8. 5 Cargo containment

8. 5. 1 The goal of this sub-Section is to ensure the safe containment of cargo under all fore*See*able design and operating conditions having regard to the nature of the cargo carried.

8. 5. 2 The cargo containment arrangements of the vessel shall comply with the following:

a. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 5 Cargo containment.*
b. Cargo tanks are to be as required by the ACS Rules as applicable for the intended cargo.
c. Integral cargo tank scantlings and arrangements are to be in accordance with the ACS Rules as applicable.
d. With respect to independent cargo tank scantlings and arrangements, these are to be considered on the basis of the standards contained in the classification Rules taking account of the cargo relative densities, and giving due consideration to the maximum pressure which will be encountered in service and the dynamic loading which will be experienced by the tanks, supports and keys. Calculations are to be submitted to enable the appraisal of the proposed arrangements.
e. Where it is intended that vessels are to carry high temperature cargoes in independent cargo tanks, the tanks are to be supported and keyed so as to permit free expansion in all directions and to eliminate heat bridges which can transmit thermal stresses to the hull of the ship.
f. All openings in independent cargo tanks are to be in the top of the tank and extended above the deck (alternative arrangements will be specially considered). Access is to be from the open deck direct, with arrangements for maintaining watertightness at the joint between the hatch coaming and the deck.

8. 6 Materials of construction

8. 6. 1 The goal of this sub-Section is to ensure that the materials used in the construction of the vessel, piping, pumps, valves, vents, and their jointing materials are of suitable quality and traceability, and shall be suitable for the temperature and pressure for their intended function in accordance with appropriate standards.

8. 6. 2 OSVs intended for the transport and handling of hazardous and noxious liquid substances in bulk shall comply with the ACS Rules as applicable.

8. 7 Cargo transfer

8. 7. 1 The goal of this sub-Section is to ensure the safe handling of all cargoes, under all normal operating conditions and fore*See*able emergency conditions, to minimise the risk to the vessel, its crew and the environment, having regard to the nature of the products involved through ensuring the integrity of integral liquid product tanks, piping systems and cargo hoses, preventing the uncontrolled transfer of cargo, and ensuring reliable means to fill and empty cargo tanks.

8. 7. 2 OSVs intended for the transport and handling of hazardous and noxious liquid substances in bulk shall comply with the following cargo transfer requirements:

a. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 6 Cargo Transfer*.
b. The nominal thickness of steel pipes is to be not less than shown in Pt 5 Main and Auxiliary Machinery Table 12. 2. 4: Minimum thickness for steel pipes in these Rules.
c. The use of and scantlings of stainless steel pipes will be specially considered.
d. Welding, post-heat treatment and non-destructive examination for piping fabrication and jointing details is also to be in accordance with the requirements of Ch 13 Requirements for Welded Construction of Pt 2.

e. Standby means for pumping out each cargo tank are to be provided. *See* Pt 5, Ch 15, 3.1 General 3.1.2 of Pt 2.
f. Details of ship's cargo hoses are to be submitted together with a type test certificate issued by a recognised authority.
g. The extreme service temperature for ship's cargo hoses is to be taken as the highest and/or lowest service temperature for which the hose is intended.

8. 8 Cargo tank venting

8. 8. 1 The goal of this sub-Section is to protect cargo containment systems from harmful over-pressure or under-pressure at all times.

8. 8. 2 The cargo tank venting arrangements for the vessel shall comply with the following:

a. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 7 Cargo Tank venting*.
b. The system for guarding against liquid rising to a height which would exceed the design head of the cargo tanks is to be independent of the gauging devices.
c. With respect to cargo tank venting, attention is drawn to the need to comply with any more onerous filling height restrictions imposed by the carriage of high relative density cargoes (i.e. above 1.025 t/m^3).

8. 9 Electrical installations

8. 9. 1 The goal of this sub-Section is to ensure that electrical installations are designed so as to minimise the risk of fire and explosion from flammable products; and ensure availability of electrical generation and distribution systems relating to the safe carriage, handling and conditioning of cargoes.

8. 9. 2 The electrical installations aboard the vessel are to comply with the following:

a. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 8 Electrical installations*.
b. Pt 6, Ch 2 Electrical Engineering of these Rules.
c. Where electrical equipment is to be of a 'safe type' in order to comply with *IEC 60092: Electrical installations in ships - Part 502: Tankers - Special features*, such equipment is to be certified for the gases/vapours involved. The construction and type testing are to be in accordance with IEC Publication *60079: Electrical Apparatus for Explosive Gas Atmospheres*, or an equivalent National Standard.
d. For electrical installations for systems or tanks which are to carry chlorosulphonic acid, hydrochloric acid, nitric acid, oleum, phosphoric acid, sulphuric acid or trimethylacetic acid, the hazardous areas identified in *IEC 60092 Electrical installations in ships - Part 502: Tankers - Special features, 4.5 Tankers carrying cargoes (for example acids) reacting with other products/materials to evolve flammable gases* are applicable. The relevant gas group and temperature class are IIC T1.
e. For electrical installations for systems or tanks which are to carry sulphur liquid, the hazardous areas identified in *IEC 60092 Electrical installations in ships - Part 502: Tankers - Special features, 4.3 Tankers carrying flammable liquids having a flashpoint exceeding 60° C*, are applicable.

8. 10 Mechanical ventilation in the cargo area

8. 10. 1 The goal of this sub-Section is to ensure that arrangements are provided for enclosed spaces in the cargo area to control the accumulation of flammable and/or toxic vapours.

8. 10. 2 Mechanical ventilation arrangements in the cargo area are to comply with the following:

a. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 10 Mechanical ventilation in the cargo area*.

b. With respect to ventilation of spaces not normally entered, the particulars of the type and number of portable fans, their arrangement and means of attachment are to be submitted to ACS for consideration in relation to the internal and external arrangement of the space concerned;

i. increased ventilation will be required for spaces which contain gas-freeing systems, unless these systems are totally enclosed; and

ii. ventilation systems are to be capable of use prior to entry and during occupation.

8. 11 Instrumentation and automation systems

8. 11. 1 The goal of this sub-Section is to ensure that any instruments and automation systems provide for the safe carriage and handling of cargoes.

8. 11. 2 Instrumentation and automation systems on board the vessel shall comply with the *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels* (OSV Chemical Code) 11 instrumentation and automation systems.

8. 12 Pollution prevention requirements

8. 12. 1 The goal of this sub-Section is to ensure control of pollution from noxious liquid substances from offshore support vessels.

8. 12. 2 The vessel shall comply with the Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 12 pollution prevention requirements.

8. 13 Carriage of liquefied gases

8. 13. 1 he goal of this sub-Section is to ensure that the vessel's design, arrangement and operational procedures are such as to minimise the risk to the vessel, its crew and the environment, when carrying liquefied gases in bulk.

8. 13. 2 Where the vessel is to carry liquefied gases as a cargo it shall comply with the following:

a. Cargo tanks are to be as required by the ACS Rules as applicable for the intended cargo.

b. The Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 18.1 General, noting that, in the context of the application of this Chapter of the code, deviation from specific requirements of the IGC code must first be agreed with the relevant Flag Administration and latterly presented to ACS for special consideration.

c. The Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 18.2 Accommodation, service and machinery spaces and control stations.

d. The Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 18.3 Cargo containment.

e. The Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 18.4 Materials of construction.

f. The Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 18.5 Vent system for cargo containment.

g. The Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 18.6 Cargo transfer.
h. The Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 18.7 Vapour detection.
i. The Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 18.8 Gauging and level detection.
j. The Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 18.9 Emergency shutdown system.
k. The *Code for the transport and handling of hazardous and noxious liquid substances in bulk on offshore support vessels (OSV Chemical Code) 18.12 Carriage of other liquefied gases listed in chapter 19 of the IGC Code* noting that, where a vessel is intended for carriage of liquefied gases listed in chapter 19 of the IGC Code, other than liquid carbon dioxide (high purity and reclaimed quality) or liquid nitrogen, then agreement on the relevant aspects of the IGC Code and any additional requirements are to be agreed during multi-party discussions to include the Flag Administration and ACS.

PART

4

CHAPTER **4** **Offshore Support Vessels**

SECTION **9** **Enhanced weather protection**

9. 1 Applicability

9. 1. 1 Where the requirements in this Section are complied with, the special features notation **EWP** may be assigned.

9. 2 Superstructure scantlings

9. 2. 1 The scantlings of deckhouses situated on the forecastle deck and above are to comply with the requirements of Table 4. 9. 1: Superstructures and deckhouses on forecastle deck.

9. 2. 2 The scantlings of forecastle end bulkheads are to be not less than those required by Table 4. 9. 1: Superstructures and deckhouses on forecastle deck for aft ends of deckhouses or less than those required by Pt 3, Ch 8, 2 Scantlings of erections other than forecastles for an exposed machinery casing.

Table 4. 9. 1: Superstructures and deckhouses on forecastle deck

Position	Thickness of plating, in mm	Modulus of stiffeners, in cm^3	Depth of stiffeners, in mm
Fronts	The greater of $t = 0.012s$ or 8.0	$Z = 0.034sle^2$	Not less than 100
Sides	The greater of $t = 0.01s$ or 6.5	$Z = 0.027sl_e^2$	Not less than 75
Aft ends	The greater of $t = 0.008s$ or 6.5	$Z = 0.027sl_e^2$	Not less than 65
Note The ends of stiffeners are to be connected on all tiers.			

9. 3 Windows and side scuttles

9. 3. 1 The requirements of this Section are to be applied in conjunction with Pt 3, Ch 11, 6.5, Side scuttles, windows and skylights.

9. 3. 2 Windows may only be fitted in the following locations:

a. Second tier and higher above the freeboard deck:
   i. in the after end bulkhead of deckhouses and superstructures,
   ii. in the sides of deckhouses and superstructures which are not part of the shell plating.

b. Third tier and higher above the freeboard deck:
   i. in the forward facing bulkheads of deckhouse and superstructures, except that in the first tier of the front bulkhead above the weather deck, only side scuttles will be accepted.

9. 3. 3 In locations not specified in Pt 4, Ch 4, 9.3 Windows and side scuttles 9.3.2, only side scuttles will be accepted.

9. 3. 4 Permanently attached deadlights are to be provided as follows:

a. Side scuttles:
   i. in the side shell plating,
   ii. in the forward facing bulkheads of superstructures and deckhouses,
   iii. in the sides of deckhouses and superstructures up to and including the third tier above the freeboard deck,
   iv. in the after end bulkheads of superstructures, deckhouses, casings and companionways in the first and second tiers above the freeboard deck.

b. Windows in locations permitted in Pt 4, Ch 4, 9.3 Windows and side scuttles 9.3.2:
   i. in the sides of deckhouses and superstructures in the second and third tiers above the freeboard deck.
   ii. in the after end bulkheads of superstructures, deckhouses, casings and companionways in the second tier above the freeboard deck.

9. 3. 5 On windows in the second tier and higher above the freeboard deck, hinged storm covers may be fitted in lieu of deadlights, provided there is safe access for closing.

9. 3. 6 Windows in the wheelhouse front are to have deadlights or storm covers. For storm covers, an arrangement for easy and safe access is to be provided, (e.g. gangway with railing). However, for practical purposes, the deadlights or storm covers may be portable if stowed adjacent to the window for quick fitting. At least two of the deadlights or storm covers are to have the means of providing a clear view.

9. 3. 7 Deadlights for side scuttles, and for windows not mentioned in Pt 4, Ch 4, 9.3 Windows and side scuttles 9.3.5 and Pt 4, Ch 4, 9.3 Windows and side scuttles 9.3.6, are to be internally hinged.

9. 3. 8 Side scuttles are to comply with ISO Standard 1751, as follows:

a. Type A side scuttles in the shell plating, in the sides of superstructures and in the forward facing bulkheads of superstructures and deckhouses on the weather deck;
b. Type B side scuttles in the after ends of superstructures and in the sides and ends of deckhouses; or
c. An equivalent National Standard.

9. 3. 9 For the location of windows and side scuttles, *See* Figure 4. 9. 1: Location of windows and side scuttles.

9. 3. 10 The thickness of the toughened safety glass for windows is to be not less than the greater of:

a.

$$t = 10 \text{ mm}$$

b.

$$t = b\sqrt{\frac{H_b \beta}{4000}} mm$$

where

H_d = design pressure head, in metres, as obtained from Table 4. 9. 2: Design pressure head, Hd, on windows

b = length of shorter side of window, in mm

β = $0.54A_R - 0.078A_R^2 - 0.17$ for $A_R < 3$

= 0.75 for $A_R > 3$

A_R = aspect ratio of window

= a/b

a = length of longer side of window, in mm.

9. 3. 11 Proposals for alternative materials will be specially considered.

Table 4. 9. 2: Design pressure head, H_d, on windows

	Design pressure head, in metres	
	Windows in front and side bulkheads	Windows in after end bulkheads
6th tier and above	3.0	2.5
5th tier	5.0	2.5
4th tier	8.0	2.5
3rd tier	12.5	6.25
2nd tier	14.0	8.0

CHAPTER **5** **Barges and Pontoons**

SECTION **1** **General**

1. 1 Application

1. 1. 1 This Chapter applies, in general, to manned or unmanned non-self-propelled ships defined as follows:

a. Barges for the carriage of general dry cargoes in cargo holds.
b. Barges for the carriage of liquid cargoes in bulk.
c. Pontoons designed specifically for the carriage of non-perishable cargo on deck.
d. Shipborne barges for the carriage of general dry cargo in cargo holds and intended to operate afloat only within specified geographical limits, and suitable for regular carriage on board a larger ship.

1. 1. 2 Manned or unmanned barges for the carriage of liquid chemicals in bulk and barges for the carriage of liquefied gases will receive individual consideration on the basis of the Rules, *See* Table 5. 1. 1: Applicable Rules.

Table 5. 1. 1: Applicable Rules

Type of barge	Applicable Rules
Barge for the carriage of general dry cargo in cargo hold	Pt 4, Ch 1 General Cargo Ships
Barge for the carriage of liquid cargo in bulk	Pt 4, Ch 10 Single Hull Oil Tankers
Pontoon designed specifically for the carriage of non-perishable cargo on deck	Pt 4, Ch 1 General Cargo Ships
Shipborne barges for the carriage of general dry cargo in cargo holds	Pt 4, Ch 1 General Cargo Ships and this Chapter for `extended protected water service' barges

1. 1. 3 The scantlings and arrangements, except where otherwise specified in this Chapter, are to comply with the Rules as indicated in Table 5. 1. 1: Applicable Rules.

1. 1. 4 The Rules assume that the structural arrangements of barges carrying cargo in holds will generally approximate to normal ship shape and construction. Barges of this type not doing so will receive individual consideration on the basis of the Rules.

1. 1. 5 The Rules also assume that barges and pontoons are homogeneously loaded. Barges or pontoons with other types of loading, e.g. crane pontoon, will receive individual consideration.

1. 1. 6 All barges and pontoons are to be fitted with adequate arrangements for towing. In general, such arrangements are to consist of, or be equivalent to, not less than two sets of bollards, each of which shall be suitable for accepting a towline of suitable breaking strength.

1. 2 Class notations

1. 2. 1 In general, ships complying with the requirements of this Chapter will be eligible for one of the following classes:

a. **100A1 barge**. This class will be assigned to non-self-propelled sea-going ships as defined in Pt 4, Ch 5, 1.1, Application 1.1.1.

b. **100A1 oil barge**. This class will be assigned to non-self-propelled sea-going ships as defined in Pt 4, Ch 5, 1.1 Application 1.1.1.b.

c. **100A1 pontoon**. This class will be assigned to non-self-propelled sea-going ships as defined in Pt 4, Ch 5, 1.1 Application 1.1.1.c.

1. 2. 2 Barges and pontoons intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.6 to Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.10, will receive individual consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval. In particular, shipborne barges as defined in Pt 4, Ch 5, 1.1 Application 1.1.1.d complying with the requirements of this Chapter will be eligible to be classed **100A1 shipborne barge extended protected water service**.

1. 2. 3 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 Classification Regulations, to which reference should be made.

1. 3 Information required

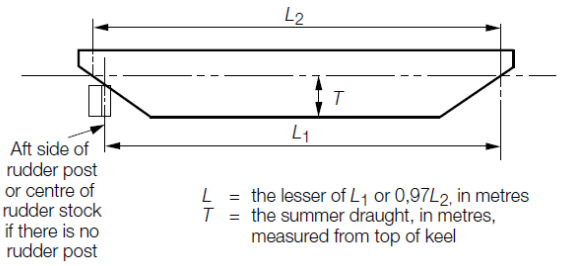
1. 3. 1 In addition to the information and plans required by Pt 3, Ch 1, 5 Information required, the following are to be submitted:

- Details of structure and fittings to which deck cargo securing lashings, etc. are attached.
- Details of the bollards and their supporting structure.
- Where pusher tugs or integral tug/barge systems are proposed, full details and data of the attachment and support arrangements.
- Details of the intended service areas required for barges or pontoons designed to operate within specified geographical limits.
- Longitudinal strength and lifting arrangements for ship-borne barges.

1. 4 Symbols and definitions

1. 4. 1 The Rule length, L, for vessels with swim ends is to be measured as shown in Figure 5. 1. 1: Definition of Rule length. Where a swim end is arranged aft but no rudder is fitted, L need not exceed 97 per cent of the extreme length on the summer load waterline. For tugs and barge units having rigid connections, the length, L, is to be taken as the combined length of the tug and barge.

Figure 5. 1. 1: Definition of Rule length



PART

4

CHAPTER **5** **Barges and Pontoons**

SECTION **2** **Longitudinal strength**

2. 1 General

2. 1. 1 Longitudinal strength calculations are to be made in accordance with the requirements given in Pt 3, Ch 4 Longitudinal Strength, and the ship service factor, f_1, is given in Table 5. 2. 1: Ship service factor f1.

Table 5. 2. 1: Ship service factor f_1

	f_1	
Type of ship	`100A1'	`100A1 extended protected water service'
Barge for the carriage of general cargo in holds and for the carriage of liquid cargoes in bulk	1.0	0.80
Pontoons for the carriage of non-perishable cargoes on deck		
Shipborne barges for the carriage of general cargo in holds and unmanned	—	0.70

2. 1. 2 The requirements of Pt 3, Ch 4, 8.3 Loading instrument regarding loading instruments are not applicable to barges and pontoons.

2. 1. 3 For shipborne barges, where it is the intention to lift the barge on board ship by crane, a condition `fully loaded barge suspended by crane' is to be submitted. For this condition the following stresses are permissible:

- Bending stress $\sigma_b = 147.2\ \mathrm{N/mm^2}$
- Shear stress $\tau = 98.1\ \mathrm{N/mm^2}$

PART

4

CHAPTER **5** **Barges and Pontoons**

SECTION **3** **Hull envelope plating**

3. 1 Shell and deck plating

3. 1. 1 The thickness of shell and deck plating is to be as necessary to give the hull section modulus required by Pt 4, Ch 5, 2.1 General and to satisfy the requirements listed in Table 5. 3. 1: Shell and deck plating.

Table 5. 3. 1: Shell and deck plating

Item of plating		Thickness for ships classed 100A1	Thickness for ships having extended protected water service notation
(a)	Keel	The separate requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable, for keel width and thickness need not be applied, except where L > 100 m and the bottom has a rise of floor	
(b)	Bottom shell and bilge	In accordance with the requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable	In accordance with the requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable, reduced by 12.5 per cent, but is to be not less than required by (c) below
		For chines, *See* Pt 4, Ch 5, 3.1 Shell and deck plating 3.1.2	
(c)	Side shell from upper turn of bilge or chine to deck	The greater of the values obtained from Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable, for the appropriate framing arrangement	
(d)	Deck	In accordance with the requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable	In accordance with the requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable, reduced by 2 mm, but is to be not less than the deck basic end thickness as required by Pt 3, Ch 5 Fore End Structure and Pt 3, Ch 6 Aft End Structure
		In pontoon barges with deck cargoes the deck thickness derived from (d) may be required to be increased	
(e)	Swim ends	The bottom shell plating thickness is to be maintained up to the summer load waterline for the rake plating. Above this point the thickness may be tapered to that of the side shell requirements from a point not less than 1 m above the load waterline	

3. 1. 2 On ships with two chines each side, the bilge plating should generally be calculated from the bottom plating formulae. On hard chine ships, flanged chines will not, in general, be approved, but where a chine is formed by knuckling the shell plating, the radius of curvature, measured on the inside of the plate, is to be not less than 10 times the plate thickness. Where a solid round chine bar is fitted, the bar diameter is to be not less than three times the thickness of the thickest abutting

plate. Where welded chines are used, the welding is to be built up as necessary to ensure that the shell plating thickness is maintained across the weld.

PART

4

CHAPTER **5** **Barges and Pontoons**

SECTION **4** **Hull envelope framing**

4. 1 Symbols

4. 1. 1 The symbols used in this Section are defined as follows:

h = head or load height, in metres, and is to be taken as:

= for bottom longitudinals, frames, girders and transverses: the depth D

= for side longitudinals: the distance of the longitudinal below the deck at side, but not less than $0.01L + 0.7$

= for side transverses: the distance from the mid-point of span to the deck at side, but not less than $0.01L + 0.7$

= for deck longitudinals and transverses: the head equivalent to cargo carried at a stowage rate of 1.39 m^3/tonne, but is not to be taken less than $0.01L + 0.7$

= for side frames: the distance from the midpoint of span to the deck at the side

= for deck beams and girders: the head equivalent to cargo carried at a stowage rate of 1.39 m^3/tonne, but is not to be taken less than required by Table 3. 5. 1: Design heads and permissible cargo loadings

l_e = effective length of stiffening member, in metres, *See* Pt 3, Ch 3, 3 Structural idealisation

s = spacing of frames, beams or longitudinals, in mm

S = spacing or mean spacing of girders, transverses or floors, in metres

Z = section modulus of stiffening member, in cm^3, *See* Pt 3, Ch 3, 3 Structural idealisation.

4. 2 General

4. 2. 1 Bottom, side and deck transverses are to be connected in such a manner as to ensure continuity of the transverse ring system, and longitudinals are to be attached to transverses. In way of deck and bottom transverses, a deep web frame is to be fitted.

4. 2. 2 End connections of longitudinals at bulkheads are to provide adequate fixity and direct continuity of longitudinal strength.

4. 2. 3 Brackets at the top and bottom of side frames are to extend to the adjacent deck or bottom longitudinal to which they are to be attached.

4. 2. 4 pontoons where truss arrangements, comprising top and bottom girders in association with pillars and diagonal bracing, are used in the support of the deck loads, the diagonal members are generally

to have angles of inclination with the horizontal of about 45° and cross-sectional area of approximately 50 per cent of the adjacent pillar in accordance with Pt 4, Ch 1, 4.4, Deck supporting structure, with a head in accordance with Pt 4, Ch 1, 4.1 General 4.1.1.

4. 2. 5 Adequate support must be provided on the centreline for the loads imposed on the structure when the ship is in dry dock.

4. 3 Longitudinal framing

4. 3. 1 The scantlings of bottom, side and deck longitudinals are to comply with the requirements of Table 5. 4. 1: Longitudinal framing.

Table 5. 4. 1: Longitudinal framing

Position of longitudinals	Modulus, in cm^3
Bottom	$* Z = 11.0le^2sh \times 10^{-3}$
Side shell	$* Z = 8.0l_e^2sh \times 10^{-3}$
Deck	$* Z = 5.5l_e^2\text{sh} \times 10^{-3}$
	* For the requirements for barges carrying liquid cargoes in bulk *See* Pt 4, Ch 10 Single Hull Oil Tankers
Note The scantlings derived from above need not exceed the scantling requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable.	

4. 4 Transverse framing

4. 4. 1 The scantlings of bottom and side frames and deck beams are to comply with the requirements of Table 5. 4. 2: Transverse framing.

Table 5. 4. 2: Transverse framing

Position of member	Modulus, in cm^3
Bottom and side frames	$* Z = 9.5l_e^2\text{sh} \times 10^{-3}$
Deck beams	$* Z = 4.5l_e^2sh \times 10^{-3}$
	* For the requirements for barges carrying liquid cargoes in bulk *See* Pt 4, Ch 10 Single Hull Oil Tankers
Note The scantlings derived from above need not exceed the scantling requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable.	

4. 5 Primary supporting structure

4. 5. 1 Primary supporting members are to comply with the requirements of Table 5. 4. 3: Primary supporting structure.

Table 5. 4. 3: Primary supporting structure

Position of member	Modulus, in cm^3
Bottom transverse	$* Z = 11.0 l_e^2 Sh$
Side transverse	$* Z = 8.0 l_e^2 Sh$ (may be reduced by 5 per cent for vessels classed `100A1 extended protected water service')
Deck transverse	$* Z = 5.5 l e^2 Sh$
Bottom girder	$* Z = 9.5 l_e^2 Sh$
Deck longitudinal girder	$* Z = 5.0 l_e^2 Sh$
	* For the requirements for barges carrying liquid cargoes in bulk *See* Pt 4, Ch 10 Single Hull Oil Tankers
Note The scantlings derived from above need not exceed the scantling requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable	

PART

4

CHAPTER **5 Barges and Pontoons**

SECTION **5 Strengthening of bottom forward**

5. 1 Application

5. 1. 1 The requirements for strengthening of bottom forward detailed in Pt 3, Ch 5 Fore End Structure do not apply to barges or pontoons less than 50 m in length.

PART

4

CHAPTER **5** **Barges and Pontoons**

SECTION **6** **Bottom strengthening for loading and unloading aground**

6. 1 Application

6. 1. 1 For barges or pontoons intended to load or unload while aground, *See* Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

PART

4

CHAPTER **5** **Barges and Pontoons**

SECTION **7** **Watertight bulkheads**

7. 1 Collision bulkheads

7. 1. 1 Barges and pontoons are to have a collision bulkhead extending intact to the strength/weather deck and, in general, this is to be positioned as detailed in Table 5. 7. 1: Collision bulkhead position.

Table 5. 7. 1: Collision bulkhead position

Length *L*, in metres	Distance of collision bulkhead aft of fore end of *L*, in metres, *See* Figure 5. 1. 1: Definition of Rule length	
	Minimum	Maximum
≤ 150	0.05*L*	0.05L + 4.5
> 150	The lesser of: 0.05*L* or 10	0.08*L*

PART

4

CHAPTER **5** **Barges and Pontoons**

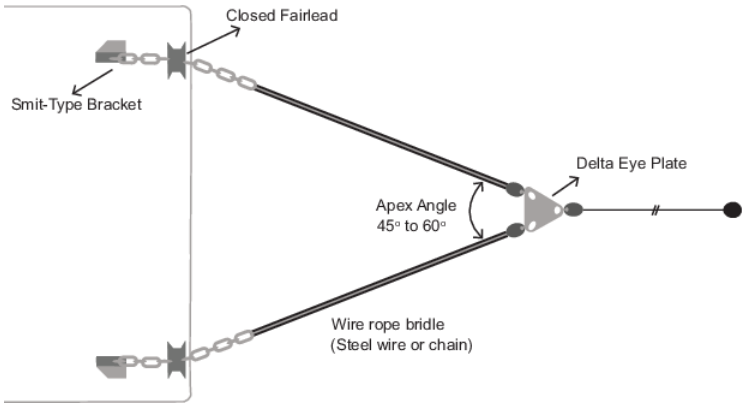
SECTION **8** **Towing fittings**

8. 1 Smit-Type towing brackets and closed fairleads

8. 1. 1 This sub-Section applies to the typical Smit-Type towing brackets and closed fairleads installed on board manned or unmanned non-self-propelled ships which are part of the envisaged towing arrangement.

8. 1. 2 The design load for Smit-Type brackets and closed fairleads shall be no less than 1.3 times the minimum breaking strength of the provided towline or of the weakest component in the envisaged towing arrangement if that is lower, applied at all possible angles of tow.

Figure 5. 8. 1: Illustration of apex angle in a towing arrangement



8. 1. 3 When towed using a bridle arrangement, the angle at the apex of the bridle shall normally be between 45° and 60° as shown in Figure 5. 8. 1: Illustration of apex angle in a towing arrangement. If it exceeds 60°, then the design load for Smit-Type brackets and closed fairleads specified in Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.2 shall be increased to account for the increased resolved load in the bridle.

8. 1. 4 The Smit-Type brackets and closed fairleads shall be selected from an industry standard accepted by ACS based on the design load specified in Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.2 or Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.3 as appropriate, applied at all possible angles of tow.

8. 1. 5 hen the Smit-Type brackets or the closed fairleads are not selected from an industry standard accepted by the society, the strength of fittings is to be adequate for the design load specified in Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.2 or Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.3as appropriate, applied at all possible angles of tow. Under the design load and with net scantlings, the stresses are not to exceed those given in Table 5. 8. 1: Permissible Stress Values. Non-linear analysis is considered acceptable subject to special consideration.

Table 5. 8. 1: Permissible Stress Values

	Permissible stress N/mm^2
Normal stress	σ_0
Shear stress	$\frac{\sigma_0}{\sqrt{3}}$
Combined stress	σ_0
Symbols	
σ_0 = specified minimum yield stress, in N/mm^2 **Note** Normal stress is defined as the sum of bending and axial stresses, with the corresponding shearing stress acting perpendicular to the normal stress.	

8. 1. 6 Prototype testing will be required to confirm the strength unless the Smit-Type bracket or the closed fairlead is selected from a recognised National or International Standard. The fitting shall be tensioned to its design load as specified in Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.2 or Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.3 as appropriate, accounting for all possible angles of tow. After the test, the prototype needs to be examined for any failures including unacceptable deformations. The prototype which was strength-tested shall not be installed on board.

8. 1. 7 The weld between the fittings and the deck shall be capable of resisting the design load specified in Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.2 or Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.3 as appropriate.

8. 1. 8 The deck and the supporting structure in way of the fittings are to be suitably reinforced to resist a design load specified in Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.2 or Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.3 as appropriate, applied at all possible angles of tow. Stresses induced in the supporting structure, determined using the design load and with net scantlings are not to exceed the permissible values given in Table 5. 8. 1: Permissible Stress Values. The capability of the structure to withstand buckling is also to be assessed, and an appropriate insert plate needs to be provided where necessary.

8. 1. 9 An allowance for corrosion is to be added to the net thickness derived as indicated below:

- For the supporting deck structure, a corrosion addition of 2 mm is to be added to the net thickness derived.
- For fittings not selected from an accepted industry standard, 2 mm is to be added to the net thickness derived.

8. 1. 10 In addition to the corrosion requirements specified in Pt 4, Ch 5, 8.1 Smit-Type towing brackets and closed fairleads 8.1.9, the wear allowance for the shipboard fittings not selected from an accepted industry standard is not to be less than 1.0 mm, added to the surfaces which are intended to be in regular contact with the towline.

PART

4

CHAPTER **5** **Barges and Pontoons**

SECTION **9** **Void spaces**

9. 1 Void spaces on unmanned pontoons not fitted with auxiliary machinery

9. 1. 1 Drainage arrangements and air pipes are to be provided in accordance with Pt 5, Ch 13, 10 Drainage arrangements for ships not fitted with propelling machinery and Pt 5, Ch 13, 12.4 Air pipes 12.4.4 respectively.

9. 1. 2 Deck openings to allow drainage in accordance with Pt 5, Ch 13, 10.1 Pumps 10.1.3 are to be as small as practicable and closed by watertight gasketed covers of steel or equivalent material.

CHAPTER 6 Trawlers and Fishing Vessels

SECTION 1 General

1. 1 Application

1. 1. 1 This Chapter applies to sea-going steel trawlers, stern trawlers and fishing vessels.

1. 1. 2 For the purpose of this Chapter, a fishing vessel is a ship used for fishing operations, but not equipped for trawling.

1. 1. 3 The scantlings and arrangements are to be as required by Pt 4, Ch 1 General Cargo Ships except as otherwise specified in this Chapter. Consideration will be given to proposals for modified scantlings on vessels where *L* is less than 24 m.

1. 2 Assignment of load lines

1. 2. 1 The *International Convention on Load Lines, 1966* does not apply to trawlers and fishing vessels, but certain National Authorities may request the assignment of load lines for ships registered in their countries.

1. 2. 2 The Rules affecting the protection of openings and protection of crew, and particularly those contained in Pt 3, Ch 11 Closing Arrangements for Shell, Deck and Bulkheads and Pt 3, Ch 12 Ventilators, Air Pipes and Discharges, may be modified to take account of National Regulations or practicabilities related to fishing operations.

1. 3 Class notations

1. 3. 1 In general, ships complying with the requirements of this Chapter will be eligible for one of the following classes:

a. **100A1 trawler**. This class will be assigned to side fishing trawlers.
b. **100A1 stern trawler**. This class will be assigned to stern fishing trawlers.
c. **100A1 fishing vessel**. This class will be assigned to fishing vessels, *See* Pt 4, Ch 6, 1.1 Application 1.1.2.

1. 3. 2 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 Classification Regulations to which reference should be made.

1. 4 Information required

1. 4. 1 In addition to the information required by Pt 3, Ch 1, 5 Information required, the position and arrangement of trawl gear and deck machinery and location of insulated compartments are to be indicated.

1. 5 Symbols and definitions

1. 5. 1 he Rule length, L, is the distance, in metres, on the classification waterline from the fore side of the stem to the after side of the rudder post, or to the centre of the rudder stock if there is no rudder post. L is to be not less than 96 per cent, and need not be greater than 97 per cent, of the extreme length on the classification waterline.

1. 5. 2 Breadth B, is the greatest moulded breadth, in metres.

1. 5. 3 Depth D, is measured, in metres, at the middle of the length, L from the base line to top of the deck beam at side on the uppermost continuous deck.

1. 5. 4 The classification waterline in single deck ships is the waterline taken perpendicular to the plane of the transverse bulkheads located at $0.85D$ from the base line amidships, or at the maximum operational draught amidships, whichever is the greater. In two-deck ships, it is the waterline located at the maximum operational draught, but if this is unknown, it may be taken at 50 mm below the lower deck. If a load line is required by a National Authority, the classification waterline is the summer load waterline.

1. 5. 5 Keel line is the line parallel to the slope of the keel intersecting the top of the keel at amidships, or the line of intersection of the inside of shell plating with the keel where a bar keel is fitted.

1. 5. 6 Base line is a line parallel to the classification waterline and intersecting the keel line at amidships.

1. 5. 7 Draught T, is the distance in metres, between the classification waterline and the base line amidships.

1. 5. 8 The block coefficient C_b is to be taken at the classification waterline.

1. 5. 9 The following symbols are also applicable to this Chapter:

k = material factor, *See* Pt 4, Ch 1, 1.5, Symbols and definitions

l_e = effective length of stiffening member, in metres, *See* Pt 3, Ch 3, 3 Structural idealisation

s = spacing of stiffeners, in mm

s_b = $470 + \frac{L}{0.6}$ with minimum limitation at ends as defined in Pt 3, Ch 5, Table 5. 3. 1: Shell and deck plating for fore end structure and Pt 3, Ch 6 Aft End Structure, Table 6. 3. 1: Shell plating aft for aft end structure

s_1 = s, but not less than s_b

t = thickness of plating, in mm

Z = section modulus of stiffening member, in cm^3, *See* Pt 3, Ch 3, 3 Structural idealisation

PART

4

CHAPTER **6** **Trawlers and Fishing Vessels**

SECTION **2** **Protection**

2. 1 Protection of steelwork

2. 1. 1 Where wood sheathing is fitted, the material is to be of good quality, well seasoned and free from sapwood, and the thickness is to be not less than 65 mm. The plank widths should not normally exceed 150 mm. Thwartship planks are to be laid at the ends of deckhouses and at break of deck. Fastenings are to be sunk below the surface of the planking and covered with turned dowels, and the whole to be thoroughly bedded in a suitable composition. All weather decks are to be caulked and payed.

2. 1. 2 Where gutter waterways are fitted, the bar forming the inner edge of the waterway is to be not less than 7.5 mm thick.

2. 1. 3 Welded studs are to be not less than 9.5 mm diameter, and are to be coated with suitable composition before the planking is laid. Bolts used instead of studs may be 12.5 mm diameter galvanised. If the steel deck is penetrated for bolts, the deck is to be hose tested in accordance with Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks.

2. 2 Protection of cargo

2. 2. 1 When a fuel oil bunker or double bottom carrying fuel oil, or a lubricating oil tank, is adjacent to a fish hold, the relevant requirements of Pt 4, Ch 3, 4 Panting and strengthening of bottom forward are to be complied with.

2. 2. 2 Compartments used for the processing of fish, or for temporary storage during or while awaiting processing, need not comply with the requirements of Pt 4, Ch 6, 2.2 Protection of cargo 2.2.1, but the construction of the bulkheads, decks and insulation, if any, should be such as to minimise the risk of oil leakage.

PART

4

CHAPTER **6** **Trawlers and Fishing Vessels**

SECTION **3** **Longitudinal strength**

3. 1 General

3. 1. 1 The longitudinal strength standard is to comply with the relevant requirements of Pt 3, Ch 4 Longitudinal Strength.

3. 1. 2 The requirements of Pt 3, Ch 4, 8.3 Loading instrument regarding loading instruments are not applicable to trawlers and fishing vessels.

PART

4

CHAPTER **6** **Trawlers and Fishing Vessels**

SECTION **4** **Deck structure**

4. 1 Deck plating

4. 1. 1 The thickness of deck plating is to be not less than that required by Pt 4, Ch 1, 4 Deck structure. Under the trawl winch, windlass, mast, centre and side bollards and gallows, the plating thickness is to be not less than:

$$t = (0.04L + 7.5)\ \text{mm}$$

where L is to be taken not less than 30 m.

4. 1. 2 When a raised deck is fitted, adequate scarfing is to be arranged at the step.

4. 2 Factory deck beams

4. 2. 1 The section modulus of the beams of factory decks under fish handling spaces is to be not less than that required by Table 1. 4. 5: Strength/weather, cargo and accommodation deck beams in Pt 4, Ch 1 General Cargo Ships, with h_2 equal to 2 m, but extra strengthening may be required in way of heavy items of machinery or equipment.

PART

4

CHAPTER **6** **Trawlers and Fishing Vessels**

SECTION **5** **Shell envelope plating**

5. 1 Shell plating

5. 1. 1 The thickness of shell plating is to be not less than that required by Pt 4, Ch 1, 5 Shell envelope plating but in no case is it to be less than the following:

$$\text{For } L > 70m \; t = (5.5 + 0.033L)\sqrt{\frac{ks_1}{s_b}}mm$$

$$\text{For } L > 70m \; t = (6.5 + 0.033L)\sqrt{\frac{ks_1}{s_b}}mm$$

5. 1. 2 For single deck side trawlers the thickness derived from the formulae in Pt 4, Ch 6, 5.1 Shell plating 5.1.1 is to be increased by 10 per cent.

5. 1. 3 When nets or control wires are in contact with the ship's side, such as below the gallows in a side trawler, the side shell plating is to be increased by 40 per cent.

5. 1. 4 Where a bar keel is fitted, the breadth of the garboard strake is to be not less than 760 mm, and the thickness is to be 10 per cent greater than the bottom shell.

5. 1. 5 The thickness of the bottom shell plating is to be increased by 10 per cent where intercostal girders are not fitted.

5. 1. 6 For increase to sheerstrake at the break of a raised deck, *See* Pt 4, Ch 1, 5 Shell envelope plating.

5. 1. 7 Cope irons are to be fitted under gallows or any other area where excessive wear could occur.

PART

4

CHAPTER 6 Trawlers and Fishing Vessels

SECTION 6 Shell envelope framing

6. 1 Transverse side framing

6. 1. 1 The section modulus of the side frames of single deck trawlers and fishing vessels need not be greater than 80 per cent of the modulus required by Pt 4, Ch 1, 6 Shell envelope framing, but in no case is the depth of the frame to be less than 60 mm. Where not specified the draught is to be taken as not less than 0.85D.

6. 1. 2 For two deck trawlers and two deck fishing vessels and all vessels requiring a load line, the requirements of Pt 4, Ch 1, 6 Shell envelope framing are to be complied with.

6. 1. 3 The section modulus of frames in the fore peak is to be the greater of the following:

a. 10 per cent greater than that required by Pt 3, Ch 5, 4 Shell envelope framing.

b. $Z=(45D-212)$ cm^3.

6. 1. 4 The section modulus of frames in the aft end region is to be not less than that required by Pt 3, Ch 6, 3 Shell envelope plating.

6. 1. 5 Where frames are stopped at watertight flats they are to be bracketed.

PART

4

CHAPTER **6** **Trawlers and Fishing Vessels**

SECTION **7** **Watertight bulkheads**

7. 1 Collision bulkheads

7. 1. 1 Consideration will be given to proposals for the collision bulkhead to be positioned further aft than 0.08*L* from the fore end of the classification waterline, provided that bow damage will not result in excessive trim forward.

PART

4

CHAPTER 6 Trawlers and Fishing Vessels

SECTION 8 Stern ramp, and cruiser and transom sterns

8. 1 Stern ramp

8. 1. 1 The thickness of plating of the stern ramp is to be not less than:

t = 0.025s mm or 10 mm, whichever is the greater.

8. 1. 2 The section modulus of stiffeners is to be not less than:

$Z = 0.019sl_e^2$ cm^3

8. 2 Cruiser and transom sterns

8. 2. 1 Cruiser and transom sterns are to have frames of the size required for peaks, and are to be additionally stiffened by web frames when required. The depth of plate floors is to be not less than that given in Pt 4, Ch 1, 7 Single bottom structure, and the floors are to be associated with a suitable system of girders.

PART

4

CHAPTER **6** **Trawlers and Fishing Vessels**

SECTION **9** **Strengthening of bottom forward**

9. 1 General

9. 1. 1 The requirements of Pt 3, Ch 5, 1 General are to be applied except when the forward draught contemplated for any sea-going condition is equal to or greater than $0.03L$ in which case the bottom shell plating in the region to be strengthened may be taken as:

$$t = 0.00818sfL^{1/4}k^{1/2}$$

where the symbols are as defined in Table 5. 1. 1: Additional strengthening of bottom forward in Pt 4, Ch 5 Barges and Pontoons.

This thickness derivation may be adopted for both longitudinal and transverse framing.

CHAPTER **7** **Bulk Carriers**

SECTION **1** **General**

1. 1 General

1. 1. 1 This Chapter applies to sea-going self propelled ships, constructed generally with single deck, double bottom, hopper side tanks and topside tanks and with single or double side skin construction in the cargo length area, and intended primarily for the carriage of bulk dry cargoes.

1. 1. 2 A 'bulk carrier of single side skin construction' is defined as a bulk carrier where one or more cargo holds are bound by the side shell only, or by two watertight boundaries, one of which is the side shell, which are less than 1000 mm apart.

1. 1. 3 The term 'bulk carrier of double side skin construction' is defined as a bulk carrier where all cargo holds are bound by two watertight boundaries, one of which is the side shell, which are greater than or equal to 1000 mm apart at any location within the hold length.

1. 1. 4 The ACSPlus Guidelines for the hull construction of ships are detailed in Pt 3, Ch 16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships and the classification notations and descriptive notes associated with these procedures are given in Pt 1, Ch 2, 3 Surveys - General.

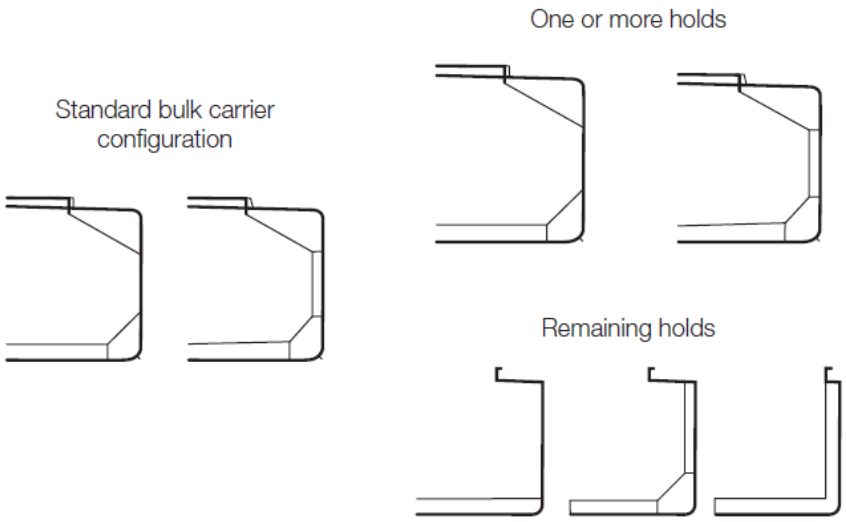
1. 1. 5 The attention of Owners, Masters and Cargo Shippers is drawn to the IMO Code of Safe Practice for Solid Bulk Cargoes when shipping these cargoes. Attention is also drawn to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered, and any special requirements of the Port Authorities at the ports of loading and discharge.

1. 1. 6 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 Classification Regulations to which reference should be made.

1. 2 Application

1. 2. 1 Single skin and double skin bulk carriers with length, L , greater than or equal to 90 m with structural configuration as shown in Figure 7. 1. 1: CSR-BC Applicability are defined as '*CSR Bulk Carriers*' and are to comply with Pt 4, Ch 7, 1.4, Class notation for CSR bulk carriers.

Figure 7. 1. 1: CSR-BC Applicability



1. 2. 2 Single skin and double skin bulk carriers other than those described in Pt 4, Ch 7, 1.2 Application 1.2.1 are defined as '*Non- CSR Bulk Carriers*' and are to comply with Pt 4, Ch 7, 1.5, Class notation for non-CSR bulk carriers.

1. 3 General class notations

1. 3. 1 Class notations applicable to CSR bulk carriers are defined as follows:

- **CSR**

Identifies the bulk carrier as being compliant with the *IACS Common Structural Rules for Bulk Carriers and Oil Tankers (CSR);*.

- **ESP**

Identifies the bulk carrier as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements and Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements, *See also* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.12.

1. 3. 2 Class notations applicable to non-CSR bulk carriers are defined as follows:

- **Strengthened for heavy cargoes**

For bulk carriers with scantlings complying with Pt 4, Ch 7, 8.2, Carriage of heavy cargoes;

- **ESP**

Identifies the bulk carrier as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements and Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements, *See also* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.12;

- **ESN**

Identifies the bulk carrier as having been assessed for enhanced survivability with respect to flooding. Scantlings and arrangements are to comply with Pt 4, Ch 7, 3.1 General 3.1.2, Pt 4, Ch 7, 8.8, Allowable hold loading in the flooded condition and Pt 4, Ch 7, 10.4, Vertically corrugated transverse watertight bulkheads – Application and definitions.

1. 4 Class notation for CSR bulk carriers

1. 4. 1 In general, CSR bulk carriers less than 150 m in length are to comply with the requirements of Pt 4, Ch 7, 1.6 Information required for CSR bulk carriers, Pt 3, Ch 2 Materials and the *IACS Common Structural Rules* (CSR) and will be eligible for one of the following mandatory class notations:

a. **100A1 bulk carrier, CSR, any holds may be empty, ESP**. This class notation is normally assigned to a ship designed to carry dry bulk cargoes of cargo density 1.0 tonne/m^3 and above, with an approved arrangement of loaded holds such that any hold may be empty at the full loaded draught.

b. **100A1 bulk carrier, CSR, hold, nos. 1, 2 ... may be empty, ESP**. This class notation is normally assigned to a ship designed to carry dry bulk cargoes of cargo density 1.0 tonne/m^3 and above with specified holds empty at maximum draught.

c. **100A1 bulk carrier, CSR, ESP**. This class notation will be assigned to a ship designed to carry dry bulk cargoes of cargo density less than 1.0 tonne/m^3.

1. 4. 2 In general, CSR bulk carriers equal to or greater than 150 m in length are to comply with the requirements of Pt 4, Ch 7, 1.6 Information required for CSR bulk carriers, Pt 3, Ch 2 Materials and the *IACS Common Structural Rules* (CSR) and will be eligible for one of the following mandatory class notations:

a. **100A1 bulk carrier, CSR, BC-A, hold, nos. 1, 2 … may be empty, GRAB [X] ESP**. This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density 1.0 tonne/m^3 and above with specified holds empty at maximum draught.

b. **100A1 bulk carrier, CSR, BC-B, GRAB [X], ESP**. This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density 1.0 tonne/m^3 and above with all cargo holds loaded.

c. **100A1 bulk carrier, CSR, BC-C, ESP**. This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density less than 1.0 tonne/m^3 with all cargo holds loaded.

1. 4. 3 The following additional notations and annotations are to be provided giving further detailed description of limitations to be observed during operation as a consequence of the design loading condition applied during the design.

- **Notations:**

a. (**maximum cargo density (in tonnes/m^3)**) For notations **BC-A** and **BC-B** if the maximum cargo density is less than 3.0 tonnes/m^3,

(**no MP**) For all notations when the vessel has not been designed for loading and unloading in multiple ports in accordance with the conditions specified in *IACS Common Structural Rules* (CSR), Pt 1, Ch 4, Sec 8, 4.2.2:

GRAB [X] where the net thickness of inner bottom, lower strake of hopper tank sloping plate and transverse lower stool plating comply with *IACS Common Structural Rules* (CSR), Pt 2, Ch 1, 6 for **BC-A** and **BC-B**, *See IACS Common Structural Rules (CSR)*, Pt 1, Ch 1, Sec 1, 3.2.1;

- **Annotations:**

(allowed combination of specified empty holds). For notation **BC-A**.

1. 4. 4 The ACSPlus notation **CM** is mandatory for CSR bulk carriers greater than 150 m in length, *See* Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.7.

1. 4. 5 Optional notations indicating compliance with specific requirements of Pt 4, Ch 7, 3 Longitudinal strength to Pt 4, Ch 7, 14 Forecastles on a voluntary basis may also be assigned.

1. 5 Class notation for non-CSR bulk carriers

1. 5. 1 In general, non-CSR Bulk Carriers are to comply with the requirements of Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.2 to Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.10 and will be eligible for one of the following mandatory class notations:

a. **100A1 bulk carrier, ESP**.

b. **100A1 bulk carrier, strengthened for heavy cargoes, ESP**. This class notation will be assigned to a ship when the double bottom structure has been specially strengthened in accordance with the requirements of Table 7. 8. 1: Strengthening for heavy cargo requirements.

c. **100A1 bulk carrier, strengthened for heavy cargoes, hold, nos. 1, 2 ... may be empty, ESP**. This class notation is normally assigned to a ship which has been specially strengthened for heavy cargoes, *See* Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.1.b, so as to enable the ship to be fully loaded with an approved arrangement of empty holds, *See also* Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.10 and Pt 4, Ch 7, 1.4 Class notation for CSR bulk carriers 1.4.3.

d. **100A1 bulk carrier, strengthened for heavy cargoes, any holds may be empty, ESP**. This class notation is normally assigned to a ship which has been specially strengthened for heavy and ore cargoes, with an approved arrangement of loaded holds such that any hold may be empty at the full loaded draught.

1. 5. 2 Plans and information are to be submitted in accordance with Pt 4, Ch 7, 1.7, Information required for non-CSR bulk carriers.

1. 5. 3 Requirements are also given for special strengthening for heavy cargoes, *See* Pt 4, Ch 7, 8.2, Carriage of heavy cargoes.

1. 5. 4 The scantlings and arrangements of the cargo region are to be as specified in this Chapter in Pt 4, Ch 7, 2 Materials and protection to Pt 4, Ch 7, 14 Forecastles. The requirements are intended to cover the midship region, but also apply, with suitable modification, to the taper regions forward and aft in way of cargo spaces.

1. 5. 5 The ACSPlus notation **CM** is mandatory for non-CSR bulk carriers greater than 150 m in length, *See* Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.7.

1. 5. 6 Where the length of the ship is greater than 190 m, or where the structural arrangements are considered such as to necessitate it, the scantlings of the primary supporting structure are to be assessed by direct calculation and the ACSPlus notations **SDA**, **FDA** and **CM** are mandatory, *See* Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.7 and Pt 4, Ch 7, 11 Direct calculation.

1. 5. 7 The 'ACSPlus Guidelines' for the hull construction of ships are detailed in Pt 3, Ch 16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships and the classification notations and descriptive notes associated with these procedures are given in Pt 1, Ch 2, 2 Character of classification and class notations.

1. 5. 8 The 'Structural Design Assessment' (**SDA**), 'Fatigue Design Assessment' (**FDA**) and 'Construction Monitoring' (**CM**) Guidelines detailed in the *ACSPlus Guidelines Manual*, published by ACS, are mandatory for non-CSR bulk carriers greater than 190 m in length and for other non-CSR bulk carriers of abnormal hull form, or of unusual structural configuration or complexity *See* Pt 4, Ch 7, 1.1 General 1.1.5 and Pt 4, Ch 7, 11 Direct calculation.

1. 5. 9 Where the class notation referred to in Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.1.d is assigned such that any hold may be empty at the full draught the following items are to be considered and the corresponding requirements complied with:

a. Longitudinal strength calculations are to be carried out for all the operational fully loaded, non-homogeneous, part loaded, heavy cargo conditions, and these conditions included in the approved Loading Manual, *See* Pt 4, Ch 7, 3 Longitudinal strength. Envelopes of the still

water bending moments and the shear forces covering these conditions are also to be submitted.

b. The double bottom structure in each hold is to satisfy the requirements of Pt 4, Ch 7, 8.4 Ships to be classed '100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP'.

c. The arrangement and scantlings of cross-deck structure between the upper deck cargo hatchways, *See* Pt 4, Ch 7, 4.1 General 4.1.2.

d. Transverse bulkheads in holds, *See* Pt 4, Ch 7, 10.1 General 10.1.4.

e. For main cargo hatchway openings the requirements of Pt 4, Ch 7, 4.3 Main cargo hatchway openings 4.3.1 are to be complied with.

1. 5. 10 Where appropriate, other cargoes or particular loading arrangements will be included in the class notation. When the class notation referred to in Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.1.c is to be assigned for other combinations of empty and loaded holds, for example where it is the intention to load fully any two adjoining holds with adjacent holds empty in sea-going or short voyage conditions, the longitudinal and local strength aspects will be specially considered, *See also* Pt 4, Ch 7, 4.1 General 4.1.2. In addition, permissible weights of cargo in each hold or pair of adjacent holds, plotted against ship's draught likely to be incurred, are to be included in the ship's approved Loading Manual.

1. 5. 11 The scantlings of structural items may be determined by direct calculation.

1. 5. 12 The additional requirements for bulk carriers for the alternate carriage of oil cargo and dry bulk cargo are given in Pt 4, Ch 9, 11 Ships for alternate carriage of oil cargo and dry bulk cargo. When complying with the requirements of this Chapter, such ships may be excluded from all requirements and notations pertaining to vessels with length, *L*, greater than or equal to 150 m. The requirements of Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.8 are however to be complied with.

1. 6 Information required for CSR bulk carriers

1. 6. 1 Plans and supporting documents/calculations are to be submitted for approval in accordance with the requirements of the CSR.

1. 6. 2 In addition, where not already required by the CSR, plans and supporting documents/calculations are to be submitted for approval as required by Pt 3, Ch 1, 5.2 Plans and supporting calculations.

1. 6. 3 A Ship Construction File (SCF) is to be provided on board of the ship containing information to facilitate inspection/survey, repair and maintenance. As a minimum it is to include documentation and plans in accordance with the requirements of the CSR.

1. 6. 4 For CSR bulk carriers subject to *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations Part A-1 - Structure of ships Regulation 3-10 – Goal-based ship construction standards for bulk carriers and oil tankers*, the SCF is to be provided instead in accordance with the requirements specified therein in SOLAS and for these goal-based standard ships an SCF contents list is to be prepared and submitted for approval.

1. 6. 5 These SCFs are also to include the documentation and plans as listed in Pt 3, Ch 1, 5.3 Plans to be supplied to the ship, where not already required by the CSR or *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations Part A-1 - Structure of ships Regulation 3-10 – Goal-based ship construction standards for bulk carriers and oil tankers*.

1. 6. 6 In all cases, as required by the CSR, *Pt 1, Ch 13 Ship in Operation - Renewal Criteria,* the mid-ship section plan to be supplied on board the ship is to include the minimum required hull girder sectional properties. Sectional properties are to be provided for transverse sections within the cargo length, i.e. each cargo hold, and are to include:

- sectional properties as defined in CSR, *Pt 1, Ch 5, 1 Strength Characteristics of Hull Girder Transverse Sections;*
- the defined section modulus at Deck and at Bottom calculated with the gross offered thickness;
- the sectional area of the defined Deck and Bottom Zones calculated with the gross offered thickness; and
- the sectional area of the defined Neutral Axis Zone calculated with the gross offered thickness minus 0.5 *t*c.

1. 7 Information required for non-CSR bulk carriers

1. 7. 1 In addition to the information and plans required by Pt 3, Ch 1, 5 Information required, the following are to be submitted:

- Cargo loadings on decks, hatchways and inner bottom if these are to be in excess of Rule, *See* Pt 3, Ch 3, 5 Design loading.
- The maximum pressure head in service on tanks, also details of any double bottom tanks interconnected with hopper and topside tanks.
- Details of the proposed depths of any partial fillings where water ballast or liquid cargo is intended to be carried in the holds.
- Details of loading arrangements where combinations of empty and loaded holds are envisaged, and where it is the intention to load fully any two adjoining holds with adjacent holds empty in sea-going or short voyage conditions.

1. 7. 2 Additional information required for bulk carriers of length, *L*, 150 m or above:

- The bulk cargo density to be used in the design homogeneous loading condition at scantling draught with all holds, including hatchways, being 100 per cent full.
- The maximum bulk cargo density the ship is designed to carry.
- The maximum bulk cargo weight to be carried in each hold.
- Tables or curves indicating the change of cargo hold volume as a function of height above moulded baseline.

1. 8 Symbols and definitions

1. 8. 1 The following symbols and definitions are applicable to this chapter unless otherwise stated: *L, B, D, T* as defined in Pt 3, Ch 1, 6 Definitions

k_L, k = higher tensile steel factor, *See* Pt 3, Ch 2, 1 Materials of construction

l = overall length of stiffening member, in metres, *See* Pt 3, Ch 3, 3 Structural idealisation

l_e = effective length of stiffening member, in metres, *See* Pt 3, Ch 3, 3 Structural idealisation

s = spacing of secondary stiffeners, in mm

t = thickness of plating, in mm

C = stowage rate, in m^3/tonne, as defined in Pt 3, Ch 3, 5 Design loading

I = inertia of stiffening member, in cm^4, *See* Pt 3, Ch 3, 3 Structural idealisation

M_H = the actual cargo mass in a cargo hold corresponding to a homogenously loaded condition at maximum draught

M_{Full} = the cargo mass in a cargo hold corresponding to cargo with virtual density (homogenous mass/hold cubic capacity, minimum 1.0 tonne/m^3) filled to the top of the hatch coaming. M_{Full} is in no case to be less than M_H

M_{HD} = the maximum cargo mass allowed to be carried in a cargo hold according to design Loading conditions with specified holds empty at maximum draught

R = sin θ

S = spacing, or mean spacing, of primary members, in metres

Z = section modulus of stiffening member, in cm^3, *See* Pt 3, Ch 3, 3 Structural idealisation

ρ = relative density (specific gravity) of liquid carried in a tank, and is not to be taken less than 1.025

θ = roll angle, in degrees

sin θ = $\left(0.45 + 0.1\frac{L}{B}\right)\left(0.54 - \frac{L}{1270}\right)$

PART

4

CHAPTER **7** **Bulk Carriers**

SECTION **2** **Materials and protection**

2. 1 Materials and grades of steel

2. 1. 1 Materials and grades of steel are to comply with the requirements of Pt 3, Ch 2 Materials.

2. 2 Protection of steelwork

2. 2. 1 For the protection of steelwork, in addition to the requirements specified in Pt 4, Ch 1, 2 Materials and protection and Pt 3, Ch 2, 3 Corrosion protection the requirements of Pt 4, Ch 7, 2.2 Protection of steelwork 2.2.2 are to be complied with.

2. 2. 2 All internal and external surfaces of hatch coamings and hatch covers, and all internal surfaces of the cargo holds, except where excluded below, are to have an efficient protective coating (epoxy coating or equivalent) applied in accordance with the manufacturer's recommendations. In the selection of coating, due consideration is to be given to the intended cargo conditions in service. Areas which may remain uncoated are:

a. The inner bottom plating.
b. The hopper tank sloping plating between the intersection with the inner bottom plating and a line approximately 300 mm below the toe of the side shell frame end brackets.

2. 2. 3 For the notation `**strengthened for regular discharge by heavy grabs'**, *See* Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

PART

4

CHAPTER **7** **Bulk Carriers**

SECTION **3** **Longitudinal strength**

3. 1 General

3. 1. 1 Longitudinal strength calculations are to be made in accordance with the requirements given in Pt 3, Ch 4 Longitudinal Strength and Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.9 and Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers 1.5.10 where appropriate.

3. 1. 2 Longitudinal strength calculations for the flooded conditions defined in Pt 4, Ch 7, 3.2, Hull vertical bending stresses for flooded conditions to Pt 4, Ch 7, 3.4 Flooded conditions are to be applied for bulk carriers which satsify all of the following criteria:

- Single skin construction, or double skin construction where any part of the longitudinal bulkhead is located within B/5 or 11.5 m, whichever is less, inboard from the ship's side at right angles to the centreline at the assigned summer load line.
- Length, L, of 150 m or above.
- Intended for the carriage of cargoes having bulk densities of 1.0 tonne/m^3 or above.

3. 2 Hull vertical bending stresses for flooded conditions

3. 2. 1 The maximum hull vertical bending stresses in the flooded condition at deck, σ_{Df}, and keel, σ_{Bf}, for use in Pt 3, Ch 4 Longitudinal Strength are given by the following, using the appropriate combination of bending moments to give sagging and hogging stresses:

$$\sigma_{Df} = \frac{|M_{sf} + 0.8M_w| \times 10^{-3}}{Z_D} \text{ N/mm}^2$$

$$\sigma_{Bf} = \frac{|M_{sf} + 0.8M_w| \times 10^{-3}}{Z_B} \text{ N/mm}^2$$

Where

M_{sf} = maximum still water bending moment in the flooded condition, in kN m, at the section under consideration, *See* Pt 4, Ch 7, 3.4 Flooded conditions

M_w = design hull vertical wave bending moment, in kN m, as defined in Pt 3, Ch 4, 5 Hull bending strength at the section under consideration

Z_D, Z_B = actual hull section moduli, in m^3, at strength deck and keel respectively, at the section under consideration.

3. 2. 2 The maximum values of σ_{Df} and σ_{Bf} are to be used in Pt 3, Ch 4 Longitudinal Strength.

3. 3 Shear stresses for flooded conditions

3. 3. 1 The shear stress, τ_{Af}, in the flooded condition to be used in Pt 3, Ch 4, 6 Hull shear strength, is to be taken as:

$$\tau_{Af} = 100Az\frac{|Q_s f| + 0.8Q_w|}{I\delta_i} \text{ N/mm}^2$$

Where

Az = the first moment, in cm^3, about the neutral axis, of the area of the effective longitudinal members between the vertical level under consideration and the vertical extremity of the effective longitudinal members, taken at the section under consideration

Q_{sf} = maximum hull still water shear force, in kN, in the flooded condition at the section under consideration

Q_w = design hull wave shear force, in kN, as defined in Pt 3, Ch 4, 6.3 Design wave shear force at the section under consideration

I = moment of inertia of the hull about the horizontal neutral axis, in cm^4, at the longitudinal section under consideration

δ_i = defined in Pt 3, Ch 4, 6.5 Permissible still water shear force.

3. 4 Flooded conditions

3. 4. 1 For the relevant loading conditions specified in Pt 3, Ch 4, 5.3, Design still water bending moments and Pt 3, Ch 4, 5.4, Minimum hull section modulus, each cargo hold is to be considered individually flooded up to the equilibrium waterline. The shear forces and still water bending moments are to be calculated for the most severe flooded conditions which will significantly load the ship's structure. Harbour conditions, docking conditions afloat, loading and unloading transitory conditions in port and loading conditions encountered during ballast water exchange need not be considered.

3. 4. 2 In calculating the weight of ingressed water into the cargo hold under consideration, the permeabilities and bulk densities given in Table 7. 3. 1: Permeability and bulk density factors are to be used.

Table 7. 3. 1: Permeability and bulk density factors

Hold condition	Permeability (*See* Note 1)	Bulk density (tonne/m^3)
Empty cargo space	0.95	-
Volume left in loaded cargo spaces above any cargo	0.95	-
Iron ore cargo	0.3(*See* Note 2)	3.0
Cement	0.3(*See* Note 2)	1.3

Note *1.* Bulk cargo permeability is defined as the ratio of the voids within the cargo mass to the volume occupied by the cargo.

Note *2.* More specific information relating to the bulk cargo may be used where available, but permeabilities are not to be less than those given above.

Note *3.* For packed cargo, the actual density of the cargo is to be used with a permeability of zero.

3. 4. 3 In calculating the strength of the ship's structure in the flooded condition it is to be assumed that the ship's structure will remain fully effective in resisting the applied loads.

PART

4

CHAPTER **7** **Bulk Carriers**

SECTION **4** **Deck structure**

4. 1 General

4. 1. 1 Longitudinal framing is, in general, to be adopted outside line of openings. The arrangement of structure between hatches is to be such as to ensure continuity of the main deck structure to resist athwartship forces, and transverse stiffening is to be arranged. For and aft knuckles in cross deck strip plating between hatches should be arranged close to longitudinal girders or supported by brackets.

4. 1. 2 In the case of large bulk carriers with narrow deck strips between hatchways, or where it is the intention to load any two adjoining holds with adjacent holds fully empty for a sea-going condition or for bulk carriers to be classed `any hold may be empty', the cross deck scantlings will be specially considered.

4. 1. 3 The requirements of Pt 4, Ch 1, 4 Deck structure are to be applied, together with the requirements of this Section.

4. 1. 4 The *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG), indicates recommended structural design configurations in critical areas, for the deck structure outside the line of openings and between hatches.

4. 2 Deck plating

4. 2. 1 Where the difference between the thickness of plating inside and outside the line of main hatches exceeds 12 mm, a transitional plate of thickness equivalent to the mean of the adjacent plate thicknesses is to be fitted. The plate thickness outside the line of hatches is to be continued inboard between hatches beyond the end of the hatch corner curvature, to ensure that the chamfered plating is clear of the corner tangent point.

4. 3 Main cargo hatchway openings

4. 3. 1 The following requirements apply to bulk carriers with vertically corrugated transverse bulkheads in cargo holds having one or more of the following characteristics:

a. $B \geq 40$ m

b. $\frac{b}{w} \geq 2.2$

b = breadth of deck opening

w = width of cross deck strip

B = moulded breadth of ship

c. A structural arrangement where the hatch side coaming and deck opening are arranged inboard of the topside tank.

d. All bulk carriers to be classed **100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP**.

4. 3. 2 The corners of main cargo hatchways in the strength deck are to be rounded with a radius not less than $\frac{1}{20}$ of the breadth of the opening, with a maximum radius of 1000 mm.

4. 3. 3 Insert plates are to be fitted at the corners having a thickness not less than 25 per cent greater than the adjacent deck thickness outside the line of openings, with a minimum increase of 5 mm, *See also* Pt 4, Ch 7, 4.3 Main cargo hatchway openings 4.3.4.

The corner inserts are to be extended transversely into the cross deck plating for a minimum distance equal to 0.075*b*, where *b*, is the breadth of deck opening.

4. 3. 4 For the extreme corners of the end hatchways of the cargo region furthest from amidships the thickness of the corner insert plates is to be not less than 60 per cent greater than the adjacent deck thickness outside the line of openings.

4. 4 Deck supporting structure

4. 4. 1 For the scantlings of deck longitudinals and transverses in way of topside tanks, *See* Pt 4, Ch 7, 7.4 Shell and deck structure and Pt 4, Ch 7, 7.5 Primary supporting structure, respectively.

PART

4

CHAPTER **7** **Bulk Carriers**

SECTION **5** **Shell envelope plating**

5. 1 General

5. 1. 1 Longitudinal framing is, in general, to be adopted at the bottom, but special consideration will be given to proposals for transverse framing in this region. The side shell may be longitudinally or transversely framed.

5. 1. 2 The requirements of Pt 4, Ch 1, 5 Shell envelope plating are to be applied together with the requirements of this Section.

5. 2 Bottom shell

5. 2. 1 The thickness of the bottom shell plating below loaded holds may be required to be increased for local strength considerations.

5. 3 Side shell

5. 3. 1 The thickness of the side shell plating may be required to be increased for shear forces to satisfy the requirements of Pt 4, Ch 7, 3.2 Hull vertical bending stresses for flooded conditions 3.2.1.

5. 3. 2 The thickness of the side shell plating located between the hopper and topside tanks of single skin bulk carriers is to be not less than:

$$t = \sqrt{L} \text{ mm}$$

PART

4

CHAPTER **7** **Bulk Carriers**

SECTION **6** **Shell envelope framing**

6. 1 Longitudinal stiffening

6. 1. 1 Side frames of all single skin bulk carriers with a hopper are to comply with Pt 4, Ch 7, 6.2, Transverse stiffening and Pt 4, Ch 7, 6.3 Primary supporting structure.

6. 1. 2 Side frames and end brackets of all double skin bulk carriers are to comply with Pt 4, Ch 1, 6 Shell envelope framing.

6. 1. 3 Side frames and end brackets of other structural configurations will be specially considered.

6. 1. 4 The end connections for the longitudinal stiffening are to satisfy the requirements of Pt 3, Ch 10, 3 Secondary member end connections, *See also* Pt 4, Ch 7, 7.6 Structural details 7.6.1 and Pt 4, Ch 7, 9.7 Structural details 9.7.1.

6. 1. 5 The arrangements at the intersections of continuous secondary and primary members are to satisfy the requirements of Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members and Pt 4, Ch 1, 6.2, Longitudinal stiffening.

6. 2 Transverse stiffening

6. 2. 1 The modulus and inertia of main and topside tank frames in the midship region are to comply with the requirements given in Table 7. 6. 1: Shell framing. Arrangements of main frames in holds in association with web frames are not recommended in view of the vulnerability to cargo handling damage. Where such web frames are proposed the arrangements and scantlings will be specially considered.

6. 2. 2 Main frames in the cargo and ballast holds are to have a web thickness not less than:

a. In general:

$t_{min} = 7 + 0.03L$ mm,

or 13 mm whichever is the lesser

b. In the foremost hold:

$t_{min} = 1.15(7 + 0.03L)$ mm,

or 15 mm whichever is the lesser

where L is the Rule length, in metres.

6. 2. 3 The web depth to thickness ratio of the frames is not to be greater than:

$60\sqrt{k}$, for symmetric sections

$50\sqrt{k}$, for asymmetric sections

The breadth to thickness ratio of the flange outstand is not to be greater than:

$10\sqrt{k}$

6. 2. 4 The upper and lower end brackets of the main frames in the cargo and ballast holds are to satisfy the requirements of Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.5 to Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.14 inclusive, based on the mild steel section modulus Z in cm^3, derived from Table 7. 6. 1: Shell framing, or the equivalent mild steel section modulus for higher tensile steel frames.

6. 2. 5 The lengths of the arms of the brackets, measured as shown in Figure 7. 6. 1: Diagrammatic arrangement of end brackets, are not to be less than:

a. Frame connection to hopper tank.

Athwartship arm:

$$\text{Dry cargo hold } l_a = 32.43\sqrt{Z}\ \text{mm}$$

$$\text{Ballast hold } l_a = 32.43(\sqrt{Z} - 7.5)\text{mm}$$

Vertical arm:

$$\text{Dry cargo hold } l_v = 27.6\sqrt{Z}\ \text{mm}$$

$$\text{Ballast hold } l_v = 27.6(\sqrt{Z} - 9.0)\text{mm}$$

b. Frame connection to topside tank

Athwartship arm:

$$\text{Dry cargo hold } l_a = 30.0\sqrt{Z}\ \text{mm}$$

$$\text{Ballast hold } l_a = 30.0(\sqrt{Z} - 9.0)\text{mm}$$

Vertical arm:

$$\text{Dry cargo hold } l_v = 26.85\sqrt{Z}\ \text{mm}$$

$$\text{Ballast hold } l_v = 26.85(\sqrt{Z} - 11.0)\text{mm}$$

In no case are the bracket arm lengths to be taken less than $0.125H$, where H is as defined in Table 7. 6. 1: Shell framing.

Table 7. 6. 1: Shell framing

Location	Modulus, in cm^3	Inertia, in cm^4
(1) Main frames in dry cargo holds	Z=3.50$skh_{T1}H^2$x10^{-3}	$I = \frac{3.2}{k}HZ$
(2) Main frames in cargo holds used for water ballast	The greater of the following: (a) Z= 1.15x modulus given in (1) (b) $Z = 6.7skh_4H^2 \times 10^{-3}$	$I = \frac{3.2}{k}HZ$
(3) Transverse frames in topside wing tanks	The greater of the following: (a) 1.15xZ as given in location (1) of Table 1. 6. 3: Shell framing (transverse) (b) As required by Pt 4, Ch 7, 7.3 Bulkhead stiffeners 7.3.1 for the sloped bulkhead stiffeners	$I = \frac{3.2}{k}HZ$

Symbols

D, T, s, k = as defined in Pt 4, Ch 7, 1.7 Information required for non-CSR bulk carriers 1.7.1

h_{T1} = head, in metres, at middle of H

= $C_W \left(1 - \frac{h_6}{D-T}\right) F_\lambda$ in metres, for frames where the mid-length of frame is above the summer load waterline,

= $\left(1 - \frac{h_6}{D-T}\right)$ is not to be taken less than 0.7

= (h6 + $C_W \left(1 - \frac{h_6}{2T}\right)'('F_\lambda$, in metres, where the mid-length of frame is below the summer load waterline

h_4 = head, in metres, measured from the middle of H to the deck at side, or half the distance from the middle of H to the top of the overflow, whichever is greater.

h_6 = vertical distance in metres, from the summer load waterline at draught T to the mid-length of H

C_w = a wave head, in metres

= $7.71 \times 10^{-2}\ e^{-0.0044L}$

= where e = base of natural logarithms 2.7183

F_λ = 1.0 for $L \leq 200$m

= (1.0+0.0023(L-200)) for L>200 m

H = length overall of frame, in metres, but is to be taken not less than 2.5 m

6. 2. 6 The section modulus of the frame and bracket or integral bracket, and associated shell plating at the location marked Z_a in Figure 7. 6. 1: Diagrammatic arrangement of end brackets is to be not less than 2.0Z.

In addition, the minimum depth of the frame and bracket or integral bracket at the location indicated in Figure 7. 6. 1: Diagrammatic arrangement of end bracketsis to be not less than 1.5d.

6. 2. 7 The upper and lower integral or separate brackets are to have a web thickness not less than the as built web thickness of the side frame. In addition, the lower bracket thickness is to be not less than:

t = t_{min}+2 mm, where t_{min} is derived from Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.2

The toes of the brackets are to be designed to avoid notch effects by making the upper and lower toes concave or otherwise tapering them off, *See also* Pt 3, Ch 10, 5.1 Continuity and alignment 5.1.7.

6. 2. 8 Except as indicated in Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.9, frames are to be fabricated symmetrical sections with integral upper and lower brackets.

The side frame face plate is to be curved (not knuckled) at the connection with the end brackets. The radius of curvature, r, is to be not less than:

$$r = \frac{0.4 b_{2f}}{t_f} \text{ mm}$$

Where

b_f = breadth of the bracket face plate, in mm

t_f = thickness of the bracket face plate, in mm

The brackets are to be arranged with soft toes and the frame section face bar tapered symmetrically to the toes with a taper rate not exceeding 1 in 3. Where the free edge of the bracket is hollowed out, it is to be stiffened or increased in size to ensure that the section modulus of the bracket through the throat is not less than that of the required straight edged bracket.

6. 2. 9 In ships of length, L, less than 190 m, mild steel fabricated frames may be asymmetric and fitted with separate brackets. Brackets are to be arranged with soft toes. The free edges of the brackets are to be stiffened as follows:

a. Where a flange is fitted, its breadth, b_f, is to be not less than:

$$b_f = 40\left(1 + \frac{Z}{1000}\right) \text{mm}$$

or 50 mm, whichever is the greater

The flange is to be tapered at the ends with a taper rate not exceeding 1 in 3.

b. Where the edge is stiffened by a welded face flat, the cross-sectional area of the face flat is to be not less than:
   i. $0.009 b_f t$ cm^2 for offset edge stiffening
   ii. $0.014 b_f t$ cm^2 for symmetrically placed stiffening

Where

t = web thickness of bracket, in mm

c. The face plate is to be tapered at the ends with a taper rate not exceeding 1 in 3.

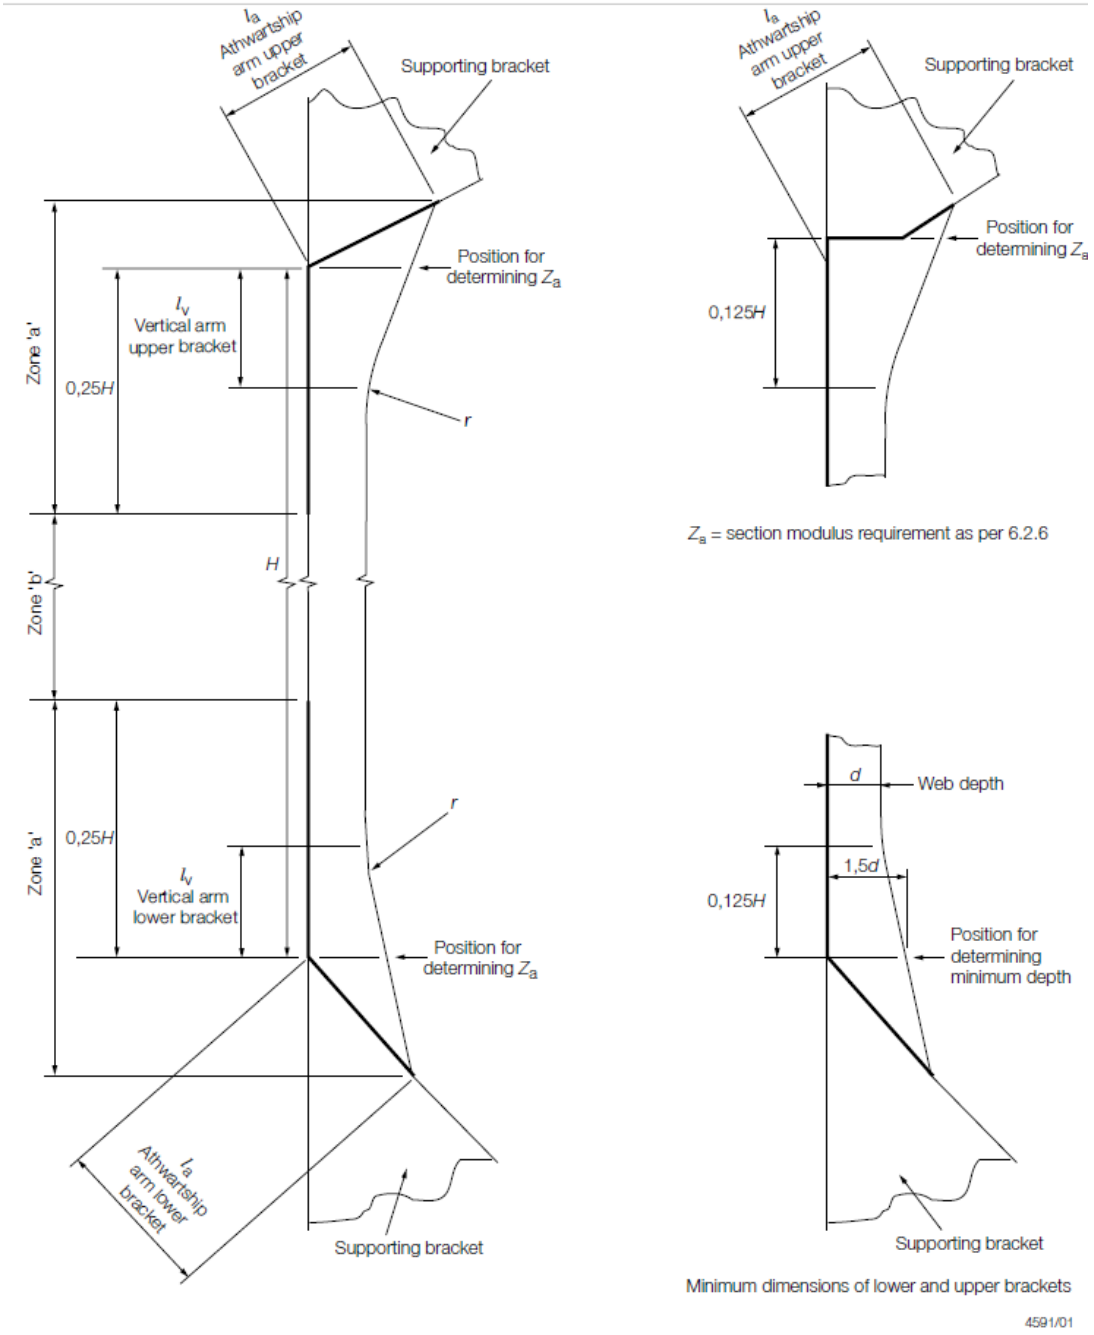
6. 2. 10 For mild steel construction with separate brackets where the frames are lapped on to the bracket, the length of the overlap is to be adequate to provide for the required area of welding to achieve equivalent strength.

6. 2. 11 Double continuous welding is to be adopted for the connections of frames and brackets to side shell, hopper and topside tank plating and web to face plates. For this purpose, the following weld factors are to be adopted:

- 0.44 in Zone 'a' and
- 0.40 in Zone ' b′, *See* Figure 7. 6. 1: Diagrammatic arrangement of end brackets.

Where the hull form is such that an effective fillet weld cannot be made, edge preparation of the web of the frame and bracket may be required, in order to ensure the required efficiency of the weld connection.

Figure 7. 6. 1: Diagrammatic arrangement of end brackets



6. 2. 12 Continuity of the frames is to be maintained by supporting brackets, *See* Figure 7. 6. 2: Supporting brackets in topside and hopper tanks, in the topside and hopper tanks. The design of end connections and their supporting structure is to be such as to provide adequate resistance to rotation and displacement of the joint. For this purpose, in the hopper and topside tanks, the thickness of the supporting brackets (which must align with the hold main frame brackets) is to be not less than the following:

a. Lower brackets (in hopper tank):

t = t_{min} + 0.5 mm, where t_{min} is derived from Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.2 or

t = 9.0 mm

whichever is the greater.

b. Upper brackets (in topside tank):

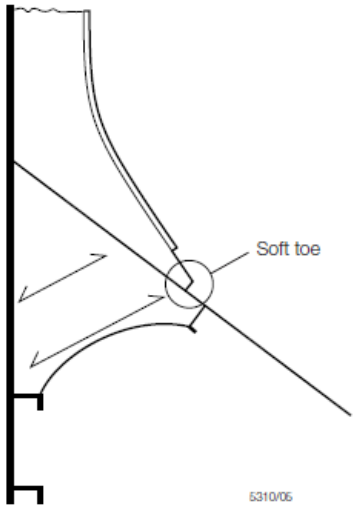
t = t_{min}, where t_{min} is derived from Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.2 or

t = 9.0 mm

whichever is the greater.

The size and arrangement of stiffening of the supporting brackets will be specially considered. Where the toe of the hold frame bracket is situated on or in close proximity to the first longitudinal from the shell of the hopper or topside tank sloped bulkheads, the supporting brackets are to be extended to the next longitudinal. This extension is to be achieved by enlarging the supporting bracket or by fitting an intercostal flat bar stiffener the same depth as the longitudinal and connected to the webs of the longitudinals.

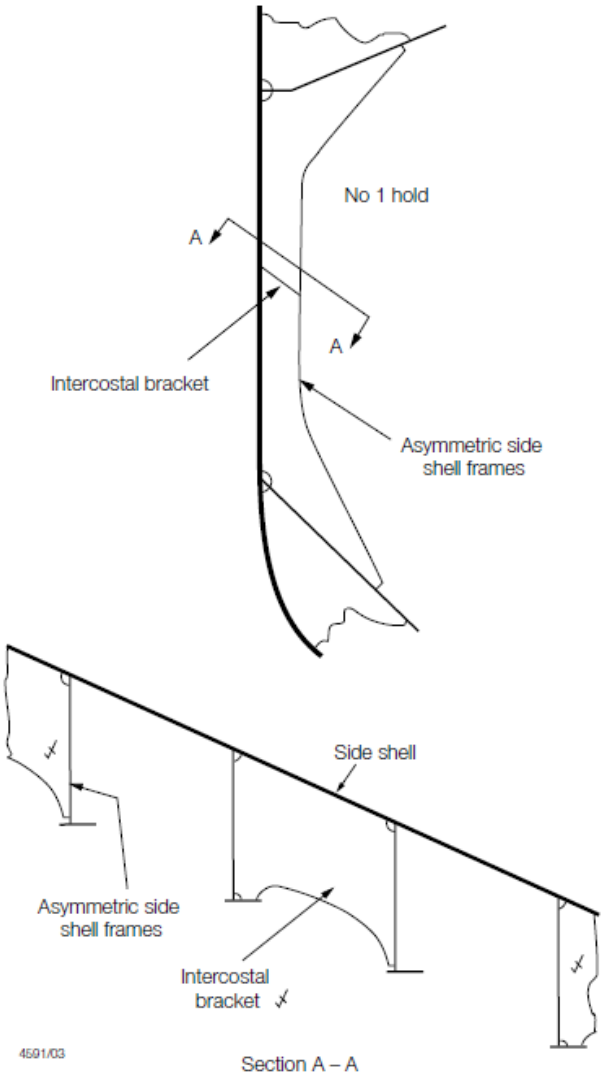
Figure 7. 6. 2: Supporting brackets in topside and hopper tanks



6. 2. 13 The requirements are to be maintained throughout the cargo hold region. However, in the forward and aft cargo holds where the shape becomes finer because of the ship form, increased requirements may be necessary and each case will be specially considered.

6. 2. 14 In way of the foremost hold, side frames of asymmetric section are to be effectively supported by intercostal brackets, *See*Figure 7. 6. 3: Typical arrangement of intercostal brackets supporting asymmetric side shell frames in No. 1 hold.

Figure 7. 6. 3: Typical arrangement of intercostal brackets supporting asymmetric side shell frames in No. 1 hold



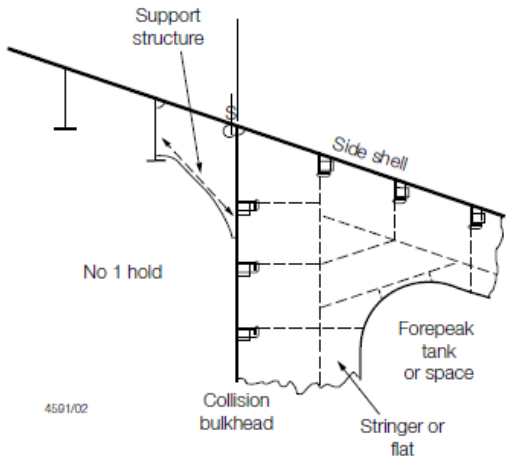
6. 2. 15 The hold side shell frame adjacent to the collision bulkhead is to be suitably strengthened. As an alternative, at least two supporting structures are to be fitted which align with the forepeak stringers or flats, *See* Figure 7. 6. 4: Hold frame supporting structures at fore end of No. 1 cargo hold. The supporting structures are to have adequate cross-sectional shear resisting area at their connections to the hold frame.

6. 2. 16 Detail design guidelines for connection of side shell frames to hopper and topside tank plating are shown in the *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG).

6. 3 Primary supporting structure

6. 3. 1 For the requirements for primary supporting structure, *See* Pt 4, Ch 7, 7.5 Primary supporting structure and Pt 4, Ch 7, 9.6 Primary supporting structure.

Figure 7. 6. 4: Hold frame supporting structures at fore end of No. 1 cargo hold



PART

4

CHAPTER **7** **Bulk Carriers**

SECTION **7** **Topside tank structure**

7. 1 General

7. 1. 1 Requirements are given in this Section for longitudinal or transverse framing in the topside tank, but, in general, the deck is to be longitudinally framed. The sloped bulkhead is to be of plane construction with the associated stiffening arranged inside or outside the tank.

7. 1. 2 The buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength are also to be satisfied.

7. 1. 3 Recommended examples of structural design configurations around the transverse ring web of the topside tank can be *Seen* in the *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG).

7. 2 Bulkhead plating

7. 2. 1 The thickness of the sloped bulkhead, tank end bulkhead, and diaphragm, if fitted, is to be the greater of the following:

a. For watertight bulkheads, the thickness, t, as derived from in Pt 4, Ch 1 General Cargo Ships for a deep tank bulkhead using a head, h_4, in metres, determined as follows:

$h_4 = h_0 \cos\theta + Rb_1$ or

= the greater of the distance from a point one-third of the height of the plate above its lower edge to the top of the tank, or half the distance to the top of the overflow

whichever is the greater, or

b. $t = 7.5\text{mm}$

In no case, however, is the thickness of the sloped bulkhead and diaphragm to be taken less than:

i. $\text{t} = 0.012s$ mm, or

$$\text{t} = 0.012s\sqrt{\frac{F_D}{k_D}} \text{ mm}$$

whichever is the greater

Where

k_D = the higher tensile steel factor equal to k_L value for deck material

F_D = as defined in Pt 3, Ch 4, 5.7 Local reduction factors

R = as defined in Pt 4, Ch 7, 1.8 Symbols and definitions 1.8.1

h_o = the vertical distance, in metres, from a point one third of the height of the plate from the lower edge to the highest point of the tank excluding hatchway

b_1 = the larger horizontal distance, in metres, from the tank corner at top of tank either side to point of plate under consideration.

7. 2. 2 The thickness of the top strake of the sloped bulkhead, including the vertical plate attached to deck, may be required to be increased to form an effective girder below the deck. In general, this plate is to be not less in thickness than 60 per cent of the thickness of the deck plate outside the line of openings nor less than:

a. $t = 0.018s$ mm, or

b. $t = 0.018s\sqrt{\frac{F_0}{k_D}}mm$

whichever is the greater.

7. 2. 3 The thickness of the transverse wash bulkhead, where fitted, is to be not less than:

t = $0.012s$ mm or 7.5 mm

= whichever is the greater.

7. 3 Bulkhead stiffeners

7. 3. 1 The section modulus of longitudinal or transverse stiffeners on the sloped bulkhead or watertight diaphragms, if fitted, is to be not less than:

$Z = 0.01skh_4l_e^2$ cm^3

Where

$h_4 = h_0\cos\theta + Rb_1$

= the greater of the distance, in metres, from the middle of the effective length to the top of the tank, or half the distance to the top of the overflow, or

= 1.5 m

= whichever is the greatest

R = as defined in Pt 4, Ch 7, 1.7 Information required for non-CSR bulk carriers 1.7.1

h_o = the vertical distance, in metres, from the mid-point of span of the stiffener to the highest point of the tank excluding hatchway

b_1 = the larger horizontal distance, in metres, from the tank corner at top of tank, either side to midpoint of span.

7. 3. 2 Where the bulkhead stiffening is fitted on the hold side of the sloped bulkhead, suitable arrangements are to be made to prevent tripping.

7. 3. 3 The scantlings of stiffeners on tank end bulkheads are to be not less than those given in Table 1. 9. 1: Watertight and deep tank bulkhead scantlings of Pt 4, Ch 1 General Cargo Ships for deep tanks, using h as defined in Pt 4, Ch 7, 7.3 Bulkhead stiffeners 7.3.1.

7. 3. 4 The section modulus of stiffeners of non-watertight fore and aft diaphragms, or transverse wash bulkheads is to be not less than 50 per cent of that required by Pt 4, Ch 7, 7.3 Bulkhead stiffeners 7.3.3. The stiffeners are to be bracketed at both ends.

7. 3. 5 Tank end bulkheads are generally to be in line with the main hold bulkheads.

7. 4 Shell and deck structure

7. 4. 1 The scantlings of shell and deck longitudinals are to comply with Pt 4, Ch 7, 7.3 Bulkhead stiffeners 7.3.1. The scantlings must also satisfy the requirements of Pt 4, Ch 1 General Cargo Ships, *See also* Pt 4, Ch 7, 7.6 Structural details 7.6.1.

7. 4. 2 The scantlings of side shell frames are to comply with Pt 4, Ch 7, 6.2, Transverse stiffening.

7. 5 Primary supporting structure

7. 5. 1 The section modulus and inertia of deck, shell and bulkhead transverses or stringers are to be not less than:

$$Z = 7.5kShl_e^2\ cm^3$$

$$I = \frac{2.5}{k} l_e Z cm^4$$

using h as defined in Pt 4, Ch 7, 7.3 Bulkhead stiffeners 7.3.1. The scantlings of shell and deck members must also satisfy the requirements of Pt 4, Ch 1 General Cargo Ships for dry cargo holds.

7. 5. 2 Primary transverse members are, in general, to be spaced not more than 3.8 m apart where the length, L, is 100 m or less, and $(0.006\mathrm{L} + 3.2)$ m apart for lengths greater than 100 m.

7. 5. 3 Transverses are to be arranged in line with the primary structure at ends of hatchways, or equivalent scarfing arranged. Where the sloped bulkhead or side shell is transversely framed, arrangements are to be made to ensure effective continuity at the ends of the deck transverse.

7. 5. 4 Where non-watertight transverse diaphragms are arranged instead of open transverses, the thickness of plating is to be in accordance with Pt 4, Ch 7, 7.2 Bulkhead plating 7.2.3. The diaphragms are to be efficiently stiffened.

7. 6 Structural details

7. 6. 1 Bracket/diaphragm connections at the bottom of the topside tank are to be of sufficient size and thickness to provide effective rigidity, and care is to be taken to ensure alignment with brackets at the heads of the side frames in the holds, *See also* Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.12. The shell and sloped bulkhead longitudinals supporting the diaphragms are to be derived using the span taken between transverses.

7. 6. 2 For ships where $\mathrm{L} \geq 300$ m a fore and aft diaphragm extending vertically from the deck to the sloping plating of the topside tank is to be arranged at about the half-width of the tank.

7. 6. 3 Where longitudinal framing is fitted to the side shell, a bracket may be required in way of a rounded gunwale, approximately halfway between transverses and extending to the adjacent shell and deck longitudinal.

PART

4

CHAPTER **7** **Bulk Carriers**

SECTION **8** **Double bottom structure**

8. 1 General

8. 1. 1 The double bottom is, in general, to be longitudinally framed, but special consideration will be given to proposals for a transverse framing system.

8. 1. 2 The requirements of Pt 4, Ch 1, 8 Double bottom structure are to be applied, together with the requirements of this Section, *See also* Pt 4, Ch 7, 2.2 Protection of steelwork 2.2.3.

8. 1. 3 Where the double bottom tanks are interconnected with double skin side tanks or combined hopper and top-side tanks, the double bottom scantlings are also to satisfy the requirements of Table 7. 8. 1: Strengthening for heavy cargo requirements (3)(c), (3)(d), (4)(c) and (4)(d) for ballast holds and (3)(c) and (4)(c) in way of dry cargo holds, *See also* Pt 4, Ch 1, 6.2, Longitudinal stiffening.

8. 1. 4 The requirements given in Pt 4, Ch 7, 8.8, Allowable hold loading in the flooded condition are to be applied to bulk carriers which satisfy the following criteria:

- Single skin construction, or double skin construction where any part of the longitudinal bulkhead is located within B/5 or 11.5 m, whichever is less, inboard from the ship's side at right angles to the centreline at the assigned summer load line.
- Length, L, of 150 m or above.
- Intended for the carriage of cargoes having bulk densities of 1.0 tonne/m^3 or above.

8. 1. 5 For all bulk carriers where bulk cargoes are discharged by grabs the maximum recommended unladen weight of the grab corresponding to the approved inner bottom plating thickness is to be calculated using the following formulae:

$$P = \left(\frac{S}{k}\right)^2 \frac{10^d}{1.775} \text{ tonnes}$$

Where

$$d = \frac{40.875(t - 1.5)\sqrt{k} + 344.5}{S} - 5.7633$$

P = unladen grab weight, in tonnes

s = spacing of inner bottom longitudinal, in mm

k = higher tensile steel factor as defined in Pt 4, Ch 7, 1.8 Symbols and definitions 1.8.1

t = thickness of inner bottom plating, in mm

The maximum recommended unladen weight of the grab rounded up to the next tonne above, is to be recorded in the Loading Manual (*See also* Pt 3, Ch 4, 8.2 Loading Manual 8.2.4.e), and does not preclude the use of heavier grabs. It is intended as an indication to the Builders, Owners and operators of the increased risk of local damage and the possibility of accelerated diminution of the plating thickness if grabs heavier than this are used regularly to discharge cargo.

8. 1. 6 Detail design guidelines for stiffeners connecting inner bottom and bottom longitudinals are shown in the *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG).

Table 7. 8. 1: Strengthening for heavy cargo requirements

Symbols	Item	Requirement
L, l_e, D, T, s, S, k, Z and t as defined in Pt 4, Ch 7, 1.8 Symbols and definitions 1.8.1 C_1 = a factor varying from 1.0 at $\frac{D}{2}$ to $\frac{75}{225-150F_B}$ at base line of ship C = stowage rate, in m³/tonne, and is defined as the volume of the hold excluding volume contained within the depth of the cargo hatchway divided by the weight of cargo stowed in the hold. The value is not to be taken greater than 0.865 F_B as defined in Pt 3, Ch 4, 3.7 Local reduction factors R and θ as defined in Pt 4, Ch 7, 1.8, Symbols and definitions H = height from tank top, position under consideration, to deck at side amidships, in metres Y_1 = distance from $\frac{D}{2}$ to tank top, in metres h_0 = for plating and stiffeners the vertical distance, in metres, from the inner bottom to the highest point of the tank excluding hatchway b_1 = the larger horizontal distance, in metres, from the tank corner at top of tank either side to the point of plate or stiffener under consideration	(1) Double bottom floors	The spacing of floors, generally, is not to exceed 2.5 m. Scantlings are to comply with the requirements of Pt 4, Ch 1, 8.5, Floors
	(2) Double bottom side girders	The spacing of side girders, generally, is not to exceed 3.7 m. Scantlings are to comply with the requirements of Pt 4, Ch 1, 8.3,, Girders
	(3) Inner bottom plating, See Note 3	The thickness of the inner bottom plating in the holds is to be not less than required by the greatest of the following: (a) $t = 0.00136(s + 660)\sqrt[4]{k^2LT} + 5mm$ or (b) $t = 0.00455s\sqrt{\frac{Hk}{C}}$mm, or (c) Where the double bottom tanks are interconnected with double skin side tanks or combined hopper and topside tanks the scantlings are also to satisfy the requirements for deep tanks in Table 1. 9. 1: Watertight and deep tank bulkhead scantlings in Chapter 1, with the load head $h_1 = h_0\cos\theta + Rb_1$ m (d) In way of ballast holds the scantlings are also to satisfy the requirements for deep tanks in Table 1. 9. 1: Watertight and deep tank bulkhead scantlings in Pt 4, Ch 1 General Cargo Ships, with the load head h in metres, measured to the deck at centre, but *See also* Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground if protection against heavy grabs is desired.

	(4) Inner bottom longitudinals *See* Notes 1 and 2	The section modulus of inner bottom longitudinals is to be not less than the greatest of the following: (a) Z = 85 per cent of the Rule value for bottom longitudinals as given in Pt 4, Ch 1 General Cargo Ships , or (b) $Z = \frac{0.0083sl_e^2HC_1k}{\left(1-0.233\frac{Y_1}{D}\right)C}$cm^3 or (c) Where the double bottom tanks are interconnected with double skin side tanks or combined hopper and topside tanks Z=0.0073$skh_4l_e^2$ cm^3 where h_4=$h_0$cosθ+Rb_1 m. Z is not to be less than the requirements for deep tanks in Table 1. 9. 1: Watertight and deep tank bulkhead scantlings in Pt 4, Ch 1 General Cargo Ships, with the load head h_4, in metres, measured to the highest point of the topside tank, or side tank, or (d) In way of ballast holds the section modulus of the longitudinals is to be not less than required for deep tanks in Table 1. 9. 1: Watertight and deep tank bulkhead scantlings in Pt 4, Ch 1 General Cargo Ships, with the load head h_4, in metres, measured to the deck at centre
Note *1.* If plate girders are fitted alternatively with built or rolled sections, the section modulus as given in (4)(b) may be reduced by 10 per cent. **Note** *2.* Consideration will be given to the fitting of struts in way of double bottom tanks in ships with homogeneous loading. The arrangement and scantlings are, in general, to be confirmed by direct calculation. **Note** *3. See also* Pt 4, Ch 7, 8.1 General 8.1.5 for the maximum recommended unladen weight of the grab corresponding to the approved inner bottom plating thickness.		

8. 2 Carriage of heavy cargoes

8. 2. 1 When the notation `strengthened for heavy cargoes' is to be assigned, the requirements of Table 7. 8. 1: Strengthening for heavy cargo requirements are to be complied with.

8. 3 Carriage of heavy cargoes with specified or alternate holds empty

8. 3. 1 For ships strengthened for heavy cargoes and having a class notation permitting specified or alternate holds to be empty, the requirements of Pt 4, Ch 7, 8.2 Carriage of heavy cargoes 8.2.1 are to be complied with. In addition the scantlings and arrangements of the primary structure are to be confirmed by additional calculations, *See* Pt 4, Ch 7, 11.1 Application.

8. 4 Ships to be classed '100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP'

8. 4. 1 For ships to be classed **'100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP'**, the requirements of Pt 4, Ch 7, 8.2 Carriage of heavy cargoes 8.2.1 and Pt 4, Ch 7, 8.3 Carriage of heavy cargoes with specified or alternate holds empty 8.3.1 are to be complied

with. In addition the value for C, the stowage rate in m^3/tonne, as defined in Table 7. 8. 1: Strengthening for heavy cargo requirements, is not be taken greater than 0.60 for each hold.

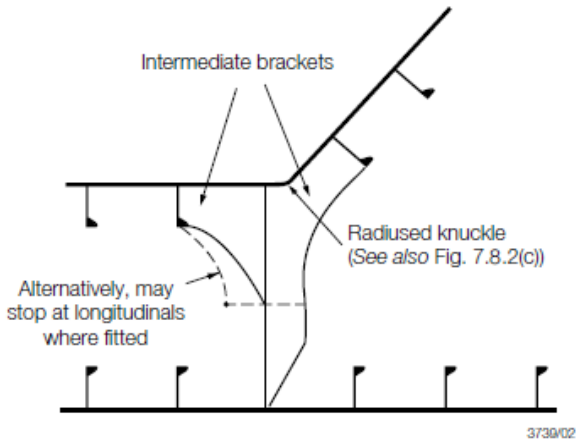
8. 5 Ballast ducts

8. 5. 1 Where ballast ducts are arranged in lieu of suction and/or filling pipes, the scantlings will be approved as suitable for a specified equivalent static head of water. This head must not be exceeded in service, and details of methods to ensure this are to be submitted. The continuity of the floors is to be maintained in way of the ducts.

8. 6 Structural details in way of double bottom tank and hopper tank knuckle

8. 6. 1 In all dry holds where the double bottom tank and hopper tank knuckle is of radiused construction and the floor spacing is 2.5 m or greater brackets shown as in Figure 7. 8. 1: Intermediate brackets at knuckle are to be arranged mid-length between floors in way of the intersection. The brackets are to be attached to the adjacent inner bottom and hopper longitudinals. The thickness of the brackets is to be in accordance with Pt 4, Ch 1, 8.5 Floors 8.5.3 but need not exceed 15 mm. This requirement does not apply where the double bottom tank and hopper tank knuckle is of welded construction.

Figure 7. 8. 1: Intermediate brackets at knuckle



8. 6. 2 In way of floodable holds, two intermediate bracket arrangements, as shown in Figure 7. 8. 1: Intermediate brackets at knuckle, are to be provided in all cases where the hopper to double bottom knuckle is radiused and are, in general, to be located at each frame space. Where the double bottom tank and hopper tank knuckle is of welded construction, a single intermediate bracket arrangement, as shown inFigure 7. 8. 1: Intermediate brackets at knuckle, is to be provided only when the floor spacing is greater than 2.5 m.

8. 6. 3 The connections at the intersection are to be as follows:

a. Where of welded construction the corner scallops in floors and transverses are to be omitted, or closed by welded collars where arranged for purposes of construction. In such cases to ensure satisfactory welding of the collars the radius of the scallops should not be less than 150 mm, *See*Figure 7. 8. 2: Connection at intersection of double bottom and hopper. Alternatively the scallop may be retained on the hopper tank side provided gusset plates are arranged in line with the inner bottom plating, *See*Figure 7. 8. 2: Connection at intersection of double bottom and hopper.

b. Where of radiused construction the corner scallops are to be omitted, and full penetration welding is to be arranged locally for the connection to the inner bottom plating. The centre of the flange is not to be greater than 70 mm from the side girder, *See*Figure 7. 8. 2: Connection at intersection of double bottom and hopper

8. 6. 4 Detail design guidelines for the connection of hopper tank sloping plating to inner bottom plating are shown in the *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG).

8. 7 Combined double bottom/hopper tank and topside tank

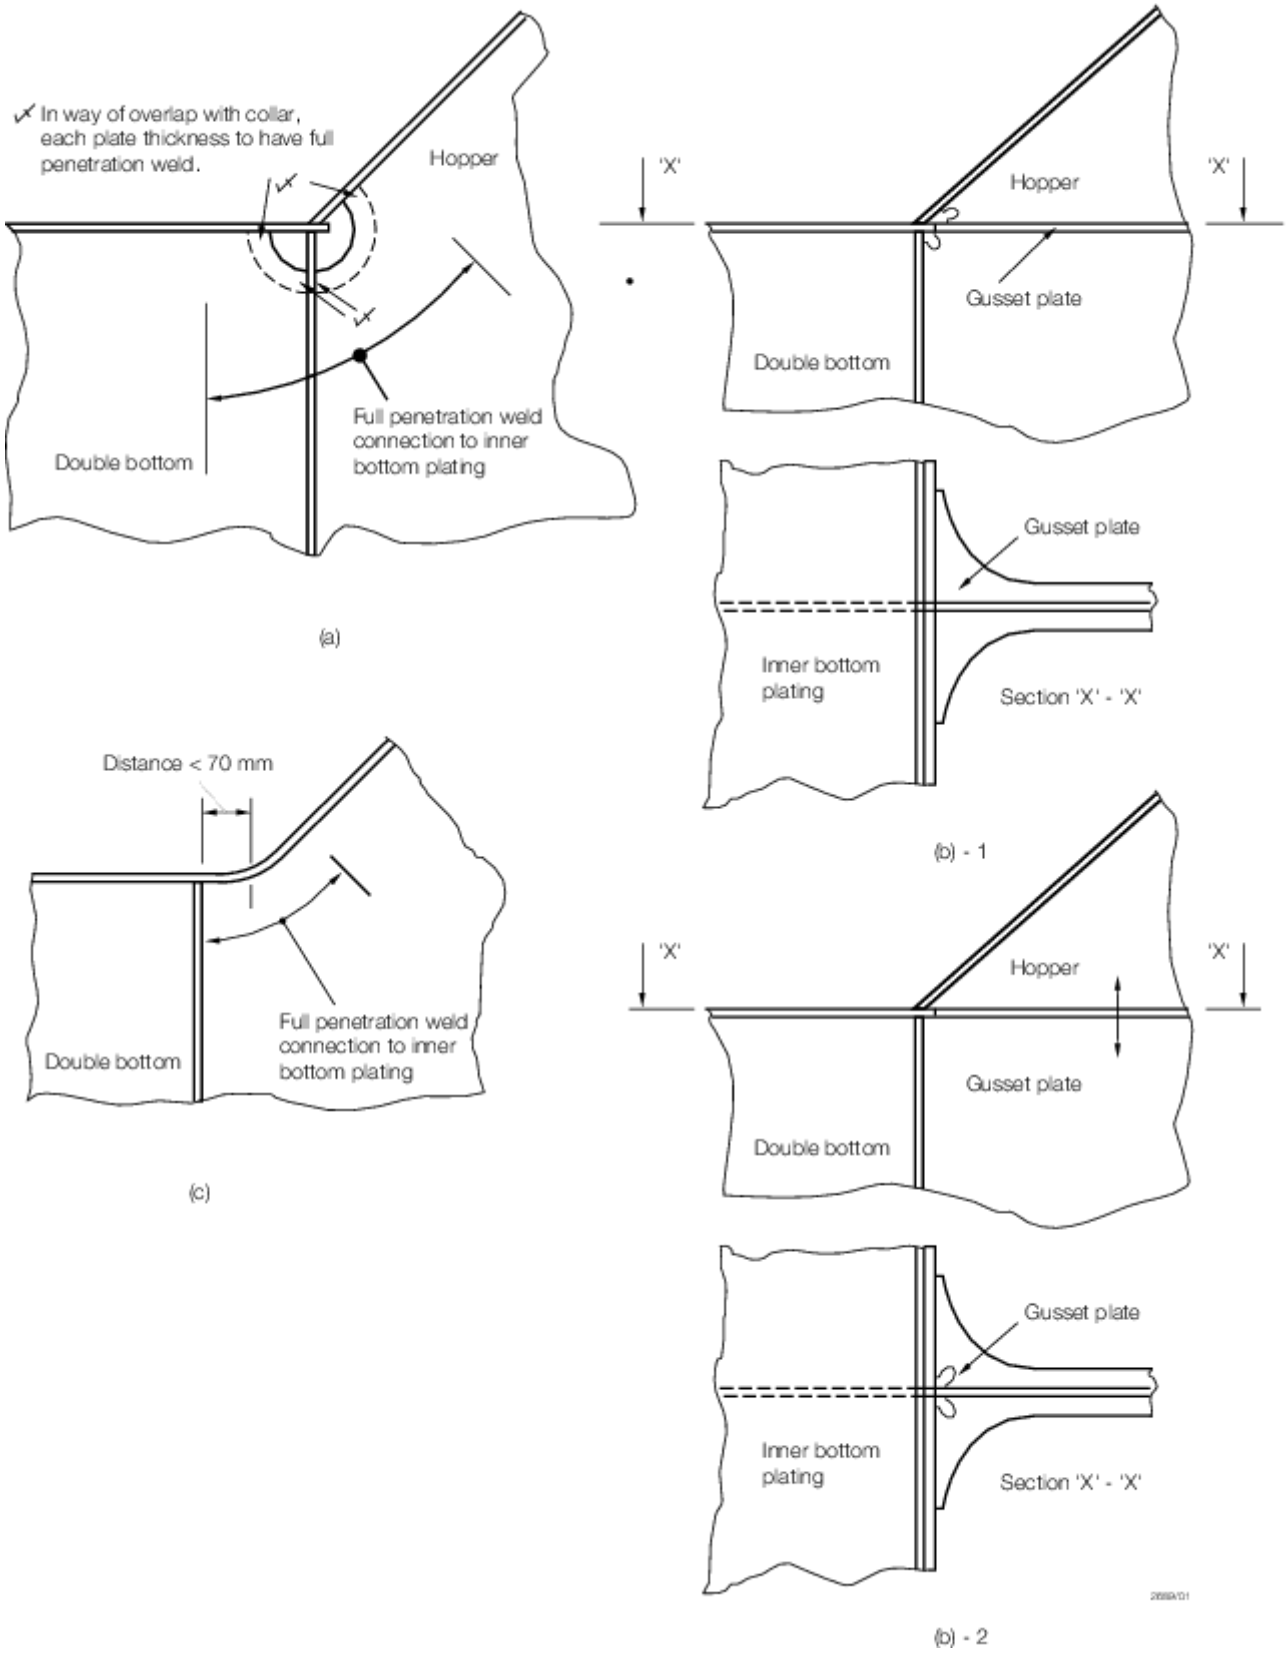
8. 7. 1 Where a double bottom/hopper tank is interconnected with a topside tank the dimensions of the connecting trunks or pipes, and the air/overflow pipe(s) and the type of closing appliance are to comply with the requirements of Pt 5, Ch 13, 12 Air, overflow and sounding pipes.

8. 8 Allowable hold loading in the flooded condition

8. 8. 1 The requirements of this sub-Section are to be applied as defined in Pt 4, Ch 7, 8.1 General 8.1.4.

8. 8. 2 The maximum load which may be carried in each cargo hold in combination with flood water is to be determined for the most severe homogeneous, non-homogeneous and packed cargo conditions contained in the Loading Manual. The maximum density of cargo intended to be carried in each condition is to be used.

Figure 7. 8. 2: Connection at intersection of double bottom and hopper



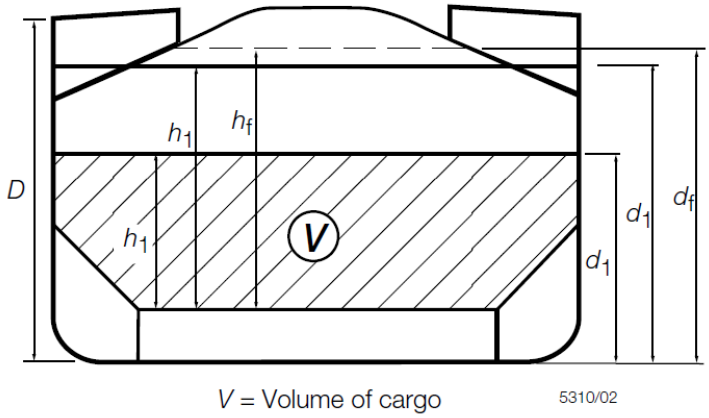
8. 8. 3 The ship is to be assumed immersed to the draught, T_F, in metres, in way of the flooded cargo hold under consideration. The flooding head, h_f, *See*Figure 7. 8. 3: Loading, is to be taken as the distance, in metres, measured vertically with the ship in the upright position, from the inner bottom to position, d_f, in metres, from the baseline given by:

a. In general:
   i. $d_f = D$ for the foremost hold
b. $d_f = 0.9D$ for other holds
c. For ships less than 50 000 tonnes deadweight with Type B freeboard:
   i. $d_f = 0.95D$ for the foremost hold
   ii. $d_f = 0.85D$ for other holds

Where

D = distance, in metres, from the baseline to the freeboard deck at side amidships.

Figure 7. 8. 3: Loading



8. 8. 4 For this application, the double bottom is defined as the structure bounded by the transverse bulkhead lower stools (or bulkhead plating if no lower stools are fitted) and the hopper sides. The floors and girders immediately in way of these structures are excluded.

8. 8. 5 The determination of shear strength required for the permissible load assessment in Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.9, is to be performed using the net plate thickness, t_{net}, for the floors and girders:

$$t_{net} = t - t_c$$

Where

t = as built thickness, in mm

t_c = thickness deduction for corrosion, in mm, generally to be taken as 2.5 mm.

8. 8. 6 Shear capacity of the double bottom is defined as the sum of the shear strengths for:

a. all the floors adjacent to both hoppers, less one half the strength of the floors adjacent to each lower stool (or transverse bulkhead if no lower stool is fitted), *See*Figure 7. 8. 4: Double bottom structure, and
b. all the girders adjacent to the lower stools (or transverse bulkheads if no lower stool is fitted).

Where a girder or floor terminates without direct attachment to the boundary stool or hopper side girder, its shear capacity is to include only that for the effectively connected end.

8. 8. 7 The shear strengths, S_{f1}, of floors adjacent to hoppers, and S_{f2}, of floors in way of openings in bays nearest to the hoppers, are as follows:

$S_{f1} = 0.001\ A_f \tau_p / \eta_1 \text{kN}$

$S_{f2} = 0.001 A_{fh} \tau_p / \eta_2 \text{kN}$

Where

A_f = net sectional area, in mm^2, of floor panel adjacent to hopper

$A_{f,h}$ = net sectional area, in mm^2, of floor panel in way of opening in the bay closest to hopper

η_1 = 1.10

η_2 = 1.20 generally

= 1.10 where appropriate reinforcement is fitted in way of the opening

σ_0 = specified minimum yield stress, in N/mm^2

τ_p = permissible shear stress, to be taken equal to the lesser of:

$\tau_0 = \frac{\sigma_0}{\sqrt{3}}$ N/mm^2 and

$\tau_c = \frac{162\sigma 0.6_0}{(s_1/t_{net})0.8}$ N/mm$_2$

Where

s_1 = spacing of stiffening members, in mm, for the panel under consideration

t_{net} = net thickness, in mm, of the panel under consideration.

For floors adjacent to the stools (or bulkhead plating if no lower stools are fitted), τ_p may be taken as $\frac{\sigma_0}{\sqrt{3}}$ N/mm^2.

8. 8. 8 The shear strengths S_{g1}, of girders adjacent to transverse bulkhead lower stools (or transverse bulkheads if no lower stools are fitted), and S_{g2}, of girders in way of the largest openings in bays nearest to the lower stools (or transverse bulkheads if no lower stools are fitted), are as follows:

$S_{g1} = 0.001 \text{Ag} \tau_p / \eta_1 \text{kN}$

$S_{g2} = 0.001\ A_{g,h} \tau_p / \eta_2 \text{kN}$

Where

$\boldsymbol{A_g}$ = net sectional area, in mm^2, of the girder adjacent to transverse bulkhead lower stool (or transverse bulkhead, if no lower stool is fitted)

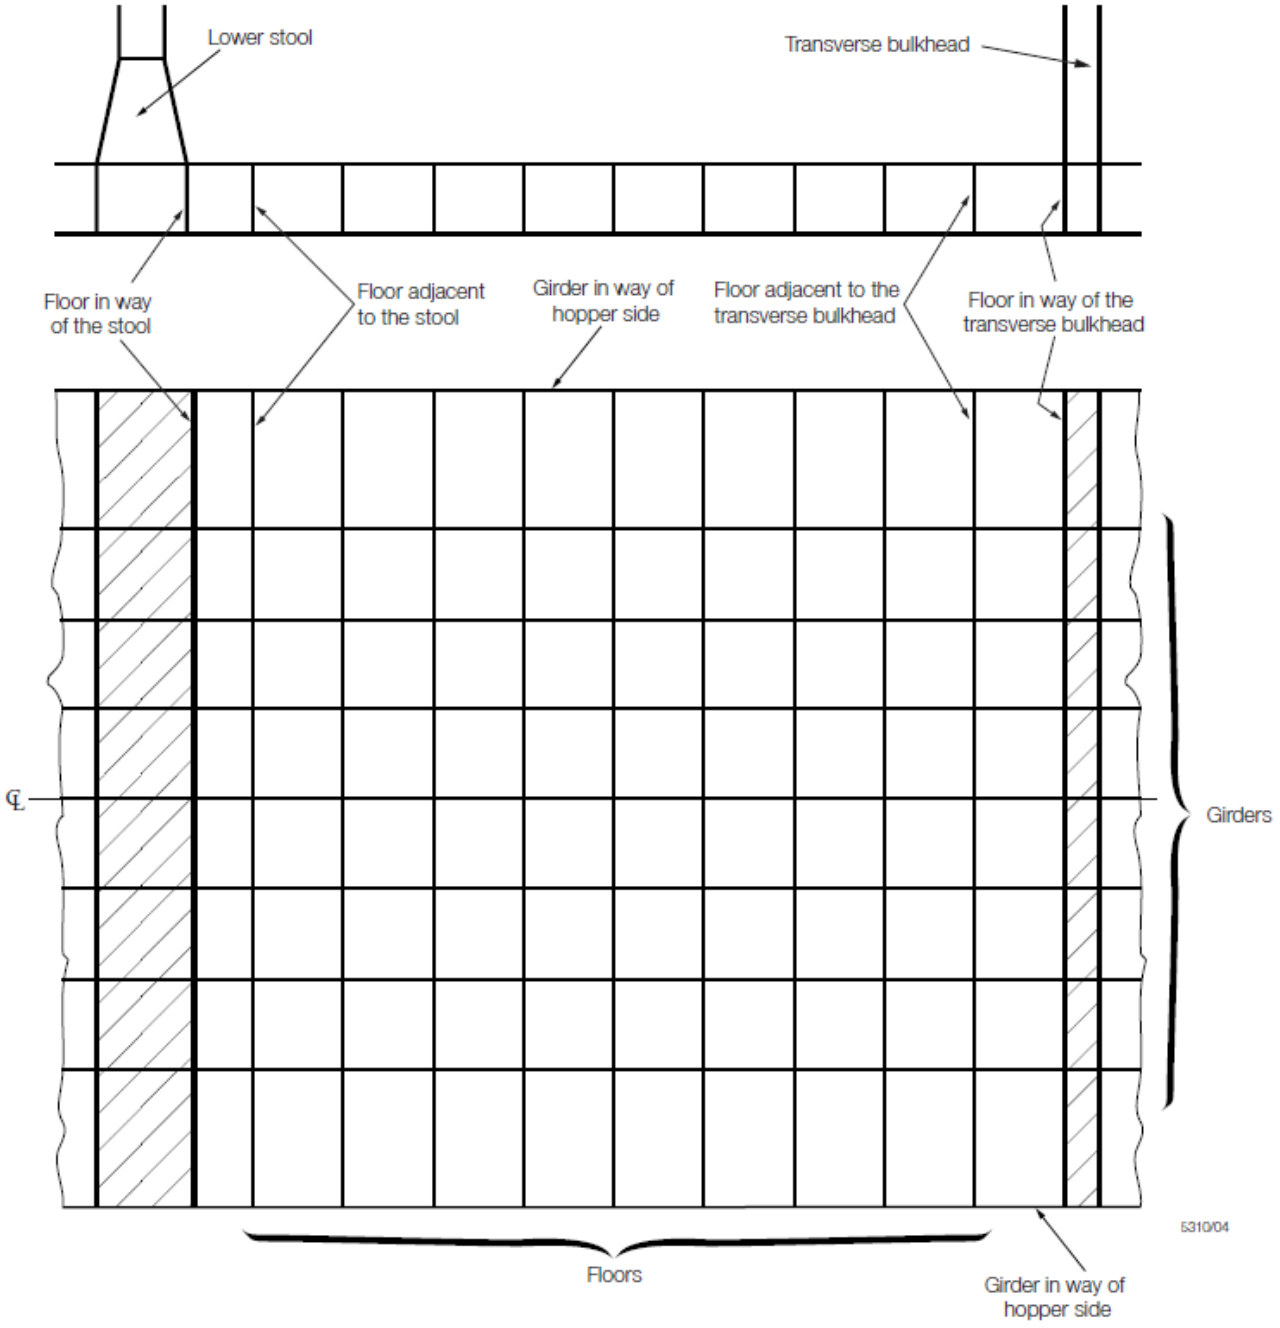
$\boldsymbol{A_{g,h}}$ = net sectional area, in mm^2, of the girder in way of the largest openings in the bays closest to the transverse bulkhead lower stool (or transverse bulkhead if no lower stool is fitted)

$\boldsymbol{\eta_1}$ = 1.10

$\boldsymbol{\eta_2}$ = 1.15 generally

= 1.10 where appropriate reinforcement is fitted in way of the opening.

Figure 7. 8. 4: Double bottom structure



8. 8. 9 The permissible cargo hold loading, W_p, is given by:

$$W_p = g\rho_c V/F_c \text{kN}$$

Where

d_f, D = as defined in Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.3

g = gravitational constant, 9.81 m/sec^2

Where

h_f = flooding head, in metres, as defined in Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.3

h_1 = $\frac{X}{\rho_c g}$ where Y is in kN/m^2

n = number of floors between transverse bulkhead lower stools or transverse bulkheads, if no lower stools are fitted

s = spacing, in metres, of double bottom longitudinals adjacent to hoppers

$A_{DB,e}$ = $\left[\sum_{i=1}^{n}\right] S_i(B_{DB} - s)$

$A_{DB,h}$ = $\left[\sum_{i=1}^{n}\right] S_i B_{DB,i}$

B_{DB} = breadth of double bottom, in metres, between hoppers *See* Figure 7. 8. 5: Double bottom breadth

$B_{DB,h}$ = distance, in metres, between openings *See* Figure 7. 8. 5: Double bottom breadth

$B_{DB,i}$ = (B_{DB}-s) for floors where shear strength is given by S_{f1}

= $B_{DB,h}$ for floors where shear strength is given by S_{f2}

C_e = shear capacity of the double bottom, in kN (tonne- f), as defined in Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.6, considering for each floor, the shear strength S_{f1}, *See* Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.7, and for each girder, the lesser of the shear strengths S_{g1} and S_{g2}, *See* Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.8

C_h = shear capacity of the double bottom, in kN (tonne- f), as defined in Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.6, considering for each floor, the lesser of the shear strengths S_{f1} and S_{f2}, *See* Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.7, and for each girder, the lesser of the shear strengths S_{g1} and S_{g2}, *See* Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition 8.8.8

F_c = 1.1 in general

= 1.05 for steel mill products

S_i = spacing of ith floor, in metres

T_F = $d_f - 0.1D$

V = volume, in m^3, occupied by cargo at a level h_1

X = the lesser of X_1 and X_2 for bulk cargoes and

X = X_1 for steel mill products

Where

X_1 = $\frac{Y+\rho g(T_F-h_f)}{1+\left(\frac{\rho}{\rho_c}\right)(\mu-1)}$ where Y is in kN/m^2

X_2 = $Y + \rho g(\ T_F - h_f\mu)$ where Y is in kN/m^2

Y = the lesser of Y_1 and Y_2 given by:

Y_1 = $\frac{C_b}{A_{DB,h}}$

Where

Y_2 = $\frac{C_e}{A_{DB,e}}$

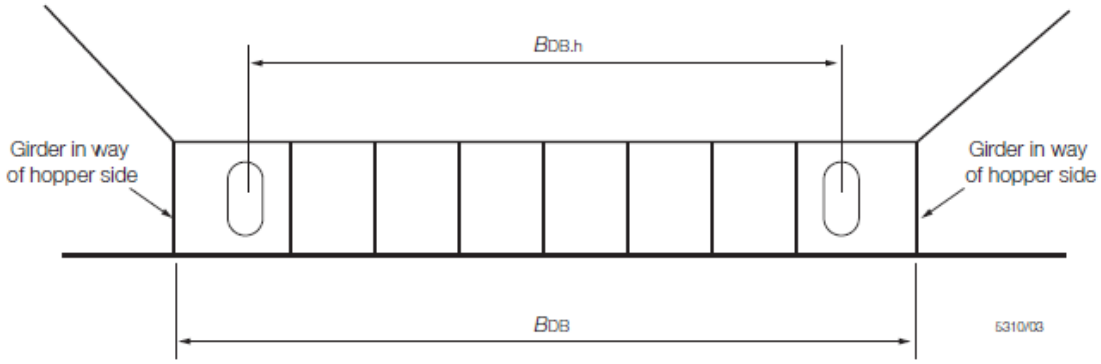
μ = permeability of cargo but need not exceed 0.3

= 0.0 for steel mill products

ρ = density of sea water, 1.025 tonne/m^3

ρ_c = cargo density, in tonne/m^3 (bulk density for bulk cargoes and actual cargo density for steel mill products).

Figure 7. 8. 5: Double bottom breadth



PART

4

CHAPTER **7** **Bulk Carriers**

SECTION **9** **Hopper side tank structure**

9. 1 General

9. 1. 1 Provision is made in this Section for longitudinal framing of the hopper side tank, but proposals for transverse framing will be specially considered.

9. 1. 2 Where oil cargoes are carried the scantlings of the sloped bulkhead are to comply with the requirements of Pt 4, Ch 7, 10.2 Bulkheads supported by stools.

9. 1. 3 For ships to be classed **'100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP'**, the requirements of Pt 4, Ch 7, 9.2, Sloped bulkhead plating, Pt 4, Ch 7, 9.3 Sloped bulkhead stiffeners and Pt 4, Ch 7, 9.6 Primary supporting structure are to be complied with. In addition the value for C, the stowage rate in m^3/tonne, as defined in Table 7. 8. 1: Strengthening for heavy cargo requirements, is not be taken greater than 0.60 for each hold.

9. 1. 4 The buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength are also to be satisfied.

9. 1. 5 The *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG), indicates recommended details of structural design configurations around the transverse ring web of the hopper tank.

9. 2 Sloped bulkhead plating

9. 2. 1 The thickness of the sloped bulkhead plating is to be as required by Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening 8.4.1 but based on actual spacing of sloped bulkhead stiffeners.

9. 2. 2 Where the ship is regularly discharged by grabs and the optional notation for heavy grabs is not desired (*See* Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground), the increase in thickness, as required by Pt 4, Ch 1, 2.2, Protection of steelwork, is to be tapered from the inner bottom knuckle to nil at the top corner of the tank.

9. 2. 3 Where a `strengthened for heavy cargo notation' is desired, in addition to Pt 4, Ch 7, 9.2 Sloped bulkhead plating 9.2.2 the thickness of the sloped bulkhead plating is also to comply with the requirements of Table 7. 8. 1: Strengthening for heavy cargo requirements (3)(b) using the actual spacing of stiffeners and with H, in metres, measured vertically from a point one third of each plate width from its lower edge to the upper deck at side.

9. 2. 4 Where the hopper tanks are interconnected with the topside tanks, or in way of ballast holds, the plating is also to comply with the requirements of Table 7. 8. 1: Strengthening for heavy cargo requirements (3)(c) and (3)(d), whichever is appropriate.

9. 3 Sloped bulkhead stiffeners

9. 3. 1 The scantlings of sloped bulkhead stiffeners are to be as required for inner bottom longitudinals, *See* Pt 4, Ch 7, 8 Double bottom structure. In ships strengthened for heavy cargoes, the scantlings of the stiffeners are to be derived from Table 7. 8. 1: Strengthening for heavy cargo requirements

using a head for heavy cargo measured vertically from the mid-point of the effective length to the underside of the topside tank sloped bulkhead. Where the hopper tanks are interconnected with the topside tanks, or in way of ballast holds, the scantlings of the stiffeners are also to comply with the requirements of Table 7. 8. 1: Strengthening for heavy cargo requirements(4)(c) and (4)(d), whichever is appropriate. For higher tensile steel longitudinals the requirements of Pt 4, Ch 1, 6.2 Longitudinal stiffening 6.2.3 are to be complied with where applicable, *See also* Pt 4, Ch 7, 9.7 Structural details 9.7.1.

9. 4 Shell and bilge stiffeners

9. 4. 1 The scantlings of the shell and bilge longitudinals are to comply with the requirements of Pt 4, Ch 1, 6 Shell envelope framing.

9. 5 Tank end bulkheads

9. 5. 1 The scantlings of tank end bulkheads are to comply with the requirements for deep tanks in Table 1. 9. 1: Watertight and deep tank bulkhead scantlings. Where the hopper tanks are interconnected with the topside tanks, the scantlings are to be derived, using the load head h_4, in metres, from Table 7. 8. 1: Strengthening for heavy cargo requirements (3)(c) and (4)(c), as appropriate.

9. 6 Primary supporting structure

9. 6. 1 Transverses supporting longitudinal stiffening are to comply with the requirements of , and are to be in line with the double bottom floors.

9. 7 Structural details

9. 7. 1 Bracket/diaphragms at the top of the hopper tank are to be of sufficient size and thickness to provide effective rigidity, and care is to be taken to ensure alignment with brackets at the bottom of the side frames in the holds. The shell and sloped bulkhead longitudinals supporting the diaphragms are to be derived using the span taken between transverses, *See also* Pt 4, Ch 7, 6.2 Transverse stiffening 6.2.11.

Table 7. 9. 1: Hopper tank primary structure

Item	Modulus, in cm^3	Inertia, in cm^4
(1) Bottom and side shell transverses	$Z = 11.71\rho k S h_1 l_e^2$	$I = \frac{2.5}{k} l_e Z$
(2) Sloped bulkhead transverses	The greater of: (a) $Z = 11.71\rho k S h_1 l_e^2$ (b) $Z = 6.6 \frac{k S H_H l_e^2}{c} \tan$	$I = \frac{2.5}{k} l_e Z$ $I = \frac{1.85}{k} l_e Z$
Symbols		

S, k, l_e, Z, I, ρ = as defined in Pt 4, Ch 7, 1.7 Information required for non-CSR bulk carriers 1.7.1

h = distance, in metres, from the mid-point of the effective length to the upper deck at side

h_1 = the greater of the distance, in metres, from the midpoint of the effective length to the top of the tank or half the distance, in metres, to the top of the overflow, or in way of cargo oil or ballast holds: the distance from the tank top to the deck at centre, or where the hopper tank is interconnected with the topside tank: the load head h_4, as derived from Table 7. 8. 1: Strengthening for heavy cargo requirements (4)(c), whichever is the greatest

C = stowage rate, in m^3/tonne, as defined in Table 7. 8. 1: Strengthening for heavy cargo requirements. For bulk carriers without the notation `strengthened for heavy cargoes', the value to be used is 1.39 $m^3$/tonne. For bulk carriers with the notation `strengthened for heavy cargoes', the actual stowage rate is to be used, but the value is not to be taken greater than 0.865 m^3/tonne.

H_H = distance, in metres, measured vertically from the mid-point of the effective length to the underside of the topside tank sloped bulkhead

PART

4

CHAPTER **7** **Bulk Carriers**

SECTION **10** **Bulkheads**

10. 1 General

10. 1. 1 The requirements of Pt 4, Ch 1, 9 Bulkheads are to be applied, together with the requirements of this Section.

10. 1. 2 Where vertically corrugated transverse watertight bulkheads are fitted, the scantlings and arrangements are also to satisfy the requirements of Pt 4, Ch 7, 10.4, Vertically corrugated transverse watertight bulkheads – Application and definitions. Other transverse watertight bulkhead types will be specially considered.

10. 1. 3 In way of ballast holds, the scantlings are to satisfy the requirements of Table 1. 9. 1: Watertight and deep tank bulkhead scantlings in Pt 4, Ch 1 General Cargo Ships for deep tanks with the load head, h_4, in metres, taken to the deck at centre. This includes the scantlings of vertically corrugated and double plate transverse bulkheads supported by stools. In addition, the thickness of corrugations is to be not less than given by Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.8 for watertight corrugated bulkheads. Alternatively, the scantlings may be based on direct calculations which are to be submitted.

10. 1. 4 All bulk carriers to be classed **'100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP'** are to be arranged with top and bottom stools. The requirements of Pt 4, Ch 7, 10.2 Bulkheads supported by stools are to be complied with as appropriate.

10. 2 Bulkheads supported by stools

10. 2. 1 The stools are to be reinforced with plate diaphragms or deep webs, and in bottom stools the diaphragms are to be aligned with double bottom side girders. Continuity is also to be maintained between the diaphragms and the bulkhead corrugations for 90° corrugations.

10. 2. 2 The sloping plate of bottom stools is to be aligned with double bottom floors. Particular attention is to be given to the through thickness properties of the inner bottom plating and continuity at the connection to the inner bottom, and to the through thickness properties of the bottom stool shelf plate, *See* Ch 3, 8 Plates with specified through thickness properties of the Pt 2 Rules for the Manufacture, Testing and Certification of Materials regarding requirements for plates with specified through thickness properties.

10. 2. 3 An efficient system of reinforcement is to be arranged in line with the hold transverse bulkheads or bulkhead stools at the intersection with the sloped plating of the hopper and topside tanks. The reinforcement fitted in the tanks is to consist of girders or intercostal bulb plate or equivalent stiffeners fitted between, and connected to, the sloped bulkhead longitudinals.

10. 2. 4 The shelf plates of the bulkhead stools are to be arranged to align with the longitudinals in the hopper and topside tanks. Where sloping shelf plates are fitted to stools, suitable scarfing is to be arranged in way of the connections of the stools to the adjoining structures.

10. 2. 5 The *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG), indicates recommended structural design configurations in the critical areas of the lower stool and of the upper boundaries.

10. 3 Structural details in way of holds confined to dry cargoes

10. 3. 1 In dry cargo holds where transverse bulkheads are arranged without bottom stools, the stiffeners and brackets of plane bulkheads, and rectangular corrugations of corrugated bulkheads, are to be aligned with floors and inner bottom longitudinals. In the case of non-rectangular corrugations, the flanges are to be aligned with floors, but consideration will be given to the fitting of a substantial transverse girder in place of one of the floors.

10. 3. 2 Where transverse corrugated bulkheads are arranged without top stools, transverse beams are to be arranged under the deck in way.

10. 4 Vertically corrugated transverse watertight bulkheads – Application and definitions

10. 4. 1 Where corrugated transverse watertight bulkheads are fitted, the scantlings are to be determined in accordance with the following requirements.

10. 4. 2 For ships of length, L, 190 m or above, the vertically corrugated transverse bulkheads are to be fitted with a bottom stool and, generally, with a top stool below the deck. The requirements of Pt 4, Ch 7, 10.6 Vertically corrugated transverse bulkheads – Support structure at ends are to be complied with as appropriate.

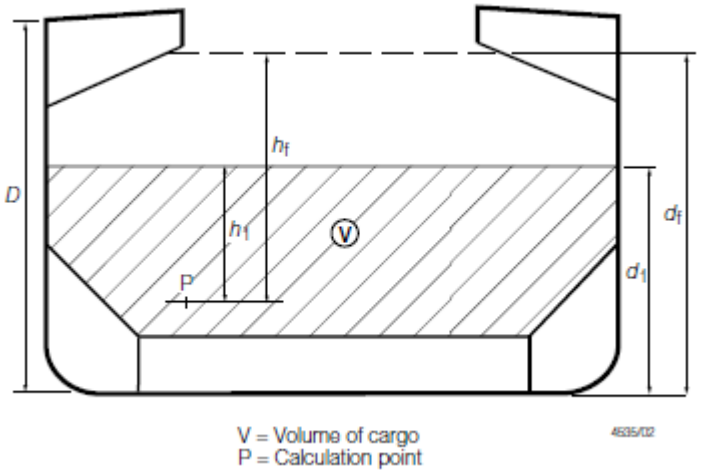
10. 4. 3 The loads to be considered as acting on the bulkheads are those given by the combination of cargo loads with those induced by the flooding of one hold adjacent to the bulkhead under consideration. The most severe combinations of cargo induced loads and flooding loads are to be used for the determination of the scantlings of each bulkhead, depending on the specified design loading conditions:

a. homogeneous loading conditions,
b. non-homogeneous loading conditions (excluding part loading conditions associated with multi-port loading and unloading),
c. packed cargo conditions (such as steel mill products).

The individual flooding of loaded and empty holds is to be considered, but the pressure used in the assessment is not to be less than that obtained for flood water alone. Holds containing packed cargo are to be treated as empty holds.

10. 4. 4 The cargo surface is to be taken as horizontal and at a distance d_1, in metres, from the base line, *See* Figure 7. 10. 1: Cargo hold dimensions, where d_1 is calculated taking into account the cargo properties and the hold dimensions. Unless the ship is designed to carry only cargo of bulk density greater than or equal to 1.78 tonne/m^3 in non-homogeneous loading conditions, the maximum mass of cargo which may be carried in the hold is to be taken as filling that hold to the upper deck level at centreline. A permeability, μ, of 0.3 and angle of repose, ψ, of 35° is to be assumed for this application.

Figure 7. 10. 1: Cargo hold dimensions



10. 4. 5 An homogeneous load condition is defined as one where the ratio between the highest and the lowest filling levels, d_1, in adjacent holds does not exceed 1.20. For this purpose, where a loading condition includes cargoes of different densities, equivalent filling levels are to be calculated for all holds on the basis of a single reference value of cargo density, which can be the minimum to be carried.

10. 4. 6 The permeability, μ, may be taken as 0.3 for ore, coal and cement cargoes. The bulk density and angle of repose, ψ, may generally be taken as 3.0 tonne/m^3 and 35° respectively for iron ore and 1.3 tonne/m^3 and 25° respectively for cement.

10. 4. 7 The flooding head, h_f, *See* Figure 7. 10. 1: Cargo hold dimensions, is the distance, in metres, measured vertically with the ship in the upright position, from the location *P*, under consideration, to a position d_f, in metres, from the base line as given in Table 7. 10. 1: Flooding head.

10. 4. 8 In considering a flooded hold, the total load is to be taken as that of the cargo and flood water at the appropriate permeability. Where there is empty volume above the top of the cargo, this is to be taken as flooded to the level of the flooding head.

10. 4. 9 Corrugations may be constructed of flanged plates or fabricated from separate flange and web plates, which may be of different thicknesses. The corrugation angle is to be not less than 55°, *See* Figure 7. 10. 2: Dimensions of bulkhead corrugation angles.

10. 4. 10 The term net plate thickness is used to describe the calculated minimum thickness of plating of the web, t_w, or flange, t_f. The plate thickness to be fitted is the net plate thickness plus a corrosion addition of 3.5 mm.

10. 5 Vertically corrugated transverse watertight bulkheads – Scantling assessment

10. 5. 1 The bending moment *M*, in kNm, for the bulkhead corrugations is given by:

$$M = \frac{Fl}{8}$$

Where

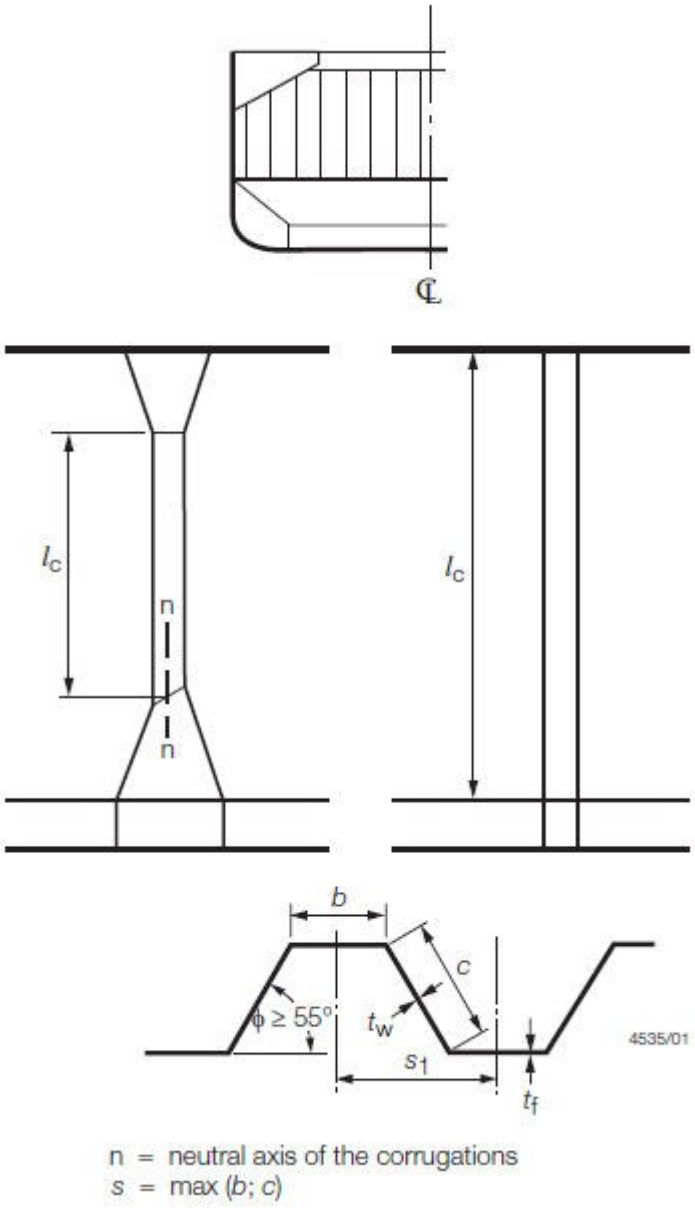
l = span of the corrugation, in metres, to be measured between the internal ends of the bulkhead upper and lower stools in way of the neutral axis of the corrugations or, where no stools are fitted, from inner bottom to deck, *See* Figure 7. 10. 2: Dimensions of bulkhead corrugation angles and Figure 7. 10. 3: Scantling assessment. The lower end of the upper stool is not to be taken greater than a distance from the deck at the centreline equal to:

= 3 times the depth of the corrugation, in general, or

= 2 times the depth of the corrugation, for rectangular stools

F = resultant force, in kN, *See* Table 7. 10. 3: Resultant pressure and force.

Figure 7. 10. 2: Dimensions of bulkhead corrugation angles



n = neutral axis of the corrugations
s = max (b; c)

10. 5. 2 The shear force, Q, in kN at the lower end of the bulkhead corrugation is given by:

$$Q = 0.8F$$

where F is defined in Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.1.

Table 7. 10. 1: Flooding head

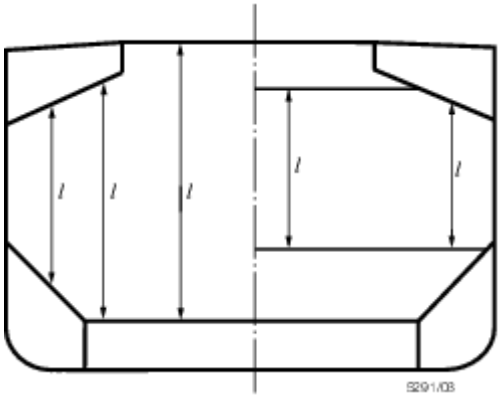
Item	Bulkhead location	Bulk carriers with Type B freeboard and deadweight < 50 000 tonnes	Other bulk carriers
I (1)	Between holds 1 and 2	$d_f = 0.95D$	$d_f = D$
	Elsewhere	$d_f = 0.85D$	$d_f = 0.9D$
II (1)	Between holds 1 and 2	$d_f = 0.9D$	$d_f = 0.95D$
	Elsewhere	$d_f = 0.8D$	$d_f = 0.85D$

Note *1.* Item **II** is to be used for non-homogeneous loading conditions where the bulk cargo density is less than 1.78 tonne/m^3.

Otherwise, Item **I** is to be used.

Note *2.* D = distance, in metres, from the base line to the freeboard deck at side amidships, *See* Fig 7.10.1.

Figure 7. 10. 3: Scantling assessment



10. 5. 3 The section modulus of the corrugations is to be calculated using net plate thicknesses. At the lower end, the following requirements apply:

a. An effective width of compression flange, b_{ef}, not greater than given in Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.7, is to be used.

b. Where corrugation webs are not supported by local brackets below the shelf plate (or below the inner bottom if no lower stool is fitted), they are to be assumed 30 per cent effective in bending. Otherwise, the full area of web plates may be used, *See also* Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.3.e.

c. Where effective shedder plates are fitted, *See* Figure 7. 10. 4: Symmetric shedder plates and Figure 7. 10. 5: Asymmetric shedder plates, the net area of the corrugation flange plates, in cm^2, may be increased by the lesser of:

$$2.5b\sqrt{(t_t t_{sh})} \text{ and } 2.5bt_f$$

Where

b = width of corrugation flange, in metres, *See* Figure 7. 10. 2: Dimensions of bulkhead corrugation angles

t_f = net flange plate thickness, in mm

t_{sh} = net shedder plate thickness, in mm

A shedder plate is considered effective when it:

- is not knuckled; and
- is welded to the corrugations and the lower stool shelf plate by one-side penetration welds or equivalent; and
- has a minimum slope of 45° and lower edges in line with the stool side plating; and
- has a thickness not less than 0.75 times the thickness of the corrugation flanges; and
- has material properties at least equal to those of the corrugation flanges.

d. Where effective gusset plates are fitted, *See* Figure 7. 10. 6: Symmetric gusset/shedder plates and Figure 7. 10. 7: Asymmetric gusset/shedder plates the net area of the corrugation flange plates, in cm^2, may be increased by:

$$7h_g t_f$$

Where

h_g = height of the gusset plate, in metres, but is not to be taken greater than $\frac{10}{7}s_{gu}$

t_f = net flange plate thickness, in mm

s_{gu} = width of the gusset plate, in metres

A gusset plate is considered effective when it:

- is fitted in combination with an effective shedder plate as defined in Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.3.c; and
- has height not less than half the flange plate width; and
- is fitted in line with the stool side plating; and
- has thickness and material properties at least equal to those of the flanges; and
- is welded to the top of the lower stool by full penetration welds and to the corrugations and shedder plates by one-side penetration welds or equivalent.

e. Where the corrugation is welded to a sloping stool shelf plate, set at an angle of not less than 45° to the horizontal, the corrugation webs may be taken as fully effective in bending. Where the slope is less than 45°, the effectiveness is to be assessed by linear interpolation between fully effective at 45° and the appropriate value from Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.3.b at 0°. Where effective gusset plates are also fitted, the area of the flange plates may be increased in accordance with Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight

bulkheads – Scantling assessment 10.5.3.d. No increase is permitted in the case where shedder plates are fitted without gussets.

Table 7. 10. 2: Bulkhead pressure and force

Item	Pressure, kN/m^2 (tonne-f/m^2)	Force, kN (tonne-f)
(1) In non-flooded bulk cargo holds	$p_c = g\rho_c h_1 \tan^2\theta$ $(p_c = g\rho_c h_1 \tan^2\theta)$	$F_c = 0.5\rho_c g s_1 (d_1 - h_{DB} - h_{LS})^2 \tan^2\theta$ $(F_c = 0.5\rho_c s_1 (d_1 - h_{DB} - h_{LS})^2 \tan^2\theta)$
(2) In flooded bulk cargo holds, when $d_f \geq d_1$ (a) For positions between d_1 and d_f from base line	$p_{cf} = g\rho h_f$ $(p_{cf} = \rho h_f)$	$F_{cf} = 0.5 s_1 \big(\rho g (d_f - d_1)^2 + (\rho g (d_f - d_1) + p_{le})(d_1 - h_{DB} - h_{LS})\big)$
(b) For positions at a distance lower than d_f from base line	$p_{cf} = g(\rho h_f + (\rho_c - \rho(1-\mu))h_c \tan^2\theta$ $(p_{cf} = (\rho h_f + (\rho_c - \rho(1-\mu))h_1 \tan^2\theta)$	$\big(F_{cf} = 0.5 s_1 \big(\rho (d_f - d_1)^2 + (\rho (d_f - d_1) + p_{le})(d_1 - h_{DB} - h_{LS})\big)\big)$
(3) In flooded bulk cargo holds, when $d_f < d_1$ (a) For positions between d_1 and d_f from base line	$p_{cf} = g\rho_c h_1 \tan^2\theta$ $(p_{cf} = \rho_c h_1 \tan^2\theta)$	$F_{cf} = 0.5 s_1 \big(\rho_c g (d_1 - d_f)^2 \tan^2\theta + (\rho_c g (d_1 - d_f)\tan^2\theta + p_{le})(d_f - h_{DB} - h_{LS})\big)$
(b) For positions at a distance lower than d_f from base line	$p_{cf} = g(\rho h_f + (\rho_c h_1 - \rho(1-\mu)h_f)\tan^2\theta)$ $(p_{cf} = (\rho h_f + (\rho_c h_1 - \rho(1-\mu)h_f)\tan^2\theta))$	$\big(F_{cf} = 0.5 s_1 \big(\rho_c (d_1 - d_f)^2 \tan^2\theta + (\rho_c (d_1 - d_f)\tan^2\theta + p_{le})(d_f - h_{DB} - h_{LS})\big)\big)$
(4) In flooded empty holds	$p_f = g\rho h_f$ $(p_f = \rho h_f)$	$F_f = 0.5 s_1 \rho g (d_f - h_{DB} - h_{LS})^2$ $(F_f = 0.5 s_1 \rho (d_f - h_{DB} - h_{LS})^2)$
Symbols		

d_f *See* Pt 4, Ch 7, 10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions 10.4.7

d_1 = vertical distance, in metres, from the base line to the top of the cargo, *See* Figure 7. 10. 1: Cargo hold dimensions

g = gravitational constant, 9.81 m/sec^2

h_{DB} = height of double bottom, in metres

h_f = flooding head, *See* Pt 4, Ch 7, 10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions 10.4.7

h_{LS} = mean height of lower stool, in metres

h_1 = vertical distance, in metres, from the calculation point to the top of the cargo, *See* Figure 7. 10. 1: Cargo hold dimensions

p_c, p_{cf}, p_f = pressure on the bulkhead at the point under consideration, in kN/m^2

p_{le} = pressure at the lower end of the corrugation, in kN/m^2

s_1 = spacing of the corrugations, in metres, *See* Figure 7. 10. 2: Dimensions of bulkhead corrugation angles

ρ = density of sea water = 1.025 tonne /m^3

ρ_c = bulk cargo density, in tonne/m^3

θ = $45° - (\psi/2)$

ψ = angle of repose of the cargo, in degrees

μ = permeability of cargo, *See* Pt 4, Ch 7, 10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions 10.4.6

Table 7. 10. 3: Resultant pressure and force

Loading condition	Resultant pressure kN/m^2	Resultant force kN
Homogeneous	$p_r = p_{cf} - 0.8p_c$	$F = F_{cf} - 0.8F_c$
Non-homogeneous	$p_r = p_{cf}$	$F = F_{cf}$
Flood water alone (adjacent holds empty)	$p_r = p_f$	$F = F_f$
Note For symbols, *See* Table 7. 10. 2: Bulkhead pressure and force.		

10. 5. 4 The section modulus of corrugations at cross-sections other than the lower end is to be calculated with fully effective webs and an effective compression flange width, b_{ef} not greater than given in Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.7.

Figure 7. 10. 4: Symmetric shedder plates

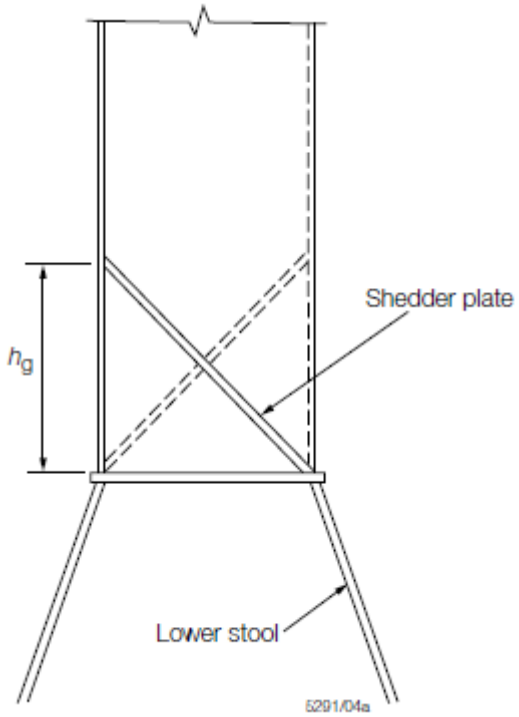


Figure 7. 10. 5: Asymmetric shedder plates

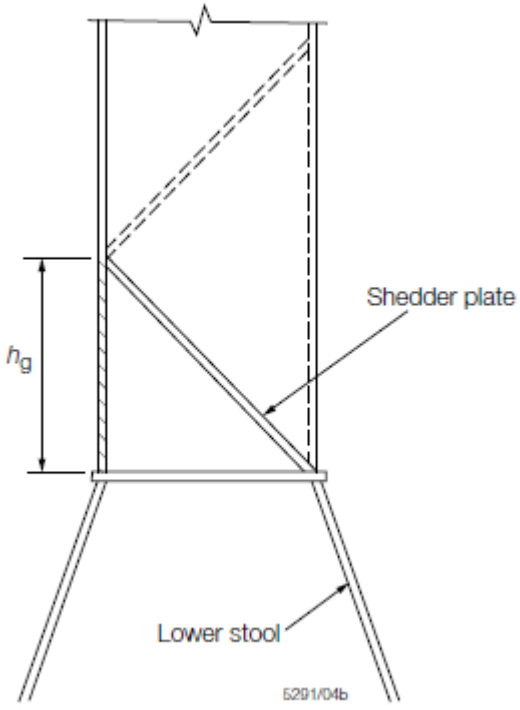

Figure 7. 10. 6: Symmetric gusset/shedder plates

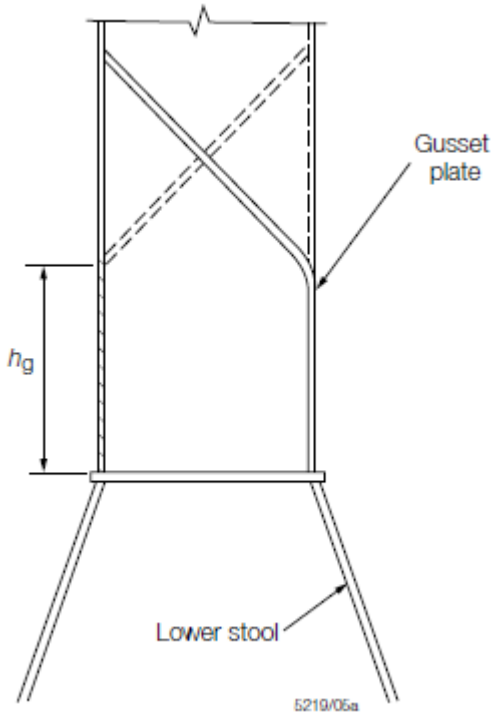


10. 5. 5 The bending capacity of the bulkhead corrugations is to comply with the following relationship:

$$\frac{1000M}{0.5Z_{le}\sigma_{p,le} + Z_m\sigma_{p,m}} \leq 0.95$$

Where

M = bending moment, in kNm, *See* Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.1

Z_{le} = section modulus at the lower end of the corrugations, in cm^3

Z_m = section modulus at mid-span of the corrugations, in cm^3

$\sigma_{p,le}$ = permissible bending stress at the lower end of the corrugations, in N/mm^2

$\sigma_{p,m}$ = permissible bending stress at mid-span of the corrugations, in N/mm^2

In the above expression Z_{le}, in cm^3, is not to be taken greater than Z'_{le} where

$$Z'_{le} = Z_g + \left(\frac{1000Qh_g - 0.5h_g^2 s_1 p_g}{\sigma_{p,le}}\right)$$

and Z_m is not to exceed the lesser of $1.15Z_{le}$ and $1.15Z'_{le}$

Where

h_g = height of the gusset plate, in metres

p_g = resultant pressure calculated in way of the middle of the shedder or gusset plates as appropriate, in kN/m^2

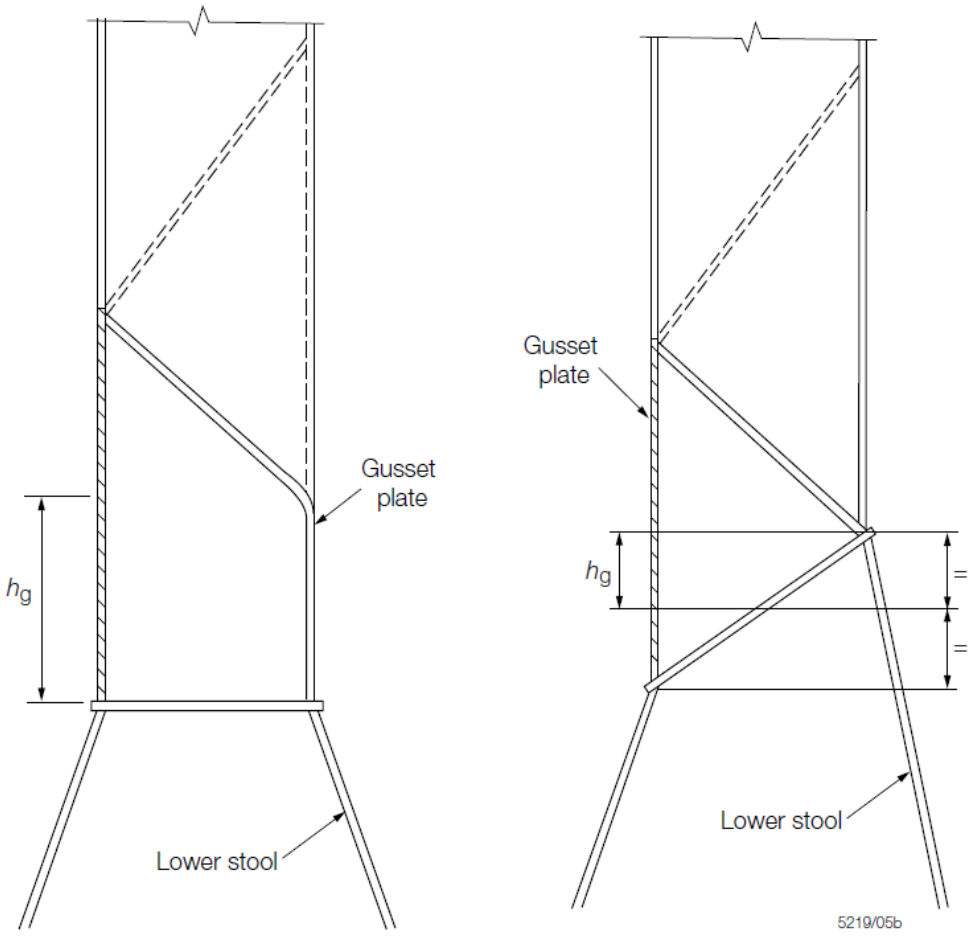
s_1 = spacing of the corrugations, in metres

Q = shear force, in kN, *See* Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.2

Where

Z_g = section modulus of the corrugations in way of the upper end of shedder or gusset plates as appropriate, in cm^3.

Figure 7. 10. 7: Asymmetric gusset/shedder plates



10. 5. 6 The applied shear stress, in N/mm^2, is determined by dividing the shear force derived from Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.2 by the shear area of the corrugation, calculated using the net plate thickness. The shear area is to be reduced to account for non- perpendicularity between the corrugation webs and flanges. In general, the reduced area may be obtained by multiplying the web sectional area by sin φ, where φ is the angle between the web and the flange, *See* Figure 7. 10. 2: Dimensions of bulkhead corrugation angles. The applied shear stress is not to exceed the permissible shear stress or the shear buckling stress given in Table 7. 10. 4: Permissible shear and buckling stresses.

Table 7. 10. 4: Permissible shear and buckling stresses

Bending, N/mm^2	Shear, N/mm^2	Shear buckling, N/mm^2

$\sigma_p = \sigma_0$	$\tau_p = 0.5\sigma_0$	$\tau_{cr} = \tau_E$ when $\tau_E \leq \frac{\tau_0}{2}$ $= \tau_0\left(1 - \frac{\tau_0}{4\tau_E}\right)$ when $\tau_E \leq \frac{\tau_0}{2}$

Symbols

b = width of corrugation flange, in metres, *See* Figure 7. 10. 2: Dimensions of bulkhead corrugation angles

c = width of corrugation web, in metres, *See* Figure 7. 10. 2: Dimensions of bulkhead corrugation angles

t_f = net flange plate thickness, in mm

t_w = web plate net thickness, in mm

E = modulus of elasticity

= 206 000 N/mm^2

σ_0 = specified minimum yield stress, in N/mm^2

$\tau_E = 5.706E(t_w/1000c)^2$ N/mm^2

$\tau_0 = \frac{\sigma_0}{\sqrt{3}}$N/mm^2

10. 5. 7 The width of the compression flange, in metres, to be used for calculating the effective modulus is:

$$b_{ef} = C_{et}b$$

Where

C_{ef} = $\frac{2.25}{\beta} - \frac{1.25}{\beta^2}$ for $\beta > 1.25$

C_{ef} = 1.0 for $\beta \leq 1.25$

β = $10^3\left(\frac{b}{t_f}\right)\sqrt{\frac{\sigma_0}{E}}$

Other symbols are as defined in Table 7. 10. 4: Permissible shear and buckling stresses.

10. 5. 8 The corrugation flange and web local net plate thickness are not to be less than:

$$t = 14.9s_w\sqrt{1.05\frac{p_r}{\sigma_0}} \text{ mm}$$

Where

s_w = plate width, in metres, to be taken equal to the width of the corrugation flange or web, whichever is the greater

p_r = resultant pressure, in kN/m^2, as defined in Table 7. 10. 3: Resultant pressure and force, at the lower edge of each strake of plating. The net thickness of the lowest strake is to be determined using the resultant pressure at the top of the lower stool, (or at the inner bottom, if no lower stool is fitted), or at the top of the shedders, if effective shedder or gusset and shedder plates are fitted

σ_0 = specified minimum yield stress of the material, in N/mm^2.

10. 5. 9 For built-up corrugations, where the thickness of the flange and of the web are different, the net thickness of the narrower plating is to be not less than:

$$t_n = 14.9 s_n \sqrt{1.05 \frac{p_r}{\sigma_0}} \text{ mm}$$

Where

s_n = width of the narrower plating, in metres.

The net thickness, in mm, of the wider plating is not to be taken less than the greater of:

$$t_{wp} = 14.9 s_w \sqrt{1.05 \frac{p_r}{\sigma_0}} \text{ mm or}$$

$$t_{wp} = \sqrt{\frac{462 s_w^2 P_r}{\sigma_0} - t_{np}^2} \text{ mm}$$

Where

t_{np} ≤ actual net thickness of the narrower plating but not greater than:.

$$14.9 s_w \sqrt{1.05 \frac{p_r}{\sigma_0}} \text{ mm}$$

10. 5. 10 The required thickness of plating is the net thickness plus the corrosion addition given in Pt 4, Ch 7, 10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions 10.4.10.

10. 5. 11 Scantlings required to meet the bending and shear strength requirements at the lower end of the bulkhead corrugation are to be maintained for a distance of 0.15l from the lower end, where l is as defined in Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment 10.5.1. Scantlings required to meet the bending requirements at mid-height are to be maintained to a location no greater than 0.3l from the top of the corrugation. The section modulus of the remaining upper part of the corrugation is to be not less than 0.75 times that required for the middle part, corrected for differences in yield stress.

10. 6 Vertically corrugated transverse bulkheads – Support structure at ends

10. 6. 1 The requirements of Pt 4, Ch 7, 10.2 Bulkheads supported by stools are to be complied with as applicable, together with the following.

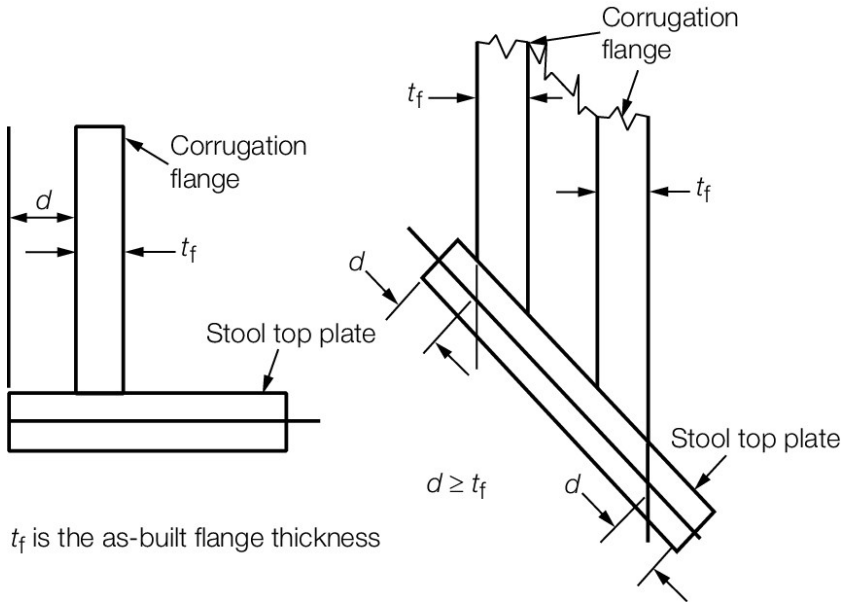
10. 6. 2 **Lower stool**:

a. The height of the lower stool is generally to be not less than three times the depth of the corrugations.

b. The thickness and steel grade of the stool shelf plate are to be not less than those required for the bulkhead plating above.

c. The thickness and steel grade of the upper portion of vertical or sloping stool side plating, within the depth equal to the corrugation flange width from the stool top, are to be not less than the flange plate thickness and steel grade needed to meet the bulkhead requirements at the lower end of the corrugation.
d. The thickness of the stool side plating and the section modulus of the stool side stiffeners are to be not less than those required by Pt 4, Ch 1, 9 Bulkheads for a plane transverse bulkhead and stiffeners using the greater of the pressures determined from the head, h_4, in Table 1. 9. 1: Watertight and deep tank bulkhead scantlings and the expressions given in Table 7. 10. 2: Bulkhead pressure and force.
e. The ends of stool side vertical stiffeners are to be attached to brackets at the upper and lower ends of the stool.
f. The width of the shelf plate is to be in accordance with Figure 7. 10. 8: Width of shelf plate.
g. The stool bottom is to have a width not less than 2.5 times the mean depth of the corrugation.
h. Scallops in the brackets and diaphragms in way of connections to the stool shelf plate are to be avoided.
i. Where corrugations are terminated on the bottom stool, corrugations are to be connected to the stool top plate by full penetration welds. The stool side plating is to be connected to the stool top plate and the inner bottom plating by either full penetration or partial penetration welds, *See* Figure 7. 10. 9: Partial penetration welding. The supporting floors are to be connected to the inner bottom by either full penetration or partial penetration welds.

Figure 7. 10. 8: Width of shelf plate



10. 6. 3 **Upper stool**:

a. The upper stool, where fitted, is to have a height generally between two and three times the depth of corrugations.
b. Rectangular stools are to have a height generally equal to twice the depth of corrugations, measured from the deck level and at hatch side girder.
c. The upper stool is to be properly supported by girders or deep brackets between the adjacent hatch-end beams.
d. The width of the shelf plate is generally to be the same as that of the lower stool shelf plate.
e. The upper end of a non-rectangular stool is to have a width not less than twice the depth of corrugations.

f. The thickness and steel grade of the shelf plate are to be the same as those of the bulkhead plating below.

g. The thickness of the lower portion of stool side plating is to be not less than 80 per cent of that required for the upper part of the bulkhead plating where the same materials are used.

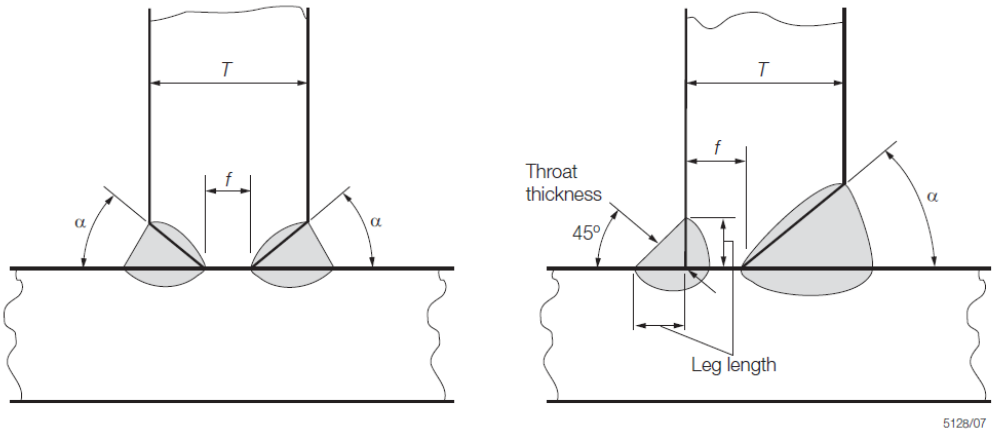
h. The thickness of the stool side plating and the section modulus of the stool side stiffeners are to be not less than those required by Ch 1.9 for plane transverse bulkheads and stiffeners using the greater of the pressures determined from the head, h_4, in Table 1. 9. 1: Watertight and deep tank bulkhead scantlings and the expressions given in Table 7. 10. 2: Bulkhead pressure and force.

i. Where vertical stiffening is fitted, the ends of stool side stiffeners are to be attached to brackets at the upper and lower end of the stool.

j. Diaphragms are to be fitted inside the stool, in line with, and effectively attached to, longitudinal deck girders extending to the hatch end coaming girders for effective support of the corrugated bulkhead.

k. Scallops in the brackets and diaphragms in way of the connection to the stool shelf plate are to be avoided.

Figure 7. 10. 9: Partial penetration welding



Root face f = 3 mm to $T/3$ mm
Groove angle α = 40 to 60
Throat thickness = } See Pt 3, Ch 10
Leg length = }

10. 6. 4 If no upper stool is fitted, two transverse reinforced beams are to be fitted in line with the corrugation flanges.

10. 6. 5 If no bottom stool is fitted, the corrugation flanges are to be in line with the supporting floors. Corrugations are to be connected to the inner bottom plating by full penetration welds. The thickness and steel grades of the supporting floors are to be at least equal to those provided for the corrugation flanges. The plating of supporting floors is to be connected to the inner bottom by either full penetration or deep penetration welds, *See* . The cut-outs for connections of the inner bottom longitudinals to double bottom floors are to be closed by collar plates. The supporting floors are to be connected to each other by suitably designed shear plates.

10. 6. 6 Stool side plating is to align with the corrugation flanges. Stool side vertical stiffeners and their brackets in the lower stool are to align with the inner bottom longitudinals to provide appropriate load transmission between these stiffening members. The lower stool side plating is not to be knuckled.

10. 6. 7 The design of local details is to take into account the transfer of the bulkhead forces and moments to the boundary structures and particularly to the double bottom and cross-deck structures.

PART

4

CHAPTER **7 Bulk Carriers**

SECTION **11 Direct calculation**

11. 1 Application

11. 1. 1 Direct calculations are to be employed in derivation of scantlings where required by the preceding Sections of this Chapter or by related provisions included in Pt 3 Ship Structures (General).

11. 1. 2 Direct calculation methods are also generally to be used where additional calculations are required by the Rules in respect of unusual structural arrangements.

11. 2 Procedures

11. 2. 1 For details of ACS's direct calculation procedures *See* Pt 3, Ch 1, 2 Direct calculations. For requirements concerning use of other calculation procedures, *See* Pt 3, Ch 1, 3 Equivalents.

PART

4

CHAPTER **7 Bulk Carriers**

SECTION **12 Steel hatch covers**

12. 1 General

12. 1. 1 These requirements apply to hatch covers on exposed decks in Position 1, *See* Pt 3, Ch 1, 6.6 Position 1 and Position 2 6.6.1, and are in addition to the following requirements:

a. Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.14, Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.16, Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.17, Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.25, Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.27, and Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.29.

b. Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.5 for the vertical weather pressure load case and cargo load, if carried on the hatch covers.
Note When cargo is carried on the hatch covers, Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.8 to Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.10 are also to be complied with. Cargo loads are to be in accordance with Pt 3, Ch 11, 2.3 Load model 2.3.4 and Pt 3, Ch 11, 2.3 Load model 2.3.5. Pt 4, Ch 8, 11.2, Direct calculations is to be considered for compliance with Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1, Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.2, Pt 3, Ch 11, 2.5 Local net plate thickness 2.5.1, Pt 3, Ch 11, 2.8 Net scantling of secondary stiffeners 2.8.1, Pt 3, Ch 11, 2.8 Net scantling of secondary stiffeners 2.8.4, Pt 3, Ch 11, 2.8 Net scantling of secondary stiffeners 2.8.5, Pt 3, Ch 11, 2.9 Net scantling of primary supporting members 2.9.1 and Pt 3, Ch 11, 2.9 Net scantling of primary supporting members 2.9.2. The vertical weather design load needs not to be combined with the cargo load.

c. For hatch covers subject to wheel loading or helicopter landing, Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles and Pt 3, Ch 9, 5 Helicopter landing areas are to be complied with.

12. 1. 2 The net plate thickness, t_{net}, is the calculated minimum thickness of the plating and stiffeners. The required thickness is the net thickness plus a corrosion addition, t_c, given in Table 7. 12. 1: Corrosion addition tc.

Table 7. 12. 1: Corrosion addition t_c

Hatch cover type	t_c, in mm
(a) Single skin	2.0
(b) Pontoon (double skin)	
(i) for the top and bottom plating	2.0
(ii) for the internal structures	1.5

12. 1. 3 Material for the hatch covers is to be steel according to the requirements for ship's hull.

12. 2 Stiffener arrangement

12. 2. 1 The secondary stiffeners and primary supporting members of the hatch covers are to be continuous over the breadth and length of the hatch covers, as far as practical. When this is impractical, sniped end connections are not to be used and appropriate arrangements are to be adopted to ensure sufficient load carrying capacity.

12. 2. 2 The spacing of primary supporting members parallel to the direction of secondary stiffeners is not to exceed $\frac{1}{3}$ of the span of primary supporting members.

12. 3 Closing arrangements

12. 3. 1 Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced alongside the coamings and between cover elements.

12. 3. 2 Arrangement and spacing are to be determined with due attention to the effectiveness for weather-tightness, depending upon the type and the size of the hatch cover, as well as on the stiffness of the cover edges between the securing devices.

12. 3. 3 The net sectional area of each securing device is not to be less than:

$$A = 1.4a/f \text{ cm}^2$$

Where

a = spacing in m of securing devices, not being taken less than 2 m

f = $(\sigma_Y/235)^e$

σ_Y = specified minimum upper yield stress in N/mm^2 of the steel used for fabrication, not to be taken greater than 70 per cent of the ultimate tensile strength

e = 0.75 for $\sigma_Y > 235$

= 1.0 for $\sigma_Y \leq 235$

12. 3. 4 Rods or bolts are to have a net diameter not less than 19 mm for hatchways exceeding 5 m^2 in area.

12. 3. 5 Between cover and coaming and at cross-joints, a packing line force sufficient to obtain weathertightness is to be maintained by the securing devices. For packing line forces exceeding 5 N/mm, the cross section area is to be increased in direct proportion. The packing line force is to be specified.

12. 3. 6 The cover edge stiffness is to be sufficient to maintain adequate sealing pressure between securing devices. The moment of inertia, $\boldsymbol{I}$, of edge elements is not to be less than:

$$I = 6pa^4 \text{ cm}^4$$

Where

p = packing line pressure in N/mm, minimum 5 N/mm

a = spacing in m of securing devices.

12. 3. 7 Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or covers. Individual securing devices on each cover are to have approximately the same stiffness characteristics.

12. 3. 8 Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

12. 3. 9 Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

12. 3. 10 Hatch covers are to be effectively secured, by means of stoppers, against transverse and longitudinal forces (acting on the forward end) arising from a pressure of 175 kN/m^2.

12. 3. 11 The equivalent stress:

- in stoppers and their supporting structures; and
- calculated in the throat of the stopper welds; is not to exceed the allowable value of $0.8\sigma_Y$.

12. 4 Load model

12. 4. 1 The pressure, p, in kN/m^2, acting on the hatch covers is given by:

a. For ships of length 100 m or greater, for hatchways located on the freeboard deck, p is to be the greater of 34.3 or the following:

$$p = 34.3 + \frac{p_{FP} - 34.3}{0.25}\left(0.25 - \frac{x}{L}\right)$$

Where a hatchway is located in position 1 and at least one superstructure standard height higher than the freeboard deck, the pressure p may be 34.3 kN/m^2.

b. For ships less than 100 m in length, for hatchways located at the freeboard deck, p is to be the greater of $0.195L + 14.9$ or the following:

$$p = 15.8 + \frac{L}{3}\left(1 - \frac{5}{3}\frac{x}{L}\right) - 3.6\frac{x}{L}$$

Where two or more panels are connected by hinges, each individual panel is to be considered separately.

p_{FP} = pressure at the forward perpendicular

Where

$= 49.1 + (L - 100)a$

a = 0.0726 for type B freeboard ships

= 0.356 for ships with reduced freeboard

L = Freeboard length, in metres, as defined in *Regulation 3 - Definitions of terms used in the Annexes* of Annex I to the 1966 Load Line Convention as modified by the Protocol of 1988, to be taken not greater than 340 m

x = distance, in metres, of the mid length of the hatch cover under examination from the forward end of L.

c. For weather deck covers for holds which may be flooded and used as ballast tanks and holds in OBO, ore or oil and similar types of ship, the pressure p, in kN/m^2, due to the internal load for a member and position under consideration is to be taken as:

$p = 5.53Y\sin\ q\text{kN/m}^2$

Where

$$\sin q = \left(0.45 + \frac{L}{10B}\right)\left(0.54 - \frac{L}{1270}\right)$$

q = roll angle, in degrees, but need not exceed 25° and is not to be taken as less than 22°

Y = transverse distance, in metres, from the side coaming at the coaming top to the member and position under consideration. Both sides of roll are to be considered.

In way of holds for oil cargo, a load equivalent to the inert gas pressure is to be applied over the full breadth of the cover and added to the load corresponding to the liquid pressure. However, where the rolling angle has been determined by direct calculations, the load may be derived accordingly.

12. 5 Allowable stress

12. 5. 1 The normal and shear stresses calculated for the net section hatch cover structures are not to exceed the values given in Table 7. 12. 2: Permissible stresses.

Table 7. 12. 2: Permissible stresses

Failure mode	Permissible stress, in N/mm^2
Bending	σ_a = . $0.80\sigma_F$
Shear	τ_a = $0.46\sigma_F$
Symbols	
σ_F	= minimum upper yield stress, in N/mm^2

12. 5. 2 The normal stress in compression of the attached flange of primary supporting members is not to exceed 0.8 times the critical buckling stress of the structure according to the buckling check as given in Pt 4, Ch 7, 12.10 Hatch cover plating, Pt 4, Ch 7, 12.11 Hatch cover secondary stiffeners and Pt 4, Ch 7, 12.12 Web panels of hatch cover primary supporting members.

12. 5. 3 The stresses in hatch covers that are designed as a grillage of longitudinal and transverse primary supporting members are to be determined by a grillage or a FE analysis. When such an analysis is used the secondary stiffeners are not to be included in the attached flange area of the primary members.

12. 5. 4 When calculating the stresses σ and τ as defined in Table 7. 12. 2: Permissible stresses, the net scantlings are to be used.

12. 6 Effective cross-sectional area of panel flanges for primary supporting members

12. 6. 1 The effective flange area, A_f, in cm^2, of the attached plating, to be considered for the yielding and buckling checks of primary supporting members, when calculated by means of a beam or grillage model, is obtained as the sum of the effective flange areas of each side of the girder web as appropriate:

$$A_f = \sum_{nf} \left(10 b_{ef} t\right)$$

Where

nf = 2 if attached plate flange extends on both sides of girder web

= 1 if attached plate flange extends on one side of girder web only

t = net thickness of considered attached plate, in mm

b_{ef} = effective breadth of attached plate flange on each side of girder web, in metres

= b_p, but not to be taken greater than 0.165ℓ

b_p = half distance between the considered primary supporting member and the adjacent one, in metres

l = span of primary supporting members, in metres.

12. 7 Local net plate thickness

12. 7. 1 The local net plate thickness of the hatch cover top plating is to be not less than:

$$t = F_p 15.8s\sqrt{\frac{p}{0.95\sigma_F}}$$

or 1 per cent of the spacing of the stiffeners or 6 mm, whichever is greater

Where

F_p = factor for combined membrane and bending response

= 1.50 in general

= $1.90\sigma/\sigma_a$, where $\sigma/\sigma_a \geq 0.8$, for the attached plate flange of primary supporting members

s = stiffener spacing, in metres

p = pressure, in kN/m^2, as defined in Pt 4, Ch 7, 12.4 Load model

σ = as defined in Pt 4, Ch 7, 12.9 Net scantlings of primary supporting members

σ_a = as defined in Pt 4, Ch 7, 12.5 Allowable stress.

12. 7. 2 For double skin hatch covers, when the lower plating is taken into account as a strength member of the hatch cover, the local net plate thickness of the hatch cover bottom plating is to be not less than:

t = $6.5s$ mm, or

t = 5.0 mm, whichever is the greater

Where

s = stiffener spacing, in metres.

12. 8 Net scantlings of secondary stiffeners

12. 8. 1 The required minimum section modulus, Z, in cm^3, of secondary stiffeners of the hatch cover top plate, based on stiffener net member thickness, is given by:

$$Z = \frac{1000 l^2 sp}{12\sigma_a}$$

Where

l = secondary stiffener span, in metres, to be taken as the spacing, in metres, of primary supporting members or the distance between a primary supporting member and the edge support, as applicable. When brackets are fitted at both ends of all secondary stiffener spans, the secondary stiffener span may be reduced by an amount equal to $\frac{2}{3}$ of the minimum bracket arm length, but not greater than 10 per cent of the gross span, for each bracket

s = secondary stiffener spacing, in metres

p = pressure, in kN/m^2, as defined in Pt 4, Ch 7, 12.4 Load model

σ_a = as defined in Pt 4, Ch 7, 12.5 Allowable stress.

12. 8. 2 The net section modulus of the secondary stiffeners is to be determined based on an attached plate width assumed equal to the stiffener spacing.

12. 9 Net scantlings of primary supporting members

12. 9. 1 The section modulus and web thickness of primary supporting members, based on member net thickness, are to be such that the normal stress σ in both flanges and the shear stress τ, in the web, do not exceed the allowable values σ_a and τ_a, respectively, defined in Pt 4, Ch 7, 12.5 Allowable stress.

12. 9. 2 The breadth of the primary supporting member flange is to be not less than 40 per cent of their depth for laterally unsupported spans greater than 3.0 m. Tripping brackets attached to the flange may be considered as a lateral support for primary supporting members.

12. 9. 3 The flange outstand is not to exceed 15 times the flange thickness.

12. 10 Hatch cover plating

12. 10. 1 The compressive stress, σ, in N/mm^2, in the hatch cover plate panels, induced by the bending of primary supporting members parallel to the direction of secondary stiffeners, is not to exceed 0.8 times the critical buckling stress σ_{C1}, to be evaluated as defined below:

$\sigma_{C1} = \sigma_{E1}$ when $\sigma_{E1} \leq \sigma_F/2$

$= \sigma_F[1 - \sigma_F/(4\sigma_{E1})]$ when $\sigma_{E1} > \sigma_F/2$

Where

σ_F = minimum upper yield stress, in N/mm^2, of the material

$\sigma_{E1} = 3.6E\left(\frac{t}{1000_s}\right)^2$

E = modulus of elasticity, in N/mm^2

$= 2.06 \times 10^5$ for steel

t = net thickness, in mm, of plate panel

s = spacing of secondary stiffeners, in metres

12. 10. 2 The mean compressive stress σ in each of the hatch cover plate panels, induced by the bending of primary supporting members perpendicular to the direction of secondary stiffeners, is not to exceed 0.8 times the critical buckling stress σ_{C2}, to be evaluated as defined below:

$\sigma_{C2} = \sigma_{E2}$ when $\sigma_{E2} \leq \sigma_F/2$

$= \sigma_F[1 - \sigma_F/(4\sigma_{E2})]$ when $\sigma_{E2} > \sigma_F/2$

Where

σ_F = minimum upper yield stress, in N/mm^2, of the material

σ_{E2} = $0.9mE\left(\frac{t}{1000s_s}\right)^2$

m = $c\left[1+\left(\frac{S_s}{l_s}\right)^2\right)\right]^2 \frac{2.1}{\psi+1.1}$

E = modulus of elasticity, in N/mm^2

= 2.06×10^5 for steel

t = net thickness of plate panel, in mm

s_s = length of the shorter side of the plate panel, in metres

l_s = length of the longer side of the plate panel, in metres

Ψ = ratio between smallest and largest compressive stress

c = 1.3 when plating is stiffened by primary supporting members

= 1.21 when plating is stiffened by secondary stiffeners of angle or T type

= 1.1 when plating is stiffened by secondary stiffeners of bulb type

= 1.05 when plating is stiffened by flat bar.

12. 10. 3 The biaxial compressive stress in the hatch cover panels, when calculated by means of FEM shell element model, is to comply with Pt 3, Ch 11, 2.11 Buckling strength of hatch cover structures 2.11.2, using S=1.25.

12. 11 Hatch cover secondary stiffeners

12. 11. 1 The compressive stress σ, in N/mm^2, in the top flange of secondary stiffeners, induced by the bending of primary supporting members parallel to the direction of secondary stiffeners, is not to exceed 0.8 times the critical buckling stress σ_{CS}, to be evaluated as defined below:

$\sigma_{CS} = \sigma_{ES}$ when $\sigma_{ES} \leq \sigma_F/2$

$= \sigma_F[1 - \sigma_F/(4\sigma_{ES})]$ when $\sigma_{ES} > \sigma_F/2$

Where

σ_F = minimum upper yield stress, in N/mm^2, of the material

σ_{ES} = ideal elastic buckling stress, in N/mm^2, of the secondary stiffener

= minimum between σ_{E3} and σ_{E4}

σ_{E3} = $0.001EI_a/(Al^2)$

E = modulus of elasticity, in N/mm^2

= 2.06x10^5 for steel

I_a = moment of inertia of the secondary stiffener, including a top flange equal to the spacing of secondary stiffeners, in cm^4

A = cross-sectional area of the secondary stiffener, including a top flange equal to the spacing of secondary stiffeners, in cm^2

l = span of the secondary stiffener, in metres

σ_{E4} = $\frac{\pi^2 EI_w}{10^4 I_p l^2}\left(m^2 + \frac{K}{m^2}\right) + 0.385E\frac{I_t}{I_p}$

K = $\frac{Cl^4}{\pi^4 EI_w}10^6$ m

m = number of half waves, given in Table 7. 12. 3: Number of half waves

I_w = sectorial moment of inertia (warping constant) of the secondary stiffener about its connection with the plating, in cm^6

= $\frac{h_w^3 t_w^3}{36}10^{-6}$ for flat bar secondary stiffeners

= $\frac{t_f b_f^3 h_w^2}{12}10^{-6}$ 'Tee' secondary stiffeners

= $\frac{b_f h^2 w^3}{12(b_f+h_w)^2}[t_f(b_f^2 + 2b_f h_w + 4h_w^2) + 3t_w b_f h_w]10^{-6}$

= for angles and bulb secondary stiffeners

I_p = polar moment of inertia of the secondary stiffener about its connection with the plating, in cm^4

= $\frac{h_w^3 t_w}{3}10^{-4}$ for flat bar secondary stiffeners

= $\left(\frac{h_w^3 t_w}{3} + h_w^2 b_f t_f\right)10^{-4}$

= for flanged secondary stiffeners

I_t = St.Venant's moment of inertia of the secondary stiffener without top flange, in cm^4

= $\frac{h_w^3 t_w}{3} 10^{-4}$ for flat secondary stiffeners

= $\frac{1}{3}\left[h_w t_w^3 + b_f t_f^3 \left(1 - 0.63\frac{t_f}{b_f}\right)\right] 10^{-4}$

= for flanged secondary stiffeners

h_w, t_w = height and net thickness of the secondary stiffener, respectively, in mm

b_f, t_f = width and net thickness of the secondary stiffener bottom flange, respectively, in mm

s = spacing of secondary stiffeners, in metres

C = spring stiffness exerted by the hatch cover top plating

= $\frac{k_p E t_p^3}{3s\left[1 + \frac{1.33 k_p h_w t_p^3}{1000 s t_w^3}\right]} 10^{-3}$

k_p = $1-\eta_p$ to be taken not less than zero; for flanged secondary stiffeners, k_p need not be taken less than 0.1

η_p = $\frac{\sigma}{\sigma_{E1}}$

σ = as defined in Pt 4, Ch 7, 12.9 Net scantlings of primary supporting members

σ_{E1} = as defined in Pt 4, Ch 7, 12.10 Hatch cover plating

t_p = net thickness of the hatch cover plate panel, in mm.

Table 7. 12. 3: Number of half waves

K	m
$0 < K < 4$	1
$4 < K < 36$	2
$36 < K < 144$	3
$(m-1)^2 m^2 < K \leq m^2 (m+1)^2$	m

12. 11. 2 For flat bar secondary stiffeners and buckling stiffeners, the ratio h/t_w is to be not greater than $15k^{0.5}$

h, t_w = height and net thickness of the stiffener, respectively

k = $235/\sigma_F$

σ_F = minimum upper yield stress, in N/mm^2, of the material.

12. 12 Web panels of hatch cover primary supporting members

12. 12. 1 This check is to be carried out for the web panels of primary supporting members formed by web stiffeners or by the crossing with other primary supporting members, the face plate (or the bottom cover plate) or the attached top cover plate.

12. 12. 2 The shear stress τ in the hatch cover primary supporting members web panels is not to exceed 0.8 times the critical buckling stress τ_C, to be evaluated as defined below:

$\tau_C = \tau_E$ when $\tau_E \leq \tau_F/2$

$= \tau_F[1 - \tau_F/(4\tau_E)]$ when $\tau_E > \tau_F/2$

Where

σ_F = minimum upper yield stress of the material, in N/mm^2

τ_F = $\dfrac{\sigma_F}{\sqrt{3}}$

τ_E = $0.9k_tE\left(\dfrac{t_{pr,n}}{1000d}\right)^2$

E = modulus of elasticity, in N/mm^2

= 2.06×10^5 for steel

$t_{pr,n}$ = net thickness of primary supporting member, in mm

k_t = $5.35 + 4.0/(a/d)^2$

a = greater dimension of web panel of primary supporting member, in metres

d = smaller dimension of web panel of primary supporting member, in metres.

12. 12. 3 For primary supporting members parallel to the direction of secondary stiffeners, the actual dimensions of the panels are to be considered.

12. 12. 4 For primary supporting members perpendicular to the direction of secondary stiffeners or for hatch covers built without secondary stiffeners, a presumed square panel of dimension d is to be taken for the determination of the stress τ_C. In such a case, the average shear stress τ between the values calculated at the ends of this panel is to be considered.

12. 13 Deflection limit and connections between hatch cover panel

12. 13. 1 Load bearing connections between the hatch cover panels are to be fitted with the purpose of restricting the relative vertical displacements.

12. 13. 2 The vertical deflection of primary supporting members is to be not more than $0.0056l$, where l is the greatest span of primary supporting members.

PART

4

CHAPTER **7** **Bulk Carriers**

SECTION **13** **Hatch coamings**

13. 1 General

13. 1. 1 The height and construction of forward and side hatch coamings are to comply with the following requirements. All hatch coamings are to comply with the requirements of Pt 3, Ch 11, 5.1 General 5.1.1, Pt 3, Ch 11, 5.1 General 5.1.4, Pt 3, Ch 11, 5.2, Construction 5.2.1, Pt 3, Ch 11, 5.2 Construction 5.2.2, Pt 3, Ch 11, 5.2 Construction 5.2.4 to Pt 3, Ch 11, 5.2 Construction 5.2.12, Pt 3, Ch 11, 5.2 Construction 5.2.16 to Pt 3, Ch 11, 5.2 Construction 5.2.18 and Pt 3, Ch 11, 5.4 Rest bars in hatchways 5.4.1.

13. 1. 2 For the structure of hatch coamings and coaming stays, the corrosion addition t_c is to be 1.5 mm.

13. 1. 3 Material for the hatch coamings is to be steel according to the requirements for the ship's hull.

13. 1. 4 The secondary stiffeners of the hatch coamings are to be continuous over the breadth and length of the hatch coamings.

13. 2 Load model

13. 2. 1 The pressure p_{coam}, on hatch coamings is to be taken as 220 kN/m^2.

13. 3 Local net plate thickness

13. 3. 1 The local net plate thickness, t, in mm, of the hatch coaming plating is to be the greater of 9.5 mm or the following:

$$t = 14.9s\sqrt{\frac{p_{\text{coum}}}{\sigma_{\text{a, coam}}}}S_{\text{coam}}$$

Where

s = secondary stiffener spacing, in metres

P_{coam} = pressure, in kN/m^2, as defined in Pt 4, Ch 7, 13.2 Load model 13.2.1

S_{coam} = safety factor to be taken equal to 1.15

$\sigma_{a,coam}$ = $0.95\sigma_F$.

σ_F = minimum upper yield stress, in N/mm^2, of the material.

13. 4 Net scantlings of longitudinal and transverse secondary stiffeners

13. 4. 1 The required section modulus, Z, in cm^3, of the longitudinal or transverse secondary stiffeners of the hatch coamings, based on net member thickness, is given by:

$$Z = \frac{1000 S_{coam} l^2 s p_{coam}}{m c_p \sigma_{a,coam}}$$

Where

m = 16 in general

= 12 for the end spans of stiffeners sniped at the coaming corners

S_{coam} = safety factor to be taken equal to 1.15

l = span of secondary stiffeners, in metres

s = spacing of secondary stiffeners, in metres

p_{coam} = pressure in kN/m^2 as defined in Pt 4, Ch 7, 13.2 Load model 13.2.1

c_p = ratio of the plastic section modulus to the elastic section modulus of the secondary stiffeners with an attached plate breadth equal to 40t, where t is the plate net thickness, in mm

= 1.16 in the absence of more precise evaluation

$\sigma_{a,coam}$ = $0.95\sigma_F$

σ_F = minimum upper yield stress, in N/mm^2, of the material.

13. 5 Net scantlings of coaming stays

13. 5. 1 The required minimum section modulus, Z, in cm^3, and web thickness, t_w, in mm of coaming stays designed as beams with flange connected to the deck or sniped and fitted with a bracket (*See* Figure 7. 13. 1: Typical coaming stays, Type A and B) at their connection with the deck, based on member net thickness, are given by:

$$Z = \frac{1000 H_c^2 s p_{coam}}{2\sigma_{a,coam}}$$

$$t_w = \frac{1000 H_c^s p_{coum}}{h\tau_{a,coam}}$$

Where

H_C = stay height, in metres

s = stay spacing, in metres

h = stay depth at the connection with the deck, in mm

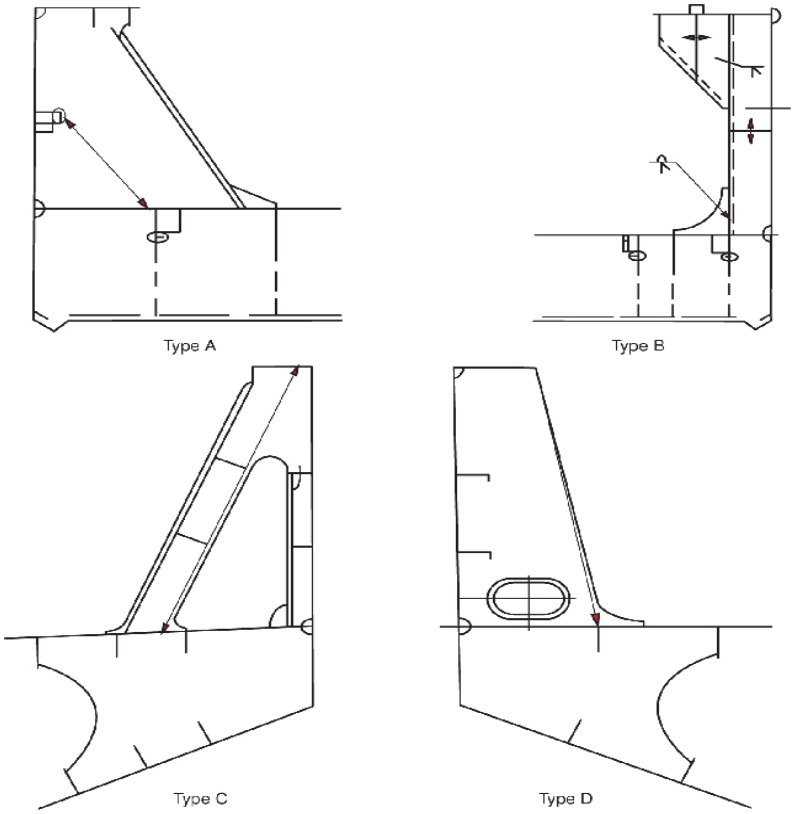
p_{coam} = pressure, in kN/m^2, as defined in Pt 4, Ch 7, 13.2 Load model 13.2.1

$\sigma_{a,coam}$ = $0.95\sigma_F$

$t_{a,coam}$ = $0.5\sigma_F$

σ_F = minimum upper yield stress, in N/mm^2, of the material.

Figure 7. 13. 1: Typical coaming stays



13. 5. 2 For calculating the section modulus of coaming stays, their face plate area is to be taken into account only when it is welded with full penetration welds to the deck plating and adequate underdeck structure is fitted to support the stresses transmitted by it.

13. 5. 3 For other designs of coaming stays, such as those shown in Figure 7. 13. 1: Typical coaming stays Type C and D, the stress levels in 12.5 apply and are to be checked at the highest stressed locations.

13. 6 Local details

13. 6. 1 The design of local details is to comply with Pt 3, Ch 11, 5 Hatch coamings for the purpose of transferring the pressures on the hatch covers to the hatch coamings and, through them, to the deck structures below. Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions.

13. 6. 2 Underdeck structures are to be checked against the load transmitted by the stays, adopting the same allowable stresses specified in Pt 4, Ch 7, 13.5 Net scantlings of coaming stays 13.5.1.

13. 6. 3 Double continuous welding is to be adopted for the connections of stay webs with deck plating and the weld throat is to be not less than $0.44t_W$, where t_W is the gross thickness of the stay web.

13. 6. 4 Toes of stay webs are to be connected to the deck plating with deep penetration double bevel welds extending over a distance not less than 15 per cent of the stay width.

PART

4

CHAPTER **7** **Bulk Carriers**

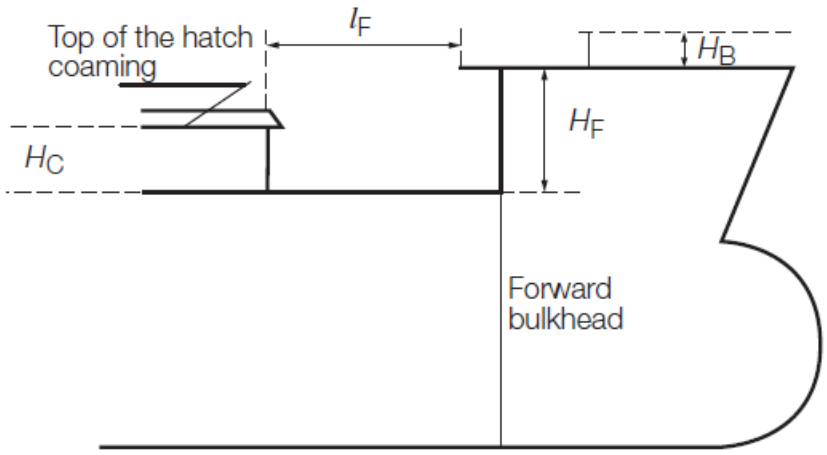
SECTION **14** **Forecastles**

14. 1 Arrangement

14. 1. 1 An enclosed forecastle is to be fitted on the freeboard deck.

14. 1. 2 The aft bulkhead of the forecastle is to be fitted in way or aft of the forward bulkhead in the foremost cargo hold. *See* Figure 7. 14. 1: Forecastle arrangement. However, if this requirement hinders hatch cover operation, the aft bulkhead of the forecastle may be fitted forward of the forward bulkhead of the foremost cargo hold provided the forecastle length is not less than 7 per cent of ship length abaft the forward perpendicular where the ship length and forward perpendicular are defined in the *International Convention on Load Lines 1966* and its Protocol of 1988.

Figure 7. 14. 1: Forecastle arrangement



14. 1. 3 The forecastle height H_F, in metres, above the main deck is to be not less than the greater of:

- the standard height of a superstructure as specified in the *Load Lines, 1966/1988 - International Convention on Load Lines, 1966, as Amended by the Protocol of 1988* ; or
- H_C+0.5 m

14. 1. 4 All points of the aft edge of the forecastle deck are to be located at a distance:

$$l_f < 5\sqrt{(H_F - H_C)}$$

from the hatch coaming, *See* Figure 7. 14. 1: Forecastle arrangement.

14. 1. 5 A breakwater is not to be fitted on the forecastle deck with the purpose of protecting the hatch coaming or hatch covers. If fitted for other purposes, it is to be located such that its upper edge at centre line is not less than:

$$H_B/\tan\ 20^\circ$$

forward of the aft edge of the forecastle deck.

Where

H_B = the height, in metres, of the breakwater above the forecastle, *See*Figure 7. 14. 1: Forecastle arrangement.

14. 2 Construction

14. 2. 1 The construction of the forecastle is to comply with the requirements of Pt 3, Ch 8, 4 Forecastles.

CHAPTER **8** **Container Ships**

SECTION **1** **General**

1. 1 Application and definitions

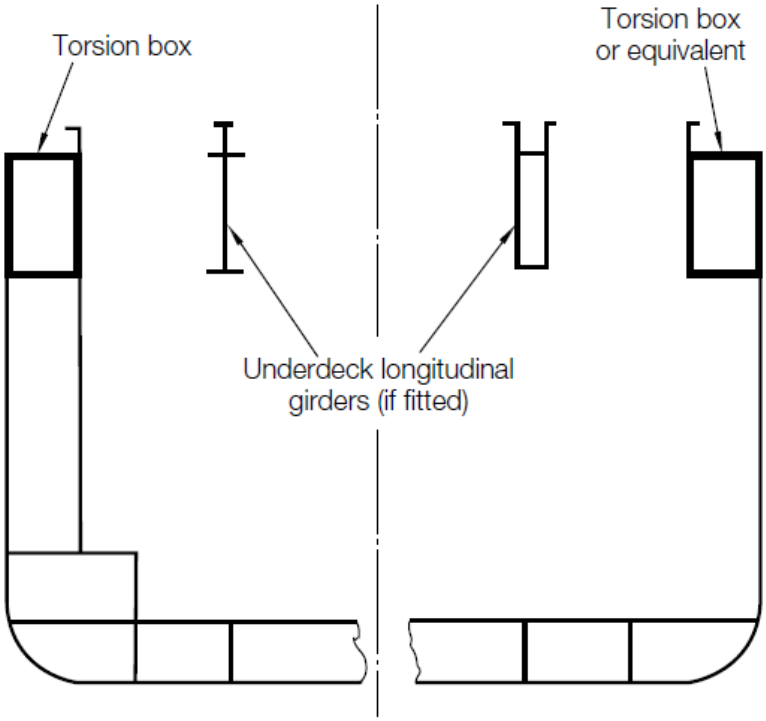
1. 1. 1 A **container ship** is defined as a ship designed exclusively for the carriage of containers in holds and on deck. Containers in holds are normally stowed within cellular guide systems.

1. 1. 2 The term ‘narrow side structures’ applies where the breadth of hatch opening exceeds 90 per cent of the breadth of the ship.

1. 1. 3 Other terms used to describe the various structural components of container ships are generally indicated in *ACSPlus FDA Guideline*, *Structural Detail Design Guide*.

1. 1. 4 Scantlings and arrangements of container ships are to be as required by Pt 4, Ch 1 General Cargo Ships, except as otherwise indicated in this Chapter.

Figure 8. 1. 1: Structural configuration



1. 2 Structural configuration

1. 2. 1 Figure 8. 1. 1: Structural configuration shows the typical structural configuration of a container ship covered by the requirements of this Chapter. The typical configuration includes:

a. An efficient torsion box girder or equivalent structure at the topsides comprising strength deck, side shell, inner skin and a second deck. The space within the torsion box is often utilised as an underdeck access passageway.
b. Single or double skin side construction with or without bilge box.
c. Double bottom.
d. Continuous or discontinuous hatch coamings.
e. Optional continuous deck girders to support hatch covers.

1. 2. 2 For container ships which do not conform to the above configuration, the application of this Chapter will be specially considered

1. 3 Class notations

1. 3. 1 In general, ships complying with the requirements of this Chapter will be eligible to be classed **100A1 Container Ship**.

1. 3. 2 'ACSPlus Guidelines' for the hull construction of ships are detailed in Pt 3, Ch 16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships and the associated notations and descriptive notes are given in Pt 1, Ch 2, 2.2 Character symbols.

1. 3. 3 The ACSPlus notations **SDA** (Structural Design Assessment) and subsequently **CM** (Construction Monitoring) are mandatory for container ships with a beam greater than 32 m or a length greater than 150 m or where the type, size and structural configuration demand, including container ships with narrow side structures, abnormal hull form or unusual structural configuration or complexity.

1. 3. 4 For large container ships, the effects of whipping and springing on the structural integrity are to be addressed. The ACSPlus notations **WDA** (Whipping Design Assessment) and **FDA SPR** (Springing Fatigue Assessment) are mandatory for ships that meet the application criteria specified in Pt 4, Ch 8, 14.3, Procedures for verification of structural response due to whipping, springing and fatigue, *See also* Table 8. 14. 1: Summary of direct calculation analysis requirements for container ships.

1. 3. 5 The ACSPlus notations **SDA, FDA, FDA SPR, WDA** may be applied on a voluntary basis. In which case all the requirements of the relevant procedures and supporting procedures are to be applied.

1. 4 Information required

1. 4. 1 In addition to the information and plans required by Pt 3, Ch 1, 5 Information required, the following are to be submitted:

a. Details of overlap arrangement of steps in decks and longitudinal bulkheads.
b. Details of outline stowage arrangement of containers.
c. Details of design container stack weights.
d. Details of cell guides and supporting structure indicating the position of guides relative to hatch corners, and attachment to structural members.
e. Details of reinforcement to structure in way of container corners/supports.
f. Details of reinforcement to structure in way of lashing bridges where fitted.
g. Details showing the location of all openings in decks within the cargo holds.
h. Details of longitudinal girders supporting hatch coamings where fitted.
i. Detailed arrangements for crack arrest design, *See* Pt 4, Ch 8, 2.3, Requirements for use of thick steel plates.

1. 5 Symbols and definitions

1. 5. 1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:
L, L_{pp}, B, D, T, V, C_b as defined in Pt 3, Ch 1, 6 Definitions

e = base of natural logarithms, 2.7183

k_L, k = higher tensile steel factor, *See* Pt 3, Ch 2, 1 Materials of construction

s = spacing of secondary stiffeners, in mm

s_1 = spacing of secondary stiffeners, but is not to be taken less than $470 + 1.67L$ mm

t = thickness of plating, in mm

L_1 = L but need not be taken greater than 190 m.

PART

4

CHAPTER **8** **Container Ships**

SECTION **2** **Materials**

2. 1 Materials

2. 1. 1 Materials are to comply with Pt 3, Ch 2 Materials.

2. 1. 2 Attention is drawn to the specific requirements for container ship hatch corners in Table 2. 2. 1: Buckling factors of safety, λ, Note 1 in Pt 3, Ch 2 Materials.

2. 2 Protection of steelwork

2. 2. 1 In addition to the requirements of Pt 3, Ch 2, 3 Corrosion protection the requirements of Pt 4, Ch 1, 2.2 Protection of steelwork 2.2.3 may also be applied.

2. 3 Requirements for use of thick steel plates

2. 3. 1 This Section provides the requirements for crack arrest design to reduce the risk of brittle fractures in container ships where thick steel plates are applied for longitudinal structural members within the cargo hold region.

2. 3. 2 This Section is to be applied to container ships where the steel plates for longitudinal structural members exceed a thickness of 50 mm but are not greater than 100 mm. Special consideration is required for plates with a thickness exceeding 100 mm.

2. 3. 3 This Section applies to plates having specified minimum yield strength of 355, 390 and 460 N/mm^2. Steels and weldments are to comply with the toughness requirements of Ch 3 Rolled Steel Plates, Strip, Sections and Bars, Ch 11 Approval of Welding Consumables and Ch 12 Welding Qualifications of Pt 2 Rules for the Manufacture, Testing and Certification of Materials.

2. 3. 4 The approach in this Section generally applies to the erection block-to-block joints. Appropriate measures are to be considered to prevent large scale fracture of the hull girder in anticipation of the following:

a. Crack initiation in the block-to-block butt weld joint in either the hatch side coaming or upper deck. Crack propagates along the butt weld joint without deviation.
b. Crack initiation in the block-to-block butt weld joint in either the hatch side coaming or upper deck. Crack propagates away from the butt weld joint running into base metal.
c. Crack initiation in any welded joint, for example in way of attachment welds, and deviates away from the butt weld joint running into base metal.

2. 3. 5 The detailed arrangements for crack arrest design are to be submitted for approval.

2. 3. 6 A number of measures are given in Table 8. 2. 1: Preventative measures to be used in design and construction for thick steel plates which are considered to be acceptable means of addressing the cases given in Pt 4, Ch 8, 2.3,, Requirements for use of thick steel plates 2.3.4. A range of thicknesses is shown for the different strength grades of steel. Where the maximum as-built

thickness of the hatch coaming top plate and side plate falls within this range, measures are to be selected as shown in the Table. If the as-built thickness of the hatch coaming top plate and side plate is below the values contained in the Table, then additional measures are not necessary regardless of the thickness and yield strength of the upper deck plating. The application of these measures is described in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.7 to Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.11.

2. 3. 7 Where Measure 1 is required in Table 8. 2. 1: Preventative measures to be used in design and construction for thick steel plates, 100 per cent ultrasonic testing in accordance with Ch 13, 2.12 Non-destructive examination of welds of Pt 2 Rules for the Manufacture, Testing and Certification of Materials, both application and acceptance criteria, is to be carried out on all block-to-block butt joints of all upper flange longitudinal structural members in the cargo hold region. Upper flange longitudinal structural members include the topmost strakes of the inner hull/bulkhead, the sheer strake, main deck, coaming plate, coaming top plate, and all attached longitudinal stiffeners. These members are defined in Figure 8. 2. 1: Upper flange longitudinal structural members.

Table 8. 2. 1: Preventative measures to be used in design and construction for thick steel plates

Nominal yield strength (N/mm^2)	Thickness of hatch coaming plating *See* Note 3 (mm)	Measure, *See* Note 1				
		1	2	3	4 *See* Note 2	5 *See* Note 2
355	50<t≤85	Not required	Not required	Not required	Not required	Not required
	85<t≤100	Required	Not required	Not required	Not required	Not required
390	50<t≤85	Required	Not required	Not required	Not required	Not required
	85<t≤100	Required	Required	Required	Not required	Not required
460	50 <t≤85	Required	Required	Required	Not required	Not required
	85<t≤100	Required	Required	Required	Not required	Not required

Key to measures:

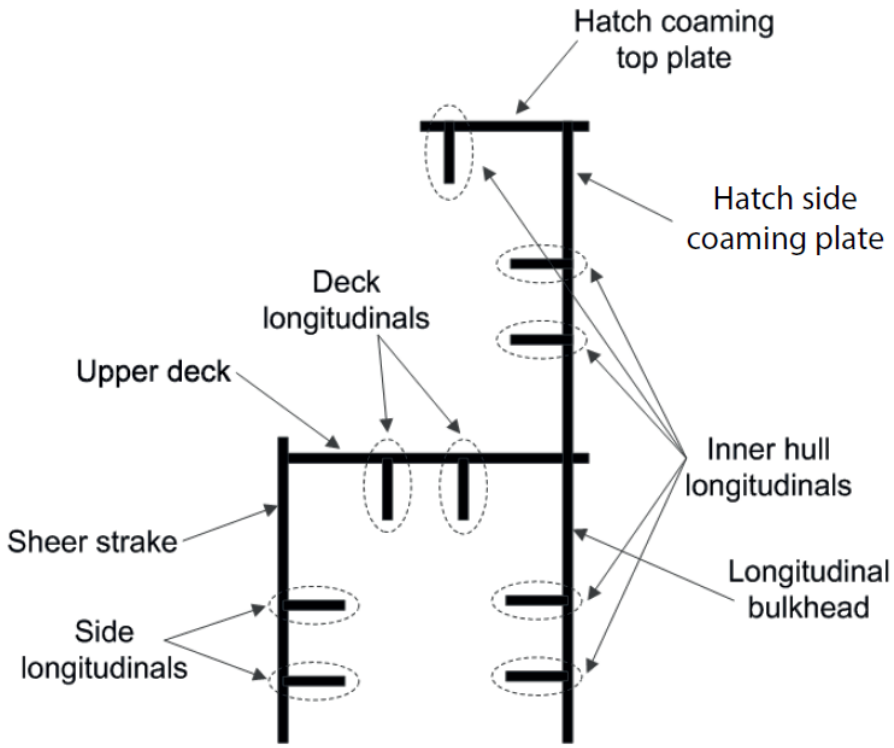
Measure 1:	NDE during construction on all upper flange longitudinal members, *See* Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.7
Measure 2:	Block shift, crack arrest insert plates, crack arrest holes and enhanced NDE, *See* Pt 4, Ch 8, 2.3,, Requirements for use of thick steel plates 2.3.8
Measure 3:	Crack arrest steel for the upper deck, *See* Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.9
Measure 4:	Periodic in-service NDE, *See* Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.10
Measure 5:	Tough welds, *See* Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.11

Note 1. Measures are to be applied where 'Required' is shown.

Note 2. Measures 4 and 5 are only required where enhanced NDE during construction has been applied as part of Measure 2

Note 3. Hatch coaming plating includes side plating and top plating

Figure 8. 2. 1: Upper flange longitudinal structural members



2. 3. 8 Where Measure 2 is required in Table 8. 2. 1: Preventative measures to be used in design and construction for thick steel plates, the following are considered to be acceptable examples of brittle crack arrest design for the case given in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.4.a:

a. Where the block-to-block butt welds of the hatch side coaming plate and those of the upper deck are staggered, this offset is to be greater than or equal to 300 mm. This offset distance is defined in Figure 8. 2. 2: Minimum offset between block-to-block butt welds of the hatch side coaming and those of the upper deck staggered. Brittle crack arrest steel, as defined in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.12, is to be provided for the hatch side coaming plate.

b. Where crack arrest holes are provided in way of the block-to-block butt welds at the region where the hatch side coaming weld meets the deck weld, *See* Figure 8. 2. 3: Crack arrest hole in way of the block-to-block butt weld at the region where hatch side coaming weld meets the deck weld, the corners of the crack arrest holes located where the hatch side coaming joints meet the deck weld are to be specially assessed for fatigue strength. The fatigue strength is also to be assessed at the location where the block-to-block butt weld intersects the crack arrest hole. Brittle crack arrest steel, as defined in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.12, is to be provided for the hatch side coaming plate.

c. Where higher crack arrest steel insert plates such as SUF (Surface Layer with Ultras-Fine grain) steel or equivalent, or weld metal inserts with high crack arrest toughness properties

are provided in way of the block-to-block butt welds at the region where hatch side coaming weld meets the deck weld. Brittle crack arrest steel, as defined in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.12, is to be provided for the hatch side coaming plate.

d. As an alternative to the provision of crack arrest steel for the hatch coaming side plate stipulated in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.8.a, Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.8.b and Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.8.c, enhanced non-destructive examination can be carried out in association with stricter acceptance criteria. The acceptance criteria are to be determined through the means of an engineering critical assessment (ECA) to be carried out in accordance with Chapter 2 of the *ACSPlus Guidelines for the Use of Enhanced NDE in Container Ships*,and the enhanced NDE is to be carried out in accordance with Chapter 3 of the *ACSPlus Guideline for the Use of Enhanced NDE in Container Ships*. Other mechanical means of crack arrest such as block shift, crack arrest insert plates and crack arrest holes are still to be fitted. This approach also requires a programme of non-destructive testing during the lifetime of the ship, *See* Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.10. The weld toughness of the block to block butt welds of the hatch coaming side plate, hatch coaming top plate and upper deck is to be as required by Pt 4, Ch 8, 2.3,, Requirements for use of thick steel plates 2.3.8 and EGW welding is not permitted.

Figure 8. 2. 2: Minimum offset between block-to-block butt welds of the hatch side coaming and those of the upper deck staggered

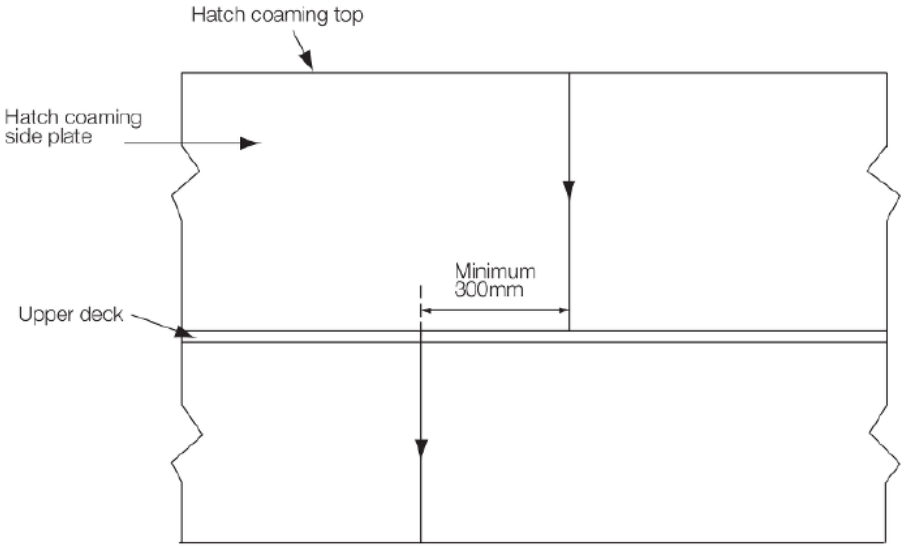


Figure 8. 2. 3: Crack arrest hole in way of the block-to-block butt weld at the region where hatch side coaming weld meets the deck weld

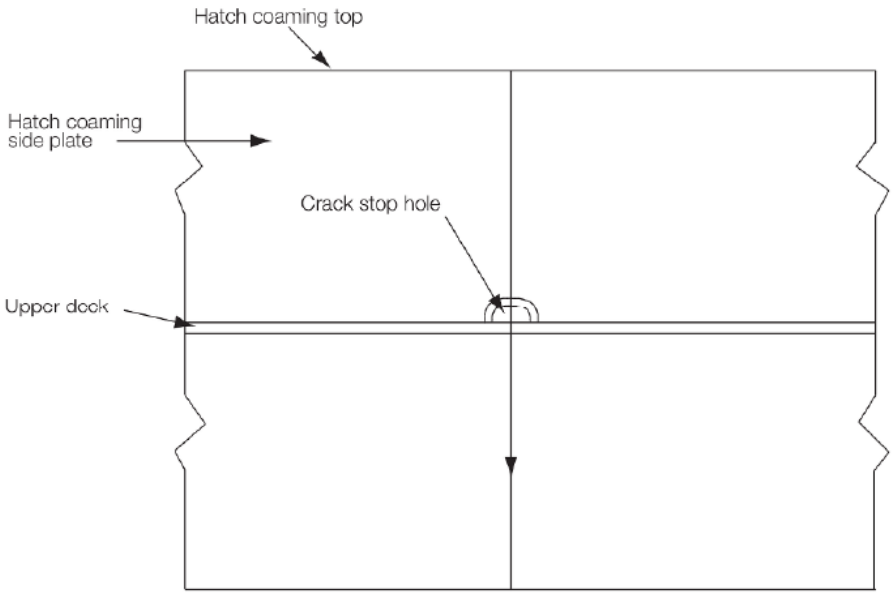


2. 3. 9 Where Measure 3 is required in Table 8. 2. 1: Preventative measures to be used in design and construction for thick steel plates for the cases given in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.4.b and Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.4.c, the use of brittle crack arrest steel, as defined in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.12, for the upper deck along the cargo hold region is considered to be an acceptable means to arrest a brittle crack initiating from the coaming side and top plate and propagating into the structure below.

2. 3. 10 Where Measure 4 is required in Table 8. 2. 1: Preventative measures to be used in design and construction for thick steel plates, periodic NDE during service is to be carried out in accordance with Chapter 3 of the *ACSPlus Guideline for the Use of Enhanced NDE in Container Ships*.

2. 3. 11 Where Measure 5 is required in Table 8. 2. 1: Preventative measures to be used in design and construction for thick steel plates, the block to block butt welds of the hatch coaming side plate, hatch coaming top plate and upper deck are to have a minimum crack tip opening displacement (CTOD) value of 0.18 mm. The CTOD tests to confirm the CTOD value are to be carried out to the satisfaction of ACS.

2. 3. 12 Brittle crack arrest steel is to be in accordance with Pt 2 Rules for the Manufacture, Testing and Certification of Materials, Ch 3, 3 Higher strength steels for ship and other structural applications.

2. 3. 13 Where higher crack arrest steel or weld inserts are proposed, as given in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates 2.3.8.c, the specific properties or grades of material are to be agreed with ACS.

PART

4

CHAPTER **8** **Container Ships**

SECTION **3** **Longitudinal strength**

3. 1 General

3. 1. 1 Longitudinal strength calculations are to be carried out in accordance with Pt 4, Ch 8, 3.2 Longitudinal strength and Pt 4, Ch 8, 3.3 Combined longitudinal and torsional strength 3.3.1

3. 1. 2 Alternatively the values and distributions of wave induced loads may be derived by direct calculation in accordance with ACSPlus *Guidance Notes on the Assessment of Global Design Loads of Large Container Ships and Other Ships Prone to Whipping and Springing.*

3. 1. 3 For ships of abnormal hull form, or for ships of unusual structural configuration or complexity, the values and distributions of wave induced loads are to be agreed with ACS. ACS may decide to mandate the application of the ACSPlus notations; **SDA, FDA, FDA SPR** or **WDA**.

3. 2 Longitudinal strength

3. 2. 1 Longitudinal strength calculations are to be made in accordance with the requirements of Pt 4, Ch 8, 16 Longitudinal strength calculations and the additional notes contained in this Section and Pt 4, Ch 8, 14 Direct calculation.

3. 2. 2 The wave vertical bending moments and shear forces given in Pt 4, Ch 8, 16 Longitudinal strength calculations apply to mono-hull displacement ships in unrestricted service and are limited to ships meeting the following criteria:

a. $65\ \text{m} \leq \text{L} \leq 500\ \text{m}$
b. $5 \leq \text{L/B} \leq 9$
c. $2 \leq \text{B/T} \leq 6$
d. $0.55 \leq C_{\text{B}} \leq 0.9$

For ships which do not meet the above criteria, the wave vertical bending moments and shear forces are to be specially considered.

3. 2. 3 In order to determine the local reduction factors, F_{D} and F_{B}, longitudinal strength calculations are to be made in accordance with the requirements of Pt 3, Ch 4 Longitudinal Strength where M_{w} is to be calculated in accordance with Pt 4, Ch 8, 16.6, Design vertical wave bending moments.

3. 2. 4 For operation in sheltered water or short voyages, *See* Pt 3, Ch 4, 5.2 Design vertical wave bending moments 5.2.3 and Pt 3, Ch 4, 5.4 Minimum hull section modulus 5.4.3 where M_{w} is to be calculated in accordance with Pt 4, Ch 8, 16.6, Design vertical wave bending moments.

3. 3 Combined longitudinal and torsional strength

3. 3. 1 The strength of the ship to resist a combination of longitudinal and torsional loads is to be determined in accordance with Pt 4, Ch 8, 15.1 Application.

PART

4

CHAPTER 8 Container Ships

SECTION 4 Deck structure

4. 1 General

4. 1. 1 The requirements of Pt 4, Ch 1, 4 Deck structure are to be complied with as modified by this Section.

4. 1. 2 The strength deck is to be longitudinally framed throughout the region of container holds for ships where$L \geq 100$m.

4. 1. 3 Lower decks/side stringers are to be efficiently scarfed into the machinery space, and the fore end and aft end structure.

4. 1. 4 The *ACSPlus FDA Guideline*, *Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of deck structures.

4. 2 Primary supporting structure

4. 2. 1 Where decks form part of the primary support structures described in Pt 4, Ch 8, 6.2 Side shell primary supporting structure and Pt 4, Ch 8, 9.2 Transverse watertight/non-watertight bulkhead primary supporting structure the scantlings of the decks are to be verified by direct calculation procedures in accordance with Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings.

4. 3 Deck plating and stiffeners

4. 3. 1 Strength/weather deck scantlings outside the line of hatch openings are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength and Pt 4, Ch 8, 4.2 Primary supporting structure, and are to be not less than required by Pt 4, Ch 1, 4.2 Deck plating and Pt 4, Ch 1, 4.3 Deck stiffening.

4. 3. 2 Within the cargo holds, strength/weather/second deck scantlings inside the line of hatch openings are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength, Pt 4, Ch 8, 4.2 Primary supporting structure and Pt 4, Ch 8, 4.4, Cross decks.

4. 3. 3 Other deck scantlings are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength, Pt 4, Ch 8, 4.2 Primary supporting structure and Pt 4, Ch 1, 4 Deck structure as appropriate.

4. 4 Cross decks

4. 4. 1 The width and scantlings of cross-deck strips are to satisfy the requirements of Pt 4, Ch 8, 4.2 Primary supporting structure. The thickness, t, of cross-deck strips is to comply with the requirements of Table 8. 4. 1: Cross deck plating.

Table 8. 4. 1: Cross deck plating

Location	Minimum thickness, in mm
At strength deck	The greater of the following: (a) $t = 0.012\ s_1$ (b) $t = 10 + 0.01L_1$
At second deck	The greater of the following: (a) $t = 0.012\ s_1$ but need not exceed 12 (b) $t = 8.0$
Symbols	
s_1 and L_1 as defined in Pt 4, Ch 8, 1.5 Symbols and definitions 1.5.1.	

4. 4. 2 The thickness may require to be increased locally in way of access openings.

4. 4. 3 Where the difference between the thickness of plating inside and outside the line of main hatchway openings exceeds 25 mm, a single transition plate is to be fitted at the end of the cross deck strip. The thickness of the transition plate is to be equal to the mean of the adjacent plate thicknesses.

4. 4. 4 The scantlings of cross-deck stiffeners are to comply with Pt 4, Ch 1, 4 Deck structure.

4. 4. 5 For initial design purposes the width of the cross deck strips, w, forming a transverse bulkhead top box (or equivalent) can be estimated according to the following formula:

w = $32.5B + 400$, or 1000mm, whichever is the greater

where B is given in Pt 4, Ch 8, 1.5 Symbols and definitions 1.5.1.

4. 5 Deck openings

4. 5. 1 The corners of main hatchway openings are generally to be rounded. However, corners with negative radii, or parabolic or elliptic profiles will be specially considered.

4. 5. 2 The design of hold corners including deck thickness and corner profile is to comply with either Pt 4, Ch 8, 4.5 Deck openings 4.5.3 or Pt 4, Ch 8, 4.5 Deck openings 4.5.4.

4. 5. 3 The design of hatch corners is to be verified by direct calculations, *See* Pt 4, Ch 8, 14.1 Procedures for calculation of combined longitudinal and torsional strength 14.1.1.

4. 5. 4 Alternatively, where the design of hatch corners has not been verified by direct calculations:

a. The outboard radius of main hatchway openings at strength deck level is, in general, to be not less than 35 per cent of the width of the cross-deck strip indicated in Pt 4, Ch 8, 4.4 Cross decks 4.4.5 with a minimum of 300 mm.

b. The radius of the hatch corners of the main hatchway openings adjacent to the engine room is to be made as large as practicable, with a radius of approximately $40B$ mm.

c. Insert plates at main hatch corners are to have an increased thickness above the adjacent plating outside the line of hatchways of 15 per cent in way of the container holds, and 25 per cent in container holds at engine room bulkheads. The minimum increase is to be not less than 4.0 mm, nor need exceed 7.0 mm, and the minimum fore and aft extent is to be 1.0 m from the edge of the openings.

4. 6 Local reinforcement

4. 6. 1 Attention is to be paid to structural continuity, and abrupt changes of shape, section or plate thickness are to be avoided, particularly in highly stressed areas. Arrangements in way of openings are to be such as to minimise the creation of stress concentrations.

4. 6. 2 In general, large access openings are not to be arranged in the strength deck outside the line of main hatchways in the region of container holds.

4. 6. 3 Small openings, such as those for ventilation pipes or scuppers, are to be kept clear of hold corners, ends of longitudinal hatch coamings, ends of cross-deck strips and other critical locations.

4. 7 Support for container corner seats

4. 7. 1 In general, local stiffening is to be fitted under seats for container supports.

4. 7. 2 The design of attachments to the strength deck is to minimise the effects of stress concentration, and consideration is to be given to the strength and grade of welding consumable used, *See*, Ch 13, 2.2 Welding consumables 2.2.2 of Pt 2 Rules for the Manufacture, Testing and Certification of Materials.

4. 7. 3 The strength of support arrangements is to be verified in accordance with Pt 3, Ch 14, 4 Ship structure.

4. 7. 4 Doubler plates are not to be utilised in connections subject to tensile loads.

PART

4

CHAPTER **8** **Container Ships**

SECTION **5** **Shell envelope plating**

5. 1 General

5. 1. 1 The requirements of Pt 4, Ch 1, 5 Shell envelope plating are to be applied, together with the requirements of this Section.

5. 1. 2 The bottom shell is, in general, to be longitudinally framed for ships where L>=100 m.

5. 1. 3 The side shell may be longitudinal or transversely framed, except in way of the topside torsion box which is, in general, to be longitudinally framed.

5. 2 Bottom shell and bilge

5. 2. 1 The thickness of the bottom shell plating is to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength and Pt 4, Ch 8, 7.2 Double bottom primary supporting structure and is to be not less than required by Pt 4, Ch 1, 5.3 Bottom shell and bilge.

5. 2. 2 In regions where transverse framing is adopted, particularly towards the end of the ship, the buckling stability of the plating will be specially considered.

5. 3 Side shell and sheerstrake

5. 3. 1 The thickness of the side shell and sheerstrake plating is to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength and Pt 4, Ch 8, 6.2 Side shell primary supporting structure and is to be not less than required by Pt 4, Ch 1, 5.4 Side shell.

5. 3. 2 At positions where high shear forces are present, local increases in thickness may be required.

5. 3. 3 The difference in thickness between the sheerstrake and shell plating below is not to exceed 25 mm.

PART

4

CHAPTER **8** **Container Ships**

SECTION **6** **Shell envelope framing**

6. 1 General

6. 1. 1 The requirements of Pt 4, Ch 1, 6 Shell envelope framing are to be applied, together with the requirements of this Section.

6. 1. 2 The *ACSPlus FDA Guideline*, *Structural Detail Design Guide (SDDG)* indicates recommended examples of configurations for end connections of shell envelope longitudinals.

6. 2 Side shell primary supporting structure

6. 2. 1 A primary supporting structure for side shell envelope framing is to be provided of either single or double skin construction. This normally consists of a combination of vertical transverse webs and horizontal side stringers/decks.

6. 2. 2 Transverse webs supporting side shell envelope framing are to be arranged in line with the floors in the double bottom to ensure continuity of transverse strength.

6. 2. 3 The scantlings of double skin primary structure, including thickness of side shell envelope plating, are to be verified by direct calculations in accordance with Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings.

6. 2. 4 The scantlings of single skin primary structure are to comply with Pt 4, Ch 1, 6.4 Primary supporting structure. Alternatively the scantlings are to be verified by direct calculations in accordance with Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings.

6. 3 Side stringers in double skin construction

6. 3. 1 The scantlings of side stringers are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength, Pt 4, Ch 8, 6.2 Side shell primary supporting structure and Pt 4, Ch 8, 6.5 Minimum thickness of transverse webs/side stringers in double skin construction.

6. 3. 2 In addition, the scantlings of watertight side stringers are to satisfy the requirements of Pt 4, Ch 1, 9 Bulkheads.

6. 4 Transverse webs in double skin construction

6. 4. 1 The scantlings of transverse webs are to satisfy the requirements of Pt 4, Ch 8, 6.2 Side shell primary supporting structure and Pt 4, Ch 8, 6.5 Minimum thickness of transverse webs/side stringers in double skin construction.

6. 4. 2 Transverse webs are to be efficiently stiffened, and the thickness increased locally where necessary on account of high shear stress.

6. 4. 3 Where, towards the end of the ship, the width of transverse webs reduces from that assumed in the direct calculations, the thickness may require to be increased locally.

6. 5 Minimum thickness of transverse webs/side stringers in double skin construction

6. 5. 1 Transverse webs and side stringers are to have a thickness, t, not less than:

$t = 7.5 + 0.015L$ or 9 mm, whichever is the lesser.

PART

4

CHAPTER **8** **Container Ships**

SECTION **7** **Double bottom structure**

7. 1 General

7. 1. 1 The double bottom is, in general, to be longitudinally framed for ships where $L \geq 100$ m.

7. 1. 2 Longitudinally framed double bottoms are to comply with Pt 4, Ch 1, 8.2, General and the contents of this Section.

7. 1. 3 Transversely framed double bottoms are to comply with Pt 4, Ch 1, 8 Double bottom structure.

7. 1. 4 The *ACSPlus FDA Guideline*, *Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of the double bottom.

7. 2 Double bottom primary supporting structure

7. 2. 1 The primary supporting structure formed by the double bottom comprises inner bottom plating, floors, longitudinal girders and bottom shell plating.

7. 2. 2 The scantlings of this primary structure are to be verified by direct calculations in accordance with Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings.

7. 2. 3 Where, towards the end of the ship, the depth of double bottom structure webs is reduced from that assumed in the direct calculations, the thickness may require to be increased locally.

7. 2. 4 Where mid-hold or quarter-length-of-hold supports for the double bottom structure are arranged, these are to take the form of an efficiently stiffened transverse box or open section structure, *See* Pt 4, Ch 8, 9.4 Transverse non-watertight mid-hold bulkheads.

7. 3 Inner bottom plating and stiffening

7. 3. 1 The scantlings of the inner bottom are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength and Pt 4, Ch 8, 7.2 Double bottom primary supporting structure and are to be not less than required by Pt 4, Ch 1, 8.4, Inner bottom plating and stiffening as modified by this sub-Section.

7. 3. 2 The requirements of Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening 8.4.2 need not be applied to container ships.

7. 3. 3 In applying Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening 8.4.5, the Rule value of bottom longitudinals may be calculated assuming $F_{sb} = 1.05$.

7. 4 Girders

7. 4. 1 Girders are, in general, to be arranged under container corner seatings.

7. 4. 2 The scantlings of watertight centreline/side girders are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength and Pt 4, Ch 8, 7.2 Double bottom primary supporting structure and are to be not less than required by Pt 4, Ch 1, 8.3,, Girders.

7. 4. 3 The scantlings of non-watertight centreline/side girders are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength and Pt 4, Ch 8, 7.2 Double bottom primary supporting structure.

7. 4. 4 For double bottoms having a depth greater than 1.6 m, additional longitudinal stiffening may have to be introduced in order to ensure the buckling stability of the girders.

7. 5 Floors

7. 5. 1 Plate floors are to be fitted under watertight bulkheads, non-watertight bulkheads/mid-hold supports, under container corners at hold quarter length locations and at other locations to ensure that the maximum spacing does not, in general, exceed 3.8 m. Proposals for floor spacings greater than 3.8 m are to be supported by direct calculations agreed with ACS.

7. 5. 2 The scantlings of watertight floors are to satisfy the requirements of Pt 4, Ch 8, 7.2 Double bottom primary supporting structure and are to be not less than required by Pt 4, Ch 1, 8.5, Floors.

7. 5. 3 The thickness, t, of non-watertight floors is to satisfy the requirements of 7.2 and is to be not less than:

$t = 6 + 0.03L$ or 12 mm, whichever is the lesser.

7. 5. 4 Non-watertight floor stiffeners are to be fitted at approximately the same spacing as the bottom longitudinals. The scantlings are to satisfy the requirements of Pt 3, Ch 10 Welding and Structural Details.

7. 5. 5 Docking brackets, or equivalent, are to be fitted in accordance with Pt 4, Ch 1, 8.5 Floors 8.5.3.

7. 6 Support for containers

7. 6. 1 In general, local stiffening is to be fitted to double bottom floors or girders under container corner seatings in order to ensure the effective transmission of load.

7. 6. 2 Such stiffening normally takes the form of additional brackets with suitable extensions to adjacent stiffening members. The scantlings of the adjacent stiffening members may require to be increased depending on the arrangements proposed.

7. 6. 3 Attention is drawn to the benefit of direct support in order to minimise the effect of eccentric loading on the support brackets.

7. 6. 4 The scantlings of these arrangements may be determined utilising simple beam models to verify the shear and bending strength. Based on static container loads, the stresses induced in the structure are not to exceed the permissible values stated in Table 8. 7. 1: Permissible stress values. Alternative more complex assessment methods are to be agreed with ACS.

7. 6. 5 In general, doubling members or equivalent structures are to be attached to the inner bottom to distribute the load from container corners into the supporting structure. Doubler plates are to have well-rounded corners.

Table 8. 7. 1: Permissible stress values

	Permissible stress, N/mm^2
Normal stress (bending, tension, compression)	$0.67\sigma_o$
Shear stress	$0.4\sigma_o$

Combined stress	$0.86\sigma_o$
Symbols	
σ_o = specified minimum yield stress, in N/mm^2	

PART

4

CHAPTER **8** **Container Ships**

SECTION **8** **Longitudinal bulkheads**

8. 1 General

8. 1. 1 The requirements of Pt 4, Ch 1, 9 Bulkheads are to be applied, together with the requirements of this Section.

8. 1. 2 Longitudinal bulkheads may be transversely or longitudinally framed, except in way of the topside torsion box which is, in general, to be longitudinally framed.

8. 1. 3 Longitudinal bulkheads are to be maintained continuous in way of the machinery space where this is situated between container holds and as far forward and aft as practicable.

8. 1. 4 The scarfing arrangements in way of the steps are to be sufficient to ensure an efficient overlap of the inner skin bulkheads.

8. 1. 5 The *ACSPlus FDA Guideline*, *Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of the double side skin structures.

8. 2 Side shell primary supporting structure

8. 2. 1 Where the longitudinal bulkhead forms the inner skin of the side shell primary supporting structure the thickness of longitudinal bulkhead plating is to be verified by direct calculations as described in Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings.

8. 3 Plating and stiffeners

8. 3. 1 The scantlings of longitudinal bulkheads are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength and Pt 4, Ch 8, 8.2 Side shell primary supporting structure and are to be not less than required by Pt 4, Ch 1, 9 Bulkheads.

8. 3. 2 Openings in the upper parts of longitudinal bulkheads are to have shapes which minimise stress concentrations and are to be framed to ensure adequate buckling stability.

8. 3. 3 The difference in thickness between the top strake and the bulkhead plating below is not to exceed 25 mm.

8. 4 Support for container corner seats

8. 4. 1 Where direct support for 20 ft containers by the longitudinal bulkhead is required at the mid length of a cell arranged for 40 ft containers, adequate stiffening is to be fitted in order to ensure the effective transmission of load.

8. 4. 2 The strength of these arrangements is to be verified in accordance with Pt 3, Ch 14, 4 Ship structure.

PART

4

CHAPTER **8** **Container Ships**

SECTION **9** **Transverse bulkheads**

9. 1 General

9. 1. 1 The requirements of Pt 4, Ch 1, 9 Bulkheads are to be applied, together with the requirements of this Section.

9. 1. 2 Watertight transverse bulkheads may be vertically or horizontally framed.

9. 1. 3 The *ACSPlus FDA Guideline*, *Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of transverse bulkhead structures.

9. 2 Transverse watertight/non-watertight bulkhead primary supporting structure

9. 2. 1 The primary supporting structure of transverse bulkheads normally comprises a grillage of vertical webs and horizontal stringers/decks.

9. 2. 2 Vertical webs are to be fitted in line with double bottom girders.

9. 2. 3 The scantlings of transverse bulkhead primary structure including bulkhead plating are to be verified by direct calculations as described in Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings.

9. 2. 4 The scantlings are to be adequate for the static and dynamic loads imposed on the structure by the container stowage arrangements.

9. 3 Transverse watertight bulkheads

9. 3. 1 The thickness of the transverse bulkhead plating is to satisfy the requirements of Pt 4, Ch 8, 9.2 Transverse watertight/non-watertight bulkhead primary supporting structure and is to be not less than required by Pt 4, Ch 1, 9.2, Watertight and deep tank bulkheads for watertight bulkheads.

9. 3. 2 In general, a transverse box structure or equivalent is to be arranged at upper deck level.

9. 3. 3 In certain cases, a transverse box structure at the inner bottom may also be required.

9. 4 Transverse non-watertight mid-hold bulkheads

9. 4. 1 Where non-watertight bulkheads are arranged in conjunction with the double bottom mid-hold support, a transverse box is to be arranged at strength deck level.

9. 4. 2 Non-watertight bulkhead scantlings are to satisfy the requirements of Pt 4, Ch 8, 9.2 Transverse watertight/non-watertight bulkhead primary supporting structure and Pt 4, Ch 1, 4.4, Deck supporting structure for a non-watertight pillar bulkhead.

PART

4

CHAPTER **8 Container Ships**

SECTION **10 Hatch coamings and support for hatch covers**

10. 1 Hatch coamings

10. 1. 1 Scantlings of hatch coamings are to comply with Pt 3, Ch 11, 5 Hatch coamings in addition to the requirements of this Section.

10. 1. 2 Continuous side coamings are to be effectively scarfed into the deckhouse structure or gradually tapered at ends, as applicable. The scantlings are also to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength.

10. 1. 3 The scantlings of transverse hatch coamings forming part of a transverse bulkhead top box are also to satisfy the requirements of Pt 4, Ch 8, 9.2 Transverse watertight/non-watertight bulkhead primary supporting structure.

10. 1. 4 The *ACSPlus FDA Guideline*, *Structural Detail Design Guide (SDDG)*, indicates examples of recommended structural design configurations in critical areas of the hatch side coamings.

10. 2 Support for inboard edges of hatch covers by girders

10. 2. 1 Where longitudinal underdeck girders are fitted at deck level to support the hatch covers the requirements of this sub-Section are to be complied with.

10. 2. 2 The girders may take the form of open or closed box sections and these should align with webs on the transverse bulkheads to form a continuous ring structure.

10. 2. 3 The girders are, in general, to be continuous throughout the container hold area, including the engine room where this is situated between container holds.

10. 2. 4 Special attention is to be given to the intersection of the girders with transverse box girders and the integration into the fore end, aft end and machinery space structures.

10. 2. 5 Where girders are integrated into the cross-deck strips, inserts plates with integral gussets are to be incorporated. The inserts are to have a thickness not less than that of the girder top and bottom plates, as appropriate. The radius of main hatchway openings in way of ends of hatch girders at upper deck level is, in general, to be not less than 20 per cent of the width of the cross-deck strip indicated inPt 4, Ch 8, 4.4 Cross decks 4.4.5 with a minimum of 250 mm.

10. 2. 6 Scantlings of girders are to comply with the requirements of Pt 4, Ch 1, 4 Deck structure.

10. 3 Support for hatch cover fittings

10. 3. 1 The width of hatch coaming top plates is to be suitable to accommodate the hatch covers and associated fittings.

10. 3. 2 Local stiffening is to be fitted below hatch cover supporting devices and in some cases the thickness of the coaming in way may need to be increased, (*See also* Pt 3, Ch 11, 4.2 Steel covers − Clamped and gasketed 4.2.3 and Pt 3, Ch 11, 5.2 Construction 5.2.12).

PART

4

CHAPTER **8 Container Ships**

SECTION **11 Hatch covers**

11. 1 General

11. 1. 1 The requirements of Pt 3, Ch 11 Closing Arrangements for Shell, Deck and Bulkheads are to be complied with in addition to the requirements of this Section.

11. 1. 2 The primary structure of hatch covers normally consists of an arrangement of deep beams and girders including hatch cover top plating.

11. 1. 3 For hatch covers subjected to point loads from containers, the primary structure scantlings are to be verified by direct calculation in accordance with Pt 4, Ch 8, 11.2, Direct calculations.

11. 1. 4 Local stiffening is to be arranged below container corners. The substructures of container foundations are to be designed for cargo and container loads according to Pt 3, Ch 11, 2.3, Load model, applying the permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection 2.4.1.

11. 2 Direct calculations

11. 2. 1 Direct calculations are to be based on 2D or 3D finite element analysis. Simplified boundary constraints may be applied in the modelling, provided this does not compromise the overall structural response.

11. 2. 2 The loads defined in Pt 4, Ch 8, 11.2 Direct calculations 11.2.3 and Pt 4, Ch 8, 11.2 Direct calculations 11.2.5 are to be applied where containers are stowed on the hatch cover.

11. 2. 3 The load P in kN, applied at each corner of a container stack, and resulting from heave and pitch (i.e. ship in upright condition) is to be determined as follows:

$$P = 9.81\frac{M}{4}(1 + a_v)$$

Where

a_v = acceleration addition according to Pt 3, Ch 11, 2.3 Load model 2.3.4

M = maximum designed mass of container stack, in t

11. 2. 4 The loads applied at each corner of a container stack, and resulting from heave, pitch, and the ship's rolling motion (i.e. ship in heeled condition) are to be determined as follows, *See* Figure 8. 11. 1: Forces due to container loads:

$$A_z = 9.81\frac{M}{2}(1 + a_v)\left(0.45 - 0.42\frac{h_m}{b}\right) \text{kN}$$

$$B_z = 9.81\frac{M}{2}(1 + a_v)\left(0.45 + 0.42\frac{h_m}{b}\right)\text{kN}$$

$$B_y = 2.4M\text{kN}$$

The loads due to single forces resulting from heave and pitch are also to be considered, as defined in Pt 3, Ch 11, 2.3 Load model 2.3.5, where

a_v = acceleration addition according to Pt 3, Ch 11, 2.3 Load model 2.3.4

b = distance between midpoints of foot points, in metres

h_m = designed height of centre of gravity of stack above hatch cover top, in metres, may be calculated as weighted mean value of the stack, where the centre of gravity of each tier is assumed to be located at the centre of each container,

= $\Sigma(z_i m_i)/M$

Z_i = distance from the hatch cover top to the centre of i^{th} container, in metres

m_i = mass of i^{th} container, in t

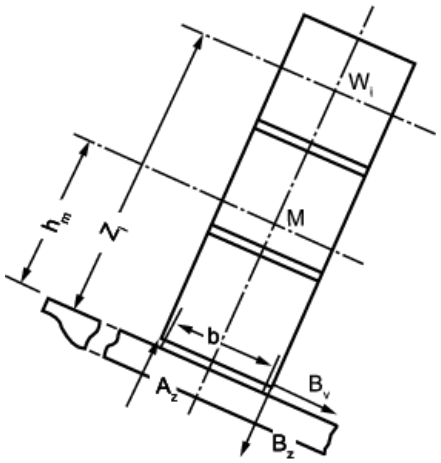
A_z, B_z = support forces in z-direction at the forward and aft stack corners, in kN

B_y = support force in y-direction at the forward and aft stack corners, in kN

M = maximum designed mass of container stack, in t.

When strength of the hatch cover structure is assessed by grillage analysis according to Pt 3, Ch 11, 2.11, Buckling strength of hatch cover structures h_m and z_i need to be taken above the hatch cover supports. Force By does not need to be considered in this case. Values of A_z and B_z applied for the assessment of hatch cover strength are to be shown in the drawings of the hatch covers. It is recommended that container loads as calculated above are considered as maximum load limits for foot point loads of container stacks in the calculations of cargo securing (container lashings).

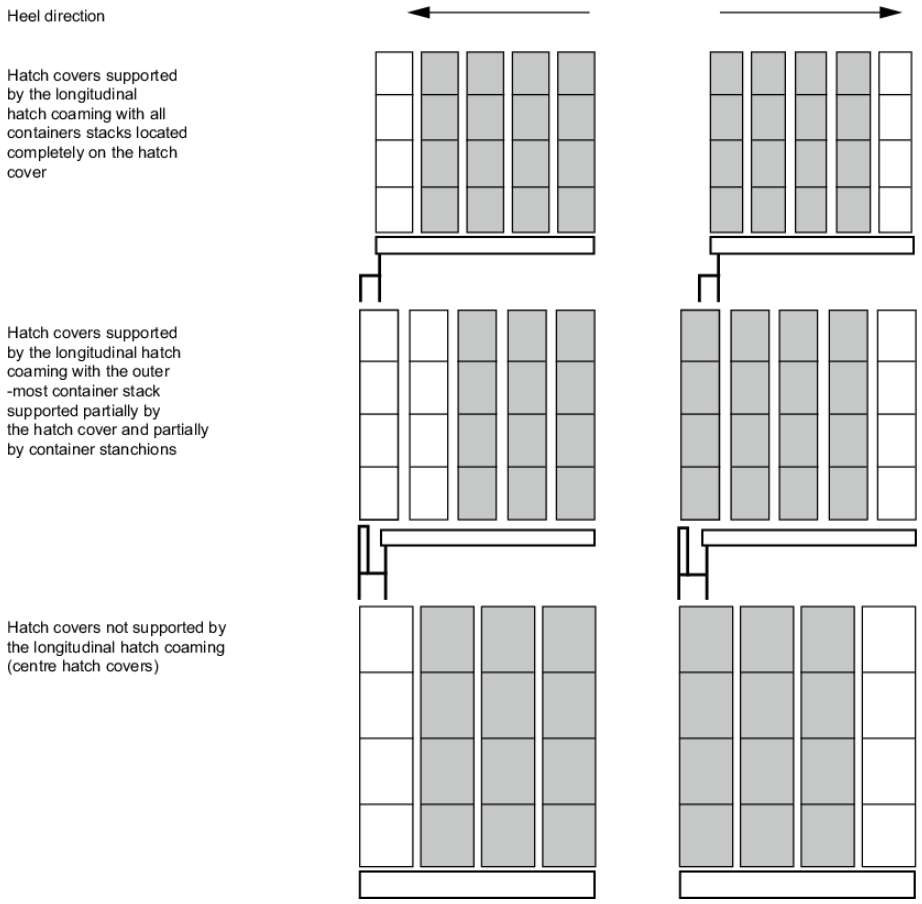
Figure 8. 11. 1: Forces due to container loads



11. 2. 5 Load cases defined in Pt 4, Ch 8, 11.2 Direct calculations 11.2.3 and Pt 4, Ch 8, 11.2 Direct calculations 11.2.4 are also to be considered for partial non-homogeneous loading which may occur in practice, e.g. where specified container stack places are empty. For each hatch cover, the heel directions as shown in are to be considered.

The load case *partial loading of container hatch covers* can be evaluated using a simplified approach, where the hatch cover is loaded without the outermost stacks that are located completely on the hatch cover. If there are additional stacks that are supported partially by the hatch cover and partially by container stanchions, then the loads from these stacks are also to be neglected. *See* Figure 8. 11. 2: Partial loading of a container hatch cover. In addition, in order to consider the maximum loads in the vertical hatch cover supports, the case where only the stack locations that are partially supported by the hatch cover and partially supported by container stanchions are left empty is to be assessed. Partial load cases where container stack positions other than those shown in Figure 8. 11. 2: Partial loading of a container hatch cover are left empty are to be considered.

Figure 8. 11. 2: Partial loading of a container hatch cover



11. 2. 6 The securing devices of hatch covers, onto which cargo is to be lashed, are to be designed for the lifting forces resulting from loads according to Pt 4, Ch 8, 11.2 Direct calculations 11.2.4, *See* Figure 8. 11. 2: Partial loading of a container hatch cover. Unsymmetrical loadings, which may occur in practice, are to be considered. Under these loadings, the equivalent stress in the securing devices is not to exceed:

$$\sigma_v = \frac{150}{k_1} \text{ in N/mm}^2$$

Where

$$k_1 = \left(\frac{235}{\sigma_o}\right)^e$$

σ_o = minimum yield stress, in N/mm^2, of the material but not to be taken greater than 0.7 σ_m

σ_m = minimum specified tensile strength, in N/mm^2, of the material

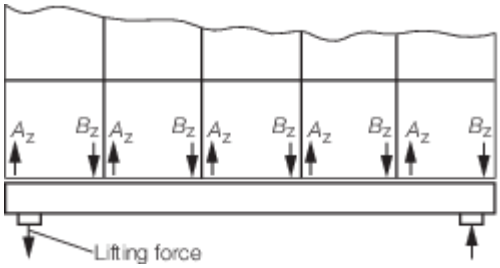
e = 0.75 for $\sigma_0 > 235$ N/mm^2

= 1.0 for $\sigma_0 \leq 235$ N/mm^2

Special consideration may be given for the omission of anti-lifting devices for non-weathertight hatch covers.

The partial load cases given in Pt 4, Ch 8, 11.2 Direct calculations 11.2.5 may not cover all unsymmetrical loadings, critical for hatch cover lifting.

Figure 8. 11. 3: Lifting forces at a hatch cover



11. 2. 7 Where hatch covers are arranged for carrying containers and mixed stowage is allowed, i.e. a 40' container stowed on top of two 20' containers, the foot point forces at the fore and aft end of the hatch cover are not to be higher than those resulting from the design stack weight for 40' containers, and the foot point forces at the middle of the cover are not to be higher than those resulting from the design stack weight for 20' containers. Particular attention is to be paid to the deflections of hatch covers. Furthermore, the possible contact of deflected hatch covers with in-hold cargo is to be considered.

11. 3 Dispensation of weathertight gaskets

11. 3. 1 For hatch covers of cargo holds solely for the transport of containers, upon request by the Owners and subject to compliance with the requirements of this Section, the fitting of weathertight gaskets according to Pt 3, Ch 11, 4.4 Packing material may be dispensed with.

11. 3. 2 The hatchway coamings are not to be less than 600 mm in height.

11. 3. 3 The exposed deck on which the hatch covers are located is situated above a depth H(x). H(x) is to be shown to comply with the following criteria:

H(x) = $\geq T_{fb} + f_b + h$, in metres

Where

T_{fb} = draught, in metres, corresponding to the assigned summer load line

f_b = minimum required freeboard, in metres, determined in accordance with ICLL Reg. 28 as modified by further regulations, as applicable

h = 4.6 m for $\frac{x}{L} \leq 0.75$

= 6.9 m for $\frac{x}{L} > 0.75$

11. 3. 4 Labyrinths, gutter bars or equivalents are to be fitted proximate to the edges of each panel in way of the coamings. The clear profile of these openings is to be kept as small as possible.

11. 3. 5 Where a hatch is covered by several hatch cover panels, the clear opening of the gap in between the panels is to be not wider than 50 mm.

11. 3. 6 The labyrinths and gaps between hatch cover panels shall be considered as unprotected openings with respect to the requirements of intact and damage stability calculations.

11. 3. 7 Bilge alarms are to be provided in each hold fitted with non-weathertight covers.

11. 3. 8 Furthermore, Chapter 3 of IMO *MSC/Circular.1087 – Guidelines for Partially Weathertight Hatchway Covers on board Containerships – (Adopted on 18 June 2003)* is to be referred to concerning the stowage and segregation of containers containing dangerous goods.

11. 4 Omission of hatch covers

11. 4. 1 Proposals for the omission of hatch covers will be specially considered. Such proposals are to include details, established by model tests or alternative means, of the quantity of water likely to ingress the cargo holds under the worst sea-going and weather conditions, and the means by which it is to be efficiently and safely discharged. The proposals will also require to be agreed by the National Authority in order that an exemption from the Load Line Convention requirements for hatch covers may be obtained.

PART

4

CHAPTER **8 Container Ships**

SECTION **12 Strengthening for wave impact loads**

12. 1 General

12. 1. 1 The scantlings of plating, stiffeners of forward and after portions of the hull are to be increased for protection against bow flare and wave impact pressure in accordance with Pt 4, Ch 2, 4.3, Strengthening for wave impact loads and Pt 4, Ch 2, 5.2, Strengthening for wave impact loads.

12. 1. 2 The scantlings of the primary support structure are to be adequate to resist the application of the Rule slamming load, P_{bf}, as defined in Pt 4, Ch 2, 4.2 Bow flare and wave impact pressures 4.2.1, over an area A_{sl}, as shown in Figure 2. 5. 2: Mean spacing between primary members, Scm, and the extents of wave impact pressure gbfh and gbfv in Pt 4, Ch 2 Ferries, Roll On-Roll Off Ships and Passenger Ships. The loaded area, A_{sl}, is a rectangle with a horizontal extent, g_{bfh}, and vertical extent, g_{bfv}, taken as follows:

$$g_{bfh} = 4 \text{ m}$$

$$g_{bfv} = \frac{8}{\sin \beta_p \sqrt{8K_{bf}}} \text{m}$$

Where

K_{bf} and β_p are given in Pt 4, Ch 2, 4.2 Bow flare and wave impact pressures 4.2.1.

12. 1. 3 To satisfy Pt 4, Ch 8, 12.1 General 12.1.2, the scantlings of web frames supporting side longitudinals or side stringers supporting transverse frames are to comply with the following:

a. Section modulus not to be less than:

$$Z = 3.75 f_{\text{rpc}} \gamma_Z k h_s q v l_e^2 \text{ cm}^3$$

b. Web area not to be less than:

$$A = 0.20 f_{rpc} \gamma_A k h_s q v l e^2 \text{ cm}^2$$

$$=$$ where

h_s = wave impact head, in metres, as defined in Pt 4, Ch 2, 4.3 Strengthening for wave impact loads 4.3.2.

$$=$$ and

$$f_{\text{rpc}} = \frac{P}{3.05 V_3}$$

$$= \left(\frac{H}{2.27 V_3}\right)$$

P = is the maximum propulsion shaft power in kW for which the machinery is classed, *See* Pt 5, Ch 1, 3 Operating conditions

H = is the maximum propulsion shaft power in HP for which the machinery is classed, *See* Pt 5, Ch 1, 3 Operating conditions

V = is the speed, in knots as defined in Pt 3, Ch 1, 6 Definitions

= γ_A and γ_Z are strength factors dependent on the load position:

= for $q < 1$: $\gamma_A = q^3 - 2q^2 + 2$ and $\gamma_Z = 3q^3 - 8q^2 + 6q$

= for $q = 1$: $\gamma_A = 1 \gamma_Z = 1$

q = $\frac{u}{l_e}$ but ≤ 1

= for web frames

u = is the minimum of g_{bfv} or l_e

v = is the minimum of g_{bfh} or S_{cm}

= for side stringers

u = is the minimum of g_{bfh} or l_e

v = is the minimum of g_{bfv} or S_{cm}

l_e = is the effective length of the primary member, in metres

S_{cm} = is the mean spacing between primary members along the plating, in metres, *See* Figure 2. 5. 2: Mean spacing between primary members, Scm, and the extents of wave impact pressure gbfh and gbfv in Pt 4, Ch 2 Ferries, Roll On-Roll Off Ships and Passenger Ships

= g_{bfv} and g_{bfh} are defined in Pt 4, Ch 8, 12.1 General 12.1.2

c. Web plating is to be adequately stiffened to resist shear buckling as required by Table 8. 12. 1: Critical shear buckling stress for web plating of primary support structure.

Table 8. 12. 1: Critical shear buckling stress for web plating of primary support structure

$\tau_A \leq \tau_{CRB}$

where

τ_{CRB} = τ_E N/mm^2 when $\tau_E \leq \frac{\tau_0}{2}$

τ_{CRB} = $\tau_0 \left(1 - \frac{\tau_0}{4\tau_E}\right)$ N/mm^2 when $\tau_E > \frac{\tau_0}{2}$

where

τ_E = $3.6\left[1.335 + \left(\frac{s}{1000S}\right)^2\right] E \left(\frac{\tau_p}{s}\right)^2$ N/mm^2

Symbols

τ_A	=	design shear stress for the web panel in N/mm^2 corresponding to the worst combination of application of the slamming load P_{bf} on the patch area A_{sl}
τ_{CRB}	=	critical buckling stress in shear, N/mm^2 corrected for yielding effects
τ_0	=	$\frac{\sigma_0}{\sqrt{3}}$
σ_o	=	specified minimum yield stress, in N/mm^2
τ_E	=	elastic critical buckling stress in shear, in N/mm^2
s	=	length of longer panel edge, in mm (generally the spacing of web stiffeners)
S	=	length of smaller panel edge, in metres (generally the web depth)
E	=	modulus of elasticity, in N/mm^2
	=	206000 N/mm^2 for steel
τ_p	=	as built thickness of primary member web plating, in mm

PART

4

CHAPTER **8 Container Ships**

SECTION **13 Container stowage systems**

13. 1 Cell guide systems

13. 1. 1 Where cell guide systems are fitted to support containers in holds or on deck, they are to comply with the requirements of Pt 3, Ch 14, 7 Container securing arrangements for stowage using cell guides.

13. 2 Stowage on decks/hatch covers

13. 2. 1 Strength of support structures for pads/pedestals under container corners, lashing equipment and lashing bridges is to comply with Pt 3, Ch 14, 4 Ship structure.

13. 3 Ergonomic container lashing

13. 3. 1 A ship designed to carry containers that is provided with safe access and securing arrangements in accordance with the *Rules for Ergonomic Container Lashing,* will be eligible to be assigned the special features notation **ECL** (Ergonomic Container Lashing), with supplementary descriptor.

PART

4

CHAPTER **8** **Container Ships**

SECTION **14** **Direct calculation**

14. 1 Procedures for calculation of combined longitudinal and torsional strength

14. 1. 1 For container ships as defined in Pt 4, Ch 8, 1.3 Class notations 1.3.3, longitudinal strength calculations are to be made in accordance with Parts A and B of ACSPlus SDA Procedure for container ships, *See also* Table 8. 14. 1: Summary of direct calculation analysis requirements for container ships.

14. 1. 2 The global, primary and local structure scantlings are to be assessed using the vertical and horizontal wave bending moments and shear forces and torsional wave moments derived using non-linear ship motion analysis based on equivalent design sea state methods where one or more of the following conditions applies:

a. B > 60 m

b. L > 425 m

The methodology to calculate the non-linear ship motion wave loads is given in ACSPlus *Guidance Notes on the Assessment of Global Design Loads of Large Container Ships and Other Ships Prone to Whipping and Springing*.

14. 2 Procedures for verification of primary structure scantlings

14. 2. 1 For container ships as defined in Pt 4, Ch 8, 1.3 Class notations 1.3.3, the strength of the ship's primary structure scantlings of double bottom, side and transverse bulkheads is to be assessed in accordance with Part C of *ACSPlus SDA Guideline for container ships.* The vertical wave bending moments are to be calculated in accordance with Pt 4, Ch 8, 16.6, Design vertical wave bending moments. All other hull girder loads are to be calculated in accordance with Pt 4, Ch 8, 3.3, Combined longitudinal and torsional strength.

14. 2. 2 For other container ships the method for analysis of primary structure of double bottom, side structure and transverse bulkheads is to be agreed with ACS.

14. 3 Procedures for verification of structural response due to whipping, springing and fatigue

14. 3. 1 The ACSPlus notations **WDA1** and **WDA2** are mandatory for container ships as indicated in Table 8. 14. 1: Summary of direct calculation analysis requirements for container ships, and where the ultimate strength of the hull girder is assessed against the extreme wave bending moments including whipping and wave impact loads, in accordance with ACSPlus Guideline *Global Design Loads of Container Ships and Other Ships Prone to Whipping and Springing:*

Table 8. 14. 1: Summary of direct calculation analysis requirements for container ships

Rule requirement *See* Note 1	Rule reference	ACSPlus notation	Application criteria. If any of the following criteria apply then the appropriate analysis is required					
			Length criteria	Any of $\|f_{fs}\| > 1.55$ or $f_{bow} > 1.85$	$f_c > f_{sp}$	Deck or hatch side coaming steel grade ≥ HT47	Bottom steel grade ≥ HT36 *See* Note 5	Breadth criteria

Symbols and definitions								
f_{fs} is defined in Pt 4, Ch 8, 16.6 Design vertical wave bending moments 16.6.1								

f_{bow} is defined in Pt 4, Ch 8, 16.6 Design vertical wave bending moments 16.6.3

f_c is a wave encounter frequency at which it is expected that springing will become important

$$= \frac{1.3}{2\pi}\left(1 + \frac{1.3V}{2g}\right) Hz$$

f_{sp} is the natural frequency of the 2 node hull girder vertical bending mode in Hz. This can be very approximately calculated as:

$$= \left(\frac{1.1}{\pi L^2}\right)\sqrt{\frac{EI10^5}{1.8BT_dC_b}} Hz$$

V = speed in knots as defined in Pt 3, Ch 1, 6.1 Principal particulars 6.1.10

E = Young's modulus in N/mm^2
= $206000\ \mathrm{N/mm^2}$ for steel

I = midship moment of inertia in m^4, *See* Pt 3, Ch 4 Longitudinal Strength

T_d = design (normal standard operating) draught, in metres

C_b, L, and B are given in Pt 3, Ch 1, 6 Definitions.

Note *1* The stated rule requirements may be deemed applicable to ships that do not meet the application criteria but where the structural configuration is such as to necessitate them.

Note *2* The results of the springing assessment may also need a fatigue assessment procedure to be undertaken.

Note *3* If ACSPlus notation **FDA** is to be assigned, the requirements of ACSPlus FDA Guideline are to be complied with; this may require calculations additional to those implied by Pt 4, Ch 8, 14.3 Procedures for verification of structural response due to whipping, springing and fatigue 14.3.2.

Note 4 A Level 2 Whipping Assessment may be carried out instead of a Level 1 Whipping Assessment at the Owner's request. Where a level 2 Whipping Assessment is undertaken, a Level 1 Whipping Assessment need not be carried out.

Note 5 This is applicable only when a bottom steel grade greater than or equal to HT36 is needed to satisfy the requirements of Pt 4, Ch 8, 16 Longitudinal strength calculations.

14. 3. 2 The ACSPlus notation **FDA SPR** is mandatory for container ships as indicated in Table 8. 14. 1: Summary of direct calculation analysis requirements for container ships, and where the fatigue performance of the hull girder taking into account the effects from springing, is assessed in accordance with *ACSPLus Guideline Global Design Loads of Container Ship and Other Ships Prone to Whipping and Springing*, which also makes reference to *ACSPlus FDA Guideline*.

PART

4

CHAPTER 8 Container Ships

SECTION 15 Requirements for ships with large deck openings

15. 1 Application

15. 1. 1 The combined stresses due to vertical bending moment, horizontal bending moment and torque are to be calculated as described in this Section.

15. 2 Symbols and definitions

15. 2. 1 The following symbols and definitions are applicable to this Section unless otherwise stated:

Z_Y = actual hull section modulus about the transverse neutral axis at the position considered, in m^3

Z_Z = actual hull section modulus about the vertical neutral axis at the position considered, in m^3

ε = shear centre distance below baseline, may be taken as the maximum shear centre distance below baseline of the ship in the midship region, in metres. ε is taken as positive where the shear centre is below the baseline

M_S = design still water bending moment at the section under consideration, in kN m

σ_C = combined stress at the position considered.

15. 3 Design loadings

15. 3. 1 The design vertical wave bending moments, M_{WC1} and M_{WC2}, at any position along the ship is defined as:

M_{WC1} = $0.0505C_0C_{31}L^2B(C_b + 0.7)$kNm

M_{WC2} = $0.0505C_0C_{32}L^2B(C_b + 0.7)$kNm

C_{31}, C_{32} = vertical wave bending moment distribution coefficients depending on the longitudinal position from A.P. as defined in Table 8. 15. 1: Distribution of wave bending moments

C_0 = $11.65\left(0.6 + 0.0942\left(\frac{L}{100} - 1\right)\right)$

L, B, C_b are given in Pt 3, Ch 1, 6 Definitions.

The sign convention is given in Figure 8. 15. 1: Sign conventions for hull girder loads

Table 8. 15. 1: Distribution of wave bending moments

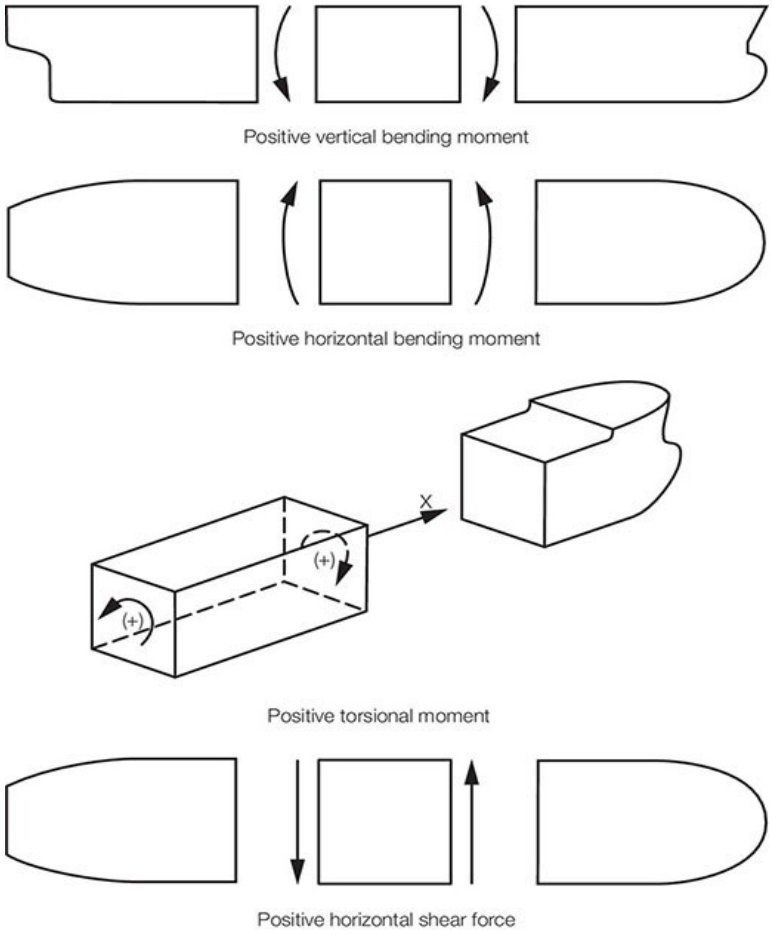
Figure 8. 15. 1: Sign conventions for hull girder loads



15. 3. 2 The design horizontal wave bending moments, M_{HC1} and M_{HC2}, at any position along the ship are defined as:

M_{HC1} = $0.2063C_0C_{41}L^2T(C_b + 0.7)$kNm

M_{HC2} = $0.2063C_0C_{42}L^2T(C_b + 0.7)$kNm

C_{41}, C_{42} = horizontal wave bending moment distribution coefficients depending on the longitudinal position from A.P. as defined in Table 8. 15. 2: Distribution of horizontal wave bending moments and hydrodynamic torques

C_0 is defined in Pt 4, Ch 8, 15.3 Design loadings 15.3.1
L, T ,C_b are given in Pt 3, Ch 1, 6 Definitions.
The sign convention is given in Figure 8. 15. 1: Sign conventions for hull girder loads.

15. 3. 3 The design hydrodynamic torques, M_{WTC1} and M_{WTC2}, at any position along the ship are defined as:

$M_{\text{WTC1}} = M_{\text{WTCB1}} + M_{\text{WTCQ1}}$

$M_{\text{WTCB1}} = 0.0728C_0C_{51}LB^2(C_b + 0.7)\text{kNm}$

$M_{\text{WTCQ1}} = -(0.65T + \varepsilon)\text{Q}_{\text{HC1}}\text{kNm}$

$M_{\text{WTC2}} = M_{\text{WTCB2}} + M_{\text{WTCQ2}}$

$M_{\text{WTCB2}} = 0.0728C_0C_{52}LB^2(C_b + 0.7)\text{kNm}$

$M_{\text{WTCQ2}} = -(0.65T + \text{E})\text{Q}_{\text{HC2}}\text{kNm}$

C_{51}, C_{52} = hydrodynamic torque distribution coefficients depending on the longitudinal position from A.P. as defined in Table 8. 15. 2: Distribution of horizontal wave bending moments and hydrodynamic torques

C_0 is defined in Pt 4, Ch 8, 15.3 Design loadings 15.3.1

$Q_{\text{HC1}} = 0.8683\text{C}_0K_{31}LT(C_\text{b} + 0.7)\text{kN}$

$Q_{\text{HC2}} = 0.8683\text{C}_0K_{32}LT(C_\text{b} + 0.7)\text{kN}$

K_{31}, K_{32} = horizontal wave shear force distribution coefficients depending on the longitudinal position from A.P. as defined in Table 8. 15. 2: Distribution of horizontal wave bending moments and hydrodynamic torques

L, B, T, C_b, are given in Pt 3, Ch 1, 6 Definitions.

ε is given in Pt 4, Ch 8, 15.2 Symbols and definitions 15.2.1

The sign convention is given in Figure 8. 15. 1: Sign conventions for hull girder loads.

15. 3. 4 The value and distribution of static cargo torque, M_{STC}, are to be specified by the designer based on the intended operation of the ship and are not to be less than minimum design value of static cargo torque. The minimum design value of static cargo torque, M_{STC}, at any position along the ship is defined as:

M_{STC} = $15.7C_6B(\eta_s\eta_t + 0.7N_{sd}N_{td})$kNm

η_s = the maximum number of stacks of containers over the breadth of the cargo hold

η_t = the maximum number of tiers of containers in the cargo hold amidships, excluding containers above the main deck or on the hatch covers

C_6 = distribution coefficient depending on the length, L_{pp}, as defined in Table 8. 15. 3: Static cargo torque distribution factor

N_{sd} = the maximum number of stacks of containers over the breadth, B, on hatch covers or above the main deck

N_{td} = the number of tiers of containers on hatch covers or above the main deck amidships, excluding containers in cargo holds

B is given in Pt 3, Ch 1, 6 Definitions.

Table 8. 15. 3: Static cargo torque distribution factor

Position		Factor C_6
Station	0 (A. P.)	0.0
	5	1.0
	15	1.0
	20 (F. P.)	0.0
Note Intermediate values are to be determined by linear interpolation.		

15. 4 Combined stress

15. 4. 1 Combined stress calculations are to be carried out at least at the following positions along the length of the ship:

a. At the forward and aft ends of the engine room.
b. At the forward and aft ends of the deck-house for multi-island designs.
c. At the forward and aft transverse bulkhead positions of each cargo bay.
d. At the forward and aft transverse bulkhead of fuel oil deep tanks.
e. At any other sections where there are significant changes in cross-section properties.

15. 4. 2 The combined stress, σ_c, is to be less than the permissible stress given in Table 8. 15. 4: Permissible stress. σ_c, is to be taken as the greatest magnitude of the following stresses:

σ_{c1} = $\sqrt{(\sigma_1 - (1-f)\sigma_{WC1})^2 + (\sigma_2 - (1-f)\sigma_{WC2})^2} + \sigma_{SC} - |\sigma_{STC}|$

σ_{c2} = $\sqrt{(\sigma_1 - (1-f)\sigma_{WC1})^2 + (\sigma_2 - (1-f)\sigma_{WC2})^2} + \sigma_{SC} - |\sigma_{STC}|$

σ'_{c1} = $\sqrt{(\sigma'_1 - (1-f)\sigma_{WC1})^2 + (\sigma'_2 - (1-f)\sigma_{WC2})^2} + \sigma_{SC} - |\sigma_{STC}|$

σ'_{c2} = $-\sqrt{(\sigma'_1 - (1-f)\sigma_{WC1})^2 + (\sigma'_2 - (1-f)\sigma_{WC2})^2} + \sigma_{SC} - |\sigma_{STC}|$

where

σ_1 = $\sigma_{WC1} + \sigma_{HC1} + \sigma_{WTC1}$

σ_2 = $\sigma_{WC2} + \sigma_{HC2} + \sigma_{WTC2}$

σ'_1 = $\sigma_{WC1} - \sigma_{HC1} - \sigma_{WTC1}$

σ'_2 = $\sigma_{WC2} - \sigma_{HC2} - \sigma_{WTC2}$

For σ_{C1}

f = $\left|f_{fH}\right|$ if $M_{WC} \geq 0, f = \left|f_{fS}\right|$ if $M_{WC} > 0$

f = $\left|f_{fH}\right|$ if $M_{WC} \leq 0, f = \left|f_{fS}\right|$ if $M_{WC} > 0$

where

M_{WC} = $M_{WC1}\frac{\sigma_1}{\sqrt{\sigma_1^2 + \sigma_2^2}} + M_{WC2}\frac{\sigma_2}{\sqrt{\sigma_1^2 + \sigma_2^2}}$

For σ'_{C1}

f = $\left|f_{fH}\right|$ if $M_{WC'} \geq 0, f = \left|f_{fS}\right|$ if $M_{WC'} > 0$

For σ'_{C2}

f = $\left|f_{fH}\right|$ if $M_{WC'} \leq 0, f = \left|f_{fS}\right|$ if $M_{WC'} > 0$

where

M_{WC}' = $M_{WC1}\frac{\sigma'_1}{\sqrt{\sigma_1'^2 + \sigma_2'^2}} + M_{WC2}\frac{\sigma'_2}{\sqrt{\sigma_1'^2 + \sigma_2'^2}}$

σ_{SC} = longitudinal stress due to hogging or sagging design still water bending moment M_s

σ_{WC1}, σ_{WC2} = longitudinal stress due to vertical wave bending moments

σ_{HC1}, σ_{HC2} = longitudinal stress due to horizontal wave bending moments

σ_{STC} = longitudinal warping stress due to static cargo torque

σ_{WTC1}, σ_{WTC2} = longitudinal warping stress due to hydrodynamic torques

f_{fH}, f_{fS} = hogging and sagging vertical bending moment correction factors calculated in accordance with Pt 4, Ch 8, 16.6 Design vertical wave bending moments 16.6.1

M_{WC1}, M_{WC2} = vertical bending moments defined in Pt 4, Ch 8, 15.3, Design loadings 15.3.1 at the longitudinal position considered

other symbols are as defined in Pt 4, Ch 8, 15.3, Design loadings and Pt 4, Ch 8, 15.4 Combined stress.

15. 4. 3 For ships with a beam greater than 32 m, longitudinal stresses are to be calculated using a finite element model of the entire hull in accordance with Part A of the *ACSPlus SDA Guideline* for container ships.

15. 4. 4 For ships with a beam less than or equal to 32 m, the longitudinal stresses may be obtained as follows:

$$\sigma_{SC} = \frac{M_s}{Z_y} \times 10^{-3} \text{ N/mm}^2$$

$$\sigma_{WC} = \frac{M_{wC}}{Z_y} \times 10^{-3} \text{ N/mm}^2$$

$$\sigma_{HC1} = C_7 \frac{M_{HCl}}{Z_z} \times 10^{-3} \text{ N/mm}^2$$

$$\sigma_{HC2} = C_7 \frac{M_{HC2}}{Z_z} \times 10^{-3} \text{ N/mm}^2$$

σ_{WTC1}, σ_{WTC2} and σ_{STC} are to be evaluated by approved calculation procedures.

C_7 = coefficient for shear lag depending on vertical location of the point under consideration

= 0.6 at inboard edge of strength deck

= 1.0 at base line

= intermediate positions by interpolation

Z_y and Z_z are given in Pt 4, Ch 8, 15.2 Symbols and definitions 15.2.1.

15. 4. 5 At each section the stresses are to be calculated on the port and starboard sides, at:

a. the inboard edge of the strength deck;
b. the point on the bilge where the combined stress is greatest; and
c. the top of continuous hatch coaming (where fitted).

15. 4. 6 Where the ship's length is greater than 425 m or the ship's beam is greater than 60 m, the vertical wave bending moments, horizontal wave bending moments and hydrodynamic torques are to be obtained from a direct calculation method. Alternatively, the hull stresses may be obtained using a probabilistic approach response-based analysis method considering the ship's responses in wave environment. The analysis method is to be agreed with ACS.

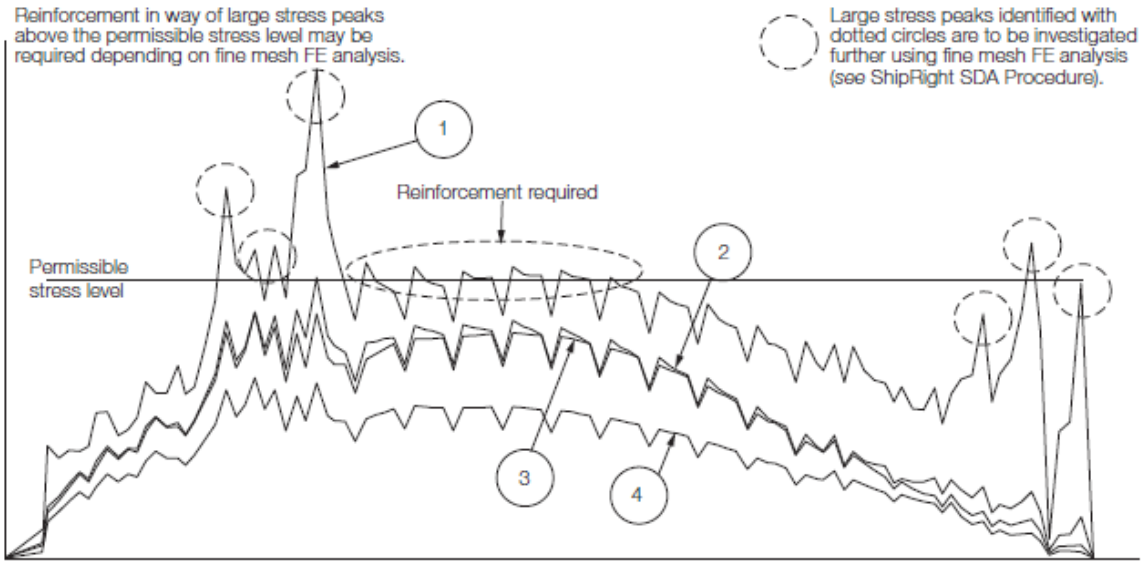
15. 5 Permissible stress

Table 8. 15. 4: Permissible stress

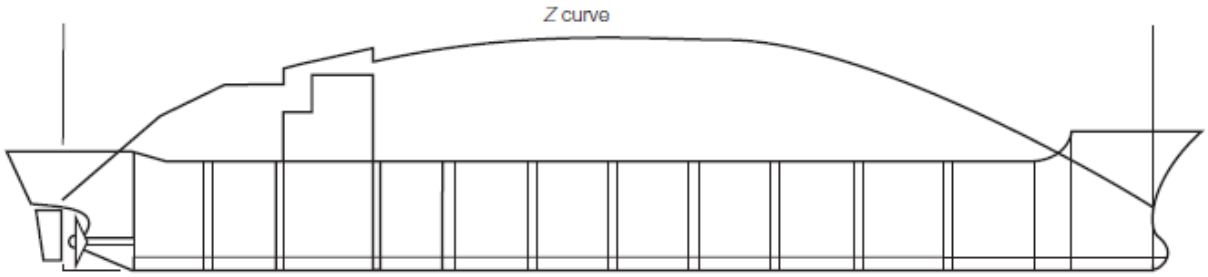
Position	Permissible combined stress, N/mm^2
Top of continuous hatch coaming	$\sigma_c = \frac{175}{K_L}$
Elsewhere	$\sigma_c = \frac{157}{K_L}$

15. 5. 1 The maximum tensile or compressive combined stress σ_c at any position along the length is not to be more than indicated in Table 8. 15. 4: Permissible stress.

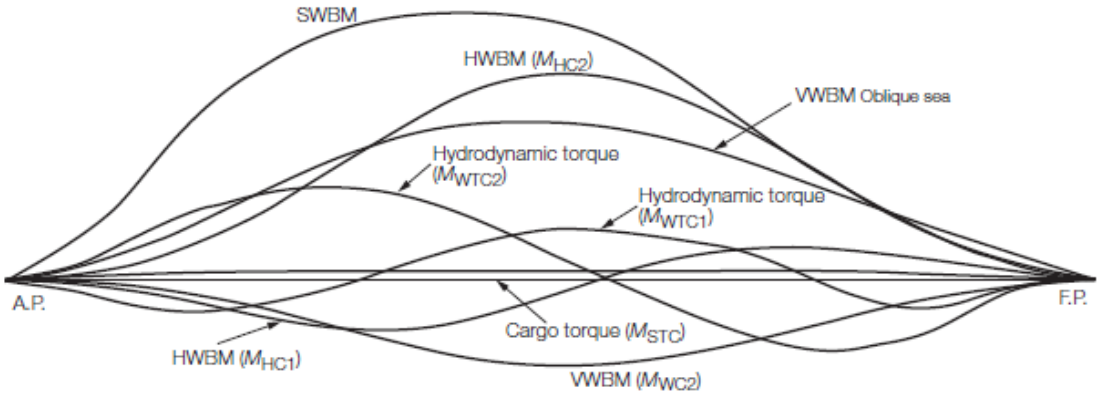
Figure 8. 15. 2: Combined stress diagram for deck - Oblique sea



(a) Longitudinal stress distributions at top of hatch coaming showing contributions from:
1) still water bending moment + vertical wave bending moment + static cargo torque + horizontal wave bending moment and hydrodynamic torque
2) still water bending moment + vertical wave bending moment + static cargo torque
3) still water bending moment + vertical wave bending moment
4) still water bending moment



(b) Ship Profile and Section modulus



(c) Oblique Sea longitudinal distribution of vertical and horizontal bending moments and torques

NOTES
1. These diagrams are for illustration only and are not to scale.
2. A similar diagram is to be prepared for the bottom structure.

PART

CHAPTER **8 Container Ships**

SECTION **16 Longitudinal strength calculations**

16. 1 Longitudinal extent of strength assessment

16. 1. 1 The stiffness, yield strength, buckling strength and hull girder strength assessment are to be carried out with due consideration given to locations where there are significant changes in the hull cross-section.

16. 2 Symbols

16. 2. 1 The symbols used in this Section are defined as follows:

C_w = Waterplane coefficient at scantling draught T, to be taken as:

C_w = $A_W/(LB)$

A_w = Waterplane area at scantling draught T, in m^2

E = Modulus of elasticity, in N/mm^2

M_s = Design still water bending moment, sagging (negative) and hogging (positive), in kNm

$\overline{M_s}$ = Maximum permissible still water bending moment, sagging (negative) and hogging (positive), in kNm, to be taken negative or positive according to the convention given in Pt 3, Ch 4, 5.3 Design still water bending moments 5.3.2

M_w = Design hull vertical wave bending moment, sagging (negative) and hogging (positive), in kNm, to be taken negative or positive according to the convention given Pt 3, Ch 4, 5.3 Design still water bending moments 5.3.2

M_U = Hull girder ultimate bending moment capacity, in kNm

Q_s = Design hull still water shear force, in kN, to be taken as negative or positive according to the convention given in Pt 3, Ch 4, 6.4 Design still water shear force 6.4.2

$\overline{Q_s}$ = Permissible hull still water shear force, in kN.

Q_w = Design hull wave shear force, in kN, to be taken as negative or positive according to the convention given in Pt 3, Ch 4, 6.4 Design still water shear force 6.4.2

q_v = Shear flow along the cross-section under consideration

I_{net} = Net vertical hull girder moment of inertia at the cross-section under consideration, in m^4, to be determined using net scantlings as defined in Table 8. 16. 3: Combination of still water and wave bending moments and shear forces

σ_{HG} = Hull girder bending stress, in N/mm^2

τ_{HG} = Hull girder shear stress, in N/mm^2

z = Vertical co-ordinate of location under consideration, in m

z_n = Distance from baseline to the horizontal neutral axis, in m

16. 3 Corrosion margin and net thickness

16. 3. 1 The strength is to be assessed using the net thickness approach for all scantlings.

16. 3. 2 The net thickness of the plates, webs and flanges is obtained as follows:

$$t_{net} = t_{as_built} - t_{vol_add} - \alpha t_c$$

Where

t_{net} = Net thickness, in mm

t_{as_built} = As built thickness, in mm

t_{vol_add} = Voluntary addition, in mm

α = is given in Table 8. 16. 1: Values of corrosion addition factor

Table 8. 16. 1: Values of corrosion addition factor

Structural requirement	Property/analysis type	Corrosion addition factor, α
Strength assessment	Section properties	0.5
Buckling strength	Section properties (stress determination)	0.5
	Buckling capacity	1.0
Hull girder ultimate strength	Section properties	0.5
	Buckling/collapse capacity	0.5

16. 3. 3 Where voluntary additions are to be applied, they are to be clearly indicated on the plans.

16. 3. 4 The total corrosion addition for both sides of a structural member is obtained as follows:

$$t_c = (t_{c1} + t_{c2}) + t_{res}$$

Where

t_{c1} , t_{c2} re given in Pt 4, Ch 8, 16.3 Corrosion margin and net thickness 16.3.6

t_{res} = reserve thickness, in mm, to be taken as 0.5 mm

16. 3. 5 For an internal member within a given compartment, the total corrosion addition is obtained as follows:

$$t_c = (2t_{c1}) + t_{res}$$

16. 3. 6 The corrosion addition of a stiffener is to be determined based on the compartment in which it is located, *See* Pt 4, Ch 8, 16.3 Corrosion margin and net thickness 16.3.6

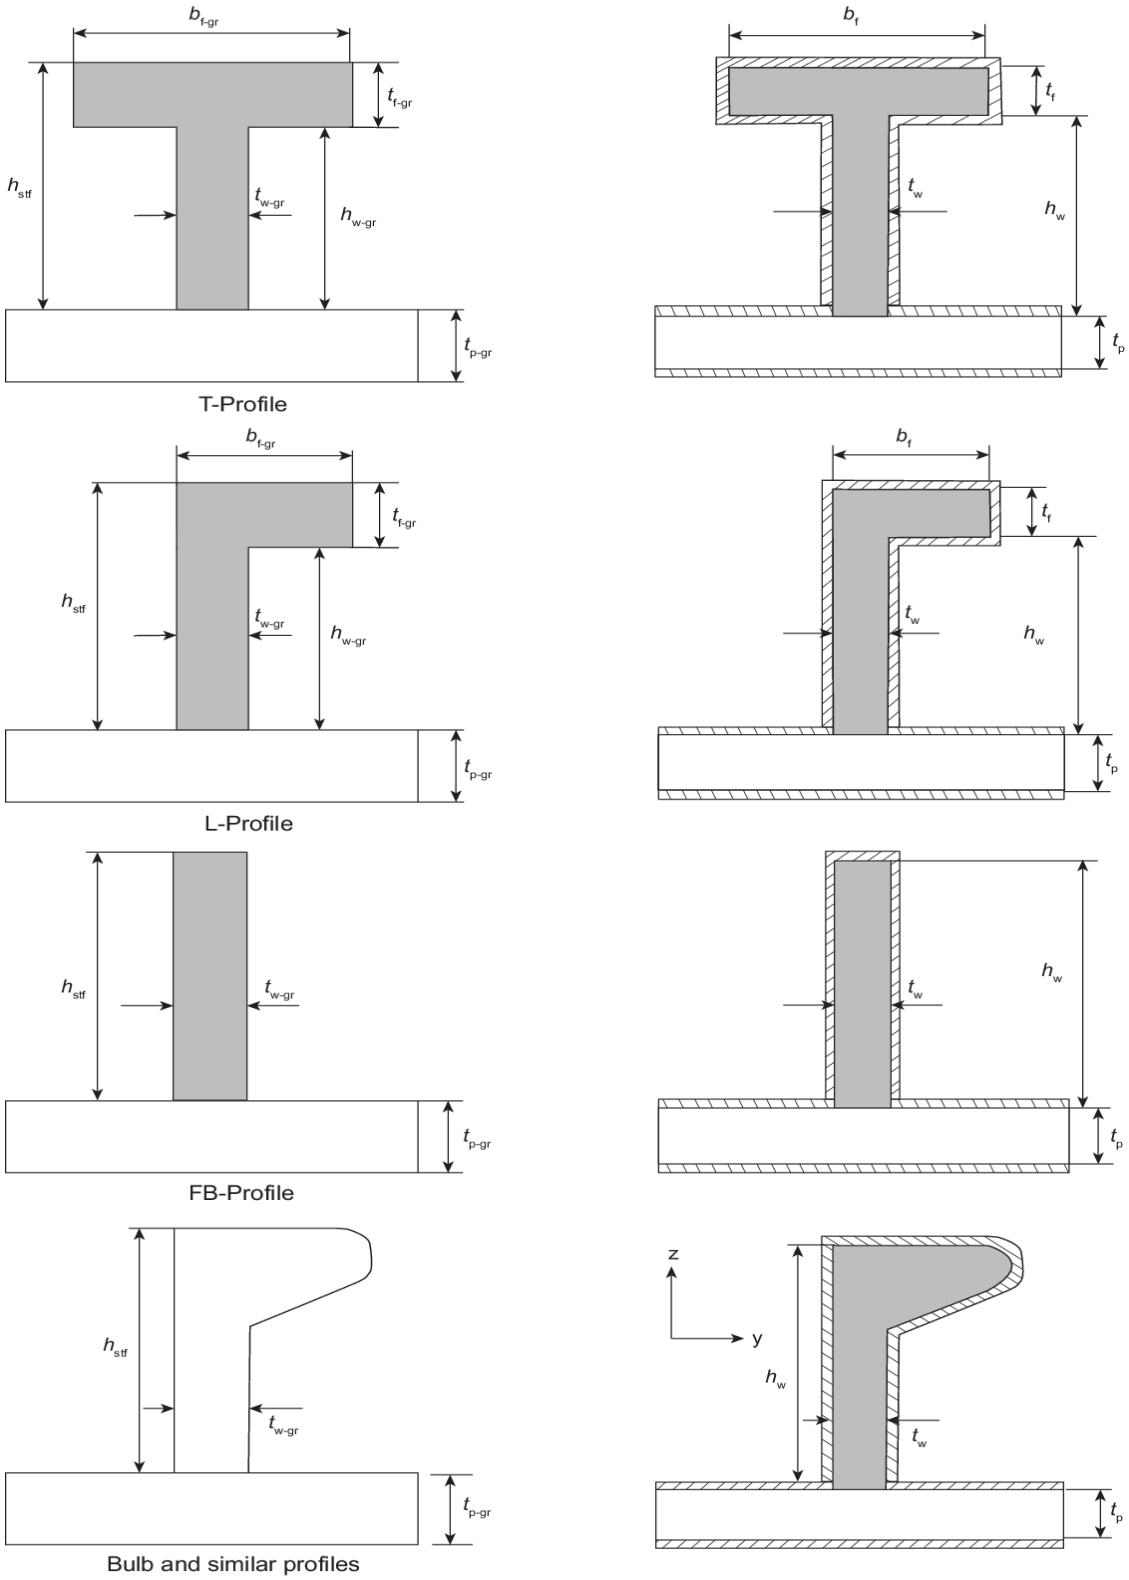
Table 8. 16. 2: Corrosion addition for one side of a structural member

Compartment type	One side corrosion addition t_c or t_{c2} in mm
Exposed to sea water	1.0
Exposed to atmosphere	1.0
Ballast water tank	1.0
Void and dry spaces	0.5
Fresh water, fuel oil and lube oil tank	0.5
Accommodation spaces	0.0
Container holds	1.0
Compartment types not mentioned above	0.5

16. 3. 7 The net section modulus, moment of inertia and shear area properties of a supporting member are to be calculated using the net dimension of the attached plate, web and flange as defined in Figure 8. 16. 1: Net sectional properties of supporting members

16. 3. 8 The net cross-sectional area, the moment of inertia about the axis parallel to the attached plate and the associated neutral axis are to be determined through applying a corrosion magnitude of deducted from the surface of the profile cross-section.

Figure 8. 16. 1: Net sectional properties of supporting members



16. 4 Permissible still water bending moments and shear forces

16. 4. 1 The permissible still water bending moments, M_s in kNm, and still water shear forces, Q_s in kNm, are to be calculated at each section along the ship's length for design loading conditions as specified in Pt 3, Ch 4, 5.3, Design still water bending moments.

16. 5 Hull moment of inertia

16. 5. 1 The hull section moment of inertia about the transverse neutral axis, at any position along the ship, is to be not less than the following for both hogging and sagging cases (*See also* Table 8. 16. 3: Combination of still water and wave bending moments and shear forces):

$$I_{ne1} \geq 1.55L|M_s + M_w| \times 10^{-7} m^4$$

16. 6 Design vertical wave bending moments

16. 6. 1 The appropriate hogging or sagging design hull vertical wave bending moment, at any position along the ship, may be taken as follows:

$$M_w = 1.5 f_1 f_2 L^3 C_3 C_w \left(\frac{B}{L}\right)^{0.8} K_f$$

Where

f_1 is the ship service factor, to be taken as 0.85

C_W and C_3 are given in Pt 4, Ch 8, 16.2 Symbols 16.2.1 and Pt 4, Ch 8, 16.6 Design vertical wave bending moments 16.6.2 respectively

f_2 is the hogging,f_{fH} , or the sagging, f_{fS} correction factor

f_{fH} is the hogging (positive) moment correction factor and is to be taken as:

$f_{fH} = 0.3\frac{C_b}{C_w}\sqrt{T}$ not to be taken greater than 1.1

f_{fS} is the sagging (negative) moment correction factor and is to be taken as:

$f_{fS} = 4.5\frac{1+0.2 f_{bow}}{C_w\sqrt{C_b}L^{0.3}}$, not to be taken less than 1.0

f_{bow} and K_f are given in Pt 4, Ch 8, 16.6, Design vertical wave bending moments 16.6.3 and Pt 4, Ch 8, 16.6 Design vertical wave bending moments 16.6.4 respectively

K_f is given in Pt 4, Ch 8, 16.6 Design vertical wave bending moments 16.6.4

B and L are given in Pt 4, Ch 8, 1.5, Symbols and definitions

16. 6. 2 The wave parameter, C_3, is to be taken as:

$$C_3 = 1 - 0.50\left(1 - \sqrt{\frac{L}{L_4}}\right)^{2.2} \text{ for } \quad L \leq L_4$$

$$C_3 = 1 - 0.45\left(\sqrt{\frac{L}{L_4}} - 1\right)^{1.7} \quad for\ L > L_4$$

Where

$$L_4 = 315C_w^{-1.3}$$

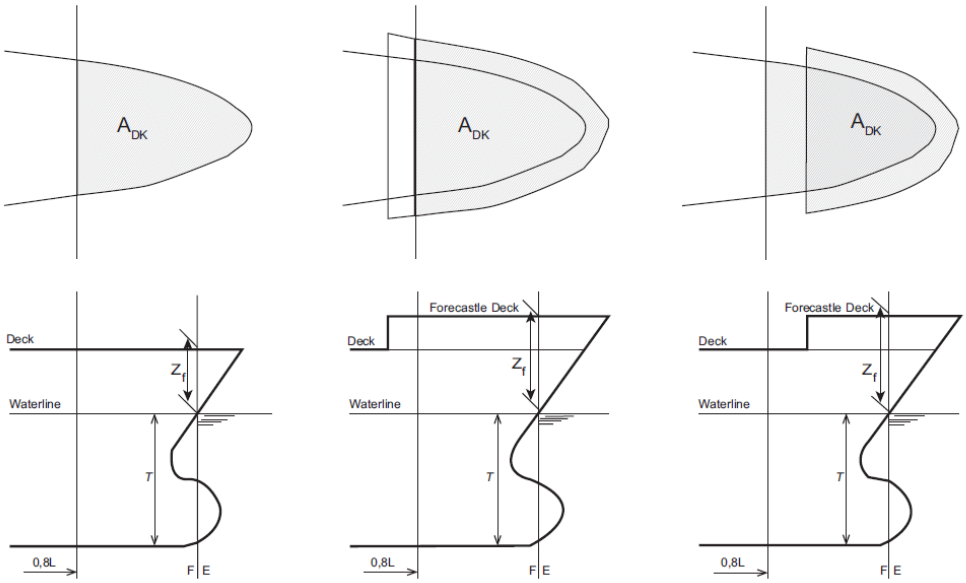
16. 6. 3 The bow flare shape, f_{bow} coefficient is to be taken as:

$$f_{bow} = \frac{A_{DK} - A_{WL}}{0.2Lz_f}$$

Where:

- A_{DK} is the projected area in the horizontal plane of the uppermost deck, in m^2, including the forecastle deck, if any, forward of 0.8L from the AP, *See also* Figure 8. 16. 2: Projected area ADK and vertical distance zf. Any other structures, e.g. plated bulwark, are to be excluded.
- $A_{WL}$is the waterplane area, in m^2, at draught T, forward of 0.8L from the AP
- z_f is the vertical distance, in m, from the waterline at draught T, to the uppermost deck at side (or forecastle deck), measured at the FP, *See also* Figure 8. 16. 2: Projected area ADK and vertical distance zf. Any other structures, e.g. plated bulwark, are to be excluded.

Figure 8. 16. 2: Projected area ADK and vertical distance zf



16. 6. 4 The distribution of the vertical wave bending moment, K_f , is to be taken as:

a. Hogging (positive) moments, *See also* Figure 8. 16. 3: Distribution of vertical wave bending moment Mw along the ship length

K_f = 0 at aft end of L

= 0.15 at 0.1 L

= 1.0 between 0.35 L and 0.55 L

= 0.25 at 0.8 L

= 0 at forward end of L

b. Sagging (negative) moments, *See also Fig 8.16.3*

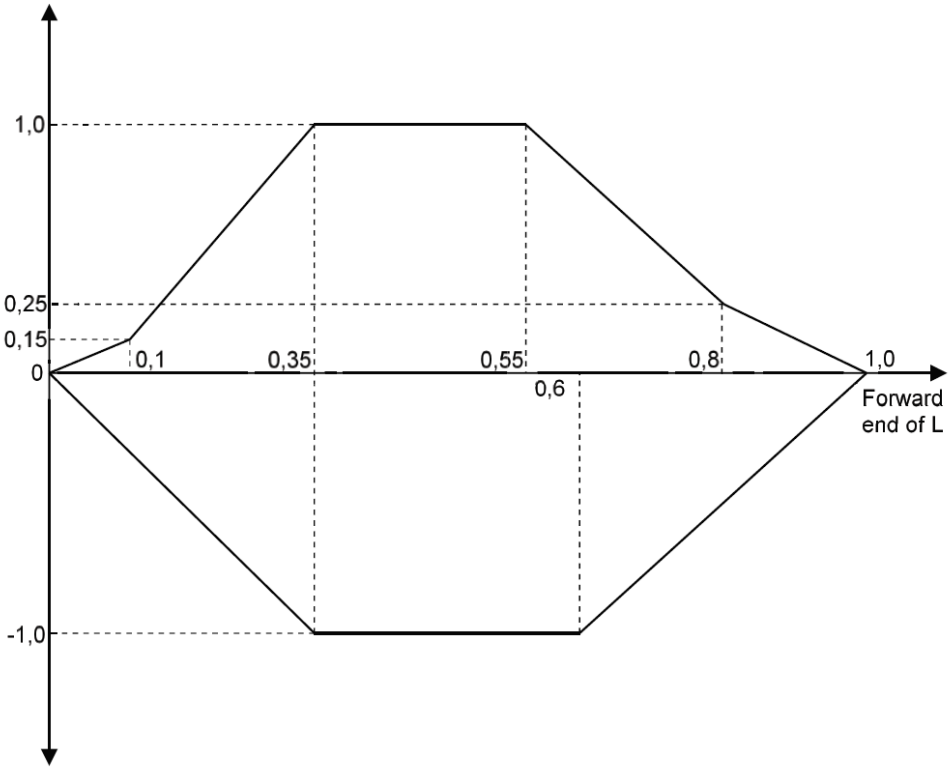
K_f = 0 at aft end of L

= -1.0 between 0.35 L and 0.6 L

= 0 at forward end of L

Intermediate values are to be obtained by linear interpolation.

Figure 8. 16. 3: Distribution of vertical wave bending moment Mw along the ship length



16. 7 Design vertical wave shear force

16. 7. 1 The design hull wave shear force,Q_w , at any position along the ship is to be taken as:

$$Q_w = K_f f_1 L^2 C_3 C_w \left(\frac{B}{L}\right)^{0.8}$$

Where

f_1 = ship service factor, to be taken as 0.85

C_w, C_3 and K_f are defined in Pt 4, Ch 8, 16.2, Symbols, Pt 4, Ch 8, 16.7 Design vertical wave shear force 16.7.2 and Pt 4, Ch 8, 16.7 Design vertical wave shear force 16.7.3 respectively B and L are given in Pt 4, Ch 8, 1.5 Symbols and definitions 1.5.1

16. 7. 2 The wave parameter, C_3, is to be taken as:

$$C_3 = 1 - 1.50\left(1 - \sqrt{\frac{L}{L_4}}\right)^{2.2} \quad f\text{or } L \le L_4$$

$$C_3 = 1 - 0.45\left(\sqrt{\frac{L}{L_4}} - 1\right)^{1.7} \quad f\text{or } L > L_4$$

Where

$$L_4 = 330C_w^{-1.3}$$

16. 7. 3 The distribution of the wave shear force, K_f, is to be taken as follows, *See also* Figure 8. 16. 4: Distribution of vertical shear force Qw along the ship length.

a. Positive shear force

K_f = 0 at aft end of L

K_f = $5.2(0.3 + 0.7f_{fH})$ between $0.2L$ and $0.3L$

K_f = 4.0 between $0.4L$ and $0.55L$

K_f = $5.7(0.25 + 0.75f_{fS})$ between $0.65L$ and $0.85L$

K_f = 0 at forward end of L

b. Negative shear force

K_f = $1.3(0.3 + 0.7f_{fS})$ at aft end of L

K_f = $5.2(0.3 + 0.7f_{fS})$ between $0.15L$ and $0.3L$

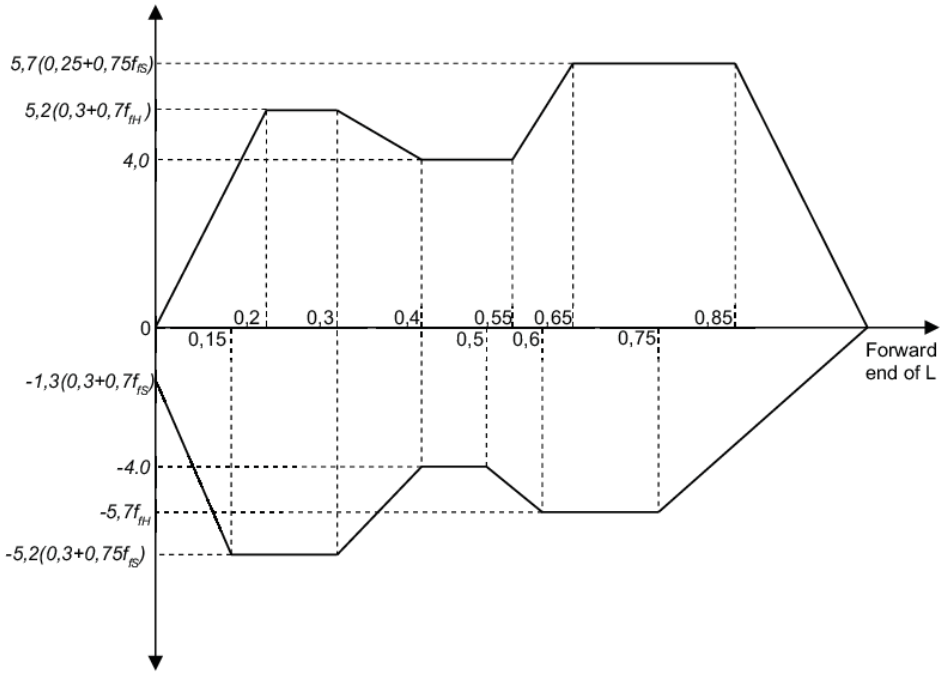
K_f = -4.0 between $0.4L$ and $0.5L$

K_f = $-5.7f_{fH}$ between $0.65L$ and $0.75L$

K_f = 0 at forward end of L

Intermediate values of K_f to be obtained by linear interpolation.
f_{fH} and f_{fS} are as defined in Pt 4, Ch 8, 16.6 Design vertical wave bending moments 16.6.1.

Figure 8. 16. 4: Distribution of vertical shear force Qw along the ship length



16. 8 Permissible hull girder stresses

16. 8. 1 The permissible combined (still water plus wave) stress for hull vertical bending, σ, is given by:

$$\sigma = \frac{190}{k,_L} \text{ N/mm}^2$$

16. 8. 2 The permissible shear stress, τ, is given by:

$$\tau = \frac{120}{k,_L} \text{ N/mm}^2$$

16. 9 Hull girder stresses

16. 9. 1 The hull girder bending stresses, σ_G, in N/mm^2 are to be determined for the section under consideration for the load cases given in Table 8. 16. 3: Combination of still water and wave bending moments and shear forces at the following locations:

a. At bottom.
b. At deck.
c. At top of hatch coaming.
d. At any point where there is a change of steel yield strength.

$$\sigma_G = \frac{\gamma_s M_s + \gamma_w M_w}{I_{net}} (z - z_n) \times 10^{-3}$$

Where

M_w and M_s are defined in Table 8. 16. 3: Combination of still water and wave bending moments and shear forces.

γ_s, γ_w are partial safety factors to be taken as:

γ_s = 1.0

γ_w = 1.0

And:

- I_{net} z and z_n is given in Pt 4, Ch 8, 16.2 Symbols 16.2.1

16. 9. 2 The hull girder shear stresses, τ_G, in N/mm^2 are to be determined for the section under consideration for the load cases given in Table 8. 16. 3: Combination of still water and wave bending moments and shear forces for all structural elements which contribute to the shear strength capability of the ship.

$$\tau_G = \frac{\gamma_s Q_s + \gamma_w Q_w}{t_{net}/q_v} \times 10^3$$

Where

Q_w and Q_s are defined in Table 8. 16. 3: Combination of still water and wave bending moments and shear forces.

γ_s, γ_w are partial safety factors to be taken as:

γ_s = 1.0

γ_w = 1.0

- q_v is calculated in accordance with the *ACSPlus Guideline Additional calculation procedures for longitudinal strength*

And:

- t_{net} is given in Pt 4, Ch 8, 16.2 Symbols 16.2.1

Table 8. 16. 3: Combination of still water and wave bending moments and shear forces

Load case	Bending moment		Shear force		
	Still water, M_s	Wave, M_w	Location, x	Still water, Q_s	Wave, Q_w
Hogging	M_{smax}	M_{wmax}	$x \leq 0.5L$	Q_{smax}	Q_{wmax}
			$x > 0.5L$	Q_{smin}	Q_{wmin}
Sagging	M_{smin}	M_{wmin}	$x \leq 0.5L$	Q_{smin}	Q_{wmin}
			$x > 0.5L$	Q_{smax}	Q_{wmax}
Symbols					
M_{smax} = positive still water bending moment at the cross-section under consideration					

M_{smin} = negative still water bending moment at the cross-section under consideration

M_{wmax} = wave bending moment at the cross-section under consideration, to be taken as the positive value of M_w as defined in Pt 4, Ch 8, 16.6 Design vertical wave bending moments 16.6.1

M_{wmin} = wave bending moment at the cross-section under consideration, to be taken as the negative value of M_w as defined in Pt 4, Ch 8, 16.6 Design vertical wave bending moments 16.6.1

Q_{smax} = positive still water shear force at the cross-section under consideration

Q_{smin} = negative still water shear force at the cross-section under consideration taken as

Q_{wmax} = maximum value of the wave shear force at the cross-section under consideration, to be taken as the positive value of Q_w as defined in Pt 4, Ch 8, 16.7 Design vertical wave shear force 16.7.1

Q_{wmin} = minimum value of the wave shear force at the cross-section under consideration, to be taken as the negative value of Q_w as defined in Pt 4, Ch 8, 16.7 Design vertical wave shear force 16.7.1

x = longitudinal coordinate or a location under consideration

16. 9. 3 The hull girder stresses for the two load cases (hogging and sagging) defined in Pt 4, Ch 8, 16.9 Hull girder stresses 16.9.1 and Pt 4, Ch 8, 16.9 Hull girder stresses 16.9.2 are to meet the following criteria:

$\sigma_{HG} < \sigma$

$\tau_{\mathrm{HG}} < \tau$

is the permissible combined bending stress as defined in Pt 4, Ch 8, 16.8 Permissible hull girder stresses 16.8.1

is the permissible shear stress as defined in Pt 4, Ch 8, 16.8 Permissible hull girder stresses 16.8.2

16. 10 Buckling strength assessment

16. 10. 1 The following requirements apply to plate panels and longitudinal stiffeners subject to hull girder bending and shear stresses.

16. 10. 2 The acceptance criteria for the buckling assessment are defined as follows:

$\eta_{\mathrm{act}} \leq 1$

Where:

η_{act} is the maximum utilisation factor

16. 10. 3 The utilisation factor, η_{act}, is given by:

$$\eta_{\mathrm{act}} = \frac{1}{\gamma_c}$$

Where:

γ_c is the stress multiplication factor at failure, *See* Figure 8. 16. 5: Example of failure state limit curve and stress multiplication factor at failure.

16. 10. 4 Failure state limits are defined in *ACSPlus Guideline Additional calculation procedures for longitudinal strength* for the following items:

a. Elementary plate panels
b. Overall stiffened panels
c. Longitudinal stiffeners

Each failure limit state is defined by an equation and, γ_c, is to be determined such that it satisfies the equation.

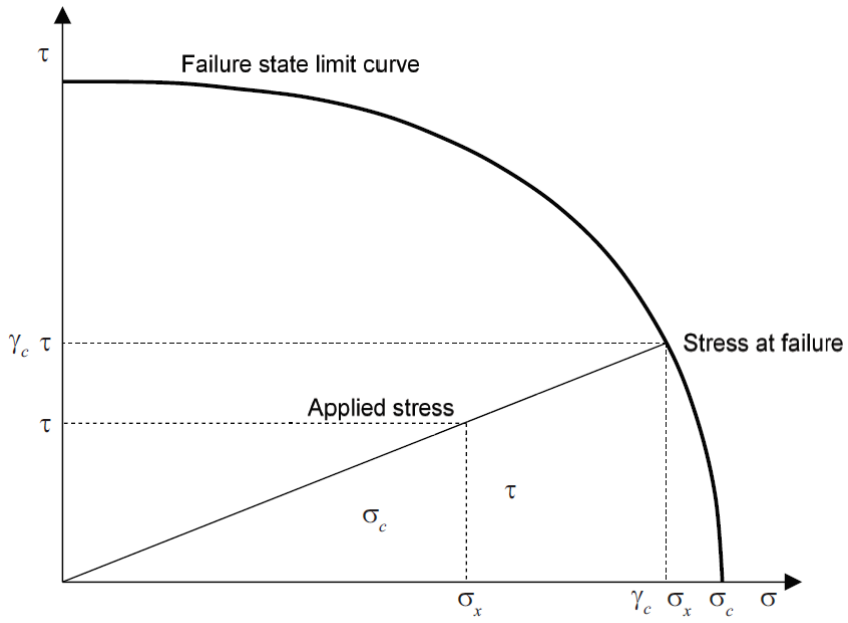
16. 10. 5 The stress multiplication factor at failure, γ_c, of a structural member is to be determined for any combination of longitudinal and shear stress, *See* Figure 8. 16. 5: Example of failure state limit curve and stress multiplication factor at failure.

Where:

σ_x τ_x is the applied stress combination for buckling given in Pt 4, Ch 8, 16.10, Buckling strength assessment

σ_c τ_c is the critical buckling stress obtained in accordance with the *ACSPlus Guideline Additional calculation procedures for longitudinal strength* for the stress combination for buckling σ and τ

Figure 8. 16. 5: Example of failure state limit curve and stress multiplication factor at failure



16. 10. 6 The following two stress combinations are to be considered for each of the load cases defined in Pt 4, Ch 8, 16.9 Hull girder stresses 16.9.1. The stresses are to be derived at the load calculation points defined in Pt 4, Ch 8, 16.10 Buckling strength assessment 16.10.7 and Pt 4, Ch 8, 16.10 Buckling strength assessment 16.10.8

a. Longitudinal framing

Stress combination 1 with:

$\sigma_x = \sigma_{HG}$

$\sigma_y = 0$

$\tau = 0.7\tau_{HG}$

Stress combination 2 with:

$\sigma_x = 0.7\sigma_{HG}$

$\sigma_y = 0$

$\tau = \tau_{HG}$

b. Transverse framing

Stress combination 1 with:

$\sigma_x = 0$

$\sigma_y = \sigma_{HG}$

$\tau = 0.7\tau_{HG}$

Stress combination 2 with:

$\sigma_x = 0$

$\sigma_y = 0.7\sigma_{HG}$

$\tau = \tau_{HG}$

16. 10. 7 The hull girder stresses for elementary plate panels are to be calculated at the load calculation points defined in Pt 4, Ch 8, 16.10 Buckling strength assessment 16.10.8.

16. 10. 8 The hull girder stresses for longitudinal stiffeners are to be calculated at the following load calculation points:

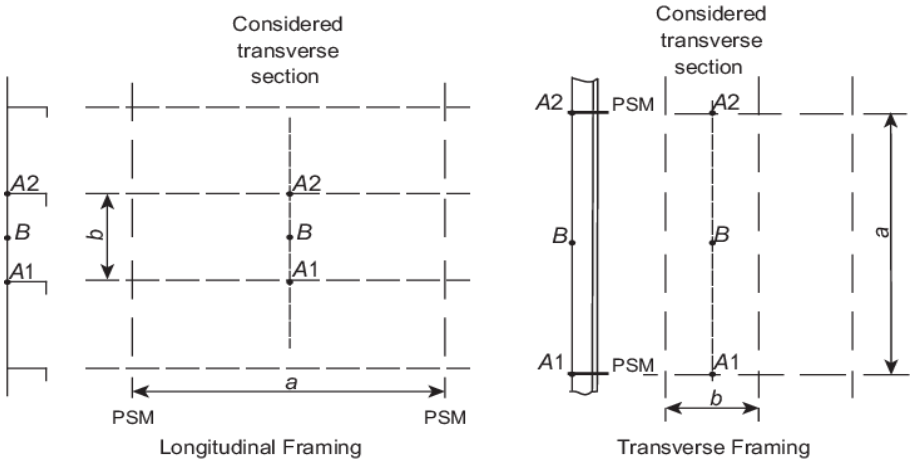
a. At the mid length of the stiffener under consideration

b. At the intersection point between the stiffener and its attached plate

Table 8. 16. 4: Load calculation points (LCP) for plate buckling assessment

LCP coordinates	Hull girder bending stress	Hull girder shear stress
x coordinate	Mid length of the elementary plate panel (EPP)	
y coordinate	Both upper and lower ends of the EPP, points A1 and A2 in Figure 8. 16. 6: Load calculation points for plate buckling	Mid-point of EPP, point B in Figure 8. 16. 6: Load calculation points for plate buckling
z coordinate	Distance from baseline to load calculation point	

Figure 8. 16. 6: Load calculation points for plate buckling



16. 11 Hull girder ultimate strength

16. 11. 1 The hull girder ultimate strength assessment is to be carried out for ships with a length L greater than or equal to 150 m.

16. 11. 2 The acceptance criteria given in Pt 4, Ch 8, 16.11 Hull girder ultimate strength 16.11.8, are applicable to intact ships only.

16. 11. 3 The hull girder ultimate bending capacity,M_U , is defined as the maximum bending moment capacity of the hull girder beyond which the hull structure collapses.

16. 11. 4 The hull girder ultimate bending capacity is to be checked for the load cases defined in Table 8. 16. 3: Combination of still water and wave bending moments and shear forces.

16. 11. 5 The ultimate bending moment capacities of a hull girder transverse section, in hogging and sagging conditions, are defined as the maximum values of the curve of bending moment M versus the curvature X of the transverse section considered

where:
M_{UH} is the hogging condition
M_{US} is the sagging condition
The curvature X is positive for the hogging condition and negative for the sagging condition, *See* Figure 8. 16. 7: Bending moment M versus curvature X

16. 11. 6 The hull girder ultimate bending capacity, M_U, is to be calculated using the incremental-iterative method as given in *Chapter 4 of ACSPlus Guideline Additional calculation procedures for longitudinal strength*.

16. 11. 7 The vertical hull girder bending moment, M in hogging and sagging conditions, to be considered in the ultimate strength check is to be taken as:

$$M = \gamma_s M_s + \gamma_w M_w$$

Where

M_s = permissible still water bending moment, in kNm, as defined in Pt 4, Ch 8, 16.4 Permissible still water bending moments and shear forces 16.4.1

M_w = vertical wave bending moment, in kNm, as defined in Pt 4, Ch 8, 16.6 Design vertical wave bending moments 16.6.1

γ_s = partial safety factor for the still water bending moment, to be taken as 1.0

γ_w = partial safety factor for the vertical wave bending moment, to be taken as 1.2

16. 11. 8 The hull girder ultimate bending capacity at any hull transverse section is to satisfy the following criteria:

$$M \leq \frac{M_U}{\gamma_M \gamma_{DB}}$$

Where

M = vertical bending moment, in kNm, as defined in Pt 4, Ch 8, 16.11 Hull girder ultimate strength 16.11.7

M_U = hull girder ultimate bending moment capacity, in kNm, as defined in Pt 4, Ch 8, 16.11 Hull girder ultimate strength 16.11.6

γ_M = partial safety factor covering material, geometric and strength prediction uncertainties, to be taken as 1.05

γ_{DB} = partial safety factor covering the effect of double bottom bending, to be taken as:

γ_{DB} = 1.15 for hogging condition درونRull؟ست اضافه سطر تا 2

γ_{DB} = 1.0 for sagging condition

For cross-sections where the double bottom breadth of the inner bottom is less than that at amidships or where the double bottom structure differs from that at amidships (e.g. engine room sections), the factor, γ_{DB}, for the hogging condition may be specially considered.

Figure 8. 16. 7: Bending moment M versus curvature X

CHAPTER **9** **Double Hull Oil Tankers**

SECTION **1** **General**

1. 1 General

1. 1. 1 This Chapter applies primarily to the arrangements and scantlings within the cargo tank region of sea-going tankers having integral cargo tanks, for the carriage of oil having a flash point not exceeding 60°C (closed-cup test), in association with the class notation indicated in Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers 1.3.1 or Pt 4, Ch 9, 1.4,, Class notation and applicable Rules for non-CSR Double Hull Oil Tankers 1.4.1. Except as indicated in Pt 4, Ch 9, 1.1 General 1.1.2, Pt 4, Ch 9, 1.1 General 1.1.3 and Pt 4, Ch 9, 1.1 General 1.1.4, the cargo spaces are to be bounded by side and bottom dedicated water ballast tanks or void spaces constituting a double hull for the ship, *See* Table 9. 1. 1: Cargo tank boundary requirements.

1. 1. 2 Double side tanks may be dispensed with for tankers of less than 5000 tonnes deadweight where each cargo tank capacity does not exceed 700 m^3, *See* Table 9. 1. 1: Cargo tank boundary requirements.

1. 1. 3 Double bottom tanks may be dispensed with for tankers of 5000 tonnes deadweight or greater subject to compliance with the requirements of Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.18.

1. 1. 4 Double bottoms and double sides may be dispensed with for vessels less than 600 tonnes deadweight, *See* Table 9. 1. 1: Cargo tank boundary requirements.

1. 1. 5 Where only oils having flash points exceeding 60°C are to be carried, the Rule requirements and class notation will be modified accordingly the additional class notation '**F.P.** exceeding 60°C' will be entered in the *Register Book*.

1. 1. 6 Oil cargoes listed in Table 9. 1. 2: Oil cargoes suitable for carriage in oil tankers, See Note 1 are those which are generally envisaged as being carried in ships classed in accordance with this Chapter.

1. 1. 7 The scantlings and arrangements of tankers intended for cargoes other than oil will be specially considered in relation to the characteristics of the cargo, and the class notation will be modified accordingly. A full list of such cargoes for a particular ship, with special requirements as applicable, can be provided by ACS on application. Special consideration will also be given to the carriage of cargoes with a relative density greater than 1.025, *See also* Pt 4, Ch 9, 1.3, Class notation and applicable Rules for CSR Double Hull Oil Tankers and Pt 4, Ch 9, 1.4, Class notation and applicable Rules for non-CSR Double Hull Oil Tankers.

1. 1. 8 The Regulations for classification and assignment of the above notations and other notations, as appropriate to the arrangements, scantlings and service are provided for in Pt 1, Ch 2, 2 Character of classification and class notations.

Table 9. 1. 1: Cargo tank boundary requirements

Deadweight (DWT) tonnes	Minimum double side width (d_s) metres	Minimum double bottom depth (d_b) metres
DWT ≥ 5000	$d_s = 0.5 + \frac{DWT}{20000}$ or 2.0 whichever is the lesser, but not less than 1.0	$d_b = \frac{B}{15}$ or $d_b = 2.0$ whichever is the lesser, but not less than 1.0
600≤DWT<5000	$d = 0.4 + \frac{2.4DWT}{20000}$ or $d_s = 0.76$ whichever is the greater, *See* Note 2	$d_b = \frac{B}{15}$ or $d_b = 0.76$ whichever is the greater,
DWT < 600	$d_s = 0$	$d_b = 0$

Note *1*. The symbols *DWT*, d_s and d_b are defined in 1.5.

Note *2*. Where each cargo tank capacity does not exceed 700 m^3, the value of d_s is taken as 0 and the inner bottom line is to run parallel to the line of the midship flat of bottom as shown in Figure 9. 1. 1: Cargo tank boundary lines for oil tankers having double bottom and double side tank arrangements (See Table 9. 1. 1: Cargo tank boundary requirements).

Note *3*. Where the double bottom tank is fitted, the centre girder depth is to be not less than as required by Pt 4, Ch 9, 9.3 Girders and floors in double bottom 9.3.3.

Table 9. 1. 2: Oil cargoes suitable for carriage in oil tankers, *See* Note 1

Asphalt solutions	**Gasoline Blending Stocks**
Blending Stocks	Alkylates – fuel
Roofers Flux	Reformates
Straight Run Residue	Polymer – fuel
Oils	**Gasolines**
Clarified	Casinghead (natural)
Crude Oil	Automotive
Mixtures containing crude oil	Aviation Straight Run
Diesel Oil	Fuel Oil No. 1 (Kerosene)
Fuel Oil No. 4	Fuel Oil No. 1-D

Fuel Oil No. 5	Fuel Oil No. 2
Fuel Oil No. 6	Fuel Oil No. 2-D
Residual Fuel Oil	
Road Oil	**Jet Fuels**
Transformer Oil	JP-1 (Kerosene)
Lubricating Oils and Blending Stocks	JP-3 JP-4
Mineral Oil	JP-5 (Kerosene, Heavy)
Motor Oil	Turbo Fuel
Penetrating Oil	Kerosene
Spindle Oil	Mineral Spirit
Turbine Oil	
	Naphtha
Distillates	Solvent
Straight Run	Petroleum
Flashed Feed Stocks	Heartcut Distillate Oil
Gas Oil	
Cracked	

Note *1.* This list of oils is taken from Appendix 1 to Annex 1 of the MARPOL Convention. Special consideration will be given to the carriage of oil cargoes not included in the above list.

1. 2 Application and ship arrangement

1. 2. 1 Double hull tankers with length, *L*, greater than or equal to 150 m with structural configuration as shown in Table 9. 1. 3: Structural arrangement are defined as 'CSR Oil Tankers' and are to comply with Pt 4, Ch 9, 1.3, Class notation and applicable Rules for CSR Double Hull Oil Tankers.

1. 2. 2 The applicable Rules for double hull tankers with length, *L*, greater than or equal to 150 m of unusual hull form or structural arrangements will be specially considered.

1. 2. 3 Double hull tankers with length, *L*, less than 150 m are defined as 'Non-CSR Oil Tankers' and are to comply with Pt 4, Ch 9, 1.4, Class notation and applicable Rules for non-CSR Double Hull Oil Tankers.

1. 2. 4 Any dry tanks, or tanks intended for water ballast and thus empty in the loaded condition, are to be so arranged that they cannot be used for any other purpose.

1. 2. 5 Cofferdams are to be provided at the forward and after ends of the oil cargo spaces; cofferdams are to be at least 760 mm in length and are to cover the whole area of the end bulkheads of the cargo spaces.

1. 2. 6 A pump-room, fuel oil bunker or water ballast tank will be accepted in lieu of a cofferdam.

Table 9. 1. 3: Structural arrangement

Arrangement	Typical configuration	$L<150$	$L\geq150$
No longitudinal bulkhead		Non CSR	CSR (specially considered)
One or two longitudinal bulkhead(s)		Non CSR	CSR
Trunk deck in association with longitudinal bulkhead(s) (*See* Ch 10.6)		Non CSR	CSR
Double deck in association with a centreline bulkhead		Non CSR	CSR (specially considered)
Mid-deck in association with a centreline bulkhead or centreline girders		Non CSR	CSR (specially considered)

1. 2. 7 Where the lower portion of the pump-room is recessed into the machinery space, the height of the recess is not, in general, to exceed one-third of the moulded depth above the keel, *See also* Pt 5, Ch 15, 1 General requirements.

1. 2. 8 Where a compartment or tank, such as a fore peak tank, forms a cofferdam, access is to be from the open deck. Alternatively, any space through which it is necessary to pass in order to obtain access is to conform to the requirements of Pt 6, Ch 2, 14 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts. Engine or electrically driven pumps are not to be sited in the space containing the access to such cofferdams.

1. 2. 9 A cofferdam is also to be arranged between a cargo oil tank and accommodation spaces, and between cargo oil tanks and spaces containing electrical equipment, other than spaces where the only items of electrical equipment are lighting fittings complying with Pt 6, Ch 2, 14 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts. Where a corner to corner situation occurs, protection may be formed by a diagonal plate across the corner. The scantlings and testing arrangements are to comply with Rule requirements for cofferdam bulkheads, and arrangements are to be made to enable the space to be filled with water ballast to assist in gas freeing, *See also* Pt 5, Ch 15, 3 Cargo handling system. Suitable corrosion protection, drainage and gas-freeing arrangements are to be provided to such spaces.

1. 2. 10 Passages or tunnels passing through, or adjacent to, a cargo oil tank and not separated from it by a cofferdam, are to be provided with mechanical ventilation, and any access is to be from the open deck.

1. 2. 11 Arrangements are to be provided to enable double bottom and vertical wing tanks to be filled with water ballast to assist in gas freeing these tanks, *See* Pt 5, Ch 15, 3 Cargo handling system.

1. 2. 12 Fittings within cargo tanks and pump-rooms are to be securely fastened to the structure.

1. 2. 13 Accommodation, control and service spaces are to be located clear of the cargo tank region such that a single failure of deck or bulkhead will not allow cargo fumes into these spaces. Navigation positions, where fitted above the cargo tank region, are to be separated from the cargo tank deck by means of an open space with a height of at least 2.0 m.

1. 2. 14 Where spill retainment flats are fitted at the sides of the weather deck, separate arrangements are to be provided for freeing the deck of oil and water respectively, *See also* Pt 3, Ch 10, 5.1 Continuity and alignment 5.1.1.

1. 2. 15 Alternative arrangements which are proposed as being equivalent to the Rules will receive individual consideration, taking into account any relevant National Authority requirements.

1. 2. 16 Reference should also be made to the relevant Regulations of the *International Convention for the Safety of Life at Sea, 1974* and applicable amendments.

1. 2. 17 Cargo spaces are to be bounded by double bottom and double side tanks or void spaces such that the distance between the cargo tank boundary and the shell plating is not less than that given in Table 9. 1. 1: Cargo tank boundary requirements and Figure 9. 1. 1: Cargo tank boundary lines for oil tankers having double bottom and double side tank arrangements (See Table 9. 1. 1: Cargo tank boundary requirements), except as otherwise specified in Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.18 and Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.19. Cargo or fuel oil are not to be carried in double bottom or double side tanks.

1. 2. 18 Where *DWT*≥ 5000 tonnes, double bottom tanks as required by Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.17 may be dispensed with, provided the following requirements are complied with:

a. The cargo height, h_c, in contact with the bottom shell plating is to be not greater than:

$$h_c = \frac{1.025T_{\mathrm{m}} - 10.2P_{\mathrm{v}}}{1.1\rho}$$

where the symbols are defined in Pt 4, Ch 9, 1.6 Information required for CSR Double Hull Oil Tankers.

b. Where a mid-deck dividing the cargo oil tanks into upper and lower spaces is arranged, it is to be located at a height of not less than the lesser of $\frac{B}{6}$ or 6 m, but

c. not more than 0.6D, above the base line.

d. Below a level 1.5d_b above the base line, the cargo tank boundary line may be vertical down to the bottom shell plating as shown in Figure 9. 1. 3: Cargo tank boundary lines for oil tankers having mid-deck arrangement (See Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.18).

1. 2. 19 Alternative arrangements which are equivalent to Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.17 will receive individual consideration, taking into account any relevant National Authority requirements.

1. 2. 20 The length of each cargo tank is not to exceed 10 m or the appropriate value obtained from Table 9. 1. 4: Permissible length of cargo tanks, See Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.20, whichever is the greater.

1. 2. 21 Where DWT ≥ 5000 tonnes, the cargo pump-room shall be provided with a double bottom such that at any cross-section the depth of each double bottom tank or space shall be such that the distance d_c, as defined in 1.5, is not

less than the lesser of $\frac{B}{15}$ and 2 m

d_c is in no case to be less than 1 m.

In the case of cargo pump-rooms whose bottom plate is located above the base line by at least the minimum height required, there will be no need for a double bottom construction in way of the cargo pump-room.

1. 2. 22 Notwithstanding the requirements of Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.21, above, where the flooding of the cargo pump-room would not render the ballast or cargo pumping system inoperative, a double bottom need not be fitted.

Figure 9. 1. 1: Cargo tank boundary lines for oil tankers having double bottom and double side tank arrangements (*See* Table 9. 1. 1: Cargo tank boundary requirements)

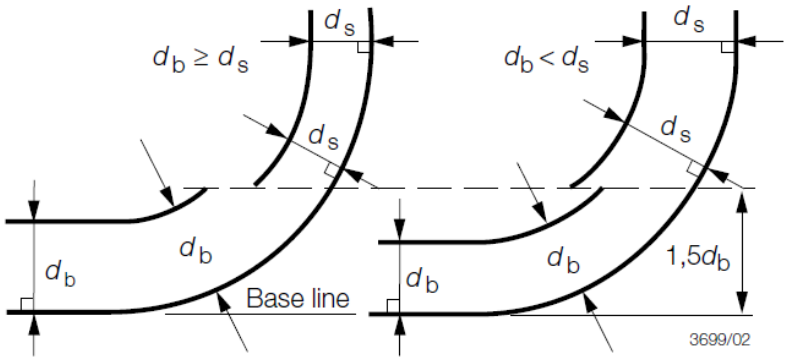

Figure 9. 1. 2: Cargo tank boundary lines for oil tankers having double bottom arrangement (*See* Table 9. 1. 1: Cargo tank boundary requirements)

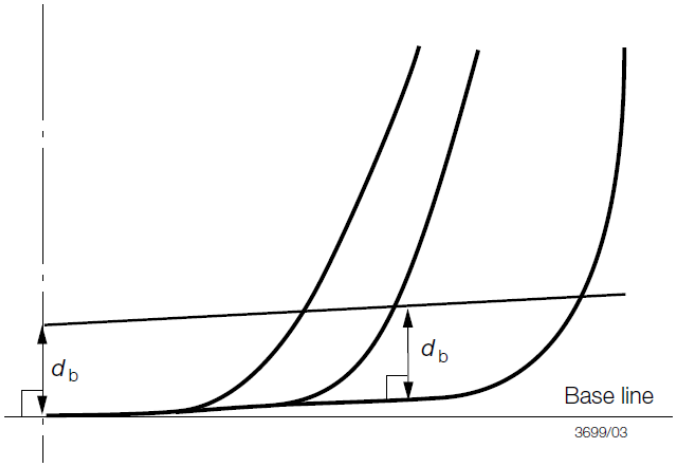

Figure 9. 1. 3: Cargo tank boundary lines for oil tankers having mid-deck arrangement (*See* Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.18)

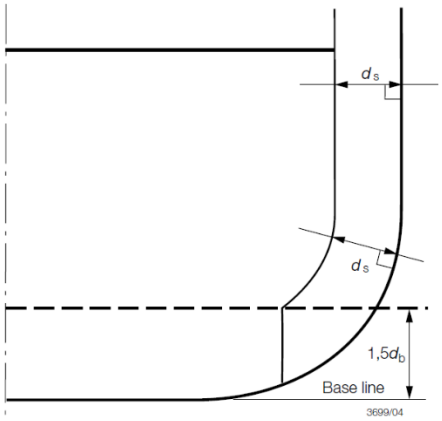

Table 9. 1. 4: Permissible length of cargo tanks, *See* Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.20

Number of longitudinal bulkheads inside cargo tanks	One (on centreline)		Two	Three (one on centreline)	Where no longitudinal bulkhead is arranged or where longitudinal bulkheads are perforated across breadth of cargo tanks
Length of wing cargo tank	$\left(0.25\frac{b_i}{B}+0.15\right)L_L$		$0.2L_L$	$0.2L_L$	$\left(0.5\frac{b_i}{B}+0.1\right)L_L$ or $0.2L_L$ whichever is the lesser
Length of centre tank	$_i \geq 0.2B$	—	$0.2L_L$	$0.2L_L$ port and starboard	
	$b_i \geq 0.2B$	—	$\left(0.5\frac{b_i}{B}+0.1\right)L_L$	$\left(0.25\frac{b_i}{B}+0.15\right)L_L$ port and starboard	
Note The symbols L_L, B and b_i are defined in Pt 4, Ch 9, 1.5, General definitions and symbols.					

1. 3 Class notation and applicable Rules for CSR Double Hull Oil Tankers

1. 3. 1 In general, CSR Double Hull Oil Tankers are to comply with Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers 1.3.2 to Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers 1.3.7 and the *IACS Common Structural Rules for Bulk Carriers and Oil Tankers (CSR)* for the draught required and will be eligible to be classed **100A1 Double Hull Oil Tanker CSR, ESP**.

1. 3. 2 Class notations applicable to CSR double hull oil tankers are defined as follows:

- **CSR**

Identifies the double hull oil tanker as being compliant with the *IACS Common Structural Rules (CSR)*

- **ESP**

  Identifies the double hull oil tanker as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements and Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements, *See also* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.12.

1. 3. 3 Materials are to comply with the Pt 2 Rules for the Manufacture, Testing and Certification of Materials. Corrosion protection is to comply with Pt 3, Ch 2, 3 Corrosion protection and Ch 15 Corrosion Prevention of Pt 2.

1. 3. 4 The rudder and rudder stock are to comply with Pt 3, Ch 13, 2 Rudders.

1. 3. 5 Ice strengthening is to be in accordance with Pt 8 Rules for Ice and Cold Operations.

1. 3. 6 The ACSPlus notation CM is mandatory for CSR double hull oil tankers greater than 150 m in length, *See* Pt 4, Ch 9, 1.4 Class notation and applicable Rules for non-CSR Double Hull Oil Tankers 1.4.6.

1. 3. 7 The 'ACSPlus Guideline' for the hull construction of ships are detailed in Pt 3, Ch 16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships and the classification notations and descriptive notes associated with these procedures are given in Pt 1, Ch 2, 2 Character of classification and class notations.

1. 4 Class notation and applicable Rules for non-CSR Double Hull Oil Tankers

1. 4. 1 In general, non-CSR Double Hull Oil Tankers are to comply with Pt 4, Ch 9, 1.4 Class notation and applicable Rules for non-CSR Double Hull Oil Tankers 1.4.2 to Pt 4, Ch 9, 1.4 Class notation and applicable Rules for non-CSR Double Hull Oil Tankers 1.4.8 for the draught required and will be eligible to be classed **100A1 Double Hull Oil Tanker, ESP**.

1. 4. 2 The notation **ESP** serves to identify the ship as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements and Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements, *See also* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.12.

1. 4. 3 At the Owner's request, the notation **MARPOL 20.1.3** may be appended to the notation**100A1 Double Hull Oil Tanker** for vessels not meeting the minimum double side width (d_s) requirements of Table 9. 1. 1: Cargo tank boundary requirements but which comply with MARPOL Annex I, Regulation 20.1.3.

1. 4. 4 At the Owners request, the notation **MARPOL 21.1.2** may be appended to the notation **100A1 Double Hull Oil Tanker** for vessels of less than 5000 tonnes deadweight which have a double hull in accordance with MARPOL Annex I, Regulation 21.1.2.

1. 4. 5 The ACSPlus notation CM is mandatory for non-CSR double hull oil tankers greater than 150 m in length, *See* Pt 4, Ch 9, 1.4 Class notation and applicable Rules for non-CSR Double Hull Oil Tankers 1.4.6.

1. 4. 6 Where the length of the ship is greater than 190 m, or where the structural arrangements are considered such as to necessitate it, the scantlings of the primary supporting structure are to be assessed by direct calculation and the ACSPlus notations **SDA, FDA** and **CM** are mandatory, *See* Pt 4, Ch 9, 1.4 Class notation and applicable Rules for non-CSR Double Hull Oil Tankers 1.4.6 and Pt 4, Ch 9, 14 Direct calculations.

1. 4. 7 The 'ACSPlus Guideline' for the hull construction of ships are detailed in Pt 3, Ch 16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships and the classification notations and descriptive notes associated with these procedures are given in Pt 1, Ch 2, 2 Character of classification and class notations.

1. 4. 8 The disposition of transverse bulkheads is to comply with the requirements of Pt 3, Ch 3, 4 Bulkhead requirements, as applicable to ships with machinery located aft.

1. 4. 9 Arrangements and scantlings forward and aft of the cargo tank region are to comply with Pt 3, Ch 5 Fore End Structure, Pt 3, Ch 6 Aft End Structure and Pt 3, Ch 7 Machinery Spaces. The remaining requirements of Part 3 are also to be complied with as appropriate to the intended arrangements.

1. 4. 10 Arrangements pertaining to gangways, bulwarks and rails are to comply with the requirements of Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks.

1. 4. 11 The structural configurations may include one or more of the arrangements shown in Table 9. 1. 3: Structural arrangement. These provisions do not preclude the fitting of additional bulkheads or the perforation of longitudinal bulkheads.

1. 4. 12 The bottom shell, inner bottom and deck are generally to be framed longitudinally in the cargo tank region where the ship length, L, exceeds 75 m. However, consideration will be given to alternative proposals for ships of special design.

1. 4. 13 The side shell, inner hull bulkheads and longitudinal bulkheads are generally to be longitudinally framed where the ship length, L, exceeds 150 m, but alternative proposals, taking account of resistance to buckling, will be considered.

1. 4. 14 Where the side shell is longitudinally framed, the inner hull bulkheads are to be similarly constructed.

1. 4. 15 Provided the ship length, L, does not exceed 200 m the longitudinal bulkheads may be horizontally corrugated. Vertically corrugated centreline bulkheads may also be considered on the basis of direct calculations.

1. 4. 16 In general, the primary member scantlings will require to be determined by direct calculation, *See also* Table 9. 1. 3: Structural arrangement.

1. 4. 17 Alternative arrangements, which are proposed as being equivalent to the Rules, will receive individual consideration. Particular attention is to be paid to deflection of members and to the ability of the structure to resist buckling. Where necessary, additional calculations will be required.

1. 4. 18 For additional requirements for single hull oil tankers, *See* Pt 4, Ch 10 Single Hull Oil Tankers.

1. 4. 19 The scantlings of structural items may be determined by direct calculation.

1. 5 General definitions and symbols

1. 5. 1 The following symbols and definitions are applicable to this chapter unless otherwise stated:

L, L_L, B, D, T as defined in Pt 3, Ch 1, 6 Definitions.

d_c = the height between the ship's base line and the bottom of the cargo pump-room, in metres

DWT = deadweight, in tonnes, at the summer load waterline

b = the width of plating supported by the primary or secondary member, in metres or mm respectively

b_e = the effective width, in metres, of end brackets as determined from Pt 3, Ch 3, 3 Structural idealisation

b_i = minimum distance from side shell to inner hull/outer longitudinal bulkhead of the tank in question measured inboard at right angles to the centreline at the summer load waterline, in metres, *See* Table 9. 1. 4: Permissible length of cargo tanks, See Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.20

d_b = the distance, in metres, between the bottom of the cargo tanks and the moulded line of the bottom shell plating measured at right angles to the bottom shell plating as shown in Table 9. 1. 1: Cargo tank boundary requirements and Table 9. 1. 2: Oil cargoes suitable for carriage in oil tankers, See Note 1

d_s = the distance, in metres, between the cargo tank boundary and the moulded line of the side shell plating measured at any cross-section at right angles to the side shell as shown in Figure 9. 1. 1: Cargo tank boundary lines for oil tankers having double bottom and double side tank arrangements (See Table 9. 1. 1: Cargo tank boundary requirements) and Figure 9. 1. 3: Cargo tank boundary lines for oil tankers having mid-deck arrangement (See Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.18)

h = the load height applied to the item under consideration, in metres

k_L, k = higher tensile steel factors. For the determination of these factors, *See* Pt 3, Ch 2, 1 Materials of construction. For mild steel, k_L, k may be taken as 1.0

l_e = effective length, in metres, of the primary or secondary member, measured between effective span points. For determination of span points, *See* Pt 3, Ch 3, 3 Structural idealisation

s = spacing of secondary members, in mm

t = thickness of plating, in mm

I = the moment of inertia, in cm^4, of a primary or secondary member, in association with an effective width of attached plating determined in accordance with Pt 3, Ch 3, 3 Structural idealisation

L_1 = length of ship, in metres, but need not be taken greater than 190 m

P_v = pressure/vacuum relief valve positive setting, in bar

T_m = minimum operating moulded draught of the ship at amidships under any expected cargo loading condition, in metres

Z = the section modulus, in cm^3, of the primary or secondary member, in association with an effective width of attached plating determined in accordance with Pt 3, Ch 3, 3 Structural idealisation

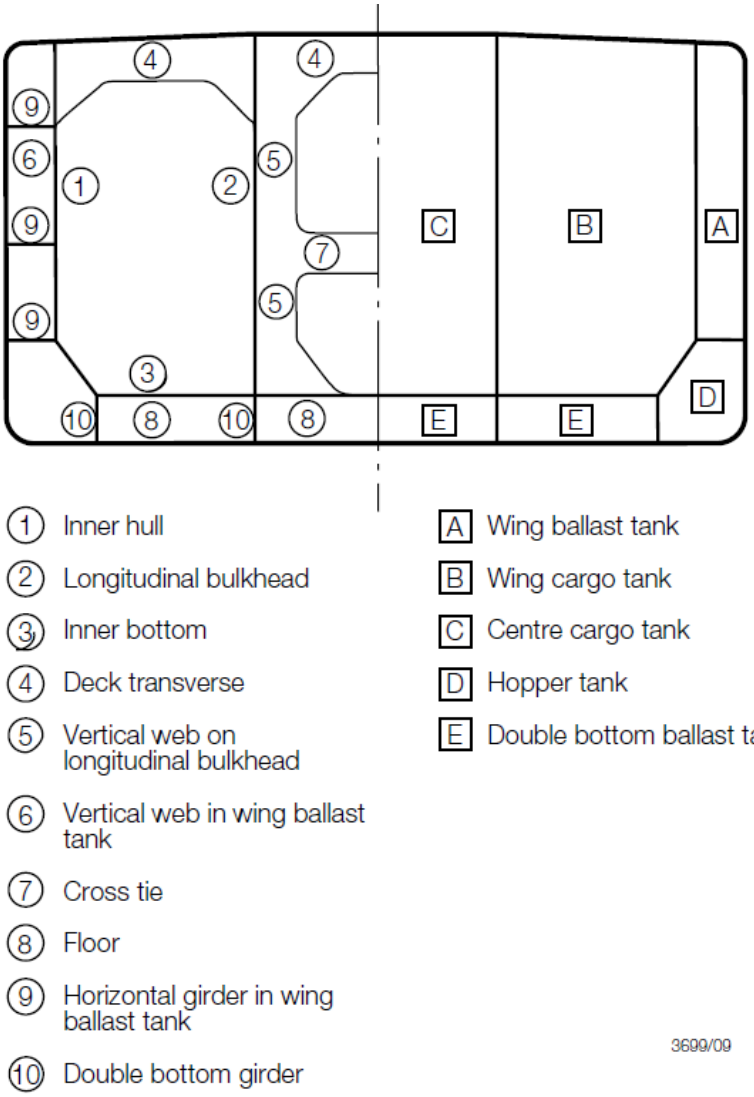
ρ = maximum cargo density, in t/m^3.

1. 5. 2 Where symbols not defined in Pt 4, Ch 9, 1.5 General definitions and symbols 1.5.1 are used these are defined at the head of the Section concerned.

1. 5. 3 For oil tankers of double hull configuration the main structural and spatial terminology within the cargo length, as used in this Chapter, is shown in Figure 9. 1. 4: Structural and spatial terminology.

1. 5. 4 The expression ‘primary member’ as used in this Chapter is defined as a girder, floor, transverse, vertical web, stringer, cross-tie or buttress. ‘Secondary members’ are supporting members other than primary members.

Figure 9. 1. 4: Structural and spatial terminology



1. 6 Information required for CSR Double Hull Oil Tankers

1. 6. 1 Plans and supporting documents/calculations are to be submitted for approval in accordance with the requirements of the CSR.

1. 6. 2 In addition, where not already required by the CSR, plans and supporting documents/calculations are to be submitted for approval as required by Pt 3, Ch 1, 5.2 Plans and supporting calculations.

1. 6. 3 A Ship Construction File (SCF) is to be provided on board of the ship containing information to facilitate inspection/survey, repair and maintenance. As a minimum it is to include documentation and plans in accordance with the requirements of the CSR.

1. 6. 4 For CSR double hull oil tankers subject to *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations Part A-1 - Structure of ships Regulation 3-10 – Goal-based ship construction standards for bulk carriers and oil tankers*, the SCF is to be provided instead in accordance with the requirements specified therein in *SOLAS - International Convention for the Safety of Life at Sea* and for these goal-based standard ships an SCF contents list is to be prepared and submitted for approval.

1. 6. 5 These SCFs are also to include the documentation and plans as listed in Pt 3, Ch 1, 5.3 Plans to be supplied to the ship, where not already required by the CSR or *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations Part A-1 - Structure of ships Regulation 3-10 – Goal-based ship construction standards for bulk carriers and oil tankers*.

1. 6. 6 In all cases, as required by the CSR, *Pt 1, Ch 13 Ship in Operation - Renewal Criteria,* the mid-ship section plan to be supplied on board the ship is to include the minimum required hull girder sectional properties. Sectional properties are to be provided for transverse sections within the cargo length, i.e. each cargo hold, and are to include:

- sectional properties as defined in CSR, *Pt 1, Ch 5, 1 Strength Characteristics of Hull Girder Transverse Sections;*
- the defined section modulus at Deck and at Bottom calculated with the gross offered thickness;
- the sectional area of the defined Deck and Bottom Zones calculated with the gross offered thickness; and
- the sectional area of the defined Neutral Axis Zone calculated with the gross offered thickness minus 0.5 *t*c.

1. 7 Information required for Non-CSR Double Hull Oil Tankers

1. 7. 1 In addition to the plans required by Pt 3, Ch 1, 5 Information required, plans showing the connections for all longitudinals and other framing members and arrangements at intersections of transverse and longitudinal framing are also to be submitted.

1. 7. 2 Any dry tanks, or tanks for water ballast only, are to be indicated on the principal structural and arrangement plans.

1. 7. 3 The information required by Pt 3, Ch 4, 4 Information required is to be forwarded as soon as possible and preferably when the midship section is submitted.

1. 7. 4 A docking plan is to be submitted for consideration of strength requirements in association with the intended docking condition.

1. 7. 5 A plan showing the location of all openings in the deck is to be submitted. Where it is intended to provide holes in the deck for staging wires, these holes are also to be shown. Full particulars of the proposed closing arrangements for all deck openings are to be submitted.

1. 7. 6 Information is required indicating the equipment provided for the acceptable means of access to meet the minimum requirements for Close-up Surveys, *See also* Pt 4, Ch 9, 13.2 Access to spaces in the cargo area 13.2.8, Pt 4, Ch 9, 13.2 Access to spaces in the cargo area 13.2.9 and Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements.

1. 7. 7 A diagrammatic plan verifying compliance with the requirements of Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.17 or Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.18 as appropriate is to be submitted.

PART

4

CHAPTER 9 **Double Hull Oil Tankers**

SECTION 2 **Materials and protection**

2. 1 General

2. 1. 1 Materials, grades of steel and protection of materials are to comply with the requirements of Pt 3, Ch 2 Materials and Pt 2 Rules for the Manufacture, Testing and Certification of Materials.

2. 2 Corrosion protection coatings for salt-water ballast spaces

2. 2. 1 The requirements of Pt 3, Ch 2, 3.6 Application of coatings and alternative means of protection and Ch 15 Corrosion Prevention of Pt 2 *Rules for the Manufacture, Testing and Certification of Materials* are to be complied with.

2. 3 Aluminium structure, fittings and paint

2. 3. 1 Aluminium may, under certain circumstances give rise to incendive sparking on impact with steel, the following requirements are therefore to be complied with:

a. Aluminium fittings in tanks used for the carriage of oil and in cofferdams and pump-rooms are to be avoided wherever possible.

b. Where fitted, aluminium fittings, units and supports, in tanks used for the carriage of oil, cofferdams and pump-rooms are to satisfy the requirements specified in Pt 3, Ch 2, 3 Corrosion protection for aluminium anodes.

c. The danger of mistaking aluminium anodes for zinc anodes must be emphasised. This gives rise to increased hazard if aluminium anodes are inadvertently fitted in unsuitable locations.

d. The underside of heavy portable aluminium structures such as gangways, etc. is to be protected by means of hard plastic or wood cover in order to avoid the creation of smears when dragged or rubbed across steel, which if subsequently struck, may create an incendive spark. It is recommended that such protection be permanently and securely attached to the structures.

2. 3. 2 For permissible locations of aluminium anodes, *See* Pt 3, Ch 2, 3.4 Aluminium and magnesium anodes.

2. 3. 3 Paint containing aluminium should not be used in positions where cargo vapours may accumulate unless it has been shown by appropriate tests that the paint to be used does not increase the incendive sparking hazard. Tests need not be performed for coatings containing less than 10 per cent aluminium by weight.

2. 4 Other materials

2. 4. 1 The suitability of coatings and their compatibility with intended cargoes are the responsibility of the Builder and the Owner. ACS will, however, require the confirmation of the coating

manufacturers that coatings which are used to protect the cargo tank structure are in order for the list of defined cargoes. A copy of the coating manufacturer's product resistance list is to be placed on board.

2. 4. 2 Attention is drawn to the requirements of Pt 3, Ch 11, 7.1 Materials 7.1.4 in respect of compatibility of cargoes and hatch packing materials. The packing material is to be resistant to both the liquids and vapours to which it is exposed.

2. 4. 3 Some plastics and rubbers are unsuitable for certain cargoes other than oil. In such cases the manufacturer's advice should be sought.

2. 4. 4 Some materials or their alloys are unsuitable for certain cargoes other than oil. Where such cargoes are to be carried, the use of these materials is not permitted in locations where they may come into contact with the cargo or its vapours, *See also* Pt 4, Ch 9, 1.1 General 1.1.7.

PART

4

CHAPTER 9 Double Hull Oil Tankers

SECTION 3 Longitudinal strength

3. 1 General

3. 1. 1 The longitudinal strength standard is to comply with the relevant requirements of Pt 3, Ch 4 Longitudinal Strength.

3. 1. 2 The readout points for loading instruments, fitted in accordance with the requirements of Pt 3, Ch 4, 8.3 Loading instrument, are to be positioned at the transverse bulkheads. In general, except when the instrument calculates the maximum values between readout points, the spacing of readout points within the cargo tank length is not to exceed five per cent of the ship length with intermediate points arranged between bulkheads as necessary.

3. 2 Symbols

3. 2. 1 The symbols used in this Section are defined in Pt 4, Ch 9, 1.5, General definitions and symbols.

3. 3 Loading conditions

3. 3. 1 The loading conditions which are to be included in the Loading Manual and examined for longitudinal strength are given in Pt 3, Ch 4, 5 Hull bending strength.

3. 3. 2 The Loading Manual is to contain the calculated still water bending moments and shear forces for the conditions proposed and the maximum permissible values calculated in accordance with Pt 3, Ch 4 Longitudinal Strength.

3. 3. 3 The strengthening of bottom forward derived in accordance with the requirements of Pt 3, Ch 5, 1 General is to be based on the minimum draught forward obtained using segregated ballast tanks only, without recourse to ballasting of cargo tanks.

3. 3. 4 Where bottom forward strengthening has not been arranged, at least one ballast departure and one ballast arrival condition providing for a forward draught of at least $0.045L$ is to be included in the Loading Manual, *See also* Pt 3, Ch 5, 1.5 Strengthening of bottom forward.

3. 3. 5 Where part-load conditions are proposed with a forward draught less than that for which the bottom forward arrangements and scantlings have been approved, the Loading Manual is to provide for the addition of ballast in segregated ballast tanks only as necessary to attain the required draught in heavy weather.

3. 3. 6 Conditions which provide for wing and centre cargo tanks abreast to be filled, with adjacent wing and centre cargo tanks empty, should, in general, be avoided. Similarly, conditions which provide for differential loading of port and starboard wing cargo tanks with centre cargo tanks empty should also be avoided. Where such conditions are contemplated, they will be subject to special consideration which may involve additional calculation in respect of the resultant effects on transverse strength and centre tank cross-tie.

3. 3. 7 Where a double bottom tank is omitted in accordance with Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers 1.3.7 a minimum operating draught T_m is to be indicated on the midship section plan, the Loading Manual and Loading Instrument.

3. 3. 8 Tanks intended for water ballast are to be indicated in the Loading Manual.

3. 3. 9 Where loading conditions having partially filled tanks are contemplated, attention is drawn to the need to ensure that the scantlings of the boundary bulkheads are capable of withstanding the loads imposed by the movement of liquid in the tanks, *See* Pt 4, Ch 9, 6.1 General 6.1.2, Pt 4, Ch 9, 7.1 General 7.1.2 and Pt 4, Ch 9, 14.2 Procedures 14.2.2.

PART

4

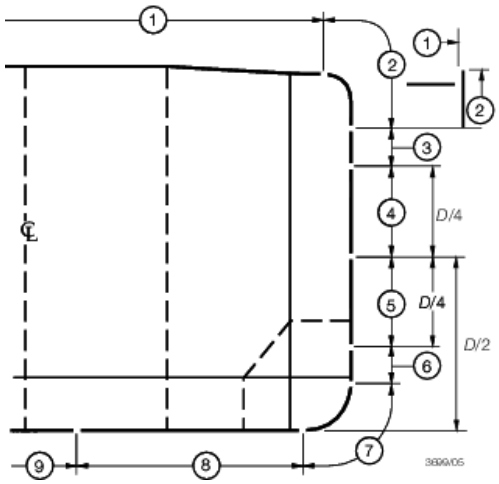
CHAPTER **9** **Double Hull Oil Tankers**

SECTION **4** **Hull envelope plating**

4. 1 General

4. 1. 1 The thickness of hull envelope plating amidships is to be as necessary to comply with the hull section modulus, shear strength and buckling requirements of Pt 3, Ch 4 Longitudinal Strength, but is to be not less than as shown in Table 9. 4. 1: Hull envelope plating - minimum thickness, in mm for the parts itemised in Figure 9. 4. 1: Hull envelope plating - Itemisation of parts (See Table 9. 4. 1: Hull envelope plating - minimum thickness, in mm). Panel stability is also to be confirmed by direct calculation taking account of shear stress and direct stresses derived from both transverse and longitudinal strength investigation.

Figure 9. 4. 1: Hull envelope plating - Itemisation of parts (*See* Table 9. 4. 1: Hull envelope plating - minimum thickness, in mm)



4. 1. 2 For requirements in respect of structural details, bilge keels, attachments, etc. *See* Pt 3, Ch 10 Welding and Structural Details. In addition the *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG), indicates recommended structural design configurations for double hull tanker structural details to assess and improve the relative fatigue life performance of the details in critical areas.

4. 2 Symbols

4. 2. 1 The symbols used in this Section are defined as follows:

F_D, F_B = as defined in Pt 3, Ch 4, 5.7 Local reduction factors

F_M = the greater of F_D or F_B

$$J = 1720.5\sqrt{\frac{1-\frac{1}{\alpha}}{\sigma_o}} f \text{ for } \alpha \leq 2$$

$$(J = 549.3\sqrt{\frac{1-\frac{1}{\alpha}}{\sigma_o}} f \text{ for } \alpha \leq 2)$$

$$J = 860.7\sqrt{\frac{\alpha}{\sigma_o}} f \text{ for } \alpha > 2$$

$$(J = 274.8\sqrt{\frac{\alpha}{\sigma_o}} f \text{ for } \alpha > 2)$$

s = spacing, in mm, of longitudinals or transverse frames. Except where indicated in the text, s is not to be taken less than:

$$470 + \frac{L}{0.6} \text{ mm}$$

- or 700 mm whichever is the lesser. For limitations in end regions, *See* Pt 3, Ch 5, 3 Shell envelope plating and Pt 4, Ch 6, 3 Longitudinal strength

C_w = a wave head, in metres

= $7.71 \times 10^{-2} L e^{-0.0044L}$

where

e = base of natural logarithms 2.7183

R_B = bilge radius, in mm, as defined in Table 1. 5. 2: Bottom shell and bilge plating in Pt 4, Ch 1 General Cargo Ships

S = overall span of frame, in mm, measured between deck and bottom support points or to, or between, stringers, where fitted

T_1 = T but to be taken not less than $0.05L$ m

α = $\frac{\sigma_o}{\sigma_c}$

σ_c = maximum compressive hull vertical bending stress, in N/mm^2 given by σ_D and σ_B as defined in Pt 3, Ch 4, 5.6 Permissible hull vertical bending stresses 5.6.1 as appropriate

= For ships of normal design, not exceeding 90 metres in length, the value of maximum compressive hull vertical bending stress may be determined as follows:

= at strength deck

= $\sigma_B = 654LB\frac{Z_{min}}{Z_B}\sigma \times 10^{-6} \text{N/mm}^2$

= at keel

= $\sigma_B = 654LB\frac{Z_{min}}{Z_B}\sigma \times 10^{-6}\text{N/mm}^2$

= where Z_{min}, Z_D, Z_B and σ are in accordance with Pt 3, Ch 4, 5 Hull bending strength

σ_o = specified minimum yield stress, in N/mm^2

h_{T1} = $T + C_w$ m but need not be taken greater than $1.36T$

h_{T2} = $T + 0.5C_w$ m but need not be taken greater than $1.2T$

= For longitudinally framed bottom and bilge plating T is to be taken as T_1

Other symbols are defined in Pt 4, Ch 9, 1.5, General definitions and symbols.

Table 9. 4. 1: Hull envelope plating - minimum thickness, in mm

Longitudinally framed	Item	Item No. *See* Fig. 9.4.1	Transversely framed, *See* Pt 4, Ch 9, 1.3, Class notation and applicable Rules for CSR Double Hull Oil Tankers for limits of application

		4	$t = 0.001s(0.059\ L_1 + 7)\sqrt{\frac{F_M}{k_L}}$ *See* Notes 6 and 7 or $t = 0.0051s\sqrt{h_{T1}k}$ whichever is the greater *See* Note 1
$t = 0.001s(0.059\ L_1 + 7)\sqrt{\frac{F_B}{k_L}}$ *See* Notes 6 and 7 But not less than:	Side shell below mid-depth	5	

(a) $t = 0.0042s\sqrt{h_{T1}k}$ at mid-depth (b) $t = 0.0054s\sqrt{\frac{h_{T2}k}{2 - F_B}}$ mm at upper turn of bilge *See* Notes 1 and 2	Intermediate thickness by interpolation Intermediate thickness by interpolation		6	$t = \frac{0.00085\ s}{1 + \left(\frac{s}{S}\right)^2}(0.083\ L_1 + 10)\sqrt{\frac{F_B}{k_L}}$ *See* Notes 2, 6 and 7 or $t = 0.0056_s\sqrt{\frac{h_{T2}k}{1.8 - F_B}}$ mm whichever is the greater *See* Note 1
$t = \frac{s}{J} + 2.0$ mm or $t = 0.0052s\sqrt{\frac{h_{T2}k}{1.8 - F_B}}$ mm whichever is the greater *See* Note 1	Bilge (*See* Note 4)	7	$t = \frac{0.00085\ s}{1 + \left(\frac{s}{S}\right)2}(0.083\ L_l + 10)\sqrt{\frac{F_B}{k_L}}$ *See* Notes 6 and 7 or $t = 0.0063_s\sqrt{\frac{h_{T2}k}{1.8 - F_B}}$ mm whichever is the greater *See* Note 1
	Bottom shell	8	*See* Pt 4, Ch 9, 1.3, Class notation and applicable Rules for CSR Double Hull Oil Tankers
As for item 8, +2mm, but need not exceed $25\sqrt{k}mm$	Keel	9	

Note *1*. The thickness is also to satisfy the buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength.

Note *2*. The thickness of side shell plating need not exceed that which would be required for the bottom shell using the spacing of the side shell longitudinals.

Note *3*. In no case is the plating thickness to be less than the cargo tank minimum value given in Pt 4, Ch 9, 10 Construction details and minimum thickness, or the basic shell end thickness for taper given in Pt 3, Ch 5 Fore End Structure and Pt 3, Ch 6 Aft End Structure.

Note *4*. *See also* Pt 4, Ch 9, 4.6 Bilge plating 4.6.2 concerning plating thickness where longitudinal framing is fitted at bottom and side, but omitted in way of bilge.

Note *5*. Keel thickness is in no case to be less than that of the adjacent bottom shell plating.

Note *6*. Where separate maximum sagging and hogging still water bending moments are assigned, F_D may be based on the sagging moment and F_B on the hogging moment.

Note *7*. Outside the Rule minimum region of higher tensile steel as defined in Pt 3, Ch 3, 2.6 Vertical extent of higher tensile steel 2.6.1 the value of k_L may be taken as 1.0.

4. 3 Deck plating

4. 3. 1 The midship thickness of deck plating is to be maintained for 0.4*L* amidships and tapered outside this region in association with the deck longitudinals in accordance with Pt 4, Ch 9, 5.5 Deck longitudinals outside 0.4L amidships. The midship thickness may, however, be required over an increased extent if it is shown to be necessary by the bending moment curves. Where partial filling

of the tanks is contemplated the deck plating is also to comply with the requirements of Pt 4, Ch 9, 6.1 General 6.1.2.

4. 3. 2 For ships not exceeding 200 m in length, the deck thickness outside 0.4L amidships is to be not less than $\frac{s}{80}$ at any point within the cargo tank region. For lengths of 250 m and over, the thickness is to be not less than $\frac{s}{70}$. Intermediate values are to be obtained by interpolation. For the purpose of this paragraph, the minimum value of s given in Pt 4, Ch 9, 4.2 Symbols 4.2.1 is not to be applied.

4. 3. 3 The plating thickness outside 0.4L amidships is to be not less than:

$$t = \frac{s}{J} + 2.0 \text{ mm}$$

Where

J = is defined in Pt 4, Ch 9, 4.2 Symbols 4.2.1 using σ_o of the plating at the location under consideration.

4. 4 Sheerstrake

4. 4. 1 The midship sheerstrake thickness is to be maintained for 0.4L amidships and tapered outside this region as provided for in Pt 3, Ch 5 Fore End Structure and Pt 3, Ch 6 Aft End Structure. In the taper region, however, the sheerstrake thickness need not exceed the adjacent deck or shell thickness, whichever is the greater.

4. 4. 2 The width of sheerstrake for 0.4L amidships is to be not less than that required by Table 2. 2. 1: Material classes and grades.

4. 4. 3 Where a rounded sheerstrake is incorporated, the radius is not, in general, to be less than 15 times the thickness. The radius is to be made by careful cold rolling or bending.

4. 5 Shell plating

4. 5. 1 The midship thicknesses of side and bottom shell plating are to be maintained for 0.4L amidships and tapered outside this region as provided for in Pt 3, Ch 5 Fore End Structure and Pt 3, Ch 6 Aft End Structure. The midship thicknesses may be required over an increased extent if it is shown to be necessary by the bending moment or shear force curves.

4. 5. 2 The requirements of Pt 3, Ch 5 Fore End Structure are to be complied with in respect of the thickness of bottom shell forward.

4. 6 Bilge plating

4. 6. 1 The midship thickness of the bilge plating is to be maintained for 0.4L amidships and tapered outside this region as provided for in Pt 3, Ch 5 Fore End Structure and Pt 3, Ch 6 Aft End Structure.

4. 6. 2 Where longitudinal bottom and side framing is adopted, but longitudinals are omitted between the upper and lower extremities of the bilge radius, the bilge thickness is to be not less than $\frac{R_B F_B}{165 k_L}$ in addition to the required minimum thickness derived from Table 9. 4. 1: Hull envelope plating - minimum thickness, in mm. The spacing of transverse supports associated with such an arrangement is to comply with the requirements of Pt 4, Ch 9, 5.4 Bilge longitudinals and brackets.

4. 6. 3 Where bilge longitudinals are omitted, the plating thickness outside 0.4L amidships will be considered in relation to the support derived from the hull form and internal stiffening

arrangements. Due regard will be taken of the possibility of increased loading in the forward region.

4. 7 Keel

4. 7. 1 The midship keel thickness is to be maintained throughout the cargo tank region, except as required by Table 9. 4. 1: Hull envelope plating - minimum thickness, in mm, Note 5.

4. 7. 2 The width of the keel over the cargo tank region is to be not less than:

$70B$ mm but need not exceed 1800 mm and is to be not less than 750 mm.

4. 8 Taper of higher tensile steel

4. 8. 1 Where higher tensile steel is used amidships and mild steel at the ends, the thickness of bottom shell, bilge and sheerstrake is to be tapered as provided for in Pt 3, Ch 3 Structural Design, Pt 3, Ch 5 Fore End Structure and Pt 3, Ch 6 Aft End Structure.

4. 8. 2 Higher tensile steel deck plating is to be tapered in association with attached longitudinals as provided for in Pt 4, Ch 9, 5.5 Deck longitudinals outside 0.4L amidships.

4. 9 Thicknesses at ends of erections

4. 9. 1 The deck plating thickness at the poop front is to extend into the poop for a distance at least equal to one-third of the breadth, B.

4. 9. 2 If the poop front extends to within $0.25L$ of amidships, the sheerstrake and the stringer plate at the break are to be increased by 20 per cent. No increase is required if the poop front is $0.3L$ from amidships or greater. The increase at intermediate lengths is to be obtained by interpolation and is to be applied to the tapered thickness of the sheerstrake and stringer plate.

4. 9. 3 Where the poop extends to within $0.3L$ of amidships and the enclosed machinery opening extends to within $\frac{B}{3}$ of the poop front and has a width exceeding one half of the breadth of the ship at the poop front, the thickness of deck plating may require to be increased. The forward corners of the casing opening are to be well rounded.

4. 10 Deck openings

4. 10. 1 Openings in the deck are to be kept to the minimum number consistent with operational requirements.

4. 10. 2 Plate panels in which openings are cut are to be adequately stiffened, where necessary, against compression and shear buckling.

4. 10. 3 The corners of all openings are to be well rounded, and the edges smooth.

4. 10. 4 Where the stress concentration factor in way of the opening exceeds 2.4, edge reinforcement is generally to be fitted. This is normally to be in the form of a spigot of adequate dimensions, but alternative arrangements will be considered.

4. 10. 5 Alternatively, the shape of the opening is to be such that a stress concentration factor of 2.4 is not exceeded.

4. 10. 6 In this respect, reinforcement will not, in general, be required in way of:

a. elliptical openings having their major axis fore and aft and ratios of length to breadth not less than 2 to 1, or

b. openings of other shapes, provided it has been shown by suitable tests that the stress concentration factor does not exceed 2.4.

4. 10. 7 Circular openings of diameter up to 325 mm will also be accepted, provided that they are situated at such a distance from any other opening that there is an intervening width of plating of not less than five times the diameter of the smaller of the two openings.

4. 10. 8 Where within 0.4*L* amidships deck openings have a total breadth or shadow area breadth in one transverse section that exceeds the limitation given in Pt 3, Ch 3, 3.4 Calculation of hull section modulus 3.4.6 and Pt 3, Ch 3, 3.4 Calculation of hull section modulus 3.4.7, compensation will be required to restore the excess. This is generally to be arranged by increasing the deck plate thickness, but other proposals will be considered.

4. 10. 9 Where a deck longitudinal is cut in way of an opening, within 0.4*L* amidships, compensation is to be arranged to ensure full continuity of area.

4. 10. 10 The area of any edge reinforcement which may be required is not to be taken into account in determining the required sectional area of compensation unless such reinforcement is designed to absorb the loadings from cut longitudinals in way of opening.

4. 10. 11 Increased scantlings and/or compensation may also be required for large openings outside 0.5*L* amidships, or where openings are close to breaks of superstructure or other areas of high stress in any location on the ship.

4. 10. 12 Where small diameter threaded openings for staging wires are arranged on the upper deck, they are to be located clear of the other openings and similar areas of stress concentration. Care is to be taken to ensure a gradual transition at the thread ends and the edges of the holes are to be smooth. The closing arrangements are to be as required by Pt 4, Ch 9, 13 Access arrangements and closing appliances.

4. 11 Shell openings

4. 11. 1 Sea inlets in pump-rooms situated within 0.4*L* amidships, are, if practicable, to be fitted clear of the bilge radius. All openings are to be arranged so as to minimise discontinuity of transverse frames, longitudinals or bilge keels. Compensation is to be provided for all openings within 0.4*L* amidships and may also be required for openings in the vicinity of the poop front. The compensation should, if possible, take the form of an insert plate rather than a doubler.

4. 11. 2 If openings are not circular or oval, the corners are to be rounded with as large a radius as practicable.

4. 12 Superstructures

4. 12. 1 The thickness of plating forming the deck and sides of forecastles and poops is to be as required by Pt 3, Ch 5 Fore End Structure, Pt 3, Ch 6 Aft End Structure and Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks.

PART

4

CHAPTER **9** **Double Hull Oil Tankers**

SECTION **5** **Hull framing**

5. 1 General

5. 1. 1 In the cargo tank region, the scantlings of deck, bottom and side longitudinals, and of transverse side framing, where fitted, are to be in accordance with the requirements of this Section.

5. 1. 2 Longitudinal and transverse framing members outside the cargo tank region are to comply with the requirements of Pt 3, Ch 5, 4 Shell envelope framing, Pt 3, Ch 6, 4 Shell envelope framing and Pt 3, Ch 7 Machinery Spaces, as appropriate to their location.

5. 1. 3 Outside the cargo tank region the structure is to be scarfed into the end structure as provided for in Pt 3, Ch 5 Fore End Structure, Pt 3, Ch 6 Aft End Structure and Pt 3, Ch 7 Machinery Spaces.

5. 2 Symbols

5. 2. 1 The symbols used in this Section are defined as follows:

b_f = the width of the face plate, in mm, of the side longitudinal under consideration, *See* Figure 9. 5. 1: Definition of b f and b f1

b_{f1} = the minimum distance, in mm, from the edge of the face plate of the side longitudinal under consideration to the centre of the web plate, *See* Figure 9. 5. 1: Definition of b f and b f1

b_1 = the value as defined in Table 9. 5. 3: Determination of b1

c_1 = $\frac{60}{225-165F_D}$ at deck

= 1.0 at $\frac{D}{2}$

= $\frac{75}{225-150F_B}$ at base line of ship intermediate values of c_1 by interpolation

c_2 = $\frac{165}{345-180F_D}$ at deck

= 1.0 at $\frac{D}{2}$

= $\frac{165}{345-180F_B}$ at base line of ship intermediate values of c_2 by interpolation

d_w = depth of web, in mm

h = distance of longitudinal below deck at side, in metres. For deck longitudinals, h=0

h_o = the distance, in metres, from the mid-point of span of the stiffener to the highest point of tank, excluding hatchway

h_1 = $\left(h_o + \frac{D_1}{8}\right)$, but in no case to be taken less than $\frac{L_1}{56}$ m or $(0.01L_1 + 0.7)$ m, whichever is the greater, and need not be taken greater than $\left(0.75D + \frac{D_1}{8}\right)$ for bottom longitudinals

h_2 = distance, in metres, from mid-point of span of transverse side frame to deck at side measured at mid-length of tank, but to be taken not less than 2.5 m

h_3 = h_0+Rb_1, but need not be taken greater than $(0.75D + Rb_1)$ for bottom longitudinals

l_e = effective length, in metres, of longitudinals measured between span points, but to be taken not less than 1.5 m in double bottom and 2.5 m elsewhere. For determination of span points, *See* Pt 3, Ch 3, 3 Structural idealisation.

t_f = thickness of flange, in mm

t_s = thickness of the bilge shell plating, in mm

t_w = thickness of web, in mm

$D1$ = D, in metres, but is to be taken not less than 10 and need not be taken greater than 16

F_B = as defined in Pt 3, Ch 4, 5.7 Local reduction factors

F_D = as defined in Pt 3, Ch 4, 5.7 Local reduction factors

F_1 = a factor determined from Table 9. 5. 1: Values of F1

F_2 = a factor determined from Table 9. 5. 2: Values of F2

R = sinθ

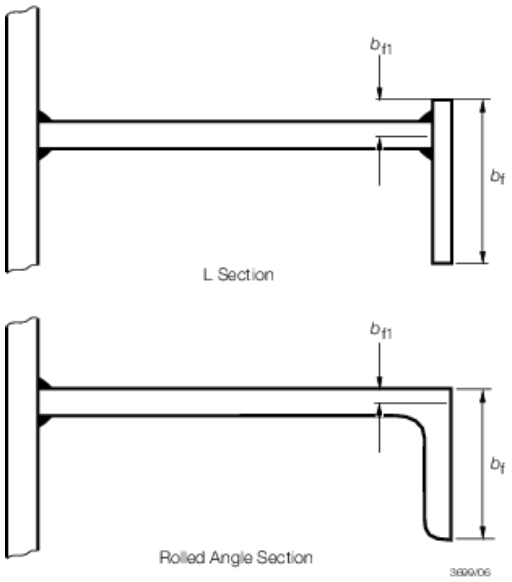
= where θ is the roll angle, in degrees

= and $\sin\ \theta = \left(0.45 + 0.1\frac{L}{B}\right)\left(0.54 - \frac{L}{1270}\right)$

R_B = bilge radius, in mm, as defined in Table 1. 5. 2: Bottom shell and bilge plating in Pt 4, Ch 1 General Cargo Ships

Other symbols are defined in Pt 4, Ch 9, 1.5, General definitions and symbols

Figure 9. 5. 1: Definition of b f and b f1



5. 3 Deck, side and bottom longitudinals

5. 3. 1 The modulus of longitudinals within the cargo tank region, except as provided for in Pt 4, Ch 9, 5.3 Deck, side and bottom longitudinals 5.3.2 and Pt 4, Ch 9, 5.5 Deck longitudinals outside 0.4L amidships is to be not less than the greater of the following:

a. $Z = 0.056\, skh_1 le^2 F_1\ F_s cm^3$, or

b. $Z = 0.0051 skh_3 l_e^2\ F_2\ cm^3$

where F_1 and F_2 values are as given in Table 9. 5. 1: Values of F1 and Table 9. 5. 2: Values of F2 and F_s is a fatigue factor to be taken as follows:

F_s = $\frac{l.l}{k}\left[1 - \frac{2b_{f1}}{b_f}(1-k)\right]$ at $0.6D$ above the base line

= 1.0 at upper deck at side and at the base line, intermediate values by linear interpolation

For flat bars and bulb plates $\frac{b_{f1}}{t_{f1}}$ may be taken as 0.5

The modulus of side longitudinals need not exceed that of a bottom longitudinal having the same spacing and configuration.

Table 9. 5. 1: Values of F_1

Item	F_1
Deck longitudinals and side longitudinals above $\frac{D}{2}$	$\frac{Dc_1}{4D + 20h}$
Side longitudinal and bottom longitudinals below $\frac{D}{2}$	$\frac{Dc_1}{25D - 20h}$
Note Minimum $F_1 = 0.12$	

Table 9. 5. 2: Values of F_2

Item	F_2
Deck longitudinals and side longitudinals above $\frac{D}{2}$	$\frac{Dc_2}{D + 2.18h}$
Side longitudinal and bottom longitudinals below $\frac{D}{2}$	$\frac{Dc_2}{3.18D - 2.18h}$
Note Minimum $F_2 = 0.73$	

5. 3. 2 The modulus of bottom longitudinals is to satisfy the requirements of Pt 4, Ch 9, 5.3 Deck, side and bottom longitudinals 5.3.1 or Table 1. 6. 1: Shell framing (longitudinal) (3) in Pt 4, Ch 1 General Cargo Ships, whichever is the greater.

5. 3. 3 The section modulus given is that of the longitudinal and associated plating, for the extent of the associated plating, *See* Pt 3, Ch 3, 3.2 Geometric properties of section 3.2.3. The webs and flanges are to comply with the minimum thickness requirements of Pt 4, Ch 9, 10 Construction details and minimum thickness.

5. 3. 4 Where the spacing of transverses exceeds 5.5 m, the scantlings of side and bottom longitudinals in way of bulkheads and primary members, including end connections, are to be verified by direct calculation.

5. 3. 5 The side and bottom longitudinal scantlings derived from Pt 4, Ch 9, 5.3 Deck, side and bottom longitudinals 5.3.1 and Pt 4, Ch 9, 5.3 Deck, side and bottom longitudinals 5.3.2, using the midship thickness of plating, are to extend throughout the cargo tanks. Where the shell plating is inclined at an angle to the horizontal longitudinal axis of greater than 10°, the span of the longitudinals is to be measured along the member. Where the shell plating is inclined at an angle to the vertical axis of greater than 10°, the spacing of longitudinals is to be measured along the chord between members. Where the angle of attachment of side longitudinals clear of amidships varies by 20° or more from a line normal to the plane of the shell, the properties of the section are to be determined about an axis parallel to the attached plating. Angles of slope greater than 40° are to be avoided.

5. 3. 6 Fabricated longitudinals having the face plate welded to the underside of the web, leaving the edge of the web exposed, are not recommended for shell, inner hull or longitudinal bulkhead longitudinals. Where it is proposed to fit such sections, a symmetrical arrangement of connection to transverse members is to be incorporated. This can be achieved by fitting backing brackets on the opposite side of the transverse web or bulkhead. The primary member web stiffener and backing bracket are to be lapped to the longitudinal. Recommended examples of such backing structure can be *See*n in the *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG).

5. 3. 7 Where partial filling of the tanks is also contemplated the deck longitudinals are to comply with the requirements of Pt 4, Ch 9, 6.1 General 6.1.2.

5. 3. 8 Stiffeners and brackets on vertical webs in wing ballast tanks, where fitted on one side and connected to higher tensile steel longitudinals between the base line and 0.8D above the base line, are to have their heels well radiused to reduce stress concentrations. Where a symmetrical arrangement is fitted, i.e. bracket or stiffening on both sides, and they are connected to higher tensile steel longitudinals, the toes of the stiffeners or brackets are to be well radiused. Alternative arrangements will be considered if supported by appropriate fatigue life assessment calculations.

5. 3. 9 Where higher tensile steel side longitudinals pass through transverse bulkheads in the cargo area, well radiused brackets of the same material are to be fitted on both the fore and after side of the connection between the upper turn of bilge and 0.8D above the base line. Particular attention should be given to ensuring the alignment of these brackets. Alternative arrangements will be considered if supported by appropriate fatigue life assessment calculations.

Table 9. 5. 3: Determination of b_1

Item No.	Structural arrangement	Location	Value of b_1, metres
1	Where wing and double bottom ballast tanks port and starboard are interconnected	(a) Bottom longitudinals	The greater horizontal distance from ship side to the longitudinal
		(b) Side longitudinals	Breadth of ship
		(c) Deck longitudinals	(i) In way of cargo tanks and inboard ballast tanks, the greater horizontal distance from tank corner at top of tank to longitudinal, either side (ii) In way of wing ballast tanks, the greater horizontal distance from ship side to longitudinal, either side
2	Where wing ballast tanks port and starboard are separate	(a) Bottom longitudinals	The horizontal distance from ship side to longitudinal
		(b) Side longitudinals	Width of wing ballast tank

5. 4 Bilge longitudinals and brackets

5. 4. 1 The scantlings of bilge longitudinals are to be graduated between those required for the bottom and lowest side longitudinals.

5. 4. 2 Where bilge longitudinals are omitted, the spacing of transverses or equivalent bilge brackets must not exceed:

$$8 \times 10^6 \frac{t_s^2}{DR_B} \sqrt{\frac{t_s}{R_B}} \text{mm}$$

Where no intermediate brackets are fitted between transverses, the spacing between the two outermost bottom longitudinals and between the two lowest side longitudinals is not to exceed one-third of the bilge radius or 40 times the local shell thickness, whichever is the greater.

5. 4. 3 Attention is drawn to Pt 4, Ch 9, 4.6 Bilge plating 4.6.2 and Pt 4, Ch 9, 4.6 Bilge plating 4.6.3 concerning bilge plating thickness where longitudinals are omitted.

5. 5 Deck longitudinals outside 0.4*L* amidships

5. 5. 1 Within the cargo tank region, deck longitudinals may be gradually tapered outside 0.4*L* amidships in association with the deck plating, on the basis of area and modulus. For the requirements, *See* Pt 3, Ch 3, 2.5 Taper requirements for hull envelope and Table 3. 2. 1: Taper requirements for hull envelope, *See also* Pt 4, Ch 9, 5.3 Deck, side and bottom longitudinals 5.3.5.

5. 5. 2 The midship spacing of longitudinals is, in general, to be maintained throughout the cargo tank region. The plating thickness and longitudinal depth and thickness are not to be increased at any point in the direction of the taper of area towards the ends of the ship, other than as may be required for compensation for openings. Changes of longitudinal section are, in general, to be avoided.

5. 5. 3 Attention is also drawn to Pt 4, Ch 9, 5.3 Deck, side and bottom longitudinals 5.3.3, which is to be complied with, where necessary, by maintaining a constant deck plating thickness in way of the ends of the cargo tank region.

5. 5. 4 Where the spacing of transverses in cargo tanks is not constant and variations in longitudinal scantlings are contemplated to suit differing spans, individual consideration will be given to the taper arrangements.

5. 6 Stability of longitudinals

5. 6. 1 The lateral and torsional stability of longitudinals together with web and flange buckling criteria are to be verified in accordance with Pt 3, Ch 4, 7 Hull buckling strength.

5. 6. 2 In addition, the following requirements are to be satisfied:

a. Flat bar longitudinal

i. when continuous at bulkheads

$$\frac{d_w}{t_w} \leq 18\sqrt{k_L}$$

ii. when non-continuous at bulkheads

$$\frac{d_w}{t_w} \leq 15\sqrt{k_L}$$

b. Built sections

i. $\frac{d_w}{t_w} \leq 60\sqrt{k_L}$

ii. $\frac{b_f}{t_f} \leq 15$ for asymmetric sections

iii. $\frac{b_f}{t_f} \leq 30$ for symmetric sections.

5. 7 Connections of longitudinals

5. 7. 1 Connections of longitudinals to bulkheads are to provide adequate fixity and continuity of longitudinal strength. *See also* the *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG), for recommended design details in critical areas.

5. 7. 2 Where the length of the ship exceeds 150 m, the longitudinals within 0.1*D* of the bottom and deck are to be continuous through the transverse bulkheads. Higher tensile steel longitudinals are to be continuous irrespective of ship length. Alternative arrangements will be individually considered.

5. 7. 3 Longitudinals are to be connected to transverse primary members as required by Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members.

5. 8 Openings in longitudinals

5. 8. 1 In general, closely spaced scallops are not permitted in longitudinals within the range of cargo tanks except in way of ballast pipe suctions, reinforcement in these areas will be specially considered.

5. 8. 2 Small air and drain holes, cut-outs at erection butts and similar widely spaced openings are, in general, to be not less than 200 mm clear of the toes of end brackets, intersections with primary supporting members and other areas of high stress. All openings are to be well rounded with smooth edges.

5. 8. 3 Drain holes in higher tensile steel longitudinals attached to higher tensile steel plating are to be elliptical in shape or of equivalent design to minimise stress concentrations. The opening is generally to be located clear of the welded connection to the plating, but where a flush opening is essential for drainage the weld connection is to end in a soft toe.

5. 8. 4 Small circular air holes may be arranged in higher tensile steel deck longitudinals.

5. 8. 5 Isolated openings spaced greater than 1 metre apart need not be taken into account in calculating the section modulus of the longitudinal, provided that the depth does not exceed 10 per cent of the web depth, or 75 mm, whichever is the greater, but in no case more than 25 per cent of the depth of the longitudinal.

5. 8. 6 Where the depths given in Pt 4, Ch 9, 5.8 Openings in longitudinals 5.8.5 are exceeded, the arrangements are to be such as will minimise resultant stress concentration.

5. 9 Transverse side frames

5. 9. 1 For limits of application of transverse side framing, *See* Pt 4, Ch 9, 1.3, Class notation and applicable Rules for CSR Double Hull Oil Tankers.

5. 9. 2 The section modulus of transverse side frames is to be not less than:

$Z = 0.01025 k s h_2 l e^2$ cm^3, where side webs are fitted;

or

$Z = 0.012 k s h_2 l_e^2$ cm^3, where side webs are not fitted.

5. 9. 3 The size of the frame is to be governed by the maximum modulus derived from the appropriate formula in Pt 4, Ch 9, 5.9 Transverse side frames 5.9.2, and is to be maintained for the full depth of the ship.

5. 9. 4 The section modulus given is that of the frame and associated side shell plating. The frame is to comply with the minimum thickness requirements of Pt 4, Ch 9, 10 Construction details and minimum thickness.

5. 9. 5 The inertia of transverse side frames is to be not less than:

In the forward $0.15L$: $I = 3.5 l_e Z$ cm^4

Elsewhere: $I = 3.2 l_e Z$ cm^4.

PART

4

CHAPTER 9 **Double Hull Oil Tankers**

SECTION 6 **Inner hull, inner bottom and longitudinal oiltight bulkheads**

6. 1 General

6. 1. 1 The inner hull, inner bottom and longitudinal bulkheads are generally to be longitudinally framed. Longitudinal bulkheads may be plane or horizontally corrugated. Centreline longitudinal bulkheads may also be vertically corrugated, *See* Pt 4, Ch 9, 1.4 Class notation and applicable Rules for non-CSR Double Hull Oil Tankers 1.4.15. Scantlings of inner hull and longitudinal oiltight bulkheads are to be in accordance with Table 9. 6. 1: Inner hull and longitudinal oiltight bulkhead scantlings and panel stability is also to be confirmed from primary structure direct calculations. The calculation is to take account of the shear stress and direct stresses derived from both the transverse and longitudinal strength investigations.

Table 9. 6. 1: Inner hull and longitudinal oiltight bulkhead scantlings

Item	Horizontally stiffened/Vertically stiffened
(1) Plating thicknesses including corrugations (mm) *See* Notes 1 and 7	(a) Within 0.1D of the deck: $t=t_0$ (b) Within 0.1D of the bottom shell: $t = \frac{t_0}{\sqrt{2-F_B}}$ (but not less than t_1) (c) Elsewhere: $t=t_1$ *See* Note 6 (d) But not less than $t = 0.0009s(0.059L_1 + 7)$
(2) Stiffener modulus (cm^3) *See* Notes 3 and 4	(a) Horizontally stiffened: (i) $Z = 0.056\mathrm{kh}_2\mathrm{Sl}_e^2F_1$ whichever is the greater (ii) $Z = 0.0051\mathrm{kh}_4\mathrm{Sl}_e^2F_2$ whichever is the greater (b) Vertically stiffened: $Z = 0.0067\mathrm{kSl}_e^2h_5$
(3) Corrugation properties *See* Note 7	(a) Modulus (cm^3): $Z = 0.0085ph_5l_e^2k$ (b) Inertia (cm^4):

	$I = 0.032ph_s le^3$

Note *1.* The plating thicknesses are not to be less than as necessary to comply with the buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength.

Note *2.* The section modulus given by the formula is that of the stiffener and associated plating or of the corrugation over pitch, *p*.

Note *3.* For vertical stiffeners, the ratio of web depth to web thickness is not to exceed 60 $\sqrt{k}$ for stiffeners with flanges or face plates, and 18 $\sqrt{k}$ for flat bars. Horizontal stiffeners are to comply with Pt 4, Ch 9, 5.6 Stability of longitudinals.

Note *4.* The minimum thickness criteria given in Pt 4, Ch 9, 10 Construction details and minimum thickness are also to be complied with and the stiffener web thickness is to be sufficient to withstand the imposed shear forces.

Note *5.* The minimum moment of inertia represented by item 3(b) of the Table is not to be reduced on account of higher tensile steel being incorporated.

Note *6.* In applying item 1(c) of the Table, it is necessary to calculate values of t_0 for plate panels within 0.4*D* each side of mid-depth, take the minimum value, t_m, and then determine value of t_1.

Note *7.* For vertically corrugated centreline longitudinal bulkheads *See also* Table 1. 9. 2: Symmetrical corrugations and double plate bulkheads (additional requirements) in Pt 4, Ch 1 General Cargo Ships for deep tanks.

6. 1. 2 Where tanks are intended to be partially filled, the scantlings and structural arrangements of the boundary bulkheads are to be capable of withstanding the loads imposed by the movement of liquid in the tanks. The magnitude of the predicted loadings, together with the scantling calculations, may require to be submitted.

6. 2 Symbols

6. 2. 1 The symbols used in this Section are defined as follows:

b_1 = the greater horizontal distance, in metres, from a point one third of the height of the strake above its lower edge or mid-point of the stiffener span, to the corners at the top of the tank on either side.

Where the angle α is less than $\left(32.5 - \frac{L}{20}\right)$ degrees, the distance is measured to the widest point of the tank, *See* Figure 9. 6. 1: Illustration of b1 determination.

α = angle, in degrees, as indicated in .

c_1 = $\frac{60}{225-165F_D}$ at deck

= 1.0 at $\frac{D}{2}$

= $\frac{75}{225-150F_B}$ at base line of ship

intermediate values of c_1 by interpolation

c_2 = $\frac{165}{345-180F_D}$ at deck

= 1.0 at $\frac{D}{2}$

= $\frac{165}{345-180F_B}$ at base line of ship

intermediate values of c_2 by interpolation

h = load height, in metres measured vertically as follows:

(a) For bulkhead plating, the distance from a point one third of the height of the plate panel above its lower edge to the highest point of the tank, excluding hatchway

(b) for bulkhead stiffeners or corrugations, the distance from the mid-point of span of the stiffener or corrugation to the highest point of the tank, excluding hatchway

h_1 = $\left(h + \frac{D_1}{8}\right)$, but not less than $0.72(h + Rb_1)$

h_2 = $\left(h + \frac{D_1}{8}\right)$, in metres, but in no case to be taken less than $\frac{L_1}{56}$m or $(0.01L_1 + 0.7)$m, whichever is the greater

h_3 = distance of longitudinal below deck at side, in metres, but is not to be less than 0

h_4 = $h + Rb_1$

h_5 = h_2 but is to be not less than $0.55h_4$

l_e = effective length, in metres, of longitudinals measured between span points, but is not to be taken less than 2.5 m. For determination of span points, *See* Pt 3, Ch 3, 3 Structural idealisation

p = pitch of symmetrical corrugations, in mm

s = spacing, in mm, of bulkhead stiffeners for plane bulkheads. In case of symmetrical corrugations, s is to be taken as b or c in Figure 3. 3. 1: Corrugation dimensions in Pt 3, Ch 3 Structural Design, whichever is the greater

t_0 = $0.005s\sqrt{kh_1}$

t_1 = $t_0\left(0.84 + 0.16\left(\frac{t_m}{t_0}\right)^2\right)$

t_m = minimum value of t_0 within $0.4D$ each side of mid-depth of bulkhead

D_1 = D, in metres, but is to be taken not less than 10 and need not be taken greater than 16

F_B = as defined in Pt 3, Ch 4, 5.7 Local reduction factors

F_D = as defined in Pt 3, Ch 4, 5.7 Local reduction factors

F_1 = a factor determined from Table 9. 6. 2: Values of F1

F_2 = a factor determined from Table 9. 6. 3: Values of F2

R = $\sin\theta$

where θ is the roll angle, in degrees

and $\sin\theta = \left(0.45 + 0.1\frac{L}{B}\right)\left(0.54 - \frac{L}{1270}\right)$

Other symbols are defined in Pt 4, Ch 9, 1.5, General definitions and symbols.

Figure 9. 6. 1: Illustration of b_1 determination

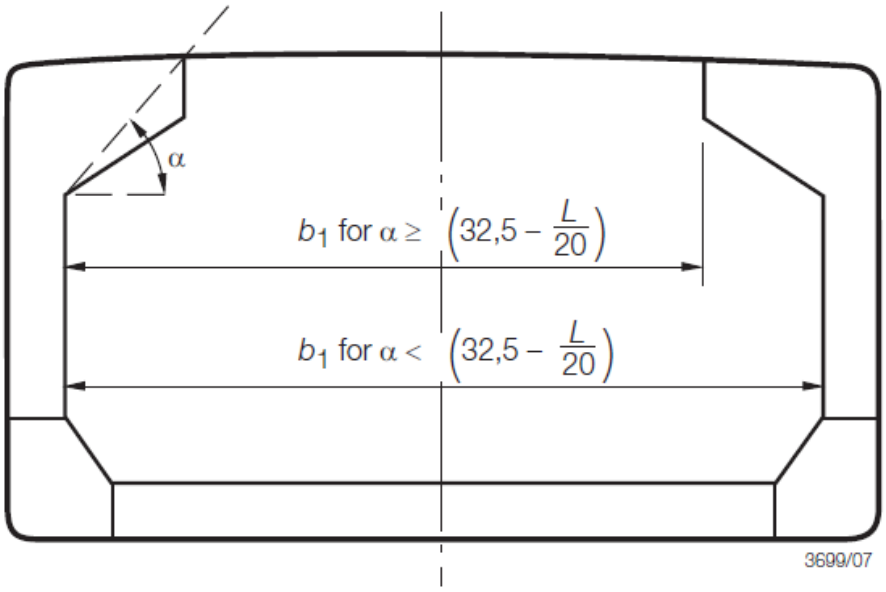


Table 9. 6. 2: Values of F_1

Longitudinal bulkhead longitudinals	F_1
Above $\frac{D}{2}$,	$\frac{Dc_1}{4D + 20h_3}$
Below $\frac{D}{2}$	$\frac{Dc_1}{25D - 20h_3}$
Note Minimum F_1=0.12	

Table 9. 6. 3: Values of F_2

Longitudinal bulkhead longitudinals	F_2
Above $\frac{D}{2}$	$\frac{Dc_2}{D + 2.18h_3}$
Below $\frac{D}{2}$	$\frac{Dc_2}{3.18D - 2.18h_3}$
Note Minimum F_2=0.73	

6. 3 Inner hull and longitudinal bulkheads

6. 3. 1 Inner hull and longitudinal bulkheads are to extend as far forward and aft as practicable and are to be effectively scarfed into the adjoining structure.

6. 3. 2 Longitudinal bulkheads only may be perforated provided suitable account is taken of the applied shear forces. Proposals to fit perforated longitudinal bulkheads in cargo tanks will be individually

considered. *See also* Pt 4, Ch 9, 7.1, General concerning penetration of pump-room, cofferdam and cargo tank bulkheads.

6. 3. 3 The thickness of inner hull and longitudinal bulkhead plating required by Table 9. 6. 1: Inner hull and longitudinal oiltight bulkhead scantlings is to be maintained throughout the cargo tank length, with the exception of item (1)(a) which may be gradually tapered outside 0.4L amidships to cargo tank minimum thickness or as required by item (1)(c), whichever is the greater, at 0.075L from the ends.

6. 3. 4 The bulkhead plating thicknesses throughout the cargo tank length are to be increased as necessary to attain compliance with the shear strength requirements of Pt 3, Ch 4, 6 Hull shear strength.

6. 3. 5 For conditions which provide for wing and centre cargo tanks abreast to be filled, with adjacent cargo tanks fore and aft empty, the thickness of longitudinal bulkheads is to comply with the requirements of Pt 4, Ch 9, 8.3 Scantlings 8.3.2.d and Pt 4, Ch 9, 8.3 Scantlings 8.3.2.e, *See also* Pt 4, Ch 9, 3.3 Loading conditions 3.3.6.

6. 3. 6 Where bulkheads are penetrated by cargo or ballast piping, the structural arrangements in way are to be capable of withstanding the loads imparted to the bulkheads by the hydraulic forces in the pipes. The requirements for cargo and ballast piping is given in Pt 5, Ch 15, 2.5 Air and sounding pipes and Pt 5, Ch 15, 3 Cargo handling system.

6. 3. 7 Openings in horizontal stiffeners are to comply with the requirements of Pt 4, Ch 9, 5.8 Openings in longitudinals.

6. 4 Longitudinal corrugated bulkheads

6. 4. 1 Where horizontally corrugated bulkheads are adopted the angle of corrugation is to be not less than 40°.

6. 4. 2 In ships exceeding 150 m in length the upper and lower strakes of the longitudinal bulkhead are to be plane for a distance of 0.1D from the deck and bottom.

6. 4. 3 Corrugations are to be aligned, and stiffening arrangements on plane members are to be arranged to give adequate support in way of flanges of abutting corrugations. Where both the longitudinal and transverse bulkheads are horizontally corrugated, the arrangements at intersections are to be designed to facilitate attachment and maintain continuity.

6. 4. 4 Where asymmetrical girders or webs are fitted to corrugated bulkheads, the angle of corrugation is not to exceed 60°.

6. 5 Inner bottom

6. 5. 1 The inner bottom is to be longitudinally framed and the inner bottom plating thickness is to be not less than the greater of:

a. $t = \frac{t_0}{\sqrt{2-F_B}}$ mm, or

b. deep tank requirements of Table 1. 9. 1: Watertight and deep tank bulkhead scantlings in Pt 4, Ch 1 General Cargo Ships.

6. 5. 2 The section modulus of inner bottom longitudinals is to be in accordance with Table 9. 6. 1: Inner hull and longitudinal oiltight bulkhead scantlings or deep tank requirements of Table 1. 9. 1: Watertight and deep tank bulkhead scantlings in Pt 4, Ch 1 General Cargo Ships, whichever is the greater, and the unsupported span may extend to the spacing between plate floors.

6. 5. 3 Buckling resistance to longitudinal and transverse stresses in the inner bottom is to be confirmed by direct calculation, *See also* Pt 3, Ch 4, 7 Hull buckling strength.

6. 5. 4 Transverse continuity of inner bottom is to be maintained outboard of inner hull, *See* Pt 4, Ch 9, 6.6 Hopper side tank 6.6.3. Recommended details are shown in the *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG).

6. 5. 5 Particular attention is to be given to the through thickness properties and continuity at the connection of bulkhead stools to the inner bottom. For requirements for plates with specified through thickness properties, *See* Ch 3, 8 Plates with specified through thickness properties of the Pt 2 Rules for the Manufacture, Testing and Certification of Materials.

6. 5. 6 Connection of inner bottom longitudinals to plate floor is to satisfy the requirements given in Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members.

6. 6 Hopper side tank

6. 6. 1 Where a hopper side tank is fitted the sloping bulkhead plating and attached longitudinals are to be as required by Table 9. 6. 1: Inner hull and longitudinal oiltight bulkhead scantlings.

6. 6. 2 A transverse is to be arranged in the hopper tank in line with each double bottom plate floor, to ensure continuity of transverse strength.

6. 6. 3 Particular attention is to be paid to the continuity of the inner bottom plating into the hopper side tank. Scarfing brackets are to be fitted in the hopper in line with the inner bottom at each transverse. These brackets are to be arranged each side of the transverse.

6. 6. 4 Knuckles in the hopper tank plating are to be supported by side girders and stringers or by a deep longitudinal.

6. 6. 5 Detail design guidelines for connections in way of hopper tank knuckles are shown in the *ACSPlus FDA Guideline, Structural Detail Design Guide* (SDDG).

6. 7 Connections

6. 7. 1 Horizontal and vertical stiffeners are to be connected to supporting primary members as required by Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members.

6. 7. 2 Stiffeners are to be bracketed or otherwise efficiently connected at their ends to provide adequate fixity, as required by Pt 3, Ch 10 Welding and Structural Details.

6. 7. 3 Connections of horizontal stiffeners to transverse bulkheads are to provide adequate fixity and continuity of longitudinal strength. Horizontal stiffeners are to be continuous through bulkheads as required by Pt 4, Ch 9, 5.7 Connections of longitudinals, for longitudinals.

6. 7. 4 Where inner hulls, longitudinal and transverse bulkheads are horizontally stiffened, consideration will be given to the stability of the arrangements at intersections. Additional calculations may be required.

PART

4

CHAPTER **9** **Double Hull Oil Tankers**

SECTION **7** **Transverse oiltight bulkheads**

7. 1 General

7. 1. 1 Transverse oiltight bulkheads may be plane or with corrugations arranged horizontally or vertically. Scantlings are to be in accordance with Table 9. 7. 1: Transverse oiltight bulkhead scantlings, except as otherwise provided for in this Section. The arrangement of stiffening is to be such as will efficiently support loads transmitted by end connections of inner hull, longitudinal bulkhead, shell and deck longitudinals. The thickness of bulkhead plating is also to be confirmed by direct calculation in respect of panel stability. The calculation is to take account of the shear stresses and direct stresses derived from both the transverse and longitudinal strength investigations.

7. 1. 2 Where tanks are intended to be partially filled, the scantlings and structural arrangements of the boundary bulkheads are to be capable of withstanding the loads imposed by the movement of liquid in the tanks. The magnitude of the predicted loadings, together with the scantling calculations, may require to be submitted.

7. 1. 3 The scantlings of water ballast tank and cofferdam bulkheads not forming the boundary of a cargo tank are to be as required by Pt 4, Ch 1, 9 Bulkheads for deep tanks. Where the bulkheads are boundaries of `U' shaped tanks, the scantlings are also to be confirmed by the requirements of this Section.

Table 9. 7. 1: Transverse oiltight bulkhead scantlings

Item	Horizontally stiffened	Vertically stiffened
(1) Plating thickness (mm)	$t = 0.0044 s f \sqrt{k h_1}$	
(a) Generally, including corrugations *See also* item 3 (b) But not less than:		
For the upper 3/4 of the bulkhead *See* Note 5	$t = \frac{a}{\left(95 + 20\frac{a}{b}\right)\sqrt{k}}$	$t = \frac{a}{\left(85 + 30\left(\frac{a}{b}\right)^2\right)\sqrt{k}}$
For the lower 1/4 of the bulkhead *See* Note 5	$t = \frac{a}{\left(80 + 20\frac{a}{b}\right)\sqrt{k}}$	$t = \frac{a}{\left(73 + 27\left(\frac{a}{b}\right)^2\right)\sqrt{k}}$
(2) Stiffener modulus (cm^3)	$Z = 0.0067 k s S_1^2 h_2$	
(3) Corrugation properties (a) Modulus (cm^3)	$Z = 0.0085 p h_2 l_e^2 k$	

(b) Inertia (cm^4) *See* Note 4	$I = 0.032ph_2l_e3$

Note *1.* The section modulus given by the formula is that of the stiffeners and associated plating or of the corrugation over pitch p.

Note *2.* The ratio of web depth to web thickness is not to exceed $60\sqrt{k}$ for stiffeners with flanges or face plates and $18\sqrt{k}$ for flat bars.

Note *3.* The minimum thickness criteria given in Pt 4, Ch 9, 10 Construction details and minimum thickness are also to be complied with, and the stiffener web thickness is to be sufficient to withstand the imposed shear forces.

Note *4.* The minimum moment of inertia required by item 3(b) of the Table is not to be reduced on account of higher tensile steel being incorporated.

Note *5.* For vertically corrugated bulkheads *See* Table 1. 9. 2: Symmetrical corrugations and double plate bulkheads (additional requirements) in Pt 4, Ch 1 General Cargo Ships for deep tanks.

7. 1. 4 Where the pump-room acts as a cofferdam, a bulkhead which does not form part of the boundary of a cargo tank or a fuel oil bunker may be of watertight bulkhead scantlings in accordance with the requirements of Pt 4, Ch 1, 9 Bulkheads provided that an inert gas system is fitted in the cargo tanks, and the corresponding notation provided for in Pt 1, Ch 2, 2 Character of classification and class notations is assigned.

7. 1. 5 Where penetration of the cofferdam or pump-room bulkheads is permitted by the Rules, the integrity of the bulkhead is to be maintained, *See also* Pt 5, Ch 13, 2 Construction and installation, Pt 5, Ch 15, 3 Cargo handling system and Pt 6, Ch 2, 14 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts.

7. 1. 6 Where bulkheads are penetrated by cargo or ballast piping, the structural arrangements in way are to be capable of withstanding the loads imparted to the bulkheads by the hydraulic forces in the pipes.

7. 1. 7 Special consideration will be given to any proposals to fit permanent repair/maintenance access openings with oiltight covers in cargo tank bulkheads. Attention is drawn to the existence of National Authority Regulations concerning load line and oil outflow aspects of such arrangements.

7. 2 Symbols

7. 2. 1 The symbols used in this Section are defined as follows:

a = the lesser dimension of an unstiffened plate panel, in mm

b = the greater dimension of an unstiffened plate panel, in mm

b_1 = the greater horizontal distance, in metres, from the centre of the plate panel or mid-point of the stiffener span to the corners at the top of the tank on either side.

f = $1.1 - \frac{s}{2500S_1}$ but not to be taken greater than 1.0

h = load height, in metres measured vertically as follows:

a. for bulkhead plating, the distance from a point one-third of the height of the plate panel above its lower edge to the highest point of the tank, excluding hatchway

b. for bulkhead stiffeners or corrugations, the distance from the mid-point of span of the stiffener or corrugation to the highest point of the tank, excluding hatchway

h_1 = $h + \frac{D_1}{8}$ but not less than $0.72(h + Rb_1)$

h_2 = $h + \frac{D_1}{8}$ but not less than $0.55(h + Rb_1)$

p = pitch of symmetrical corrugations, in mm

s = spacing, in mm, of bulkhead stiffeners or the breadth, in mm, of flange or web, whichever is the greater, of symmetrical corrugations

D_1 = D, in metres, but is to be taken not less than 10 and need not be taken greater than 16

R = sinθ

where θ is the roll angle, in degrees

and $\sin\ \theta = \left(0.45 + 0.1\frac{L}{B}\right)\left(0.54 - \frac{L}{1270}\right)$

S_1 = spacing of primary members, in metres. For the span at top, span may be reduced by the depth of deck longitudinal.

Other symbols are defined in Pt 4, Ch 9, 1.5, General definitions and symbols

7. 3 Corrugated bulkheads

7. 3. 1 Where corrugated bulkheads are adopted the angle of corrugation is to be not less than 40°, *See* Figure 3. 3. 1: Corrugation dimensions in Pt 3, Ch 3 Structural Design.

7. 3. 2 Where transverse bulkheads are vertically corrugated, adequate resistance to transverse compressive forces is to be provided by horizontal stringers or equivalent.

7. 3. 3 Where transverse bulkheads are horizontally corrugated, the span of the corrugations should not, in general, exceed 5.0 m. Consideration is to be given to providing an efficient connection between the corrugations and the inner hull and longitudinal bulkhead stiffeners including local reinforcement where necessary.

7. 3. 4 Corrugations are to be aligned and stiffening arrangements on plane members are to be arranged to give adequate support in way of flanges of abutting corrugations. Where both the longitudinal and transverse bulkheads are horizontally corrugated, the arrangements at intersections are to be designed to facilitate attachment and maintain continuity.

7. 3. 5 Where asymmetrical girders or webs are fitted to corrugated bulkheads, the angle of corrugation is not to exceed 60°.

7. 3. 6 Where corrugated bulkheads on stools are adopted, attention is to be paid to the design of end connection. The arrangements are to be in accordance with the requirements of Pt 4, Ch 9, 7.4, Bulkheads supported by stools.

7. 3. 7 Where vertically corrugated bulkheads are proposed without stools both flanges are to be adequately supported at deck and inner bottom. Proposals will be specially considered. Particular attention is to be given to the through thickness properties of the inner bottom plating and continuity at the connection to the inner bottom. For the requirements for plates with specified through thickness properties, *See* Ch 3, 8 Plates with specified through thickness properties of the Pt 2 Rules for the Manufacture, Testing and Certification of Materials.

7. 4 Bulkheads supported by stools

7. 4. 1 The scantlings of vertically corrugated and double plate bulkheads supported by stools are generally to be confirmed by direct calculations which are to be submitted.

7. 4. 2 In addition the scantlings are to be determined in accordance with the requirements of Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads 9.2.1 for deep tank bulkheads with the load head h_4, in metres, measured to the highest point of the tank, excluding hatchway, but is not to be taken less than $0.44(h_4+Rb_1)$.

7. 4. 3 The sloping stool plate thickness adjacent to the corrugation is to be not less than the thickness of the corrugation flange at mid span as required by Pt 4, Ch 9, 7.4 Bulkheads supported by stools 7.4.1 and Pt 4, Ch 9, 7.4 Bulkheads supported by stools 7.4.2. Where the plate thickness is increased locally, the vertical extent is to be not less than the width of the flange of the corrugation.

7. 4. 4 The stools are to be reinforced with plate diaphragms or deep webs, and in bottom stools the diaphragms are to be aligned with double bottom side girders. Continuity is also to be maintained between the diaphragms and the webs of bulkhead corrugations as far as practicable.

7. 4. 5 Additional double bottom girders are to be arranged extending at least to the first plate floor adjacent to the bulkhead each side and, in general, are to be spaced not more than 3.8 m apart.

7. 4. 6 The sloping plate of bottom stools is to be aligned with double bottom floors. Particular attention is to be given to the through thickness properties of the inner bottom plating and continuity at the connection to the inner bottom, and to the through thickness properties of the bottom stool shelf plate. For requirements for plates with specified through thickness properties *See* Ch 3, 8 Plates with specified through thickness properties of the Pt 2 Rules for the Manufacture, Testing and Certification of Materials.

7. 4. 7 An efficient system of reinforcement is to be arranged in line with the tank transverse bulkheads or bulkhead stools at the intersection with the sloped plating of the double bottom hopper tanks and topside tanks. The reinforcement fitted in the tanks is to consist of girders or intercostal bulb plate or equivalent stiffeners fitted between and connected to the sloped bulkhead longitudinals.

7. 4. 8 The shelf plates of the bulkhead stools are to be arranged to align with the longitudinals in the double bottom hopper tank and topside tanks. Where sloping shelf plates are fitted to stools suitable scarfing is to be arranged in way of the connections of the stools to the adjoining structures.

7. 4. 9 The arrangement of stools and adjacent structure common with the cargo tank is to be designed to avoid pockets in which gas could collect.

7. 5 Connections

7. 5. 1 Horizontal and vertical stiffeners are to be connected to supporting primary members as required by Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members.

7. 5. 2 Stiffeners are to be bracketed or otherwise efficiently connected at their ends to provide adequate fixity.

7. 5. 3 Arrangements and scantlings of end brackets for vertical stiffeners are to be as required by Pt 3, Ch 10 Welding and Structural Details.

7. 5. 4 Horizontal stiffener end brackets are generally to satisfy the requirements of Pt 3, Ch 10 Welding and Structural Details. However, the length of the bracket arm at the side shell, inner hull and longitudinal bulkhead longitudinals is, in general, not to exceed the depth of the longitudinal. In order to provide the necessary weld connection, consideration may require to be given to fitting brackets on both sides of the bulkhead or to welding the stiffener to the longitudinal. The arrangements are also to be such as to maintain transverse continuity at intersections. Examples can be *See*n in the *ACSPlus FDA Guideline, Structural Detail Design Guide*, (SDDG), published by ACS.

PART

4

CHAPTER **9** **Double Hull Oil Tankers**

SECTION **8** **Non-oiltight bulkheads**

8. 1 General

8. 1. 1 The requirements of this Section are applicable to longitudinal and transverse wash bulkheads, where fitted. Proposals to fit perforated longitudinal bulkheads in cargo tanks will be individually considered, *See also* Pt 4, Ch 9, 1.3, Class notation and applicable Rules for CSR Double Hull Oil Tankers.

8. 1. 2 Wash bulkheads are generally to be of plane construction, horizontally or vertically stiffened, having an area of perforations not less than 10 per cent of the total area of the bulkhead. The perforations are to be so arranged that the efficiency of the bulkhead as a support is not impaired.

8. 1. 3 Where tanks are intended to be partially filled, the scantlings and structural arrangements of the wash bulkheads are to be capable of withstanding the loads imposed by the movement of liquid in the tanks. The magnitude of the predicted loads, together with the scantling calculations, may require to be submitted.

8. 2 Symbols

8. 2. 1 The symbols used in this Section are defined as follows:

a = the horizontal length of the plate panel, in mm

a_T = the cross-sectional area of the vertical web on longitudinal bulkhead and associated bulkhead plating over one transverse space, in cm^2

b_i = half the distance, in metres, between members supporting floors as shown in Figure 9. 8. 1: Horizontal girder

b_L = half the distance, in metres, between members supporting horizontal girder, adjacent to the bulkhead under consideration, as shown in Figure 9. 8. 1: Horizontal girder

b_T = overall breadth of tank, in metres

D_1 = D, in metres, but is to be taken not less than 10 and need not be taken greater than 16

D_L = the depth of the longitudinal bulkhead, including double bottom girder, in metres

d_L = the distance, in metres, from the top of the longitudinal bulkhead to the centre of the plate panel under consideration and need not be taken greater than the distance to the bracket toe of the double bottom transverse primary member

h = the distance, in metres, from the centre of the load on the horizontal girder to $\frac{D_1}{8}$ m above the highest point of the tank, excluding the hatchway

d_H = the mean depth of horizontal girders at the longitudinal bulkhead, in metres, including the depth of the end brackets as shown in Figure 9. 8. 1: Horizontal girder

l_G = the distance, in metres, from the horizontal girders to the adjacent horizontal primary member below

t_3 = $\frac{(Q_{SL}+Q_{sw})}{D_L \tau}$mm

Q_s, Q_w = as defined in Pt 3, Ch 4, 6.1 Symbols

τ = $\frac{110}{k_L}$ N/mm^2

Q_{SL} = the maximum still water shear force on the longitudinal bulkhead, in kN, of the loading condition in question.

= Where two longitudinal bulkheads are fitted, Q_{SL} may be taken as:

= $Q_{sL} = 0.34Q_s$

= Where one longitudinal bulkhead is fitted, Q_{SL} may be taken as:

= $Q_{sL} = 0.40Q_s$

= Q_{SL} may also be derived by direct calculation to determine the distribution of shear force between the shell, inner hull and longitudinal bulkheads.

Q_{SW} = design wave shear force on the longitudinal bulkhead, in kN.

= Where two longitudinal bulkheads are fitted, Q_{SW} may be taken as:

= $Q_{sw} = 0.20Q_w$

= Where one longitudinal bulkhead is fitted, Q_{SW} may be taken as:

= $Q_{sw} = 0.28Q_w$

l_T = overall length of tank, in metres

F_d = $W_h S b_i \frac{d_L}{D_L}$

l_b = the distance between the transverse bulkheads (oiltight or non-oiltight) adjacent to the bulkhead under consideration, in metres

S = spacing of the double bottom transverse primary members, in metres

T_p = the maximum operating draught of ship, in metres, where the tank with non-oiltight bulkhead is empty.

W_h = $T_p + 0.023Le^{-0.0044\,L}$

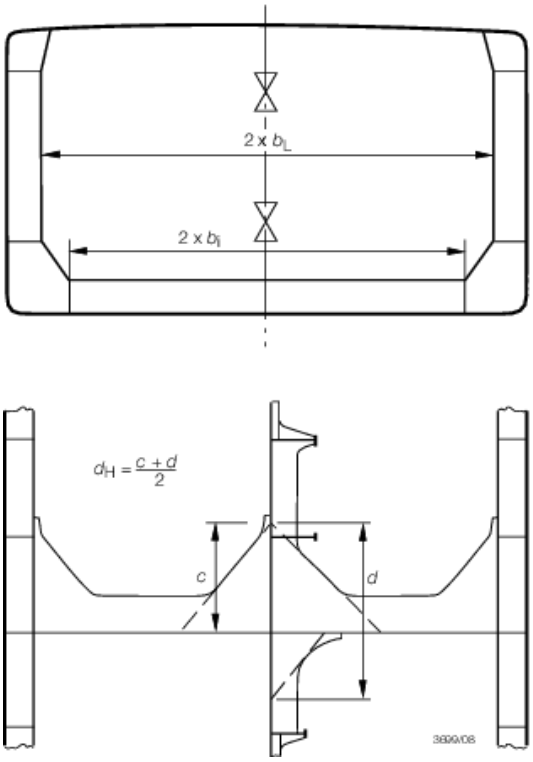
α = $\frac{s}{a}$, but not to be taken greater than 1.0

Other symbols are defined in Pt 4, Ch 9, 1.5, General definitions and symbols.

8. 3 Scantlings

8. 3. 1 The thickness of plating may be the compartment minimum, *See* Pt 4, Ch 9, 10 Construction details and minimum thickness, except as given in Pt 4, Ch 9, 8.3, Scantlings 8.3.2 and Pt 4, Ch 9, 8.3 Scantlings 8.3.4.

Figure 9. 8. 1: Horizontal girder



8. 3. 2 Where non-oiltight **longitudinal** wash bulkheads support a bottom primary member, the following additional requirements are to be met:

a. The area of perforation is to be not greater than 25 per cent of the total area of the bulkhead, and consideration is to be given to the disposition and geometry of the perforations so that the shear rigidity of the bulkhead is a maximum.

b. The net section area of the bulkhead is to be not less than 0.135 l_T b_T D cm^2.

c. The plating thickness is to comply with Table 9. 6. 1: Inner hull and longitudinal oiltight bulkhead scantlings (1)(d).

d. The thickness of longitudinal bulkhead plating and web plating of the vertical web on longitudinal bulkhead is generally to be not less than:

$$t = 0.026 \frac{s}{1+\alpha^2} \sqrt{\frac{F_d}{a_T}} \text{mm}$$

e. The thickness of the longitudinal bulkheads supporting a transverse bulkhead horizontal girder is in general to be not less than:

i. $t = \frac{0.0437 h l_G b_L k}{d_H} + \frac{0.892 t_3 k}{k_L}$ mm

ii. $t = 0.0011 s(0.059 L_1 + 7)$ mm

whichever is the greater.

f. The thickness is also to satisfy the buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength.

g. The increased thickness is to extend over the end bracket and buttress of the horizontal girder down to a distance of $0.5l_G$.

8. 3. 3 The section modulus of longitudinal wash bulkhead stiffeners is to be not less than, *See also* Pt 3, Ch 4, 7 Hull buckling strength:

$$Z = 0.0036\left(0.54 - \frac{L}{1270}\right) b_T k_S S^2 \ cm^3$$

8. 3. 4 Where non-oiltight **transverse** wash bulkheads support a primary fore and aft bottom centreline girder, the following additional requirements are to be met:

a. The area of perforation is to be not greater than 25 per cent of the total area of the bulkhead, and consideration is to be given to the disposition and geometry of the perforations so that the shear rigidity of the bulkhead is a maximum.

b. The net section area of the bulkhead is to be not less than $0.135 l_b b_T D$ cm^2.

c. The plating thickness is to comply with Table 9. 7. 1: Transverse oiltight bulkhead scantlings (1)(b). In no case is either panel dimension to exceed 180 times the thickness required by this sub-paragraph or by Pt 4, Ch 9, 8.3 Scantlings 8.3.1, whichever is the greater.

8. 3. 5 The section modulus of transverse wash bulkhead stiffeners is to be not less than:

$$Z = 0.1215 k s l_{e^2} \frac{l_b}{L} \ cm^3$$

8. 4 Connections

8. 4. 1 Stiffeners are to be bracketed or otherwise efficiently connected at their ends and to primary supporting members, in accordance with the requirements of Pt 3, Ch 10 Welding and Structural Details.

PART

4

CHAPTER **9** **Double Hull Oil Tankers**

SECTION **9** **Primary members supporting longitudinal framing**

9. 1 General

9. 1. 1 These requirements are applicable to ships having structural arrangements in accordance with Pt 4, Ch 9, 1.4, Class notation and applicable Rules for non-CSR Double Hull Oil Tankers.

9. 1. 2 The minimum thickness and constructional detail requirements of Pt 4, Ch 9, 10 Construction details and minimum thickness are also to be complied with.

9. 1. 3 The scantlings of primary members are, in general, to be determined from direct calculations carried out in accordance with the requirements of Pt 4, Ch 9, 14 Direct calculations or in accordance with the requirements of this Section or the relevant Sections of Pt 4, Ch 10 Single Hull Oil Tankers. The direct calculations are to be submitted with the plans for confirmatory purposes, *See also* Pt 4, Ch 9, 1.4 Class notation and applicable Rules for non-CSR Double Hull Oil Tankers 1.4.6.

9. 2 Symbols

9. 2. 1 The symbols used in this Section are defined as follows:

b_{e1}, b_{e2} = effective end bracket leg length, in metres, at each end of the member, *See* Pt 3, Ch 3, 3 Structural idealisation

d_{DB} = Rule depth of centre girder, in mm

h_c = vertical distance from the centre of the cross-ties to deck at side amidships, in metres

h_s = distance between the lower span point of the vertical web and the moulded deck line at centreline, in metres

l_b = the distance, in metres, between the transverse bulkheads (oiltight or non-oiltight) adjacent to the bulkhead under consideration

l_c = one-half the vertical distance, in metres, between the centres of the adjacent cross-ties or between the centre of the adjacent cross-tie and the centre of the adjacent bottom or deck transverse, or double bottom, *See* Figure 9. 9. 1: Wing tank construction

s = spacing of transverses, in metres

A_c = cross sectional area of the cross-tie material which is continuous over the span of the cross-tie in cm^2

l_c = least moment of inertia of the cross-tie in cm^4

S_c = length of cross-tie, in metres, measured as follows:

- **(a)** For centre tank cross-ties: S_c is the distance between the face plates of the vertical webs on the longitudinal bulkheads.
- **(b)** For wing tank cross-ties: S_c is the distance between the face plate of the vertical web on the longitudinal bulkhead and the inner hull

S_s = span of the vertical web, in metres, and is to be measured between end span points, *See* Figure 9. 9. 1: Wing tank construction.

Other symbols are defined in Pt 4, Ch 9, 1.5, General definitions and symbols.

9. 3 Girders and floors in double bottom

9. 3. 1 Girders are to be arranged at the centreline or duct keel, at the hopper side and in way of longitudinal bulkheads and bulkhead stools. Plate floors are to be arranged in way of transverse bulkheads and bulkhead stools.

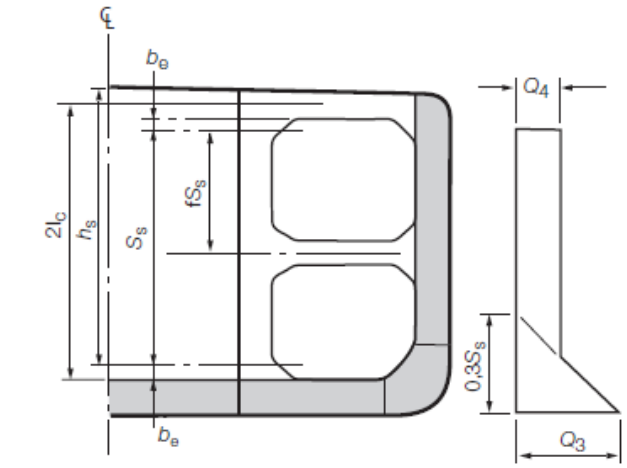
9. 3. 2 In way of vertically corrugated transverse bulkheads supported by stools, additional girders are to be arranged extending at least to the first plate floor adjacent to the bulkhead each side and spaced not more than 3.8 m apart, *See* Pt 4, Ch 9, 7.4 Bulkheads supported by stools 7.4.5.

9. 3. 3 The centre girder is to have a depth of not less than that given by:

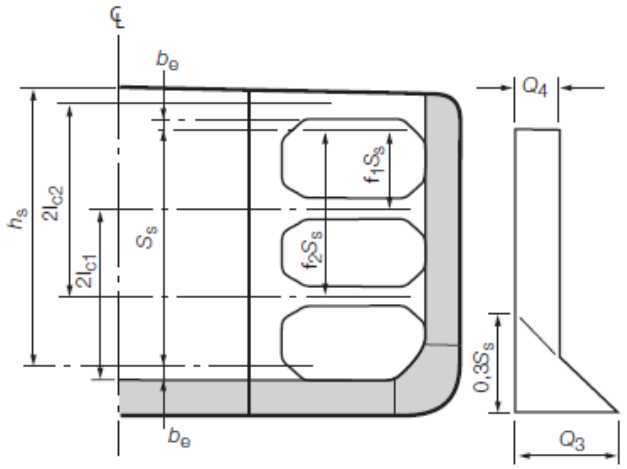
$$d_{DB} = 28B + 205\sqrt{T}\ mm$$

The height of the double bottom is also to satisfy the requirements given in Pt 4, Ch 9, 1.3, Class notation and applicable Rules for CSR Double Hull Oil Tankers.

Figure 9. 9. 1: Wing tank construction



(a) One cross-tie



(b) Two cross-ties

NOTE : $Q_3 = 9{,}81K_4\, h_s\, s\, S_s$ kN

$Q_4 = 9{,}81K_5\, h_s\, s\, S_s$ kN

3837/02

9. 3. 4 Thickness of floors and girders is to be confirmed by means of a direct calculation. Due account is to be taken of access and other openings. The minimum thickness however, is to be not less than that given by:

a. Centre girder or duct keel:

$t = (0.008d_{DB} + 1.0)\sqrt{k}$ mm

b. Floors and side girders:

$t = (0.007d_{DB} + 1.0)\sqrt{k}$ mm but need not exceed $12.0\sqrt{k}$mm.

9. 3. 5 The scantlings of plating and stiffeners of longitudinal girders are not to be less than necessary to comply with the buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength.

9. 3. 6 Floors and girders forming the boundaries of tanks are also to satisfy the requirements of tank bulkheads given in Pt 4, Ch 1, 9 Bulkheads.

9. 3. 7 Provision is to be made for the free passage of air and water from all parts of the tanks to the air pipes and suctions, account being taken of the pumping rates required. Adequate access is also to be provided to all parts of the double bottom. The edges of all openings are to be smooth. The size of the opening should not, in general, exceed 50 per cent of the double bottom depth, unless edge reinforcement is provided. In way of ends of floors and fore and aft girders at transverse bulkheads, the number and size of openings are to be kept to a minimum, and the openings are to be circular or elliptical. Edge stiffening may be required in these positions.

9. 3. 8 For ships intended to load or unload while aground, *See* Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

9. 3. 9 The structure of girders and duct keels is to be sufficient to withstand the forces imposed by dry-docking the ship, *See also* Pt 4, Ch 9, 10.10, Double bottom girders in way of docking supports.

9. 4 Vertical webs and horizontal girders in wing ballast tanks and hopper spaces

9. 4. 1 The width of the double skin side structure is to comply with the requirements given in Pt 4, Ch 9, 1.3, Class notation and applicable Rules for CSR Double Hull Oil Tankers.

9. 4. 2 Vertical webs are to be arranged in line with the floors in the double bottom to ensure continuity of transverse strength.

9. 4. 3 A horizontal girder is to be arranged at the top of the hopper space and is to be located close to the knuckle between the hopper and inner hull. Where additional longitudinal girders are provided to satisfy access requirements in accordance with Pt 4, Ch 9, 13.2 Access to spaces in the cargo area 13.2.8, these are to be arranged in line with horizontal girders on the transverse bulkhead and wing tank cross-ties where these are fitted.

9. 4. 4 The scantlings of vertical webs and horizontal girders are to be determined by means of direct calculations and due account is to be taken of openings in the structure, *See also* the buckling requirements in Pt 3, Ch 4, 7 Hull buckling strength for horizontal girders.

9. 4. 5 Access openings are to be kept clear of other small openings and are to have smooth edges. Edge stiffening is also to be arranged in regions of high shear stress.

9. 5 Deck transverses and girders

9. 5. 1 Deck transverses are to be arranged in line with the vertical webs at the side and vertical transverses at longitudinal bulkheads, where fitted, to ensure continuity of transverse structure.

9. 5. 2 Deck girders are to be supported at transverse bulkheads by vertical webs or equivalent.

9. 5. 3 The scantlings of deck transverses and girders are to be determined by means of direct calculations or, alternatively, in accordance with the requirements of Pt 4, Ch 10, 2.8 Deck transverses and Pt 4, Ch 10, 2.9 Deck girders.

9. 6 Cross-ties

9. 6. 1 Cross-ties, where fitted, may be of plate or sectional material and are to have an area and least moment of inertia to satisfy the following:

$$A_c \geq \frac{0.765 l_c h_c s k}{\left(1 - \frac{0.45 S_c}{r\sqrt{k}}\right)} \quad cm^2$$

Where

$$r = \sqrt{\frac{I_c}{A_c}} \text{cm}.$$

(As a first approximation the area and inertia of the cross-tie may be calculated in accordance with Pt 4, Ch 10, 2.10 Cross-ties 2.10.1.)

9. 6. 2 The scantlings of the webs and flanges of cross-ties are also to be confirmed by means of direct calculation.

9. 6. 3 Design of end connections is to be such that the area of the welding, including vertical brackets, where fitted, is to be not less than the minimum cross-sectional area of the cross-tie derived from Pt 4, Ch 9, 9.6 Cross-ties 9.6.1. To achieve this, full penetration welding may be required and thickness of brackets may require further consideration. Attention is to be given to the full continuity of area of the backing structure on the vertical webs and within the wing ballast tank. Particular attention is also to be paid to the welding at the toes of all vertical end brackets on the cross-tie.

9. 7 Primary members supporting oiltight bulkheads

9. 7. 1 The scantlings of primary members supporting oiltight bulkheads are, in general, to be determined by means of direct calculation, *See also* Pt 4, Ch 9, 9.7 Primary members supporting oiltight bulkheads 9.7.4 and Pt 4, Ch 9, 9.7 Primary members supporting oiltight bulkheads 9.7.5.

9. 7. 2 Alternatively, the scantlings of vertical webs and horizontal girders on transverse bulkheads are to be determined in accordance with the requirements of Pt 4, Ch 10, 4 Primary members supporting oiltight bulkheads

9. 7. 3 Where longitudinal oiltight bulkheads are fitted, vertical webs are to be arranged in line with the deck transverses and the double bottom floors. Particular attention is to be paid to the alignment of the bulkhead web end brackets with the double bottom floors.

9. 7. 4 The section modulus of vertical webs on longitudinal bulkheads in ships with one or two longitudinal bulkheads is to be not less than:

$$Z = K_3 s h_s S_s^2 k \text{ cm}^3$$

where K_3 is given in Table 9. 9. 1: Vertical web on longitudinal bulkhead coefficient.

Table 9. 9. 1: Vertical web on longitudinal bulkhead coefficient

Number of cross- ties	K_3	K_4	K_5	Range of application
1	2.16	$0.455 - 0.316\varphi$	0.103	$0.5 \le \varphi \le 0.7$
2	1.88	$0.441 - 0.267\varphi_1$	$0.498\varphi_2 - 0.249$	$0.4 \le \varphi_1 \le 0.5$ $0.65 \le \varphi_2 \le 0.8$

9. 7. 5 In ships with two longitudinal bulkheads, the net sectional area of the web at any section is not to be less than:

$$A = 0.12 Q_x k \ cm^2$$

where Q_x is calculated from shear force diagrams constructed as shown in Figure 9. 9. 1: Wing tank construction. For this purpose the values of K_4 and K_5 and the range of application are given in Table 9. 9. 1: Vertical web on longitudinal bulkhead coefficient.

9. 7. 6 The moment of inertia of vertical webs on longitudinal bulkheads is to be not less than:

$$I = \frac{7.5}{k} S_s Z cm^4$$

9. 7. 7 Where horizontal girders and vertical webs on transverse bulkheads do not form part of a ring structure, they are to be arranged with substantial end brackets forming a buttress extending to the adjacent vertical web or transverse. The shear and combined stresses in the buttress arrangements are to be examined.

9. 7. 8 Where the cross-ties are omitted from the transverse ring in the wing or centre tanks adjacent to the transverse bulkhead, the design of the horizontal girder, end buttress and vertical webs is to take account of the loads imposed and the deflection of the structure.

9. 7. 9 Where, in ships exceeding 150 m in length, the longitudinal bulkhead is corrugated, the transverses are generally to be symmetrical on both sides of the bulkhead, and the scantlings may require to be increased to limit deflection.

9. 8 Primary members supporting non-oiltight bulkheads

9. 8. 1 These requirements are applicable to primary members supporting non-oiltight transverse bulkheads. Where non-oiltight longitudinal bulkheads are proposed, the requirements for primary members will be individually considered.

9. 8. 2 Direct calculation procedures will generally be required where non-oiltight bulkhead primary members will interact with, or tend to support, the primary bottom, longitudinal bulkhead or side structure, and in other cases where warranted by structural design features. In general the section modulus of horizontal girders is to be not less than:

$$Z = 145\ kbl_e^2 \frac{l_b}{L}\ cm^3$$

9. 8. 3 When determining the width of plating supported and the effective breadth for calculating the section modulus, no deduction is to be made on account of perforations.

PART

4

CHAPTER 9 Double Hull Oil Tankers

SECTION 10 Construction details and minimum thickness

10. 1 Symbols

10. 1. 1 The symbols used in this Section are defined as follows:

For the primary member:

10.5 = depth of member web, in mm

s_t = spacing of tripping or docking brackets on the web of the member, in metres

t_w = thickness of member web, in mm

S_w = spacing of members, in metres

For the primary member web stiffener:

d = depth of web plate panel, in mm

l_s = span of stiffeners between effective support points, in metres

s = spacing of stiffeners on the web, in mm

A_s = cross-sectional area of the web stiffener and associated web plating, in cm^2

I_s = moment of inertia of the web stiffener and associated web plating, in cm^4

For the primary member end bracket, *See* Figure 9. 10. 1: Key to application requirements:

d_b = arm length, in metres

l_b = effective length of the free edge, in metres

t_b = thickness of the end bracket plating, in mm

A_b = cross-sectional area of the end bracket edge stiffeners and associated plating, in cm^2

I_b = moment of inertia of the end bracket edge stiffeners and associated plating, in cm^4

Other symbols are defined in Pt 4, Ch 9, 1.5, General definitions and symbols.

10. 2 Compartment minimum thickness

10. 2. 1 Within the cargo tank region, including wing ballast tanks and cofferdams at the ends of or between cargo tanks, the thickness of primary member webs and face plates, hull envelope and bulkhead plating is to be not less than:

t = $2.15L^{0.3}$ mm, or

t = 7.5 mm

whichever is the greater.

10. 2. 2 The minimum thickness of secondary members is to be determined as above, but need not exceed 11.0 mm.

10. 2. 3 In pump-rooms the minima apply to shell, deck, longitudinal bulkhead and associated longitudinals. For other items solely within the pump-room, including transverse bulkheads separating the adjacent machinery spaces from the pump-room, the minima may be reduced by 1.0 mm, subject to a lower limit of 7.5 mm.

10. 2. 4 Within the fore peak tank, minimum thicknesses are to be in accordance with Pt 4, Ch 9, 10.2 Compartment minimum thickness 10.2.1 and Pt 4, Ch 9, 10.2 Compartment minimum thickness 10.2.2 reduced by 1.0 mm but are to be not less than 7.5 mm.

10. 3 Geometric properties and proportions of members

10. 3. 1 The depth of the web of any primary member is to be not less than 2.5 times the depth of the cut-outs for the passage of secondary members, except where compensation is arranged to provide satisfactory resistance to deflection and shear buckling in the web.

10. 3. 2 The area of material in the face plate of any primary member structure is not to exceed:

$0.00667 d_w t_w cm^2$

nor is it to be less than:

$0.00417 s_t d_w cm^2$

10. 3. 3 The geometric properties of rolled stiffeners and built sections are to be calculated in association with an effective width of attached plating in accordance with Pt 3, Ch 3, 3 Structural idealisation.

10. 4 Continuity of primary members

10. 4. 1 Primary members are to be so arranged as to ensure effective continuity of strength throughout the range of tank structure. Abrupt changes of depth or section are to be avoided. Where members abut on both sides of a bulkhead or on other members, arrangements are to be made to ensure that they are in alignment.

10. 4. 2 The members are to have adequate end fixity, lateral support and web stiffening, and the structure is to be arranged to minimise hard spots or other sources of stress concentration. Openings are to have well rounded corners and smooth edges and are to be located having regard to the stress distribution and buckling strength of the plate panel.

10. 5 Primary member web plate stiffening

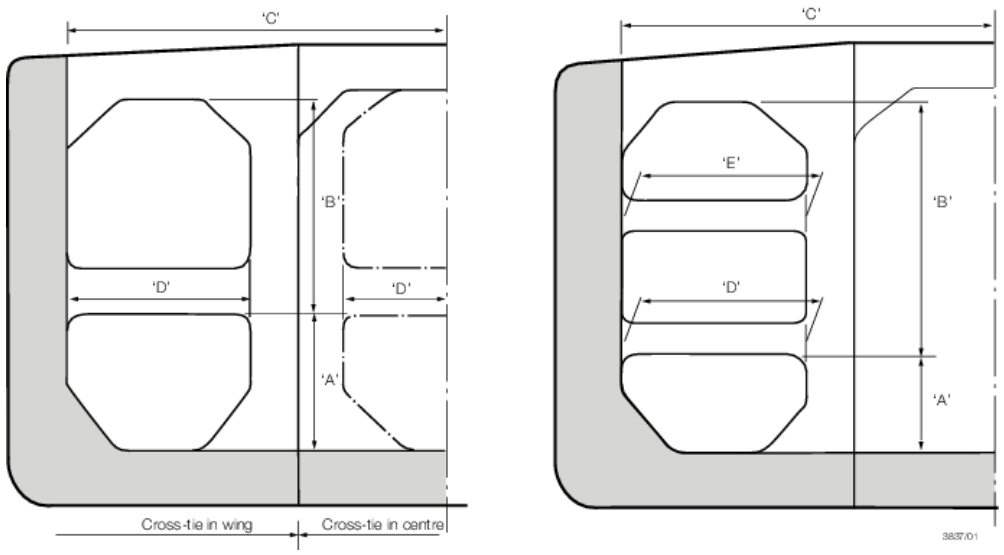
10. 5. 1 The webs of primary members are to be supported and stiffened in accordance with the following requirements, which are designated as requirements `A', `B', `C', `D' and `E'. The application of these requirements is detailed in Pt 4, Ch 9, 10.7 Application of stiffening requirements, and the corresponding locations indicated in Figure 9. 10. 1: Key to application requirements. Where webs are slotted for the passage of secondary members, the web stiffeners are to be arranged to provide adequate support for the loads transmitted, *See* Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members. Where direct calculations are carried out in accordance with Pt 4, Ch 9, 1.1 General 1.1.8 and Pt 4, Ch 9, 14 Direct calculations, other stiffening arrangements will be accepted subject to compliance with the maximum permissible

stress and plate panel buckling criteria given in the *ACSPlus SDA Guideline, Guidance Notes on Direct Calculations: Primary Structure of Tankers*.

10. 5. 2 Where higher tensile steel is used for the primary members, the maximum spacing of stiffeners given in this Section is to be multiplied by $\sqrt{k}$.

10. 5. 3 In addition to these stiffeners, tripping brackets as required by Pt 4, Ch 9, 10.11 Lateral stability of primary members are also to be fitted.

Figure 9. 10. 1: Key to application requirements



10. 5. 4 For requirement `A' stiffening:

a. The thickness, t_w of the web is to be not less than $\frac{s}{80}$

b. Stiffening is generally to be fitted normal to the face plate of the member, but the stiffeners parallel to the face plate will be required when the web depth, d_w, exceeds a value, d_{max} which is to be taken as:

$for\ s \leq 55t_w\ d_{max} = 3s$

$for\ s > 55t_w\ d_{max} = \frac{45st_w}{s-40t_w}$

c. Where stiffening parallel to the face plate is required, the distance from the face plate of the member to the nearest stiffener is not to exceed $65t_w$. Further stiffeners are to be fitted at similar spacing so that the distance between the last stiffener and the shell or bulkhead plating does not exceed d_{max}. In way of end brackets to transverse bulkhead primary structure, stiffeners are to be fitted normal to the face plate of the member so that web plate panel dimensions parallel to the face plate do not exceed $80t_w$.

10. 5. 5 For requirement `B' stiffening:

a. The thickness, t_w of the web is to be not less than $\frac{s}{80}$

b. Stiffening is generally to be fitted normal to the face plate of the member, but stiffeners parallel to the face plate will be required when the web depth, d_w, exceeds a value d_{max}, which is to be taken as:

$for\ s \leq 70t_w\ d_{max} = 3s$

$for\ s > 70t_w\ d_{max} = \frac{48st_w}{s-54t_w}$

c. Where stiffening parallel to the face plate is required, the distance from the face plate of the member to the nearest stiffener is not to exceed $80t_w$. Further stiffeners are to be fitted at

similar spacing so that the distance between the last stiffener and the shell or bulkhead plating does not exceed d_{max}.

10. 5. 6 For requirement `C' stiffening:

a. Stiffening is generally to be fitted normal to the face plate of the member in line with alternate secondary members, but stiffeners parallel to the face plate will be required, when the web depth, d_w exceeds a value, d_{max} which is to be taken as:
$for\ s \leq 76t_w\ d_{\max} = 3s$
$for\ s > 76t_w\ d_{\max} = \frac{48st_w}{s-60t_w}$

b. Where stiffening parallel to the face plate is required, the distance from the face plate of the member to the nearest stiffener is not to exceed $90t_w$. Further stiffeners are to be fitted at similar spacing so that the distance between the last stiffener and the deck plating does not exceed d_{max}.

10. 5. 7 For requirement `D' stiffening:

a. Stiffening parallel to the face plate will be required such that the distance between the stiffener and face plate, or between two stiffeners, does not exceed:
$80t_w$ where $L \leq 90$ m
$55t_w$ where $L \geq 190$ m
with intermediate values by interpolation.

b. Brackets are to be fitted to support the face plates and stiffeners.

10. 5. 8 For requirement `E' stiffening:

a. Stiffening parallel to the face plate will be required such that the distance between the stiffener and face plate, or between two stiffeners, does not exceed:
$85t_w$ where $L \leq 90$ m
$60t_w$ where $L \geq 190$ m
with intermediate values by interpolation.

b. Brackets are to be fitted to support the face plates and stiffeners.

10. 6 Inertia and dimensions of stiffeners

10. 6. 1 The moment of inertia is to be not less than:

a. For stiffeners normal to the primary member face plate:

$$I_s = pst_w{}^3 \times 10^{-4} cm^4$$

Where t_w need not be greater than the values in Table 9. 10. 1: Maximum web thickness for stiffener inertia and p is to be obtained from Table 9. 10. 2: Coefficients for stiffener inertia.

b. For stiffeners parallel to the primary member face plate:

On transverses, webs and stringers

$$I_s = 2l_s^2 A_S cm^4$$

On longitudinal deck, side and double bottom girders, *See also* Pt 3, Ch 4, 7 Hull buckling strength

$$I_s = 2.85l_s^2 A_S cm^4$$

Table 9. 10. 1: Maximum web thickness for stiffener inertia

Requirement	Web thickness t_w, in mm

`A'	$\frac{s}{55}$
`B' and `C'	$\frac{s}{70}$
`D'	$\frac{s}{80}$ where $L \leq 90$ m $\frac{s}{55}$ where $L \leq 190$ m Intermediate values by interpolation.
`E'	$\frac{s}{85}$ where $L \leq 90$ m $\frac{s}{60}$ where $L \leq 190$ m Intermediate values by interpolation.

10. 6. 2 Where stiffeners are fitted in both directions, the inertia of the stiffeners parallel to the face plate of the member is to be not less than that of the stiffeners fitted normally.

10. 6. 3 The depth of web stiffeners is to be not less than 75 mm.

10. 6. 4 Where flat bar stiffeners are used, the ratio of depth to thickness is not to exceed $18\sqrt{k}$.

10. 7 Application of stiffening requirements

10. 7. 1 The requirements as detailed in Pt 4, Ch 9, 10.5 Primary member web plate stiffening and Pt 4, Ch 9, 10.6 Inertia and dimensions of stiffeners are to be applied in the following locations, *See also* Figure 9. 10. 1: Key to application requirements.

a. For transverses at longitudinal bulkhead:
Requirement `A' stiffening is to extend at least as far as the lower surface of the lower cross-tie. Elsewhere, requirement `B' stiffening is to be fitted.

b. For deck transverses:
Requirement `C' stiffening is to be fitted.

c. For stringers and horizontal girders on bulkheads:
Requirement `A' stiffening is to extend for a distance from each end of 20 per cent of the span of the stringer or girder, but at least beyond the toes of the end brackets. Elsewhere, requirement `B' stiffening is to be fitted.

d. For cross-ties:
Cross-ties are to be suitably stiffened to prevent buckling and twisting. Requirement `D' stiffening is to be fitted to the lower or to a single cross-tie. Requirement `E' stiffening is to be fitted to the upper cross-ties where two cross-ties are arranged.

e. For shell stringers and vertical webs in fore peak:
Requirement `A' stiffening is to extend the full length of the member.

10. 7. 2 The application of stiffening requirements to transverse structures where no cross-ties are fitted and within double hull structures are to be based on the results of direct calculation and will be specially considered.

10. 8 Stiffening of continuous longitudinal girders

10. 8. 1 The webs of continuous longitudinal deck and double bottom girders are to be stiffened longitudinally. Particular attention is to be given to the stiffening of docking girders, *See also* the buckling requirements in Pt 3, Ch 4, 7 Hull buckling strength.

Table 9. 10. 2: Coefficients for stiffener inertia

Aspect ratio of plate panel, $\frac{s}{d}$	1.0 or more	0.9	0.8	0.7	0.6	0.5	0.4	0.3 or less
p	1.5	2.1	2.9	4.2	6.1	9.2	14.6	30.0

Note *1.* Intermediate values by interpolation.

Note *2.* The depth of panel, d, used in calculating aspect ratio may be measured from the face of the secondary member to which the primary member web stiffener is attached.

10. 8. 2 The stiffeners on deck girders are to be spaced not more than $55t_w$ mm apart except in way of vertical webs and end brackets, where the spacing is not to exceed $45t_w$ mm. Alternatively, a combination of parallel stiffeners at $55t_w$ mm spacing and normal stiffeners at $45t_w$ mm spacing may be adopted. Particular attention is to be given to the stiffening of the docking girder.

10. 8. 3 The application of stiffening requirements to girders within double hull structures is to be based on the results of direct calculation, *See also* Pt 4, Ch 9, 10.10 Double bottom girders in way of docking supports 10.10.1.

10. 8. 4 The moment of inertia of the stiffeners is to comply with Pt 4, Ch 9, 10.6 Inertia and dimensions of stiffeners.

10. 9 Stiffening of vertical webs on transverse bulkheads

10. 9. 1 Vertical webs are to be fitted with stiffeners parallel to the face plate of the web and spaced not more than $60t_w$ mm apart. Stiffeners normal to the face plate are to be fitted when a vertical web supports horizontal stiffeners on transverse bulkheads. The length of stiffener is to be sufficient to distribute the load transmitted, and the connection between web stiffener and bulkhead stiffener is to comply with the relevant requirements of Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members.

10. 9. 2 The moment of inertia of the stiffeners is to comply with Pt 4, Ch 9, 10.6 Inertia and dimensions of stiffeners.

10. 10 Double bottom girders in way of docking supports

10. 10. 1 Additional vertical stiffeners may be required on the bottom panels of the girder to resist docking pressures.

10. 11 Lateral stability of primary members

10. 11. 1 Tripping brackets are generally to be fitted close to the toes of end brackets, in way of cross-ties and elsewhere, so that the spacing between brackets does not exceed the lesser of 4.5 m or 15 times the width of the face plate (20 times in the case of deck transverses). Arrangements in way of the intersections of primary members are to be such as to prevent tripping. A closer spacing of brackets may be required to be adopted with asymmetrical face plates.

10. 11. 2 To maintain continuity of strength, substantial horizontal and vertical brackets are to be fitted to transverses or stringers at ends of cross-ties. Horizontal brackets are to be aligned with the cross-tie face plates, and vertical end brackets are to be aligned with the cross-tie web.

10. 11. 3 Wide face plates may require additional support between brackets.

10. 11. 4 In the fore peak tank, if the angle between the normal to the shell plating and the vertical webs exceeds 20°, tripping brackets are to be fitted at the toes of end brackets and elsewhere, such that their spacing does not exceed 3 m.

10. 12 Openings in web plating

10. 12. 1 Where openings are cut in the webs of primary supporting members, the greatest dimension of the opening is not to exceed 20 per cent of the web depth. The openings are to be kept equidistant from the corners of notches for frames and stiffeners. In the case of webs supporting single skin structures the openings are to be located so that the edges are not less than 40 per cent of web depth from the face plate. Openings are to be suitably framed where required.

10. 12. 2 In way of cross-ties and their end connections lightening holes are not to be cut in horizontal girders on the ship's side and longitudinal bulkheads, in symmetrical webs nor in vertical webs on longitudinal bulkheads and wing ballast tanks.

10. 12. 3 Holes cut in primary longitudinal members within 0.1D of the deck and bottom are, in general, to be reinforced as required by Pt 4, Ch 9, 4.10 Deck openings. Access holes may be cut in deep transverses and girders with suitable compensation to provide satisfactory resistance to deflection and shear buckling in the web.

10. 12. 4 All holes are to have smooth edges and are to be kept well clear of notches and the toes of brackets.

10. 12. 5 Small air and drain holes cut in primary members are to be kept clear of the toes of brackets and are to be well rounded with smooth edges. Where holes are cut in primary longitudinal members in areas of high stress, or where primary members are of higher tensile steel, they are to be elliptical, or equivalent, to minimise stress concentration.

10. 12. 6 Where holes are cut for heating coils, the lower edge of the hole is to be not less than 100 mm from the inner bottom. Where large notches are cut in the transverses for the passage of longitudinal framing, adjacent to openings for heating coils, the longitudinal notches are to be collared. Examination of the buckling strength of the web plate panel between notches for longitudinals may be required.

10. 13 Brackets connecting primary members

10. 13. 1 The arm length of brackets connecting primary supporting members should, in general, be not less than the depth of the member web, nor exceed 1.5 times the web depth. The two arms should be of approximately equal lengths.

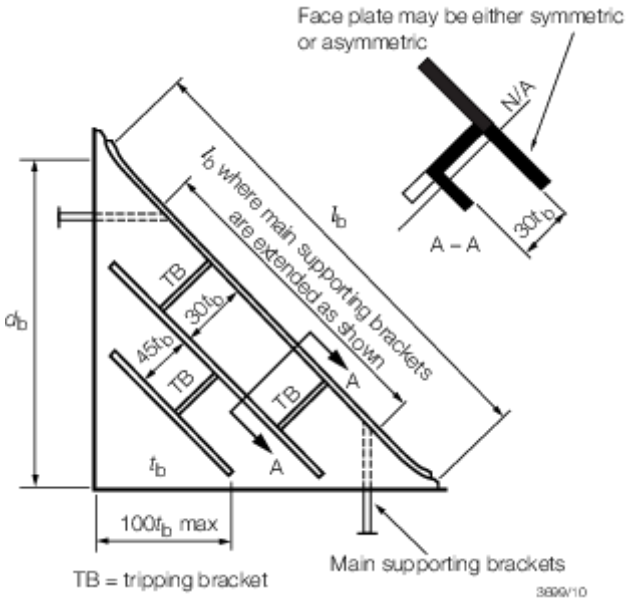
10. 13. 2 In a ring system where the end bracket is integral with the webs of the members, and the face plate is carried continuously along the edges of the members and the bracket, the full area of the largest face plate is to be maintained to the mid-point of the bracket and gradually tapered to the smaller face plates. Butts in face plates are to be kept well clear of the toes of brackets. Where a wide face plate abuts on a narrower one, the taper is generally not to exceed 1 in 4. Where a thick face plate abuts against a thinner one, if the difference in thickness exceeds 3 mm, the taper on thickness is not to exceed 1 in 3.

10. 13. 3 The thickness of separate end brackets is generally to be not less than that of the thicker of the primary member webs being connected, but may be required to be increased locally at the toes. The bracket is to extend to adjacent tripping brackets, stiffeners or other support points. Bracket toes are to be well radiused. Where the bracket is attached to a corrugated bulkhead, suitable arrangements are to be made to dissipate the load at the bracket toe. Details of the welding to be used is way of toes separate brackets are to be submitted, *See also* Pt 3, Ch 10, 5.1 Continuity and alignment 5.1.7.

10. 13. 4 Brackets are to be fitted with suitable face plates and stiffeners. The maximum distance from the face plate to the first parallel stiffener is to be 30t_b. Subsequent stiffeners lying parallel to the face

may be spaced not more than $45t_b$ apart. The maximum arm length for an unstiffened triangular panel is $100t_b$, *See* Figure 9. 10. 2: Primary member end brackets. The depth of stiffeners is to be not less than 75 mm, and their moment of inertia is to comply with 10.6.

Figure 9. 10. 2: Primary member end brackets



10. 13. 5 The area of discontinuous face plates is generally to be about 80 per cent of the area of the face plates of the adjacent members. However, where the stiffener adjacent to the face plate is of increased size, consideration will be given to the face area required. In addition, the following expression is to be satisfied:

$$\sqrt{\frac{I_b}{A_b}} \geq 2l_b$$

10. 13. 6 The ends of discontinuous face plates are to be well tapered. The taper may be 1 in 3, but where the width of the face plate exceeds 500 mm, a taper not less than 1 in 4 is generally to be adopted. Stiffeners adjacent to the face plate should be tapered 1 in 2, and other stiffeners may be cut at 45.

10. 13. 7 Face plates and web stiffeners are to be suitably supported against tripping, *See* Figure 9. 10. 2: Primary member end brackets.

10. 13. 8 In the case of very large brackets with heavy face plates, it is recommended that the effective span, l_b, be reduced by extending the primary member main supporting brackets to provide lateral stability to the face plate, *See* Figure 9. 10. 2: Primary member end brackets.

10. 14 Arrangements at intersections of continuous secondary and primary members

10. 14. 1 For details and connections of collars, *See* Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members.

PART

4

CHAPTER 9 **Double Hull Oil Tankers**

SECTION 11 **Ships for alternate carriage of oil cargo and dry bulk cargo**

11. 1 Application

11. 1. 1 The requirements of this Section apply to ships intended to carry oil in bulk with a flash point not exceeding 60° (closed-cup test) or dry bulk cargo alternatively.

11. 1. 2 In addition to this Chapter the requirements of Pt 4, Ch 7 Bulk Carriers and Pt 4, Ch 11 Ore Carriers are also to be complied with as applicable. Particular attention is drawn to the minimum thickness requirements of Pt 4, Ch 9, 10 Construction details and minimum thickness.

11. 2 Class notations

11. 2. 1 Ships complying with the requirement of this section will be eligible for one of the following class notations, as applicable.

a. **100A1 Oil or Bulk Carrier, ESP**
b. **100A1 Oil or Bulk Carrier strengthened for heavy cargoes, holds ... may be empty, ESP**
c. **100A1 Oil or Bulk Carrier strengthened for heavy cargoes, any hold may be empty, ESP**
d. **100A1 Ore or Oil Carrier, ESP**.

11. 2. 2 The notation **ESP** serves to identify the ship as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements and Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements and Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements, *See also* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.12.

11. 2. 3 The above notations assume that dry cargoes and oil cargoes will not be carried simultaneously. However, oil may be retained in slop tanks when the ship is carrying dry cargo, provided that these tanks comply with the requirements of the Rules. Gas freeing, inerting, and isolating by approved arrangements of the remaining tanks and holds before loading ore or other dry cargoes is the responsibility of the Owner and is to be in accordance with National and Port Authority requirements.

11. 2. 4 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 Classification Regulations to which reference should be made.

11. 3 Structural configuration and ship arrangement

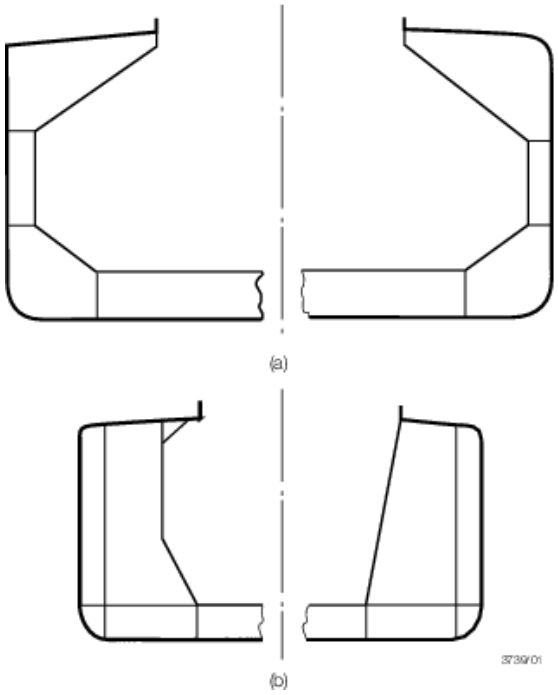
11. 3. 1 The requirements contained in this Section apply to the following ship types:

a. Oil or bulk carrier with a basic structural configuration having a single deck hull and which includes, a double skin side structure, double bottom, hopper side tanks and topside tanks fitted below the upper deck. A typical cross-section is indicated in Figure 9. 11. 1: Structural

configuration. However, consideration will be given to other arrangements on the basis of the requirements of this Section. The requirements of Pt 4, Ch 7 Bulk Carriers are to be applied.

b. Ore or oil carrier with a basic structural configuration having a single deck hull and which includes, a double skin side structure, two longitudinal bulkheads, and a double bottom throughout the centre hold and wing tanks. A typical cross-section is indicated in Figure 9. 11. 1: Structural configuration. The requirements of Pt 4, Ch 11 Ore Carriers are to be applied.

Figure 9. 11. 1: Structural configuration



11. 3. 2 Where oil residues are to be retained on board, slop tanks of sufficient capacity to meet MARPOL requirements are to be provided and are to be separated from adjacent spaces by cofferdams which are to be capable of being flooded, except where the adjacent space is used as a pump-room, ballast tank, or a fuel oil bunker tank, *See also* Pt 4, Ch 9, 1.2, Application and ship arrangement 1.2.2, Pt 5, Ch 15, 1.9 Non-sparking fans for hazardous areas and SOLAS Reg. II-2 *Part D - Escape*.

11. 3. 3 Arrangements are to be provided for the mechanical ventilation of cargo spaces and any enclosed spaces adjacent to cargo spaces, *See* Pt 5, Ch 15, 3 Cargo handling system. Similar arrangements are to be provided for cargo oil ducts which are used as pipe tunnels when the ship is carrying dry cargo, *See also* Pt 4, Ch 9, 11.3 Structural configuration and ship arrangement 11.3.5.

11. 3. 4 Openings which may be used for cargo operations, for example in the bottom of topside tanks, are not permitted in bulkheads and decks separating oil cargo spaces from other spaces not designed and equipped for the carriage of oil cargoes unless such openings are equipped with alternative approved means to ensure equivalent integrity.

11. 3. 5 For the requirements of ducts for cargo oil lines below decks on ore or oil carriers, *See* Pt 5, Ch 15, 3.3 Cargo piping system.

11. 3. 6 For the requirements for access arrangements to pipe tunnels and spaces in the cargo area, *See* Pt 4, Ch 9, 13 Access arrangements and closing appliances.

11. 4 Bulkheads in way of dry/oil cargo holds

11. 4. 1 In way of cargo oil holds, the scantlings of the cargo space boundaries are to comply with Pt 4, Ch 9, 11.4 Bulkheads in way of dry/oil cargo holds 11.4.2 and Pt 4, Ch 9, 11.4 Bulkheads in way of dry/oil cargo holds 11.4.6.

11. 4. 2 The scantlings of vertically corrugated and double plate transverse bulkheads supported by stools are to be determined in accordance with the requirements of Pt 4, Ch 9, 7.4 Bulkheads supported by stools 7.4.1, Pt 4, Ch 9, 7.4 Bulkheads supported by stools 7.4.2 and Pt 4, Ch 7, 10.2 Bulkheads supported by stools. In general, the bulkheads are to have stiffening or corrugations arranged vertically, supported by top and bottom end stools. Alternative arrangements will, however, be considered.

11. 4. 3 The longitudinal bulkheads including bulkhead forming inner hull, and the sloped bulkheads of the topside and double bottom tanks are to comply with Pt 4, Ch 9, 6 Inner hull, inner bottom and longitudinal oiltight bulkheads. However, in way of cargo holds b_1 is to be taken as the horizontal distance from the plate or longitudinal under consideration to the vertical projection of the hatch side furthest away from the bulkhead. For longitudinal framing the determination of the span point may be in accordance with Pt 3, Ch 3, 3 Structural idealisation. The scantlings of the sloped bulkhead of the double bottom hopper tanks in way of the dry cargo holds are to be not less than the requirements of Pt 4, Ch 7, 9 Hopper side tank structure.

11. 4. 4 The arrangement of stools and adjacent structure common with dry cargo holds is to be designed to avoid pockets in which gas could collect.

11. 4. 5 Where the form of construction used for transverse bulkheads in wing tanks is different from that used in centre holds, arrangements are to be made to ensure continuity of transverse strength through the longitudinal bulkhead.

11. 4. 6 Where partial filling of centre holds with liquid is contemplated, the scantlings and structural arrangements of the boundary bulkheads are to be capable of withstanding the loads imposed by the movement of liquid in the holds. The magnitude of the predicted loadings, together with the scantling calculations, may require to be submitted.

11. 5 Bulkheads in wing tanks of ore or oil carriers

11. 5. 1 Oiltight bulkheads in wing tanks of ore or oil carriers, *See* Pt 4, Ch 9, 11.3 Structural configuration and ship arrangement 11.3.1.b are to comply with the requirements for transverse oiltight bulkhead plating, stiffening and primary structure given in Pt 4, Ch 9, 7 Transverse oiltight bulkheads and Pt 4, Ch 9, 9 Primary members supporting longitudinal framing.

11. 5. 2 Non-oiltight bulkheads in wing tanks are to comply with the requirements given in Pt 4, Ch 9, 8 Non-oiltight bulkheads and Pt 4, Ch 9, 9 Primary members supporting longitudinal framing. The bulkhead plating is to be suitably reinforced in way of double bottom scarfing arrangements and the ends of centre hold deck transverses. Openings in wing tank bulkheads are to be kept clear of these areas.

11. 6 Cofferdam bulkheads

11. 6. 1 The scantlings of cofferdam bulkheads not forming the boundary of a cargo space are to be as required by Pt 4, Ch 9, 7 Transverse oiltight bulkheads.

11. 7 Hatchways

11. 7. 1 The scantlings of the cargo hold hatch coamings are to comply with Pt 3, Ch 11, 5 Hatch coamings and the cargo hold hatch covers with Pt 3, Ch 11, 2 Steel hatch covers and Pt 4, Ch 7, 12 Steel hatch covers.

11. 7. 2 Where cargo holds are intended to be partly filled the hatch covers may require to be additionally strengthened, *See also* Pt 4, Ch 9, 11.4 Bulkheads in way of dry/oil cargo holds 11.4.6.

11. 7. 3 Slop tank hatches and cleaning openings are only permitted on open deck. Unless these openings are closed with a watertight bolted plate, the locking arrangements are to be under the control of a responsible officer.

11. 8 Hatch coamings

11. 8. 1 The height and construction of hatch coamings are to comply with Pt 3, Ch 11, 5 Hatch coamings and Pt 4, Ch 7, 13 Hatch coamings.

PART

4

CHAPTER **9** **Double Hull Oil Tankers**

SECTION **12** **Cargo temperatures**

12. 1 General

12. 1. 1 This Section applies to the carriage of heated and low temperature cargoes in vessels having a structural configuration as shown in Table 9. 1. 3: Structural arrangement and Figure 9. 11. 1: Structural configuration.

12. 2 Loading and carriage of heated cargoes

12. 2. 1 Where cargoes are to be loaded or carried at temperatures above 80°C, temperature distribution investigations and thermal stress calculations are to be submitted. These are to be carried out using the highest cargo temperature during any part of the voyage, including loading and unloading.

12. 2. 2 The calculations are to give the resultant stresses on the hull structure, based on a sea temperature of 0°C and an air temperature of 5°C. Any proposals for reinforcement of the hull structure and/or limitation of the still water bending moment for heated cargo conditions are to be submitted.

12. 2. 3 Submitted proposals are to take account of non-uniform loading patterns with resultant variations in temperature distribution, where applicable.

12. 3 Low temperature cargoes

12. 3. 1 The hull structural and engineering systems permit cargoes to be loaded down to –10°C. For low temperature operations, *See* Pt 8 Rules for Ice and Cold Operations.

PART

4

CHAPTER 9 Double Hull Oil Tankers

SECTION 13 Access arrangements and closing appliances

13. 1 General

13. 1. 1 For requirements in respect of coamings and closing of deck openings, *See* Pt 3, Ch 11, 7 Tanker access arrangements and closing appliances.

13. 1. 2 Openings in cargo oil tanks are not to be located in enclosed spaces.

13. 1. 3 Ladders and

platforms in cargo tanks, pump-rooms and cofferdams are to be securely fastened to the structure, *See also* Pt 4, Ch 9, 2.3 Aluminium structure, fittings and paint.

13. 2 Access to spaces in the cargo area

13. 2. 1 Access to cofferdams, vertical wing and double bottom ballast tanks, cargo tanks and other spaces in the cargo area shall be direct from the open deck and such as to ensure their complete inspection. Access to double bottom tanks in way of cargo oil tanks, where wing ballast tanks are omitted, is to be provided by trunks from the exposed deck led down the bulkhead. Alternative proposals will, however, be considered provided the integrity of the inner bottom is maintained. Access to double bottom spaces may also be through a cargo pump-room, pump-room, deep cofferdam, pipe tunnel or similar compartments, subject to consideration of ventilation aspects.

13. 2. 2 Where a duct keel or pipe tunnel is fitted, and access is normally required for operational purposes, access is to be provided at each end and at least one other location at approximately mid-length. Access is to be directly from the exposed deck. Where an after access is to be provided from the pump-room to the duct keel, the access manhole from the pump-room to the duct keel is to be provided with an oiltight cover plate. Access is not to be via the engine room. Mechanical ventilation is to be provided and such spaces are to be adequately ventilated prior to entry. A notice-board is to be fitted at each entrance to the pipe tunnel stating that before any attempt is made to enter, the ventilating fan must have been in operation for an adequate period. In addition, the atmosphere in the tunnel is to be sampled by a reliable gas monitor, and where an inert gas system is fitted in cargo tanks, an oxygen monitor is to be provided.

13. 2. 3 In ships for the alternate carriage of oil cargo and dry bulk cargo where the boundary of a slop tank is part of a cargo pump-room bulkhead, any openings from the cargo pump-room to the double bottom, pipe tunnel or other enclosed space are to be provided with a gastight bolted cover.

13. 2. 4 Every double bottom space is to be provided with separate access without passing through other neighbouring double bottom spaces.

13. 2. 5 Where the tanks are of confined or cellular construction, two separate means of access from the weather deck are to be provided, one to be provided at either end of the tank space.

13. 2. 6 For access through horizontal openings, hatches or manholes, the dimensions are to be sufficient to allow a person wearing a self-contained air-breathing apparatus and protective equipment to

ascend or descend any ladder without obstruction and also to provide a clear opening to facilitate the hoisting of an injured person from the bottom of the space. The minimum clear opening is to be not less than 600 mm x 600 mm.

13. 2. 7 At least one horizontal access opening of 600 mm x 800 mm clear opening is to be fitted in each horizontal girder in the vertical wing ballast space and weather deck to assist in rescue operations.

13. 2. 8 For access through vertical openings, or manholes providing passage through the length and breadth of the space, the minimum clear opening is to be not less than 600 mm x 800 mm at a height of not more than 600 mm from the bottom shell plating unless gratings or other footholds are provided.

13. 2. 9 For oil tankers of less than 5000 tonnes DWT smaller dimensions may be approved by the National Administration concerned in special circumstances, if the ability to traverse such openings or to remove an injured person can be proved to the satisfaction of the Administration.

13. 2. 10 In double hull construction with the wing ballast tanks having restricted access through the vertical transverse webs, permanent arrangements are to be provided within the tanks to permit access for inspection at all heights in each bay. These arrangements which should comprise fixed platforms or other means are to provide sufficiently close access to carry out Close-Up Surveys as defined in Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements, using limited portable equipment where appropriate. Details of these arrangements are to be submitted for approval.

13. 2. 11 On very large tankers it is recommended that consideration be given to providing permanent facilities for staging the interior of cargo tanks situated within the cargo tank region and of large tanks elsewhere. Suitable provisions would be:

- Staging which can be carried on board and utilised in any tank, including power-operated lift or platform systems.
- Enlargement of structural members to form permanent, safe platforms, e.g. bulkhead longitudinals widened to form stringers (in association with manholes through primary members).
- Provision of inspection/rest platforms at intervals down the length of access ladders.
- Provision of manholes in upper deck for access to staging in cargo tanks.

13. 2. 12 Attention is drawn to Pt 4, Ch 9, 7.1 General 7.1.7, concerning provision of manholes in transverse bulkheads.

PART

4

CHAPTER **9** **Double Hull Oil Tankers**

SECTION **14** **Direct calculations**

14. 1 Application

14. 1. 1 Direct calculations are to be carried out for the derivation of scantlings where they are required by the preceding Sections of this Chapter or by related provisions included in Pt 3 Ship Structures (General).

14. 1. 2 Direct calculation methods are also generally to be used where additional calculations are required by the Rules in respect of unusual structural arrangements.

14. 2 Procedures

14. 2. 1 For details of ACS's direct calculation procedures, *See* Pt 3, Ch 1, 2 Direct calculations. For requirements concerning use of other calculation procedures, *See* Pt 3, Ch 1, 3 Equivalents.

14. 2. 2 Details of direct calculation procedures for determining the scantlings of boundary bulkheads for partially filled tanks are given in *ACSPlus SDA Guideline, Sloshing loads and Scantling Assessment*.

CHAPTER 10 Single Hull Oil Tankers

SECTION 1 General

1. 1 Application

1. 1. 1 The requirements specified in Pt 4, Ch 9 Double Hull Oil Tankers are applicable to small conventional single hull oil tankers where relevant, together with the additional requirements of this Chapter.

1. 1. 2 For tankers intended to load or unload whilst aground, *See* Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

1. 2 Class notations

1. 2. 1 Sea-going ships complying with the requirements of Pt 4, Ch 9 Double Hull Oil Tankers, where relevant, together with the additional requirements of this Chapter will be eligible to be classed **100A1 Oil Tanker, ESP**.

1. 2. 2 The Notation **ESP** serves to identify the ships as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements and Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements, *See also* Pt 1, Ch 2, 2 Character of classification and class notations.

PART

4

CHAPTER 10 Single Hull Oil Tankers

SECTION 2 Primary members supporting longitudinal framing

2. 1 General

2. 1. 1 These requirements are applicable to the following structural arrangements for ships with two longitudinal bulkheads:

a. Centre tank structure:

i. Primary supporting centreline girder between oiltight transverse bulkheads, in association with up to five transverses.

ii. Bottom transverses spanning between longitudinal bulkheads in association with a non-primary centreline docking girder.

iii.Double bottom.

b. Wing tank structure:

i. Transverse ring structure consisting of bottom, side shell, longitudinal bulkhead and deck transverses and incorporating one cross-tie or no cross-ties in tankers not exceeding 75 m in length.

ii. Double bottom.

2. 1. 2 The requirements are also applicable to structural arrangements incorporating a single longitudinal bulkhead located on the ship's centreline without cross-ties, for tankers not exceeding 75 m in length.

2. 1. 3 The minimum thickness and constructional detail requirements of Pt 4, Ch 10, 7 Construction details and minimum thickness are to be complied with. Particular attention is to be paid to the design of end connections between primary members and buttresses. The shear and combined stress levels in these connections are to be examined and should be within the limits specified in *ACSPlus SDA Guideline - Guidance Notes on Direct Calculations*.

2. 2 Symbols

2. 2. 1 The symbols used in this Section are defined as follows:

b_{e1}, b_{e2} = effective end bracket leg length, in metres, at each end of the member, *See* Pt 3, Ch 3, 3 Structural idealisation

b_T = overall breadth of tank, in metres

h_b = 0.75D+2.45 m

h_c = vertical distance from the centre of the cross-tie to deck at side amidships, in metres

h_s = distance between the lower span point of the side transverse and the moulded deck line at side, in metres

l_c = one-half the vertical distance, in metres, between the cross tie and the centre of the adjacent bottom or deck transverse, or double bottom, *See* Figure 10. 2. 3: Wing tank construction

l_T = overall length of tank, in metres

s = spacing of transverses, in metres

A = net sectional area of the web including end bracket where applicable, in cm^2

I_G = moment of inertia of the girder, in cm^4

I_T = moment of inertia of the transverse, in cm^4

Q_x = shear force at the actual section under consideration, obtained from shear force diagrams constructed as indicated, in kN

S_c = length of cross-tie between the face plates on the vertical transverse webs at the cross ties, in metres

S_G = span of girder, in metres, and is in no case to be taken less than (l_T−1.8s) metres

S_s = span of the side transverses, in metres, and is to be measured between end span points, *See* Figure 10. 2. 3: Wing tank construction

S_T = span of transverses, in metres

2. 2. 2 Other symbols are defined in Pt 4, Ch 9, 1.6 Information required for CSR Double Hull Oil Tankers.

2. 3 Structural arrangements

2. 3. 1 The spacing of transverses is not to exceed 3.6 m.

2. 3. 2 Where a trunk is fitted, the scantlings of primary members are to be modified as required by Pt 4, Ch 10, 6 Trunked construction.

2. 4 Bottom structure coefficients

2. 4. 1 Where a primary supporting bottom centreline girder is fitted, in a single bottom, the requirements for the girder and transverses may be derived using bending moment and shear force coefficients K_1 and K_2 determined from Table 10. 2. 1: Bottom structure coefficients. To obtain the coefficients, the following factors are required:

$$\alpha = \frac{l_T - S_G}{2s}$$

$$\beta = \frac{S_G^3 l_T}{S_T^3 l_G}$$

Initially, an estimated value of the ratio $\frac{I_T}{I_G}$ may be used, and an iterative process adopted to obtain the final required values.

2. 4. 2 Where bottom transverses are fitted in association with a non-primary centreline girder the coefficients for the transverse are to be taken as:

K_1 = 0.083

K_2 = 0.50

For the requirements for the non-primary girder, *See* Pt 4, Ch 10, 2.6, Bottom girders.

2. 4. 3 In ships with one longitudinal bulkhead, the coefficient for the bottom transverse is to be taken as:

a. K_1=0.177.

2. 5 Bottom transverses

2. 5. 1 The section modulus of bottom transverses is to be not less than:

$$Z = 62K_1, h_b S_T^2 k \text{ cm}^3$$

2. 5. 2 In ships with two longitudinal bulkheads, the depth of the bottom transverse web plate is to be not less than $0.2S_T$ and the net sectional area of the web at any section, including vertical end connections, is to be not less than:

$$A = 0.12Q_x k \ cm^2$$

where Q_x is calculated from shear force diagrams constructed as shown in Figure 10. 2. 1: Bottom transverses. For end connections, Q_x is to be determined by projection of the shear force diagram as indicated.

2. 5. 3 The moment of inertia of bottom transverses is to be not less than:

$$I = \frac{10.5}{k} S_T Z \ cm^4$$

2. 6 Bottom girders

2. 6. 1 The section modulus of the primary centreline bottom girder, where fitted, is to be not less than:

$$Z = 31K_1 b_T S_G h_b sk \ \ cm^3$$

2. 6. 2 The net sectional area of the web at any section, including vertical end connections, is to be not less than:

$$A = 0.12Q_x k \ \ cm^3$$

where Q_x is calculated from a shear force diagram constructed as shown in Figure 10. 2. 2: Bottom centreline girder. For end connections, Q_x is to be determined by projection of the shear force diagram as indicated.

2. 6. 3 In a single bottom the section modulus and web area of a non-primary centreline docking girder are to be not less than:

Z = $3.6b_T Ds^2 k$ cm^3

A = $0.3b_T Dsk$ cm^2

The scantlings of this girder may, however, be required to be increased, depending upon the docking condition and support arrangements, details of which are to be submitted. Consideration may be required to be given to restricting the level of ballast tank filling for docking purposes. The loads are to be specially considered when wing tanks are ballasted for docking.

2. 6. 4 Consideration will be given to alternative methods of stiffening in way of the keel blocks when accompanied by supporting calculations.

2. 6. 5 In way of the vertical centreline web and centreline supports to horizontal girders of transverse bulkheads, the docking girder is to be increased in depth and scantlings as necessary to provide an effective support.

2. 7 Side transverses

2. 7. 1 The section modulus of side transverses in ships with one or two longitudinal bulkheads is to be not less than:

$$Z = K_3 s h_s S_s^2 k \ cm^3$$

where K_3 is given in Table 10. 2. 2: Side transverse cofficients

Table 10. 2. 1: Bottom structure coefficients

Figure 10. 2. 1: Bottom transverses

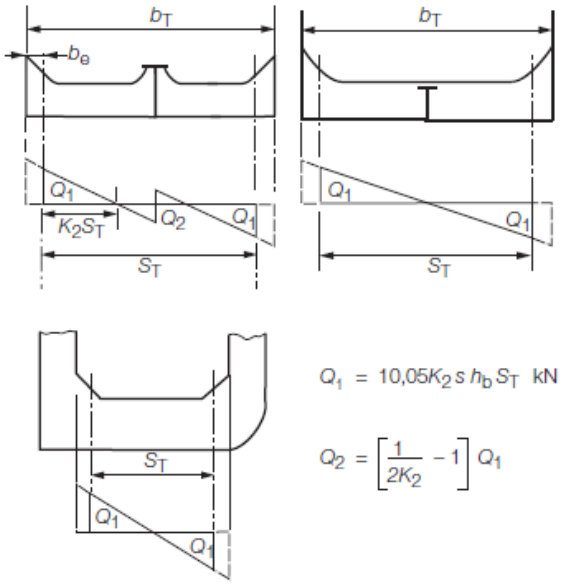

Figure 10. 2. 2: Bottom centreline girder

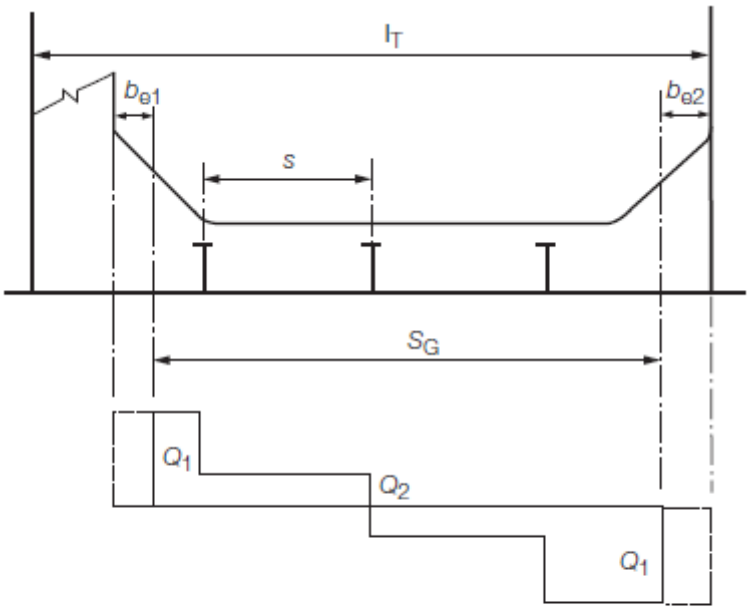


$$Q_1 = 5{,}025 K_2 h_b s b_T \text{ kN}$$

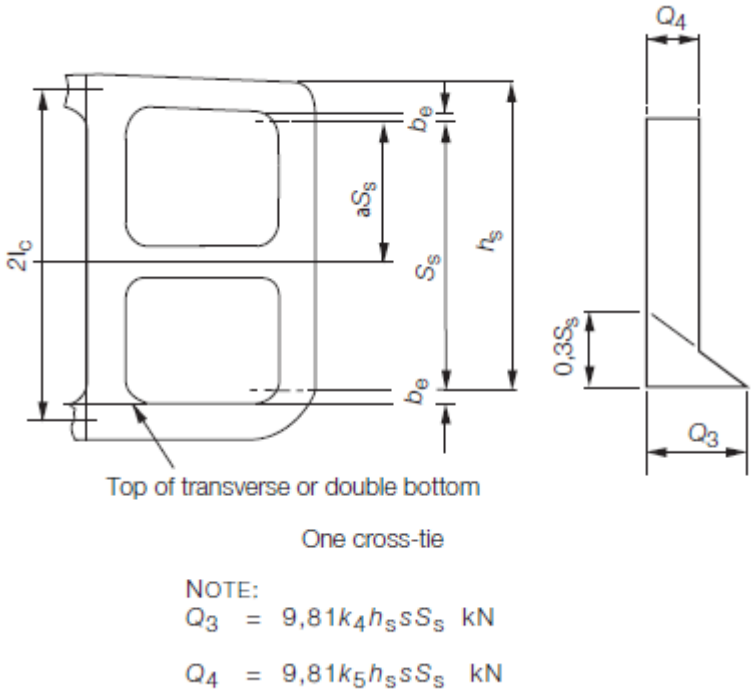
$$Q_2 = \left[\frac{l_T - 3s}{l_T - s}\right] Q_1$$

2. 7. 2 In ships with two longitudinal bulkheads, the net sectional area of the web at any section is to be not less than:

$$A = 0.12 Q_x k \ cm^2$$

where Q_x is calculated from shear force diagrams constructed as shown in Figure 10. 2. 3: Wing tank construction. For this purpose the values of K_4 and K_5 and the range of application is given in Table 10. 2. 2: Side transverse cofficients.

Figure 10. 2. 3: Wing tank construction



NOTE:

$Q_3 = 9{,}81k_4h_sSS_s$ kN

$Q_4 = 9{,}81k_5h_sSS_s$ kN

2. 7. 3 The moment of inertia of side transverses is to be not less than:

$$I = \frac{7.5}{k}S_sZ\ cm^4$$

2. 8 Deck transverses

2. 8. 1 The section modulus of deck transverses is to be not less than:

$$Z = 53.75(0.0269sL + 0.8)(S_T + 1.83)k\ \ cm^3$$

Where a continuous deck girder is fitted, the term S_T in the above formula is to be replaced by $\frac{S_T}{2}$.

Table 10. 2. 2: Side transverse cofficients

Number of cross-ties	K_3	K_4	K_5	Range of application
0	8	Not applicable		$L \leq 75$ m, *See* Pt 4, Ch 10, 2.3 Structural arrangements
1	2.16	0.455-0.316α	0.103	$0.5 \leq \alpha \leq 0.7$

2. 8. 2 The net sectional area of the web is to satisfy the requirements of Pt 4, Ch 10, 2.5 Bottom transverses 2.5.2 using a head, $h_b = \frac{L_1}{56}$m.

2. 8. 3 The moment of inertia of the transverses is to be not less than:

$$I = \frac{7.5}{k}S_TZ\ cm^4$$

2. 9 Deck girders

2. 9. 1 Where a continuous deck centreline girder supporting deck transverses is fitted, it is to have a section modulus not less than:

$$Z = 0.0476 S_G^2 b_T L k \ \ cm^3$$

2. 9. 2 The net sectional area of the web is to satisfy the requirements of Pt 4, Ch 10, 2.6 Bottom girders 2.6.2 using a head, $h_b = \frac{L_1}{56}$ m.

2. 9. 3 In way of the vertical centreline web on transverse bulkheads, the continuous deck girder is to be increased in depth and scantlings as necessary to provide an effective support.

2. 9. 4 Where an intercostal deck girder is fitted, it is to have a depth not less than 50 per cent of the depth of the deck transverse and the area of the face flat is to be not less than that of the transverse.

2. 9. 5 In way of the vertical centreline web and centreline supports to horizontal girder on transverse bulkheads, the intercostal deck girder may be required to be increased in depth and scantlings to provide an effective support.

2. 10 Cross-ties

2. 10. 1 Cross-ties, where fitted, may be of plate or sectional material and are to have an area and least moment of inertia not less than:

$$A = (64 + 1.035 l_c h_c s) k \text{ cm}^2$$
$$I = 2.45 l_c h_c S_c^2 \quad cm^4$$

2. 10. 2 Design of end connections is to be such that the area of the welding, including vertical brackets, where fitted, is to be not less than the minimum cross-sectional area of the cross tie derived from Pt 4, Ch 10, 2.10 Cross-ties 2.10.1. To achieve this full penetration may be required and thickness of brackets may require further consideration. Attention is to be given to the full continuity of area of the backing structure on the transverses. Particular attention is also to be paid to the welding at the toes of all vertical end brackets on the cross-tie.

2. 11 Double bottom girders and floors

2. 11. 1 The scantlings of girder and floors are to satisfy the requirements of Pt 4, Ch 1, 8.3,, Girders and Pt 4, Ch 1, 8.5, Floors respectively for longitudinally framed ships.

PART

4

CHAPTER **10** **Single Hull Oil Tankers**

SECTION **3** **Primary members supporting transverse side framing**

3. 1 General

3. 1. 1 The requirements of this Section are applicable to side stringers and transverse webs associated with transverse framing.

3. 1. 2 The minimum thickness and constructional detail requirements of Pt 4, Ch 10, 7 Construction details and minimum thickness are to be complied with.

3. 2 Symbols

3. 2. 1 The symbols used in this Section are defined as follows:

h_1 = head, in metres, from stringer to highest point of tank excluding hatchway, but not less than 2.5 m

Q_x = shear force at the actual section under consideration, obtained from shear force diagrams constructed as indicated, in kN (tonne-f)

S_1 = span, in metres, of the horizontal girder measured between span points, but to be taken not less than the lesser of$(1.2 + 0.02L)$m or 3m.

3. 2. 2 Other symbols are defined in Pt 4, Ch 9, 1.6 Information required for CSR Double Hull Oil Tankers.

3. 3 Structural arrangements

3. 3. 1 Side shell stringers are to be fitted as required by Table 10. 3. 1: Requirements for stringers. Alternatively, the number of stringers may be derived by direct calculation, particular regard being given to secondary bending effects on the frames supported.

Table 10. 3. 1: Requirements for stringers

Ship depth, in metres	Number of stringers
D ≤ 6.0	0
6.0 < D ≤ 7.5	1
7.5 < D ≤ 11.0	2

3. 3. 2 Where the spacing of bulkheads (oiltight or non-oiltight) exceeds 15 m, side transverses are to be fitted in line with each bottom transverse.

3. 3. 3 Where side transverses are not required, bottom transverses are to be adequately supported at the side shell and longitudinal bulkhead, and the lower side stringer is to be suitably buttressed from the bottom transverse.

3. 3. 4 Cross-ties, where fitted, are to comply with the requirements of 2.10 and are, in general, to be aligned with the stringers.

3. 3. 5 Where the ship is fitted with a trunk, the scantlings as given in this Section are to be modified as required by Pt 4, Ch 10, 6 Trunked construction.

3. 4 Scantlings

3. 4. 1 The section modulus of side stringers is to be not less than:

$$Z = 10bh_1S_1^2k\ cm^3$$

3. 4. 2 The net sectional area of the web at any section is to be not less than:

$$A = 0.12Q_xk\ cm^2$$

where Q_x is calculated from a shear force diagram constructed using the shear force at the span point, Q_1 given by the following:

$$Q_1 = 5.03sh_1S_1 \text{ kN}$$

3. 4. 3 The moment of inertia of the stringer is to be not less than:

$$I = S_1Z\frac{7.5}{k}\ cm^4.$$

3. 4. 4 Where side transverses supporting side stringers are fitted, they are to have a section modulus not less than that required by Pt 4, Ch 10, 2.7 Side transverses. Where the side transverse does not support side stringers, the section modulus required by Pt 4, Ch 10, 2.7 Side transverses may be reduced by 20 per cent.

PART

4

CHAPTER **10 Single Hull Oil Tankers**

SECTION **4 Primary members supporting oiltight bulkheads**

4. 1 General

4. 1. 1 These requirements are applicable to ships having two longitudinal bulkheads, and to ships not exceeding 75 m in length having one longitudinal bulkhead located on the centreline of the ship.

4. 1. 2 The minimum thickness and construction detail requirements of Pt 4, Ch 10, 7 Construction details and minimum thickness are to be complied with. Particular attention is to be paid to the design of end connections between primary members and buttresses. Where considered necessary, the shear and combined stresses in the connections may require to be examined and the scantlings and stiffening increased.

4. 2 Symbols

4. 2. 1 The symbols used in this Section are defined as follows:

h = the distance from the centre of the load on the member to a point 2.45 m above the highest point of the tank, excluding the hatchway, in metres

Q_x = shear force at the actual section under consideration, obtained from shear force diagrams constructed as indicated, in kN.

4. 2. 2 Other symbols are defined in Pt 4, Ch 9, 1.6 Information required for CSR Double Hull Oil Tankers.

4. 3 Structural arrangements

4. 3. 1 Where horizontal girders and vertical webs do not form part of a ring structure, they are to be arranged with substantial end brackets forming a buttress extending to the adjacent vertical web or transverse.

4. 3. 2 Where the cross-ties are omitted from the transverse ring in the wing tank adjacent to the bulkhead, the design of the horizontal girder, of the end buttress and of the transverse is to take account of the loads imposed and the deflection of the structure.

4. 3. 3 The spacing of transverses on longitudinal bulkheads is not to exceed 3.6 m.

4. 3. 4 Where, on ships with transverse side framing, transverses are required by Pt 4, Ch 10, 3 Primary members supporting transverse side framing, vertical webs are also to be fitted in line on the longitudinal bulkhead. Where such vertical webs are not required the lower horizontal girder on the bulkhead is to be suitably buttressed from the bottom transverses.

4. 4 Scantlings

4. 4. 1 The scantlings of vertical webs on longitudinal bulkheads are to be as required for side transverses by Pt 4, Ch 10, 2 Primary members supporting longitudinal framing.

4. 4. 2 The section modulus of vertical webs on transverse bulkheads and of horizontal girders is to be not less than:

$$Z = 8bhl_e^2k \quad cm^3$$

4. 4. 3 The net sectional area of the web at any section is to be not less than:

$$A = 0.12Q_xk\ cm^2$$

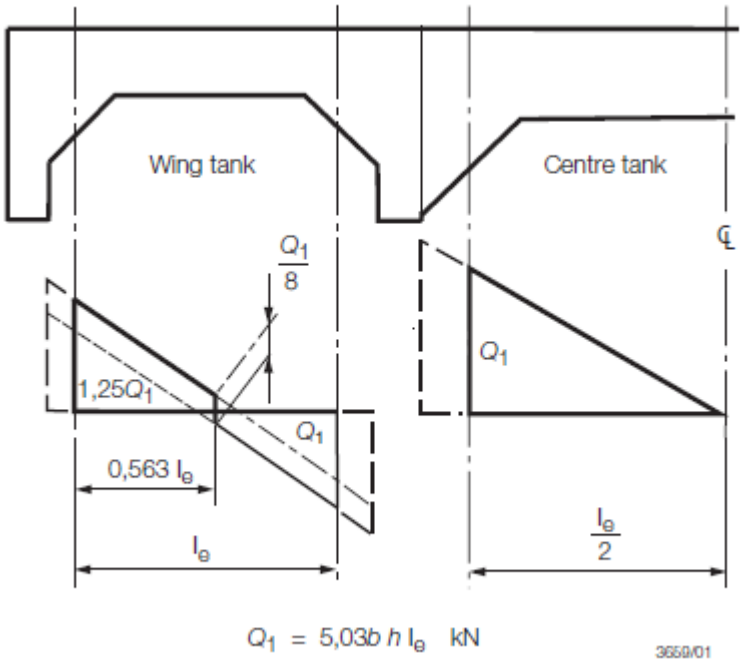
where Q_x is the shear force at the section. For the horizontal girders on ships with two longitudinal bulkheads, Q_x is calculated from shear force diagrams as shown in Figure 10. 4. 1: Horizontal girders. For end connections, Q_x is to be determined by projection of the shear force diagrams as indicated.

4. 4. 4 The moment of inertia of vertical webs and horizontal girders is to be not less than:

$$I = \frac{10.5}{k} l_e Z\ cm^4$$

4. 4. 5 For the calculation of section modulus, the minimum span of horizontal girders on longitudinal bulkheads is to be taken as not less than the lesser of$(1.2 + 0.02L)$ m or 3 m.

Figure 10. 4. 1: Horizontal girders



4. 4. 6 Where a trunk is fitted, the scantlings of primary members are to be modified as required by Pt 4, Ch 10, 6 Trunked construction.

PART

4

CHAPTER **10** **Single Hull Oil Tankers**

SECTION **5** **Primary members supporting non-oiltight bulkheads**

5. 1 General

5. 1. 1 These requirements are applicable to primary members supporting non-oiltight transverse bulkheads. Where non-oiltight longitudinal bulkheads are proposed, the requirements for the primary members will be individually considered.

5. 1. 2 The minimum thickness and constructional detail requirements of Pt 4, Ch 10, 7 Construction details and minimum thickness are to be complied with.

5. 2 Symbols

5. 2. 1 The symbol, l_b, used in this Section is defined as follows:

l_b = the distance, in metres, between the transverse bulkheads (oiltight or non-oiltight) adjacent to the bulkhead under consideration.

5. 2. 2 Other symbols are defined in Pt 4, Ch 9, 1.6 Information required for CSR Double Hull Oil Tankers.

5. 3 Direct calculations

5. 3. 1 Direct calculation procedures will generally be required where the non-oiltight bulkhead primary members will interact with, or tend to support, the primary bottom, longitudinal bulkhead or side structure, and in other cases where warranted by structural design features.

5. 4 Scantlings and arrangements

5. 4. 1 The section modulus of vertical webs is to be not less than that required for a vertical web on an oiltight transverse bulkhead in the same position, *See* Pt 4, Ch 10, 4 Primary members supporting oiltight bulkheads, multiplied by the factor $\left(0.3 + 2\frac{l_b}{L}\right)$.

5. 4. 2 The section modulus of horizontal girders is to be not less than:

$$Z = 145\, kbl_e^2 \frac{l_b}{L} \quad cm^3$$

5. 4. 3 When determining the width of plating supported and the effective breadth for calculating the section modulus, no deduction is to be made on account of perforations.

PART

4

CHAPTER **10 Single Hull Oil Tankers**

SECTION **6 Trunked construction**

6. 1 General

6. 1. 1 The requirements of this Section are additional to those of Pt 4, Ch 10, 1 General to Pt 4, Ch 10, 5 Primary members supporting non-oiltight bulkheads.

6. 1. 2 Where a trunk is fitted it is to extend over the full length of the cargo tanks and is to be effectively scarfed into the main hull structure.

6. 1. 3 The minimum thickness and constructional detail requirements of Pt 4, Ch 10, 7 Construction details and minimum thickness are also to be complied with.

6. 2 Symbols

6. 2. 1 The symbols used in this Section are defined as follows:

b_t = breadth of trunk, in metres

h_t = height of trunk, in metres, above the deck at the trunk side. Where the trunk top has excess camber, the value of h_t will be considered.

D_1 = equivalent depth of ship and is to be taken as:

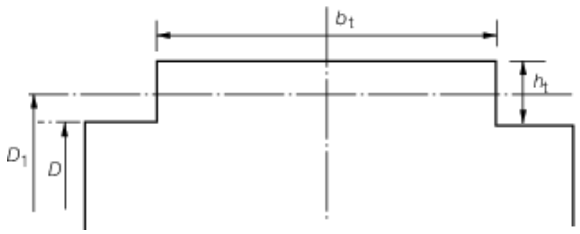
$$D + 0.6\frac{b_1 h_1}{B} \text{ where } \frac{b_1}{B} \leq 0.8 \text{ and}$$

$$D + h_t\left(2.6\frac{b_t}{B} - 1.6\right), \text{ where } \frac{b_t}{B} > 0.8$$

(*See* Figure 10. 6. 1: Equivalent depth).

6. 2. 2 Other symbols are defined in Pt 4, Ch 9, 1.6 Information required for CSR Double Hull Oil Tankers.

Figure 10. 6. 1: Equivalent depth



6. 3 Structural arrangements

6. 3. 1 The trunk deck and sides are to be longitudinally framed, and the transverse primary members are to be aligned with the deck transverses.

6. 3. 2 Particular attention is to be given to the arrangements in way of the connection of the trunk side to the deck at side. The construction is to be such as to ensure adequate rigidity and continuity of strength.

6. 3. 3 Typical arrangements of primary structure are shown diagrammatically in Figure 10. 6. 2: Primary structure, which also indicates the effective spans to be used in the determination of scantlings.

6. 3. 4 Where the trunk primary stiffening is fitted externally, individual consideration will be given to the arrangement and scantlings.

6. 3. 5 Where longitudinal stiffening is fitted externally to the trunk, tripping brackets are to be fitted to maintain lateral stability in way of transverse bulkheads and elsewhere as necessary.

6. 3. 6 Extension brackets and web stiffeners or equivalent arrangements are to be provided at the forward and after ends of the trunk to ensure full continuity of strength from the trunk into hull and superstructures.

6. 3. 7 Where the carriage of heated cargoes is contemplated and, in particular, bituminous cargoes, special attention is to be given to the alignment of the scarfing arrangements and softening of the extension bracket toes at the trunk ends to alleviate the effects of thermal stressing.

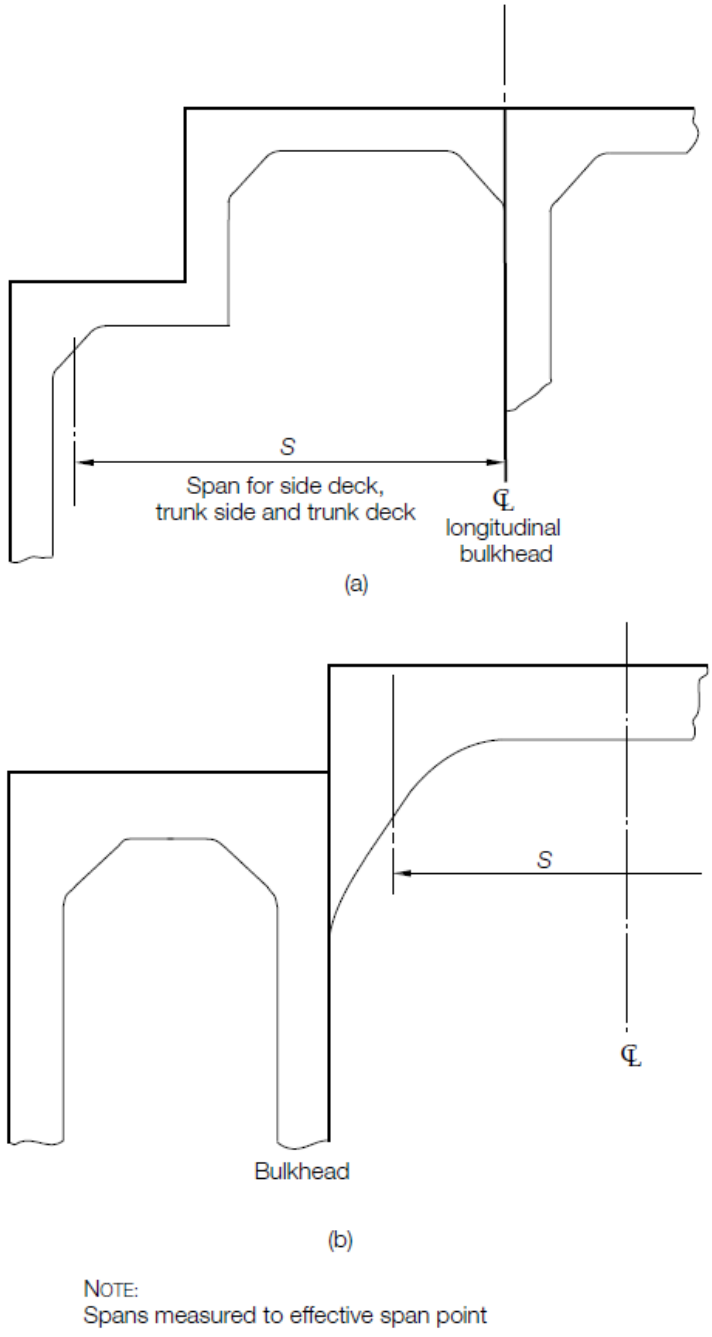
6. 4 Trunk scantlings

6. 4. 1 The thickness of the trunk top and side plating is to be not less than as required by Pt 4, Ch 9, 4 Hull envelope plating for hull envelope plating, the item numbers for these being as given in Figure 10. 6. 3: Hull envelope plating - Itemisation of parts.

6. 4. 2 The section modulus of trunk longitudinals is to be not less than as required by Pt 4, Ch 9, 5 Hull framing for deck longitudinals.

6. 4. 3 The section modulus and moment of inertia of the transverses is to be not less than as required by Pt 4, Ch 10, 2.8 Deck transverses for deck transverses.

Figure 10. 6. 2: Primary structure



NOTE:
Spans measured to effective span point

6. 5 Modification to hull scantlings

6. 5. 1 The thickness of the deck plating outboard of the trunk side is to be that necessary to obtain the required hull section modulus, but is to be not less than that required by Pt 4, Ch 9, 4 Hull envelope plating multiplied by the factor

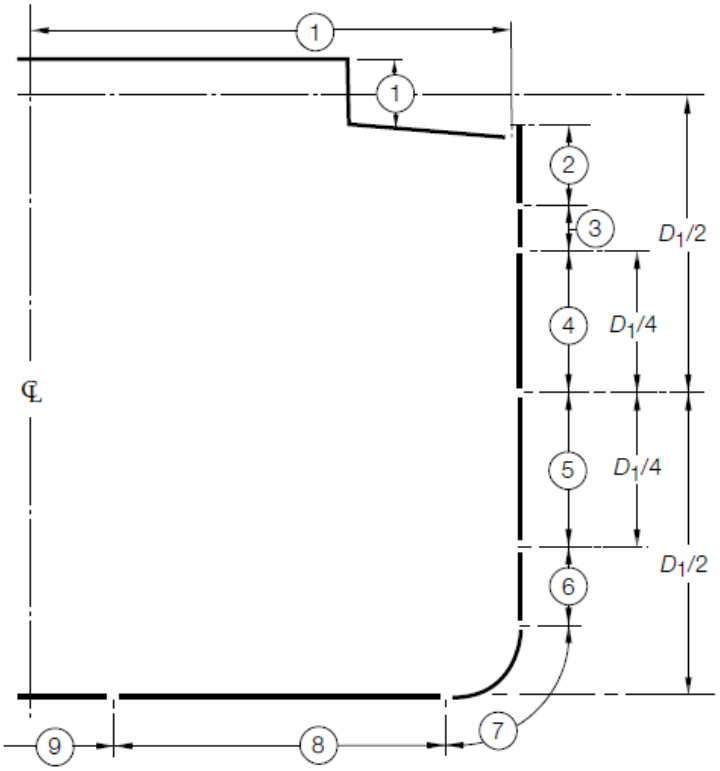
$$\frac{2BD}{2BD + b_t h_t}.$$

6. 5. 2 The scantlings of the shell plating, framing, primary structure and bulkheads are to be determined on the basis of the equivalent ship depth D_1, i.e. where the depth, D, enters into the calculation or structural arrangement it is to be replaced by D_1.

6. 5. 3 The head to the deck at side is to be increased by $(D_1 - D)$.

6. 5. 4 The head to the highest point of the tank is to be replaced by the actual distance to the highest point of the tank, reduced by the amount $(D + h_t - D_1)$.

Figure 10. 6. 3: Hull envelope plating - Itemisation of parts



PART

4

CHAPTER 10 Single Hull Oil Tankers

SECTION 7 Construction details and minimum thickness

7. 1 Symbols

7. 1. 1 The symbols used in this Section are defined in Pt 4, Ch 9, 10.1 Symbols.

7. 2 Compartment minimum thickness

7. 2. 1 The requirements of Pt 4, Ch 9, 10.2, Compartment minimum thickness are also applicable to small conventional single hull tankers.

7. 3 Geometric properties and proportions of members

7. 3. 1 The depth of the web of any primary member is to be not less than 2.5 times the depth of the cut-outs for the passage of secondary members, except where compensation is arranged to provide satisfactory resistance to deflection and shear buckling in the web.

7. 3. 2 The area of material in the face plate of any primary member is not to exceed:

$$0.00667 d_w t_w \ cm^2$$

nor is it to be less than:

$0.0167 s_1 d_w \ cm^2$ for the bottom centreline girder

$0.00417 s_t d_w \ cm^2$ elsewhere.

7. 3. 3 The geometric properties of rolled stiffeners and built sections are to be calculated in association with an effective width of attached plating in accordance with Pt 3, Ch 3, 3 Structural idealisation.

7. 4 Continuity of primary members

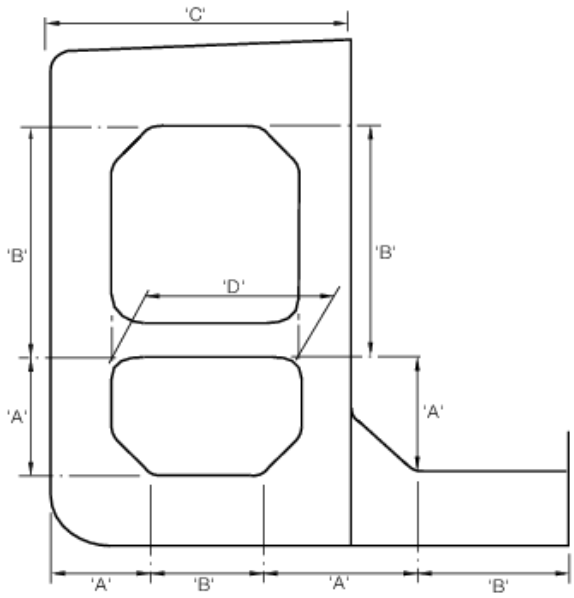
7. 4. 1 Primary members are to be so arranged as to ensure effective continuity of strength throughout the range of tank structure. Abrupt changes of depth or section are to be avoided. Where members abut on both sides of a bulkhead or on other members, arrangements are to be made to ensure that they are in alignment.

7. 4. 2 The members are to have adequate end fixity, lateral support and web stiffening, and the structure is to be arranged to minimize hard spots or other sources of stress concentration. Openings are to have well rounded corners and smooth edges and are to be located having regard to the stress distribution and buckling strength of the plate panel.

7. 5 Primary member web plate stiffening

7. 5. 1 The webs of primary members are to be supported and stiffened in accordance with the following requirements, which are designated as requirements `A', `B', `C' and `D'. The application of these requirements is detailed in Pt 4, Ch 10, 7.5 Primary member web plate stiffening, and the corresponding locations indicated in Figure 10. 7. 1: Key to application requirements. Where webs are slotted for the passage of secondary members, the web stiffeners are to be arranged to provide adequate support for the loads transmitted, *See* Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members.

Figure 10. 7. 1: Key to application requirements



7. 5. 2 Where higher tensile steel is used for the primary members, the maximum spacing of stiffeners given in this Section is to be multiplied by $\sqrt{k}$.

7. 5. 3 In addition to these stiffeners, tripping brackets as required by Pt 4, Ch 9, 10.11 Lateral stability of primary members are also to be fitted.

7. 5. 4 For requirement `A' stiffening:

a. The thickness, t_w of the web is to be not less than $\frac{s}{80}$

b. Stiffening is generally to be fitted normal to the face plate of the member, but the stiffeners parallel to the face plate will be required when the web depth, d_w, exceeds a value, d_{max} which is to be taken as:

$$for\ s \leq 55t_w\ d_{\max} = 3s$$

$$for\ s > 55t_w\ d_{\max} = \frac{45st_w}{s-40t_w}$$

c. Where stiffening parallel to the face plate is required, the distance from the face plate of the member to the nearest stiffener is not to exceed $65t_w$. Further stiffeners are to be fitted at similar spacing so that the distance between the last stiffener and the shell or bulkhead plating does not exceed d_{max}. In way of end brackets to transverse bulkhead primary structure, stiffeners are to be fitted normal to the face plate of the member so that web plate panel dimensions parallel to the face plate do not exceed $80t_w$.

7. 5. 5 For requirement `B` stiffening:

a. The thickness, t_w of the web is to be not less than $\frac{s}{85}$

b. Stiffening is generally to be fitted normal to the face plate of the member, but stiffeners parallel to the face plate will be required when the web depth, d_w, exceeds a value d_{max}, which is to be taken as:

$$for\ s \leq 70t_w\ d_{\max} = 3s$$

$$for\ s > 70t_w\ d_{\max} = \frac{48st_w}{s-54t_w}$$

c. Where stiffening parallel to the face plate is required, the distance from the face plate of the member to the nearest stiffener is not to exceed $80t_w$. Further stiffeners are to be fitted at similar spacing so that the distance between the last stiffener and the shell or bulkhead plating does not exceed d_{max}.

7. 5. 6 For requirement `C' stiffening:

a. Stiffening is generally to be fitted normal to the face plate of the member in line with alternate secondary members, but stiffeners parallel to the face plate will be required, when the web depth, d_w exceeds a value, d_{max} which is to be taken as:

$$for\ s \leq 76t_w\ d_{\max} = 3s$$

$$for\ s > 76t_w\ d_{\max} = \frac{48st_w}{s-60t_w}$$

b. Where stiffening parallel to the face plate is required, the distance from the face plate of the member to the nearest stiffener is not to exceed $90t_w$. Further stiffeners are to be fitted at similar spacing so that the distance between the last stiffener and the deck plating does not exceed d_{max}.

7. 5. 7 For requirement `D' stiffening:

a. Stiffening parallel to the face plate will be required such that the distance between the stiffener and face plate, or between two stiffeners, does not exceed:

$80t_w$ where $L \leq 90$ m

$55t_w$ where $L \geq 190$ m

with intermediate values by interpolation.

b. Brackets are to be fitted to support the face plates and stiffeners.

7. 6 Inertia and dimensions of stiffeners

7. 6. 1 The moment of inertia is to be not less than:

a. For stiffeners normal to the primary member face plate:

$$I_s = pst_{w^3} \times 10^{-4}\ cm^4$$

Where t_w need not be greater than the values in Table 10. 7. 1: Maximum web thickness for stiffener inertia and p is to be obtained from Table 10. 7. 2: Coefficient for stiffener inertia.

b. For stiffeners parallel to the primary member face plate:

On transverses, webs and stringers

$$I_s = 2l_sA_s^2\ \ cm^4$$

On longitudinal deck and bottom girders

$$I_s = 2.85l_sA_s^2\ \ cm^4$$

Table 10. 7. 1: Maximum web thickness for stiffener inertia

Requirement	Web thickness t_w, in mm
`A'	$\frac{s}{55}$
`B' and `C'	$\frac{s}{70}$
`D'	$\frac{s}{80}$ where $L \leq 90$ m, *See Note* $\frac{s}{60}$ where $L \leq 190$ m, *See Note*
Note Intermediate values by interpolation	

7. 6. 2 Where stiffeners are fitted in both directions, the inertia of the stiffeners parallel to the face plate of the member is to be not less than that of the stiffeners fitted normally.

7. 6. 3 The depth of web stiffeners is to be not less than 75 mm.

7. 6. 4 Where flat bar stiffeners are used, the ratio of depth to thickness is not to exceed $18\sqrt{k}$.

Table 10. 7. 2: Coefficient for stiffener inertia

Aspect ratio of plate panel, $\frac{s}{d}$	1.0 or more	0.9	0.8	0.7	0.6	0.5	0.4	0.3 or less
p	1.5	2.1	2.9	4.2	6.1	9.2	14.6	30.0

Note *1.* Intermediate values by interpolation.

Note *2.* The depth of panel, *d*, used in calculating aspect ratio may be measured from the face of the secondary member to which the primary member web stiffener is attached.

7. 7 Application of stiffening requirements

7. 7. 1 The requirements as detailed in Pt 4, Ch 10, 7.5 Primary member web plate stiffening and Pt 4, Ch 10, 7.6 Inertia and dimensions of stiffeners are to be applied in the following locations, *See also* Figure 10. 7. 1: Key to application requirements.

a. For bottom transverses:
In the centre tank requirement `A' stiffening is to extend for 20 per cent of the breadth of the tank from the longitudinal bulkhead, but at least beyond the toe of the end bracket. In the wing tank, requirement `A' stiffening is to extend at least as far as the toes of the end brackets from the longitudinal bulkhead and the shell. Elsewhere, requirement `B' stiffening is to be fitted.

b. For transverses at side shell and longitudinal bulkhead:
Requirement `A` stiffening is to extend at least as far as the lower surface of the lower cross-tie. Elsewhere, requirement `B` stiffening is to be fitted.

c. For deck transverses:
Requirement `C' stiffening is to be fitted.

d. For stringers and horizontal girders:
Requirement `A' stiffening is to extend for a distance from each end of 20 per cent of the span of the stringer or girder, but at least beyond the toes of the end brackets. Elsewhere, requirement `B' stiffening is to be fitted.

e. For cross-ties:

Cross-ties are to be suitably stiffened to prevent buckling and twisting. Requirement `D' stiffening is to be fitted.

f. For shell stringers and vertical webs in fore peak:
Requirement `A' stiffening is to extend the full length of the member.

7. 7. 2 The application of stiffening requirements to transverse wing structures in wing tanks where no cross-ties are fitted is to be based on the results of direct calculation and will be specially considered.

7. 8 Stiffening of continuous longitudinal girders

7. 8. 1 The webs of continuous longitudinal deck and bottom girders are to be stiffened parallel to the girder face plate.

7. 8. 2 The stiffeners are to be spaced not more than $55t_w$ mm apart except in way of vertical webs and end brackets, where the spacing is not to exceed $45t_w$ mm. Alternatively, a combination of parallel stiffeners at $55t_w$ mm spacing and normal stiffeners at $45t_w$ mm spacing may be adopted. Particular attention is to be given to the stiffening of the docking girder.

7. 8. 3 The moment of inertia of stiffeners is to comply with Pt 4, Ch 10, 7.6 Inertia and dimensions of stiffeners.

7. 9 Stiffening of vertical webs on transverse bulkheads

7. 9. 1 Vertical webs are to be fitted with stiffeners parallel to the face plate of the web and spaced not more than $60t_w$ mm apart. Stiffeners normal to the face plate are to be fitted when a vertical web supports horizontal stiffeners on transverse bulkheads. The length of stiffener is to be sufficient to distribute the load transmitted, and the connection between web stiffener and bulkhead stiffener is to comply with the relevant requirements of Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members.

7. 9. 2 The moment of inertia of the stiffeners is to comply with Pt 4, Ch 10, 7.6 Inertia and dimensions of stiffeners.

7. 10 Docking brackets on bottom centreline girder

7. 10. 1 Stiffened docking brackets are to be fitted on both sides of the bottom centreline girder, midway between transverses, and are to be connected to a suitable bottom shell longitudinal. The bracket on one side is to be connected to the face plate of the girder but the other may be stopped at a suitable horizontal stiffener.

7. 10. 2 Additional vertical stiffeners may be required on the bottom panels of the girder to resist docking pressures.

7. 11 Lateral stability of primary members

7. 11. 1 Tripping brackets are generally to be fitted close to the toes of end brackets, in way of cross-ties and elsewhere, so that the spacing between brackets does not exceed the lesser of 4.5 m or 15 times the width of the face plate (20 times in the case of deck transverses). Arrangements in way of the intersections of primary members are to be such as to prevent tripping. A closer spacing of brackets may be required to be adopted with asymmetrical face plates.

7. 11. 2 To maintain continuity of strength, substantial horizontal and vertical brackets are to be fitted to transverses or stringers at ends of cross-ties. Horizontal brackets are to be aligned with the cross-tie face plates, and vertical end brackets are to be aligned with the cross-tie web.

7. 11. 3 Tripping brackets are to be connected to the face plate of the bottom transverses. Elsewhere, other than for docking girders, the bracket is to be connected to the face plate whenever the unsupported width of the latter exceeds 150 mm. Where the width of symmetrically placed face plates exceeds 400 mm, a small bracket is to be fitted opposite, and in line with, the tripping bracket. Equivalent support arrangements are to be provided for cross-tie face plates. Particular attention is to be paid to the support of continuous face plates in way of the radius at toes of brackets.

7. 11. 4 Wide face plates may require additional support between brackets.

7. 11. 5 In the fore peak tank, if the angle to the normal of the shell plating and the vertical webs exceeds 20°, double tripping brackets are to be fitted to the web at about midspan, but in no case greater than 3.0 m apart.

7. 12 Openings in web plating

7. 12. 1 Where openings are cut in the webs of primary supporting members, the greatest dimension of the opening is not to exceed 20 per cent of the web depth. The opening is to be located so that the edges are not less than 40 per cent of the web depth from the face, and are equidistant from the corners of notches for frames or stiffeners. Openings are to be suitably framed where required.

7. 12. 2 Lightening holes are not to be cut in horizontal girders on the ship's side and longitudinal bulkheads, in symmetrical webs nor in side transverses and vertical webs in way of cross-ties and their end connections.

7. 12. 3 Holes cut in primary longitudinal members within $0.1D$ of the deck and bottom are, in general, to be reinforced as required by Pt 4, Ch 9, 4.10 Deck openings. Access holes may be cut in deep transverses and girders with suitable compensation to provide satisfactory resistance to deflection and shear buckling in the web.

7. 12. 4 All holes are to have smooth edges and are to be kept well clear of notches and the toes of brackets.

7. 12. 5 Small air and drain holes cut in primary members are to be kept clear of the toes of brackets and are to be well rounded with smooth edges. Where holes are cut in primary longitudinal members of higher tensile steel, they are to be elliptical or equivalent to minimize stress concentration.

7. 12. 6 Where holes are cut for heating coils, the lower edge of the hole is to be not less than 100 mm from the inside of the shell plating. Where large notches are cut in the transverses for the passage of longitudinal framing, adjacent to openings for heating coils, the longitudinal notches are to be collared. Examination of the buckling strength of the web plate panel between notches for longitudinals may be required.

7. 13 Brackets connecting primary members

7. 13. 1 The requirements of Pt 4, Ch 9, 10.13 Brackets connecting primary members are also applicable to small conventional single hull tankers.

7. 14 Arrangements at intersections of continuous secondary and primary members

7. 14. 1 For details and connections of collars, *See* Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members.

CHAPTER **11 Ore Carriers**

SECTION **1 General**

1. 1 Application

1. 1. 1 This Chapter applies to the arrangements and scantlings within the cargo region of sea-going ore carriers, intended for the carriage of ore in centre holds.

1. 1. 2 The requirements of Pt 4, Ch 9 Double Hull Oil Tankers are to be applied to ore carriers, except as required by the provisions of this Chapter.

1. 1. 3 The scantlings of structural items may be determined by direct calculation. Where the length of the ship exceeds 150 m, the scantlings of the primary supporting structure and the fatigue performance of structural details are to be assessed in accordance with the relevant ACSPlus Guidelines, *See* Pt 4, Ch 11, 1.3 Class notation 1.3.5. In such cases, the calculations are to be submitted for approval.

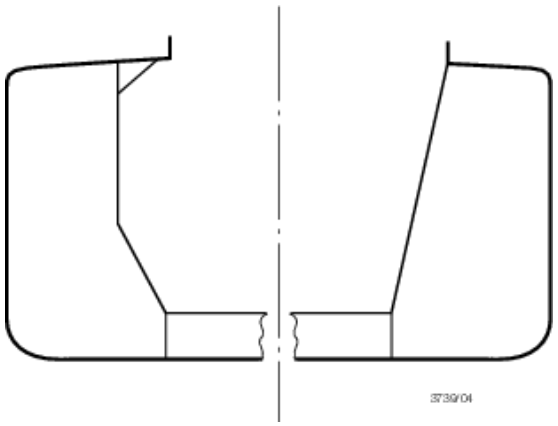
1. 1. 4 The additional requirements for ore-carriers for the alternate carriage of oil cargo and dry bulk cargo are given in Pt 4, Ch 9, 11 Ships for alternate carriage of oil cargo and dry bulk cargo.

1. 1. 5 Ore carriers with a deadweight greater than 200 000 tonnes are to comply with the requirements of Pt 4, Ch 11, 13 Single pass loading.

1. 2 Structural configuration and ship arrangement

1. 2. 1 The requirements contained in the Chapter apply to single deck ships with machinery aft, having two longitudinal bulkheads and a double bottom throughout the centre hold. A typical cross-section is indicated in Figure 11. 1. 1: Typical cross-section.

Figure 11. 1. 1: Typical cross-section



1. 2. 2 The bottom, and the deck outside the line of ore hatchways, are to be framed longitudinally within the cargo region. The side shell and longitudinal bulkheads are generally to be framed longitudinally where the length of the ship exceeds 150 m, but alternative proposals will be specially considered. Inside the line of openings, the deck is to be transversely framed.

1. 2. 3 The notation **Strengthened to carry cargoes which may liquefy (IMSBC Group A)** is only applicable to ore carriers having a conventional structural configuration with cargo holds bounded by two longitudinal bulkheads widely separated from the side shell, *See* Figure 11. 1. 1: Typical cross-section.

1. 3 Class notation

1. 3. 1 Sea-going ships complying with the requirements of this Chapter and other relevant Rule requirements for the draught required will be eligible to be classed **100A1 ore carrier, ESP**.

1. 3. 2 The notation **ESP** serves to identify the ship as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements and Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements, *See also* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.12.

1. 3. 3 Where a vessel is built in accordance with the requirements detailed in this Section, the vessel will be eligible for the notation **Strengthened to carry cargoes which may liquefy (IMSBC Group A)**. The requirements in this Section do not allow the loading of cargo with moisture content in excess of the transportable moisture limit (TML), as defined in the IMSBC Code, but instead make allowance for the rise in moisture content of the cargo above the TML after loading. Attention is drawn to Section 7.3.2.1 of the IMSBC Code.

1. 3. 4 The notation **Strengthened to carry cargoes which may liquefy (IMSBC Group A)** serves to identify the ship as being specially constructed for loads from Group A cargoes, as defined in the IMSBC Code.

The loading condition cargo density, ρ_c, applicable to this notation is not to be less than the virtual homogeneous load density as calculated based on M_{Full} at maximum draught, *See* Pt 4, Ch 7, 1.8, Symbols and definitions. The virtual cargo density is calculated based on homogeneous cargo at maximum draught.

The density is to be agreed between the Owner and the Builder and is to be noted in the Loading Manual in this form: 'Carriage of cargo with moisture content above TML shall only be undertaken if the cargo density is above <density> t/m^3'.

To be eligible for this notation additional calculations are required to assess stresses from liquefied cargo. The following structures are to be assessed:

a. Longitudinal bulkheads using one of the following cargo density cases:
   i. Assessment using virtual cargo density, i.e. fully filled:
      - According to Table 9. 6. 1: Inner hull and longitudinal oiltight bulkhead scantlings with the following considerations:
      - load height, h, measured up to the highest point of the hold; and
      - the results are to be corrected for density by applying a factor of $\rho_c/1.025$ to the load height.
   ii. Assessment using cargo density higher than the virtual cargo density, i.e. partially filled:
      - According to Table 9. 6. 1: Inner hull and longitudinal oiltight bulkhead scantlings with the following considerations:
      - load height, h, measured up to the height of the cargo in the hold;
      - horizontal distance, b_1, measured from the calculation point to the centreline as the filling level allows. When the level of the liquefied cargo is above the hold corner after the ship is heeled over, b_1 is to be specially considered to ensure a correct increased load height, $h+Rb_1$, in the heeled state with roll angle θ; and

- the results are to be corrected for density by applying a factor of $\rho_c/1.025$ to the load height.

b. Transverse bulkheads using one of the following cargo density cases:
   i. Assessment using virtual cargo density, i.e. fully filled:
      - According to Table 9. 7. 1: Transverse oiltight bulkhead scantlings with the following considerations:
      - load height, *h,* measured to the highest point of the hold; and
      - the results are to be corrected for density by applying a factor of $\rho_c/1.025$ to the load height.
   ii. Assessment using cargo density higher than the virtual cargo density, i.e. partially filled:
      - According to Table 9. 7. 1: Transverse oiltight bulkhead scantlings with the following considerations:
      - load height, *h*, measured up to the height of the cargo in the hold;
      - horizontal distance, b_1, measured from the calculation point to the centreline as the filling level allows. When the level of the liquefied cargo is above the hold corner after the ship is heeled over, b_1 is to be specially considered to ensure a correct increased load height, $h+Rb_1$, in the heeled state with roll angle θ; and
      - the results are to be corrected for density by applying a factor of $\rho_c/1.025$ to the load height.

c. Intersection of continuous secondary and primary members according to Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members using loads in the same Section from Table 10. 5. 1: Total load transmitted to connection of secondary members *(3)(b)(iii)* in Pt 3 Ship Structures (General) with K_c=1.

d. Cross ties in wing tanks as per requirements for primary structure in this Chapter.

e. Lower stool as per requirements for Pt 4, Ch 11, 1.3 Class notation 1.3.4.c transverse bulkheads.

Additionally, the vessel is to be designed in accordance with *ACSPlus SDA Guideline for Primary Structures of Ore Carriers*.

1. 3. 5 Where the length of the ship is greater than 150 m, or where the structural arrangements are considered such as to necessitate it, the scantlings of the primary supporting structure are to be assessed by direct calculation and the ACSPlus notations **SDA**, **FDA** and **CM** are mandatory, *See* Pt 4, Ch 11, 1.3 Class notation 1.3.7 and Pt 4, Ch 11, 11 Direct calculations.

1. 3. 6 For ore carriers where an assessment of multiple port loading and unloadinghas been carried out in accordance with the relevant ACSPlus Guidelines and the ACSPlus notation **SDA** has been assigned, an optional ACSPlus notation **MP** can be assigned.

1. 3. 7 The 'ACSPlus Guidelines' for the hull construction of ships are detailed in Pt 3, Ch 16 ACSPlus Guidelines for the Design, Construction and Lifetime Care of Ships and the classification notations and descriptive notes associated with these procedures are given in Pt 1, Ch 2, 2 Character of classification and class notations.

1. 3. 8 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2, 2 Character of classification and class notations.

1. 4 Symbols and definitions

1. 4. 1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

L, *B*, *D*, *T* as defined in Pt 3, Ch 1, 6 Definitions.

b = the width of plating supported by the primary member, in metres or mm

h = the load head, in metres, applied to the item under consideration

k = higher tensile steel factor. For the determination of this factor, *See* Pt 3, Ch 2, 1 Materials of construction. For mild steel k may be taken as 1.0

l_e = effective length of primary or secondary member, in metres, *See* Pt 3, Ch 3, 3 Structural idealisation.

s = spacing, in mm, of secondary members

Z = the section modulus, in cm^3, of the primary or secondary member, in association with an effective width of attached plating determined in accordance with Pt 3, Ch 3, 3 Structural idealisation.

1. 4. 2 The expression `primary member' as used in this Chapter is defined as a girder, transverse, vertical web, stringer, cross-tie, buttress or double bottom floor. `Secondary members' are supporting members other than primary members.

PART

4

CHAPTER **11 Ore Carriers**

SECTION **2 Materials and protection**

2. 1 Materials and grades of steel

2. 1. 1 Materials, grades of steel and protection of materials are to comply with the requirements of Pt 3, Ch 2 Materials, and the Pt 2 Rules for the Manufacture, Testing and Certification of Materials.

2. 2 Corrosion protection coating for salt-water ballast spaces

2. 2. 1 The requirements of Pt 3, Ch 2, 3.6 Application of coatings and alternative means of protection and Ch 15 Corrosion Prevention of the Pt 2 *Rules for the Manufacture, Testing and Certification of Materials* are to be complied with.

PART

4

CHAPTER **11 Ore Carriers**

SECTION **3 Longitudinal strength**

3. 1 General

3. 1. 1 The longitudinal strength standard is to comply with the relevant requirements of Pt 3, Ch 4 Longitudinal Strength.

3. 1. 2 For ships of length≥150 m, with holds where any part of the longitudinal bulkhead is located within B/5 or 11.5 m, whichever is less, inboard from the ship's side at right angles to the centreline at the assigned summer load line, the requirements of Pt 4, Ch 7, 3 Longitudinal strength are also to be applied.

PART

4

CHAPTER 11 Ore Carriers

SECTION 4 Hull envelope plating

4. 1 General

4. 1. 1 The requirements for hull envelope plating as given for oil tankers in Pt 4, Ch 9, 4 Hull envelope plating are to be applied, except as provided for in this Section.

4. 2 Deck plating in way of ore hatchways

4. 2. 1 The arrangement and scantlings of deck plating inside the line of ore hatchways and in way of ore hatchway corners are to be in accordance with the requirements for bulk carriers given in Pt 4, Ch 7, 4 Deck structure.

4. 3 Hatchways

4. 3. 1 The scantlings of the cargo hold hatch covers are to comply with Pt 3, Ch 11, 2 Steel hatch covers and Pt 4, Ch 7, 12 Steel hatch covers.

4. 4 Hatch coamings

4. 4. 1 The height and construction of hatch coamings are to comply with Pt 4, Ch 7, 13 Hatch coamings.

4. 4. 2 Wire rope grooving in way of cargo hold openings is to be prevented by fitting suitable protection, such as halfround bars, on the hatch side girders (upper portion of top-side tank plates), hatch end beams, and the upper portion of hatch coamings.

PART

4

CHAPTER **11 Ore Carriers**

SECTION **5 Hull framing**

5. 1 General

5. 1. 1 The framing requirements given for oil tankers in Pt 4, Ch 9, 5 Hull framing are to be applied, except as provided for in this Section.

5. 1. 2 Lateral buckling of longitudinal and transverse ordinary stiffeners is to be assessed in the following areas in association with a factor of safety of not less than 1.15 (allowable utilisation factor to be reduced by at least 1/1.15 = 0.87). Details are to be submitted:

- hatchway coaming;
- inner bottom;
- sloped stiffened panel of topside tanks (if any);
- longitudinal bulkhead;
- top stool and bottom stool of transverse bulkhead (if any) and
- stiffened transverse bulkhead (if any).

5. 2 Symbols

5. 2. 1 The symbols used in this Section are defined as follows:

h = load height, in metres, on the weather deck for primary and secondary members between ore hatchways

= 1.8 for secondary members forward of 0.075L from F. P.

= 4.2 + 2.04E for primary members forward of 0.075L from F. P.

= 1.5 between 0.075L and 0.12L from F. P.

= 1.2 + 2.04E elsewhere

= where $E = \frac{0.0914+0.003L}{D-T} - 0.15$ but not to be greater than 0.147

K_1 = 1.6 in the forward $0.12L$

= 1.06 elsewhere

K_2 = 0.00054 in the forward $0.075L$

= 0.00033 elsewhere.

5. 2. 2 Other symbols are defined in Pt 4, Ch 11, 1.4 Symbols and definitions.

5. 3 Bottom longitudinals in double bottom tanks

5. 3. 1 The section modulus of bottom longitudinals in the double bottom in the centre hold is to satisfy the requirements of in Chapter 1.

5. 3. 2 In general, the span of longitudinals in the double bottom in the centre hold is not to exceed 2.5 m or $0.01L$, whichever is the greater, and the span in the wing tanks is not to exceed the greater of 3.6 m or $0.02L$.

5. 4 Deck structure in way of centre hold

5. 4. 1 Where the hatch coamings are situated inboard of the longitudinal bulkhead, the deck between the two is to be fitted with suitably supported longitudinals complying with Pt 4, Ch 9, 5 Hull framing.

5. 5 Primary and secondary members inside line of ore hatchways

5. 5. 1 The section modulus of secondary members between hatches is to be not less than:

$$Z = \mathrm{k}(K_1 TD + K_2 hBl_e^2 s)\mathrm{cm}^3$$

but need not exceed twice the value given by the second term within the brackets in the formula.

5. 5. 2 The section modulus of primary members between hatches is to be not less than:

$$Z = 5.46\mathrm{kbhl}_e^2\ \mathrm{cm}^3$$

Forward of $0.075L$ from the forward perpendicular, the depth of the primary member is to be not less than twice that of the secondary member supported.

5. 5. 3 Particular attention is to be paid to the scarfing of deck beams into the structure outside the line of openings. Substantial brackets or equivalent arrangements are to be provided.

PART

4

CHAPTER **11 Ore Carriers**

SECTION **6 Double bottom construction**

6. 1 General

6. 1. 1 The double bottom depth and scantlings are to be as required by Pt 4, Ch 7, 8 Double bottom structure for the double bottom structure of a bulk carrier to which the notation `strengthened for heavy cargoes' is to be assigned. However, where Pt 4, Ch 11, 3.1 General 3.1.2 is not applicable, the requirements of Pt 4, Ch 7, 8.8, Allowable hold loading in the flooded condition need not be applied. The required depth of double bottom and scantlings of double bottom structure are to be verified by direct calculation. The calculation is to be submitted.

6. 1. 2 Where the proposed depth of double bottom exceeds 1.5 times the Rule minimum depth given in Pt 4, Ch 1, 8 Double bottom structure, the scantlings of the floors and girders may be required to be increased to ensure adequate resistance to buckling.

6. 1. 3 The thickness of inner bottom plating in the cargo hold is to be not less than required by Pt 4, Ch 7, 8 Double bottom structure for ships having the notation `**strengthened for heavy cargoes**'.

6. 1. 4 For all vessels intended to be unloaded by grabs, the thickness of inner bottom plating is to meet the requirements of Pt 3, Ch 9, 8.2 Inner bottom plating 8.2.1 for a maximum design grab weight specified and recorded in the Loading Manual. For vessels of deadweight >200 000 tonnes, the design grab weight is not to be less than 25 tonnes.

6. 1. 5 Where the requirements of Pt 4, Ch 11, 6.1 General 6.1.4 are met the descriptive note '**holds suitable for unloading by grabs**' may be employed. Where the design grab weight is 25 tonnes or more the notation '**strengthened for regular discharge by heavy grabs**' may be assigned.

6. 2 Arrangement

6. 2. 1 In way of the cargo hold a centreline girder is to be fitted and side girders spaced not more than 3.8 m apart are generally to be arranged in way of transverse bulkheads. The side girders are to extend at least to the first plate floor adjacent to the bulkhead each side. The outboard side girder is to be continuous, forming the lower part of the longitudinal bulkhead.

6. 2. 2 Plate floors are to be fitted in line with each transverse in the wing tanks and in way of transverse bulkhead stools. Additional floors are to be so arranged that the spacing of floors does not exceed 2.5 m or 0.01L, whichever is the greater.

6. 2. 3 Attention is to be given to structural continuity and alignment between double bottom structure and transverses in wing tanks, *See also* Pt 4, Ch 11, 9.7 Scarfing of double bottom.

6. 2. 4 Alternative arrangements will be considered on the basis of the results of direct calculations.

PART

4

CHAPTER **11 Ore Carriers**

SECTION **7 Longitudinal bulkheads**

7. 1 General

7. 1. 1 The requirements for longitudinal oiltight bulkheads given in Pt 4, Ch 9, 6 Inner hull, inner bottom and longitudinal oiltight bulkheads and Pt 4, Ch 9, 9 Primary members supporting longitudinal framing are to be applied, together with the additional requirements of this Section.

7. 1. 2 Longitudinal bulkhead scantlings are to be additionally assessed against ore loading in accordance with Table 11. 7. 1: Longitudinal and transverse bulkhead scantlings for ore loading.

Table 11. 7. 1: Longitudinal and transverse bulkhead scantlings for ore loading

Item	Longitudinal and transverse bulkhead
Plate thickness including corrugations (mm)	$t = 0.004sf\sqrt{\frac{K_c Hk}{C}} + 3.5$ mm
Modulus of rolled and built stiffeners, and symmetrical corrugations (cm^3)	$Z = \frac{skK_c Hl_e^2}{22C\gamma(\omega_1 + \omega_2 + 2)}\ cm^3$
Symbols	

= s, S, k, l as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1

f = $1.1 - s/2500S$ but not to be taken greater than 1.0

l_e = effective length of stiffening member, in metres, and for bulkhead stiffeners, to be taken as $l - e1 - e2$

γ = 1.4 for rolled or built sections and double plate bulkheads

= 1.6 for flat bars

= 1.1 for symmetrical corrugations of deep tank bulkheads

= 1.0 for symmetrical corrugations of watertight bulkheads

ω_e = as defined in Table 1. 9. 3: Bulkhead end constraint factors in Chapter 1, *See also* Figure 1. 9. 1: End connections. Where applicable the value of M_2 is to be taken as

$$= \frac{K_c H s l^2}{22C}$$

K_c = ore pressure coefficient, to be taken as $\cos^2 \alpha + (1 - \sin \psi) \sin^2 \alpha$ for inner side (hopper tank, transverse and longitudinal bulkheads, lower stool, vertical upper stool, etc.), and where:

K_c = 0 for top side tank, upper deck and sloped upper stool یک سطر در Rullوجود دارد

α = angle, in degrees, between panel considered and the horizontal plane

ψ = assumed angle of repose, in degrees, of bulk cargo (considered drained and removed); in the absence of more precise evaluation to be taken as ψ=35° for iron ore

H = height, from position under consideration to deck at side amidships, in metres

C = stowage rate, in m^3/tonne, as defined in Pt 3, Ch 3, 5.2 Symbols. For vessels where Pt 4, Ch 11, 1.1 Application 1.1.5 is applicable, C is to include the cargo overshoot specified in Pt 4, Ch 11, 13.4 Cargo loading conditions for design assessment 13.4.1.e

7. 1. 3 Longitudinal bulkheads on ore carriers are to be plane with rolled or fabricated longitudinal stiffeners. The bulkhead may be sloped to form a hopper shape in the lower part of the hold or over its full depth.

7. 1. 4 Where the upper part of the bulkhead is vertical and the lower part sloped to form a hopper shape, the thickness of the bulkhead plating in way of the knuckle may be required to be increased to resist transverse compressive buckling stresses. The knuckle is to be arranged in way of a longitudinal.

7. 1. 5 The thickness of the lowest strake of sloped bulkhead plating is also to comply with inner bottom requirements as given in Pt 4, Ch 11, 6.1 General 6.1.3. Where this provision results in an increase in thickness, the latter may be gradually tapered above the lowest strake to the required longitudinal bulkhead thickness at the position of the knuckle, or at a point one third of the depth of the bulkhead above the inner bottom, whichever is the lower.

PART

4

CHAPTER **11 Ore Carriers**

SECTION **8 Transverse bulkheads**

8. 1 General

8. 1. 1 Where the form of construction used for transverse bulkheads in wing tanks is different from that used in centre holds, arrangements are to be made to ensure continuity of transverse strength through the longitudinal bulkhead.

8. 2 Transverse watertight bulkheads in wing tanks

8. 2. 1 The requirements for transverse bulkhead plating, stiffening and primary structure given in Pt 4, Ch 1, 9 Bulkheads for deep tank bulkheads are to be applied.

8. 3 Transverse watertight bulkheads in centre holds

8. 3. 1 Scantlings are to comply with Pt 4, Ch 1, 9 Bulkheads and assessed against ore loading in accordance with Table 11. 7. 1: Longitudinal and transverse bulkhead scantlings for ore loading. Transverse corrugated bulkhead scantlings may be determined by direct calculations but are not to be less than required by the watertight bulkhead requirements of Pt 4, Ch 1, 9 Bulkheads.

8. 3. 2 For ships where the requirements of Pt 4, Ch 11, 3.1 General 3.1.2 are applicable, the requirements for transverse hold bulkheads given for the carriage of dry bulk cargoes in Pt 4, Ch 7, 10 Bulkheads are also to be applied.

8. 3. 3 In general, the bulkheads are to have stiffening or corrugations arranged vertically, supported by top and bottom end stools. Alternative arrangements will, however, be considered.

8. 3. 4 Where inner bottom plating is increased as required by Pt 4, Ch 11, 6.1 General 6.1.4, the lower part of the transverse bulkhead should also be increased in accordance with Pt 3, Ch 9, 8.4 Transverse bulkhead plating 8.4.1.

8. 3. 5 For vessels eligible for the notation **Strengthened to carry cargoes which may liquefy (IMSBC Group A)**, the plate thickness of corrugated bulkheads in any cargo hold shall be determined based on differential pressure between liquefied cargo and dry cargo in the adjacent hold.

8. 4 Non-watertight bulkheads

8. 4. 1 Non-watertight bulkheads in wing tanks are to comply with the requirements given in Pt 4, Ch 9, 8 Non-oiltight bulkheads and Pt 4, Ch 9, 9.8 Primary members supporting non-oiltight bulkheads.

8. 4. 2 The bulkhead plating is to be suitably reinforced in way of double bottom scarfing arrangements and the ends of centre hold deck transverses. Openings in wing tank bulkheads are to be kept clear of these areas.

PART

4

CHAPTER 11 Ore Carriers

SECTION 9 Primary structure in wing tanks

9. 1 Bottom transverses

9. 1. 1 The scantlings of the bottom transverses are to be determined by means of direct calculations or, alternatively, in accordance with the requirements of Pt 4, Ch 10, 2.5, Bottom transverses.

9. 2 Side transverses

9. 2. 1 The scantlings of the side transverses are to be determined by means of direct calculations or, alternatively, in accordance with the requirements of Pt 4, Ch 10, 2.7 Side transverses.

9. 3 Cross ties in wing tanks

9. 3. 1 Cross ties in wing tanks are to comply with requirements in Pt 4, Ch 9, 9 Primary members supporting longitudinal framing.

9. 3. 2 Cross ties in wing tanks of vessels eligible for the notation **Strengthened to carry cargoes which may liquefy (IMSBC Group A)** are to comply with the requirements in:

- Pt 4, Ch 9, 9.3 Girders and floors in double bottom 9.3.3;
- Pt 4, Ch 9, 9.3 Girders and floors in double bottom 9.3.4; and
- Pt 4, Ch 9, 9.3 Girders and floors in double bottom 9.3.5.
- *ACSPlus Additional Design Guideline (ADG), Guideline for Assessment of Ore Carriers filled with Liquefied Cargoes*.

9. 3. 3 Actual wing tank cross tie area, A_{cl}, in cm^2, is to satisfy:

$$A_{cl} \geq f_{liq} A_c$$

Where

A_c = Area of cross tie, in cm^2, *See* Pt 4, Ch 11, 9.5 Cross-ties 9.5.1

f_{liq} = $0.5 + \frac{f_{lc}}{2.025C}$ and is not to be taken less than 1.0.

Where

C = stowage rate, in m^3/t

The stowage rate is defined in Table 11. 7. 1: Longitudinal and transverse bulkhead scantlings for ore loading but need not take into account the cargo overshoot defined in Pt 4, Ch 11, 13.4 Cargo loading conditions for design assessment 13.4.1.e.

f_p = 1.0

If the cargo density of the intended loading condition is higher than the virtual cargo density , *See* Pt 4, Ch 11, 1.3, Class notation 1.3.4, then f_{lc} is the be taken as (*See also* Pt 4, Ch 11, 1.3, Class notation 1.3.4):

f_p = $\frac{Ch_p\rho_p}{h_c}$ but is not to be taken less than 0.0 and need not be taken greater than 1.0.

Where

ρ_p = the loading condition cargo density (*See* Pt 4, Ch 11, 1.3, Class notation 1.3.4), in t/m^3

h_p = the vertical distance from the centre of the cross tie to the level cargo surface, in m, with the loading condition density in an upright condition. The determination of cargo surface height need not take into account the cargo overshoot defined in Pt 4, Ch 11, 13.4 Cargo loading conditions for design assessment 13.4.1.e.

h_c = the vertical distance from the centre of the cross-ties to deck at side amidships, in metres.

وجود داردRullتعدادی سطر در

9. 3. 4 Cross tie flange thickness t_f, in mm, is not to be less than:

$$t_f \geq \frac{b_f}{24\sqrt{kf_a}}$$

Where

f_a = $\frac{A_{cl}}{f_{liq}A_c}$

A_{cl} = actual wing tank cross tie area, in cm^2

A_c = wing tank cross tie area in cm^2, *See* Pt 4, Ch 11, 9.5 Cross-ties 9.5.1

f_{liq} = scantling factor for cargo with moisture level exceeding TML, *See* Pt 4, Ch 9, 9.3 Girders and floors in double bottom 9.3.3

b_f = flange breadth of cross tie, in mm.

9. 3. 5 Length of cross tie, S_c, as defined in Pt 4, Ch 9, 9.2 Symbols 9.2.1, is to be less than or equal to l_{perm}:

$$S_c \leq l_{perm}$$

Where

l_{perm} = permissible length of cross tie, in metres, from the torsional buckling aspect:

$$= \frac{0.038 b_f \sqrt{kf}}{\sqrt{1 + \frac{d_w t_w}{6 b_f t_f}}}$$

f_a = $\frac{A_{cl}}{f_{liq} A_c}$

A_{cl} = actual wing tank cross tie area, in cm^2

A_c = wing tank cross tie area in cm^2, *See* Pt 4, Ch 11, 9.5 Cross-ties 9.5.1

f_{liq} = scantling factor for cargo with moisture level exceeding TML, *See* Pt 4, Ch 9, 9.3 Girders and floors in double bottom 9.3.3

d_w = web depth of cross tie, in mm

t_w = web thickness of cross tie, in mm

b_f = flange breadth of cross tie, in mm

t_f = flange thickness of cross tie, in mm

9. 4 Deck transverses

9. 4. 1 The scantlings of the deck transverses are to be determined by means of direct calculations or, alternatively, in accordance with the requirements of Pt 4, Ch 10, 2.8 Deck transverses.

9. 5 Cross-ties

9. 5. 1 The scantlings and arrangement of the cross-ties are to be determined by means of direct calculations or, alternatively, in accordance with the requirements of Pt 4, Ch 9, 9.6, Cross-ties.

9. 6 Primary members supporting bulkheads

9. 6. 1 The scantlings of primary members supporting bulkheads are, in general, to be determined by means of direct calculation, *See also* Pt 4, Ch 11, 9.6 Primary members supporting bulkheads 9.6.3, Pt 4, Ch 11, 9.6 Primary members supporting bulkheads 9.6.4 and Pt 4, Ch 11, 9.6 Primary members supporting bulkheads 9.6.5.

9. 6. 2 Vertical webs are to be arranged in line with deck transverses and the double bottom floors. Particular attention is to be paid to the alignment of the bulkhead web end brackets with the double bottom floors.

9. 6. 3 The section modulus of vertical webs on longitudinal bulkheads is to be as required by Pt 4, Ch 9, 9.7 Primary members supporting oiltight bulkheads 9.7.4.

9. 6. 4 The net sectional area of the web at any section is to be as required by Pt 4, Ch 9, 9.7 Primary members supporting oiltight bulkheads 9.7.5.

9. 6. 5 The moment of inertia of vertical webs on longitudinal bulkheads is to be as required by Pt 4, Ch 9, 9.7 Primary members supporting oiltight bulkheads 9.7.6.

9. 7 Scarfing of double bottom

9. 7. 1 The inner bottom plating is to be extended into the wing tank in the form of a horizontal diaphragm, arranged to ensure a smooth structural transition in way of transverse primary members and to maintain longitudinal continuity. The diaphragms are to be of sufficient width to provide effective scarfing of the inner bottom into the wing tank structure.

9. 7. 2 Floors intermediate between transverses are to be backed in the wing tanks by substantial vertical brackets extending transversely over at least three bottom longitudinal spaces and vertically to a sufficient height above the horizontal diaphragms to provide effective support for the double bottom structure.

9. 8 Construction details and minimum thickness

9. 8. 1 The construction details are to comply with the requirements of Pt 7, Ch 10, 7 Water cooler refrigeration units with the exception of lateral stability of primary members which is to be as required by Pt 4, Ch 9, 10.11 Lateral stability of primary members.

9. 8. 2 The minimum thickness is to be as required by Pt 4, Ch 9, 10.2, Compartment minimum thickness.

PART

4

CHAPTER **11 Ore Carriers**

SECTION **10 Structural details**

10. 1 Intersection of continuous secondary and primary members

10. 1. 1 For vessels eligible for the notation **Strengthened to carry cargoes which may liquefy (IMSBC Group A),** the arrangement at the intersection of longitudinal stiffeners on the longitudinal bulkhead and hopper plate with transverse primary members are to comply with Pt 3, Ch 10, 5.2, Arrangements at intersections of continuous secondary and primary members and Table 10. 5. 1: Total load transmitted to connection of secondary members with K_c=1.0.

PART

4

CHAPTER **11 Ore Carriers**

SECTION **11 Direct calculations**

11. 1 Application

11. 1. 1 Direct calculations are to be employed in the derivation of scantlings where required by the preceding Sections of this Chapter or by related provisions included in Pt 3 Ship Structures (General).

11. 1. 2 Direct calculation methods are also generally to be used where additional calculations are required by the Rules in respect of unusual arrangements.

11. 1. 3 For complex structural arrangements, e.g. a double plate transverse bulkhead with stool in a centre hold, associated with plane wing tank bulkheads supported by stringers and buttresses, an investigation of bottom primary structure over a full cargo hold length and three-dimensional analysis of the transverse bulkhead structure will generally be required, taking account of applied longitudinal hull bending effects.

11. 1. 4 The cross-deck structure is to be verified as being capable of supporting transverse compressive stresses resulting from lightship weight, deadweight, hydrostatic and wave loads. For ore carriers that are designed to operate with an asymmetrical loading condition, or large ore carriers with $B \geq 40$ m or $b/w \geq 2.2$, the wave loads should take account of hydrodynamic torque in an oblique sea. The cross-deck structure is to comprise the hatch coamings and beams, the plating and attached stiffeners and the upper stool. Non-corrugated bulkhead plating may also be included

where

B = moulded breadth, in metres

b = breadth of the deck hatch openings, in metres

w = width of the cross-deck strip between hatchways, in metres.

11. 2 Procedures

11. 2. 1 For details of ACS's direct calculation procedures, *See* Pt 3, Ch 1, 2 Direct calculations. For requirements concerning use of other calculation procedures, *See* Pt 3, Ch 1, 3 Equivalents.

11. 2. 2 Where appropriate to the structural configuration, the direct calculation procedures for tanker primary structure, *See* Pt 4, Ch 9, 14 Direct calculations, will be adapted for application to ore carriers.

PART

4

CHAPTER **11 Ore Carriers**

SECTION **12 Forecastles**

12. 1 General

12. 1. 1 A forecastle is to be fitted in accordance with the requirements of Pt 4, Ch 7, 14 Forecastles.

PART

4

CHAPTER **11 Ore Carriers**

SECTION **13 Single pass loading**

13. 1 Scope and application

13. 1. 1 The requirements of this Section are to be applied to all ore carriers with a deadweight greater than 200 000 tonnes. The requirements are for single pass loading where the maximum permissible cargo intake per cargo hold may be loaded in a single loading pour.

13. 2 Information required

13. 2. 1 In addition to the plans required for submission by Pt 3, Ch 1, 5.2 Plans and supporting calculations and as detailed in the applicable Chapters, the following information is also to be submitted:

a. Maximum permissible cargo in each cargo hold.

b. Cargo mass curves for a single and adjacent hold loadings taking into account the cargo overshoot defined in Pt 4, Ch 11, 13.4 Cargo loading conditions for design assessment 13.4.1.e.

c. One or more cargo loading sequences intended for single pass loading, *See* Pt 4, Ch 11, 13.2, Information required 13.2.2.

d. Details of ballast and deballast piping arrangements and pumping capacity.

e. Specification of loading computer.

13. 2. 2 The cargo loading sequences as required by Pt 4, Ch 11, 13.2 Information required 13.2.1.c are to include the following:

a. Start and end times of each cargo pour and the intended loading rate.

b. Start and end times of each deballasting operation and the intended discharge rate.

c. Intermediate points (in time) during pours and between pours. In general, the interval between intermediate points is not to be greater than 1 hour.

d. The ship's loading condition, including the ship's draughts at the fore and aft perpendiculars, amount of cargo in each hold and amount of ballast in each tank, and the still water bending moments and shear forces, are to be provided for each point (in time) of the loading operation specified in Pt 4, Ch 11, 13.2, Information required 13.2.2, Pt 4, Ch 11, 13.2 Information required 13.2.2.b and Pt 4, Ch 11, 13.2 Information required 13.2.2.c.

13. 3 Definitions

13. 3. 1 **Pour**. A pour is defined by the start and finish of loading of a cargo hold. A pour finishes when the loading equipment changes position to a new cargo hold.

13. 3. 2 **Overshooting**. Overshooting is to be taken as the consequence of mistiming the loading of cargo, resulting in cargo overloading.

13. 4 Cargo loading conditions for design assessment

13. 4. 1 For the purpose of the design assessment, the following conditions are assumed:

a. Cargo loading and deballasting operations are coordinated, with the deballast capacity and arrangement of the vessel designed to accommodate the specified loading sequences.

b. The cargo is distributed symmetrically in a hold space.

c. Deballasting is carried out for each pair of symmetrical port and starboard tanks simultaneously, so that each pair of symmetrical port and starboard ballast tanks contain equal amounts of water ballast throughout deballasting operations.

d. To improve deballasting and stripping, the trim of the ship is to be, in general, by the stern throughout the cargo loading operation.

e. A cargo overshoot per cargo hold is taken as 10 per cent of the maximum permissible hold cargo mass or 3000 tonnes, whichever is the lesser, but not less than 5 per cent of the maximum permissible hold cargo weight, in any case. A higher cargo overshoot may be specially considered.

f. Loading more than one cargo hold simultaneously in a single pass, i.e. simultaneous filling of two or more holds, will be specially considered. The specific loading conditions are to be submitted for appraisal in addition to the condition(s) for standard single-pass loading.

13. 5 Design assessment

13. 5. 1 The following criteria are to be complied with in all cargo loading sequences:

a. Still water bending moment and shear force are within the allowable limits.

b. Single hold loading is within the allowable hold mass curve.

c. Two adjacent holds loading are within the allowable hold mass curve.

13. 5. 2 Arrangements and scantlings of local stiffeners and plating within the cargo hold region are to comply with Pt 4, Ch 11, 1 General to Pt 4, Ch 11, 12 Forecastles with consideration of the maximum permissible cargo mass per hold in the loading manual and the cargo overshoot specified in Pt 4, Ch 11, 13.4 Cargo loading conditions for design assessment 13.4.1.e.

13. 5. 3 The primary structure and plating within the cargo hold region are to be assessed in accordance with the *ACSPlus SDA Guideline for Ore Carriers*.

13. 6 Ballast arrangements

13. 6. 1 The deballasting capacity of the vessel, including arrangement of ballast tanks, pumps and relevant piping system, is to be sufficient for the loading operations as agreed in the approved loading plan.

13. 6. 2 A smaller diameter stripping system with separate main and branch lines may need to be provided in order to achieve the required deballasting capacity.

13. 7 Loading manual

13. 7. 1 All loading sequences of single pass loading, maximum loading rates and ballast pumping details are to be submitted for approval and included in the Loading Manual. Loading conditions at intermediate points as described in Pt 4, Ch 11, 13.2 Information required 13.2.2.c need not be included in the Loading Manual.

13. 8 Loading computer

13. 8. 1 The ship is to be installed with sensors for remote measurement of water ballast, fuel oil and ship's draughts.

13. 8. 2 In addition, it is recommended that an interface with the onboard loading computer, connecting to the installed sensors detailed in Pt 4, Ch 11, 13.8 Loading computer 13.8.1, is to be provided to check the ship's condition during loading and unloading.

CHAPTER 12 Dredging and Reclamation Craft

SECTION 1 General

1. 1 Application

1. 1. 1 This Chapter applies, in general, to manned or unmanned self-propelled or non-self-propelled ships defined as follows:

a. Dredgers designed to operate wholly or generally for the purpose of raising spoil such as mud, silt, gravel, clay, sand or similar substances, general rubbish or ore, minerals, etc. for the bed of the sea, rivers, lakes, canals or harbours, etc. The dredged material may be placed in suitably designed holds or similar spaces within the ship.

b. Hopper dredgers, designed to raise spoil, as described in Pt 4, Ch 12, 1.1, Application 1.1.1, and so arranged that the dredged material may be placed in one or more hoppers within the ship. For the purpose of this definition, a hopper is a hold or other space designed to carry dredged spoil and also arranged to enable such spoil to be discharged through doors or valves in the bottom of the ship. Spaces arranged to be unloaded by means of conveyor belts, suction pipes or similar gear are not to be regarded as hoppers unless adequate bottom doors or valves are also fitted.

c. Split hopper dredgers, which are designed similarly to that described in Pt 4, Ch 12, 1.1 Application 1.1.1.b but arranged such that the spoil is discharged through the bottom of the ship by means of the split hull being separated using hinges and actuating devices.

d. Reclamation craft, reclamation ships, etc. which work in a manner similar to dredgers but draw their spoil from dredging craft and discharge it ashore.

e. Hopper barges designed to carry spoil or dredged material in hoppers within the ship. For the definition of a hopper, *See* Pt 4, Ch 12, 1.1 Application 1.1.1.b.

f. Split hopper barges, which are designed similarly to that described in Pt 4, Ch 12, 1.1 Application 1.1.1.e but arranged such that the spoil is discharged through the bottom of the ship by means of the split hull being separated using hinges and actuating devices.

1. 1. 2 The scantlings and arrangements are to be as required by Pt 4, Ch 1 General Cargo Ships, except as otherwise specified in this Chapter.

1. 1. 3 Where bottom dump doors or valves are fitted, hatch covers are not required. Proposals for the omission of hatch covers where bottom dump doors or valves are not fitted will be specially considered.

1. 1. 4 Ships which have their machinery placed on a shallow raft, rather than within a hull, will have their scantlings specially considered. Dredgers which resemble drilling rigs, or similar offshore structures, in their design or mode of operation will be considered under the Rules for such structures.

1. 1. 5 Ships of unusual form or proportions, or intended for unusual dredging methods, will receive individual consideration on the basis of the general standards of the Rules.

1. 1. 6 The requirements provide for transverse and longitudinal framing of the structure. In general, the midship region scantlings are to extend over the full length of hoppers and holds. The extent is to be not less than 0.4L amidships, and may need to be increased if the design and loading conditions of a particular ship result in its maximum bending moment occurring other than at amidships.

1. 2 Stability

1. 2. 1 Attention is drawn to the thixotropic properties of certain types of dredged material which, as a result of the ship's motions, can cause the spoil to shift within spoil spaces, resulting in undesirable changes in trim or angles of heel. This can be particularly dangerous in ships with closed top spaces.

1. 3 Class notations

1. 3. 1 In general, ships complying with the requirements of this Chapter will be eligible for one of the following classes:

a. **100A1 dredger**. This class will be assigned to ships as defined in Pt 4, Ch 12, 1.1, Application 1.1.1.

b. **100A1 hopper dredger**. This class will be assigned to ships as defined in Pt 4, Ch 12, 1.1 Application 1.1.1.b.

c. **100A1 split hopper dredger**. This class will be assigned to ships as defined in Pt 4, Ch 12, 1.1 Application 1.1.1.c

d. **100A1 reclamation craft**. This class will be assigned to ships as defined in Pt 4, Ch 12, 1.1 Application 1.1.1.d.

e. **100A1 hopper barge**. This class will be assigned to ships as defined in Pt 4, Ch 12, 1.1 Application 1.1.1.e.

f. **100A1 split hopper barge**. This class will be assigned to ships as defined in Pt 4, Ch 12, 1.1 Application 1.1.1.f.

1. 3. 2 The class notations will be assigned to ships based on the following:

a. The class notations in Pt 4, Ch 12, 1.3, Class notations 1.3.1 will be assigned to ships which are intended to make unrestricted sea-going voyages, either as part of their work or while transferring from one work area to another as part of their normal operations and have also been designed to perform dredging operations in defined dredging service areas.

b. Where dredger types listed in Pt 4, Ch 12, 1.3 Class notations 1.3.1.a, Pt 4, Ch 12, 1.3 Class notations 1.3.1.b and Pt 4, Ch 12, 1.3 Class notations 1.3.1.c perform dredging operations at reduced freeboards, resulting in a dredging draught (T_m) greater than the summer draught and without a dredging service area restriction, the class notation will be extended as follows: **'dredging draught T_m of … metres in sea states with H_s <... metres'** and will be subject to special requirements of National Authorities, *See* Pt 4, Ch 12, 1.6 Requirements for dredgers operating at reduced freeboards 1.6.1.

c. Where dredger types listed in Pt 4, Ch 12, 1.3 Class notations 1.3.1.a, Pt 4, Ch 12, 1.3 Class notations 1.3.1.b and Pt 4, Ch 12, 1.3 Class notations 1.3.1.c perform dredging operations at reduced freeboards, resulting in a dredging draught (T_m) greater than the summer draught but with a dredging service area limited to within 21 nautical miles from shore, the class notation will be extended as follows: **'dredging within 21 miles from shore at a dredging draught T_m of … metres'** and will be subject to special requirements of National Authorities, *See* Pt 4, Ch 12, 1.6 Requirements for dredgers operating at reduced freeboards 1.6.1 and Pt 4, Ch 12, 1.6 Requirements for dredgers operating at reduced freeboards 1.6.2.

d. Where requested, the assignment of more than one dredging draught may be considered, i.e. **'dredging at draught T_{m1}…'** and **'dredging at draught T_{m2}…'** , etc. provided agreement is

obtained from the National Authorities and the applicable requirements of this Chapter are complied with.

1. 3. 3 Ships intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.6, Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.7, Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.8 and Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.10, will receive individual consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval. In particular, dredgers complying with the requirements of this Chapter and Pt 3, Ch 13, 7 Equipment for the reduced equipment requirements, will be eligible to be classed:

a. **A1 dredger protected waters service**, *See* Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.6, or **100A1 dredger with service restriction notation**.

whichever is applicable. Hopper dredgers, split hopper dredgers, reclamation craft, hopper barges and split hopper barges would be considered similarly.

1. 3. 4 Where a ship complying with the requirements of this Chapter has the bottom structure additionally strengthened for operating aground in accordance with Pt 4, Ch 12, 7 Bottom strengthening for operating aground, it will be eligible for the special feature notation `bottom strengthened for operating aground'.

1. 3. 5 In addition to the above notations, an appropriate descriptive note may be entered in the *Register Book* indicating the type of dredging or reclamation craft (*See* Pt 1, Ch 2, 2.6 Class notations (refrigerated cargo installations (RMC), controlled atmosphere (CA) systems and carriage of refrigerated containers (CRC)) 2.6.1), e.g. `trailing suction dredger', `cutter suction dredger', `bucket dredger', `grab dredger', `dipper dredger', `self-discharging sand dredger', etc.

1. 3. 6 The Regulations for classification and assignment of class notations are given in Pt 1, Ch 2 Classification Regulations to which reference should be made.

1. 4 Information required

1. 4. 1 In addition to the information and plans required by Pt 3, Ch 1, 5 Information required details of the following are to be submitted:

- Sections through hoppers, wells, pump-rooms and dredging machinery spaces.
- Hopper, hold and well bulkheads and associated weirs.
- Scarfing arrangements at hopper, hold and well ends.
- Hinges, actuating and locking arrangements, together with supporting structure, weld connection details and calculations of design forces for split hull separation devices.
- Deckhouse and deckhouse support structure.
- Outline arrangement and main scantlings of `A' frames, gantries, positioning spuds, hopper doors and similar items, the strength and integrity of which directly affect the hull structure of the vessel. Support structure in way of `A' frames, positioning spuds and other dredging structures. Seats of dredging machinery and pumps. If dredging equipment is stored during voyages, plans of any special arrangements for dismantling, storage and reassembly. Sufficient particulars of static and dynamic loading for these items are to accompany the details to enable verification of the strength and effectiveness of the supporting ship structure.
- A full set of stability data which is to be placed on board the ship, *See* Pt 1, Ch 2, 3 Surveys - General.
- Calculations of hull girder still water bending moment and shear force where applicable, *See* Pt 4, Ch 12, 2.1 General 2.1.1, for the proposed loading conditions, including densities of

spoil. When the still water bending moment and block coefficient are being calculated, any water within spoil spaces should be regarded as added weight, whilst that in dredging ladder wells and spud wells should be regarded as lost buoyancy.

1. 5 Symbols

1. 5. 1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

B = breadth, in metres, defined as the greatest moulded breadth excluding any localised bulge on the hull associated with the attachment or handling of the dredging gear

C_b = the moulded block coefficient at draught T but is to be taken as not less than 0.6. The block coefficient is to be determined using the length, L. Spoil spaces should be regarded as added weight, whilst dredging ladder wells and spud wells should be regarded as lost buoyancy

C_{bm} = the moulded block coefficient at the dredging draught T_m, but is to be taken as not less than 0.6. The block coefficient is to be determined using length, L. Spoil spaces should be regarded as added weight, whilst dredging ladder wells and spud wells should be regarded as lost buoyancy

D = moulded depth, in metres, to the uppermost continuous deck

L = Rule length, in metres, as defined in Pt 3, Ch 1, 6 Definitions for ships classed for unrestricted service. For ships classed **A1 protected waters service** where the load waterline is not required to be determined by the International Load Line Convention method, the length is to be measured on the deepest waterline at which the ship is designed to operate. On sea-going vessels with unusual stern arrangement, or with unusual bow arrangement associated with a dredging draught in excess of the summer load line draught, the length, L, will be specially considered

M_s = design still water bending moment, in kNm, at draught, T, or less

$\overline{M_s}$ = maximum permissible still water bending moment, in kNm, at draught, T, or less

M_{sm} = design still water bending moment, in kNm, under dredging conditions at draught, T_m

$\overline{M_{sm}}$ = maximum permissible still water bending moment, in kNm, under dredging conditions at draught, T_m

M_w = design hull vertical wave bending moment amidships, in kN m, *See* Pt 4, Ch 12, 2.4 Design vertical wave bending moments 2.4.1

T = summer draught, in metres, as established by the method described in the International Load Line Convention, measured from top of keel amidships

T_m = maximum dredging draught, in metres, at which the ship is designed to operate. It is to be measured amidships from the top of keel and is to be taken not less than T, *See* Pt 4, Ch 12, 15.1 General 15.1.4

ρ = relative density (specific gravity) which, in general, is to be taken not less than 1.86, or as derived from the stowage rate of spoil. This stowage rate of dredged spoil is to be determined from the maximum spoil weight at dredging draught and volume of spoil space up to the sill of the uppermost overflow weir. The value used in the calculations of scantlings is to be clearly marked on the relevant plans

Hogging bending moments are positive.

1. 5. 2 For symbols not defined in this Chapter, *See* Pt 4, Ch 1 General Cargo Ships.

1. 6 Requirements for dredgers operating at reduced freeboards

1. 6. 1 Requirements of IMO DR 68 *Guidelines for the Operation of Dredgers at Reduced Freeboards* are to be complied with.

1. 6. 2 The dredger is to be of a self discharging type and equipped with bottom valves. When the ship is operating at a reduced freeboard, i.e. 1/2 or 1/3 of its summer freeboard, the capacity of these bottom valves, or a part thereof, is to be sufficient to obtain the summer freeboard by discharging the appropriate amount of cargo within 8 minutes (IMO DR 68 refers).

1. 6. 3 Where the class notation **'dredging draft T_m of … metres in sea states with H_s<… metres'** is assigned, the Master is to be provided with suitable information on the actual situation of the sea conditions and the forecast in terms of significant wave heights.

PART

4

CHAPTER 12 Dredging and Reclamation Craft

SECTION 2 Longitudinal strength

2. 1 General

2. 1. 1 Longitudinal strength calculations are to be made in accordance with the relevant requirements given in Pt 3, Ch 4 Longitudinal Strength, except as indicated in this Section.

2. 2 Loading conditions

2. 2. 1 Details are to be submitted of the following loading conditions for examination of longitudinal strength:

a. Homogeneous load conditions (including details of densities of spoil) for both departure and arrival at draught, T, and maximum dredging draught, T_m, where this exceeds T, *See also* Pt 4, Ch 12, 15.1 General 15.1.4.

b. Part loaded conditions (including details of densities of spoil) and ballast conditions for both departure and arrival.

c. Any specified non-homogeneous load conditions.

2. 2. 2 If any dredging equipment has to be unshipped, lowered or otherwise specially arranged or stowed before the ship proceeds on a sea-going voyage, this fact is to be indicated on the longitudinal strength information required to be submitted and is also to be clearly stated in the final Loading Manual supplied to the ship.

2. 2. 3 For loading conditions, and any other preparations required to permit ships with a notation specifying some service limitation to undertake a sea-going voyage, either from port or building to service area or from one service area to another, *See* Pt 1, Ch 2, 1 Conditions for classification.

2. 2. 4 Where a ship is arranged with two spoil spaces account is to be taken in the calculation of the still water bending moment of either one of these spaces being empty, unless such loading is specifically precluded in the Loading Manual supplied to the ship.

2. 2. 5 The requirements of Pt 3, Ch 4, 8.3 Loading instrument regarding loading instruments are not applicable to dredging and reclamation craft.

2. 3 Hull bending strength

2. 3. 1 Hull bending strength standards are to comply with the relevant requirements of Pt 3, Ch 4 Longitudinal Strength, taking account of the contents of Pt 4, Ch 12, 2.4, Design vertical wave bending moments and Pt 4, Ch 12, 2.5 Permissible still water bending moment for dredging conditions.

2. 3. 2 For split hopper dredgers or barges, due account is to be taken of the lateral forces and moments on each half hull which are exerted by the pressure of the spoil and dynamic wave loading, *See* Pt 4, Ch 12, 17.2 Hull bending strength.

2. 4 Design vertical wave bending moments

2. 4. 1 For the transit conditions at draught T, the design vertical wave bending moment at amidships, M_w, is to be determined from Pt 3, Ch 4, 5.2, Design vertical wave bending moments with the ship service factor, f_1, given in Table 12. 2. 1: Ship service factors f1 and fwd.

2. 4. 2 For the dredging conditions at draught T_m, the design hull vertical wave bending moment at amidships, M_{wd}, is given by the following expression:

$$M_{wd} = f_{wd} f_2 M_{wo}$$

where
T_m is the dredging draught and is not to be taken less than draught, T
M_{wo} is determined from Pt 3, Ch 4, 5.2, Design vertical wave bending moments, using C_{bm} in place of C_b
f_2 is given in Pt 3, Ch 4, 5.2, Design vertical wave bending moments
f_1 and f_{wd} are defined in Table 12. 2. 1: Ship service factors f1 and fwd.

Table 12. 2. 1: Ship service factors f_1 and f_{wd}

Class Notation	f_1	f_{wd}
+100A1…, dredging draught T_m of … metres in sea states with H_s <... metres	1.00	f_{uds}
+100 A1…, dredging within 21 miles from shore at a dredging draught T_m of … metres	0.75	0.60
+A1…, Protected waters service	0.65	0.35
Symbols		
f_{uds} = $2.2H_sL^{-0.48}$, not to be taken less than 0.35 nor greater than 1 H_s = significant wave height for the dredging operations at the considered dredging draught T_m		
Note The wave reduction factors may only be used for dredgers complying with the applicable requirements of Pt 4, Ch 12, 1.6 Requirements for dredgers operating at reduced freeboards 1.6.1.		

2. 5 Permissible still water bending moment for dredging conditions

2. 5. 1 The maximum permissible still water bending moment, M_{sm} , for dredging conditions where draught T_m exceeds T is not to exceed:

$$|\bar{M}_{sm}| = |\bar{M}_s + f_L f_2 M_{wo} - M_{wd}| \; kN\,m$$

where M_{wd} is defined in Pt 4, Ch 12, 2.4 Design vertical wave bending moments 2.4.2.
Where applicable, the relevant loading conditions are to be included in the final Loading Manual, *See* Pt 4, Ch 12, 15.1 General 15.1.4 and Pt 3, Ch 4, 8.1 General.

2. 6 Calculation of hull section modulus

2. 6. 1 The hull midship section modulus is to be calculated in accordance with the requirements of Pt 3, Ch 3, 3.4, Calculation of hull section modulus taking account of Pt 4, Ch 12, 2.6 Calculation of

hull section modulus 2.6.2 and Pt 4, Ch 12, 2.6 Calculation of hull section modulus 2.6.3. *See also* Pt 4, Ch 12, 17.1 Symbols and definitions for split hull arrangements.

2. 6. 2 Centreline box keels within the hopper spaces may normally be regarded as 100 per cent effective provided that they are effectively scarfed to the vertical keels or equivalent structure at each end of the hopper spaces.

2. 6. 3 Where a long superstructure or deckhouse is fitted extending within the midship region, the requirements for longitudinal strength in the hull and erection will be specially considered.

2. 7 Hull shear strength

2. 7. 1 Special attention is to be paid to the actual shear forces at the spoil space end bulkheads. The inclusion of the effective thickness of longitudinal bulkheads, centre box keel plating and other longitudinal material at these positions, will be considered in relation to the arrangement of structure proposed.

2. 7. 2 For ships classed **A1 protected waters service**, *See* Pt 4, Ch 12, 4.6 Side shell 4.6.1.

2. 7. 3 The vertical wave shear forces, Q_w, are to be calculated in accordance with Pt 3, Ch 4, 6 Hull shear strength. In dredging conditions, where the dredging draught T_m is greater than T, K_2 may be taken as f_{wd}.

PART

4

CHAPTER 12 Dredging and Reclamation Craft

SECTION 3 Deck structure

3. 1 Deck plating

3. 1. 1 Dredgers, hopper dredgers and hopper barges classed for unrestricted service are to have the minimum thicknesses required by Pt 4, Ch 1, 4 Deck structure increased by 2 mm for those areas of the strength deck outside line of openings which are exposed to the weather.

3. 1. 2 Ships classed **100A1 extended protected waters service** are to have the minimum thicknesses required by Pt 4, Ch 1, 4 Deck structure for all strength deck plating outside line of openings. The minimum value of s, used in the formulae, may be taken as 550 mm.

3. 1. 3 Ships classed **A1 protected waters service** may have the minimum thicknesses as given in Pt 4, Ch 1, 4 Deck structure for all strength deck plating outside line of openings reduced by 1 mm, with an overall minimum of 5 mm. The minimum value of s, used in the formulae, may be taken as 550 mm.

3. 1. 4 Strength deck plating within the line of openings in the midship region, and for $0.075L$ from the ends, is to have a thickness not less than:

$$t = 0.01s \text{ mm}$$

3. 1. 5 The deck plating thickness and supporting structure may be required to be reinforced in those areas of deck which are liable to be subjected to regular, heavy, impact loads such as could occur when maintaining or inspecting large items of dredging gear, etc. It is recommended that consideration be given to increasing the plating thickness in these areas to:

$$t = 0.02s \text{ mm}$$

$$= \text{with a minimum}$$

$$t = 10 \text{ mm}$$

3. 2 Deck stiffening

3. 2. 1 The scantlings of deck beams or longitudinals are to comply with the requirements of Pt 4, Ch 1, 4.3 Deck stiffening.

3. 3 zeck supporting structure

3. 3. 1 The scantlings of the deck supporting structure are to comply with the requirements of Pt 4, Ch 1, 4.4, Deck supporting structure.

PART

4

CHAPTER **12 Dredging and Reclamation Craft**

SECTION **4 Shell envelope plating**

4. 1 Keel

4. 1. 1 On ships over 50 m in length, where there is a centreline well, or where hopper doors are fitted on the ship's centreline, i.e. where no centreline box keel is fitted in a hopper, a keel strake is to be fitted on each side of the well or hopper door opening, dependent upon the proposed docking arrangements for the ship. The width of each keel strake is to be not less than half that required for a centreline keel nor less than 400 mm. The thickness of each keel strake is to be not less than the thickness required for a centreline keel in Pt 4, Ch 1, 5.2 Keel.

4. 2 Bottom shell

4. 2. 1 The minimum thickness of bottom shell plating amidships on hopper dredgers and hopper barges classed for unrestricted service is to be 15 per cent greater than that required by Pt 4, Ch 1, 5.3 Bottom shell and bilge. The thickness of bottom shell plating on ships classed **A1 protected waters service** is to be not less than:

$$t = (5sL\sqrt{D} \times 10^{-5} + 5)\text{mm}$$

or that required for Pt 4, Ch 1, 5.3 Bottom shell and bilge, whichever is the lesser, but with an overall minimum thickness of 6 mm.

4. 2. 2 Where hoppers extend outside $0.4L$ amidships, the thicknesses required for the bottom shell amidships are to be maintained for at least two frame spaces beyond the ends of the hoppers before being tapered to the end thicknesses.

4. 3 Operating aground

4. 3. 1 For ships intended to operate aground, *See* Pt 4, Ch 12, 7 Bottom strengthening for operating aground.

4. 4 Bottom openings

4. 4. 1 The corners of hopper door openings and of bucket and ladder wells are generally to be parabolic or elliptical on all ships where L is greater than 50 m, and should generally be rounded on smaller ships. On ships where L is greater than 90 m, the arrangement of hopper and well corners within $0.5L$ amidships should generally be as required for deck hatch corners. The sealing arrangements for hopper doors may lie within the line of the corners, provided that the construction is such as to avoid high stress concentrations in the structure.

4. 5 Ships with chines

4. 5. 1 On ships arranged with two chines each side, the bilge plating should generally be calculated from the bottom plating formulae. On hard chine ships, flanged chines will not generally be approved, but where a chine is formed by knuckling the shell plating, the radius of curvature, measured on the inside of the plate, is to be not less than 10 times the plate thickness. Where a solid round chine bar is fitted, the bar diameter is to be not less than 50 mm or three times the thickness of the thickest abutting plate, whichever is the greater. Where welded chines are used, the welding is to be built up as necessary to ensure that the shell plating thickness is maintained across the weld.

4. 6 Side shell

4. 6. 1 The thickness of the side shell is to be in accordance with Pt 4, Ch 1, 5.4 Side shell. On ships classed **A1 protected waters service** the thickness of the side shell throughout, including at ends, may be reduced by 20 per cent from that required by Pt 4, Ch 1, 5.4 Side shell and Pt 3, Ch 5 Fore End Structure and Pt 3, Ch 6 Aft End Structure as appropriate, provided that the combined shear stress does not exceed 110 N/mm^2.

4. 6. 2 Where high compressive loads occur in the sheerstrake, the thickness may be required to be increased to minimise the likelihood of buckling.

4. 7 Swim ends

4. 7. 1 The plating of swim ends is to have a thickness not less than that required for the bottom shell up to the waterline at draught T, *See also* Table 12. 7. 1: Bottom strengthening for operating aground. It is to have a thickness not less than that required for side shell in the areas more than 1.0 m above the waterline at draught T_m. In intermediate areas the thickness may be tapered from the bottom to the side shell requirements.

PART

4

CHAPTER **12 Dredging and Reclamation Craft**

SECTION **5 Shell envelope framing**

5. 1 Longitudinal stiffening

5. 1. 1 The scantlings of bottom and side shell longitudinals are to comply with the requirements given in Table 12. 5. 1: Longitudinal stiffening.

5. 1. 2 For ships intended to operate aground, *See* Pt 4, Ch 12, 7 Bottom strengthening for operating aground.

5. 2 Transverse stiffening

5. 2. 1 For bottom structure with transverse framing, *See* Pt 4, Ch 12, 6 Bottom structure.

5. 2. 2 For ships intended to operate aground, *See* Pt 4, Ch 12, 7 Bottom strengthening for operating aground.

5. 2. 3 The scantlings of side frames amidships are to be in accordance with Pt 4, Ch 1, 6 Shell envelope framing for ships classed for unrestricted service or **100A1 extended protected waters service**. The modulus of side frames may be reduced by eight per cent for ships classed **A1 protected waters service**.

5. 3 Primary supporting structure at sides

5. 3. 1 The spacing of transverses supporting side longitudinals is generally to be in accordance with Pt 4, Ch 1, 6.4 Primary supporting structure, but is not to exceed 4.0 m.

5. 3. 2 Transverses supporting side longitudinals are to comply with the requirements of Pt 4, Ch 1, 6.4 Primary supporting structure, except for ships classed with a service restriction notation and all ships classed **A1 protected waters service**, where the requirements are given in Table 12. 5. 2: Primary supporting structure at sides.

5. 3. 3 In way of transverse framing, web frames may be required in way of hopper cross members. Alternative arrangements may be submitted for consideration.

5. 3. 4 The end connections of side transverses and web frames to deck and bottom transverses abreast of spoil spaces are to be arranged to prevent shear buckling of the members' webs.

5. 3. 5 For wash bulkheads fitted in lieu of web frames abreast spoil spaces, *See* Pt 4, Ch 12, 8.3 Spoil space and well boundaries 8.3.6.

Table 12. 5. 1: Longitudinal stiffening

Position of longitudinals	Modulus

(1) Bottom	$Z = \frac{l_e^2 sHkc}{K_1} cm^3$ **Where** l_e = effective span of longitudinals, in metres, and is to be taken as not less than 1.85m except as provided for in Pt 4, Ch 12, 6.3 Single bottoms longitudinally framed 6.3.1
	= In way of single bottoms
	$H = D$
	= In way of double bottoms
	$H = D$ on ships classed **100A1** or **100A1 extended protected waters service**
	= T_m for ships classed **A1 protected waters service**
	c = a factor varying from 1.0 at $\frac{D}{2}$ to $\frac{2060}{3620-1560F_B}$ at bottom, intermediate values by interpolation. For ships with hogging still water bending moments in loaded conditions and for split hull vessels, c=1.0
	F_B = as defined in Pt 3, Ch 4, 5.1 Symbols
	K_1 = 120 on ships classed **100A1** or **100A1 extended protected waters service**
	= 150 on ships classed **A1 protected waters service**
	k = higher tensile steel factor, *See* Pt 3, Ch 2, 1 Materials of construction
(2) Side shell	(a) For ships classed **100A1** or **100A1 extended protected waters service** The minimum modulus of side longitudinals is to be in accordance with Pt 4, Ch 1, 6.2, Longitudinal stiffening. (b) For ships classed **A1 protected waters service** The modulus required by (a) and reduced by 5 per cent
(3) Bilge	The scantlings of bilge longitudinals are to be graduated between those required for the bottom longitudinals and the lowest side longitudinals

Table 12. 5. 2: Primary supporting structure at sides

Symbols	Item	Requirement
h= vertical distance from mid-point of span to deck at side, in metres		All ships classed

l_e=	effective length of supporting member, in metres, *See* Pt 3, Ch 3, 3 Structural idealisation	Transverses supporting side longitudinals amidships	**100A1 extended protected waters service**: $Z = 9.5Shl_e^2$ cm^3
			All ships classed **A1 protected waters service:** $Z = 9.0She^2$ cm^3
I=	moment of inertia of supporting member, in cm^4, *See* Pt 3, Ch 3, 3 Structural idealisation		
S=	spacing, or mean spacing, of supporting member, in metres	Transverses and web frames supporting side longitudinals abreast of spoil spaces	Inertia of not less than: $I = 2.5l_eZ$ cm^4
Z=	section modulus of supporting member, in cm^3, *See* Pt 3, Ch 3, 3 Structural idealisation		

PART

4

CHAPTER 12 Dredging and Reclamation Craft

SECTION 6 Bottom structure

6. 1 General

6. 1. 1 This Section provides for longitudinal or transverse framing of the bottom structure of ships with single or double bottoms.

6. 1. 2 For ships intended to operate aground, *See* Pt 4, Ch 12, 7 Bottom strengthening for operating aground.

6. 2 Single bottoms transversely framed

6. 2. 1 The scantlings of single bottom floors, extending for the full width of the ship, are to be in accordance with Pt 4, Ch 1, 7 Single bottom structure irrespective of the length of the ship. Floors below dredging pumps or similar items which could induce large concentrated loads or large dynamic forces, may be required to be of increased strength. Floors may be recessed locally in way of dredging pumps, etc. provided that suitable compensation is arranged.

6. 2. 2 The spacing of intercostals and longitudinal side girders is to be such as to ensure continuity of strength at bulkheads, ends of spoil spaces and wells and at ends of machinery seats so far as practicable, *See also* Pt 4, Ch 1, 7 Single bottom structure. An intercostal is to be fitted in the buoyancy space abreast hopper openings when the distance between the hopper opening and the ship's side exceeds 4.0 m.

6. 2. 3 Abreast of dredging wells and spoil spaces the minimum depth of floor at its inboard end is to be not less than:

$$d_w = 20(B + l_e + 2T_m)\text{mm}$$

The thickness of the web and area of the face plate are to be as required by Pt 4, Ch 1, 7.2 Girders and floors.

6. 3 Single bottoms longitudinally framed

6. 3. 1 The spacing of transverses is to be in accordance with Pt 4, Ch 12, 5.3 Primary supporting structure at sides 5.3.1, and are to be supplemented by the following arrangements of brackets:

a. On the ship's centreline, or on each side of dredging wells where there is no structure on the centreline, the brackets are to be spaced not more than 1.25 m apart and are to extend outboard to the first longitudinal, port and starboard. The longitudinals supported by the brackets may be calculated using a nominal transverse spacing of 1.6 m.

b. On ships where the side are transversely framed, the brackets are to be fitted at every frame and are to extend inboard to the first longitudinal on the flat of bottom. This longitudinal is to be based on a span equal to the spacing of the transverses.

c. The thickness of these intermediate brackets is to be not less than:

$$t = \left(0.25B + 1.85\sqrt{T_{\mathrm{m}}}\right)mm$$

6. 3. 2 In areas of high shear loading, the thickness and stiffening of the web plates on transverses, etc. may have to be increased. The depth of transverses is to be not less than 2.5 times the depth of the slot for the bottom longitudinals, and thickness of the web plates is to be not less than 8 mm.

6. 3. 3 Bottom transverses in spoil space side buoyancy tanks in way of cross-ties are to have a depth, d, of not less than:

$$d = 28B + 205\sqrt{T_{\mathrm{m}}}\ mm$$

Their arrangement, scantlings and end connections are to be such as to provide proper continuity of strength across the ship. The transverses are to be fitted with stiffeners in way of every shell longitudinal. The stiffeners should, in general, be equivalent to flat bars with a depth one-eighth of the transverse at that point and a thickness not less than the thickness of the transverse.

6. 4 Double bottom - General

6. 4. 1 Self-propelled dredgers and reclamation ships of more than 500 tons gross and intended for International voyages are to be provided with a double bottom extending from the collision bulkhead to the after peak bulkhead, as far as this is practicable and compatible with the design and proper working of the ship.

6. 4. 2 A double bottom need not be fitted in way of watertight compartments used exclusively for the carriage of liquids provided the safety of the ship, in the event of bottom damage, is not thereby impaired.

6. 4. 3 The double bottom may, however, be interrupted locally, or fitted with wells in way of dredging pumps and other equipment. Where such openings are large, their scantlings and arrangements will be specially considered.

6. 4. 4 The scantlings are to be in accordance with Pt 4, Ch 1, 8 Double bottom structure except for the following:

a. The Rule thickness of centre girders may be reduced by 2.0 mm on ships classed **A1 protected waters service**.
b. The Rule thickness of side girders may be reduced by 1.0 mm on ships classed **100A1 extended protected waters service**.
c. The scantlings of floors, longitudinals and plating supporting the bottom of spaces intended to carry spoil are to be determined in accordance with Pt 4, Ch 12, 8 Spoil space and well structure.

6. 5 Double bottom with transverse framing

6. 5. 1 Plate floors may be fitted at every frame or may be spaced not more than 3.0 m apart with the shell and inner bottom plating between these floors supported by bracket floors. However, plate floors are to be fitted at every frame in the following areas:

a. As required for Pt 4, Ch 1, 8.5, Floors.
b. Below spaces from which dredged material will be discharged by grabs.
c. In main propulsion and dredging machinery rooms and in peak tanks.
d. For three frame spaces at ends of spoil spaces and dredging wells.

6. 6 Double bottom with longitudinal framing

6. 6. 1 In locations other than below spaces intended for dredged spoil the section modulus of inner bottom longitudinals is to be not less than:

$$Z = \frac{l_e^2 sHkc}{K_1} cm^3$$

Where

l_e = effective span of longitudinals, in metres, and is to be taken as not less than 1.85 m

s = spacing of longitudinals, in mm

H = height, in metres, from the tank top to the deck at side, (but need not exceed T_m on ships classed **A1 protected waters service**)

c = as defined in Table 12. 5. 1: Longitudinal stiffening

K_1 = 120 in machinery spaces on ships classed **100A1**

= 150 otherwise.

k = higher tensile steel factor, *See* Pt 3, Ch 2, 1 Materials of construction.

6. 6. 2 The section modulus of longitudinals below spaces intended for dredged spoil is to comply with the requirements of Pt 4, Ch 12, 8.3 Spoil space and well boundaries 8.3.7.

6. 6. 3 The spacing of transverses is generally to be as for dry cargo ships but is not to exceed 4.0 m. Below main dredging machinery the transverses are generally to be spaced not more than 1.0 m apart.

6. 6. 4 The ends of longitudinal girders under dredging machinery are to be tapered off or efficiently scarfed into other longitudinal structural items.

PART

4

CHAPTER 12 Dredging and Reclamation Craft

SECTION 7 Bottom strengthening for operating aground

7. 1 Application

7. 1. 1 The scantlings of bottom structure are to comply with the requirements given in Table 12. 7. 1: Bottom strengthening for operating aground.

7. 1. 2 Unless otherwise specified by the Owner, it should be assumed that non-self-propelled dredging and reclamation craft are to operate aground.

Table 12. 7. 1: Bottom strengthening for operating aground

Item	Requirement	
The following requirements are to be applied to the bottom structure upon which the ship is likely to be supported whilst aground		
(1) Bottom shell, keel and swim end plating	Thickness to be increased by 20% over the minimum requirements of Pt 4, Ch 1, 5 Shell envelope plating, with a minimum of 8 mm	
(2) Bottom longitudinals	Scantlings as required by Table 12. 5. 1: Longitudinal stiffening (1) taking K_1=74 and c=1.0	
(3) Bilge longitudinals (where fitted)	Scantlings to be the same as bottom longitudinals	
	Transverse framing	Longitudinal framing
(4) Primary stiffening in way of single bottoms, *See* Notes 1 and 2	(a) Floors to be fitted at every frame with vertical stiffeners spaced, in general, not more than 1.25 m apart (b) Side girders to be spaced not more than 2.2 m apart and intermediate 100 mm x 10 mm bulb plate longitudinals, or equivalent, fitted	(a) The spacing of transverses or floors is, in general, not to exceed 2.5 m outboard of wells or 1.85 m elsewhere (b) The panel size nearest the shell plating of web plates of transverses or floors is, in general, not to exceed 80t x 80t where t is the actual web thickness (c) Side girders to be spaced not more than 2.2 m apart
(5) Primary stiffening in way of double bottoms, *See* Notes 1 and 2	(a) Plate floors are to be fitted at every frame with vertical stiffeners spaced, in general, not more than 1.25 m apart	(a) The spacing of plate floors is, in general, not to exceed 1.85 m

	(b) Side girders to be spaced not more than 2.5 m apart and intermediate 100 mm x 10 mm bulb plate longitudinals, or equivalent, fitted (c) Where the span of floors between a hopper space and the ship's side exceeds 3.75 m, a longitudinal girder is to be fitted	(b) Side girders to be spaced not more than 2.5 m apart

Note *1.* The scantlings of floors, girders and transverses are to be determined in accordance with the requirements of Pt 4, Ch 12, 6 Bottom structure.

Note *2.* The number and size of holes in floors, girder and transverses are to be kept to a minimum, *See* Pt 4, Ch 1, 8 Double bottom structure.

PART

4

CHAPTER 12 Dredging and Reclamation Craft

SECTION 8 Spoil space and well structure

8. 1 Symbols and definitions

8. 1. 1 The symbols used in this Section are defined as follows:

ρ_{ef} = effective specific gravity to be taken, as defined in Table 12. 8. 1: Effective specific gravity

h = load head, in metres, measured vertically as follows:

a. For plating, the distance from a point one-third of the height of the plate above its lower edge to the sill of the uppermost overflow weir.

b. For stiffeners or girders, the distance from the middle of the effective length to the sill of the uppermost overflow weir.

l_e = effective length of stiffening members, in metres, *See* Pt 3, Ch 3, 3 Structural idealisation

s = spacing of stiffeners, in mm

t = plate thickness, in mm

A_1 = cross-sectional area of flange or stiffener, in cm^2, including coaming plating.

Table 12. 8. 1: Effective specific gravity

<table>
<tr><td rowspan="2">Effective specific gravity less than or equal to 1.4</td><td colspan="2">Effective specific gravity greater than 1.4</td></tr>
<tr><td rowspan="2">ρ≤1.4</td><td colspan="2">ρ>1.4</td></tr>
<tr><td>for vertical boundaries</td><td>for boundaries which have an angle, a with the horizontal plane</td></tr>
<tr><td>$\rho_{ef} = 1.4$</td><td>$\rho_{ef} = 1.4$</td><td>$\rho_{ef} = 1.4 + (\rho - 1.4)(\cos\ \alpha)^2$</td></tr>
</table>

8. 1. 2 Other symbols are defined in Pt 4, Ch 12, 1.5 Symbols 1.5.1.

8. 2 General

8. 2. 1 This Section provides for:

a. horizontally and vertically stiffened boundary bulkheads to hoppers, and holds intended for dredged spoil, to ladder wells and to spud wells,
b. protection against flooding in the event of the ladder well or adjacent bottom plating being damaged by objects dredged up by bucket dredgers, and
c. continuity of transverse strength in spoil spaces and wing tanks abreast of spoil spaces.

8. 2. 2 As an alternative to the requirements of this section regarding primary structure, scantlings may be derived on the basis of direct calculation methods, *See* Pt 4, Ch 12, 18 Direct calculations.

8. 2. 3 **Continuity of strength.** Arrangements are to be made to ensure continuity of strength at the ends of longitudinal and well side bulkheads. In general, the design should be such that the bulkheads are connected to bottom and deck girders by means of large, suitably shaped brackets arranged to give a good stress flow at their junctions with both the girders and the bulkheads.

8. 2. 4 **Ladder well cofferdams.** Ladder wells of trailing suction dredgers are to be isolated from the remainder of the dredger's structure by local cofferdams at least 600 mm wide, or are to be otherwise protected to prevent serious flooding due to the well side plating being breached by the ladder structure should this be damaged in service. Ladder wells of bucket dredgers are to be isolated by cofferdams, the extent and widths of which are to be sufficient to contain any damage to the well side bulkheads or bottom shell plating that could result from the impact of large objects brought up in the dredge buckets. In way of the buckets the cofferdam may be extended outboard in the form of a local watertight double bottom.

8. 3 Spoil space and well boundaries

8. 3. 1 The plating thickness of spoil space boundaries is to be not less than the following:

t = $0.0046 s f\sqrt{khp_{ef}} + 3.0$ mm, or

t = 8.5 mm, whichever is the greater

In the case of grab dredgers the minimum thickness is to be 10 mm. These thickness requirements also apply to the plating of watertight box keels and inner bottom plating. The value of ρ_{ef} used in the calculations and the height(s) of the overflow weir(s) are to be clearly shown on the midship section plan.

8. 3. 2 Attention is drawn to the high rate of wear that can occur on spoil space boundaries, and it is recommended that an additional corrosion allowance of 3.0 mm be added on areas subject to particularly onerous conditions. Where such an allowance is added, the fact is to be marked on the relevant plans.

8. 3. 3 The thickness of plating forming the sides and ends of bucket ladder wells is to be not less than:

$$t = \left(0.0055_s\sqrt{T_m + 3.0}\right)\text{mm}$$

In no case, however, is the side plating to have a thickness less than 12 mm nor is the well end plating to have a thickness less than 8.5 mm. Plating forming the boundaries of suction pipe ladder wells is generally to be as required for shell plating. Corrosion allowance on well end plating below bucket ladders may be 2.0 mm.

8. 3. 4 The thickness of spoil space and ladder well bulkheads may be required to be increased where high shear forces are present.

8. 3. 5 Bulkheads forming the boundaries of spud wells are to be of increased strength. Each case will be considered on its merits, but in general such bulkheads should have a thickness of not less than 12 mm.

8. 3. 6 Where non-watertight bulkheads are fitted in the side buoyancy tanks, the thickness of the plating is to be not less than:

a. t = 6.5 mm, or

b. t = $(5.35 + 0.024L)$mm

whichever is the greater. Where the bulkhead is in the form of a wash bulkhead, the openings should be so arranged that, in general, the distance from lightening holes to any slots cut to accommodate side shell or bulkhead longitudinals is at least equal to 1.5 times the depth of the slot. The edges of large openings are to be stiffened.

8. 3. 7 The section modulus of framing on spoil space boundaries is to be not less than:

$$Z = \frac{0.0113\rho_{ef} sh\ l_e^2 kc}{\gamma} cm^3$$

Where

c = as defined in Pt 4, Ch 12, 8.3 Spoil space and well boundaries 8.3.7 for longitudinal framing

= 1.0 for transverse framing

γ = 1.4 for rolled or built sections

= 1.6 for flat bars.

ρ_{ef} = effective specific gravity, *See* Pt 4, Ch 12, 8.1 Symbols and definitions 8.1.1

k = higher tensile steel factor, *See* Pt 3, Ch 2, 1 Materials of construction

The section modulus of longitudinals below $\frac{D}{2}$ is to be taken not less than the value obtained at $\frac{D}{2}$.

Table 12. 8. 2: Definition of c for longitudinal framing

Symbols	Location	c, *See* Note 2
F_B as defined in Pt 3, Ch 4, 5.1 Symbols	$0.8D\ \frac{D}{2}$ and above	1.0
	$At\ \frac{D}{2}$	0.85
	0.2D above base (*See* Note 1)	$\frac{550}{1590 - 1040F_B}$
	Base line (*See* Note 1)	$\frac{2060}{3620 - 1560F_B}$

Note *1.* For ships with hogging still water bending moments in loaded conditions and for split hull vessels, c=1.0.

Note *2.* Intermediate values are to be calculated by linear interpolation.

8. 3. 8 The section modulus of stiffeners bounding wells and deep tanks is to satisfy the requirements of Pt 4, Ch 1, 9.2, Watertight and deep tank bulkheads.

8. 3. 9 For non-watertight bulkheads, the modulus of the stiffeners may be 50 per cent of that required for intact bulkheads. The stiffeners are to be bracketed at top and bottom.

8. 3. 10 Structure supporting spud well plating and bulkheads below, and in way of, `A' frames and dredging machinery supports, is to be of substantial construction, account being taken of the dynamic loads likely to occur with the dredging machinery in operation.

8. 3. 11 Horizontal girders supporting stiffeners on spoil space and ladder well boundaries are, in general, to have scantlings as required by Pt 4, Ch 1, 9.2, Watertight and deep tank bulkheads for deep tanks, with ρ and h as defined in Pt 4, Ch 12, 1.5 Symbols 1.5.1 and Pt 4, Ch 12, 8.1 Symbols and definitions 8.1.1 respectively and with span, l_e for horizontal girders supporting vertical stiffeners on longitudinal bulkheads, measured between bulkhead bracket and bulkhead bracket, i.e. ignoring any struts which may be fitted between spoil space girder and shell stringer. Alternatively, the section modulus of these horizontal girders may be reduced by 40 per cent from the formula value if struts are fitted on alternate frames between the spoil space girder and a shell stringer. These struts should generally be horizontal and are to have a sectional area as required for pillars by Pt 4, Ch 1, 4.4, Deck supporting structure with ρ as defined in Pt 4, Ch 1, 1.5 Symbols and definitions 1.5.1 and h measured from the inboard end of the strut to the height defined in Pt 4, Ch 12, 8.1 Symbols and definitions 8.1.1. Web frames and girders are to have scantlings as required by Pt 4, Ch 1 General Cargo Ships, with ρ and h as defined in Pt 4, Ch 12, 1.5 Symbols 1.5.1 and Pt 4, Ch 12, 8.1 Symbols and definitions 8.1.1 respectively.

8. 4 Cross members

8. 4. 1 Cross-members are to be fitted within the hopper space in line with the bottom and side shell transverses and with the bulkheads in the side buoyancy spaces. Where the spacing between the cross-members exceeds 4 m, the scantlings of all primary members contributing to the continuity of the transverse strength in the spoil space are to be verified by direct calculations, *See also* Pt 3, Ch 1, 2.2 Submission of direct calculations. Where a box keel is fitted on the centreline, webs are to be fitted within the box keel to ensure proper continuity of strength across the ship in way of the hopper cross-member. The webs required within centreline watertight box keels may have a thickness 3.5 mm less than that required for the hopper cross-members with which they are associated, but their minimum thickness is to be not less than 6.5 mm.

8. 4. 2 The upper edge of the hopper lower cross-members should, in general, be a height of not less than $\frac{D}{4}$ above the keel in ships with the number 100 in their character of classification. The lower edge should be as low as practicable after allowing for the proper design of hopper doors, suction passages, etc. Lower cross-members may be fabricated from flat plate suitably stiffened or may take the form of a hollow box, generally of triangular cross-section.

8. 4. 3 The scantlings of box-type cross-members should be determined from the requirements for hopper bulkheads where applicable. When flat plate lower cross-members are fitted, the thickness of the web is to be not less than:

$$t = (0.7B + 3)\text{mm or } 8.5\text{ mm}$$

whichever is the greater.

8. 4. 4 The cross-sectional area of the cross-member web after deducting access openings, lightening holes, etc. is to be not less than:

$$A = 6h_w S_M \text{cm}^2$$

Where

h_w = height, in metres, of the uppermost hopper overflow weir above the keel

S_M = spacing of the cross-member webs, in metres.

8. 4. 5 The upper edge of the cross-member is to be stiffened by means of a tube having an outside diameter not less than:

$$\delta = 30l_s \text{ mm}$$

Where

l_s = span, in metres, of the upper edge of the cross-member (to the centreline box girder if fitted), and a thickness equal to the minimum required cross-tie web thickness, or by an equivalent flange or structure. The lower edge of the cross-member is also to be suitably stiffened.

8. 4. 6 The cross-member web is to be fitted with stiffeners, spaced not more than $80t$ mm apart having a modulus of not less than:

$$Z = 0.04sl_e^2 \text{ cm}^3$$

8. 4. 7 The transverse strength of primary structural members, such as upper and lower cross members and wing tank bulkheads, forming transverse ring systems are to be verified by direct calculations, e.g. finite element calculations on the basis of loads arising from hydrostatic, wave, spoil pressure and loadings on closing appliances of bottom openings. The stresses are in general not to exceed the following values:

Bending+axial stress (σ_b)	$130/k$ N/mm^2
Shear stress (T)	$70/k$ N/mm^2
Combined stress	$180/k$ N/mm^2

= where

k = higher tensile steel factor, *See* Pt 3, Ch 2, 1 Materials of construction.

8. 5 Pillars within hoppers

8. 5. 1 Pillars are generally to comply with the requirements of Pt 4, Ch 1, 4.4, Deck supporting structure, account being taken of the maximum forces that can be applied by rams or other gear fitted for the purpose of activating hopper doors or valves.

8. 6 Continuous coamings

8. 6. 1 Continuous coamings are to have a plate thickness of not less than 8.5 mm. A minimum thickness of 10 mm is recommended for coamings on grab dredgers. Where the depth of the coaming exceeds $80t$, the plating is to be stiffened by one or more horizontal members so spaced that the width of the upper panel of plating does not exceed $65t$ and the width(s) of the lower panel(s) do(es) not exceed $80t$.

8. 6. 2 Where the coaming is stiffened with flat bar members, the members are to have a breadth not less than $0.04S_s$ and a thickness not less than 0.05 times their breadth, or 8.5 mm, whichever is the greater. They are to have a minimum inertia of:

$$I = 2S_s^2A_1 \text{ cm}^4$$

Where

= A_1 and I include the coaming plating for mid-panel above to mid-panel below the stiffener, and

S_s = spacing of the brackets required by this sub-Section, in metres.

= Where stiffeners other than flat bars are used, they are to have at least the same minimum thickness and inertia as required for flat bars.

8. 6. 3 The upper edge of the coaming is to be stiffened by a fabricated flange, box girder or equivalent structure having a width not less than $0.05S_s$ and an inertia not less than:

$$I = 2.86S_s^2A_1 \text{ cm}^4$$

Where

= A_1 and I include the coaming plating down to mid-panel below

= The thickness and/or attachments of the stiffening member are to be such as to minimise any likelihood of local instability under compression loading.

8. 6. 4 The coamings are to be supported by substantial brackets spaced generally not more than 3.0 m apart where the coamings have a height of more than 600 mm, nor more than 2.5 m where the coamings have a height of more than 1.0 m but on longitudinally framed ships the brackets are to be arranged in way of each deck transverse. Additional brackets may be required in way of the ends of hopper upper cross-ties, especially those which themselves support hopper door operating rams or similar equipment.

8. 6. 5 The ends of continuous coamings are to be well scarfed into the ship's structure at the ends of spoil spaces. Unless longitudinal deckhouse bulkheads are fitted in this area, the coamings are to be extended beyond the end of the spoil space opening for a distance of at least one frame space, or 1.5 times the coaming height, whichever is the greater.

PART

4

CHAPTER **12 Dredging and Reclamation Craft**

SECTION **9 Watertight bulkheads**

9. 1 Arrangements of bulkheads

9. 1. 1 The number of watertight bulkheads is to be not less than that required for dry cargo ships, *See* Pt 3, Ch 3, 4 Bulkhead requirements. Their positioning is to be such that one extends the full width of the ship at each end of the spoil spaces, *See also* Pt 4, Ch 12, 8.2 General. Proposals to dispense with one or more of the watertight bulkheads in that part of the ship in way of spoil spaces may be submitted for consideration. In particular, watertight bulkheads need not be fitted within spoil spaces and an increased spacing of bulkheads in the spaces abreast of spoil spaces will generally be accepted provided that:

a. Suitable structural compensation is arranged; and
b. the stability is checked in the damaged condition.

PART

4

CHAPTER **12 Dredging and Reclamation Craft**

SECTION **10 Exposed casings**

10. 1 Scantlings and access

10. 1. 1 Exposed casings on ships classed **A1 protected waters service** are to have scantlings as required for deckhouses on dry cargo ships classed **100A1**. On ships classed **100A1**, where T_m equals or exceeds the draught corresponding to a Type 'B-60' ship freeboard, direct access is not permitted to the machinery spaces (including dredging pump-rooms) from the freeboard deck. Doors may be fitted in exposed casing bulkheads, provided that they lead to a space which is of equivalent strength to the casing and is separated from the machinery space by a second watertight door.

PART

4

CHAPTER **12 Dredging and Reclamation Craft**

SECTION **11 Dredging machinery seats and dredging gear**

11. 1 Dredging machinery seats

11. 1. 1 The seats supporting the main dredging machinery are to be at least as substantial as those required for the main propulsion machinery for dry cargo ships, *See* Pt 3, Ch 7, 6 Engine seatings. Continuity between the longitudinal and transverse members of main engine seats and the ship's bottom structure is to be arranged where practicable. Where floors are cut away below dredging pumps, they are to be fitted with face bars, and special care is to be taken to minimise stress-raising details and to ensure good workmanship.

11. 2 Dredging gear

11. 2. 1 Where masts or derrick posts support dredging gear which will be subjected to vibration or other dynamic loads in addition to its true weight, this must be taken into account in the calculations. The dynamic multiplier should be taken between two and three according to the type of machinery and gear used.

PART

4

CHAPTER **12 Dredging and Reclamation Craft**

SECTION **12 Ladder wells**

12. 1 Transverse strength at deck

12. 1. 1 Where ladder wells are incorporated so that the length of the well exceeds 1.5 times the width of the deck remaining on each side of the well, the portions of the ship on each side of the well are to be adequately cross-connected in the region of their free ends, unless the design of the ship renders this impracticable, in which case alternative arrangements are to be made to avoid high stress concentrations at the inboard end of the well.

PART

4

CHAPTER **12 Dredging and Reclamation Craft**

SECTION **13 Fenders**

13. 1 Fenders and reinforcement in way

13. 1. 1 Dredgers designed to work in conjunction with hopper barges are to be fitted with permanent rubbing strakes or fenders extending down to their lowest normal operating waterline. On transversely framed vessels it is recommended that the side structure in way of the lower edge of the fender be reinforced by a stringer and/or cross-ties. It is recommended that, where wooden fenders are fitted to dredgers operating in tropical sea-water, the fenders be cut just above the deepest working waterline and a gap be left sufficient to prevent water soaking up into the fenders.

PART

4

CHAPTER **12 Dredging and Reclamation Craft**

SECTION **14 Rudders**

14. 1 Rudders on bucket dredgers

14. 1. 1 Where bucket dredgers are arranged with bucket ladders at their stern, the ship's rudders are to be kept well clear of the buckets to minimise the likelihood of damage to the rudders by large objects which may be dredged up. For rudder calculations, *See* Pt 3, Ch 13 Ship Control Systems.

PART

4

CHAPTER 12 Dredging and Reclamation Craft

SECTION 15 Spoil space weirs and overflows

15. 1 General

15. 1. 1 All spoil spaces are to be arranged to allow the safe and efficient overboard discharge of excess water in all weather conditions in which the ship is classed to operate. In ships over 90 m in length and in all ships classed for unrestricted service the spoil space overflows are to be arranged via enclosed overflow trunks so designed as to keep the decks of the ship clear of spoil and water.

15. 1. 2 In general, bulwarks are not to be fitted in way of open top spoil spaces on dredging and reclamation craft.

15. 1. 3 Where a ship operates at the maximum draught that could be assigned in accordance with the *International Convention on Load Lines, 1966*, the overflow arrangements fitted should ensure that when the spoil space is loaded, this draught is not exceeded.

15. 1. 4 Where a hopper dredger having releasing arrangements for cargo dumping, e.g. bottom doors, etc. is permitted by an Administration to be assigned a freeboard less than that which could be assigned by the *International Convention on Load Lines, 1966:*

a. The structural strength and bending moments are to be acceptable for the deeper draught indicated, and
b. the dredger is to be operated in a zone of operation and in such weather conditions as are considered appropriate.

15. 1. 5 Adequate arrangements are to be fitted to prevent overloading under any condition of loading having due regard to trim. The size and position of the overflows are to be confirmed by a loading trial, which is to be carried out when the spoil space is loaded with dredgings of the same density as is likely to be loaded in service.

15. 1. 6 The cutting of overflow discharge trunk openings in the sheerstrake is to be avoided wherever practicable. In ships over 70 m in length, spoil space overflow discharge trunk openings are not to be cut within 800 mm of the upper edge of the sheerstrake. They are to have corner radii of not less than 150 mm, and suitable compensation is to be arranged. In no case is a discharge trunk to pierce the sheerstrake in way of discontinuities such as breaks of superstructure.

PART

4

CHAPTER **12** **Dredging and Reclamation Craft**

SECTION **16** **Scuppers and sanitary discharges and side scuttles**

16. 1 General

16. 1. 1 In all areas where mechanical damage might be likely, all side scuttles, scuppers and discharges, including their valves, controls and indicators, are to be well protected. Consideration is to be given to the likelihood of impact damage to scuttles and discharges due to barges coming alongside, and to scuppers becoming blocked by sand or other spoil which may spill onto the decks or other areas being drained.

16. 1. 2 Consideration will be given to requests for relaxation of requirements relating to scuttles, scuppers and discharges on ships classed **A1 protected waters service**.

PART

4

CHAPTER **12 Dredging and Reclamation Craft**

SECTION **17 Split hopper dredgers and barges**

17. 1 Symbols and definitions

17. 1. 1 The symbols used in this Section are defined as follows:

H = height of spoil above base line, in metres

H_s = depth of hopper seal, in metres

L_h = length of hopper well, in metres

M_H = design horizontal bending moment in hopper side wall, in kN m. A moment giving rise to tensile stress in the side shell is to be taken as positive

P = net pressure per metre ship length resulting from the spoil pressure and the hydrostatic load, *See* Figure 12. 17. 2: Split hopper dredger

= $4.9(p(H - H_s)^2 - 1.025(T - H_s)^2)\text{kN/m}$

S_h = span between the centres of hinges, in metres

17. 1. 2 Other symbols are defined in Pt 4, Ch 12, 1.5 Symbols 1.5.1.

17. 2 Hull bending strength

17. 2. 1 The modulus of the cross-section of the vessel is to be not less than that required by Pt 4, Ch 12, 2.3 Hull bending strength 2.3.1. In addition, the combined stress σ_c, at any point on the cross-section of one half hull, is not to exceed the permissible combined stress σ given in Pt 3, Ch 4, 5.5 Permissible still water bending moments. The combined stress at any point on the cross-section is to be determined from the following expression:

$$\sigma_c = \left(\frac{M_N}{Z_N} + \frac{M_p}{Z_p}\right) \times 10^{-3} \text{ N/mm}^2$$

Where

M_N = $\pm M_V \cos\varphi \pm M_H \sin\varphi \text{kNm}$

M_p = $\pm M_H \cos\varphi \pm M_v \sin\varphi \text{kNm}$

M_V = $\pm 0.5(M_s + M_w)\text{kNm}$

where the still water bending moments hogging and sagging are to be combined with the appropriate wave bending moment to give a total moment, M_V, hogging (positive) and sagging (negative)

M_w is defined in Pt 4, Ch 12, 1.5 Symbols 1.5.1.

f_1 = ship service factor, *See* Table 12. 2. 1: Ship service factors f1 and fwd

$M_H = 0.125PL_h(2S_h - L_h) \pm M_L$kNm

$M_L = 0.286f_1L^2B$kNm

$P = 4.9(\rho(H - H_s)^2 - 1.025(T - H_s)^2)$kNm

Account is to be taken of the sign of individual bending moment component in the determination of M_N, M_p, M_V and M_H

I_{NN} = second moment of area of the section of one half hull for all longitudinal continuous material above principal axis NN, in m^4

I_{PP} = second moment of area of the section of one half hull for all longitudinal continuous material about principal axis PP, in m^4

$Z_p = \frac{I_{PP}}{y_P}$ in m^3, the modulus of section to a point y_P m, from the principal axis PP

$Z_N = \frac{I_{NN}}{y_N}$ in m^3, the modulus of section to a point y_N m, from the principal axis NN

φ = angle of rotation of the principal axis NN with respect to the global horizontal axis YY, in degrees

See also Figure 12. 17. 1: Split hulled vessels.

17. 2. 2 The combined stress for dredging conditions where draught T_m exceeds T, is not to exceed the permissible combined stress, $\sigma_c$obtained from Pt 4, Ch 12, 17.2 Hull bending strength 17.2.1.

The combined stress is to be obtained from the expression for σ_c given in Pt 4, Ch 12, 17.2 Hull bending strength 17.2.1, substituting the following expression of M_V:

$$M_V = \pm 0.5(M_{sm} + M_{wd})\text{kNm}$$

Where

M_{wd} = $0.56f_2M_{wo}$ and M_{wo} is determined from Pt 3, Ch 4, 5.2, Design vertical wave bending moments, using C_{bm} in place of C_b and f_2 is given in Pt 3, Ch 4, 5.2, Design vertical wave bending moments.

17. 3 Separation arrangements

17. 3. 1 Hinges, actuating and locking devices provided to facilitate separation of the split hulls to discharge spoil are to be of efficient design and of adequate strength and scantlings to ensure safe discharge operations. Hydraulic rams or other actuating devices are to have sufficient power to ensure controlled opening operations and to achieve closing of the hulls in all anticipated weather conditions.

17. 3. 2 Locking devices are to be of a suitable design and strength to ensure that accidental separation of the hulls cannot occur due to ship motions and vibrations.

17. 3. 3 Hinge pin gudgeons are to be efficiently connected to the hull structure by means of brackets or equivalent and effectively integrated with local structure which is to be suitably reinforced. Suitable reinforcement is to be fitted to local hull structure in way of anchorages for rams and locking devices to ensure efficient transmission of loading from these devices into the hull.

Figure 12. 17. 1: Split hulled vessels

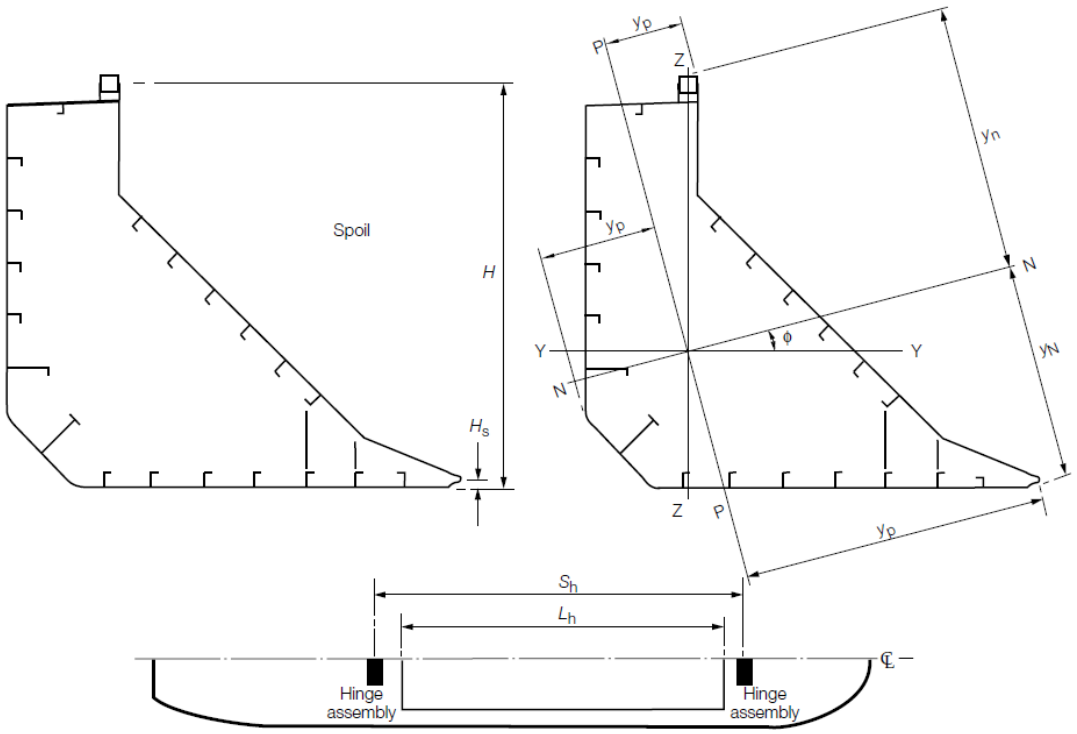

Figure 12. 17. 2: Split hopper dredger

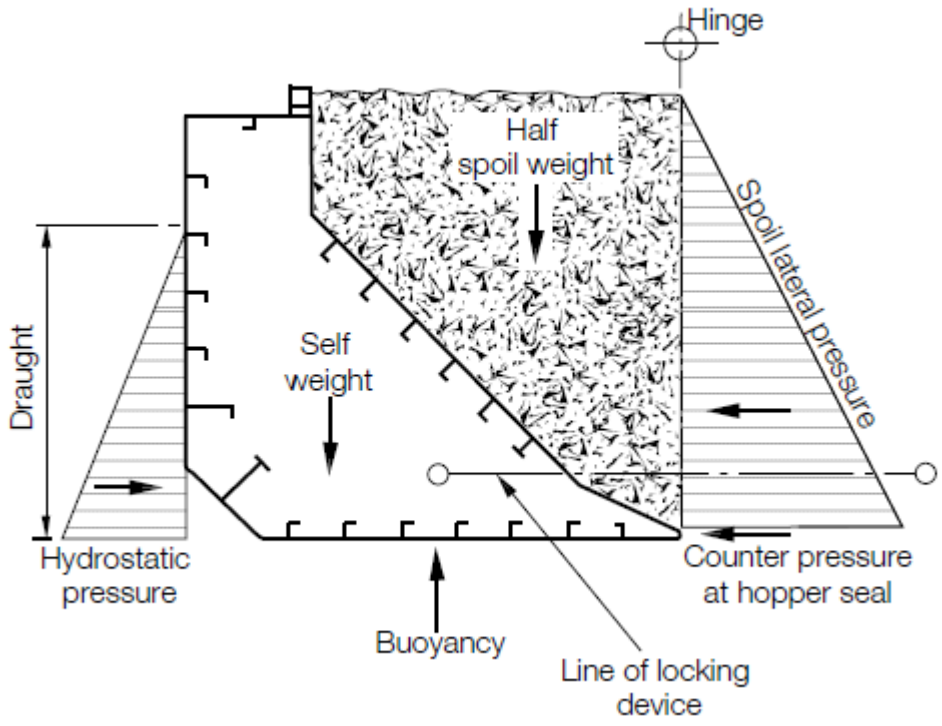

17. 3. 4 The forces acting on hinges, actuating mechanisms and locking devices are to be determined by direct calculations based on the maximum combination of loading which can be expected in any

service condition. In general, this will require the resolution of the static and dynamic systems of force acting on the hulls taking due account of the relative locations of hinges, actuating mechanisms and locking devices. Figure 12. 17. 2: Split hopper dredger illustrates a typical arrangement of hinges and mechanisms together with associated static loads. In general, one half of the load acting on one half hull may be assumed to act on the forward hinge assembly and one half on the after hinge assembly.

17. 4 Hinge pins

17. 4. 1 The diameter of the hinge pins is to be determined using the maximum resultant shear force acting on the pin cross-section in conjunction with an average shear stress not exceeding $\frac{62}{k}\ N/mm^2$.

In no case is the diameter of the hinge pin to be less than that calculated from the following expression:

$$D_p = 20\sqrt{\frac{L^{0.5}BDk}{n}}\ mm$$

k = higher tensile steel factor, *See* Pt 3, Ch 2, 1 Materials of construction

n = the number of pin cross-sections resisting shear forces

and L, B and D are defined in Pt 4, Ch 12, 1.5 Symbols 1.5.1.

17. 4. 2 Where arrangements are such that hinge pins are subjected to significant bending, the diameter of the pins will be specially considered.

PART

4

CHAPTER 12 Dredging and Reclamation Craft

SECTION 18 Direct calculations

18. 1 Application

18. 1. 1 Direct calculations may be used to assess the scantlings of primary structure in spoil spaces and adjacent structure.

18. 1. 2 Direct calculations may be required to be submitted in respect of unusual structural arrangements.

18. 2 Procedures

18. 2. 1 Methods applied for direct calculations of scantlings will be given individual consideration dependent on the particular structural configuration, *See also* Pt 3, Ch 1, 3.1 Alternative arrangements and scantlings.

CHAPTER 1

General Requirements for the Design and Construction of Machinery

SECTION

Scope

The Chapters in this Part cover the construction and installation of main propulsion and auxiliary machinery systems, together with their associated equipment, boilers, pressure vessels, pumping and piping arrangements and steering gear fitted in classed ships.

PART

5

CHAPTER 1 **General Requirements for the Design and Construction of Machinery**

SECTION 1 **General**

1. 1 Machinery and equipment to be constructed under survey

1. 1. 1 Unless an alternative approach for product assurance has been approved by ACS (*See* Pt 5, Ch 1, 1.3 Alternative approach for product assurance), all items of machinery and equipment in ships built under Special Survey are to be surveyed at the manufacturer's works. The Surveyor is to be satisfied that the workmanship is of a suitable standard and that the components are suitable for the intended purpose and duty. Examples of such items are:

- Main propulsion engines including their associated gearing, flexible couplings, scavenge blowers and superchargers.
- Boilers supplying steam for propulsion or for services essential for the safety or the operation of the ship at sea, including superheaters, economisers, desuperheaters, steam heated steam generators and steam receivers. All other boilers having working pressures exceeding 0.34 MPa, and having heating surfaces greater than 4.65 m^2.
- Auxiliary engines which are the source of power for services essential for safety or for the operation of the ship at sea.
- Steering machinery.
- Athwartship thrust units, their prime movers and control mechanisms.
- All pumps necessary for the operation of main propulsion and essential machinery, e.g. boiler feed, cooling water circulating, condensate extraction, fuel oil and lubricating oil pumps.
- All heat exchangers necessary for the operation of main propulsion and essential machinery, e.g. air, water and lubricating oil coolers, fuel oil and feed water heaters, de-aerators and condensers, evaporators and distiller units.
- Air compressors, air receivers and other pressure vessels necessary for the operation of main propulsion and essential machinery. Any other unfired pressure vessels for which plans are required to be submitted as detailed in Pt 5, Ch 11, 1.6, Plans.
- All pumps essential for safety of the ship, e.g. fire, bilge and ballast pumps.
- Valves and other components intended for installation in pressure piping systems having working pressures exceeding 0.7 MPa.
- Alarm and control equipment as detailed in Pt 6, Ch 1 Control Engineering Systems.

- Electrical equipment and electrical propelling machinery as detailed in Pt 6, Ch 2 Electrical Engineering.

1. 2 Survey for classification

1. 2. 1 The Surveyors are to examine and test the materials and workmanship from the commencement of work until the final test of the machinery under full power working conditions. Any defects, etc. are to be indicated as early as possible. On completion, the Surveyors will submit a report and if this is found to be satisfactory by the Committee a certificate will be granted and an appropriate notation will be assigned in accordance with Pt 1, Ch 2 Classification Regulations.

1. 3 Alternative approach for product assurance

1. 3. 1 ACS will be prepared to give consideration to the adoption of an approach for product assurance, utilising regular and systematic audits of an organisations's arrangements for assuring product quality as an alternative to the direct survey of individual items.

1. 3. 2 Alternative approaches for product assurance are to be approved by ACS. In order to obtain approval, the requirements of Pt 5, Ch 1, 6 Quality Assurance Scheme for Machinery or the Pt 2 Rules for the Manufacture, Testing and Certification of Materials, Ch 1, 2.4 Materials Quality Scheme are to be complied with. Proposals for equivalent approaches are to be submitted for consideration.

1. 3. 3 Where manufacturers are approved by ACS under an alternative approach for product assurance (e.g. QAM, MQS, PVS), the intervention arrangements agreed under the scheme shall ensure that the relevant Rule requirements and corresponding certification requirements are met.

1. 4 Deviations from the Rules

1. 4. 1 Any proposal to deviate from the requirements of the Rules will be specially considered.

PART

5

CHAPTER 1 **General Requirements for the Design and Construction of Machinery**

SECTION 2 **Plans and particulars**

2. 1 Plans

2. 1. 1 Before the work is commenced, plans in triplicate of all machinery items, as detailed in the Chapters giving the requirements for individual systems, are to be submitted for consideration. The particulars of the machinery, including power ratings, grade(s) of fuel and design calculations, where applicable, necessary to verify the design, are also to be submitted. Any subsequent modifications are subject to approval before being put into operation. It will not be necessary for plans and particulars to be submitted for each ship, provided the basis plans for the engine size and type have previously been approved as meeting the requirements of these Rules. Any alterations to basis design materials or manufacturing procedure are to be re-submitted for consideration.

2. 2 Materials

2. 2. 1 The materials used in the construction are to be manufactured and tested in accordance with the requirements of the Pt 2 Rules for the Manufacture, Testing and Certification of Materials. Materials for which provision is not made therein may be accepted, provided that they comply with an approved specification and such tests as may be considered necessary.

2. 2. 2 Materials used in the construction of machinery and its installation are not to contain asbestos.

2. 3 Welding

2. 3. 1 Welding consumables, plant and equipment are to be in accordance with the requirements specified in Ch 13, 1.8 Welding equipment and welding consumables of the Rules for Materials.

2. 3. 2 Welding procedures and welder qualifications are to be tested and qualified in accordance with the requirements specified in Ch 12 Welding Qualifications of the Rules for Materials.

2. 3. 3 Production weld tests are to be carried out where specified in the subsequent Chapters of these Rules.

2. 3. 4 All finished welds are to be subjected to non-destructive examination in accordance with the requirements specified in Ch 13, 2.12 Non-destructive examination of welds of the Rules for Materials and or the requirements specified in the subsequent chapters of these Rules.

PART

5

CHAPTER 1 **General Requirements for the Design and Construction of Machinery**

SECTION 3 **Operating conditions**

3. 1 Availability for operation

3. 1. 1 The design and arrangement are to be such that the machinery can be started and controlled on board ship, without external aid.

3. 1. 2 Machinery is to be capable of operating at defined power ratings with a range of fuel grades specified by the engine, boiler or machinery manufacturer and agreed by the Owner/Operator.

3. 1. 3 Machinery is to be capable of operating satisfactorily in accordance with the manufacturer's stated operating conditions within an operational profile specified for the ship by the Owner/Operator and agreed by the manufacturer/system designer.

3. 2 Fuel

3. 2. 1 The flash point (closed cup test) of fuel oil for use in ships classed for unrestricted service is, in general, to be not less than 60°C.

3. 2. 2 For emergency generator engines, fuel having a flash point of not less than 43°C may be used.

3. 2. 3 Fuels with flash points lower than 60°C, but not less than 43°C unless specially approved, may be used in ships intended for service restricted to geographical limits where it can be ensured that the temperature of the machinery and boiler spaces will always be 10°C below the flash point of the fuel. In such cases, safety precautions and the arrangements for storage and pumping will be specially considered.

3. 2. 4 The use of fuel having a lower flash point than specified in Pt 5, Ch 1, 3.2 Fuel 3.2.1 to Pt 5, Ch 1, 3.2 Fuel 3.2.3 as applicable may be permitted provided that such fuel is not stored in any machinery space and the arrangements for the complete installation are specially approved.

3. 2. 5 For engines operating on `boil-off' vapours from the cargo, *See* ACS *Rules for Ships for Liquefied Gases*.

3. 3 Power ratings

3. 3. 1 In the Chapters where the dimensions of any particular component are determined from shaft power, P, in kW (H, in shp), and revolutions per minute, R, the values to be used are to be derived from the following:

- For main propelling machinery, the maximum shaft power and corresponding revolutions per minute giving the maximum torque for which the machinery is to be classed.

- For auxiliary machinery, the maximum continuous shaft power and corresponding revolutions per minute which will be used in service.

3. 4 Definitions

3. 4. 1 Main propulsion engines and turbines are defined as those which drive main propelling machinery directly or indirectly through mechanical shafting and which may also drive electrical generators to provide power for auxiliary services. Auxiliary engines and turbines are defined as those coupled to electrical generators which provide power for auxiliary services, for electrical main propulsion motors or a combination of both.

3. 4. 2 Units and formulae included in the Rules are shown in SI units followed by metric units in brackets, where appropriate.

3. 4. 3 Where the metric version of shaft power, i.e. (shp), appears in the Rules, 1 shp is equivalent to 75 kgf m/s or 0.735 kW.

3. 4. 4 3.4.4 Pressure gauges may be calibrated in MPa, where:
1 MPa = 10 bar = 1 N/mm^2 = 10.2 kgf/cm^2.

3. 5 Ambient reference conditions

3. 5. 1 The rating for classification purposes of main and essential auxiliary machinery intended for installation in sea-going ships to be classed for unrestricted (geographical) service is to be based on a total barometric pressure of 1000 mb, an engine room ambient temperature or suction air temperature of 45°C, a relative humidity of 60 per cent and sea-water temperature or, where applicable, the temperature of the charge air coolant at the inlet of 32°C. The equipment manufacturer is not expected to provide simulated ambient reference conditions at a test bed.

3. 5. 2 In the case of a ship to be classed for restricted service, the rating is to be suitable for the temperature conditions associated with the geographical limits of the restricted service, *See* Pt 1, Ch 2 Classification Regulations.

3. 6 Ambient operating conditions

3. 6. 1 Main and essential auxiliary machinery and equipment is to be capable of operating satisfactorily under the conditions shown in Table 1. 3. 1: Ambient operating conditions.

3. 6. 2 Where it is intended to allow for operation in ambient temperatures outside those shown in Table 1. 3. 1: Ambient operating conditions, the permissible temperatures and associated periods of time are to be specified and details are to be submitted for consideration. Propelling and essential auxiliary machinery, *See* Pt 1, Ch 2, 2.8 Descriptive notes 2.8.1, is to retain a continuous level of functional capability under these conditions and any level of degraded performance is to be defined. Operation under these circumstances is not to be the cause of damage to equipment in the system and is additionally to be acceptable to the National Authority of the country in which the ship is to be registered.

Table 1. 3. 1: Ambient operating conditions

Air		
Installations, Components	Location, arrangement	Temperature range (°C)
	In enclosed spaces	0 to +45, *See* Note 1
Machinery and electrical installations	On machinery component, boilers. In spaces subject to higher and lower temperatures	According to specific local conditions, *See* Note 2

	On the open deck	–25 to +45, *See* Note 1
Water		
Coolant		Temperature (°C)
Sea-water or charge air coolant inlet to charge air cooler		–2 to +32, *See* Notes 1 and 3

Note *1.* For ships intended to be classed for restricted service, a deviation from the temperatures stated may be considered.

Note *2.* Details of local environmental conditions are stated in Annex B of IEC 60092: *Electrical installations in ships – Part 101: Definitions and general requirements.*

Note *3.* Charge air cooling arrangements utilising re-circulated cooling to maintain temperatures in a different range are accepted where the machinery and equipment operation is not degraded with a primary supply of cooling in the temperature range stated in this Table.

3. 7 Inclination of ship

3. 7. 1 Main and essential auxiliary machinery is to operate satisfactorily under the conditions as shown in Table 1. 3. 2: Inclination of ship.

3. 7. 2 Any proposal to deviate from the angles given in Table 1. 3. 2: Inclination of ship will be specially considered taking into account the type, size and service conditions of the ship.

3. 7. 3 The dynamic angles of inclination in Table 1. 3. 2: Inclination of ship may be exceeded in certain circumstances dependent upon ship type and operation. The Shipbuilder is, therefore, to ensure that the machinery is capable of operating under these angles of inclination.

Table 1. 3. 2: Inclination of ship

	Angle of inclination, degrees, *See* Note 1			
Installations, components	Athwartships		Fore-and-aft	
	Static	Dynamic	Static	Dynamic
Main and auxiliary machinery essential to the propulsion and safety of the ship	15	22.5	5 *See* Note 2	7.5
Emergency machinery and equipment fitted in accordance with Statutory Requirements	22.5 *See* Note 3	22.5 *See* Note 3	10	10

Note *1.* Athwartships and fore-and-aft inclinations may occur simultaneously.

Note *2.* Where the length of the ship exceeds 100 m, the fore-and-aft static angle of inclination may be taken as: $\frac{500}{L}$ degrees

where L = length of ship, in metres.

Note *3.* In ships for the carriage of liquefied gas and of liquid chemicals the emergency machinery and equipment fitted in accordance with Statutory Requirements is also to remain operable with the ship flooded to a final athwartships inclination to a maximum angle of 30°.

3. 8 Power conditions for generator sets

3. 8. 1 Auxiliary engines coupled to electrical generators are to be capable under service conditions of developing continuously the power to drive the generators at full rated output (kW) and in the case

of reciprocating internal combustion engines and gas turbines, of developing for a short period (15 minutes) an overload power of not less than 110 per cent of full rated output, *See* Pt 5, Ch 2, 9.2 Air receiver capacity. In the case of reciprocating internal combustion engines, they are to be tested at works trials as required by Table 2. 11. 2: Scope of shipboard trials for engines in Pt 5, Ch 2 Reciprocating Internal Combustion Engines.

3. 8. 2 Engine builders are to satisfy the Surveyors by tests on individual engines that the above requirements, as applicable, can be complied with, due account being taken of the difference between the temperatures under test conditions and those referred to in Pt 5, Ch 1, 3.5 Ambient reference conditions. Alternatively, where it is not practicable to test the engine/generator set as a unit, type tests (e.g. against a brake) representing a particular size and range of engines may be accepted. With engines and gas turbines any fuel stop fitted is to be set to permit the short period overload power of not less than 10 per cent above full rated output (kW) being developed.

3. 9 Astern power

3. 9. 1 In order to maintain sufficient manoeuvrability and secure control of the ship in all normal circumstances, the main propulsion machinery is to be capable of reversing the direction of thrust so as to bring the ship to rest from the maximum service speed. The main propulsion machinery is to be capable of maintaining in free route astern at least 70 per cent of the ahead revolutions corresponding to the maximum continuous ahead power for which the vessel is classed.

3. 9. 2 Where steam turbines are used for main propulsion, they are to be capable of maintaining in free route astern at least 70 per cent of the ahead revolutions corresponding to the maximum continuous ahead power for which the vessel is classed for a period of at least 15 minutes.

3. 10 Machinery interlocks

3. 10. 1 Interlocks are to be provided to prevent any operation of engines or turbines under conditions that could cause a hazard to the machinery and personnel. These are to include ‘turning gear engaged’, ‘low lubricating oil pressure’, where oil pressure is essential for the prevention of damage during start up, ‘shaft brake engaged’ and where machinery is not available due to maintenance or repairs. The interlock system is to be arranged to be ‘fail safe’.

3. 10. 2 Where machinery is provided with manual turning gear, warning devices or notices may be provided as an alternative to interlocks as required by Pt 5, Ch 1, 3.10 Machinery interlocks 3.10.1.

PART

5

CHAPTER 1 **General Requirements for the Design and Construction of Machinery**

SECTION 4 **Machinery room arrangements**

4. 1 Accessibility

4. 1. 1 Accessibility, for attendance and maintenance purposes, is to be provided for machinery plants.

4. 2 Machinery fastenings

4. 2. 1 Bedplates, thrust seatings and other fastenings are to be of robust construction, and the machinery is to be securely fixed to the ship's structure to the satisfaction of the Surveyor.

4. 3 Resilient mountings

4. 3. 1 The dynamic angles of inclination in Table 1. 3. 2: Inclination of ship may be exceeded in certain circumstances dependent upon ship type and operation. The Shipbuilder is, therefore, to ensure that the vibration levels of flexible pipe connections, shaft couplings and mounts remain within the limits specified by the component manufacturer for the following conditions:

a. Maximum dynamic inclinations to be expected during service;
b. Start-stop operation; and
c. The natural frequencies of the system.

Due account is to be taken of any creep that may be inherent in the mount.

4. 3. 2 For equipment of installed power greater than 375 kW, *See* Pt 6, Ch 2, 1.6 Definitions 1.6.10.b, a calculation report is to be submitted to demonstrate that the requirements of Pt 5, Ch 1, 4.3 Resilient mountings 4.3.1 are met. The calculation report is to include as a minimum:

a. A plan showing the arrangement of the machinery including mounts, exhaust bellows, and flexible couplings and pipe connections, as applicable; and
b. Maximum allowable loads and deflections and any appropriate type approval documentation for each flexible element (resilient mounts, exhaust gas bellows, flexible couplings and any other applicable flexible pipe connections) for the conditions identified in Pt 5, Ch 1, 4.3 Resilient mountings 4.3.1; and
c. Calculations including natural frequencies and maximum expected loads and deflections of each flexible element (resilient mounts, exhaust gas bellows, flexible couplings and any other applicable flexible pipe connections) for the conditions identified in Pt 5, Ch 1, 4.3 Resilient mountings 4.3.1.

4. 3. 3 Chocks are to be fitted, together with positive means to ensure that manufacturers' limits for lateral or vertical motion are not exceeded. Where resilient mounts are approved for collision loading, then the extent of any additional chocking that may be required will be specially considered. Suitable means are to be provided to accommodate the propeller thrust.

4. 3. 4 Mounts are to be shielded from the possible detrimental effects of oil and, where appropriate, paint and other contaminants.

4. 3. 5 Shafting, piping connections and electrical cable connections are to be provided with sufficient flexibility to accommodate expected movements. Particular attention should be paid to exhaust bellows and the effectiveness of flexible couplings.

4. 4 Resin chocks

4. 4. 1 Synthetic resin compounds used as materials for chocks under machinery components for which alignment is critical, e.g. main engine, gearbox and auxiliary installations where the engine and generator do not share a common baseplate, are to be of a type approved by ACS.

4. 4. 2 The resin chock materials referred to in Pt 5, Ch 1, 4.4 Resin chocks 4.4.1 are to be tested in accordance with Ch 14, 2.11 Machinery chocking compounds (resin chocks) of the Pt 2 Rules for the Manufacture, Testing and Certification of Materials.

4. 4. 3 Materials for chocks are to be approved for the maximum service temperature that the chock will experience.

4. 4. 4 The use of resin for chocking gas turbine casings or similar high temperature applications will be specially considered.

4. 5 Ventilation

4. 5. 1 All spaces including engine and cargo pump spaces, where flammable or toxic gases or vapours may accumulate, are to be provided with adequate ventilation under all conditions.

4. 5. 2 Machinery spaces of category A shall be adequately ventilated so as to ensure that when machinery or boilers therein are operating at full power in all weather conditions, including heavy weather, a sufficient supply of air is maintained to the spaces for the safety and comfort of personnel and the operation of the machinery. Any other machinery space shall be adequately ventilated, as appropriate for the purpose of that machinery space.

4. 6 Fire protection

4. 6. 1 All surfaces of machinery where the surface temperature may exceed 220°C and where impingement of flammable liquids may occur are to be effectively shielded to prevent ignition. Where insulation covering these surfaces is oil-absorbing or may permit penetration of oil, the insulation is to be encased in steel or equivalent.

4. 7 Means of escape

4. 7. 1 For means of escape from machinery spaces, *See* SOLAS 1974 as amended Regulation II-2/ *4.1 Means of escape on passenger ships* or *4.2 Means of escape on cargo ships*, as applicable.

4. 8 Communications

4. 8. 1 Two independent means of communication are to be provided between the bridge and engine room control station from which the engines are normally controlled, *See also* Pt 6, Ch 1, 2 Essential features for control, alarm, monitoring and safety systems .

4. 8. 2 One of these means is to visually indicate the order and response, both at the engine room control station and on the bridge.

4. 8. 3 At least one means of communication is to be provided between the bridge and any other control position(s) from which the propulsion machinery may be controlled.

4. 9 Category A machinery spaces

4. 9. 1 'Machinery spaces of Category A' are those spaces and trunks to such spaces which contain:

a. internal combustion machinery used for main propulsion; or

b. internal combustion machinery used for purposes other than main propulsion where such machinery has in the aggregate a total power output of not less than 375 kW; or

c. any oil-fired boiler or fuel oil unit.

PART

5

CHAPTER 1 **General Requirements for the Design and Construction of Machinery**

SECTION 5 **Trials**

5. 1 Inspection

5. 1. 1 Tests of components and trials of machinery, as detailed in the Chapters giving the requirements for individual systems, are to be carried out to the satisfaction of the Surveyors.

5. 2 Sea trials

5. 2. 1 For all types of installation, the sea trials are to be of sufficient duration, and carried out under normal manoeuvring conditions, to prove the machinery under power. The trials are also to demonstrate that any vibration which may occur within the operating speed range is acceptable.

5. 2. 2 The trials are to include demonstrations of the following:

a. The adequacy of the starting arrangements to provide the required number of starts of the main engines.

b. The ability of the machinery to reverse the direction of thrust of the propeller in sufficient time, under normal manoeuvring conditions, and so bring the ship to rest from maximum service speed. Results of the trials to be recorded.

c. The ability to permit astern running at 70 per cent of the full power ahead revolutions corresponding to the maximum continuous ahead power for which the vessel is classed.

d. In steam turbine installations, the ability to permit astern running at 70 per cent of the ahead revolutions corresponding to the maximum continuous ahead power for which the vessel is classed. This astern trial need only be of 15 minutes' duration, but may be extended to 30 minutes at the Surveyor's discretion. To avoid overheating of the turbine due to the effects of ‘windage’ and friction, the astern trial is not to exceed 30 minutes or the manufacturer’s recommendation.

5. 2. 3 Main propulsion systems are to undergo tests to demonstrate the astern response characteristics. The tests are to be carried out over at least the manoeuvring range of the propulsion system and from all control positions. A test plan is to be provided by the yard and accepted by the Surveyor. If specific operational characteristics have been defined by the manufacturer, then these are to be included in the test plan.

5. 2. 4 The reversing characteristics of the propulsion plant, including the blade pitch control system of controllable pitch propellers, are to be demonstrated and recorded during trials.

5. 2. 5 Where controllable pitch propellers are fitted, the free route astern trial is to be carried out with the propeller blades set in the full pitch astern position. Where emergency manual pitch setting facilities are provided, their operation is to be demonstrated to the satisfaction of the Surveyors.

5. 2. 6 In geared installations, prior to full power sea trials, the gear teeth are to be suitably coated to demonstrate the contact markings, and on conclusion of the sea trials all gears are to be opened up sufficiently to permit the Surveyors to make an inspection of the teeth. The marking is to indicate freedom from hard bearing, particularly towards the ends of the teeth, including both ends of each helix where applicable. The contact is to be not less than that required by Pt 5, Ch 5, 4.2 Accuracy of gear cutting and alignment or Pt 5, Ch 5, 5.2 Meshing tests, as applicable.

5. 2. 7 The following information is to be available on board for the use of the master and designated personnel:

- The results of trials to determine stopping times, ship headings and distance;
- For ships having multiple propellers, the results of trials to determine the ability to navigate and manoeuvre with one or more propellers inoperative.
- For ships having a single propulsor driven by multiple engines or electric motors, the results of trials to determine the ability to navigate and manoeuvre with the largest engine or electric motor inoperative.

5. 2. 8 Where the ship is provided with supplementary means for manoeuvring or stopping, the effectiveness of such means are to be demonstrated and recorded as referred to in Pt 5, Ch 1, 5.2 Sea trials 5.2.7.

5. 2. 9 The stopping distance achieved when ship is initially proceeding ahead with a speed of at least 90 per cent of the ship's speed corresponding to 85 per cent of the maximum rated propulsion power should not exceed 15 ship lengths after the astern order has been given. However, if the displacement of the ship makes this criterion impracticable then in no case should the stopping distance exceed 20 ship lengths.

5. 2. 10 For main propulsion systems with reversing gears, controllable pitch propellers or electric propeller drive, running astern is not to lead to the overload of propulsion machinery.

5. 2. 11 All trials are to be to the Surveyor's satisfaction.

PART

5

CHAPTER 1 **General Requirements for the Design and Construction of Machinery**

SECTION 6 **Quality Assurance Scheme for Machinery**

6. 1 General

6. 1. 1 The Quality Assurance Scheme for Machinery (QAM Scheme) is an alternative to direct survey and certification of machinery components and equipment required by the Rules. Under the QAM Scheme ACS will consider the extent to which manufacturing processes and control procedures ensure conformity of that machinery to Rules, technical specifications and any other applicable standards or codes.

6. 1. 2 This QAM Scheme is applicable to items manufactured under closely controlled conditions. The products for which the QAM Scheme is applicable are provided in ACS's ACSPlus Procedure *Approval of a Manufacturer according to the Quality Assurance Scheme for Machinery*.

6. 1. 3 The QAM Scheme does not reduce the test requirements to be carried out in accordance with ACS's Rules.

6. 2 Definitions

6. 2. 1 The following definitions apply in the context of this Section:

6. 2. 2 QAM Scheme audit

An audit, conducted by ACS at the manufacturer's, or their supplier's or subcontractor's, works, of their products and/or processes, which may include direct survey, in order to provide confidence that products are manufactured, tested and inspected in accordance with ACS's Rules. Periodicity of surveillance audits is as agreed in the QAM Scheme Certification Schedule, *See* ACS's ACSPlus Procedure *Approval of a Manufacturer according to the Quality Assurance Scheme for Machinery*.

6. 2. 3 Assessment

A review, conducted by ACS, of evidence gained through a number of sources, such as documentation, submitted by the manufacturer, supplier or subcontractor, and regular QAM Scheme audit reports, in order to verify that products are manufactured, tested and inspected in accordance with the Rules.

6. 2. 4 Manufacturer

A company who contracts to supply components or equipment products to a customer or user and applies for approval under the QAM Scheme.

6. 2. 5 Supplier

A company who contracts to supply materials, components or equipment products to the Manufacturer applying for approval under the QAM Scheme.

6. 2. 6 Sub-contractor

A company who contracts to deliver a service to a supplier or manufacturer under the agreed QAM Scheme arrangements.

6. 3 QAM Scheme Arrangements

6. 3. 1 A manufacturer may apply to be approved under the QAM Scheme where the following requirements are met:

a. The manufacturer has a quality management system which has been certified as meeting the requirements of ISO 9001, or industry-specific equivalent standard, by a certification body accredited by a member of the International Accreditation Forum and recognised by ACS.
b. The manufacturer has processes in place suitable for the products to be certified under the QAM Scheme.
c. The manufacturer has a satisfactory and documented history of quality performance in the supply of products for which certification under the QAM Scheme is requested.

6. 3. 2 The scope and arrangements for survey, identification and certification of products covered by the QAM Scheme are to be agreed with ACS and will be detailed in a Scheme Certification Schedule. Survey will be based on a technical audit approach, focussing on product realisation. Direct survey may also be used where it is considered appropriate to do so.

6. 3. 3 The QAM Scheme procedures given in ACS's ACSPlus Procedure *Approval of a Manufacturer according to the Quality Assurance Scheme for Machinery* are to be complied with.

6. 3. 4 Where ACS is satisfied that the manufacturer meets all of the requirements of the QAM Scheme, and that it is appropriate for the products being manufactured, ACS will issue the manufacturer with a QAM Scheme Certificate which will list products covered.

6. 3. 5 ACS reserves the right to carry out unscheduled audits, with appropriate notice, at the manufacturer's works or their suppliers' and sub-contractors' works.

6. 3. 6 Once every three years, a full re-certification assessment of QAM Scheme compliance, including an audit of the manufacturer's works, will be conducted by ACS.

6. 3. 7 The manufacturer is to advise ACS of changes to the product, processes, suppliers or subcontractors which would affect compliance with the QAM Scheme or ACS's Rules. Any deviations from the approved plans or specifications are to be reported to ACS and written approval obtained prior to dispatch of the items.

6. 3. 8 Where it is considered that the manufacturer no longer meets the approval requirements for the QAM Scheme, the QAM Scheme Certificate will be suspended. In these circumstances, the manufacturer will be notified in writing of ACS's reasons for suspension of the scheme and the manufacturer will revert to direct survey and issue of ACS certificates.

6. 3. 9 **QAM Scheme product certificates** Where the manufacturer is approved according to the QAM Scheme, they will be entitled to issue 'QAM Scheme product certificates'. These certificates are to clearly detail the product being certified and are to be validated by an authorised representative of the manufacturer. The certificates are to be countersigned by ACS to certify that the Rule requirements for that product are being met.

6. 4 Acceptance of purchased materials, components and equipment

6. 4. 1 The manufacturer is to establish and maintain procedures and controls to ensure compliance with ACS's requirements for certification of products from its suppliers. The manufacturer is to ensure that purchased products that are required to be certified in accordance with Ch 3 Rolled Steel Plates, Strip, Sections and Bars to Ch 10 Equipment for Mooring and Anchoring of the Rules for

Materials are made at works which have been approved by ACS for the type and grade of product being supplied. The manufacturer's system for control of purchased products is to be based on one or a combination of the following alternatives:

a. Product certification by ACS at the supplier's works in accordance with the requirements of the Rules.
b. Product certification by a supplier separately approved by ACS under the QAM Scheme or other ACS Quality Scheme covering those products.
c. Product certification by the supplier in accordance with quality processes for control of suppliers of purchased products included within the scope of the manufacturer's QAM Scheme approval. These quality schemes are to ensure compliance with Rule requirements for the purchased products.

6. 4. 2 **Manufacturers' certificates issued under the QAM Scheme**

Where the manufacturer's system for control of purchased products from suppliers is based on paragraph Pt 5, Ch 1, 6.4 Acceptance of purchased materials, components and equipment 6.4.1.c and Surveyors have confirmed that ACS Rules are being satisfied, in lieu of ACS Certificates for purchased products, the manufacturer will be permitted to accept 'Manufacturers' certificates issued under the QAM Scheme'. The certificates must bear the QAM Scheme mark and the following statement:

"This certificate is issued under the arrangements authorised by Asia Classification Society(operating entity, e.g. EMEA) in accordance with the requirements of the Quality Assurance Scheme for Machinery and Scheme number, QAM……."

PART

5

CHAPTER 1 **General Requirements for the Design and Construction of Machinery**

SECTION 7 **Spare gear for machinery installations**

7. 1 Application

7. 1. 1 Adequate spare parts for the propelling and essential auxiliary machinery, together with the necessary tools for maintenance and repair, are to be readily available for use.

7. 1. 2 The spare parts to be supplied and their location is to be the responsibility of the Owner, but they must take into account the design and arrangement of the machinery and the intended service and operation of the ship. Account must also be taken of the recommendations of the manufacturers and any applicable statutory requirement of the country of registration of the ship.

7. 2 Guidance for spare parts

7. 2. 1 For general guidance purposes, spare parts for main and auxiliary machinery installations are shown in the ACS's *Spare Gear Guidance* located on Class Direct.

CHAPTER 2 Reciprocating Internal Combustion Engines

SECTION Scope

Engines providing power for services essential to the safety of the vessel are to be constructed under survey and in accordance with the requirements of this Chapter (*See also* Pt 1, Ch 2, 2.4 Class notations (machinery) 2.4.1).

The requirements of this Chapter are applicable to reciprocating internal combustion engines operating on liquid, gas or dual fuel for main propulsion and essential auxiliary services (hereinafter referred to as engines). Pt 5, Ch 2, 3 Crankshaft Design is not applicable to auxiliary engines having powers of less than 110 kW.

For the purposes of this Chapter engine type, expressed by the manufacturer/licensor's designation, is defined by:

a. the bore and stroke;
b. the method of injection (i.e. direct injection, indirect injection, pilot injection);
c. the fuel pump and injection system (independent line to fuel oil valve, common rail);
d. the valve and injection operation (by cams or electronically controlled);
e. the fuel(s) used (liquid, dual-fuel, gaseous, etc.);
f. the working cycle (4-stroke, 2-stroke);
g. the gas exchange (naturally aspirated, turbocharged, etc.);
h. the method of turbocharging (pulsating system, constant pressure system);
i. the charging air cooling system (with or without intercooler, number of stages);
j. cylinder arrangement (in-line, vee, etc.);
k. the maximum continuous power per cylinder (or maximum continuous brake mean effective pressure) at maximum continuous speed;
l. the manufacturer and type of governor (and control system if applicable) fitted.

A complete engine includes the control system, turbocharger(s) and all ancillary systems and equipment referred to in this Chapter that are used for operation of the engine for which there are rule requirements; this includes systems allowing the use of different fuel types.

Arrangements for dual fuel engines will be specially considered.

Primary exhaust gas emissions abatement plant (where fitted) is to meet the requirements of this Chapter; additionally, it is to meet the requirements of Pt 5, Ch 24 Emissions Abatement Plant for Combustion Machinery. Where secondary exhaust gas emissions abatement systems are fitted to engines, they are to meet the requirements of Pt 5, Ch 24 Emissions Abatement Plant for Combustion Machinery.

PART

5

CHAPTER 2 Reciprocating Internal Combustion Engines

SECTION 1 General requirements

1. 1 Application

1. 1. 1 The requirements of this Chapter are applicable to reciprocating internal combustion engines operating on liquid, gas or dual fuel for main propulsion and essential auxiliary services (hereinafter referred to as engines). Pt 5, Ch 2, 3 Crankshaft Design is not applicable to auxiliary engines having powers of less than 110 kW.

1. 1. 2 Engines providing power for services essential to the safety of the vessel are to be constructed under survey and in accordance with the requirements of this Chapter (*See also* Pt 1, Ch 2, 2.4 Class notations (machinery) 2.4.1).

1. 2 Scope

1. 2. 1 For the purposes of this Chapter engine type, expressed by the manufacturer/licensor's designation, is defined by:

a. the bore and stroke;
b. the method of injection (i.e. direct injection, indirect injection, pilot injection);
c. the fuel pump and injection system (independent line to fuel oil valve, common rail);
d. the valve and injection operation (by cams or electronically controlled);
e. the fuel(s) used (liquid, dual-fuel, gaseous, etc.);
f. the working cycle (4-stroke, 2-stroke);
g. the gas exchange (naturally aspirated, turbocharged, etc.);
h. the method of turbocharging (pulsating system, constant pressure system);
i. the charging air cooling system (with or without intercooler, number of stages);
j. cylinder arrangement (in-line, vee, etc.);
k. the maximum continuous power per cylinder (or maximum continuous brake mean effective pressure) at maximum continuous speed;
l. the manufacturer and type of governor (and control system if applicable) fitted.

1. 2. 2 A complete engine includes the control system, turbocharger(s) and all ancillary systems and equipment referred to in this Chapter that are used for operation of the engine for which there are rule requirements; this includes systems allowing the use of different fuel types.

1. 2. 3 Arrangements for dual fuel engines will be specially considered.

1. 2. 4 Primary exhaust gas emissions abatement plant, e.g. Exhaust Gas Recirculation (EGR), (where fitted), is to meet the requirements of this Chapter; additionally, it is to meet the applicable requirements of Pt 5, Ch 24 Emissions Abatement Plant for Combustion Machinery. Where secondary exhaust gas emissions abatement plants are fitted to engines, e.g. Scrubbers and Selective Catalytic Reduction (SCR), they are to meet the requirements of Pt 5, Ch 24 Emissions Abatement Plant for Combustion Machinery.

1. 3 Approval process

1. 3. 1 All engines intended for installation on an ACS Class ship are to be Type Approved by ACS (*See* ACS Type Approval System Procedure TA14 for details of the ACS Type Approval process).

1. 3. 2 Each complete engine, as defined in Pt 5, Ch 2, 1.2 Scope, intended for installation on an ACS Classed vessel, is to have an ACS Engine Certificate.

1. 3. 3 For the first engine of a type, the type approval process and the engine certification process may be performed simultaneously.

1. 3. 4 To apply for an ACS Engine Certificate, the following are to be submitted:

a. a list of all documents identified in the 'for information' and 'for appraisal' columns of Table 2. 1. 1: Plans and particulars to be submitted with the relevant drawing numbers and revision status. This list is to cross-reference the approved plans previously submitted as part of the engine Type Approval and identify any plans that have been modified.

b. where there is a licensor/licen*See* arrangement, the list required by Pt 5, Ch 2, 1.3 Approval process 1.3.4.a is to cross-reference the drawings submitted by the designer as part of the engine Type Approval. This list is to identify all changes where the approved design has been modified by the licen*See*. Where the licen*See* proposes design modifications to components, a statement is to be made confirming the licensor's acceptance of the proposed changes. If designer/licensor's acceptance is not confirmed, the engine is to be regarded as a different type and is subject to the complete appraisal and type approval process.

c. all documents with changes from the approved design are to be submitted for review/appraisal.

d. In all cases the complete set of endorsed documents and the list referenced in Pt 5, Ch 2, 1.3 Approval process 1.3.4.a, which are to be provided by the manufacturer, will be required by the Surveyor(s) attending the manufacturer's works. Where a licen*See*/licensor arrangement is in place, this set of documents may be a combination of licensor and licen*See* documents.

1. 3. 5 An ACS Engine Certificate is issued upon satisfactory completion of engine assembly, with associated component testing (*See* Pt 5, Ch 2, 2 Materials and Components) and factory acceptance testing (*See* Pt 5, Ch 2, 11 Factory Acceptance Test and Shipboard Trials of Engines) or, issued in accordance with the alternative approach for product assurance approved by ACS, *See* Pt 5, Ch 1, 1.3 Alternative approach for product assurance.

1. 3. 6 For appraisal of emergency generator engines and turbochargers additional submissions are required. *See* Pt 5, Ch 2, 1.4 Submission requirements 1.4.4 and Pt 5, Ch 2, 1.4 Submission requirements 1.4.5 as applicable.

1. 4 Submission requirements

1. 4. 1 The plans and information are to be submitted as required in Table 2. 1. 1: Plans and particulars to be submitted and Pt 5, Ch 2, 1.4 Submission requirements 1.4.2 to Pt 5, Ch 2, 1.4 Submission requirements 1.4.7 as applicable.

Table 2. 1. 1: Plans and particulars to be submitted

.	For information (X indicates reason for submission)	For appraisal
Engine particulars (ACS Form 2073 with general engine and ancillaries information, Project Guide, Marine Installation Manual), *See* Note 1	X	

Material specifications of principal components with information on non-destructive material tests and pressure tests		X
Engine cross-section	X	
Engine longitudinal section	X	
Engine frames, welding drawings, *See* Notes 2 and 3		X
Main engine foundation and holding down and securing arrangements	X (metal chocks)	X (non-metallic chocks)
Bedplate and crankcase of cast design	X	
Bedplate and crankcase of welded design, with welding details and welding instructions, *See* Notes 2 and 3		X
Bedplate/oil sump welding drawings, *See* Note 2		X
Thrust bearing assembly, *See* Note 4	X	
Thrust shaft or intermediate shaft (if integral with engine)		X
Thrust bearing bedplate of welded design, with welding details and welding instructions, *See* Note 2		X
Frame (*See* Note 3), framebox *See* Note 3 and gearcase of cast construction	X	
Tie rod	X	
Connecting rod, assembly, *See* Note 5	X	
Crosshead, assembly, *See* Note 5	X	
Piston rod, assembly, *See* Note 5	X	
Piston, assembly, *See* Note 5	X	
Piston head	X	
Cylinder jacket/ block of cast construction, *See* Note 3	X	
Cylinder cover, assembly, *See* Note 5	X	
Cylinder liner	X	
Counterweights (if not integral with crankshaft), including fastening	X	
Crankshaft, details (for each crankthrow)		X
Crankshaft, assembly (for each crankthrow)		X
Crankshaft calculations (*See* Pt 5, Ch 2, 3 Crankshaft Design)	X	
Camshaft drive, assembly, *See* Note 5	X	
Flywheel or turning-wheel	X	
Shaft coupling interface arrangement including dimensions and material details		X
Details of shielding and insulation of exhaust pipes and other parts operating at an elevated temperature, which might be impinged by flammable fluid(s) as a result of a system failure	X	
Schematic layout or other equivalent documents for the engine, *See* Note 6:		
• Starting and control air systems		X
• Fuel system		X
• Lubricating oil system		X

• Cooling water system		X
• Hydraulic systems		X
• Engine control and safety system		X
High pressure fuel injection pump assembly	X	
High pressure parts for fuel oil injection system, *See* Note 7		X
Shielding arrangements for high pressure piping - fuel, hydraulic & flammable oils (*See* Pt 5, Ch 2, 8.1 Fuel oil, hydraulic and high pressure oil systems 8.1.4)		X
Fastening arrangements for main bearings	X	
Fastening arrangements for cylinder heads and exhaust valve (two stroke design)	X	
Fastening arrangements for connecting rods	X	
Vibration dampers/detuners and moment compensators	X	
Construction and arrangement of vibration dampers	X	
Details of mechanical joints of piping systems		X
Oil mist detection and/or alternative arrangements		X
Construction of accumulators for electronically controlled engine		X
Construction of common accumulators for electronically controlled engine		X
Construction of accumulators for hydraulic oil and fuel oil		X
Arrangement and details of the crankcase explosion relief valve where applicable (*See* Pt 5, Ch 2, 10 Safety arrangements)		X
Calculation results for crankcase explosion relief valves (*See* Pt 5, Ch 2, 10 Safety arrangements)		X
Construction and arrangements of hydraulic systems for actuation of sub-systems:		
• Control valves, high-pressure pumps, pipes and accumulators	X	
• Drive for high pressure pumps	X	
• Valve bodies, if applicable	X	
For engine control, alarm monitoring and safety systems, the plans and information required by Pt 5, Ch 2, 1.4,, Submission requirements 1.4.3 , *See* Note 8		X
Generator test results that state the engine maximum load steps which satisfy the quality of power supply requirements specified in Pt 6, Ch 2, 1.7 Design and construction		X
Planned operating profiles for the vessel at sea and during manoeuvring as agreed with the Operators		X
List of sub-contractors for main parts	X	
Operation and service manuals, *See* Note 9	X	
Risk-based analysis (for engine control system), *See* Note 10	X	

Test program resulting from risk-based analysis (for engine control system), *See* Note 10		X
Production specifications for castings and welding procedures	X	
Evidence of quality control system for engine design, production and in-service maintenance, *See* Notes 5 and 11	X	
Type approval certification for environmental tests of control components, *See* Note 12	X	
Details of the engine type test program and the type test report, *See* Note 13		X
Engine test schedule (FAT & shipboard trials, *See* Pt 5, Ch 2, 1.4 Submission requirements 1.4.2)		X
Documentation verifying compliance with inclination limits (*See* Pt 5, Ch 1, 3.7 Inclination of ship)		X
Combustion pressure-displacement relationship		X
Plans and details for dead ship condition starting arrangements, *See* Pt 5, Ch 2, 9.1, Dead ship condition starting arrangements		X

Note *1.* *ACS* Form 2073 will be supplied on application. Note that the turbochargers, if required to be type approved, are to have plans and particulars submitted as detailed in Pt 5, Ch 2, 1.4 Submission requirements 1.4.5.

Note *2.* For approval of materials and weld procedure specifications. The weld procedure specification is to include details of pre- and post-weld heat treatment, weld consumables and fit-up conditions.

Note *3.* For each cylinder for which dimensions and details differ.

Note *4.* If integral with engine and not integrated in the bedplate.

Note *5.* Including identification of components to ensure traceability in accordance with the Rules for Materials.

Note *6.* Details of the system so far as supplied by the engine manufacturer such as: main dimensions, operating media and maximum working pressures.

Note *7.* The documentation to contain specifications for pressures, pipe dimensions and materials.

Note *8.* The submission is to include a general overview of the operating principles, supported by schematics explaining the functionality of individual systems and sub-systems. The information is to relate to the engine capability and functionality under defined operating and emergency conditions such as recovery from a failure or malfunction, with particular reference to the functioning of programmable electronic systems and any sub-systems. The information is also to indicate if the engine has different modes of operation, such as to limit exhaust gas emissions and/or to run under an economic fuel consumption mode or any other mode that is electronically controlled.

Note *9.* Operational manuals are to contain maintenance requirements (servicing and repair) including details of any special tools and gauges that are to be used with their fitting/settings together with any test requirements on completion of maintenance. They are to include a description of each system's particulars and include reference to the functioning of sub-systems.

Note *10.* Where engines rely on hydraulic, pneumatic or electronic control of fuel injection and/or valves, the risk-based analysis is to address the mechanical, pressure containing, electrical, electronic and programmable electronic systems and arrangements that support the operation of the engine. It is to demonstrate that failure of the control system will not result in the operation of the engine being degraded beyond acceptable performance criteria for the engine and that suitable risk mitigation has been achieved in accordance with Pt 5, Ch 2, 4.2, Risk-based analysis.

Note *11.* Including quality plan for sourcing, traceability, design, installation and testing of all components used in the fuel and hydraulic oil systems installed with the engine.

Note *12.* Tests are to demonstrate the ability of the control, protection and safety equipment to function as intended under the specified testing conditions as per ACS Type Approval Test Specification Number 1.

Note *13.* The type test report may be submitted shortly after the conclusion of the type test. For electronically controlled engines evidence of type testing of the engine with the programmable electronic system, or a proposed factory acceptance test plan at the engine builders with the programmable electronic system functioning, is to be submitted to verify the functionality and behaviour under normal operating and fault conditions of the programmable electronic control system.

1. 4. 2 A schedule of testing at engine packager's or system integrator's facility, pre-sea trial commissioning and sea trials is to be submitted. The test schedules are to identify all modes of engine operation and the sea trials are to include typical port manoeuvres under the intended engine operating modes. The schedule is to include:

a. testing and trials to demonstrate that the engine is capable of operating as described in Table 2. 1. 1: Plans and particulars to be submitted, Note 10;
b. tests to verify that the response of the complete mechanical, hydraulic, electrical and electronic system is as predicted for the intended operational modes; and
c. testing required to verify the conclusions of the risk-based analysis.

The scope of these tests is to be agreed with ACS based on the risk-based analysis.

1. 4. 3 In addition to the applicable plans and particulars required by Pt 6, Ch 1, 1.2 Documentation required for design review the following information for control, alarm, monitoring and safety systems relating to the operation of an electronically controlled engine is to be submitted:

a. Engine configuration details, *See* Pt 5, Ch 2, 4.3 Control engineering systems 4.3.2.
   i. Local and remote means to carry out system configuration.
   ii. Engine builder procedures for undertaking configuring.
   iii. Roles and responsibilities for configuration (e.g. Engine builder, engine packager, system integrator or other nominated party) with accompanying schedule.
   iv. Configurable settings and parameters (including those not to be modified from a default value).
   v. Configuration for propulsion, auxiliary or emergency engine application.
b. Software quality plans, including configuration management documents.
c. Software safety evidence.
d. Software conformity assessment report.

Configuration records are to be maintained and are to be made available to the Surveyor at testing and trials and on request in accordance with Pt 6, Ch 1, 1.1 General 1.1.4 and Pt 6, Ch 1, 7.1 General 7.1.3.

1. 4. 4 Emergency generator engine plans, information and test schedules, required for design appraisal, are to be in accordance with Pt 6, Ch 1 Control Engineering Systems.

1. 4. 5 For turbochargers, the following plans and particulars are to be submitted. The submission requirements vary depending on the category of the turbocharger; category A, B and C turbochargers are defined in Pt 5, Ch 2, 12.1 General 12.1.2:

a. Category A (on request):
   i. Turbocharger specification including type, compression ratio and operating condition.
   ii. Cross-sectional drawing with principal dimensions and names of components.
   iii. Containment test report.
   iv. Test program.
b. Category B:
   i. Turbocharger specification including type of turbine and compressor, compression ratio, bearing and cooling method.
   ii. Cross-sectional drawing with principal dimensions and materials of housing components for containment evaluation.
   iii. Documentation of containment in the event of disc fracture.
   iv. Operational data and limitations, i.e.:
      - Maximum permissible operating speed (rpm)
      - Alarm level for over-speed
      - Maximum permissible exhaust gas temperature before turbine
      - Alarm level for exhaust gas temperature before turbine
      - Minimum lubrication oil inlet pressure
      - Lubrication oil inlet pressure low alarm set point
      - Maximum lubrication oil outlet temperature
      - Lubrication oil outlet temperature high alarm set point
      - Maximum permissible vibration levels, i.e. self- and externally generated vibration (Alarm levels may be equal to permissible limits but are not to be reached when operating the engine at 110 per cent power or at any approved intermittent overload beyond 110 per cent.)

i. Arrangement of lubrication system, all variants within a range.
ii. A list of main current suppliers and subcontractors for rotating parts and an operation and maintenance manual.
iii. Type test reports.

b. Category C:
i. Plans and particulars as for Category B.
ii. Drawings of the housing and rotating parts (shaft, wheels, blades and nozzle) including details of blade fixing for turbine and compressor.
iii. Material specifications (including density, Poisson's ratio, range of chemical composition and mechanical properties (at room temperature), and high-temperature strength characteristics as well as creep rate and rupture strength for the design service life (parts subject to 450 degrees Celsius or more)) of all parts mentioned above including details of the material and quality control system to be used for these parts.
iv. Welding details and welding procedure of above mentioned parts, if applicable.
v. Documentation* of safe torque transmission when the disc is connected to the shaft by an interference fit.
vi. Information on expected lifespan, considering creep, low cycle fatigue and high cycle fatigue.
vii. Operation and maintenance manuals*.
viii. Arrangements of cooling system.

Note * Documentation is to be provided applicable to two representative sizes in a generic range of turbochargers.

1. 4. 6 Where considered necessary ACS may require additional documentation to be submitted.

1. 4. 7 The following information is to be submitted to ACS for acceptance of oil mist detection equipment and alarm arrangements:

a. Description of oil mist detection equipment and system including alarms.
b. Copy of the test house report in accordance with the requirements of Test Specification No. 4 – *Type testing of reciprocating internal combustion engines and associated ancillary equipment. See also* Pt 5, Ch 2, 14.4 Crankcase oil mist detection system.
c. Schematic layout of engine oil mist detection arrangements showing location of detectors/sensors and piping arrangements and dimensions.
d. Maintenance and test manual which is to include the following information:
i. Intended use of equipment and its operation;
ii. Functionality tests to demonstrate that the equipment is operational and that any faults can be identified and corrective actions notified;
iii. Maintenance routines and spare parts recommendations;
iv. Limit setting and instructions for safe limit levels; and
v. Where necessary, details of configurations in which the equipment is and is not to be used.

1. 4. 8 Where engine components are subject to autofrettage, the following information is to be submitted (*See also* Pt 5, Ch 2, 2.4 Autofrettage):

a. Drawings and other related documents/information for products to be subjected to autofrettage, including material grade and dimensions.
b. Details of product quality assurance processes.
c. Place of manufacture and details of external providers of products subjected to autofrettage.
d. A report detailing how repeatability and reliability of autofrettage process are achieved. This is to include the following:
i. Method of autofrettage
ii. Method to control extent of autofrettage
iii. Calibration of the autofrettage system
iv. Details of how the critical parameters affecting product characteristics are controlled.

e. Method for recording results and list of data that is recorded.
f. Finished component and/or system testing.

PART

5

CHAPTER **2** **Reciprocating Internal Combustion Engines**

SECTION **2** **Materials and Components**

2. 1 Crankshaft Materials

2. 1. 1 The specified minimum tensile strength of castings and forgings for crankshafts is to be selected within the following general limits:

a. Carbon and carbon-manganese steel castings –400 to 550 N/mm^2
b. Carbon and carbon-manganese steel forgings (normalised and tempered) -400 to 600 N/mm^2
c. Carbon and carbon-manganese steel forgings (quenched and tempered) -not exceeding 700 N/mm^2
d. Alloy steel castings - not exceeding 700 N/mm^2
e. Alloy steel forgings - not exceeding 1000 N/mm^2
f. Spheroidal or nodular graphite iron castings -370 to 800 N/mm^2.

2. 1. 2 Where it is proposed to use alloy castings, micro alloyed or alloy steel forgings or iron castings, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval.

2. 2 Testing and inspection

2. 2. 1 Materials and components for engines are to be manufactured, tested and documented in accordance with Table 2. 2. 1: Summary of testing and associated documentation for engine componentsunder a quality control system that is suitable for the actual engine types to be certified by ACS. *See also* Pt 5, Ch 2, 2.2 Testing and inspection 2.2.4 and the applicable requirements specified in the Pt 2 Rules for the Manufacture, Testing and Certification of Materials.

2. 2. 2 Where an ACS quality scheme is in place (*See* Pt 5, Ch 1, 1.3 Alternative approach for product assurance), the testing and documentation requirements in Table 2. 2. 1: Summary of testing and associated documentation for engine components will be in accordance with a specific ACS quality scheme certification schedule identifying the tests, intervention requirements and associated documentation including types of certificates that are to be issued.

2. 2. 3 The testing and inspection in Table 2. 2. 1: Summary of testing and associated documentation for engine components is to be documented by the manufacturer (e.g. manufacturer certified materials testing or manufacturer issued NDT report as applicable), except where ACS intervention is explicitly required, in which case an ACS Component Certificate is to be issued which confirms conformity with the Rule requirements, with tests carried out on either the finished component itself, or on samples taken from earlier stages in the production of the component, as applicable.

2. 2. 4 Where an ACS material certificate is specified for components listed in Table 2. 2. 1: Summary of testing and associated documentation for engine components, the material is to be from an ACS approved manufacturer, and manufactured within the scope of approval of that manufacturer, except where explicitly stated otherwise in other Parts and Chapters of the Rules.

2. 2. 5 The manufacturer is not exempted from responsibility for any relevant tests and inspections of those parts for which documentation is not explicitly requested by ACS. Manufacturers are to be equipped in such a way that all materials and components can be consistently produced to the required standard. This includes production and assembly lines, machining units, special tools and devices, assembly and testing rigs as well as all lifting and transportation devices.

2. 2. 6 Where Table 2. 2. 1: Summary of testing and associated documentation for engine components states that a test report is required, this is to be issued by the manufacturer and provided for review by the Surveyor. The report is to identify the samples from the current production batch that have been tested and inspected to confirm that the component complies with all applicable requirements.

2. 2. 7 Where a manufacturer's document (test certificate or NDT report) is required in Table 2. 2. 1: Summary of testing and associated documentation for engine components, this is to be issued by the manufacturer and provided for review by the Surveyor. The document is to comply with the requirements of the Pt 2 Rules for the Manufacture, Testing and Certification of Materials, Ch 1, 3.1 General 3.1.3.c or Ch 1, 5.5 Non-destructive examination reports 5.5.1 as applicable and is to identify the tests and inspections that have been carried out on the finished component itself or, where applicable, on samples taken from earlier stages in the production of the component.

2. 2. 8 Components and materials not specified in Table 2. 2. 1: Summary of testing and associated documentation for engine components or of novel design will be specially considered upon submission of their details.

Table 2. 2. 1: Summary of testing and associated documentation for engine components

Part	Material properties *See* Note 2	Non-destructive examination	Hydraulic testing *See* Note 4	Dimensional inspection *See* Note 3	Visual inspection	Applicable to engines	Final document to be issued
Welded bedplate	W (C + M)	W (UT + CD)	-	-	ACS(V) fit-up + post-welding	All	ACS Component Certificate

SYMBOLS:

B = Bore dimension, refers to engine cylinder bores		*p* = Maximum working pressure of item concerned
C = Chemical composition analysis		P = Pressure test at 1.5*p*
M = Mechanical property analysis		V = Visual examination of accessible surfaces
UT = Ultrasonic testing (*See* Note 1)		ACS( ) = Test/inspection to be certified by ACS
CD = Crack detection by MPI or DPT (*See* Note 7)		TR[ ] = Test report required for process in brackets (*See* Pt 5, Ch 2, 2.2 Testing and inspection 2.2.6)
W ( ) = Test/inspection to be certified by manufacturer		

Note 1. Ultrasonic testing is not required for components manufactured from cast iron.

Note 2. Material properties include chemical composition and mechanical properties, as identified in the table above. Where mechanical testing is required this is to include testing of surface treatment, such as surface hardening (hardness, depth and extent), peening and rolling (extent and applied force) as applicable. Mechanical tests are to be conducted after the final heat treatment has been applied.

Note 3. Dimensional inspection, including assessment of surface condition.

Note 4. Hydraulic testing is applied on the water/oil side of the component. The full lengths of cooling spaces are to be tested, where applicable. Where design or testing features may require modification of these test requirements, special consideration may be given.

Note 5. Where welding is carried out, welding and welder qualifications are to be carried out in accordance with the Pt 2 Rules for the Manufacture, Testing and Certification of Materials, Ch 12 Welding Qualifications.

Note 6. Hydraulic testing is also required for those parts filled with cooling water and having the function of containing the water which is in contact with the cylinder or cylinder liner.

Note 7. Magnetic particle testing is to be carried out on ferro-magnetic materials, penetrant testing is only to be carried out on non-ferritic materials. Visual examination alone is considered insufficient. Magnetic particle and dye penetrant testing are to be carried out when the forgings are in the finished machined condition.

Note 8. *See also* Pt 2 Rules for the Manufacture, Testing and Certification of Materials, Ch 5, 3.5 Non-destructive examination 3.5.1 for detailed non-destructive examination requirements for other bolts and studs.

Note 9. Magnetic particle testing of tie rods may be confined to the threaded portions and the adjacent material over a length equal to that of the thread.

Note 10. Where components are subjected to an autofrettage process accepted by ACS (*See* Pt 5, Ch 2, 2.4 Autofrettage), the component pressure test may be omitted. The assembled system containing such components is to be shown, where practicable, to be pressure-tight as required for hydraulic systems.

Note 11. Pumps used in jerk or timed pump systems only need to have the assembled high pressure containing components hydraulically tested.

Note 12. Material and component certification for accumulators or coolers which are classed as pressure vessels are dependent on the operating pressure and temperature, *See* Pt 5, Ch 11, 1.5, Classification of fusion welded pressure vessels and Pt 5, Ch 11, 1.7 Materials. Charge air coolers are only to be tested on the water side.

Note 13. Ultrasonic testing is required to prove full adhesion between base material and bearing metal.

Note 14. Material certification requirements for pumps and piping components are dependent on the operating pressure and temperature. Requirements given in this table apply except where alternative requirements are explicitly given elsewhere in the Rules. *See* Pt 5, Ch 12, 1.7 Materials.

2. 3 Alignment gauges

2. 3. 1 All main and auxiliary engines exceeding 220 kW (300 shp) are to be provided with an alignment gauge which may be either a bridge weardown gauge, or a micro-meter clock gauge for use between the crankwebs. Only one micrometer clock gauge need be supplied for each ship provided the gauge is suitable for use on all engines.

2. 4 Autofrettage

2. 4. 1 Manufacturers, and external providers of products or services, who carry out autofrettage of engine components, are to apply an approach for product assurance that is accepted by ACS.

2. 4. 2 Documentation for the autofrettage process and the associated approach for product assurance is to be submitted in accordance with Pt 5, Ch 2, 1.4 Submission requirements 1.4.7.

2. 4. 3 Testing carried out as part of the approach for product assurance is to confirm that the autofrettage process has not detrimentally affected the components and demonstrate that the prescriptive Rule requirements for pressure containment have been met, *See* Table 2. 2. 1: Summary of testing and associated documentation for engine components

PART

5

CHAPTER 2 Reciprocating Internal Combustion Engines

SECTION 3 Crankshaft Design

3. 1 Application

3. 1. 1 Pt 5, Ch 2, 3 Crankshaft Design is not applicable to auxiliary engines having powers of less than 110 kW.

3. 2 Scope

3. 2. 1 The formulae given in this Section are applicable to solid or semi-built crankshafts of forged or cast steel, having a main support bearing adjacent to each crankpin.

3. 2. 2 This section uses the statically determinate method; alternative methods, including a fully documented stress analysis, will be considered.

3. 2. 3 Calculations are to be carried out for the maximum continuous power rating for all designed operating conditions.

3. 2. 4 Designs of crankshafts not included in this scope will be subject to special consideration.

3. 2. 5 Where a crankshaft design involves the use of surface treated fillets, or when fatigue parameter influences are tested, or when working stresses are measured, the relevant documents with calculations/analysis are to be submitted to ACS.

3. 2. 6 The design of crankshafts is based on an evaluation of safety against fatigue in the highly stressed areas. The calculation is also based on the assumption that the areas exposed to highest stresses are:

- fillet transitions between the crankpin and web as well as between the journal and web; and
- outlets of crankpin oil bores.

3. 2. 7 When the journal diameter is equal to or larger than the crankpin diameter, the outlets of main journal oil bores are to be formed in a similar way to the crankpin oil bores, otherwise separate documentation of fatigue safety will be specially considered.

3. 2. 8 Calculation of crankshaft strength consists initially in determining the nominal alternating bending (*See* Pt 5, Ch 2, 3.6, Calculation of bending stresses) and nominal alternating torsional stresses (*See* Pt 5, Ch 2, 3.7, Calculation of torsional stresses) which when multiplied by the appropriate stress concentration factors (SCF) (*See* Pt 5, Ch 2, 3.8, Stress concentration factors), result in an equivalent alternating stress (uniaxial stress) (*See* Pt 5, Ch 2, 3.10 Equivalent alternating stress). This equivalent alternating stress is then compared with the fatigue strength of the selected crankshaft material (*See* Pt 5, Ch 2, 3.11, Fatigue strength). This comparison will show whether or not the crankshaft concerned is dimensioned adequately (*See* Pt 5, Ch 2, 3.12 Acceptability criteria).

3. 2. 9 Further information and guidance on crankshaft design is provided in the ACS's *Guidance Notes for the Calculation of Stress Concentration Factors, Fatigue Enhancement Methods and Evaluation of Fatigue Tests.*

3. 3 Information to be submitted

3. 3. 1 For the calculation of crankshafts, the documents and particulars listed below are required. This information is provided by completing ACS Form 2073 and submitting the applicable plans required in Table 2. 1. 1: Plans and particulars to be submitted:

- crankshaft drawing (which must contain all data in respect of the geometrical configurations of the crankshaft);
- type designation and kind of engine (in-line engine or V-type engine with adjacent connecting rods, forked connecting rod or articulated-type connecting rod);
- operating and combustion method (2-stroke or 4-stroke cycle/direct injection, precombustion chamber, etc.);
- number of cylinders;
- output power at maximum continuous rating (MCR), in kW;
- output speed at maximum continuous power, in rpm;
- maximum firing pressure, P_{max}, in MPa;
- mean indicated pressure, in MPa;
- charge air pressure (before inlet valves or scavenge ports, whichever applies), in MPa;
- digitised gas pressure/crank angle cycle for MCR (presented at equidistant intervals at least every 5° CA);
- mean piston speed;
- compression ratio;
- vee angle α_v, in degrees;
- firing order numbered from driving end, *See* Figure 2. 3. 1: Designation of cylinders;
- direction of rotation;
- cylinder diameter, in mm;
- piston stroke, in mm;
- centre of gravity of connecting rod from large end centre, in mm;
- radius of gyration of connecting rod, in mm;
- length of connecting rod between bearing centres, L_H, in mm;
- mass of single crankweb (indicate if webs either side of pin are of different mass values), in kg;
- centre of gravity of crankweb mass from shaft axis, in mm;
- mass of counterweights fitted (for complete crankshaft) indicate positions fitted, in kg;
- centre of gravity of counterweights (for complete crankshaft) measured from shaft axis, in mm;

- all individual reciprocating masses acting on one crank, in kg;
- crankshaft material specification(s) (according to ISO, EN, DIN, AISI, etc.);
- mechanical properties of material (minimum values obtained from longitudinal test specimens):
    - tensile strength, in N/mm^2
    - yield strength, in N/mm^2
    - reduction in area at break, percentage
    - elongation, percentage
- method of manufacture (free form forged, continuous grain flow forged, drop-forged, etc.; with description of the forging process);
- for semi-built crankshafts – minimum and maximum diametral interference, in mm; and
- particulars of alternating torsional stress calculations, *See* Pt 5, Ch 2, 3.7, Calculation of torsional stresses.

Figure 2. 3. 1: Designation of cylinders

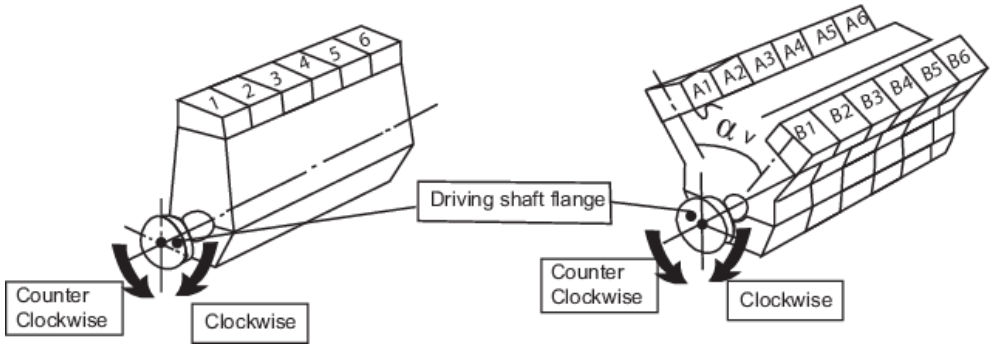

Figure 2. 3. 2: Articulated-type connecting rod

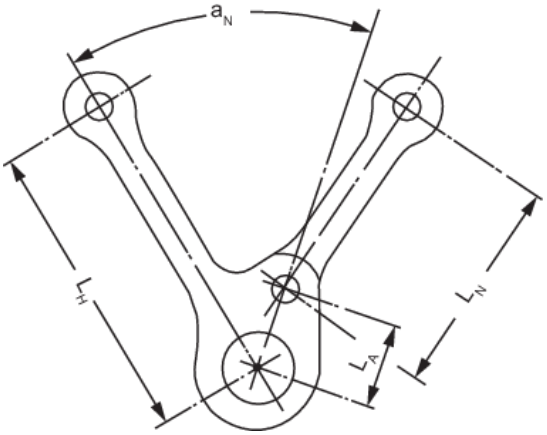

3. 3. 2 The following information is also required for appraisal of the crankshaft (not contained in Form 2073):

- for engines with articulated-type connecting rod (*See* Figure 2. 3. 2: Articulated-type connecting rod);
    - distance to link point L_A, in mm
    - link angle α_N, in degrees

- connecting rod length L_N, in mm

- firing interval (if applicable) i.e. if not evenly distributed
- mass of connecting rod (including bearings), in kg;
- mass of piston (including piston rod and crosshead where applicable), in kg;
- every surface treatment affecting fillets or oil holes shall be specified so as to enable calculation according to Chapter 2 of the ACS *Guidance Notes for Crankshaft SCF Calculation using Finite Element Method;*

  - this is to include Crankshaft fatigue enhancement factors K_1 and K_2 where applicable.
- maximum alternating torsional stress τ_a (N/mm^2)
- mechanical properties of material (minimum values obtained from longitudinal test specimens), in addition to the information listed above:
- Impact energy K_V, in Joules.

3. 4 Symbols

3. 4. 1 For the purposes of this Chapter the following symbols apply, *See also;*

- Figure 2. 3. 3: Crank dimensions for overlapped crankshaft
- Figure 2. 3. 4: Crank dimensions for crankshaft without overlap
- Figure 2. 3. 5: Crankpin section through the oil bore and
- Figure 2. 3. 6: Crankthrow of semi-built crankshaft

B = transverse breadth of web, in mm

D = crankpin diameter, in mm

D_A = the outside diameter of web or twice the minimum distance between centre-line of journals and outer contour of web, whichever is less, in mm

D_{BH} = diameter of axial bore in crankpin, in mm

D_{BG} = diameter of axial bore in journal, in mm

D_G = journal diameter, in mm

D_o = diameter of radial oil bore in crankpin, in mm

D_s = shrink diameter of main journal in web, in mm

E = pin eccentricity

E_m = Young's modulus of crankshaft material, in N/mm^2

F = area related to cross-section of web, in mm^2

K_e = bending stress factor (considers the influence of adjacent crank and bearing restraint)

K = fatigue enhancement factor ($K = K_1.K_2$)

K_1 = fatigue enhancement factor due to manufacturing process

K_2 = fatigue enhancement factor due to surface treatment

L_s = length of shrink fit, in mm

M_{BON} = alternating bending moment calculated at the outlet of crankpin oil bore

M_{BRFN} = alternating bending moment related to the centre of the web, in Nm

M_{TN} = maximum alternating torque, in Nm

M_{Tmax} = maximum value of the torque, in Nm

M_{Tmin} = minimum value of the torque, in Nm

Q_{RFN} = alternating radial force related to the web, in N

R_H, R_G = fillet radius at junction of web and pin or journal, in mm

S = pin overlap, in mm $S = \frac{D+D_G}{2} - E$

T_H, T_G = recess of pin or journal fillet radius into web measured from web face, in mm

W = axial thickness of web, in mm

W_{eqw} = xection modulus related to cross-section of web, in mm^3

W_e = section modulus related to cross-section of axially bored crankpin, in mm^3

W_p = polar section modulus related to cross-section of axially bored crankpin or bored journal, in mm^3

y = distance between the adjacent generating lines of journal and pin, in mm

Note For $y \geq 0.05D_S$, where y is less than $0.1D_S$, special consideration is to be given to the effect of the stress due to the shrink fit on the fatigue strength at the crankpin fillet.

α_B = bending stress concentration factor for crankpin fillet

α_T = torsional stress concentration factor for crankpin fillet

β_B = bending stress concentration factor for main journal fillet

Note α_B and β_B are defined as the ratio of the maximum equivalent stress (von Mises) occurring in the fillets under bending load, to the nominal bending stress related to the web cross-section. *See* Figure 2. 3. 7: Stress concentration factors in crankshaft fillets.

β_Q = compression stress concentration factor for main journal fillet

Note β_Q is defined as the ratio of the maximum equivalent stress (von Mises) occurring in the fillet due to the radial force, to the nominal compressive stress related to the web cross-section.

β_T = torsional stress concentration factor for main journal fillet

Note Note. α_T and β_T are defined as the ratio of the maximum equivalent shear stress occurring in the fillets under torsional load, to the nominal torsional stress related to the axially bored crankpin or journal cross-section. *See* Figure 2. 3. 7: Stress concentration factors in crankshaft fillets.

γ_B = bending stress concentration factor for outlet of crankpin oil bore

γ_T = torsional stress concentration factor for outlet of crankpin oil bore

Note γ_B and γ_T are defined as the ratio of the maximum principal stress occurring at the outlet of the crankpin oil-hole under bending and torsional loads respectively, to the corresponding nominal stress related to the axially bored crankpin cross section. *See* Figure 2. 3. 8: Stress concentration factors and stress distribution at the edges of oil drillings.

σ_{add} = additional bending stress due to misalignment and bedplate deformation as well as due to axial and bending vibrations, in N/mm^2

σ_B = specified minimum UTS of crankshaft material, in N/mm^2

σ_{BFN} = nominal alternating bending stress related to the web, in N/mm^2

σ_{BG} = alternating bending stress in journal fillet, in N/mm^2

σ_{BH} = alternating bending stress in crankpin fillet, in N/mm^2

σ_{BO} = alternating bending stress in the outlet of the oil bore, in N/mm^2

σ_{BON} = nominal alternating bending stress in the outlet of the oil bore related to the crankpin diameter, in N/mm^2

σ_{QFN} = nominal alternating compressive stress due to radial force related to the web, in N/mm^2

σ_{DW} = allowable fatigue strength of crankshaft, in N/mm^2

σ_{SP} = minimum yield strength of material for journal pin, in N/mm^2

σ_{SW} = minimum yield strength of material for crankweb, in N/mm^2

σ_{TO} = alternating torsional stress in the outlet of the crankpin oil bore, in N/mm^2

σ_y = equivalent alternating stress for crankpin fillet, journal fillet or outlet of crankpin oil bore as applicable, in N/mm^3

τ_H = alternating torsional stress in crankpin fillet, in N/mm^2

τ_G = alternating torsional stress in journal fillet, in N/mm^2

τ_N = calculated nominal alternating torsional stress referred to crankpin or journal (as applicable), in N/mm^2

τ_a = manufacturer stated crankshaft half range torsional stress limit, in N/mm^2

Figure 2. 3. 3: Crank dimensions for overlapped crankshaft

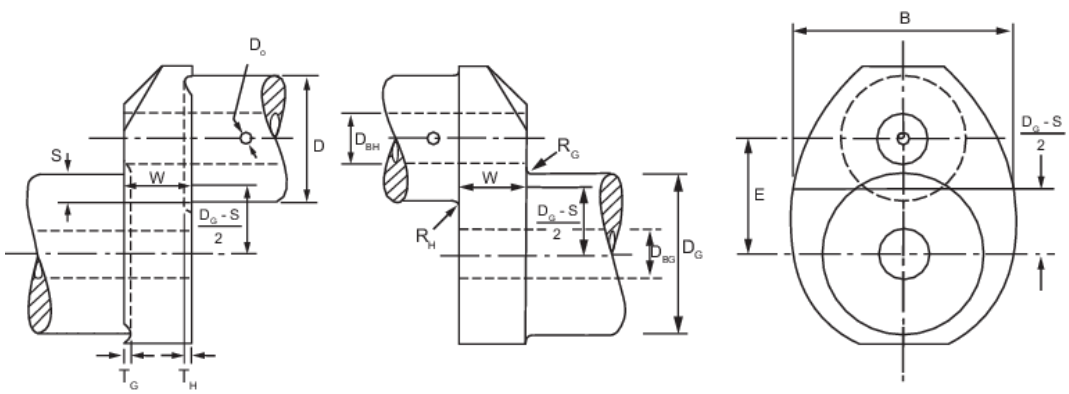

Figure 2. 3. 4: Crank dimensions for crankshaft without overlap

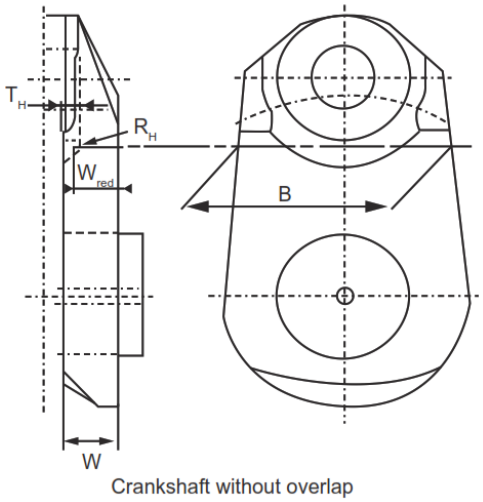

Figure 2. 3. 5: Crankpin section through the oil bore

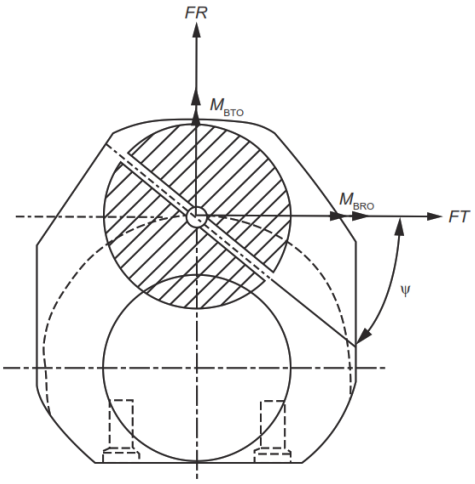

Figure 2. 3. 6: Crankthrow of semi-built crankshaft

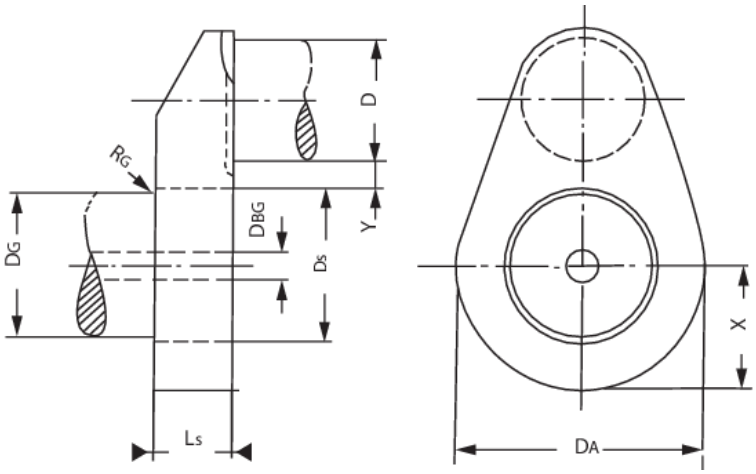

Figure 2. 3. 7: Stress concentration factors in crankshaft fillets

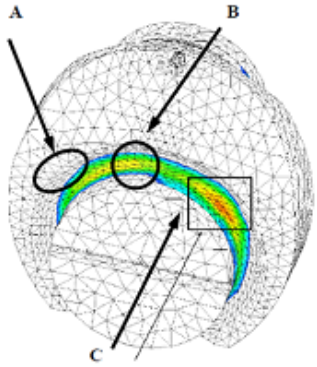
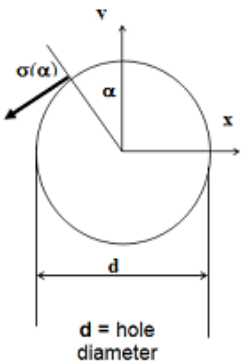


Stress Type	Stress	Max $\|\sigma_3\|$	Max σ_1	
Torsional loading	Location of maximal stresses	*A*	*C*	*B*
	Typical principal stress system Mohr's circle diagram with $\sigma_2 = 0$			
		$\|\sigma_3\| > \sigma_1$	$\sigma_1 > \|\sigma_3\|$	$\sigma_1 \approx \|\sigma_3\|$
	Equivalent stress and **S.C.F.**	$\tau_{equiv} = \frac{\sigma_1 - \sigma_3}{2}$ $S.C.F. = \frac{\tau_{equiv}}{\tau_n}$ for α_T, β_T		
Bending loading	Location of maximal stresses	*B*	*B*	*B*
	Typical principal stress system Mohr's circle diagram with $\sigma_3 = 0$		$\sigma_2 \neq 0$	
	Equivalent stress and **S.C.F.**	$\sigma equiv = \sqrt{\sigma_1^2 + \sigma_2^2 - \sigma_1 . \sigma_2}$ $S.C.F. = \frac{\sigma equiv}{\sigma_n}$ for $\alpha_B, \beta_B, \beta_Q$		

Figure 2. 3. 8: Stress concentration factors and stress distribution at the edges of oil drillings



Stress type	Nominal stress tensor	Uniaxial stress distribution around the edge	Mohr's circle diagram
Tension	$\begin{bmatrix} \sigma_n & 0 \\ 0 & 0 \end{bmatrix}$	$\sigma_\alpha = \sigma_n \gamma_B / 3 [1+2 \cos(2\alpha)]$ 	 $\gamma_B = \sigma_{max}/\sigma_n$ for $\alpha = k\pi$
Shear	$\begin{bmatrix} 0 & \tau_n \\ \tau_n & 0 \end{bmatrix}$	$\sigma_\alpha = \gamma_T \tau_n \sin(2\alpha)$ 	 $\gamma_T = \sigma_{max}/\tau_n$ for $\alpha = \frac{\pi}{4} + k\frac{\pi}{2}$
Tension + shear	$\begin{bmatrix} \sigma_n & \tau_n \\ \tau_n & 0 \end{bmatrix}$	$\sigma_\alpha = \frac{\gamma_B}{3}\sigma_n\left\{1+2\left[\cos(2\alpha)+\frac{3}{2}\frac{\gamma_T}{\gamma_B}\frac{\tau_n}{\sigma_n}\sin(2\alpha)\right]\right\}$ 	 $\sigma_{max} = \frac{\gamma_B}{3}\sigma_n\left[1+2\sqrt{1+\frac{9}{4}\left(\frac{\gamma_T}{\gamma_B}\frac{\tau_n}{\sigma_n}\right)^2}\right]$ for $\alpha = \frac{1}{2}tg^{-1}\left(\frac{3\gamma_T\tau_n}{2\gamma_B\sigma_n}\right)$

3. 5 Calculation of alternating stresses due to bending moments and radial forces – assumptions

3. 5. 1 The calculation is based on a statically determined system, composed of a single crankthrow supported in the centre of adjacent main journals and subject to gas and inertia forces. The bending length is taken as the length between the two main bearing midpoints (distance L_3, *See* Figure 2. 3. 9: Bending moment and shear force for in-line engine crankthrows and Figure 2. 3. 10: Bending moment and shear force for V engine crankthrows.

3. 5. 2 The bending moments, M_{BR} and M_{BT}, are calculated in the relevant section based on triangular bending moment diagrams due to the radial component F_R and tangential component F_T of the connecting-rod force, respectively (*See* Figure 2. 3. 9: Bending moment and shear force for in-line engine crankthrows). For crankthrows with two connecting-rods acting upon one crankpin the relevant bending moments are obtained by superposition of the two triangular bending moment diagrams according to phase (*See* Figure 2. 3. 10: Bending moment and shear force for V engine crankthrows).

Figure 2. 3. 9: Bending moment and shear force for in-line engine crankthrows

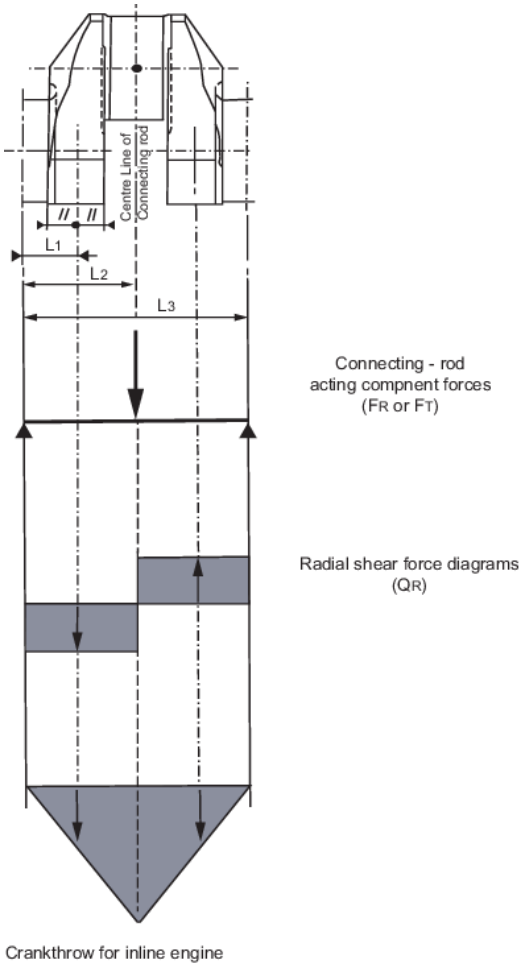


Figure 2. 3. 10: Bending moment and shear force for V engine crankthrows

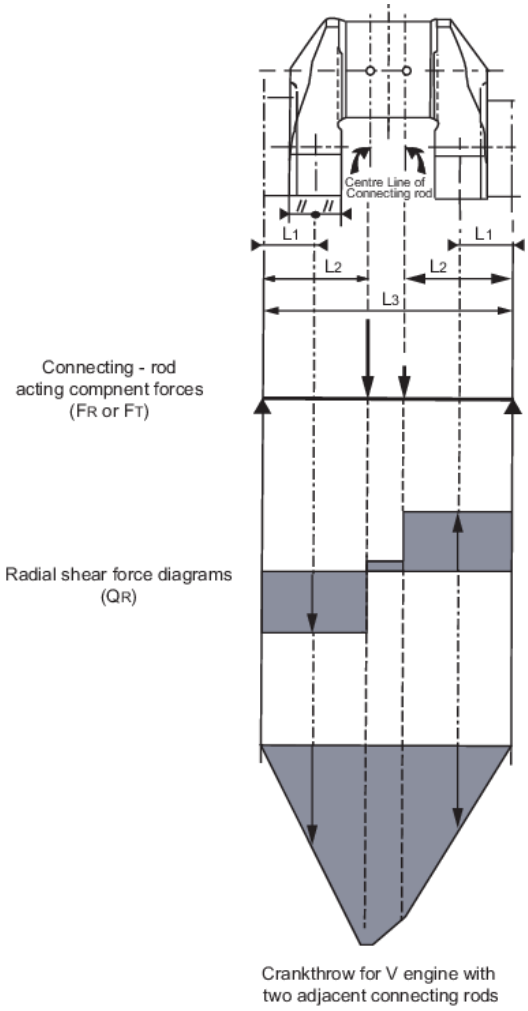

3. 5. 3 The bending moment M_{BRF} and the radial force Q_{RF} are taken as acting in the centre of the solid web (distance L_1) and are derived from the radial component of the connecting-rod force. The alternating bending and compressive stresses due to bending moments and radial forces are to be related to the cross-section of the crankweb. This reference section results from the web thickness W and the web width B (*See* Figure 2. 3. 3: Crank dimensions for overlapped crankshaft and Figure 2. 3. 4: Crank dimensions for crankshaft without overlap). Mean stresses are neglected.

3. 5. 4 The two relevant bending moments for bending acting on the outlet of crankpin oil bores are taken in the crankpin cross-section through the oil bore. *See* Figure 2. 3. 9: Bending moment and shear force for in-line engine crankthrows and Figure 2. 3. 10: Bending moment and shear force for V engine crankthrows. M_{BRO} is the bending moment of the radial component of the connecting-rod force and M_{BTO} is the bending moment of the tangential component of the connecting-rod force. The alternating stresses due to these bending moments are to be related to the cross-sectional area of the axially bored crankpin. Mean bending stresses are neglected.

3. 6 Calculation of bending stresses

3. 6. 1 The radial and tangential forces due to gas and inertia loads acting upon the crankpin at each connecting-rod position are to be calculated over one working cycle. Using the forces calculated over one working cycle and taking into account of the distance from the main bearing midpoint, the time curve of the bending moments, M_{BRF}, M_{BRO} and M_{BTO}, and radial forces, Q_{RF}, as defined

in Pt 5, Ch 2, 3.5 Calculation of alternating stresses due to bending moments and radial forces – assumptions 3.5.2 and Pt 5, Ch 2, 3.5 Calculation of alternating stresses due to bending moments and radial forces – assumptions 3.5.3 are then calculated.

3. 6. 2 Nominal bending stresses are referred to the web bending modulus.

3. 6. 3 In case of V-type engines, the bending moments – progressively calculated from the gas and inertia forces – of the two cylinders acting on one crankthrow are superposed according to phase. Different designs (forked connecting-rod, articulated-type connecting-rod or adjacent connecting-rods) shall be taken into account.

3. 6. 4 Where there are cranks of different geometrical configurations in one crankshaft, the calculation is to cover all crank variants.

3. 6. 5 The decisive alternating values will then be calculated according to:

$$X_N = \pm\frac{1}{2}(X_{max} - X_{min})$$

where

X_N is considered as the alternating force, moment or stress

X_{max} is the maximum value within one working cycle

X_{min} is the minimum value within one working cycle

3. 6. 6 Nominal alternating bending and compressive stresses in web cross-section are calculated as follows:

$$\sigma_{BFN} = \pm\frac{M_{BRFN}}{W_{eqw}} 10^3 K_e \text{ N/mm}^2$$

$$\sigma_{QFN} = \pm\frac{Q_{RFN}}{F} K_e \text{ N/mm}^2$$

Where

M_{BRFN} = $\pm\frac{1}{2}(X_{BRF\,max} - X_{BRF\,min})$ Nm

W_{eqw} = $\frac{BW^2}{6}$ mm^3

K_e = 0.8 for crosshead engines

= 1.0 for trunk piston engines

Q_{RFN} = $\pm\frac{1}{2}(Q_{RF\,max} - Q_{RF\,min})$ Nm

F = BW mm^2

3. 6. 7 Nominal alternating bending stress in the outlet of the crankpin oil bore is calculated as follows:

$$\sigma BON = \pm\frac{M_{BON}}{W_e} 10^3 \text{ N/mm}^2$$

where

M_{BON} is taken as the ½ range value $M_{BON} = \pm 1/2(M_{BOmax} - M_{BOmin})$

and

M_{BO} = (M_{BTO} cosψ + M_{BRO} sinψ), ψ = angular position in degrees, *See* Figure 2. 3. 5: Crankpin section through the oil bore

M_{BRO} = bending moment of the radial component of the connecting-rod force

M_{BTO} = bending moment of the tangential component of the connecting-rod force

W_e = $\frac{\pi}{32}\left(\frac{D^4 - D_{BH}^4}{D}\right) mm^3$

3. 6. 8 Alternating bending stresses for the crankpin fillet and journal fillet are calculated as follows:

a. For the crankpin fillet:

$$\sigma_{BH} = \pm(\alpha_b \quad \sigma_{BFN})\text{N/mm}^2$$

where α_B is calculated according to Pt 5, Ch 2, 3.8 Stress concentration factors 3.8.6.a

b. For the journal fillet:

$$\sigma_{BG} = \pm(\beta_B\sigma_{BFN} + \beta_Q\sigma_{QFN})\text{N/mm}^2$$

where

β_B is calculated according to Pt 5, Ch 2, 3.8 Stress concentration factors 3.8.7.a

β_Q is calculated according to Pt 5, Ch 2, 3.8 Stress concentration factors 3.8.7.b

3. 6. 9 Alternating bending stresses for the outlet of the crankpin oil bore are calculated as follows:

$$\sigma_{BO} = \pm(\gamma_B\sigma_{BON})\text{N/mm}^2$$

where

γ_B is calculated according to Pt 5, Ch 2, 3.8 Stress concentration factors 3.8.8.a

3. 7 Calculation of torsional stresses

3. 7. 1 The nominal alternating torsional stress, τ_n, is to be taken into consideration. The value is to be derived from forced-damped vibration calculations of the complete dynamic system. Alternative methods will be given consideration. The engine designer is to advise the maximum level of alternating vibratory stress that is permitted (τ_a).

3. 7. 2 τ_a or τ_n(as applicable) is to be applied as a limiting value for the torsional vibration assessment required by Pt 5, Ch 8, 2 Torsional vibration.

3. 7. 3 Nominal alternating torsional stress is calculated as follows:

$$\tau_n = \pm\frac{M_{TN}}{W_p}10^3\text{N/mm}^2$$

where

$$M_{TN} = \pm\frac{1}{2}(M_{Tmax} - M_{Tmin})\text{Nm}$$

$W_p = \frac{\pi}{16}\left(\frac{D^4 - D_{BH}^4}{D}\right)\text{mm}^3$ for the crankpin, or $W_p = \frac{\pi}{16}\left(\frac{D_G^4 - D_{BG}^4}{D_c}\right)\text{mm}^3$ for the jornal

τ_N is to be ascertained from assessment of the torsional vibration calculations where the maximum and minimum torques are determined for every mass point of the complete dynamic system and for the entire speed range by means of a harmonic synthesis of the forced vibrations from the first order up to and including the 15th order for 2-stroke cycle engines and from the 0.5th order up to and including the 12th order for 4-stroke cycle engines. Whilst doing so, allowance must be made for the damping that exists in the system and for unfavourable conditions (misfiring in one of the cylinders when no combustion occurs but only on the compression cycle). The speed step calculation shall be selected in such a way that any resonance found in the operational speed range of the engine shall be detected.

3. 7. 4 For the purpose of the crankshaft assessment, the nominal alternating torsional stress considered in calculations is to be the highest calculated value, according to the method described in Pt 5, Ch 2, 3.7 Calculation of torsional stresses 3.7.3, occurring at the most torsionally loaded mass point of the crankshaft system.

3. 7. 5 The approval of the crankshaft will be based on the installation having the largest nominal alternating torsional stress (but not exceeding the maximum figure specified by the engine manufacturer). For each installation it is to be ensured by calculation that the maximum approved nominal alternating torsional stress is not exceeded. *See* Pt 5, Ch 8, 2 Torsional vibration.

3. 7. 6 Alternating torsional stresses for the crankpin fillet, the journal fillet and the outlet of the crankpin oil bore are calculated as follows.

a. Maximum alternating torsional stress in crankpin fillet:

$$\tau_H = \pm(\alpha_T \tau_N) \mathrm{N/mm^2}$$

where

α_T is calculated according to Pt 5, Ch 2, 3.8 Stress concentration factors 3.8.6.b.

b. Maximum alternating torsional stress in the journal fillet (not applicable to semi-built crankshafts):

$$\tau_G = \pm(\beta_T \tau_N) \mathrm{N/mm^2}$$

where

β_T is calculated according to Pt 5, Ch 2, 3.8 Stress concentration factors 3.8.7.c.

c. Maximum alternating torsional stress in the outlet of the crankpin oil bore:

$$\sigma_{TO} = \pm(\gamma_T \tau_N) \mathrm{N/mm^2}$$

where

γ_T is calculated according to Pt 5, Ch 2, 3.8 Stress concentration factors 3.8.8.b.

3. 8 Stress concentration factors

3. 8. 1 Stress concentration factors (SCF) are to be calculated using the analytical formulae outlined in this Section.

3. 8. 2 Crankshaft variables to be used in calculating the geometric stress concentrations factors are shown in Table 2. 3. 1: Crankshaft variables for SCF calculation, their limits of applicability are shown in Table 2. 3. 2: Crankshaft variable boundaries for analytical SCF calculationTable 2. 3. 2: Crankshaft variable boundaries for analytical SCF calculation.

3. 8. 3 Where the geometry of the crankshaft is outside the boundaries (*See* Table 2. 3. 2: Crankshaft variable boundaries for analytical SCF calculation) of the analytical SCF the calculation method detailed in Chapter 1 of ACS *Guidance Notes for Crankshaft SCF Calculation using Finite Element Method* may be undertaken.

3. 8. 4 Where reliable experimental measurements and/or calculations are available, which can allow direct assessment of SCF, these can be used. The relevant documents and their analysis are to be submitted for consideration in order to demonstrate their equivalence. This is always to be performed when dimensions are outside the boundaries shown in Table 2. 3. 2: Crankshaft variable boundaries for analytical SCF calculation.

3. 8. 5 Chapters 1 and 3 of ACS *Guidance Notes for Crankshaft SCF Calculation using Finite Element Method* describe how finite element (FE) analyses can be used for the calculation of the SCF. Care needs to be taken to avoid mixing equivalent (von Mises) stresses and principal stresses.

Table 2. 3. 1: Crankshaft variables for SCF calculation

Variable	Function
r	$= R_H/D$ for crankpin fillet $= R_G/D$ for journal fillet
s	$= S/D$
w	$= W/D$ crankshafts with overlap $= W_{red}/D$ crankshafts without overlap
b	$= B/D$
d_o	$= D_O/D$
d_G	$= D_{BG}/D$
d_H	$= D_{BH}/D$
t_H	$= T_H/D$
t_G	$= T_G/D$

Table 2. 3. 2: Crankshaft variable boundaries for analytical SCF calculation

Lower bound	Variable	Upper bound
	s	≤ 0.5
$0.2 \leq$	w	≤ 0.8
$1.1 \leq$	b	≤ 2.2
$0.03 \leq$	r	≤ 0.13
$0 \leq$	d_G	≤ 0.8
$0 \leq$	d_H	≤ 0.8
$0 \leq$	d_o	≤ 0.2

Notes

The lower bound of s can be extended down to large negative values provided that:

If calculated f(recess) < 1, then the factor f(recess) is not to be considered (f(recess) = 1)

If $s < -0.5$ then $f(s,w)$ and $f(r,s)$ are to be evaluated replacing actual value of s by –0.5.

3. 8. 6 Crankpin SCF are calculated as follows:

a. Bending

$$\alpha_B = 2.6914\text{f(s,w)}.\text{f(w)}.\text{f(b)}.\text{f(r)}.\text{f(dG)}.\text{f(d}_\text{H}\text{)}.\text{f(recess)}$$

where

$$\text{f(s,w)} = -4.1883 + 29.2004\text{w} - 77.5925\text{w}^2 + 91.9454w^3 - 40.0416\text{w}^4 + (1-\text{s})(9.5440 - 58.3480\text{w} + 159.3415\text{w}^2 - 192.5846\text{w}^3 + 85.2916\text{w}^4) + (1-\text{s})^2(-3.8399 + 25.0444\text{w} - 70.5571\text{w}^2 + 87.0328\text{w}^3 - 39.1832\text{w}^4)$$

$$\text{f(w)} = 2.1790\text{w}^{0.7171}$$

$$\text{f(b)} = 0.684 - 0.0077\text{b} + 0.1473\text{b}^2$$

$$\text{f(r)} = 0.2081\text{r}^{(-0.5231)}$$

$$\text{f(d}_\text{G}\text{)} = 0.9993 + 0.27\text{d}_\text{G} - 1.0211\text{d}_\text{G}^2 + 0.5306\text{d}_\text{G}^3$$

$$\text{f(d}_\text{H}\text{)} = 0.9978 + 0.3145\text{d}_\text{H} - 1.5241\text{d}_\text{H}^2 + 2.4147\text{d}_\text{H}^3$$

$$\text{f(recess)} = 1 + (\text{t}_\text{H} + \text{t}_\text{G})(1.8 + 3.2s)$$

b. Torsion

$$\alpha_\text{T} = 0.8\text{f(r,s)}.\text{f(b)}.\text{f(w)}$$

where

$$f(r,s) = r^{(-0.322 + 0.1015\,(1-s))}$$

$$\text{f(b)} = 7.8955 - 10.654\text{b} + 5.3482\text{b}^2 - 0.857\text{b}^3$$

$$\text{f(w)} = \text{w}^{(-0.145)}$$

3. 8. 7 Journal fillet SCF are calculated as follows (not applicable to semi-built crankshafts):

a. Bending

$$\beta_B = 2.7146 f_\text{B}(s,w) \cdot f_\text{B}(w) \cdot f_\text{B}(b) \cdot f_\text{B}(r) \cdot f_\text{B}(d_\text{G}) \cdot f_\text{B}(d_\text{H}) \cdot f\,\text{(recess)}$$

where

$$\text{f(s,w)} = -4.1883 + 29.2004\text{w} - 77.5925\text{w}^2 + 91.9454w^3 - 40.0416\text{w}^4 + (1-\text{s})(9.5440 - 58.3480\text{w} + 159.3415\text{w}^2 - 192.5846\text{w}^3 + 85.2916\text{w}^4) + (1-\text{s})^2(-3.8399 + 25.0444\text{w} - 70.5571\text{w}^2 + 87.0328\text{w}^3 - 39.1832\text{w}^4)$$

$$\text{f}_\text{B}\text{(s,w)} = -1.7625 + 2.9821w - 1.5276w^2 + (1-s)(5.1169 - 5.8089w + 3.1391w^2) + (1-s)^2(-2.1567 + 2.3297w - 1.2952w^2)$$

$$\text{f}_\text{B}\text{(w)} = 2.2422\text{W}^{0.7548}$$

$$\text{f}_\text{B}\text{(b)} = 0.5616 + 0.1197b + 0.1176b^2$$

$$\text{f}_\text{B}\text{(r)} = 0.1908r^{(-0.5568)}$$

$$\text{f}_\text{B}\text{(d}_\text{G}\text{)} = 1.0012 - 0.6441\text{d}_\text{G} + 1.2265\text{d}_\text{G}^2$$

$$f_B(d_H) = 1.0022 - 0.1903d_H + 0.0073d_H^2$$

$$f(recess) = 1 + (t_H + t_G)(1.8 + 3.2s)$$

b. Compression due to the radial force:

$$\beta_Q = 3.0128 f_Q(s) \cdot f_Q(w) \cdot f_Q(b) \cdot f_Q(r) \cdot f_Q(d_H) \cdot \text{frecess}$$

where

$$f_Q(s) = 0.4368 + 2.1630(1 - s) - 1.5212(1 - s)^2$$

$$f_Q(w) = \frac{w}{0.0637 + 0.9369w}$$

$$f_Q(b) = b - 0.5$$

$$f_Q(r) = 0.5331r^{(-0.2038)}$$

$$f_Q(d_H) = 0.9937 - 1.1949d_H + 1.7373d_H^2$$

$$f(recess) = 1 + (t_H + t_G)(1.8 + 3.2s)$$

c. Torsion

β_T = α_T if the diameters and fillet radii of crankpin and journal are the same, or

β_T = $0.8f(r,s).f(b).f(w)$ if crankpin and journal diameters and/or radii are of different sizes

where

$f(r,s)$, $f(b)$ and $f(w)$ are to be determined in accordance with Pt 5, Ch 2, 3.8 Stress concentration factors 3.8.6.b, however, the radius of the journal fillet is to be related to the journal diameter: $r = \frac{R_G}{D_G}$

3. 8. 8 Crankpin oil bore SCF for radially drilled oil holes are calculated as follows:

a. Bending

$$\gamma_B = 3 - 5.88d_0 + 34.6d_0^2$$

b. Torsion

$$\gamma_T = 4 - 6d_0 + 30d_0^2$$

3. 9 Additional bending stress

3. 9. 1 In addition to the alternating bending stresses in fillets (*See* Pt 5, Ch 2, 3.6 Calculation of bending stresses 3.6.8) further bending stresses due to misalignment and bedplate deformation as well as due to axial and bending vibrations are to be considered by applying α_{add} as given by Table 2. 3. 3: Additional bending stresses.

Table 2. 3. 3: Additional bending stresses

Type of engine	σ_{add}
Crosshead engines	± 30 N/mm^2 (*See* Note 1)
Trunk piston engines	± 10 N/mm^2
Note 1. The additional stress of ±30 N/mm^2 is composed of two components: an additional stress of ±20 N/mm^2 resulting from axial vibration an additional stress of ±10 N/mm^2 resulting from misalignment/bedplate deformation	

3. 9. 2 It is recommended that a value of ±20 N/mm^2 be used for the axial vibration component for assessment purposes where axial vibration calculation results of the complete dynamic system (engine/shafting/gearing/propeller) are not available. Where axial vibration calculation results of the complete dynamic system are available, the calculated figures can be used instead.

3. 10 Equivalent alternating stress

3. 10. 1 In the fillets, bending and torsion lead to two different biaxial stress fields which can be represented by a von Mises equivalent stress with the additional assumptions that bending and torsion stresses are time phased and the corresponding peak values occur at the same location (*See* Figure 2. 3. 7: Stress concentration factors in crankshaft fillets). As a result the equivalent alternating stress is to be calculated for the crankpin fillet as well as for the journal fillet by using the von Mises criterion.

3. 10. 2 At the oil hole outlet, bending and torsion lead to two different stress fields which can be represented by an equivalent principal stress equal to the maximum of principal stress resulting from combination of these two stress fields with the assumption that bending and torsion are time phased (*See* Figure 2. 3. 8: Stress concentration factors and stress distribution at the edges of oil drillings).

3. 10. 3 The above two different ways of equivalent stress evaluation both lead to stresses which can be compared to the same fatigue strength value of crankshaft assessed according to the von Mises criterion.

3. 10. 4 Equivalent alternating stress, σ_v, is defined as:

a. For the crankpin fillet:

$$\sigma_v = \pm\sqrt{(\sigma_{BG} + \sigma_{add})^2 + 3\tau_G^2}\ \text{N/mm}^2$$

b. For the journal fillet:

$$\sigma_v = \pm\sqrt{(\sigma_{BH} + \sigma_{add})^2 + 3\tau_H^2}\ \text{N/mm}^2$$

c. For the outlet of crankpin oil bore:

$$\sigma_v = \pm\frac{1}{3}\sigma_{BO}\left[1 + 2\sqrt{1 + \frac{9}{4}\left(\frac{\sigma_{TO}}{\sigma_{BO}}\right)^2}\right]\ \text{N/mm}^2$$

3. 11 Fatigue strength

3. 11. 1 The fatigue strength is to be understood as that value of equivalent alternating stress (Von Mises) which a crankshaft can permanently withstand at the most highly stressed points. The fatigue strength can be evaluated by means of the following formulae:

a. Related to the crankpin diameter:

$$\sigma_{DW} = \pm K(0.42\sigma_B + 39.3)\left[0.264 + 1.073D^{-0.2} + \frac{785 - \sigma_B}{4900} + \frac{196}{\sigma_E}\sqrt{\frac{1}{R_X}}\right]\ \text{N/mm}^2$$

with

R_X = R_H in the fillet area

R_X = $D_o/2$ in the oil bore area

b. Related to the journal diameter:

$$\sigma_{DW} = \pm K(0.42\sigma_B + 39.3)\left[0.264 + 1.073D_G^{-0.2} + \frac{785 - \sigma_B}{4900} + \frac{196}{\sigma_E}\sqrt{\frac{1}{R_G}}\right] \text{N/mm}^2$$

Where

$$K = K_1 K_2$$

K_1 = fatigue endurance factor appropriate to the manufacturing process

= 1.05 for continuous grain flow forged or drop-forged crankshafts

= 1.0 for free form forged crankshafts (without continuous grain flow)

= 0.93 for cast steel crankshafts with cold rolling treatment in fillet area manufactured by companies using an ACS approved cold rolling process

K_2 = fatigue enhancement factor for surface treatment. These treatments are to be applied to the fillet radii

A value for K_2 will be assigned upon application by the engine designers. Full details of the process, together with the results of full scale fatigue tests will be required to be submitted for consideration *See ACS Guidance note - Guidance for the evaluation of Crankshaft Fatigue Tests*. Alternatively, the following values may be taken (surface hardened zone to include fillet radii):

K_2 = 1.15 for induction hardened

= 1.25 for nitrided

Where a value of K_1 or K_2 greater than unity is to be applied, details of the manufacturing process are to be submitted. An enhanced K_1 factor will be considered, subject to special approval of the manufacturing specification. *See Materials and Qualification Procedures for Ships, Book E, Procedure MQPS 5-2*.

3. 11. 2 The formulae in Pt 5, Ch 2, 3.11 Fatigue strength 3.11.1 are subject to geometry limits. The junction of the oil hole with the crankpin or main journal surface is to be formed with an adequate radius and smooth surface finish down to a minimum depth equal to 1.5 times the oil bore diameter and for calculation purposes R_H, R_G or R_X are to be taken as not less than 2 mm.

3. 11. 3 Fatigue strength calculations or, alternatively, fatigue test results determined by experiment based either on full size crankthrow (or crankshaft), or on specimens taken from a full size crankthrow, may be required to demonstrate acceptability. The experimental procedure for fatigue evaluation of specimens and fatigue strength of crankshaft assessment are to be submitted for approval by ACS. The procedure is to include as a minimum: method, type of specimens, number of specimens (or crankthrows), number of tests, survival probability, and confidence number. *See also* ACS *Guidance for the Evaluation of Crankshaft Fatigue Tests.*

3. 11. 4 When journal diameter is equal or larger than the crankpin diameter, the outlets of main journal oil bores are to be formed in a similar way to the crankpin oil bores, otherwise separate fatigue strength calculations or, alternatively, fatigue test results may be required.

3. 11. 5 Only surface treatment processes approved by ACS are permitted. Guidance for calculation of surface treated fillets and oil bore outlets is presented in Chapter 2 of the ACS *Guidance Notes for Crankshaft SCF Calculation using Finite Element Method*.

3. 12 Acceptability criteria

3. 12. 1 The sufficient dimensioning of a crankshaft is confirmed by a comparison of the equivalent alternating stress and the fatigue strength. The acceptability factor, Q, is to be greater than or equal to 1.15 for the crankpin fillet, the journal fillet and the outlet of crankpin oil bore:

$$Q = \frac{\sigma_{DW}}{\sigma_V}$$

3. 13 Shrink fit of semi-built crankshafts

3. 13. 1 The following formulae are applicable to crankshafts assembled by shrinking main journals into the crankwebs, *See also* Figure 2. 3. 6: Crankthrow of semi-built crankshaft.

3. 13. 2 In general, the radius of transition, R_G, between the main journal diameter, D_G, and the shrink diameter, D_S, is to be not less than $0.015D_G$ or $0.5(D_S - D_G)$ where the greater value is to be considered.

3. 13. 3 Deviations from these parameters will be specially considered.

3. 13. 4 The maximum permissible internal diameter in the journal pin is to be calculated in accordance with the following formula, this condition serves to avoid plasticity in the hole of the journal pin:

$$D_{BG} = D_s \sqrt{1 - \frac{4000 S_R M_{max}}{\mu \pi D_S^2 L_S \sigma_{SP}}} \text{ mm}$$

where

S_R = safety factor against slipping; however, a value of not less than 2 is to be taken unless documented by experiments.

M_{max} = absolute maximum value of the torque M_{Tmax} in accordance with Pt 5, Ch 2, 3.13 Shrink fit of semi-built crankshafts 3.13.7, in Nm

μ = coefficient for static friction; however, a value of not greater than 0.2 is to be taken unless documented by experiments.

3. 13. 5 The actual oversize Z of the shrink fit must be within the limits Z_{min} and Z_{max} calculated in accordance Pt 5, Ch 2, 3.13 Shrink fit of semi-built crankshafts 3.13.7 and Pt 5, Ch 2, 3.13 Shrink fit of semi-built crankshafts 3.13.8. When Pt 5, Ch 2, 3.13 Shrink fit of semi-built crankshafts 3.13.4 cannot be complied with, then the calculated values of Z_{min} and Z_{max} are not applicable due to multizone-plasticity problems. In such cases Z_{min} and Z_{max} are to be established from FEM calculations.

3. 13. 6 The minimum required diametral Interference is to be taken as the greater of:

$$Z_{min} \geq \frac{\sigma_{SW} D_S}{E_m} \text{mm}$$

and

$$Z_{min} \geq \frac{4000}{\mu\pi} \frac{S_R M_{max}}{E_m D_S L_S} \frac{1 - Q_A^2 Q_S^2}{(1 - Q_A^2)(1 - Q_S^2)} \text{ mm}$$

where

Q_A = shaft ratio, $Q_A = \frac{D_S}{D_A}$

Q_S = web ratio, $Q_S = \frac{D_{BG}}{D_S}$

3. 13. 7 The maximum diametral interference is not to be greater than:

$$Z_{max} \leq D_S \left(\frac{Q_{SW}}{E_m} + \frac{0.8}{1000} \right) \text{mm}$$

This condition serves to restrict the shrinkage induced mean stress in the fillet.

3. 13. 8 Reference marks are to be provided on the outer junction of the crankwebs with the journals.

PART

5

CHAPTER **2** **Reciprocating Internal Combustion Engines**

SECTION **4** **Electronically controlled engines**

4. 1 General

4. 1. 1 The requirements of this Section are applicable to engines for propulsion, auxiliary or emergency power purposes with programmable electronic systems implemented and used to control fuel injection timing and duration, and which may also control combustion air or exhaust systems. The requirements of this Section also apply to programmable electronic systems used to control other functions (e.g. starting and control air, cylinder lubrication etc.) where essential for the operation of the engine.

4. 1. 2 These engines may be of the crosshead or trunk piston type. They generally have no direct camshaft driven fuel systems, but have common rail fuel/hydraulic arrangements and may have hydraulic actuating systems for the functioning of the exhaust systems.

4. 1. 3 The operation of these engines relies on the effective monitoring of a number of parameters such as crank angle, engine speed, temperatures and pressures using programmable electronic systems to provide the services essential for the operation of the engine such as fuel injection, air inlet, exhaust and speed control.

4. 1. 4 Details of proposals to deviate from the requirements of this Section are to be submitted and will be considered on the basis of a technical justification produced by the Enginebuilder.

4. 1. 5 Each engine is to be configured for the specified performance and is to satisfy the relevant requirements for propulsion, auxiliary or emergency engines.

4. 1. 6 During the life of the engine details, of any proposed changes to control, alarm, monitoring or safety systems which may affect safety and the reliable operation of the engine are to be submitted to ACS for approval.

4. 2 Risk-based analysis

4. 2. 1 An analysis is to be carried out in accordance with relevant standards acceptable to ACS to demonstrate compliance with the applicable requirements of this sub-Section appropriate to the engine application. The analysis is to be a risk-based consideration of engine operation and ship and personnel safety, and is to demonstrate adequate risk mitigation through fault tolerance and/or reliability in accordance with the specified criteria in Pt 5, Ch 2, 4.2 Risk-based analysis 4.2.2 to Pt 5, Ch 2, 4.2 Risk-based analysis 4.2.4 relevant to the engine application.

4. 2. 2 For ships with a single main propulsion engine, a Failure Mode and Effects Analysis (FMEA), or alternative recognised analysis of system reliability, is to be carried out and is to demonstrate that an electronic control system failure:

a. will not result in the loss of the ability to provide the services essential for the operation of the engine, *See* Pt 6, Ch 1, 2.5 Control systems, general requirements 2.5.7 and Pt 6, Ch 1, 2.13

Programmable electronic systems - Additional requirements for essential services and safety critical systems 2.13.2;

b. will not affect the normal operation of the services essential for the operation of the engine other than those services dependent upon the failed part, *See* Pt 6, Ch 1, 2.14 Programmable electronic systems – Additional requirements for integrated systems 2.14.4 and Pt 6, Ch 1, 2.14 Programmable electronic systems – Additional requirements for integrated systems 2.14.5; and

c. will not leave either the engine, or any equipment or machinery associated with the engine, or the ship in an unsafe condition, *See* Pt 6, Ch 1, 2.3 Alarm systems, general requirements 2.3.13, Pt 6, Ch 1, 2.4 Safety systems, general requirements 2.4.5, Pt 6, Ch 1, 2.5 Control systems, general requirements 2.5.3, Pt 6, Ch 1, 2.10 Programmable electronic systems - General requirements 2.10.3, Pt 6, Ch 1, 2.10 Programmable electronic systems - General requirements 2.10.4 and Pt 6, Ch 1, 2.14 Programmable electronic systems – Additional requirements for integrated systems 2.14.5.

4. 2. 3 A risk-based analysis is to be carried out for:

a. main engines on ships with multiple main engines or other means of providing propulsion power; and/or

b. auxiliary engines intended to drive electric generators forming the ship's main source of electrical power or otherwise providing power for essential services.

The analysis is to demonstrate that adequate hazard mitigation has been incorporated in electronically controlled engine systems or the overall ship installation with respect to personnel safety and providing propulsion power and/or power for essential services for the safety of the ship. Arrangements satisfying the criteria of Pt 5, Ch 2, 4.2 Risk-based analysis 4.2.2 will also be acceptable.

4. 2. 4 For engines for emergency power purposes, a risk-based analysis is to be carried out to demonstrate that the design incorporates adequate hazard mitigation such that the likelihood of an electronic control system failure resulting in the loss of the ability to provide emergency power when required has been reduced to a level considered acceptable by ACS and that means are provided to detect failures and permit personnel to restore engine availability to operate on demand. Failures which would result in engine failure and/or damage or loss of availability are to be identified and the report is to include documentation of:

a. component reliability evidence;
b. failure detection and alarms; and
c. failure response required to restore engine availability and maintain personnel safety.

4. 2. 5 The risk-based analysis report is to:

a. Identify the standards used for analysis and system design.
b. Identify the engine, its purpose and the associated objectives of the analysis.
c. Identify any assumptions made in the analysis.
d. Identify the equipment, system or sub-system and the mode of operation.
e. Identify potential failure modes and their causes.
f. Evaluate the local effects (e.g. fuel injection failure) and the effects on the system as a whole (e.g. loss of propulsion power) of each failure mode.
g. Identify measures for reducing the risks associated with each failure mode (e.g. system design, failure detection and alarms, redundancy, quality control procedures for sourcing, manufacture and testing, etc.).
h. Identify trials and testing necessary to prove conclusions.

4. 2. 6 At sub-system level it is acceptable to consider failure of equipment items and their functions, e.g. failure of a pump to produce flow or pressure head. It is not required that the failure of components within that pump be analysed, and failure need only be dealt with as a cause of failure of the pump.

4. 3 Control engineering systems

4. 3. 1 Control, alarm, monitoring, safety and programmable electronic systems are to comply with Pt 6, Ch 1 Control Engineering Systems as applicable.

4. 3. 2 The engine control, alarm monitoring and safety systems are to be configured to comply with the relevant requirements (e.g. operating profile, alarms, shutdowns, etc.) of this Chapter and Pt 6, Ch 1 Control Engineering Systems for an engine for main, auxiliary or emergency power purposes. Details of the engine configuration are to be submitted for consideration, *See* Pt 5, Ch 2, 1.4,, Submission requirements 1.4.3.

4. 4 Software

4. 4. 1 Software lifecycle activities are to be carried out in accordance with an acceptable quality management system, *See* Pt 6, Ch 1, 2.13 Programmable electronic systems - Additional requirements for essential services and safety critical systems 2.13.2 and Pt 6, Ch 1, 2.13 Programmable electronic systems - Additional requirements for essential services and safety critical systems 2.13.7.

4. 4. 2 Appropriate safety related processes, methods, techniques and tools are to be applied to software development and maintenance by the Enginebuilder. Selection and application of techniques and measures in accordance with Annex A of IEC 61508-3, *Functional safety of electrical/electronic/programmable electronic systems: Software requirements*, or other relevant standards or codes acceptable to ACS, will generally be acceptable.

4. 4. 3 To demonstrate compliance with Pt 5, Ch 2, 4.4 Software 4.4.1 and Pt 5, Ch 2, 4.4 Software 4.4.2:

a. software quality plans and safety evidence are to be submitted for consideration, *See* Pt 5, Ch 2, 1.4 Submission requirements 1.4.3.b; and

b. an assessment inspection of the Enginebuilder's completed development is to be carried out by ACS. The inspection is to be tailored to verify application of the standards and codes used in software safety assurance accepted by ACS.

PART

5

CHAPTER 2 Reciprocating Internal Combustion Engines

SECTION 5 Construction and welded structures

5. 1 Crankcases

5. 1. 1 Crankcases and their doors are to be of robust construction to withstand anticipated crankcase pressures that may arise during a crankcase explosion, taking into account the installation of explosion relief valves required by Pt 5, Ch 2, 10 Safety arrangements and the doors are to be securely fastened so that they will not be readily displaced by a crankcase explosion.

5. 2 Welded joints

5. 2. 1 Bedplates and major components of engine structures are to be made with a minimum number of welded joints.

5. 2. 2 Double welded butt joints are to be adopted wherever possible in view of their superior fatigue strength.

5. 2. 3 Girder and frame assemblies should, so far as possible, be made from one plate or slab, shaped as necessary, rather than by welding together a number of small pieces.

5. 2. 4 Steel castings are to be used for parts which would otherwise require complicated weldments.

5. 2. 5 Care is to be taken to avoid stress concentrations such as sharp corners and abrupt changes in section.

5. 2. 6 Joints in parts of the engine structure which are stressed by the main gas or inertia loads are to be designed as continuous full strength welds and for complete fusion of the joint. They are to be so arranged that, in general, welds do not intersect, and that welding can be effected without difficulty and adequate inspection can be carried out. Abrupt changes in plate section are to be avoided and where plates of substantially unequal thickness are to be butt welded, the thickness of the heavier plate is to be gradually tapered to that of the thinner plate. Tee joints are to be made with full bevel or equivalent weld preparation to ensure full penetration.

5. 2. 7 In single plate transverse girders the castings for main bearing housings are to be formed with web extensions which can be butt welded to the flange and vertical web plates of the girder. Stiffeners in the transverse girder are to be attached to the flanges by full penetration welds.

5. 3 Materials and construction

5. 3. 1 Plates, sections, forgings and castings are to be of welding quality in accordance with the requirements of the Pt 2 Rules for the Manufacture, Testing and Certification of Materials, and with a carbon content generally not exceeding 0.23 per cent. Steels with higher carbon contents may be approved subject to satisfactory results from welding procedure tests.

5. 3. 2 Welding is to be carried out in accordance with the requirements of Ch 13 Requirements for Welded Construction of the Rules for Materials, using welding procedures and welders that have been qualified in accordance with Ch 12 Welding Qualifications of the Rules for Materials.

5. 3. 3 Before welding is commenced the component parts of bedplates and framework are to be accurately fitted and aligned.

5. 3. 4 The welding is to be carried out in positions free from draughts and is to be downhand (flat) wherever practicable. Welding consumables are to be suitable for the materials being joined. Preheating is to be adopted when heavy plates or sections are welded. The finished welds are to have an even surface and are to be free from undercutting.

5. 3. 5 Welds attaching bearing housings to the transverse girders are to have a smooth contour and, if necessary, are to be made smooth by grinding.

5. 4 Post-weld heat treatment

5. 4. 1 Bedplates are to be given a stress relieving heat treatment except engine types where the bedplate as a whole is not subjected to direct loading from the cylinder pressure. For these types, only the transverse girder assemblies need be stress relieved.

5. 4. 2 Stress relieving is to be carried out by heating the welded structure uniformly and slowly to a temperature between 580°C and 620°C, holding that temperature for not less than one hour per 25 mm of maximum plate thickness and thereafter allowing the structure to cool slowly in the furnace.

5. 4. 3 Omission of post-weld heat treatment of bedplates and their sub-assemblies will be considered on application by the engine builder with supporting evidence in accordance with Ch 13, 2.10 Post-weld heat treatment 2.10.6 of the Rules for Materials.

5. 5 Inspection

5. 5. 1 Welded engine structures are to be examined during fabrication, special attention being given to the fit of component parts of major joints prior to welding.

5. 5. 2 Inspection of welds is to be in accordance with the requirements of Ch 13, 1.11 Non-destructive examination of welds of the Rules for Materials.

5. 5. 3 Welds in transverse girder assemblies are to be crack detected by an approved method to the satisfaction of the Surveyors. Other joints are to be similarly tested if required by the Surveyors.

PART

CHAPTER **2** **Reciprocating Internal Combustion Engines**

SECTION **6** **Turning gear**

6. 1 General requirements

6. 1. 1 Turning gear is to be provided for all engines to facilitate operating and maintenance regimes as required by the manufacturer.

6. 1. 2 The turning gear for all main propulsion engines is to be power-driven and is to be continuously rated at a value to ensure protection to the weakest part of the machinery. Alternative proposals may be made subject to special consideration.

6. 1. 3 The turning gear for auxiliary engines may be hand operated (manual) except where this is not practicable, in which case the provision of Pt 5, Ch 2, 6.1 General requirements 6.1.2 is to be complied with.

6. 1. 4 The turning gear for all engines is to be fitted with safety interlocks which prevent engine operation when engaged, *See* Pt 5, Ch 1, 3.10 Machinery interlocks. Indication of engaged/not engaged is to be provided at all start positions.

6. 1. 5 The remote control device of power-driven turning gear is to be so designed that power is removed from the turning gear when the operating switch is released.

6. 1. 6 Means are to be provided to secure the turning gear when disengaged.

6. 1. 7 Overload protection arrangements are to be provided to prevent damage to the electric motor and the turning gear train.

PART

5

CHAPTER 2 **Reciprocating Internal Combustion Engines**

SECTION 7 **Control and monitoring of main, auxiliary and emergency engines**

7. 1 General

7. 1. 1 Control engineering systems are to be in accordance with the requirements of Pt 6, Ch 1 Control Engineering Systems.

7. 1. 2 Oil mist detection or bearing temperature monitoring (or equivalent device in accordance with SOLAS II-1, *Regulation 47 - Fire precautions*, 47.2) fitted as required by Pt 5, Ch 2, 10.8,, Oil mist detection 10.8.1 are to operate as follows:

a. For trunk piston engines, automatic shutdown of the engine is to occur when oil mist or high bearing temperature is detected.

b. For crosshead engines, automatic slow-down is to occur when oil mist or high bearing temperature is detected.

c. Where arrangements are made to override the automatic slow-down or shutdown due to high oil mist or bearing temperature, the override is to be independent of other overrides.

d. Where the bearing temperature monitoring method is chosen, all bearings in the crankcase are to be monitored where practicable, e.g. main, crankpin, crosshead.

e. Where engine bearing temperature monitors or equivalent devices in accordance with SOLAS II-1, *Regulation 47 - Fire precautions*, 47.2 are provided for the prevention of the build-up of oil mist that may lead to a potentially explosive condition within the crankcase, details are to be submitted for consideration. The submission is to demonstrate that the arrangements are equivalent to those provided by oil mist detection, *See* Pt 5, Ch 2, 10.8 Oil mist detection 10.8.15.

Where required, for each trunk piston engine, one oil mist detector (or engine bearing temperature monitoring system or equivalent device) having two independent outputs for initiating the alarm and shutdown would satisfy the requirement for independence between alarm and shutdown systems.

7. 1. 3 All main and auxiliary engines intended for essential services are to be provided with means of indicating the lubricating oil pressure supply to them. Where such engines are of more than 37 kW (50 shp), audible and visual alarms are to be fitted to give warning of an appreciable reduction in pressure of the lubricating oil supply. Further, these alarms are to be actuated from the outlet side of any restrictions, such as filters, coolers, etc.

7. 2 Main engine governors

7. 2. 1 An efficient governor is to be fitted to each main engine so adjusted that the speed does not exceed that for which the engine is to be classed by more than 15 per cent.

7. 2. 2 Engines coupled to electrical generators which are the source of power for main electric propulsion motors are to comply with the requirements for auxiliary engines in respect of governors and overspeed protection devices.

7. 2. 3 When electronic speed governors of main internal combustion engines form part of a remote control system, they are to comply with the following conditions:

a. If lack of power to the governor may cause changes in the present speed and direction of thrust of the propeller, which consequently compromises safe operation of the vessel, then backup power supply is to be provided;
b. Local control of the engines is always to be possible. A means to effect safe transfer of control to the local control position and then control the engine is to be available in all normal and reasonably fore*See*able abnormal conditions;
c. In addition, electronic speed governors and their actuators are to be Type Approved in accordance with ACS's *Type Approval System Test Specification Number 1*.

7. 3 Auxiliary and emergency engine governors

7. 3. 1 Prime movers for driving generators of the main and emergency sources of electrical power are to be fitted with a speed governor which will prevent transient frequency variations in the electrical network in excess of ±10 per cent of the rated frequency, with a recovery time to steady state conditions not exceeding 5 seconds, when the maximum electrical step load is switched on or off.

7. 3. 2 In the case when a step load equivalent to the rated output of a generator is switched off, a transient speed variation in excess of 10 per cent of the rated speed may be acceptable, provided that this does not cause the intervention of the overspeed device as required by Pt 5, Ch 2, 7.4 Overspeed protective devices.

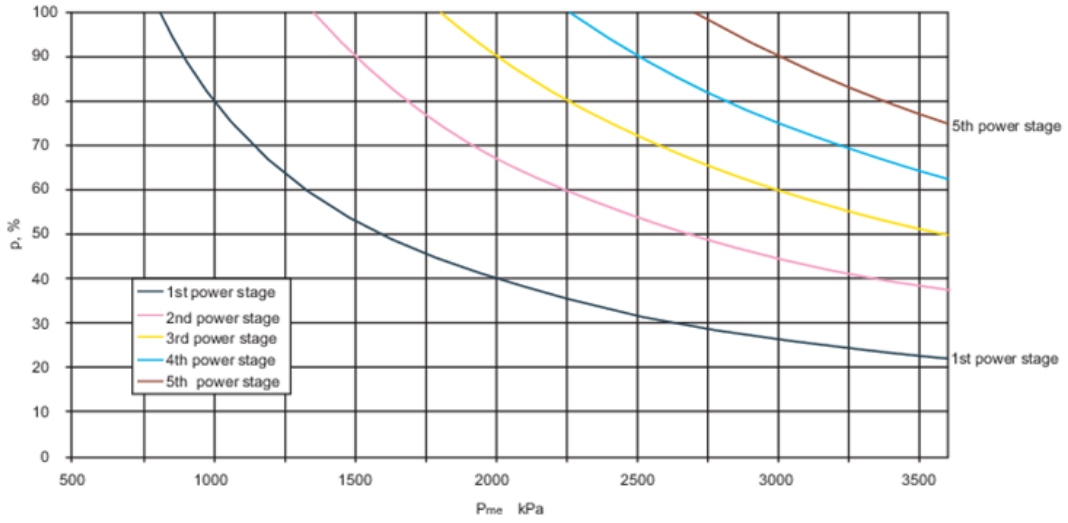
7. 3. 3 At all loads between no load and rated power, the permanent speed variation should not be more than ±5 per cent of the rated speed.

7. 3. 4 Prime movers are to be selected in such a way that they will meet the load demand within the ship's power distribution system. Application of electrical load should be possible with two load steps and must be such that prime movers, running at no load, can suddenly be loaded to 50 per cent of the rated power of the generator followed by the remaining 50 per cent after an interval sufficient to restore the speed to steady state. Steady state conditions should be achieved in not more than 5 seconds. Steady state conditions are those at which the envelope of speed variation does not exceed +1 per cent of the declared speed at the new power.

7. 3. 5 Application of electrical load in more than two load steps can only be permitted if the conditions within the ship's power distribution system permit the use of such prime movers which can only be loaded in more than two load steps (*See* Figure 2. 7. 1: Reference values for maximum possible sudden power increase (four-stroke engines)) and provided that this is already allowed for at the design stage. This is to be verified in the form of system specifications to be approved and to be demonstrated at ship's trials. In this case, due consideration is to be given to:

a. The power required for the electrical equipment to be automatically switched on after black-out and to the sequence in which it is connected.
b. Where generators are to be operated in parallel and where the power has to be transferred from one generator to another in the event of any one generator being switched off.

Figure 2. 7. 1: Reference values for maximum possible sudden power increase (four-stroke engines)



P_{me} : mean effective pressure at declared power

P : power increase referred to declared power at site conditions

7. 3. 6 Emergency generator sets are to comply with the requirements of Pt 5, Ch 2, 7.3 Auxiliary and emergency engine governors 7.3.1 to Pt 5, Ch 2, 7.3 Auxiliary and emergency engine governors 7.3.3 even when:

a. their total consumer load is applied suddenly; or

b. their total consumer load is applied in steps, subject to:

- the total load being supplied within 45 seconds of power failure on the main switchboard;
- the maximum step load being declared and demonstrated;
- the power distribution system being designed such that the declared maximum step loading is not exceeded, and;
- the compliance of time delays and loading sequence with the above being demonstrated at ship's trials.

7. 3. 7 For a.c. generating sets operating in parallel, the governing characteristics of the prime movers shall be such that within the limits of 20 per cent and 100 per cent total load, the load on any generating set will not normally differ from its proportionate share of the total load by more than 15 per cent of the rated power of the largest machine, or 25 per cent of the rated power of the individual machine in question, whichever is the less. For an a.c. generating set intended to operate in parallel, facilities are to be provided to adjust the governor sufficiently finely to permit an adjustment of load not exceeding 5 per cent of the rated load at normal frequency.

7. 3. 8 For generator set voltage control requirements *See* Pt 6, Ch 2, 9.4 Generator control.

7. 3. 9 For quality of power supplies (QPS) requirements *See* Pt 6, Ch 2, 1.8 Quality of power supplies.

7. 4 Overspeed protective devices

7. 4. 1 Each main engine developing 220kW (300 shp) or over which can be declutched or which drives a controllable pitch propeller, and also each auxiliary engine developing 220 kW (300 shp) and over for driving an electric generator, is to be fitted with an approved overspeed protective device.

7. 4. 2 The overspeed protective device, including its driving mechanism, is to be independent of the governor required by Pt 5, Ch 2, 7.2 Main engine governors or Pt 5, Ch 2, 7.3, Auxiliary and

emergency engine governors and is to be so adjusted that the speed does not exceed that for which the engine and its driven machinery are to be classed by more than 20 per cent for main engines and 15 per cent for auxiliary engines.

7. 5 Unattended machinery

7. 5. 1 Where main and auxiliary engines are fitted with automatic or remote controls so that under normal operating conditions they do not require any manual intervention by the operators, they are to be provided with the alarms and safety arrangements required by Pt 5, Ch 2, 7.5, Unattended machinery to Pt 5, Ch 2, 7.7 Auxiliary engines, as appropriate. Alternative arrangements which provide equivalent safeguards will be considered.

7. 5. 2 Where machinery is arranged to start automatically or from a remote control station, interlocks are to be provided to prevent start-up under conditions which could cause a hazard to the machinery.

7. 5. 3 Where machinery specified in this Section is required to be provided with a standby pump, the standby pump is to start automatically if the discharge pressure from the working pumps falls below a predetermined value.

7. 5. 4 Where a first stage alarm together with a second stage alarm and automatic shutdown of machinery are required in the relevant Tables of this Section, the sensors and circuits utilised for the second stage alarm and automatic shutdown are to be independent of those required for the first stage alarm.

7. 5. 5 Means are to be provided to prevent leaks from high pressure fuel oil injection piping for main and auxiliary engines dripping or spraying onto hot surfaces or into machinery air inlets. Such leakage is to be collected and, where practicable, led to a collector tank(s) fitted in a safe position. An alarm is to be provided to indicate that leakage is taking place. These requirements may also be applicable to high pressure hydraulic oil piping, depending upon the location.

7. 6 Engines for propulsion purposes

7. 6. 1 Alarms and safeguards are indicated in Pt 5, Ch 2, 7.6 Engines for propulsion purposes 7.6.2 to Pt 5, Ch 2, 7.6 Engines for propulsion purposes 7.6.8 and Table 2. 7. 1: Engines for propulsion purposes: Alarms and slow-downs and Table 2. 7. 2: Engines for propulsion purposes: Automatic shutdowns.

Table 2. 7. 1: Engines for propulsion purposes: Alarms and slow-downs

Item	Alarm	Note
Lubricating oil sump level	Low	Engines
Lubricating oil inlet pressure*	1st stage low	Engines. Slow-down
Lubricating oil inlet temperature*	High	Engines
Lubricating oil filters differential pressure	High	—
Activation of oil mist detection arrangements (or activation of the temperature monitoring systems or equivalent devices of: - the engine main, crank and crosshead bearing oil outlet; or - the engine main, crank and crosshead bearing)	High	For crosshead engines, automatic slow-down. For trunk-piston engines, *See* Table 2. 7. 2: Engines for propulsion purposes: Automatic shutdowns *See also* Pt 5, Ch 2, 7.1 General 7.1.2.

Cylinder lubricator flow	Low	One sensor per lubricator unit on crosshead engines. Slow down.
Thrust bearing temperature*	High	Slow-down
Piston coolant inlet pressure	Low	If a separate system. Slow-down
Piston coolant outlet temperature*	High	Per cylinder (if a separate system). Slow-down
Piston coolant outlet flow*	Low	Per cylinder (if a separate system)
Cylinder coolant inlet pressure or flow*	Low	Slow-down (automatic on trunk piston engines)
Cylinder coolant outlet temperature*	1st stage high	Per cylinder (if a separate system). Slow-down (automatic on trunk piston engines)
Engine cooling water system – oil content	High	Required for crosshead engines where engine cooling water used in oil/water heat exchangers
Sea-water cooling pressure	Low	—
Fuel valve coolant pressure	Low	If a separate system
Fuel valve coolant temperature	High	If a separate system
Fuel oil pressure from booster pump	Low	—
Fuel oil temperature or viscosity*	High and Low	Heavy oil only
Fuel oil high pressure piping*	Leakage	*See* Pt 5, Ch 2, 7.5 Unattended machinery 7.5.5
Common rail fuel oil pressure	Low	—
Common rail servo oil pressure	Low	—
Charge air cooler outlet temperature	High	Trunk piston engines
Scavenge air temperature (fire)	High	Per cylinder (2-stoke engines). Slow-down
Scavenge air receiver water level	High	—
Exhaust gas temperature*	High	Per cylinder. Slow-down (automatic on trunk piston engines), *See* Note 5
Exhaust gas temperature deviation from average*	High	Per cylinder, *See* Note 5
Turbocharger speed	High	Category B and C turbochargers, *See* Notes 11 and 12
Turbocharger exhaust gas inlet temperature*	High	Category B and C turbochargers, *See* Notes 6 and 12
Turbocharger lubricating oil inlet pressure	Low	Only for forced lubrication systems on category B and C turbochargers, *See* Notes 7, 10 and 12

Turbocharger lubricating oil outlet temperature	High	Category C turbochargers, if not a forced system, oil temperature near each bearing, *See* Notes 7 and 12
Starting air pressure*	Low	Before engine manoeuvring valve
Control air pressure	Low	—
Direction of rotation	Wrong way	Reversible engines, *See also* Pt 5, Ch 2, 7.6 Engines for propulsion purposes 7.6.7
Automatic start of engine	Failure	*See* Pt 5, Ch 2, 7.6 Engines for propulsion purposes 7.6.7
Electrical starting battery charge level	Low	—
Feed water or water/thermal fluid forced circulation flow (if fitted)	Low	*See* Pt 5, Ch 14, 6.2 Feed and circulation pumps 6.2.7 and Note 8
Uptake temperature	High	To monitor for soot fires. *See* Notes 8 and 9

Note *1.* Where 'per cylinder' appears in this Table, suitable sensors may be situated on manifold outlets for trunk piston engines.

Note *2.* For engines and gearing of 1500 kW or less, only the items marked* are required.

Note *3.* Common sensors are acceptable for alarms and slow-down functions.

Note *4.* Except where stated otherwise in the Table, slow-down may be effected by either manual or automatic means, by reduction of speed or power as appropriate.

Note *5.* For trunk piston engine power <500 kW/cylinder, a common sensor for exhaust gas manifold temperature may be fitted.

Note *6.* Alarm and indication of the exhaust gas temperature at turbocharger inlet may be waived if alarm and indication for individual exhaust gas temperature is provided for each cylinder and the alarm level is set to a value specified by the turbocharger manufacturer. For Category B turbochargers, the exhaust gas temperature may be alternatively monitored at the turbocharger outlet provided that the correlation between inlet and outlet temperatures is established and verified and the alarm level is set to a correspondingly safe level for the turbine.

Note *7.* Where the outlet temperature for each bearing cannot be measured due to the design, details of alternative proposals in accordance with the turbocharger manufacturer's instructions may be submitted for consideration.

Note *8.* Alarm only required when an exhaust gas economiser/boiler/thermal oil heater is fitted.

Note *9.* Alternatively, details of an appropriate fire detection system are to be submitted for consideration.

Note *10.* Separate sensors are to be provided if the lubrication oil system of the turbocharger is not integrated with the lubrication oil system of the engine or if it is separated by a throttle or pressure reduction valve from the engine lubrication oil system. Where the turbocharger is provided with a self-contained lubricating oil system integrated with the turbocharger, lubricating oil inlet pressure need not be monitored.

Note 11. Where multiple turbochargers are activated sequentially, speed monitoring is not required for the turbocharger(s) being activated last in the sequence, provided that all turbochargers share the same intake air filter and they are not fitted with waste gates.

Note 12. *See* Pt 5, Ch 2, 12.1 General 12.1.2 for details of turbocharger categorisations.
